Chapter 8

Accessibility

8.1 module AccessibilityMBS

8.1.1 module AccessibilityMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: A class to handle all the global stuff of the Accessibility API.
Example:

```
// check accessibility permission and find the UI element at a screen position
If Not AccessibilityMBS.IsProcessTrusted(True) Then // True = ask the user
MessageBox "Please allow accessibility in System Settings."
Return
End If

Var systemWide As AXUIElementMBS = AccessibilityMBS.SystemWideAXUIElement
Var element As AXUIElementMBS = systemWide.ElementAtPosition(200, 200) // screen coordinates
If element <>Nil Then System.DebugLog "Element at 200/200 belongs to process " + element.ProcessID.ToString
```

Notes: This class has a lot of CFStringMBS functions to return you constants. Please check Apple's documentation about those constants.
If you miss a function or a constant, please email.

8.1.2 Methods

8.1.3 ApplicationAXUIElement(pid as Integer) as AXUIElementMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The AXUIElement for the current application.

8.1.4 Available as Boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: True if the Accessibility API is available.
Notes: Should always be true on Mac OS X 10.2.

8.1.5 AXAPIEnabled as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: True if the user permitts Accessibility services.

8.1.6 IsProcessTrusted(Prompt as Boolean = false) as boolean

MBS MacCF Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: Returns whether the current process is a trusted accessibility client.
Notes: Added prompt flag for version 18.1.

8.1.7 kAXAllowedValuesAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.8 kAXAMPMFieldAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.9 kAXApplicationActivatedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.10 kAXApplicationDeactivatedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.11 kAXApplicationDockItemSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.12 kAXApplicationHiddenNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.13 kAXApplicationRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.14 kAXApplicationShownNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.15 kAXAscendingSortDirectionValue as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: A constant used for the AXUIElement class.

8.1.16 kAXAttributedStringForRangeParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.17 kAXBoundsForRangeParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.18 kAXBrowserRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.19 kAXBusyIndicatorRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.20 kAXButtonRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.21 kAXCancelAction as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the action names used for the AXUIElement class.

8.1.22 kAXCancelButtonAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.23 kAXCellForColumnAndRowParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.24 kAXCellRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.25 kAXCheckBoxRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.26 kAXChildrenAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.27 kAXClearButtonAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.28 kAXCloseButtonAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.29 kAXCloseButtonSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.30 kAXColorWellRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.31 kAXColumnCountAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.32 kAXColumnHeaderUIElementsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.33 kAXColumnIndexRangeAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.34 kAXColumnRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.35 kAXColumnsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.36 kAXColumnTitleAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.37 kAXColumnTitlesAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.38 kAXComboBoxRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.39 kAXConfirmAction as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the action names used for the AXUIElement class.

8.1.40 kAXContentListSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.41 kAXContentsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.42 kAXCreatedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification constants.

8.1.43 kAXCriticalValueAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.44 kAXDateFieldRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.45 kAXDayFieldAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.46 kAXDecrementAction as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the action names used for the AXUIElement class.

8.1.47 kAXDecrementArrowSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.48 kAXDecrementButtonAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.49 kAXDecrementPageSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.50 kAXDefaultButtonAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.51 kAXDefinitionListSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.52 kAXDescendingSortDirectionValue as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: A constant used for the AXUIElement class.

8.1.53 kAXDescription as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.54 kAXDescriptionAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.55 kAXDialogSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.56 kAXDisclosedByRowAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.57 kAXDisclosedRowsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.58 kAXDisclosingAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.59 kAXDisclosureLevelAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.60 kAXDisclosureTriangleRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.61 kAXDockExtraDockItemSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.62 kAXDockItemRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.63 kAXDocumentAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.64 kAXDocumentDockItemSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.65 kAXDrawerCreatedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification constants.

8.1.66 kAXDrawerRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.67 kAXEditedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.68 kAXEnabledAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.69 kAXExpandedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.70 kAXFilenameAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.71 kAXFloatingWindowSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.72 kAXFocusedApplicationAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.73 kAXFocusedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.74 kAXFocusedUIElementAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.75 kAXFocusedUIElementChangedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.76 kAXFocusedWindowAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.77 kAXFocusedWindowChangedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.78 kAXFolderDockItemSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.79 kAXFrontmostAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.80 kAXGridRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.81 kAXGroupRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.82 kAXGrowAreaAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.83 kAXGrowAreaRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.84 kAXHandleRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.85 kAXHandlesAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.86 kAXHeaderAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.87 kAXHelpAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.88 kAXHelpTagCreatedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification constants.

8.1.89 kAXHelpTagRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.90 kAXHiddenAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.91 kAXHorizontalOrientationValue as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: A constant used for the AXUIElement class.

8.1.92 kAXHorizontalScrollBarAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.93 kAXHorizontalUnitDescriptionAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.94 kAXHorizontalUnitsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.95 kAXHourFieldAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.96 kAXImageRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.97 kAXIncrementAction as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the action names used for the AXUIElement class.

8.1.98 kAXIncrementArrowSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.99 kAXIncrementButtonAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.100 kAXIncrementorAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.101 kAXIncrementorRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.102 kAXIncrementPageSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.103 kAXIndexAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.104 kAXInsertionPointLineNumberAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.105 kAXIsApplicationRunningAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.106 kAXIsEditableAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.107 kAXLabelUIElementsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.108 kAXLabelValueAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.109 kAXLayoutAreaRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.110 kAXLayoutItemRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.111 kAXLayoutPointForScreenPointParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.112 kAXLayoutSizeForScreenSizeParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.113 kAXLevelIndicatorRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.114 kAXLineForIndexParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.115 kAXLinkedUIElementsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.116 kAXListRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.117 kAXMainAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.118 kAXMainWindowAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.119 kAXMainWindowChangedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.120 kAXMarkerTypeAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.121 kAXMarkerTypeDescriptionAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.122 kAXMarkerUIElementsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.123 kAXMatteContentUIElementAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.124 kAXMatteHoleAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.125 kAXMatteRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.126 kAXMaxValueAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.127 kAXMenuBarAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.128 kAXMenuBarItemRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.129 kAXMenuBarRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.130 kAXMenuButtonRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.131 kAXMenuClosedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.132 kAXMenuItemCmdCharAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.133 kAXMenuItemCmdGlyphAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.134 kAXMenuItemCmdModifiersAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.135 kAXMenuItemCmdVirtualKeyAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.136 kAXMenuItemMarkCharAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.137 kAXMenuItemPrimaryUIElementAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.138 kAXMenuItemRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.139 kAXMenuItemSelectedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.140 kAXMenuOpenedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.141 kAXMenuRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.142 kAXMinimizeButtonAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.143 kAXMinimizeButtonSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.144 kAXMinimizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.145 kAXMinimizedWindowDockItemSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.146 kAXMinuteFieldAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.147 kAXMinValueAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.148 kAXModalAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.149 kAXMonthFieldAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.150 kAXMovedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification constants.

8.1.151 kAXNextContentsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.152 kAXNumberOfCharactersAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.153 kAXOrderedByRowAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.154 kAXOrientationAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.155 kAXOutlineRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.156 kAXOutlineRowSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.157 kAXOverflowButtonAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.158 kAXParentAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.159 kAXPickAction as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the action names used for the AXUIElement class.

8.1.160 kAXPlaceholderValueAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.161 kAXPopUpButtonRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.162 kAXPositionAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.163 kAXPressAction as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the action names used for the AXUIElement class.

8.1.164 kAXPreviousContentsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.165 kAXProcessSwitcherListSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.166 kAXProgressIndicatorRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.167 kAXProxyAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.168 kAXRadioButtonRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.169 kAXRadioGroupRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.170 kAXRaiseAction as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the action names used for the AXUIElement class.

8.1.171 kAXRangeForIndexParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.172 kAXRangeForLineParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.173 kAXRangeForPositionParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.174 kAXRatingIndicatorSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.175 kAXRelevanceIndicatorRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.176 kAXResizedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification constants.

8.1.177 kAXRoleAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.178 kAXRoleDescriptionAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.179 kAXRowCollapsedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the outline notification constants.

8.1.180 kAXRowCountAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.181 kAXRowCountChangedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification constants.

8.1.182 kAXRowExpandedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the outline notification constants.

8.1.183 kAXRowHeaderUIElementsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.184 kAXRowIndexRangeAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.185 kAXRowRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.186 kAXRowsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.187 kAXRTFForRangeParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.188 kAXRulerMarkerRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.189 kAXRulerRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.190 kAXScreenPointForLayoutPointParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.191 kAXScreenSizeForLayoutSizeParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.192 kAXScrollAreaRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.193 kAXScrollBarRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.194 kAXSearchButtonAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.195 kAXSearchFieldSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.196 kAXSecondFieldAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.197 kAXSecureTextFieldSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.198 kAXSelectedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.199 kAXSelectedCellsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.200 kAXSelectedCellsChangedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the cell-based table notification constants.

8.1.201 kAXSelectedChildrenAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.202 kAXSelectedChildrenChangedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification constants.

8.1.203 kAXSelectedChildrenMovedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the layout area notification constants.

8.1.204 kAXSelectedColumnsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.205 kAXSelectedColumnsChangedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification constants.

8.1.206 kAXSelectedRowsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.207 kAXSelectedRowsChangedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification constants.

8.1.208 kAXSelectedTextAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.209 kAXSelectedTextChangedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification constants.

8.1.210 kAXSelectedTextRangeAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.211 kAXSelectedTextRangesAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.212 kAXServesAsTitleForUIElementsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.213 kAXSharedCharacterRangeAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.214 kAXSharedTextUIElementsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.215 kAXSheetCreatedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification constants.

8.1.216 kAXSheetRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.217 kAXShowMenuAction as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the action names used for the AXUIElement class.

8.1.218 kAXShownMenuUIElementAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.219 kAXSizeAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.220 kAXSliderRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.221 kAXSortButtonSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.222 kAXSortDirectionAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.223 kAXSplitGroupRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.224 kAXSplitterRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.225 kAXSplittersAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.226 kAXStandardWindowSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.227 kAXStaticTextRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.228 kAXStringForRangeParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.229 kAXStyleRangeForIndexParameterizedAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.230 kAXSubroleAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.231 kAXSystemDialogSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.232 kAXSystemFloatingWindowSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.233 kAXSystemWideRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.234 kAXTabGroupRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.235 kAXTableRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.236 kAXTableRowSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.237 kAXTabsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.238 kAXTextAreaRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.239 kAXTextAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.240 kAXTextFieldRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.241 kAXTimeFieldRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.242 kAXTimelineSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.243 kAXTitleAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.244 kAXTitleChangedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification constants.

8.1.245 kAXTitleUIElementAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.246 kAXToolbarButtonAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.247 kAXToolbarButtonSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.248 kAXToolbarRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.249 kAXTopLevelUIElementAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.250 kAXTrashDockItemSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.251 kAXUIElementDestroyedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.252 kAXUIElementMBSTypeID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns the TypeID of the AXUIElement class.

8.1.253 kAXUnitDescriptionAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.254 kAXUnitsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.255 kAXUnitsChangedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the layout area notification constants.

8.1.256 kAXUnknownOrientationValue as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: A constant used for the AXUIElement class.

8.1.257 kAXUnknownRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.258 kAXUnknownSortDirectionValue as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: A constant used for the AXUIElement class.

8.1.259 kAXUnknownSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.260 kAXURLAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.261 kAXURLDockItemSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.262 kAXValueAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.263 kAXValueChangedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.264 kAXValueDescriptionAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.265 kAXValueIncrementAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.266 kAXValueIndicatorRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.267 kAXValueWrapsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.268 kAXVerticalOrientationValue as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: A constant used for the AXUIElement class.

8.1.269 kAXVerticalScrollBarAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.270 kAXVerticalUnitDescriptionAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.271 kAXVerticalUnitsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.272 kAXVisibleCellsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.273 kAXVisibleCharacterRangeAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.274 kAXVisibleChildrenAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.275 kAXVisibleColumnsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.276 kAXVisibleRowsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.277 kAXVisibleTextAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.278 kAXWarningValueAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.

8.1.279 kAXWindowAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.280 kAXWindowCreatedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.281 kAXWindowDeminiaturizedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.282 kAXWindowMiniaturizedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.283 kAXWindowMovedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.284 kAXWindowResizedNotification as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names used for the axobserver class.

8.1.285 kAXWindowRole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.286 kAXWindowsAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.287 kAXYearFieldAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the attribute constants.
Notes: Convenience attribute that yields the year field of a date field element.

8.1.288 kAXZoomButtonAttribute as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the attribute names used for the AXUIElement class.

8.1.289 kAXZoomButtonSubrole as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: One of the role names used for the AXUIElement class.

8.1.290 MakeAXValue(theCFObject as CFObjectMBS) as AXValueMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Creates an AXValue object containing the CFObject.
Notes: Actually only the RB object around the cfobject handle is replaced.
You can't do this using a cast in RB, so this function was created.

8.1.291 MakeAXValueFromCFRange(location as Integer, length as Integer) as AXValueMBS

MBS MacCF Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Creates an AXValue object for a CFRange structure with the given values.
Example:

```
// create with values and read them back
Var a as AXValueMBS = AccessibilityMBS.MakeAXValueFromCFRange(5, 9)

if a.AXIsCFRange then
Var lo, le as Integer

if a.AXGetCFRange(lo, le) then
```

```
MessageBox str(lo)+" "+str(le)
else
break // error
end if
else
break // error
end if
```

8.1.292 MakeAXValueFromCGPoint(x as single, y as single) as AXValueMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Creates an AXValue object for a CGPoint structure with the given values.

8.1.293 MakeAXValueFromCGRect(x as single, y as single, width as single, height as single) as AXValueMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Creates an AXValue object for a CGRect structure with the given values.

8.1.294 MakeAXValueFromCGSize(width as single, height as single) as AXValueMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Creates an AXValue object for a CGSize structure with the given values.

8.1.295 MakeProcessTrusted(path as string) as Integer

MBS MacCF Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: Attempts to make the process represented by the specified path a trusted accessibility client.
Notes: Use this function to make a process a trusted accessibility client.
Note: The caller must be running as root to successfully call this function. In addition, the caller should relaunch the process after this function returns successfully for the trusted status to take effect.

Path: The path to the executable of the process to make trusted.

Returns an error code that indicates success or failure.

8.1.296 SystemWideAXUIElement as AXUIElementMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns a AXUIElement which covers the whole system.
Example:

```
// displays the current window title if accessibility is enabled in Mac OS X 10.2 or newer
// your application needs permissions for accessibility to make this work!

Var SystemWideElement,FocusedApplicationElement,FocusedWindowElement as AXUIElementMBS
Var FocusedApplication,FocusedWindow,Title as AXValueMBS
Var s as String
Var cs as CFStringMBS

// show a window so there is one which can be found
Window1.show

SystemWideElement=AccessibilityMBS.SystemWideAXUIElement
if SystemWideElement<>nil then
FocusedApplication=SystemWideElement.AttributeValue(AccessibilityMBS.kAXFocusedApplicationAttribute)
if FocusedApplication.Type=AccessibilityMBS.kAXUIElementMBSTypeID then
FocusedApplicationElement=new AXUIElementMBS
FocusedApplicationElement.Handle=FocusedApplication.Handle
FocusedApplicationElement.RetainObject

FocusedWindow=FocusedApplicationElement.AttributeValue(AccessibilityMBS.kAXFocusedWindowAttribute)

if FocusedWindow<>nil and AccessibilityMBS.kAXUIElementMBSTypeID=FocusedWindow.Type then

FocusedWindowElement=new AXUIElementMBS
FocusedWindowElement.Handle=FocusedWindow.Handle
FocusedWindowElement.RetainObject

Title=FocusedWindowElement.AttributeValue(AccessibilityMBS.kAXTitleAttribute)
if Title<>nil and Title.Type=kCFStringMBSTypeID then
cs=new CFStringMBS
cs.handle=Title.Handle
cs.RetainObject
MessageBox cs.str
end if
end if
end if
end if
```

Notes: In the current implementation you can use this to get the AXUIElement for the frontmost application.

8.1.297 Constants

Constants

Constant	Value	Description
kAXErrorActionUnsupported	-25206	One of the error values used for the lasterror property.
kAXErrorAPIDisabled	-25211	One of the error values used for the lasterror property.
kAXErrorAttributeUnsupported	-25205	One of the error values used for the lasterror property.
kAXErrorCannotComplete	-25204	One of the error values used for the lasterror property.
kAXErrorFailure	-25200	One of the error values used for the lasterror property.
kAXErrorIllegalArgument	-25201	One of the error values used for the lasterror property.
kAXErrorInvalidUIElement	-25202	One of the error values used for the lasterror property.
kAXErrorInvalidUIElementObserver	-25203	One of the error values used for the lasterror property.
kAXErrorNotEnoughPrecision	-25214	One of the error values used for the lasterror property.
kAXErrorNotificationAlreadyRegistered	-25209	One of the error values used for the lasterror property.
kAXErrorNotificationNotRegistered	-25210	One of the error values used for the lasterror property.
kAXErrorNotificationUnsupported	-25207	One of the error values used for the lasterror property.
kAXErrorNotImplemented	-25208	One of the error values used for the lasterror property.
kAXErrorNoValue	-25212	One of the error values used for the lasterror property.
kAXErrorParameterizedAttributeUnsupported	-25213	One of the error values used for the lasterror property.
kAXErrorSuccess	0	One of the error values used for the lasterror property.

8.2 class AXObserverMBS

8.2.1 class AXObserverMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: A class to observes notifications sent by the Accessibility services.
Notes: This class requires Mac OS X 10.2 to work.
Subclass of the CFObjectMBS class.

8.2.2 Methods

8.2.3 AddNotification(element as AXUIElementMBS, notification as CFStringMBS) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Adds a notification to the observer.
Notes: Returns an error code. (0 for no error and -1 if the function is not available)

8.2.4 Create(pid as Integer) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new observer for the given process.
Notes: You need a valid process ID to observe the target application. The ProcessMBS class can help you.

8.2.5 RemoveNotification(element as AXUIElementMBS, notification as CFStringMBS) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Removes a notification from the observer.
Notes: Returns an error code. (0 for no error and -1 if the function is not available)

8.2.6 Events

8.2.7 Action(element as AXUIElementMBS, notification as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Called whenever an action occurs.

8.3 class AXUIElementMBS

8.3.1 class AXUIElementMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: This class represents an element of the User Interface of an application.
Example:

```
// displays the current window title if accessibility is enabled in Mac OS X 10.2 or newer

Var SystemWideElement,FocusedApplicationElement,FocusedWindowElement as AXUIElementMBS
Var FocusedApplication,FocusedWindow,Title as AXValueMBS
Var s as String
Var cs as CFStringMBS

SystemWideElement=AccessibilityMBS.SystemWideAXUIElement
if SystemWideElement<>nil then
FocusedApplication=SystemWideElement.AttributeValue(AccessibilityMBS.kAXFocusedApplicationAttribute)
if FocusedApplication.Type=AccessibilityMBS.kAXUIElementMBSTypeID then
FocusedApplicationElement=new AXUIElementMBS
FocusedApplicationElement.Handle=FocusedApplication.Handle
FocusedApplicationElement.RetainObject

FocusedWindow=FocusedApplicationElement.AttributeValue(AccessibilityMBS.kAXFocusedWindowAttribute)

if FocusedWindow<>nil and AccessibilityMBS.kAXUIElementMBSTypeID=FocusedWindow.Type then

FocusedWindowElement=new AXUIElementMBS
FocusedWindowElement.Handle=FocusedWindow.Handle
FocusedWindowElement.RetainObject

Title=FocusedWindowElement.AttributeValue(AccessibilityMBS.kAXTitleAttribute)
if Title<>nil and Title.Type=kCFStringMBSTypeID then
cs=new CFStringMBS
cs.handle=Title.Handle
cs.RetainObject
MessageBox cs.str
end if
end if
end if
end if
```

Notes: e.g. a window, a menuitem or a button.
This class requires Mac OS X 10.2 to work.
Subclass of the CFObjectMBS class.

8.3.2 Methods

8.3.3 ActionDescription(action as CFStringMBS) as CFStringMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns the description of the action with the given name.
Notes: Returns nil on any error.

8.3.4 ActionNames as CFArrayMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: An CF array with all the possible action names.
Notes: Returns nil on any error.

8.3.5 AttributeNames as CFArrayMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns a CF array with all the possible attribute names.

8.3.6 AttributeValue(attribute as CFStringMBS) as AXValueMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns the value of an attribute.

8.3.7 AttributeValues(attribute as CFStringMBS, minindex as Integer, maxindex as Integer) as CFArrayMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns the values of an attribute as a CF array.

8.3.8 ElementAtPosition(x as single, y as single) as AXUIElementMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns the element which is on the given position.
Notes: e.g. on a window.

8.3.9 GetAttributeValueCount(attribute as CFStringMBS) as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Counts how much attributes of the given name exists.

8.3.10 IsAttributeSettable(attribute as CFStringMBS) as Boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns true if the attribute with the given name is setable.
Notes: Returns false on any error.

8.3.11 PerformAction(action as CFStringMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Performs a named action.

8.3.12 PostKeyboardEvent(keyChar as Integer, virtualKey as Integer, keydown as boolean)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Posts a keyboard event.
Example:

```
// For example, to produce a 'Z',
// the SHIFT key must be down,
// the 'z' key must go down,
// and then the SHIFT and 'z' key must be released:

Var a as AXUIElementMBS
// get the element

a.PostKeyboardEvent( 0, 56, true ) // shift down
a.PostKeyboardEvent( asc("Z"), 6, true ) // 'z' down
a.PostKeyboardEvent( asc("Z"), 6, false ) // 'z' up
```

```
a.PostKeyboardEvent( 0, 56, false ) // shift up
```

Notes: You can only pass the root or application uielement.
The KeyCodesMBS class may help you to find the correct codes.

Synthesize keyboard events. Based on the values entered, the appropriate key down, key up, and flags changed events are generated.
If keyChar is NUL (0), an appropriate value will be guessed at, based on the default keymapping.

All keystrokes needed to generate a character must be entered, including SHIFT, CONTROL, OPTION, and COMMAND keys.

To find the virtual keys, well check the RB documentation for the keyboard class.

8.3.13 ProcessID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: The Process ID of an application.
Notes: The unix PID.

8.3.14 SetAttributeValue(attribute as CFStringMBS, value as CFObjectMBS)

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Sets the value of an attribute.
Notes: Changed type of value to CFObject in plugin version 6.3. Before it was an AXValue.

8.4 class AXValueMBS

8.4.1 class AXValueMBS

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: An AXValue is a CFObject but some extra data types are allowed.
Notes: Every AXValue is a CFObject. In case the CFObject contains unknown data or just binary data it can be a AXValue object.
This class requires Mac OS X 10.2 to work.
Subclass of the CFObjectMBS class.

8.4.2 Methods

8.4.3 AXGetCFRange(byref location as Integer, byref length as Integer) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns the values of a CFRange in case the AXValue holds a CFRange.
Notes: Returns true if it's a CFRange.

8.4.4 AXGetCGPoint(byref x as single, byref y as single) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns the values of the CGPoint structure inside the AXValue.
Notes: Returns true if successful.

8.4.5 AXGetCGRect(byref x as single, byref y as single, byref width as single, byref height as single) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns the values of the CGRect inside the AXValue in case there is one.
Notes: Returns true if successful.

8.4.6 AXGetCGSize(byref width as single, byref height as single) as boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns the values of the CGSize structure inside the AXValue in case there is one.
Notes: Returns true if successful.

8.4.7 Properties

8.4.8 AXIsCFRange as Boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns true if the AXValue contains a CFRange structure.
Notes: (Read only property)

8.4.9 AXIsCGPoint as Boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns true if the AXValue contains a CGPoint structure.
Notes: (Read only property)

8.4.10 AXIsCGRect as Boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns true if the AXValue contains a CGRect structure.
Notes: (Read only property)

8.4.11 AXIsCGSize as Boolean

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns true if the AXValue contains a CGSize structure.
Notes: (Read only property)

8.4.12 AXTypeID as Integer

MBS MacCF Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop only.

Function: Returns the Type ID of the AXValue.
Notes: Values:

Types from CoreGraphics:
kAXValueCGPointType = 1,
kAXValueCGSizeType = 2,
kAXValueCGRectType = 3,

Types from CFBase:
kAXValueCFRangeType = 4,

Other:
kAXValueIllegalType = 0

In case this function returns 0 the object may be a normal CFObject.
(Read only property)

8.5 Globals

8.5.1 InstallNSAccessibilityPatchMBS

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: Patches crashes with [NSMenuItem accessibilityIsAttributeSettable:] .
Notes: The plugin adds a method [NSMenuItem accessibilityIsAttributeSettable:] if missing to make sure the app doesn't crash when some framework method from Apple calls it.

Chapter 9

Addressbook

9.1 class ABAccountMBS

9.1.1 class ABAccountMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CNContainerMBS class instead. **Function:** The class for an addressbook account.
Example:

```
Var a as new ABAddressBookMBS
Var accounts() as ABAccountMBS = a.allAccounts

for each c as ABAccountMBS in accounts
MessageBox c.Name + EndOfLine + c.Identifier + EndOfLine + c.BaseURL
next
```

Notes: The ABAccount functions are not documented by Apple, but work well on OS X version 10.8 to 10.10.
They may work in newer versions if Apple does not change them. They may work in past OS X versions if Apple hat the same features there, too.
If the functions are not available in a OS X version, you will see NSExceptionMBS being raised.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

9.1.2 Methods

9.1.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

9.1.4 Properties

9.1.5 BaseURL as String

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The base URL for this account.
Notes: (Read only property)

9.1.6 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

9.1.7 Identifier as String

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The identifier.
Notes: (Read only property)

9.1.8 isMainAccount as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Whether this account is the main account.
Notes: (Read only property)

9.1.9 Name as String

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Name of account.
Example:

```
Var a as new ABAddressBookMBS
Var accounts() as ABAccountMBS = a.allAccounts

Var c as ABAccountMBS = accounts(0)
MessageBox c.Name
```

Notes: (Read only property)

9.2 class ABAddressBookMBS

9.2.1 class ABAddressBookMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CNContactStoreMBS class instead. **Function:** The Addressbook class for Mac OS X 10.2 and newer.
Example:

```
// list the people in the address book with their email addresses
Var book As New ABAddressBookMBS
Var lines() As String
For Each p As ABPersonMBS In book.people
Var first As String = p.valueForProperty(ABAddressBookMBS.kABFirstNameProperty)
lines.Add first
Next
MessageBox lines.Count.ToString + " people" + EndOfLine + String.FromArray(lines, ", ")
// for new code use the Contacts framework, see CNContactStoreMBS
```

Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

9.2.2 Methods

9.2.3 ABAddressBookErrorDomain as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The error domain for Addressbook.

9.2.4 ABMultiValueIdentifiersErrorKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the error keys for the addressbook.

9.2.5 accountWithIdentifier(Identifier as string) as ABAccountMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Finds account with matching identifier.

9.2.6 addRecord(record as ABRecordMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Adds a record (ABPersonMBS or ABGroup) to the AddressBook Database
Example:

```
Var a as new ABAddressBookMBS
Var p as new ABPersonMBS

if not p.setValue("Miller",a.kABLastNameProperty) then
MessageBox "Failed to set field "+a.LocalizedPropertyOrLabel(a.kABLastNameProperty)
end if

if not p.setValue("Ben",a.kABFirstNameProperty) then
MessageBox "Failed to set field "+a.LocalizedPropertyOrLabel(a.kABFirstNameProperty)
end if

if a.addRecord(p) then
MessageBox "Record added"
else
MessageBox "Failed to add record"
end if

if a.save then
MessageBox "Changes saved"
else
MessageBox "Failed to save changes"
end if
```

Notes: Returns true if the addition was successful
See also:

- 9.2.7 addRecord(record as ABRecordMBS, Account as ABAccountMBS, byref error as NSErrorMBS) as boolean 2774
- 9.2.8 addRecord(record as ABRecordMBS, byref error as NSErrorMBS) as boolean 2774

9.2.7 addRecord(record as ABRecordMBS, Account as ABAccountMBS, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Adds a record (ABPersonMBS or ABGroup) to the AddressBook Database with given account.
Notes: Returns true if the addition was successful.
On Mac OS X 10.7 the error parameter is set to describe the error.
See also:

- 9.2.6 addRecord(record as ABRecordMBS) as boolean 2773
- 9.2.8 addRecord(record as ABRecordMBS, byref error as NSErrorMBS) as boolean 2774

9.2.8 addRecord(record as ABRecordMBS, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Adds a record (ABPersonMBS or ABGroup) to the AddressBook Database.
Notes: Returns true if the addition was successful.
On Mac OS X 10.7 the error parameter is set to describe the error.
See also:

- 9.2.6 addRecord(record as ABRecordMBS) as boolean 2773
- 9.2.7 addRecord(record as ABRecordMBS, Account as ABAccountMBS, byref error as NSErrorMBS) as boolean 2774

9.2.9 addressBook as ABAddressBookMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Returns a new instance of ABAddressBook, or nil if the Address Book database can't be initialized.
Notes: If you're just making one-off lookups and edits, the sharedAddressBook method is probably more

appropriate.
If the user denies your application access to the Address Book database, this method returns nil.

Available in OS X v10.5 and later.
You need to use this method if you want to get an addressbook for ABPersonViewMBS.

9.2.10 allAccounts as ABAccountMBS()

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Queries list of all accounts.
Example:

```
Var a as new ABAddressBookMBS
Var accounts() as ABAccountMBS = a.allAccounts
Break // look in debugger
```

9.2.11 Constructor

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The constructor.

9.2.12 enabledAccounts as ABAccountMBS()

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Queries list of enabled accounts.
Example:

```
Var a as new ABAddressBookMBS
Var accounts() as ABAccountMBS = a.enabledAccounts
Break // look in debugger
```

9.2.13 EnableEvent

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Activates the events in this class.
Notes: You only need to call this if you use AddHandler command in Xojo to add event handlers. The plugin automatically does that in the constructor, but that is too early for AddHandler. And plugin on

enables events if you use them.

9.2.14 formattedAddressFromDictionary(address as Dictionary) as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns an attributed string containing the formatted address.
Notes: The string's attributes match address dictionary keys (kABAddressStreetKey for example).
Each attribute value contains the localized description of the key. (For example, the value of a Canadian kABAddressZIPKey field would be Postal Code)

9.2.15 GotSharedAddressbook as boolean

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Whether some other part of your app queried the shared addressbook already.
Notes: sharedAddressbook asks for permissions the first time you call it.
So with this function you can check if some other application part already queried the sharedAddressbook function. If true, a call to sharedAddressbook should return quickly. Either with nil (no permissions) or the addressbook.

9.2.16 groupForName(name as string) as ABGroupMBS

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Searches the group with the given name.
Example:

```
Var a as new ABAddressBookMBS
Var name as string = "Some Group"
Var g as ABGroupMBS = a.groupForName(name)
MessageBox g.DisplayName+": "+str(g.members.Count)
```

9.2.17 groupForUniqueId(uniqueid as string) as ABGroupMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns a ABGroupMBS matching a given unique ID.
Example:

```
Var a as new ABAddressBookMBS

// you have some uid
Var groups() as ABGroupMBS = a.groups
Var uid as string = groups(0).valueForProperty(a.kABUIDProperty)

// later you want to find the group
Var g as ABGroupMBS = a.groupForUniqueId(uid)

// shows the name
MessageBox g.valueForProperty(a.kABGroupNameProperty)
```

Notes: Returns nil if the record could not be found or matches to a person.
Available in Mac OS X 10.3 or newer.
see also recordForUniqueId.
See also:

- 9.2.18 groupForUniqueId(uniqueid as string, account as ABAccountMBS) as ABGroupMBS 2777

9.2.18 groupForUniqueId(uniqueid as string, account as ABAccountMBS) as ABGroupMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Finds a group for given unique ID for given account.
See also:

- 9.2.17 groupForUniqueId(uniqueid as string) as ABGroupMBS 2776

9.2.19 groups as ABGroupMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns an array of all the groups in the AddressBook database
Example:

```
// list all email addresses in one group

Var book as ABAddressBookMBS
Var groups() as ABGroupMBS
Var person as ABPersonMBS
Var data as ABMultiValueMBS
Var s as string

book=new ABAddressBookMBS
```

```
groups=book.groups

for each group as ABGroupMBS in groups
If group.valueForProperty(book.kABGroupNameProperty)= "test" then // or any valid group
Var members() as ABPersonMBS = group.members

for each member as ABPersonMBS in members

data=person.valueForProperty(book.kABEmailProperty)

if data<>nil then
for k as Integer=data.count-1 downto 0
s=s+data.valueAtIndex(k)+EndOfLine
next
end if
next
end if
Next
MessageBox s
```

Notes: Returns an empty array in case the DB doesn't contain any groups.
Returns nil on any error.

9.2.20 groupsForAccount(account as ABAccountMBS) as ABGroupMBS()

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Returns an array of all the groups for this account.
Example:

```
Var a as new ABAddressBookMBS
Var c as ABAccountMBS = a.defaultAccount
Var groups() as ABGroupMBS = a.groupsForAccount(c)

Break // look in debugger
```

Notes: Returns an empty array in case the DB doesn't contain any body.

9.2.21 kABAddressCityKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the dictionary keys for the address.

9.2.22 kABAddressCountryCodeKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The Country Code of an address.
Notes: kABAddressCountryCodeKey code must be one of the following:
iso country codes

ae = United Arab Emirates
ar = Argentina
at = Austria
au = Australia
ba = Bosnia and Herzegovina
be = Belgium
bg = Bulgaria
bh = Bahrain

9.2.23 kABAddressCountryKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the dictionary keys for the address.
Notes: kABAddressCountryCodeKey code must be one of the following:
iso country codes

9.2.24 kABAddressHomeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the home address.

9.2.25 kABAddressProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Street Addresses - kABMultiDictionaryProperty
Notes: This property is used for persons only.

9.2.26 kABAddressStateKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the dictionary keys for the address.

9.2.27 kABAddressStreetKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the dictionary keys for the address.

9.2.28 kABAddressWorkLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the work address.

9.2.29 kABAddressZIPKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the dictionary keys for the address.

9.2.30 kABAIMHomeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the home AIM Instant Messaging account.

9.2.31 kABAIMInstantProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: AIM Instant Messaging - kABMultiStringProperty
Notes: This property is used for persons only.
Deprecated in Mac OS 10.7. You should use kABInstantMessageProperty.

9.2.32 kABAIMMobileMeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the labels for the multistring value for the kABAIMInstantProperty property.
Notes: Available on Mac OS X 10.7 or later.

9.2.33 kABAIMWorkLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the work AIM Instant Messaging account.

9.2.34 kABAlternateBirthdayComponentsProperty as string

MBS MacCocoa Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Alternate non-Gregorian birth date.

9.2.35 kABAnniversaryLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The label for the anniversary date.

9.2.36 kABAssistantLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the labels for the related names.

9.2.37 kABBirthdayComponentsProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the property names for the addressbook records.
Notes: Available on Mac OS X 10.7 or later.
Birth date - kABDateComponentsProperty

9.2.38 kABBirthdayProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Birth date - kABDateProperty
Notes: This property is used for persons only.

9.2.39 kABBrotherLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the labels for the related names.

9.2.40 kABCalendarURIsProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The calendars associated to a person.
Notes: Calendar URIs - kABMultiStringProperty

9.2.41 kABChildLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the labels for the related names.

9.2.42 kABCreationDateProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creation Date (when first saved) - kABDateProperty
Notes: A property for all records.

9.2.43 kABDatabaseChangedExternallyNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The notification name to use with NSNotificationObserverMBS class.
Notes: Posted when a process other than the current one has changed the Address Book database.
Depending on the operation performed on the address book, one or more of the following keys may be

included in the user-info dictionary: kABInsertedRecords, kABUpdatedRecords, and kABDeletedRecords. The values for each of the keys are the unique IDs of the records that were inserted, updated, or deleted, respectively. If the values for all the keys are nil, every record has changes. For example, this happens when the Address Book database is restored from a backup copy.

The plugin implements this notification for you and calls the DatabaseChanged event in ABAddressBookMBS class.

9.2.44 kABDatabaseChangedNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The notification name to use with NSNotificationObserverMBS class.
Notes: Posted when this process has changed the Address Book database.
Depending on the operation performed on the address book, one or more of the following keys may be included in the user-info dictionary: kABInsertedRecords, kABUpdatedRecords, and kABDeletedRecords. The values for each of the keys are the unique IDs of the records that were inserted, updated, or deleted, respectively. If the values for all the keys are nil, every record has changes. For example, this happens when the Address Book database is restored from a backup copy.

The plugin implements this notification for you and calls the DatabaseChanged event in ABAddressBookMBS class.

9.2.45 kABDeletedRecords as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys contained by the user-info dictionary of the notifications posted by the Address Book framework.
Notes: Records that have been deleted.

9.2.46 kABDepartmentProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Department name - (Person)
Notes: This property is used for persons only.

9.2.47 kABEmailHomeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the home email address.

9.2.48 kABEmailMobileMeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the labels for emails.
Notes: Available on Mac OS X 10.7 or later.
MobileMe email

9.2.49 kABEmailProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Email(s) - kABMultiStringProperty
Notes: This property is used for persons only.

9.2.50 kABEmailWorkLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the work email address.

9.2.51 kABFatherLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the labels for the related names.

9.2.52 kABFirstNamePhoneticProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: First name Phonetic - kABStringProperty
Notes: This property is used for persons only.

9.2.53 kABFirstNameProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: First name - kABStringProperty
Example:

```
Var a as new ABAddressBookMBS
Var p as new ABPersonMBS

if not p.setValue("Ben",a.kABFirstNameProperty) then
MessageBox "Failed to set field "+a.LocalizedPropertyOrLabel(a.kABFirstNameProperty)
end if
```

Notes: This property is used for persons only.

9.2.54 kABFriendLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the labels for the related names.

9.2.55 kABGroupNameProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Name of the group - kABStringProperty
Example:

```
Var theAB as new ABAddressBookMBS
Var result as new ABGroupMBS
Var error as NSErrorMBS
Var b as Boolean=result.SetValue("test",TheAB.kABGroupNameProperty,error)
if not b then
MessageBox("Failed to name group test."+error.description)
else
MessageBox "OK"
end if
```

Notes: This property is used for groups only.

9.2.56 kABHomeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A generic label.
Notes: All kABXXXXHomeLabel are equivalent to this label.

9.2.57 kABHomePageLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Homepage URL label for the kABURLsProperty.

9.2.58 kABHomePageProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Home Web page - kABStringProperty
Notes: This property is used for persons only.
Deprecated in Mac OS 10.4. You should use kABURLsProperty.

9.2.59 kABICQHomeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the home ICQ Instant Messaging account.

9.2.60 kABICQInstantProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: ICQ Instant Messaging - kABMultiStringProperty
Notes: Deprecated in Mac OS 10.7. You should use kABInstantMessageProperty.
This property is used for persons only.

9.2.61 kABICQWorkLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the work ICQ Instant Messaging account.

9.2.62 kABInsertedRecords as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys contained by the user-info dictionary of the notifications posted by the Address Book framework.
Notes: Records that have been inserted.

9.2.63 kABInstantMessageProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the addressbook record properties.
Notes: Available on Mac OS X 10.7 or later.
Instant Messaging - kABMultiDictionaryProperty

9.2.64 kABInstantMessageServiceAIM as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.
AIM

9.2.65 kABInstantMessageServiceFacebook as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.
Facebook

9.2.66 kABInstantMessageServiceGaduGadu as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.

Gadu-Gadu

9.2.67 kABInstantMessageServiceGoogleTalk as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.
Google Talk

9.2.68 kABInstantMessageServiceICQ as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.
ICQ

9.2.69 kABInstantMessageServiceJabber as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.
Jabber

9.2.70 kABInstantMessageServiceKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the dictionary for an instant message.
Notes: Available on Mac OS X 10.7 or later.
Dictionary key for the service type, not guaranteed to be present; possible values follow.

9.2.71 kABInstantMessageServiceMSN as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.

MSN

9.2.72 kABInstantMessageServiceQQ as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.
QQ

9.2.73 kABInstantMessageServiceSkype as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.
Skype

9.2.74 kABInstantMessageServiceYahoo as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the kABInstantMessageUsernameKey key.
Notes: Available on Mac OS X 10.7 or later.
Yahoo!

9.2.75 kABInstantMessageUsernameKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the dictionary for an instant message.
Notes: Available on Mac OS X 10.7 or later.
Dictionary key for the instant messaging handle/username

9.2.76 kABJabberHomeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the home jabber Instant Messaging account.

9.2.77 kABJabberInstantProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Jabber Instant Messaging - kABMultiStringProperty
Notes: Deprecated in Mac OS 10.7. You should use kABInstantMessageProperty.
This property is used for persons only.

9.2.78 kABJabberWorkLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the work jabber Instant Messaging account.

9.2.79 kABJobTitleProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Job Title - kABStringProperty
Notes: This property is used for persons only.

9.2.80 kABLastNamePhoneticProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Last name Phonetic - kABStringProperty
Notes: This property is used for persons only.

9.2.81 kABLastNameProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Last name - kABStringProperty
Example:

```
Var a as new ABAddressBookMBS
Var p as new ABPersonMBS

if not p.setValue("Miller",a.kABLastNameProperty) then
MessageBox "Failed to set field "+a.LocalizedPropertyOrLabel(a.kABLastNameProperty)
end if
```

Notes: This property is used for persons only.

9.2.82 kABMaidenNameProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The maiden name of the person - kABStringProperty
Example:

```
Var a as new ABAddressBookMBS
Var p as ABPersonMBS = a.owner // get my card
MessageBox p.valueForProperty(a.kABMaidenNameProperty) // show my maiden name
```

Notes: This property is used for persons only.

9.2.83 kABManagerLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the labels for the related names.

9.2.84 kABMiddleNamePhoneticProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The middle name phonic - kABStringProperty
Notes: This property is used for persons only.

9.2.85 kABMiddleNameProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The middle name - kABStringProperty
Notes: This property is used for persons only.

9.2.86 kABMobileMeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the generic labels.
Notes: Available on Mac OS X 10.7 or later.
MobileMe - for AIM or email values

9.2.87 kABModificationDateProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Last saved date - kABDateProperty
Notes: A property for all records.

9.2.88 kABMotherLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the labels for the related names.

9.2.89 kABMSNHomeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the home MSN Instant Messaging account.

9.2.90 kABMSNInstantProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: MSN Instant Messaging - kABMultiStringProperty
Notes: This property is used for persons only.
Deprecated in Mac OS 10.7. You should use kABInstantMessageProperty.

9.2.91 kABMSNWorkLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the work MSN Instant Messaging account.

9.2.92 kABNicknameProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The nick name of the person - kABStringProperty
Notes: This property is used for persons only.

9.2.93 kABNoteProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Note - kABStringProperty
Example:

```
Var a as new ABAddressBookMBS
Var p as ABPersonMBS = a.owner

// read
MessageBox p.valueForProperty(a.kABNoteProperty).StringValue

// write
if p.setValue("Hello World", a.kABNoteProperty) then
if a.save then
MessageBox "Changed."
end if
end if
```

Notes: This property is used for persons only.

9.2.94 kABOrganizationProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Company name - kABStringProperty
Example:

```
Var a as new ABAddressBookMBS
Var p as new ABPersonMBS

if not p.setValue("My Company",a.kABOrganizationProperty) then
MessageBox "Failed to set field "+a.LocalizedPropertyOrLabel(a.kABOrganizationProperty)
end if
```

Notes: This property is used for persons only.

9.2.95 kABOtherDateComponentsProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the properties for a addressbook records.
Notes: Available on Mac OS X 10.7 or later.
Dates associated with this person - kABMultiDateComponentsProperty - (Person)

9.2.96 kABOtherDatesProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Dates associated with this person - kABMultiDateProperty - (Person)
Notes: This property is used for persons only.

9.2.97 kABOtherLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A generic label.
Notes: Can be used with any multi-value property.

9.2.98 kABParentLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the labels for the related names.

9.2.99 kABPartnerLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the labels for the related names.

9.2.100 kABPersonFlags as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Various flags - kABIntegerProperty
Example:

```
Var a as new ABAddressBookMBS
Var p as new ABPersonMBS

if not p.setValue("Miller",a.kABLastNameProperty) then
MessageBox "Failed to set field "+a.LocalizedPropertyOrLabel(a.kABLastNameProperty)
end if

if not p.setValue("Ben",a.kABFirstNameProperty) then
MessageBox "Failed to set field "+a.LocalizedPropertyOrLabel(a.kABFirstNameProperty)
end if

if not p.setValue("My Company",a.kABOrganizationProperty) then
MessageBox "Failed to set field "+a.LocalizedPropertyOrLabel(a.kABOrganizationProperty)
end if

if not p.setValue(a.kABShowAsCompany,a.kABPersonFlags) then
MessageBox "Failed to set field "+a.LocalizedPropertyOrLabel(a.kABPersonFlags)
end if

if a.addRecord(p) then
MessageBox "Record added"
else
MessageBox "Failed to add record"
end if

if a.save then
MessageBox "Changes saved"
else
MessageBox "Failed to save changes"
end if
```

Notes: This property is used for persons only.

9.2.101 kABPhoneHomeFAXLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The label for the home fax number.

9.2.102 kABPhoneHomeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The label for the home phone number.

9.2.103 kABPhoneiPhoneLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The label for the mobile phone number (for iPhone).

9.2.104 kABPhoneMainLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The label for the main phone number.

9.2.105 kABPhoneMobileLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The label for the mobile phone number.

9.2.106 kABPhonePagerLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The label for the pager number.

9.2.107 kABPhoneProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Generic phone number - kABMultiStringProperty
Notes: This property is used for persons only.

9.2.108 kABPhoneWorkFAXLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The label for the work fax number.

9.2.109 kABPhoneWorkLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The label for the work phone number.

9.2.110 kABRelatedNamesProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: names related to this person - kABMultiStringProperty
Notes: This property is used for persons only.

9.2.111 kABSisterLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the labels for the related names.

9.2.112 kABSocialProfileProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Social Profiles - kABMultiDictionaryProperty
Notes: Available on Mac OS X 10.7 or later.
The multi dictionary contains dictionaries. Each has keys like kABSocialProfileURLKey, kABSocialProfileUsernameKey, kABSocialProfileUserIdentifierKey and kABSocialProfileServiceKey.

kABSocialProfileServiceKey has values like kABSocialProfileServiceTwitter, kABSocialProfileServiceFacebook, kABSocialProfileServiceLinkedIn, kABSocialProfileServiceFlickr and kABSocialProfileServiceMySpace.

9.2.113 kABSocialProfileServiceFacebook as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the social profile dictionary's kABSocialProfileServiceKey key.
Notes: Available on Mac OS X 10.7 or later.
Facebook

9.2.114 kABSocialProfileServiceFlickr as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the social profile dictionary's kABSocialProfileServiceKey key.
Notes: Available on Mac OS X 10.7 or later.
Flickr

9.2.115 kABSocialProfileServiceKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for addressbook record values.
Notes: Available on Mac OS X 10.7 or later.
The service for this social profile. Can be kABSocialProfileServiceTwitter, kABSocialProfileServiceFacebook, kABSocialProfileServiceLinkedIn, kABSocialProfileServiceFlickr or kABSocialProfileServiceMySpace.

9.2.116 kABSocialProfileServiceLinkedIn as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the social profile dictionary's kABSocialProfileServiceKey key.
Notes: Available on Mac OS X 10.7 or later.
LinkedIn

9.2.117 kABSocialProfileServiceMySpace as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the social profile dictionary's kABSocialProfileServiceKey key.
Notes: MySpace
Available on Mac OS X 10.7 or later.

9.2.118 kABSocialProfileServiceSinaWeibo as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the values for the social profile dictionary's kABSocialProfileServiceKey key.
Notes: SinaWeibo
Available in Mac OS X 10.8 and newer.

9.2.119 kABSocialProfileServiceTencentWeibo as string

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the values for the social profile dictionary's kABSocialProfileServiceKey key.
Notes: Available on Mac OS X 10.9 or later.
Tencent Weibo

9.2.120 kABSocialProfileServiceTwitter as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the values for the social profile dictionary's kABSocialProfileServiceKey key.
Notes: Available on Mac OS X 10.7 or later.
Twitter

9.2.121 kABSocialProfileServiceYelp as string

MBS MacCocoa Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the values for the social profile dictionary's kABSocialProfileServiceKey key.
Notes: Available on Mac OS X 10.7 or later.
Yelp

9.2.122 kABSocialProfileURLKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for addressbook record values.
Notes: Available on Mac OS X 10.7 or later.
Service name. Possible values follow.

9.2.123 kABSocialProfileUserIdentifierKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for addressbook record values.
Notes: Available on Mac OS X 10.7 or later.
Service-specific identifier.

9.2.124 kABSocialProfileUsernameKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for addressbook record values.
Notes: Available on Mac OS X 10.7 or later.
User-visible profile name.

9.2.125 kABSpouseLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the labels for the related names.

9.2.126 kABSuffixProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The name suffix - kABStringProperty
Notes: e.g. "Sr." "Jr." "III"
This property is used for persons only.

9.2.127 kABTitleProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: the title of the person - kABStringProperty
Notes: e.g. "Sir" "Duke" "General" "Lord"
This property is used for persons only.

9.2.128 kABUIDProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The UID property - kABStringProperty
Notes: A property for all records.

9.2.129 kABUpdatedRecords as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys contained by the user-info dictionary of the notifications posted by the Address Book framework.
Notes: Records that have been updated.

9.2.130 kABURLsProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: URLs - kABMultiStringProperty
Example:

```
// shows all websites with labels

Var a as new ABAddressBookMBS
Var p as ABPersonMBS = a.owner
Var m as ABMultiValueMBS = p.valueForProperty(a.kABURLsProperty)

Var u as Integer = m.count-1
for i as Integer = 0 to u
Var label as string = m.labelAtIndex(i)
Var value as string = m.valueAtIndex(i)

MessageBox label+" ->"+value
next
```

Notes: This property is used for persons only.

9.2.131 kABWorkLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A generic label.
Notes: All kABXXXXWorkLabel are equivalent to this label

9.2.132 kABYahooHomeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the home yahoo Instant Messaging account.

9.2.133 kABYahooInstantProperty as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Yahoo Instant Messaging - kABMultiStringProperty
Notes: This property is used for persons only.
Deprecated in Mac OS 10.7. You should use kABInstantMessageProperty.

9.2.134 kABYahooWorkLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A label for the work yahoo Instant Messaging account.

9.2.135 LocalizedPropertyOrLabel(propertyOrLabel as string) as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the localized version of built in properties, labels or keys
Notes: Returns propertyOrLabel if not found (e.g. if not built in).

9.2.136 NewPersonWithVCardRepresentation(data as memoryblock) as ABPersonMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Create a person from a vCard.
Notes: Returns nil on failure.
Convenience function which cen be used instead of the ABPersonMBS constructor.

9.2.137 people as ABPersonMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns an array of all the people in the AddressBook database
Example:

```
Var a as new ABAddressBookMBS

// get all people
Var p(-1) as ABPersonMBS = a.people
```

```
// walk over people list
for each m as ABPersonMBS in p
try
// ask for image

Var j as NSImageMBS = m.image

// do something with image
if j<>nil then
Backdrop=j.CopyPictureWithMask
end if

catch x as NSExceptionMBS
// raises exception if there is no image
end try
next
```

Notes: Returns an empty array in case the DB doesn't contain any body.
Returns nil on any error.

9.2.138 peopleForAccount(account as ABAccountMBS) as ABPersonMBS()

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Returns an array of all the people for this account.
Example:

```
Var a as new ABAddressBookMBS
Var c as ABAccountMBS = a.defaultAccount
Var people() as ABPersonMBS = a.peopleForAccount(c)

Break // look in debugger
```

Notes: Returns an empty array in case the DB doesn't contain any body.

9.2.139 peopleForEmail(email as string) as ABPersonMBS()

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Searches a contact for the given email.
Example:

```
Var a as new ABAddressBookMBS
Var persons() as ABPersonMBS = a.peopleForEmail("support@monkeybreadsoftware.de")
```

```
if persons.LastIndex >= 0 then
MessageBox persons(0).DisplayName
else
MessageBox "nothing found."
end if
```

9.2.140 persistentAccounts as ABAccountMBS()

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Queries list of all persistent accounts.
Example:

```
Var a as new ABAddressBookMBS
Var accounts() as ABAccountMBS = a.persistentAccounts
Break // look in debugger
```

9.2.141 personForUniqueId(uniqueid as string) as ABPersonMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns a ABPersonMBS matching a given unique ID.
Example:

```
Var a as new ABAddressBookMBS

// you have some uid
Var uid as string = a.owner.valueForProperty(a.kABUIDProperty)

// later you want to find the person
Var p as ABPersonMBS = a.personForUniqueId(uid)

// shows the name
MessageBox p.valueForProperty(a.kABFirstNameProperty)
```

Notes: Returns nil if the record could not be found or matches to a group.
Available in Mac OS X 10.3 or newer.
see also recordForUniqueId.
See also:

- 9.2.142 personForUniqueId(uniqueid as string, account as ABAccountMBS) as ABPersonMBS 2808

9.2.142 personForUniqueId(uniqueid as string, account as ABAccountMBS) as ABPersonMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Finds a person for given unique ID for given account.
See also:

- 9.2.141 personForUniqueId(uniqueid as string) as ABPersonMBS 2807

9.2.143 recordClassFromUniqueId(uniqueid as string) as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Given a record uniqueId returns the record class name.
Notes: Return "ABPersonMBS" or "ABGroup" or "" for a given uniqueid.

9.2.144 recordForUniqueId(uniqueid as string) as ABRecordMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns a record (ABPersonMBS or ABGroup) matching a given unique ID.
Example:

```
Var a as new ABAddressBookMBS

// you have some uid
Var uid as string = a.owner.valueForProperty(a.kABUIDProperty)

// later you want to find the person
Var r as ABRecordMBS = a.recordForUniqueId(uid)
if r isa ABPersonMBS then
Var p as ABPersonMBS = ABPersonMBS(r)

// shows the name
MessageBox p.valueForProperty(a.kABFirstNameProperty)
end if
```

Notes: Returns nil if the record could not be found.
Available in Mac OS X 10.3 or newer.
See also:

- 9.2.145 recordForUniqueId(uniqueid as string, account as ABAccountMBS) as ABRecordMBS 2809

9.2.145 recordForUniqueId(uniqueid as string, account as ABAccountMBS) as ABRecordMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Finds a record for given unique ID for given account.
See also:

- 9.2.144 recordForUniqueId(uniqueid as string) as ABRecordMBS 2808

9.2.146 recordsMatchingSearchElement(search as ABSearchElementMBS) as ABRecordMB

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns an array of records matching the given search element
Example:

```
Var ab as new ABAddressBookMBS

// search for people with birthday, by searching for dates starting 1901.
Var searchDate as new date( 1901, 1, 1 )
Var search as ABSearchElementMBS = ab.SearchElementForPersonProperty( ab.kABBirthdayProperty, "",
"", searchDate, ab.kABGreaterThan )

// do the search
Var people() as ABRecordMBS = ab.RecordsMatchingSearchElement( search )

for each person as ABRecordMBS in people
Var p as ABPersonMBS = ABPersonMBS( person )
// now work on them
next
```

Notes: Returns an empty array if no matches or an error.

9.2.147 removeRecord(record as ABRecordMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Removes a record (ABPersonMBS or ABGroup) from the AddressBook Database
Notes: Returns true if the removal was successful.
See also:

- 9.2.148 removeRecord(record as ABRecordMBS, byref error as NSErrorMBS) as boolean 2810

9.2.148 removeRecord(record as ABRecordMBS, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Removes a record (ABPersonMBS or ABGroup) from the AddressBook Database.
Notes: Returns true if the removal was successful.
On Mac OS X 10.7 the error parameter is set to describe the error.
See also:

- 9.2.147 removeRecord(record as ABRecordMBS) as boolean 2809

9.2.149 save as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Saves changes made since the last save.
Notes: Return true if successful (or there was no change).
See also:

- 9.2.150 save(byref error as NSErrorMBS) as boolean 2810

9.2.150 save(byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Saves changes made since the last save.
Notes: Return true if successful (or there was no change).
On Mac OS X 10.5 the error object is returned. On Mac OS X 10.4 this error property is nil and you only can use the result.
See also:

- 9.2.149 save as boolean 2810

9.2.151 searchElementForConjunction(conjunction as Integer, children() as ABSearchElementMBS) as ABSearchElementMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Creates a search element combining several sub search elements.
Notes: Convenience function which can be used instead of ABSearchElementMBS.searchElementForConjunction.

9.2.152 searchElementForGroupProperty(PropertyName as string, Label as string, Key as string, value as Variant, comparison as Integer) as ABSearchElementMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns a search element that will search groups.
Notes: Convenience function to be used instead of the searchElementForProperty method in the ABGroupMBS class.

9.2.153 searchElementForPersonProperty(PropertyName as string, Label as string, Key as string, value as Variant, comparison as Integer) as ABSearchElementMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns a search element that will search people.
Example:

```
// search person by record's unique ID
// this is same as calling recordForUniqueId function directly
Var a as new ABAddressBookMBS
Var e as ABSearchElementMBS

Var PropertyName as string = a.kABUIDProperty
const Label = ""
const Key = ""
const value = "637FA922-7A2B-4F9A-BFA3-023253D4A3D5:ABPerson" // some person ID
const comparison = a.kABEqual

e = ABPersonMBS.searchElementForProperty(PropertyName, label, key, value, comparison)

Var records() as ABRecordMBS = a.recordsMatchingSearchElement(e)

for each r as ABRecordMBS in records
Var p as ABPersonMBS = ABPersonMBS(r)

MessageBox p.DisplayName
next
```

Notes: Convenience function to be used instead of the searchElementForProperty method in the ABPersonMBS class.

9.2.154 setMe(moi as ABPersonMBS)

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Sets "Me" to moi.
Notes: Pass nil to clear "Me".

9.2.155 sharedAddressbook as ABAddressBookMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Returns the shared addressbook object.
Example:

```
// quickly find the addressbook, locate me and display my name:
MessageBox ABAddressBookMBS.sharedAddressbook.owner.DisplayName
```

Notes: If you call this method several times, the object is cached, so it's only created the first time (singleton).
Returns nil on Windows or Linux or low memory or missing permissions.

9.2.156 sharedAddressbookMT as ABAddressBookMBS

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Returns the shared addressbook object.
Notes: On Mac OS X 10.8, the user will be asked to allow access to the addressbook for your application. As the call to sharedAddressbook blocks in this case, this method can be called on a thread to avoid the blocking of your app.

If you call this method several times, the object is cached, so it's only created the first time (singleton).
Returns nil on Windows or Linux or low memory or missing permissions.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

9.2.157 Properties

9.2.158 defaultAccount as ABAccountMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Queries default account.
Example:

Var a as new ABAddressBookMBS
MessageBox a.defaultAccount.Name

Notes: (Read only property)

9.2.159 defaultCountryCode as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the default country code for records without specified codes.
Notes: Available in Mac OS X 10.3 or newer.
(Read only property)

9.2.160 defaultNameOrdering as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the default name ordering defined by the user in the Address Book preferences.
Notes: Possible values: kABFirstNameFirst or kABLastNameFirst
Available in Mac OS X 10.3 or newer.
(Read only property)

9.2.161 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: The handle to the used ABAddressbook object.
Notes: (Read and Write property)

9.2.162 hasUnsavedChanges as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns true if they are unsaved changes.
Notes: The unsaved changes flag is automatically set when changes are made.
(Read only property)

9.2.163 owner as ABPersonMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the person that represents the user.
Notes: Returns nil if "me" was never set.
(function is not named me as me is a reserved word in Xojo)
(Read only property)

9.2.164 Events

9.2.165 DatabaseChanged(Externally as boolean, InsertedRecords() as string, UpdatedRecords() as string, DeletedRecords() as string)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The database has changed.
Notes: Externally: true if changes were made by another application.
InsertedRecords: Record UIDs of records changed. (can be empty)
UpdatedRecords: Record UIDs of records updated. (can be empty)
DeletedRecords: Record UIDs of records deleted. (can be empty)

9.2.166 Constants

Constants

Constant	Value	Description
kABArrayProperty	5	One of the property type constants. Array object.
kABBitsInBitFieldMatch	11	One of the search comparison modes. Supported in Mac OS X 10.3 and newer versions.
kABContainsSubString	7	One of the search comparison modes.
kABContainsSubStringCaseInsensitive	8	One of the search comparison modes.
kABDataProperty	7	One of the property type constants. Data object.
kABDateComponentsProperty	8	One of the property type constants. Available on Mac OS X 10.7 or later. Date component.
kABDateProperty	4	One of the property type constants. Date.
kABDefaultNameOrdering	0	One of the flags constants for the integer value stored in the prop sonFlags.
kABDictionaryProperty	6	One of the property type constants. Dictionary.
kABDoesNotContainSubString	12	One of the search comparison modes. Supported in Mac OS X 10.4 and newer versions.
kABDoesNotContainSubStringCaseInsensitive	13	One of the search comparison modes. Supported in Mac OS X 10.4 and newer versions.
kABEqual	0	One of the search comparison modes.
kABEqualCaseInsensitive	6	One of the search comparison modes.
kABErrorInProperty	0	One of the property type constants. Invalid property.
kABFirstNameFirst	&h40	One of the flags constants for the integer value stored in the prop sonFlags.
kABGreaterThan	4	One of the search comparison modes.
kABGreaterThanOrEqual	5	One of the search comparison modes.
kABIntegerProperty	2	One of the property type constants. Integer.
kABLastNameFirst	&h20	One of the flags constants for the integer value stored in the prop sonFlags.
kABLessThan	2	One of the search comparison modes.
kABLessThanOrEqual	3	One of the search comparison modes.
kABMultiArrayProperty	261	One of the property type constants. Multiple arrays.
kABMultiDataProperty	263	One of the property type constants. Multiple data values.
kABMultiDateComponentsProperty	264	One of the property type constants. Available on Mac OS X 10.7 or later. Date components.
kABMultiDateProperty	260	One of the property type constants. Multiple date values.
kABMultiDictionaryProperty	262	One of the property type constants.
kABMultiIntegerProperty	258	One of the property type constants. Multiple integer values.
kABMultiRealProperty	259	One of the property type constants. Multiple floating point values.
kABMultiStringProperty	257	One of the property type constants. Multiple strings
kABMultiValueMask	&h100	One of the property type constants. This value is combined with other values to define multi value c
kABNameOrderingMask	&h70	One of the flags constants for the integer value stored in the prop sonFlags.
kABNotEqual	1	One of the search comparison modes.
kABNotEqualCaseInsensitive	14	One of the search comparison modes. Supported in Mac OS X 10.4 and newer versions.

Error codes.

Constant	Value	Description
ABAddRecordsError	1001	
ABPropertyReadOnlyError	1014	
ABPropertyUnsupportedBySourceError	1013	
ABPropertyValueValidationError	1012	
ABRemoveRecordsError	1002	

9.3 class ABGroupMBS

9.3.1 class ABGroupMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CNGroupMBS class instead. **Function:** ABGroup is a subclass of ABRecord.
Example:

```
Var a as new ABAddressBookMBS
Var g() as ABGroupMBS = a.groups
Var names() as string
for each gg as ABGroupMBS in g
names.Add gg.DisplayName
next
MessageBox Join(names,EndOfLine)
```

Notes: It represents a group of people or other groups. No recursions allowed.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the ABRecordMBS class.

9.3.2 Methods

9.3.3 addMember(group as ABPersonMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Adds person to this group.
Example:

```
Var wbook As new ABAddressBookMBS
Var Group as new ABGroupMBS

if not Group.setValue("Test Group", wbook.kABGroupNameProperty) then
MessageBox "Failed to set group name."
Return
```

```
end if

if not wbook.addRecord(Group) then
MessageBox "Failed to add group to database."
return
end if

Var Person as new ABPersonMBS

if not person.setValue("John", wbook.kABFirstNameProperty) then
MessageBox "Failed to set first name."
Return
end if

if not person.setValue("Miller", wbook.kABLastNameProperty) then
MessageBox "Failed to set last name."
Return
end if

if not wbook.addRecord(person) then
MessageBox "Failed to add person to database."
return
end if

if not group.addMember(person) then
MessageBox "Failed to add person to group."
Return
end if

if not wbook.save then
MessageBox "Failed to save addressbook."
return
end if

MessageBox "Created test group with a person."
```

Notes: Does nothing if person is already part of this group (returns false)
Returns true if successful.

9.3.4 addProperty(propertyName as string, type as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Adds property to all group records.
Example:

call ABGroupMBS.addProperty "GroupWeight",1

Notes: Property name must be unique.
For types see typeOfProperty.
Returns the number of properties successfully added.

9.3.5 addSubgroup(group as ABGroupMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Add group to this group.
Notes: Does nothing if group is already part of this group (returns false)
Recursions are not allowed (returns false)
Returns true if successful

9.3.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new ABGroup object.
Notes: Available in Mac OS X 10.5 or newer.
See also:

- 9.3.7 Constructor(addressBook as ABAddressBookMBS) 2819

9.3.7 Constructor(addressBook as ABAddressBookMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new ABGroup object in the given addressbook.
See also:

- 9.3.6 Constructor 2819

9.3.8 members as ABPersonMBS()

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns an array of ABPersonMBS.
Notes: Returns an empty array if this group doesn't contain any people.
Returns an empty array on any error.

9.3.9 parentGroups as ABGroupMBS()

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns an array of ABGroup this group belongs to.
Notes: Returns an empty array if this group doesn't belong to any groups.
Returns an empty array on any error.

9.3.10 properties as string()

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns an array of property names.
Notes: Returns nil on any error.

9.3.11 removeMember(group as ABPersonMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Removes group from this group.
Notes: Does nothing if group is not part of this group (returns false)
Returns true if successful.

9.3.12 removeProperties(properties() as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Removes properties from all groups.
Notes: Returns the number of properties successfully removed.

9.3.13 removeProperty(propertyName as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Removes property from all groups
Notes: Returns the number of properties successfully removed.

9.3.14 removeSubgroup(group as ABGroupMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Removes group from this group.
Notes: Does nothing if group is not part of this group (returns false).
Returns true if successful.

9.3.15 searchElementForProperty(PropertyName as string, Label as string, Key as string, value as Variant, comparison as Integer) as ABSearchElementMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns a search element object that searches for records of this type.
Notes: property: The name of the property to search on. It cannot be "".
label: The label name for a multivalue list. If property does not have multiple values, pass "". If property does have multiple values, pass "" to search all the values. By default, ABGroup records don't contain any multivalue list properties.
key: The key name for a dictionary. Pass "" if property is not a dictionary. If property is a dictionary, pass "" to search all keys. By default, ABGroup records don't contain any properties that are dictionaries.
value: What you're searching for. If "", the only supported value for comparison is kABEqual or kABNotEqual.
comparison: The type of comparison to perform and is an ABSearchComparison, such as kABEqual or kABPrefixMatchCaseInsensitive.

9.3.16 subgroups as ABGroupMBS()

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns an array of ABGroup
Notes: Returns an empty array if this group doesn't contain any other groups.
Returns an empty array on any error.

9.3.17 typeOfProperty(propertyName as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the type of a given property.
Notes: Possible values:

const kABMultiValueMask = &h100
const kABErrorInProperty = &h0
const kABStringProperty = &h1
const kABIntegerProperty = &h2
const kABRealProperty = &h3

const kABDateProperty = &h4
const kABArrayProperty = &h5
const kABDictionaryProperty = &h6
const kABDataProperty = &h7
const kABMultiStringProperty = kABMultiValueMask + kABStringProperty
const kABMultiIntegerProperty = kABMultiValueMask + kABIntegerProperty
const kABMultiRealProperty = kABMultiValueMask + kABRealProperty
const kABMultiDateProperty = kABMultiValueMask + kABDateProperty
const kABMultiArrayProperty = kABMultiValueMask + kABArrayProperty
const kABMultiDictionaryProperty = kABMultiValueMask + kABDictionaryProperty
const kABMultiDataProperty = kABMultiValueMask + kABDataProperty

9.3.18 Properties

9.3.19 distributionIdentifierForProperty(propertyName as string, person as ABPersonMBS) as String

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the distribution identifier for a given property and person.
Notes: If not set then returns the property primary identifier.
Returns the distribution identifier or "" if not successful.
(Read and Write computed property)

9.4 class ABMultiValueMBS

9.4.1 class ABMultiValueMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CNLabeledValueMBS class instead. **Function:** Represents values of type ABMultiXXXXXProperty.
Example:

```
// shows all websites with labels

Var a as new ABAddressBookMBS
Var p as ABPersonMBS = a.owner
Var m as ABMultiValueMBS = p.valueForProperty(a.kABURLsProperty)

Var u as Integer = m.count-1
for i as Integer = 0 to u
Var label as string = m.labelAtIndex(i)
Var value as string = m.valueAtIndex(i)

MessageBox label+" ->"+value
next
```

Notes: All values in an ABMultiValue must be of the same type (kABMultiStringProperty: all values must be strings....)

In case your application needs to store away a reference to a specific value/label pair, use the identifier. Index won't work in this case because any client can add/remove/reorder a multivalue making your index point to the wrong pair. Identifiers are unique Ids.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Xojo Developer Magazine

- 13.2, page 8: News

9.4.2 Methods

9.4.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

9.4.4 copy as ABMultiValueMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Creates an immutable copy of the data.
Notes: Returns nil on any error.

9.4.5 edit as ABMutableMultiValueMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Creates a mutable copy of the data.
Notes: Returns nil on any error.

9.4.6 identifierAtIndex(index as UInt32) as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns an identifier at a given index
Notes: Returns "" on any error.
Index is zero based.

9.4.7 identifiers as string()

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Returns list of identifiers.

9.4.8 indexForIdentifier(identifier as string) as UInt32

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of a given identifier
Notes: Returns NotFound (&h7fffffff) on any error.

9.4.9 indexForLabel(label as string) as UInt32

MBS MacCocoa Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: Returns the index of a given label
Notes: Returns NotFound (&h7fffffff) on any error.

9.4.10 labelAtIndex(index as UInt32) as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns a label at a given index.
Example:

```
// get an entry
Var a as new ABAddressBookMBS
Var p as ABPersonMBS = a.owner

// query all emails
Var e as ABMultiValueMBS = p.valueForProperty(a.kABEmailProperty)

// walk over all
Var u as Integer = e.count-1
for i as Integer = 0 to u
Var label as string = e.labelAtIndex(i)
Var value as string = e.valueAtIndex(i)

// show label and value for this entry
MessageBox str(i)+": "+label+", "+value

// is it home?
if label = a.kABEmailHomeLabel then
MessageBox "Home: "+value
end if
```

next

Notes: Returns "" on any error.
Index is zero based.

9.4.11 labelForIdentifier(identifier as string) as string

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the label with the given identifier.
Example:

```
// same as the following code, but with index bound checking:

Var s as string
Var identifier as string = "fill the identifier here"
Var a as ABMultiValueMBS
// get multivalue somehow

s=a.labelAtIndex(a.indexForIdentifier(identifier))
```

Notes: Returns "" if identifier is not found.
A convenience method.

9.4.12 labels as string()

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Returns list of labels.

9.4.13 valueAtIndex(index as UInt32) as Variant

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns a value at a given index
Example:

```
// shows all websites with labels

Var a as new ABAddressBookMBS
Var p as ABPersonMBS = a.owner
Var m as ABMultiValueMBS = p.valueForProperty(a.kABURLsProperty)
```

```
Var u as Integer = m.count-1
for i as Integer = 0 to u
Var label as string = m.labelAtIndex(i)
Var value as string = m.valueAtIndex(i)

MessageBox label+" ->"+value
next
```

Notes: Returns nil on any error.
Index is zero based.

9.4.14 valueForIdentifier(identifier as string) as Variant

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the value with the given identifier.
Notes: Returns nil if identifier is not found.
A convenience method.

9.4.15 valueForLabel(label as string) as Variant

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the value for the value with the given label.
Example:

```
Var a as new ABAddressBookMBS
Var p as ABPersonMBS
Var m as ABMultiValueMBS

a=new ABAddressBookMBS
p=a.owner

m=p.valueForProperty(a.kABPhoneProperty)

MessageBox "Work phone: "+m.valueForLabel(a.kABPhoneWorkLabel)
MessageBox "Mobile phone: "+m.valueForLabel(a.kABPhoneMobileLabel)
```

Notes: Returns nil if not value exists for the label.
A convenience method.

9.4.16 values as Variant()

MBS MacCocoa Plugin, Plugin Version: 16.1, Platform: macOS, Targets: Desktop only.

Function: Returns list of all values.
Notes: Returns nil on any error.
Useful to get all email addresses as array.

9.4.17 Properties

9.4.18 Addressbook as ABAddressBookMBS

MBS MacCocoa Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Reference to parent addressbook.
Notes: Plugin sets this for most objects to keep reference to addressbook and avoid this addressbook from being closed too early.
(Read and Write property)

9.4.19 Content as Dictionary

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Returns content of multi value as dictionary.
Notes: This is more for inspection in debugger.
The plugin will add key and value for all values.
Values will be twice in the dictionary, once with label and once with identifier as key.
So if two items have same label, one will overwrite other in dictionary.
(Read only property)

9.4.20 count as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the number of value/label pairs.
Notes: Returns 0 on any error.
(Read only property)

9.4.21 Description as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The description for this multi value.
Example:

```
Var a as new ABAddressBookMBS
Var m as new ABMutableMultiValueMBS
call m.insertValue("Hello World", "Owner", 0)
MessageBox m.Description
```

Notes: (Read only property)

9.4.22 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: The handle of the used ABMultiValue object.
Notes: (Read and Write property)

9.4.23 primaryIdentifier as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Identifier for the primary value.
Notes: Returns "" on any error.
(Read only property)

9.4.24 propertyType as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Type of this multivalue (kABMultiXXXXProperty)
Notes: Returns kABErrorInProperty if this multi-value is empty or not all values have the same type.

Possible values:

const kABMultiValueMask = &h100
const kABErrorInProperty = &h0
const kABStringProperty = &h1
const kABIntegerProperty = &h2
const kABRealProperty = &h3
const kABDateProperty = &h4
const kABArrayProperty = &h5
const kABDictionaryProperty = &h6

const kABDataProperty = &h7
const kABMultiStringProperty = kABMultiValueMask + kABStringProperty
const kABMultiIntegerProperty = kABMultiValueMask + kABIntegerProperty
const kABMultiRealProperty = kABMultiValueMask + kABRealProperty
const kABMultiDateProperty = kABMultiValueMask + kABDateProperty
const kABMultiArrayProperty = kABMultiValueMask + kABArrayProperty
const kABMultiDictionaryProperty = kABMultiValueMask + kABDictionaryProperty
const kABMultiDataProperty = kABMultiValueMask + kABDataProperty
(Read only property)

9.5 class ABMutableMultiValueMBS

9.5.1 class ABMutableMultiValueMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CNLabeledValueMBS class instead. **Function:** Mutable variant of ABMultiValueMBS.
Example:

```
// add a person with two email addresses to the address book
Var book As New ABAddressBookMBS
Var person As New ABPersonMBS
Call person.setValue("John", ABAddressBookMBS.kABFirstNameProperty)

Var emails As New ABMutableMultiValueMBS
Call emails.addValue("john@work.example", ABAddressBookMBS.kABWorkLabel)
Call emails.addValue("john@home.example", ABAddressBookMBS.kABEmailHomeLabel)
Call person.setValue(emails, ABAddressBookMBS.kABEmailProperty)

If book.addRecord(person) And book.save Then MessageBox "Saved."
```

Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the ABMultiValueMBS class.

- Saying goodbye to AddressBook framework

9.5.2 Methods

9.5.3 addValue(value as Variant, label as string) as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Adds a value with its label.
Notes: Returns the identifier if successful, "" otherwise.

Note: No type checking is made when adding a value. But trying to set a multivalue property with a multivalue that doesn't have all its values of the same type will return an error.

Supported types: Date, Integer, String, Dictionary.

9.5.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new ABMutableMultiValue object.

9.5.5 insertValue(value as Variant, label as string, index as UInt32) as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Insert a value/label pair at a given index.
Notes: Returns the identifier if successful. "" otherwise

Note: No type checking is made when adding a value. But trying to set a multivalue property with a multivalue that doesn't have all its values of the same type will return an error

Index is zero based.

9.5.6 removeValueAndLabelAtIndex(index as UInt32) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Removes a value/label pair at a given index
Notes: Returns true if successful.

Index is zero based.

9.5.7 replaceLabelAtIndex(index as UInt32, label as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Replaces a label at a given index.
Notes: Index is zero based.
Returns true on success.

9.5.8 replaceValueAtIndex(index as UInt32, value as Variant) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Replaces a value at a given index
Notes: Index is zero based.
Returns true on success.

9.5.9 setPrimaryIdentifier(identifier as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Sets the primary value given its identifier.
Notes: Returns true if successful.

9.6 control ABPeoplePickerViewControlMBS

9.6.1 control ABPeoplePickerViewControlMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CNContactPickerMBS class instead. **Function:** The control to host a people picker view.
Notes: Shows people and groups from Addressbook and allows picking them.

9.6.2 Properties

9.6.3 View as ABPeoplePickerViewMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The view used.
Notes: Access properties of the view hosted in the control via this variable.
(Read only property)

9.6.4 Events

9.6.5 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

9.6.6 Close

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The control is about to close.

9.6.7 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

9.6.8 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

9.6.9 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

9.6.10 DisplayedPropertyDidChange

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Called when the displayed property in the record list is changed.

9.6.11 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event where you can enable menu items.

9.6.12 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

9.6.13 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

9.6.14 GroupDoubleClick

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The event to be invoked when a group is double-clicked.

9.6.15 GroupSelectionDidChange

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Called when the selection in the group list is changed.

9.6.16 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

9.6.17 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.

Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

9.6.18 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

9.6.19 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

9.6.20 NameDoubleClick

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The event to be invoked when a name is double-clicked.

9.6.21 NameSelectionDidChange

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Called when the selection in the name list is changed.

9.6.22 Open

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The control is about to was created and you can initialize it.

9.6.23 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

9.6.24 ValueSelectionDidChange

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Called when the selection in a multivalue property is changed.

9.6.25 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

9.7 class ABPeoplePickerViewMBS

9.7.1 class ABPeoplePickerViewMBS

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CNContactViewControllerMBS class instead. **Function:** This is a view for Mac applications to select people from the addressbook.
Example:

```
// show the address book picker in the window and read the selection
// Picker is a property of the window: Picker As ABPeoplePickerViewMBS
Picker = New ABPeoplePickerViewMBS(20, 20, 500, 300)
Picker.allowsMultipleSelection = True
Self.NSWindowMBS.contentView.addSubview Picker

// later, e.g. when a button is clicked:
For Each record As ABRecordMBS In Picker.selectedRecords
System.DebugLog record.valueForProperty(ABAddressBookMBS.kABFirstNameProperty).StringValue
Next
```

Notes: The ABPeoplePickerView class allows you to customize the behavior of people-picker views in an application's user interface.

Use CocoaControlMBS control to put this view on a window.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.
Blog Entries

- Saying goodbye to AddressBook framework
- MBS Real Studio Plugins, version 13.0pr7
- MBS Real Studio Plugins, version 12.3pr10

9.7.2 Methods

9.7.3 ABPeoplePickerDisplayedPropertyDidChangeNotification as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the notification names.
Notes: Use this string with NSNotificationObserverMBS class. Or use the DisplayedPropertyDidChange event.

Posted when the displayed property in the record list is changed.

9.7.4 ABPeoplePickerGroupSelectionDidChangeNotification as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the notification names.
Notes: Use this string with NSNotificationObserverMBS class. Or use the GroupSelectionDidChange event. Posted when the selection in the group list is changed.

9.7.5 ABPeoplePickerNameSelectionDidChangeNotification as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the notification names.
Notes: Use this string with NSNotificationObserverMBS class. Or use the NameSelectionDidChange event. Posted when the selection in the name list is changed.

9.7.6 ABPeoplePickerValueSelectionDidChangeNotification as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the notification names.
Notes: Use this string with NSNotificationObserverMBS class. Or use the ValueSelectionDidChange event. Posted when the selection in a multivalue property is changed.

9.7.7 addProperty(PropertyName as string)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Adds a property to the group of properties whose values are shown in the record list.

9.7.8 clearSearchField

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Clears the search field and resets the list of displayed records.

9.7.9 Constructor

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new people picker view object.
See also:

- 9.7.10 Constructor(Handle as Integer) 2841
- 9.7.11 Constructor(left as Double, top as Double, width as Double, height as Double) 2841

9.7.10 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new people picker view object.
Notes: Pass a handle to a Cocoa ABPeoplePickerView object.
See also:

- 9.7.9 Constructor 2841
- 9.7.11 Constructor(left as Double, top as Double, width as Double, height as Double) 2841

9.7.11 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new people picker view object.
Notes: Pass rectangle for new control.
See also:

- 9.7.9 Constructor 2841
- 9.7.10 Constructor(Handle as Integer) 2841

9.7.12 deselectAll

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Deselects all selected groups, records, and values in multivalue properties.

9.7.13 deselectGroup(group as ABGroupMBS)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Deselects a group selected in the group list.

9.7.14 deselectIdentifier(identifier as string, person as ABPersonMBS)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Deselects a value selected in a multivalue property.
Notes: identifier: The identifier of the value that will be deselected.
person: The person whose value will be deselected.

9.7.15 deselectRecord(record as ABRecordMBS)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Deselects a record selected in the record list.
Notes: record: The record to deselect.

9.7.16 editInAddressBook

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Launches Address Book to edit the item selected in the people picker.

9.7.17 properties as string()

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns an array of the properties whose values are shown in the record list.

9.7.18 removeProperty(PropertyName as string)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Removes a property from the group of properties whose values are shown in the record list.

9.7.19 selectedGroups as ABGroupMBS()

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The groups selected in the group list.
Notes: The selected groups are returned as an array of ABGroupMBS objects.
Available in Mac OS X v10.6 and later.

9.7.20 selectedIdentifiersForPerson(person as ABPersonMBS) as string()

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns the identifiers of the selected values in a multivalue property.
Notes: person: The person whose identifiers for selected values will be returned.

Returns nil if the property displayed is a single-value property.

9.7.21 selectedRecords as ABRecordMBS()

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The selection in the records list.
Notes: The selection is returned as an array of ABGroupMBS or ABPersonMBS objects.
Available in Mac OS X v10.6 and later.

9.7.22 selectedValues as Variant()

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns an array of all the values selected in the displayed multivalue property.

9.7.23 selectGroup(group as ABGroupMBS, byExtendingSelection as boolean)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Selects a group or a set of groups in the group list.
Notes: group: The group to be selected, or to be added to the current selection.
byExtendingSelection: True to extend the current selection; otherwise, false.

9.7.24 selectIdentifier(identifier as string, person as ABPersonMBS, byExtendingSelection as boolean)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Selects a value or a set of values in a multivalue property.
Notes: identifier: The identifier to be selected, or to be added to the current selection.
person: The person that the value to be selected is associated with.
byExtendingSelection: True to extend the current selection; otherwise, false.

9.7.25 selectInAddressBook

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Launches Address Book and selects the item selected in the people picker.

9.7.26 selectRecord(group as ABRecordMBS, byExtendingSelection as boolean)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Selects a record or a set of records in the record list.
Notes: record: The record to be selected, or to be added to the current selection.
byExtendingSelection: True to extend the current selection; otherwise, false.

9.7.27 Properties

9.7.28 accessoryView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The view that is placed to the left of the search field.
Notes: Available in Mac OS X v10.6 and later.
If accessory is nil, the accessory view is removed.
(Read and Write property)

9.7.29 allowsGroupSelection as boolean

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that specifies whether the user can select entire groups in the group column.
Notes: If true, the user can to select entire groups. If false, the user is required to select at least one person in the group.

Available in Mac OS X v10.6 and later.
(Read and Write property)

9.7.30 allowsMultipleSelection as boolean

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that specifies whether multiple groups, records, or values of multivalue properties can be selected at a time.
Notes: Available in Mac OS X v10.6 and later.
(Read and Write property)

9.7.31 autosaveName as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The name under which the column positions and the filter selection are saved.
Notes: Available in Mac OS X v10.6 and later.
(Read and Write property)

9.7.32 displayedProperty as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The property currently displayed in the record list.
Notes: Available in Mac OS X v10.6 and later.
(Read and Write property)

9.7.33 valueSelectionBehavior as Integer

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The current selection behavior.
Notes: The default behavior is ABSingleValueSelection.
Available in Mac OS X v10.6 and later.
(Read and Write property)

9.7.34 columnTitleForProperty(propertyName as string) as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The title of a custom property.
Notes: (Read and Write computed property)

9.7.35 Events

9.7.36 DisplayedPropertyDidChange

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Called when the displayed property in the record list is changed.

9.7.37 GroupDoubleClick

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The event to be invoked when a group is double-clicked.

9.7.38 GroupSelectionDidChange

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Called when the selection in the group list is changed.

9.7.39 NameDoubleClick

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The event to be invoked when a name is double-clicked.

9.7.40 NameSelectionDidChange

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Called when the selection in the name list is changed.

9.7.41 ValueSelectionDidChange

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Called when the selection in a multivalue property is changed.

9.7.42 Constants

Constants for the Selection Behavior type.

Constant	Value	Description
ABMultipleValueSelection	2	The user can select multiple values.
ABNoValueSelection	0	The user cannot select individual values.
ABSingleValueSelection	1	The user can select a single value.

9.8 class ABPersonMBS

9.8.1 class ABPersonMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CNContactMBS class instead. **Function:** ABPersonMBS is a subclass of ABRecord and represents a person.
Example:

```
Var a as new ABAddressBookMBS // get addressbook
Var p as ABPersonMBS = a.owner // and find me

// read note
MessageBox p.valueForProperty(a.kABNoteProperty).StringValue

// write note
if p.setValue("Hello World", a.kABNoteProperty) then
if a.save then
MessageBox "Changed."
end if
end if
```

Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Subclass of the ABRecordMBS class.

9.8.2 Methods

9.8.3 addProperty(propertyName as string, type as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Adds property to all people records.
Example:

```
Var p as ABPersonMBS
// get a person
```

```
call p.addProperty "Distance",1
```

Notes: Property name must be unique.
For types see typeOfProperty.
Returns the number of properties successfully added.

9.8.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new ABPersonMBS object.
See also:

- 9.8.5 Constructor(addressBook as ABAddressBookMBS) 2849
- 9.8.6 Constructor(vCardData as Memoryblock) 2849

9.8.5 Constructor(addressBook as ABAddressBookMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new ABPersonMBS object in the given addressbook.
Notes: Available in Mac OS X 10.5 or newer.
See also:

- 9.8.4 Constructor 2849
- 9.8.6 Constructor(vCardData as Memoryblock) 2849

9.8.6 Constructor(vCardData as Memoryblock)

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Create a person from a vCard
Notes: Handle is 0 on failure after constructor finished.
(e.g. because of invalid vCard data)

This gives a temporary ABPersonMBS object which is only useful in the same method.
At least we observed problems and crashes when this person is stored in a property of a window and used later.
See also:

- 9.8.4 Constructor 2849
- 9.8.5 Constructor(addressBook as ABAddressBookMBS) 2849

9.8.7 EditInAddressbook as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Opens addressbook entry in the addressbook for editing.
Notes: Returns true on success and false on failure.

9.8.8 linkedPeople as ABPersonMBS()

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Returns an array of all linked people, including this person.
Notes: Returns an array of only this person if this person is not linked.
Available in Mac OS X 10.8 and newer.

9.8.9 parentGroups as ABGroupMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns an array of ABGroup this group belongs to.
Notes: Returns an empty array if this person doesn't belong to any groups.
Returns an empty array on any error.

9.8.10 properties as string()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns an array of property names.
Notes: Returns an empty array on any error.

9.8.11 removeProperties(properties() as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Removes properties from all people
Notes: Returns the number of properties successfully removed.

9.8.12 removeProperty(propertyName as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Removes property from all people
Notes: Returns the number of properties successfully removed.

9.8.13 searchElementForProperty(PropertyName as string, Label as string, Key as string, value as Variant, comparison as Integer) as ABSearchElementMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns a search element object that specifies a query for records of this type.
Notes: property: The name of the property to search on, such as kABAddressProperty or kABLastNameProperty. This name cannot be "".
label: The label name for a multivalue list, such as kABAddressHomeLabel, kABPhoneWorkLabel, or a user-specified label, such as Summer Home. If the specified property does not have multiple values, pass "". If the specified property does have multiple values, pass "" to search all the values.
key: The key name for a dictionary, such as kABAddressCityKey or kABAddressStreetKey. If the specified property is not a dictionary, pass "". If the specified property is a dictionary, pass nil to search all keys.
value: What you're searching for. If nil, then the only supported value for comparison is kABEqual or kABNotEqual.
comparison: The type of comparison to perform, such as kABEqual or kABPrefixMatchCaseInsensitive.

9.8.14 setImageData(data as Memoryblock) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Set the image of a person to data. data should be in an NSImage/QuickTime compatible format.
Notes: Pass "" to clear the image.

9.8.15 ShowInAddressbook as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Shows addressbook entry in the addressbook.
Example:

```
// open addressbook
Var a as new ABAddressBookMBS

// pick a person, in this case me
Var p as ABPersonMBS = a.owner

// show in AddressBook
```

call p.ShowInAddressbook

Notes: Returns true on success and false on failure.

9.8.16 typeOfProperty(propertyName as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the type of a given property.
Notes: Possible values:

const kABMultiValueMask = &h100
const kABErrorInProperty = &h0
const kABStringProperty = &h1
const kABIntegerProperty = &h2
const kABRealProperty = &h3
const kABDateProperty = &h4
const kABArrayProperty = &h5
const kABDictionaryProperty = &h6
const kABDataProperty = &h7
const kABMultiStringProperty = kABMultiValueMask + kABStringProperty
const kABMultiIntegerProperty = kABMultiValueMask + kABIntegerProperty
const kABMultiRealProperty = kABMultiValueMask + kABRealProperty
const kABMultiDateProperty = kABMultiValueMask + kABDateProperty
const kABMultiArrayProperty = kABMultiValueMask + kABArrayProperty
const kABMultiDictionaryProperty = kABMultiValueMask + kABDictionaryProperty
const kABMultiDataProperty = kABMultiValueMask + kABDataProperty

9.8.17 vCardRepresentation as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the vCard representation of a person
Notes: Returns nil on any error.

9.8.18 Properties

9.8.19 image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 7.5, Platform: macOS, Targets: Desktop only.

Function: Synchronously returns data containing an image for this person.
Example:

```
Var a as new ABAddressBookMBS
Var p as ABPersonMBS = a.owner

Backdrop=p.image.CopyPictureWithMask
```

Notes: Only does local file system searches.
Raises an exception if no image exists.

Convenience function which calls imageData and converts data to and from NSImage.
(Read and Write computed property)

9.8.20 imageData as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Synchronously returns data containing an image for this person.
Example:

```
Var a as new ABAddressBookMBS
Var owner as ABPersonMBS = a.owner
Var s as string = owner.imageData
Var p as Picture

p=JPEGStringToPictureMBS(s) // try jpeg
if p<>Nil then
Title="jpeg"
Backdrop=p
Return
end if

p=TIFFStringToPictureMBS(s) // try tiff
if p<>Nil then
Title="tiff"
Backdrop=p
Return
end if
```

Notes: Only does local file system searches. Data will be in an NSImage/QuickTime compatible format.
Raises an exception if no image exists.
(Read and Write computed property)

9.9 control ABPersonViewControlMBS

9.9.1 control ABPersonViewControlMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CNContactViewControllerMBS class instead. **Function:** The control to host a Person view.
Notes: Shows people from Addressbook and allows editing.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.0pr9

9.9.2 Methods

9.9.3 retainObject

MBS MacControls Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop only.

Function: Retains the viewer object.
Notes: This method is to workaround a bug which your app may see in OS X 10.11.
So to avoid crashes with releasing an view, you can retain it an extra time.

9.9.4 Properties

9.9.5 View as ABPersonViewMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The view used.
Notes: Access properties of the view hosted in the control via this variable.
(Read only property)

9.9.6 Events

9.9.7 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

9.9.8 Close

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The control is about to close.

9.9.9 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

9.9.10 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

9.9.11 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

9.9.12 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event where you can enable menu items.

9.9.13 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

9.9.14 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

9.9.15 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

9.9.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

9.9.17 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

9.9.18 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

9.9.19 Open

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The control is about to was created and you can initialize it.

9.9.20 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

9.9.21 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

9.10 class ABPersonViewMBS

9.10.1 class ABPersonViewMBS

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CNContactViewControllerMBS instead. **Function:** ABPersonViewMBS provides a view for displaying and editing ABPersonMBS objects in your user interface.
Example:

```
// show the card of the address book owner in the window
Var view As New ABPersonViewMBS(20, 20, 400, 300)
Var book As New ABAddressBookMBS
view.person = book.owner
view.editing = False
Self.NSWindowMBS.contentView.addSubview view
```

Notes: Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the ABPersonView class.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

9.10.2 Methods

9.10.3 available as Boolean

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Whether this class is available.
Example:

```
MessageBox "ABPersonView available: "+str(ABPersonViewMBS.available)
```

Notes: Returns true on Mac OS X 10.7 or later.

9.10.4 Constructor

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new people picker view object.
See also:

- 9.10.5 Constructor(Handle as Integer) 2859
- 9.10.6 Constructor(left as Double, top as Double, width as Double, height as Double) 2859

9.10.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new people picker view object.
Notes: Pass a handle to a Cocoa ABPersonView object.
See also:

- 9.10.4 Constructor 2859
- 9.10.6 Constructor(left as Double, top as Double, width as Double, height as Double) 2859

9.10.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new people picker view object.
Notes: Pass rectangle for new control.
See also:

- 9.10.4 Constructor 2859
- 9.10.5 Constructor(Handle as Integer) 2859

9.10.7 Properties

9.10.8 editing as Boolean

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that determines whether the receiver is in editing mode.
Notes: When true, ABPersonView includes additional controls to manipulate person properties.
(Read and Write property)

9.10.9 person as ABPersonMBS

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: An ABPersonMBS record for display.
Notes: Raises if person originates from ABAddressBook's sharedAddressBook. Use ABAddressBookMBS constructor.
Person must be exist in an ABAddressBook created and manipulated on the main thread only.
When person is nil, displays an empty selection state.
(Read and Write property)

9.10.10 shouldShowLinkedPeople as Boolean

MBS MacControls Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the view should include information for linked contacts in addition to the set contact.
Notes: If true, information is included from linked contacts. If false, only the information on this person is shown.
Available in Mac OS X 10.8 and newer.
(Read and Write property)

9.11 class ABPickerMBS

9.11.1 class ABPickerMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CNContactPickerMBS class instead. **Function:** A class to control a people picker window.
Example:

```
Var p as ABPickerMBS // a global property

p = new ABPickerMBS
p.Create
p.visible = True
```

Notes: Requires Mac OS X 10.3 or newer.

This class is for Carbon as event handling does not work on Cocoa.
For Cocoa better use ABPeoplePickerViewMBS.
Blog Entries

- Saying goodbye to AddressBook framework
- MBS Xojo Plugins, version 20.5pr9
- MBS Xojo / Real Studio Plugins, version 13.2pr6
- MBS Real Studio Plugins, version 12.3pr10

9.11.2 Methods

9.11.3 AddProperty(propertyname as String)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Adds a property to the value column.
Notes: Requires Mac OS X 10.3 or newer.

9.11.4 ClearSearchField

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Clear the search field and reset the list of displayed names.
Notes: Requires Mac OS X 10.3 or newer.

9.11.5 Create

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new window.
Example:

```
Var p as ABPickerMBS // a global property

p = new ABPickerMBS
p.Create

p.visible = True
```

Notes: The window is created invisible.
Requires Mac OS X 10.3 or newer.
The handle property is not 0 if this call was successful.

9.11.6 DeselectAll

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Remove selection.

9.11.7 DeselectGroup(group as ABGroupMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Removes selection.
Notes: Requires Mac OS X 10.3 or newer.

9.11.8 DeselectIdentifier(person as ABPersonMBS, Identifier as String)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Removes selection.
Notes: Requires Mac OS X 10.3 or newer.

9.11.9 DeselectPerson(person as ABPersonMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Removes selection.
Notes: Requires Mac OS X 10.3 or newer.

9.11.10 EditInAddressBook

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Launch AddressBook and edit the current selection
Notes: Requires Mac OS X 10.3 or newer.

9.11.11 InstallEvents(targetwindow as window)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Installs the event handler.
Notes: Requires Mac OS X 10.3 or newer.
The target window is only used as an anchor to send and receive events. You can use any window for that.

9.11.12 Properties as string()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A list of all the properties shown in the value columns.
Notes: Requires Mac OS X 10.3 or newer.

9.11.13 RemoveEvents

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Removes the event handler.
Notes: Requires Mac OS X 10.3 or newer.

9.11.14 RemoveProperty(propertyname as String)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Removes a property from the value column.
Notes: Requires Mac OS X 10.3 or newer.

9.11.15 SelectedDictionaries as Dictionary()

MBS MacCocoa Plugin, Plugin Version: 9.0, Platform: macOS, Targets: Desktop only.

Function: Returns an array containing dictionaries for each item selected in the values column.
Notes: Use this method if you select single addresses.
Requires Mac OS X 10.3 or newer.

9.11.16 SelectedGroups as ABGroupMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns group column selection as an array of ABGroup object handles.
Notes: Requires Mac OS X 10.3 or newer.

9.11.17 SelectedIdentifiers(person as ABPersonMBS) as string()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of selected multi-value identifiers.
Notes: Requires Mac OS X 10.3 or newer.
Returns empty array if the displayed property is a single value type.

9.11.18 SelectedRecords as ABRecordMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns names column selection as an array of ABGroup or ABPersonMBS objects.
Notes: Requires Mac OS X 10.3 or newer.
You need to cast the objects from the array to ABGroupMBS or ABPersonMBS to use them better. And IsA can tell you whether an object is from the group or the person class.

9.11.19 SelectedStrings as String()

MBS MacCocoa Plugin, Plugin Version: 9.0, Platform: macOS, Targets: Desktop only.

Function: Returns an array containing strings for each item selected in the values column.
Notes: Use this method if you select single strings like a phone number.
Requires Mac OS X 10.3 or newer.

9.11.20 SelectedValues as Variant()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns an array containing variants for each item selected in the values column.
Notes: Use this method if you select single strings like a phone number.
Requires Mac OS X 10.3 or newer.
Changed from string to variant in plugin version 13.2, so you don't need to use SelectedDictionaries.

9.11.21 SelectGroup(group as ABGroupMBS, ExtendSelection as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Select group programatically.
Notes: Requires Mac OS X 10.3 or newer.

9.11.22 SelectIdentifier(person as ABPersonMBS, Identifier as String, ExtendSelection as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Individual values contained within an multi-value property can be selected with this method.
Notes: Requires Mac OS X 10.3 or newer.

9.11.23 SelectInAddressBook

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Launch AddressBook and select the current selection
Notes: Requires Mac OS X 10.3 or newer.

9.11.24 SelectPerson(person as ABPersonMBS, ExtendSelection as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Select person programatically.
Notes: Requires Mac OS X 10.3 or newer.

9.11.25 Properties

9.11.26 AllowGroupSelection as Boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Allow the user to select entire groups in the group column.
Notes: Requires Mac OS X 10.3 or newer.
If false, at least one person in the group will be selected. Defaults to false.
(Read and Write property)

9.11.27 AllowMultipleSelection as Boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Allow the user to select more than one group/record at a time.
Notes: Default is true.
Requires Mac OS X 10.3 or newer.
(Read and Write property)

9.11.28 AllowMultipleValueSelection as Boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Allow user to choose multiple values for a person.
Notes: Requires Mac OS X 10.3 or newer.
Choose the selection behavior for the value column. If multiple behaviors are selected, the most restrictive behavior will be used. Defaults to SingleValueSelection set.
(Read and Write property)

9.11.29 AllowSingleValueSelection as Boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Allow user to choose a single value for a person.
Notes: Requires Mac OS X 10.3 or newer.
Choose the selection behavior for the value column. If multiple behaviors are selected, the most restrictive behavior will be used. Defaults to SingleValueSelection set.
(Read and Write property)

9.11.30 Available as Boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: True if the picker is available.
Notes: Returns true on Mac OS X 10.3 or newer.
(Read only property)

9.11.31 DisplayedProperty as String

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Which property is displayed currently.
Notes: Returns nil on any error.
(Read and Write property)

9.11.32 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The handle of the ABPickerRef used internally.
Notes: (Read and Write property)

9.11.33 Height as Single

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The current height of the picker window.
Notes: Requires Mac OS X 10.3 or newer.
(Read and Write property)

9.11.34 Left as Single

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The current position of the picker window.
Notes: Requires Mac OS X 10.3 or newer.
(Read and Write property)

9.11.35 Top as Single

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The current position of the picker window.
Notes: Requires Mac OS X 10.3 or newer.

top=0 is on the bottom of the screen as this is the Cocoa coordinate system.
(Read and Write property)

9.11.36 Visible as Boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Whether the picker window is visible.
Notes: The window is created invisible, so you must make it visible to show it to the user.
Requires Mac OS X 10.3 or newer.
(Read and Write property)

9.11.37 Width as Single

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The current width of the picker window.
Notes: Requires Mac OS X 10.3 or newer.
(Read and Write property)

9.11.38 ColumnTitle(columntitle as String) as String

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Localized titles for third party properties.
Notes: Requires Mac OS X 10.3 or newer.
(Read and Write computed property)

9.11.39 Events

9.11.40 DisplayedPropertyChanged

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: One of the events of a People Picker.
Notes: Requires Mac OS X 10.3 or newer.

9.11.41 GroupDoubleClicked

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: One of the events of a People Picker.
Notes: Requires Mac OS X 10.3 or newer.

9.11.42 GroupSelectionChanged

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: One of the events of a People Picker.
Notes: Requires Mac OS X 10.3 or newer.

9.11.43 NameDoubleClicked

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: One of the events of a People Picker.
Notes: Requires Mac OS X 10.3 or newer.

9.11.44 NameSelectionChanged

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: One of the events of a People Picker.
Notes: Requires Mac OS X 10.3 or newer.

9.11.45 ValueSelectionChanged

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: One of the events of a People Picker.
Notes: Requires Mac OS X 10.3 or newer.

9.12 class ABRecordMBS

9.12.1 class ABRecordMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CNContactMBS class instead. **Function:** A class to hold an Addressbook Record.
Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Real Studio Plugins, version 11.4pr2

9.12.2 Methods

9.12.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

9.12.4 removeValueForProperty(propertyName as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Remove the value of a given property.
Notes: Subsequent calls to valueForProperty on the same property will return nil.
Returns true if the value was removed successfully and false on any error.

9.12.5 setValue(value as Variant, propertyName as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Set the value of a given property. The type of the value must match the property type.
Example:

```
Var a as ABAddressBookMBS
Var p as ABPersonMBS
```

```
// get a somehow
// get p somehow

if not p.setValue("My Company",a.kABOrganizationProperty) then
MessageBox "Failed to set field "+a.LocalizedPropertyOrLabel(a.kABOrganizationProperty)
end if
```

Notes: Value can be Date, Integer, Double, Dictionary, MultiValueMBS/MutableMultiValueMBS or String.
Returns true if the value was set successfully
See also:

- 9.12.6 setValue(value as Variant, propertyName as string, byref error as NSErrorMBS) as boolean 2871

9.12.6 setValue(value as Variant, propertyName as string, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Set the value of a given property. The type of the value must match the property type.
Notes: Value can be Date, Integer, Double, Dictionary, MultiValueMBS/MutableMultiValueMBS or String.
Returns true if the value was set successfully

On Mac OS X 10.7 or later, we set the error property on any error.
See also:

- 9.12.5 setValue(value as Variant, propertyName as string) as boolean 2870

9.12.7 valueForProperty(PropertyName as string) as Variant

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the value of a given property.
Example:

```
Var a as new ABAddressBookMBS // get addressbook
Var p as ABPersonMBS = a.owner // and find me

// read note
MessageBox p.valueForProperty(a.kABNoteProperty).StringValue
```

Notes: The type of the value depends on the property type.
Returns nil on any error.

Tip: Put the result in a variant, so you can see the type in the debugger. Emails for example can be a

ABMultiValueMBS object while name is normally a string.

9.12.8 Properties

9.12.9 account as ABAccountMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Queries account for this record.
Notes: (Read only property)

9.12.10 Addressbook as ABAddressBookMBS

MBS MacCocoa Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Reference to parent addressbook.
Notes: Plugin sets this for most objects to keep reference to addressbook and avoid this addressbook from being closed too early.
(Read and Write property)

9.12.11 Description as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The description for this record.
Example:

```
Var a as new ABAddressBookMBS
Var m as ABPersonMBS = a.owner
MessageBox m.Description
```

Notes: (Read only property)

9.12.12 DisplayName as string

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The display name.
Example:

```
// quickly find the addressbook, locate me and display my name:
```

```
MessageBox ABAddressBookMBS.sharedAddressbook.owner.DisplayName
```

Notes: For a group, the group name, for an organization the organization name and for a normal person the first name, last name, prefix/suffix and middle name. Name order depends on the settings for person or addressbook.
(Read only property)

9.12.13 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: The handle of the ABGroup or ABPersonMBS object being used.
Notes: (Read and Write property)

9.12.14 isReadOnly as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether or not the record is read only.
Notes: Available on Mac OS X 10.4.
Returns false on older systems or other errors.
(Read only property)

9.12.15 uniqueId as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Convenience method to return the unique ID of a record.
Example:

```
Var a as new ABAddressBookMBS
Var o as ABPersonMBS = a.owner

// the unique ID for this record including the type
Var u as string = o.uniqueId

// the raw ID as Apple stores it
Var i as string = o.valueForProperty("com.apple.uuid")

// show it
MessageBox u+EndOfLine+i
```

Notes: Equivalent to valueForProperty(kABUIDProperty).
(Read only property)

9.13 class ABSearchElementMBS

9.13.1 class ABSearchElementMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use CNContactFetchRequestMBS class instead. **Function:** A class for a search element.
Example:

```
// search and display all entries with a given name in a 2 column listbox with address

// Save reference to caller.
Var addr as new ABAddressBookMBS // Initialise the Address Book plugin
Var searchName as string = "Schmitz" // search on.

// Do the search
Var srch as ABSearchElementMBS = addr.searchElementForPersonProperty(addr.kABLastNameProperty,
"", "", searchName, addr.kABContainsSubStringCaseInsensitive)
Var srchRes() as ABRecordMBS = addr.recordsMatchingSearchElement(srch) // Get the results into an
array

for each rc as ABRecordMBS in srchRes
if rc isa ABPersonMBS then // Is it a person record?
Var pers as ABPersonMBS = ABPersonMBS(rc) // Get it into a personnel record

// Now get out the names and addresses.
ListBox1.AddRow(pers.valueForProperty(addr.kABFirstNameProperty) + " " + pers.valueForProperty(addr.kABLast-
NameProperty))
ListBox1.RowTag(ListBox1.LastAddedRowIndex) = pers.valueForProperty(addr.kABUIDProperty)

// Need to find the home address.
Var mlv as ABMultiValueMBS = pers.valueForProperty(addr.kABAddressProperty)
if mlv <>nil Then
// get home address
Var d as Dictionary = mlv.valueForLabel(addr.kABHomeLabel)

if d = nil then
// get primary
d = mlv.valueForIdentifier(mlv.primaryIdentifier)
end if

if d<>Nil then
// show address with street and city
ListBox1.CellTextAt(ListBox1.LastAddedRowIndex,1) = d.Lookup(addr.kABAddressStreetKey,"")+" "+d.Lookup(addr.kAB
dressCityKey,"")
end if
end if
```

```
end if
next
```

Notes: Use searchElementForProperty in ABPersonMBS and ABGroupMBS classes to create objects.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

9.13.2 Methods

9.13.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

9.13.4 matchesRecord(record as ABRecordMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Whether a record matches the search element.
Notes: Returns false if handle=0 or record=nil or record does not match. Else yes.

9.13.5 searchElementForConjunction(conjunction as Integer, children() as ABSearchElementMBS) as ABSearchElementMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Creates a search element combining several sub search elements.
Notes: conjunction can be kABSearchAnd or kABSearchOr.
Returns nil on any error.

Pass kABSearchOr or kABSearchAnd for conjunction.

This is a class method. No need to have a valid handle.

9.13.6 Properties

9.13.7 Addressbook as ABAddressBookMBS

MBS MacCocoa Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Reference to parent addressbook.
Notes: Plugin sets this for most objects to keep reference to addressbook and avoid this addressbook from being closed too early.
(Read and Write property)

9.13.8 Description as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: The description for this search element.
Example:

```
Var a as new ABAddressBookMBS
Var m as ABSearchElementMBS = a.searchElementForPersonProperty(a.kABFirstNameProperty, "", "",
"John", a.kABContainsSubStringCaseInsensitive)
MessageBox m.Description
```

Notes: (Read only property)

9.13.9 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: The handle to the Cocoa object being used.
Notes: (Read and Write property)

9.13.10 Constants

Constants

Constant	Value	Description
kABSearchAnd	0	A search conjunction.
kABSearchOr	1	A search conjunction.

Chapter 10

Alias

10.1 class AliasInfoMBS

10.1.1 class AliasInfoMBS

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use CFBookmarkMBS module instead. **Function:** A class for information about an alias.
Example:

```
// select an alias file. use TrueChild so it's not resolved
Var f as FolderItem = SpecialFolder.Desktop.TrueChild("Development")

// get alias info
Var a as AliasInfoMBS = f.AliasInfoMBS

// show info
MessageBox "alias points to "+a.TargetName+" in path "+a.PathString+" of volume "+a.VolumeName
```

Notes: Only for Mac OS X.
This is for resource fork based alias files.
Newer OS X version use the newer bookmark format, so please use CFBookmarkMBS module there.

10.1.2 Methods

10.1.3 Constructor

MBS MacClassic Plugin, Plugin Version: 5.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: A dummy constructor used only for automatic plugin testing.
See also:

- 10.1.4 Constructor(AliasHandle as Integer) 2880

10.1.4 Constructor(AliasHandle as Integer)

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor: Loads object properties with information about the alias inside the Alias Handle.
Notes: Check Lasterror code to see whether it was successful.
See also:

- 10.1.3 Constructor 2880

10.1.5 InfoForAliasData(data as string) as AliasInfoMBS

MBS MacClassic Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Query information for alias data.
Example:

```
Var folder as FolderItem = SpecialFolder.Desktop
Var m as new MacAliasMBS
Var error as Integer = m.Create(nil, folder)
if error = 0 then
Var data as string = m.GetRecord
Var info as AliasInfoMBS = AliasInfoMBS.InfoForAliasData(data)
MessageBox info.PathString
else
MessageBox "Failed to create the alias. Error "+str(error)
end if
```

Notes: Returns nil on any error.

10.1.6 InfoForSaveInfo(data as string) as AliasInfoMBS

MBS MacClassic Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Query information about alias in SaveInfo.
Example:

```
Var folder as FolderItem = SpecialFolder.Desktop
Var SaveInfo as string = folder.GetSaveInfo(nil, FolderItem.SaveInfoDefaultMode)
Var info as AliasInfoMBS = AliasInfoMBS.InfoForSaveInfo(SaveInfo)
MessageBox info.PathString
```

Notes: This is for saveinfo data returns by GetSaveInfo function in folderitem class.
Returns nil on any error.

10.1.7 Properties

10.1.8 FileCreator as String

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The file creator code.
Example:

```
// select an alias file. use TrueChild so it's not resolved
Var f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
Var a as AliasInfoMBS = f.AliasInfoMBS

// show info
MessageBox "FileCreator: "+a.FileCreator // shows Mac OS creator code like GKON
```

Notes: (Read only property)

10.1.9 FilesystemID as Integer

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The file system ID of the target file system.
Notes: (Read only property)

10.1.10 FileType as String

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The file type code.
Example:

```
// select an alias file. use TrueChild so it's not resolved
Var f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
Var a as AliasInfoMBS = f.AliasInfoMBS

// show info
MessageBox "FileType: "+a.FileType // shows Mac OS creator code like JPEG
```

Notes: (Read only property)

10.1.11 Flags as Integer

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Which properties do have valid content.
Notes: some contants:

AliasInfoNone	= &h00000000	no valid info
AliasInfoVolumeCreateDate	= &h00000001	volume creation date is valid
AliasInfoTargetCreateDate	= &h00000002	target creation date is valid
AliasInfoFinderInfo	= &h00000004	file type and creator are valid
AliasInfoIsDirectory	= &h00000008	isDirectory boolean is valid
AliasInfoIDs	= &h00000010	parentDirID and nodeID are valid
AliasInfoFSInfo	= &h00000020	filesystemID and signature are valid
AliasInfoVolumeFlags	= &h00000040	volumeIsBootVolume, volumeIsAutomounted, volumeIsEjectable and volumeHasPersistentFileIDs are valid

(Read only property)

10.1.12 IsDirectory as Boolean

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the target item is a directory or not.
Example:

```
// select an alias file. use TrueChild so it's not resolved
```

```
Var f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
Var a as AliasInfoMBS = f.AliasInfoMBS

// show info
MessageBox "IsDirectory: "+str(a.IsDirectory)
```

Notes: (Read only property)

10.1.13 LastError as Integer

MBS MacClassic Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read only property)

10.1.14 NodeID as Integer

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The node ID of the target file.
Notes: (Read only property)

10.1.15 ParentDirID as Integer

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The Directory ID of the parent directory.
Notes: (Read only property)

10.1.16 PathString as String

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The POSIX path to target.
Example:

```
// select an alias file. use TrueChild so it's not resolved
Var f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")
```

```
// get alias info
Var a as AliasInfoMBS = f.AliasInfoMBS

// show info
MessageBox "TargetName: "+a.PathString // shows target file path
```

Notes: (Read only property)

10.1.17 Signature as Integer

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The signature of the target file system.
Notes: (Read only property)

10.1.18 TargetCreateDate as Double

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Target file creation date.
Notes: Value should be in absolute seconds.
(Read only property)

10.1.19 TargetName as String

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the target item.
Example:

```
// select an alias file. use TrueChild so it's not resolved
Var f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
Var a as AliasInfoMBS = f.AliasInfoMBS

// show info
MessageBox "TargetName: "+a.TargetName // shows target file name
```

Notes: (Read only property)

10.1.20 VolumeCreateDate as Double

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The creation date of the target volume.
Notes: (Read only property)

10.1.21 VolumeHasPersistentFileIDs as Boolean

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The target volume has persistent file IDs, so the NodeID and parentDirID are useable.
Example:

```
// select an alias file. use TrueChild so it's not resolved
Var f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
Var a as AliasInfoMBS = f.AliasInfoMBS

// show info
MessageBox "VolumeHasPersistentFileIDs: "+str(a.VolumeHasPersistentFileIDs)
```

Notes: (Read only property)

10.1.22 VolumeIsAutomounted as Boolean

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the volume is automounted.
Notes: // select an alias file. use TrueChild so it's not resolved
Var f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
Var a as AliasInfoMBS = f.AliasInfoMBS

// show info
MessageBox "VolumeIsAutomounted: "+str(a.VolumeIsAutomounted)
(Read only property)

10.1.23 VolumeIsBootVolume as Boolean

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the target volume is bootable.
Example:

```
// select an alias file. use TrueChild so it's not resolved
Var f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
Var a as AliasInfoMBS = f.AliasInfoMBS

// show info
MessageBox "VolumeIsBootVolume: "+str(a.VolumeIsBootVolume)
```

Notes: (Read only property)

10.1.24 VolumeIsEjectable as Boolean

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the target file is on an ejectable volume.
Example:

```
// select an alias file. use TrueChild so it's not resolved
Var f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
Var a as AliasInfoMBS = f.AliasInfoMBS

// show info
MessageBox "VolumeIsEjectable: "+str(a.VolumeIsEjectable)
```

Notes: (Read only property)

10.1.25 VolumeName as String

MBS MacClassic Plugin, Plugin Version: 5.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the volume the target resides on.
Example:

```
// select an alias file. use TrueChild so it's not resolved
Var f as FolderItem = SpecialFolder.Desktop.TrueChild("IMG_0793.jpg")

// get alias info
Var a as AliasInfoMBS = f.AliasInfoMBS
```

```
// show info
MessageBox "VolumeName: "+a.VolumeName // shows target volume name
```

Notes: (Read only property)

10.1.26 Constants

Info Flags

Constant	Value	Description
kAliasInfoFinderInfo	4	File type and creator are valid.
kAliasInfoFSInfo	32	FilesystemID and signature are valid.
kAliasInfoIDs	16	ParentDirID and nodeID are valid.
kAliasInfoIsDirectory	8	IsDirectory boolean is valid.
kAliasInfoNone	0	No valid info.
kAliasInfoTargetCreateDate	2	Target creation date is valid.
kAliasInfoVolumeCreateDate	1	Volume creation date is valid.
kAliasInfoVolumeFlags	64	VolumeIsBootVolume, volumeIsAutomounted, volumeIsEjectable and volumeHasPersistentFileIDs are valid.

10.2 module CFBookmarkMBS

10.2.1 module CFBookmarkMBS

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The module for Mac OS X bookmark/alias functions.
Example:

```
// remember a folder the user picked across app launches in a sandboxed app
Var folder As FolderItem = FolderItem.ShowSelectFolderDialog
If folder = Nil Then Return

Var empty() As String
Var bookmark As String = CFBookmarkMBS.CreateBookmarkData(folder, CFBookmarkMBS.kCreation-
WithSecurityScope, empty, Nil)
// store bookmark, e.g. EncodeBase64(bookmark) in your preferences

// later, after the next launch:
Var stale As Boolean
Var path As String = CFBookmarkMBS.ResolveBookmarkData(bookmark, CFBookmarkMBS.kResolution-
WithSecurityScope, "", stale)
System.DebugLog "Resolved: " + path + If(stale, " (create a new bookmark)", "")
```

Notes: Bookmark data strings have no text encoding. If you use ConvertEncoding on them, you destroy them.
Available with Mac OS X 10.6 or newer.
For older systems, please use MacAliasMBS class.

10.2.2 Methods

10.2.3 Available as boolean

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Whether bookmark functions are available.
Notes: Returns true on Mac OS X 10.6 or newer.

10.2.4 CreateBookmarkData(file as folderitem, options as UInt32 = 1024, relativeToURL as folderitem = nil) as string

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Create a string containing an externalizable representation from a folderitem, modified with the given options, including (at the minimum) any properties in the propertiesToInclude array which are retrievable from the given url.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var Bookmark as string = CFBookmarkMBS.CreateBookmarkData(file, CFBookmarkMBS.kCreationSuitableForBookmarkFile)

MessageBox str(lenb(Bookmark))+" bytes"
```

Notes: file: the folderitem to create a bookmark data from.
options: a set of options which control creation of the bookmark data
resourcePropertiesToInclude: Optional, If non-empty, an array of additional properties copied from the url to include in the created bookmark data.
relativeToURL: If non-nil, the created bookmark will be relative to the given url

Lasterror is set.
Returns a string containing an data, which can be later be passed to ResolveBookmarkData.

10.2.11 CreateBookmarkData(URL as string, options as UInt32, resourcePropertiesToInclude() as string, relativeToURL as string = "") as string

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Create a string containing an externalizable representation from a URL, modified with the given options, including (at the minimum) any properties in the propertiesToInclude array which are retrievable from the given url.
Notes: URL: the URL to create a bookmark data from.
options: a set of options which control creation of the bookmark data
resourcePropertiesToInclude: Optional, If non-empty, an array of additional properties copied from the url to include in the created bookmark data.
relativeToURL: If non-nil, the created bookmark will be relative to the given url

Lasterror is set.
Returns a string containing an data, which can be later be passed to ResolveBookmarkData.

- 10.2.10 CreateBookmarkData(URL as string, options as UInt32 = 1024, relativeToURL as string = "") as string 2894

10.2.12 CreateBookmarkDataFromAliasRecord(AliasRecordData as string) as string

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Create a string containing bookmarkdata by converting the alias data in aliasRecordData which should be the contents of an AliasRecord copied into a string.
Notes: The created bookmarkdata can be passed into ResolveBookmarkData to resolve the item into a folderitem or URL, or a small set of information can be returned from ResourcePropertiesForKeysFromBookmarkData / ResourcePropertyForKeyFromBookmarkData.
AliasRecordData: the contents of an AliasRecord to create bookmark data for

Returns a string containing bookmark data.

10.2.13 LastError as CFErrorMBS

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The last error.
Notes: This ia CFErrorMBS object.

10.2.14 ReadBookmarkDataFromFile(file as folderitem) as string

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Given a file which is a Finder "alias" file, return a string with the bookmark data from the file.
Notes: If file points to an alias file created before SnowLeopard which contains Alias Manager information and no bookmark data, then a bookmark data string will be synthesized which contains a approximation of the alias information in a format which can be used to resolve the bookmark. If an error prevents reading the data or if it is corrupt, nil will be returned and lasterror will be filled in if error object.

File: a folderitem to the alias file to create the bookmark data from.

Returns a string containing bookmark data, or nil if there was an error creating bookmark data from the file, such as if the file is not an alias file.

10.2.15 ResolveBookmarkData(bookmark as string, options as UInt32, relativeToURL as folderitem, byref isStale as boolean) as folderitem

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Given a bookmark data string, returns a folderitem of the item it was a bookmark to.
Example:

```
Var AliasFile as FolderItem = SpecialFolder.Desktop.trueChild("test.alias")
Var Bookmark as string = CFBookmarkMBS.ReadBookmarkDataFromFile(AliasFile)
Var isStale as Boolean
Var options as UInt32 = CFBookmarkMBS.kResolutionWithoutUIMask + CFBookmarkMBS.kResolution-
WithoutMountingMask
Var file as FolderItem = CFBookmarkMBS.ResolveBookmarkData(Bookmark, options, nil, isStale)

if file<>Nil then
MessageBox file.NativePath
else
Var e as CFErrorMBS = CFBookmarkMBS.LastError
if e = nil then
MessageBox "Failed to resolve."
else
```

MessageBox e.Description
end if
end if

Notes: If in the process of resolving the bookmark into the folderitem it points to this determines that some properties in the bookmark are out of date or not correct for the item it resolves to, set isStale to true, which the client may want to use to decide to make a new bookmark from the returned item and replace the saved bookmark it has. If the bookmarked item cannot be found, return nil. If an error (other than "original item can not be found") occurs during the process, return nil and fill in lasterror property)

bookmark: a string containing a bookmark data, created with CreateBookmarkData
options: options which affect the resolution
relativeToURL: If non-nil, and if the bookmark was created relative to another file/folder, then resolve it relative to this file/folder.
resourcePropertiesToInclude: Optional, if non-empty, an array containing those properties which the caller would like to already be cached on the given url.
isStale: On exit will be set to true if during resolution any of the properties in the bookmark no longer seemed to match the corresponding properties on the returned file. Clients, upon seeing a stale representation, may want to replace whatever stored bookmark data they have saved and create a new one.

Lasterror is set.

Returns a folderitem of a file which is the closest match to the file the bookmark data.

Raises an exception if bookmark is empty string.

10.2.16 ResolveBookmarkData(bookmark as string, options as UInt32, relativeToURL as folderitem, resourcePropertiesToInclude() as string, byref isStale as boolean) as folderitem

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Given a bookmark data string, returns a folderitem of the item it was a bookmark to.
Notes: If in the process of resolving the bookmark into the folderitem it points to this determines that some properties in the bookmark are out of date or not correct for the item it resolves to, set isStale to true,

which the client may want to use to decide to make a new bookmark from the returned item and replace the saved bookmark it has. If the bookmarked item cannot be found, return nil. If an error (other than "original item can not be found") occurs during the process, return nil and fill in lasterror property)

bookmark: a string containing a bookmark data, created with CreateBookmarkData
options: options which affect the resolution
relativeToURL: If non-nil, and if the bookmark was created relative to another file/folder, then resolve it relative to this file/folder.
resourcePropertiesToInclude: Optional, if non-empty, an array containing those properties which the caller would like to already be cached on the given url.

10.2.19 ResolveBookmarkDataToCFURLMBS(bookmark as string, options as UInt32, relativeToURL as CFURLMBS, byref isStale as boolean) as CFURLMBS

MBS MacCF Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Given a bookmark data string, returns a CFURL of the item it was a bookmark to.
Notes: If in the process of resolving the bookmark into the folderitem it points to this determines that some properties in the bookmark are out of date or not correct for the item it resolves to, set isStale to true, which the client may want to use to decide to make a new bookmark from the returned item and replace the saved bookmark it has. If the bookmarked item cannot be found, return nil. If an error (other than "original item can not be found") occurs during the process, return nil and fill in lasterror property)

bookmark: a string containing a bookmark data, created with CreateBookmarkData
options: options which affect the resolution
relativeToURL: If non-nil, and if the bookmark was created relative to another file/folder, then resolve it relative to this file/folder.
resourcePropertiesToInclude: Optional, if non-empty, an array containing those properties which the caller would like to already be cached on the given url.
isStale: On exit will be set to true if during resolution any of the properties in the bookmark no longer seemed to match the corresponding properties on the returned file. Clients, upon seeing a stale representation, may want to replace whatever stored bookmark data they have saved and create a new one.

Lasterror is set.

Returns a CFURLMBS of a file which is the closest match to the file the bookmark data.
See also:

10.2.20 ResolveBookmarkDataToCFURLMBS(bookmark as string, options as UInt32, relativeToURL as CFURLMBS, resourcePropertiesToInclude() as string, byref isStale as boolean) as CFURLMBS

MBS MacCF Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Given a bookmark data string, returns a CFURL of the item it was a bookmark to.
Notes: If in the process of resolving the bookmark into the folderitem it points to this determines that some properties in the bookmark are out of date or not correct for the item it resolves to, set isStale to true, which the client may want to use to decide to make a new bookmark from the returned item and replace the saved bookmark it has. If the bookmarked item cannot be found, return nil. If an error (other than "original item can not be found") occurs during the process, return nil and fill in lasterror property)

bookmark: a string containing a bookmark data, created with CreateBookmarkData
options: options which affect the resolution
relativeToURL: If non-nil, and if the bookmark was created relative to another file/folder, then resolve it relative to this file/folder.
resourcePropertiesToInclude: Optional, if non-empty, an array containing those properties which the caller would like to already be cached on the given url.
isStale: On exit will be set to true if during resolution any of the properties in the bookmark no longer seemed to match the corresponding properties on the returned file. Clients, upon seeing a stale representation, may want to replace whatever stored bookmark data they have saved and create a new one.

Lasterror is set.

Returns a CFURLMBS of a file which is the closest match to the file the bookmark data.

10.2.21 ResolveBookmarkDataToCFURLMBS(bookmark as string, options as UInt32, relativeToURL as folderitem, byref isStale as boolean) as CFURLMBS

MBS MacCF Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Given a bookmark data string, returns a CFURL of the item it was a bookmark to.
Notes: If in the process of resolving the bookmark into the folderitem it points to this determines that some properties in the bookmark are out of date or not correct for the item it resolves to, set isStale to true, which the client may want to use to decide to make a new bookmark from the returned item and replace the saved bookmark it has. If the bookmarked item cannot be found, return nil. If an error (other than "original item can not be found") occurs during the process, return nil and fill in lasterror property)

bookmark: a string containing a bookmark data, created with CreateBookmarkData
options: options which affect the resolution
relativeToURL: If non-nil, and if the bookmark was created relative to another file/folder, then resolve it relative to this file/folder.
resourcePropertiesToInclude: Optional, if non-empty, an array containing those properties which the caller would like to already be cached on the given url.
isStale: On exit will be set to true if during resolution any of the properties in the bookmark no longer seemed to match the corresponding properties on the returned file. Clients, upon seeing a stale representation, may want to replace whatever stored bookmark data they have saved and create a new one.

Lasterror is set.

Returns a CFURLMBS of a file which is the closest match to the file the bookmark data.

10.2.22 ResolveBookmarkDataToCFURLMBS(bookmark as string, options as UInt32, relativeToURL as folderitem, resourcePropertiesToInclude() as string, byref isStale as boolean) as CFURLMBS

MBS MacCF Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Given a bookmark data string, returns a CFURL of the item it was a bookmark to.
Notes: If in the process of resolving the bookmark into the folderitem it points to this determines that some properties in the bookmark are out of date or not correct for the item it resolves to, set isStale to true,

which the client may want to use to decide to make a new bookmark from the returned item and replace the saved bookmark it has. If the bookmarked item cannot be found, return nil. If an error (other than "original item can not be found") occurs during the process, return nil and fill in lasterror property)

bookmark: a string containing a bookmark data, created with CreateBookmarkData
options: options which affect the resolution
relativeToURL: If non-nil, and if the bookmark was created relative to another file/folder, then resolve it relative to this file/folder.
resourcePropertiesToInclude: Optional, if non-empty, an array containing those properties which the caller would like to already be cached on the given url.
isStale: On exit will be set to true if during resolution any of the properties in the bookmark no longer seemed to match the corresponding properties on the returned file. Clients, upon seeing a stale representation, may want to replace whatever stored bookmark data they have saved and create a new one.

Lasterror is set.

Returns a CFURLMBS of a file which is the closest match to the file the bookmark data.
See also:

- 10.2.21 ResolveBookmarkDataToCFURLMBS(bookmark as string, options as UInt32, relativeToURL as folderitem, byref isStale as boolean) as CFURLMBS 2902

10.2.23 ResourcePropertiesForKeysFromBookmarkData(BookmarkData as string) as dictionary

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Given a bookmark, return a dictionary of all properties.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.TrueChild("Webseiten")

Var data as string = CFBookmarkMBS.ReadBookmarkDataFromFile(f)

if data.lenb >0 then
Var dic as Dictionary = CFBookmarkMBS.ResourcePropertiesForKeysFromBookmarkData(data)

Break // see in debugger
end if
```

Notes: This returns only the properties stored within the bookmark and will not attempt to resolve the bookmark or do i/o.

BookmarkData: a string containing a bookmark data, created with CreateBookmarkData

Returns a dictionary containing the values for all properties passed in obtained from the bookmark data (not by attempting to resolve it or do i/o in any way)

Version 17.1 of our plugin knows a list of keys, so it tries all keys and returns the dictionary with matching ones.
See also:

- 10.2.24 ResourcePropertiesForKeysFromBookmarkData(BookmarkData as string, resourcePropertiesToReturn() as string) as dictionary 2904

10.2.24 ResourcePropertiesForKeysFromBookmarkData(BookmarkData as string, resourcePropertiesToReturn() as string) as dictionary

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Given a bookmark, return a dictionary of properties.
Notes: This returns only the properties stored within the bookmark and will not attempt to resolve the bookmark or do i/o.

BookmarkData: a string containing a bookmark data, created with CreateBookmarkData
resourcePropertiesToReturn: Optional an array of string of the properties of the bookmark data which the client would like returned.

Returns a dictionary containing the values for the properties passed in obtained from the bookmark data (not by attempting to resolve it or do i/o in any way)
See also:

- 10.2.23 ResourcePropertiesForKeysFromBookmarkData(BookmarkData as string) as dictionary 2903

10.2.25 ResourcePropertyForKeyFromBookmarkData(BookmarkData as string, resourcePropertyKey as string) as Variant

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Given a bookmark, return the value for a given property from the bookmark data.
Notes: This returns only the properties stored within the bookmark and will not attempt to resolve the bookmark or do i/o.
BookmarkData: a string containing a bookmark data, created with CreateBookmarkData

resourcePropertyKey: the property key to return.

Returns a variant value for the property passed in obtained from the bookmark data (not by attempting to resolve it or do i/o in any way)

10.2.26 StartAccessingSecurityScopedResource(URL as CFURLMBS) as boolean

MBS MacCF Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Given a file URL created by resolving a bookmark data created with security scope, make the resource referenced by the url accessible to the process.
Notes: When access to this resource is no longer needed the client should call StopAccessingSecurityScopedResource(). Each call to StartAccessingSecurityScopedResource() must be balanced with a call to StopAccessingSecurityScopedResource().
URL: the file URL for the resource returned by CreateByResolvingBookmarkData() using kResolutionWithSecurityScope.

Returns true if access was granted and false if the url does not reference a security scoped resource, or if some error occurred which didn't allow access to be granted.
Available on Mac OS X 10.7 or newer.

10.2.27 StopAccessingSecurityScopedResource(URL as CFURLMBS)

MBS MacCF Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Revokes the access granted to the url by a prior successful call toStartAccessingSecurityScopedResource().
Notes: Available on Mac OS X 10.7 or newer.

10.2.28 WriteBookmarkDataToFile(BookmarkData as string, file as folderitem, options as UInt32) as boolean

MBS MacCF Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Given a created bookmarkData object, create a new Finder "alias" file at file which contains the bookmark data.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.TrueChild("test.rtf")
Var Bookmark as string = CFBookmarkMBS.CreateBookmarkData(file, CFBookmarkMBS.kCreationSuitableForBookmarkFile)
```

```
Var AliasFile as FolderItem = SpecialFolder.Desktop.TrueChild("test.alias")
if CFBookmarkMBS.WriteBookmarkDataToFile(Bookmark, AliasFile, 0) then
MessageBox "OK"
else
Var e as CFErrorMBS = CFBookmarkMBS.lasterror
MessageBox "Failed: "+e.Description
end if
```

Notes: If file points to a directory, an alias file will be created with the same name as the bookmarked item and a ".alias" extension. If file points to a file and it exists it will be overwritten. If a .alias extension is not present it will be added. In addition to the bookmark data, sufficient pre-SnowLeopard alias data will added to the file to allow systems running something before SnowLeopard to resolve this file using Alias Manager routines and get back the same file as the bookmark routines.

The bookmark data must have been created with the kCFURLBookmarkCreationSuitableForBookmarkFile option and an error will be returned if not.

bookmark: A string containing a bookmark data, created with CreateBookmarkData
file: The file/folder to write the alias to.
options: options flags

Lasterror is set.

10.2.29 Constants

Creation options.

Constant	Value	Description
kCreationMinimalBookmarkMask	512	Creates a bookmark with "less" information, which may be small able to resolve in certain ways.
kCreationPreferFileIDResolutionMask	256	At resolution time, this alias will prefer resolving by the embed the path.
kCreationSecurityScopeAllowOnlyReadAccess	4096	Mac OS X 10.7.3 and later, if used with kCFURLBookmarkCreat rityScope, at resolution time only read access to the resource wil
kCreationSuitableForBookmarkFile	1024	Includes in the created bookmark those properties which are neede mark/alias file.
kCreationWithSecurityScope	2048	Mac OS X 10.7.3 and later, include information in the bookmark c lows the same sandboxed process to access the resource after bein

Resolving options.

Constant	Value	Description
kResolutionWithoutMountingMask	512	Don't mount a volume during bookmark resolution.
kResolutionWithoutUIMask	256	Don't perform any UI during bookmark resolution.
kResolutionWithSecurityScope	1024	Mac OS X 10.7.3 and later, extract the security scope included at creation ti to provide the ability to access the resource.

10.3 class MacAliasMBS

10.3.1 class MacAliasMBS

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use CFBookmarkMBS module instead. **Function:** Gives access to Aliases on Mac.
Example:

```
// Store the reference to a FolderItem in a Binary File

Var alias as MacAliasMBS
Var t,f as FolderItem
Var bf as BinaryStream, s as String
t=SpecialFolder.Desktop.Child("test")
bf = t.CreateBinaryFile("") // open your binary file here
f = SpecialFolder.Desktop // the FolderItem you want to save
alias = new MacAliasMBS
if alias.Create(nil, f) = 0 then
s = alias.GetRecord
bf.WriteLong LenB(s) // this saves the length of the record
bf.Write s // this saves the record itself
end
bf.Close

// Retrieve the reference to a FolderItem from a Binary File

Var l as Integer

t=SpecialFolder.Desktop.Child("test")
bf = t.OpenAsBinaryFile(false) // open your binary file here
alias = new MacAliasMBS
l = bf.ReadLong
alias.SetRecord bf.Read(l)
f = alias.Resolve(nil, alias.attemptMount)
if alias.needsUpdate then
if alias.Update(nil, f) = 1 then
// ... you might want to save the updated alias in your file here
end
end
// f now describes the FolderItem again.
// It may not be existing any more, however, so here's a check for that:
if not f.exists then
MessageBox "oops! the file is not available any more. Select a new one, please"
//... let the user locate the file
end
```

Notes: This Plugin implements a new Class for handling Mac OS Alias Records.

AliasRecords are like FolderItems, but can be made persistent: You can convert a FolderItem into a AliasRecord and store that AliasRecord in a file (like your Preferences file). Later you can retrieve that information again and convert it back into a FolderItem.

AliasRecords also appear inside Alias Files, that are usually created by the Finder. The enclosed sample application (Alias Mgr Plugin Demo.œÄ) shows how to create and resolve such Alias Files.

Additional Background Information
The purpose of the class is to store paths to files and/or folders between runs of a RB application.
To store a path to a file/folder in an RB app, currently your only option is to get the absolute path as a string, and store that string in a file, usually your preferences file.
However, there is problem with using this technique: If, between runs of your app, the user changes the path of the file by moving it, or by renaming the file or any of its parent folders (including the volume name), your app will fail to locate the file next time
it is looking for it.
Fortunately, at least in Mac OS, there is a solution to this, which helps you to track your files in such a case. This is done by using Alias Records: they are the basic data structure that is also used in Alias Files as created and used in the Finder.
This class attempts to give the flexibility of Alias Records to your RB apps.

The meaning of the Relative path
When no relative path is specified, then the file is only located by its folder hierarchy down to the root of the volume. However, if a relative path is given, then the file is optionally located relative to that point.
So, if you locate files relatively to some folder, like the folder your application is in, you should specify your app's folder as the relative path so that the target is even found easily when the user moved the whole folder including your app and its related files. This is even more important when using this Alias class under Windows than under Mac OS (if files are moved in Mac OS, they often still can be found even without the help of the original folder hierarchy, while this is not possible under Windows 9x).

For Mac OS X 10.6 or newer, please also check CFBookmarkMBS module.

10.3.2 Methods

10.3.3 AliasInfo as AliasInfoMBS

MBS MacClassic Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries alias info for the alias.
Example:

```
Var m as new MacAliasMBS
Var f as FolderItem = SpecialFolder.Desktop

if m.Create(nil, f) = 0 then
Var info as AliasInfoMBS = m.AliasInfo

MessageBox info.TargetName + EndOfLine + info.VolumeName + EndOfLine + info.PathString
end if
```

10.3.4 close

MBS MacClassic Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

10.3.5 Create(relPath as FolderItem, target as FolderItem, isDirectory as boolean = false) as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an AliasRecord for a given file or folder.
Example:

```
Var m as new MacAliasMBS

Var e as Integer = m.Create(nil, SpecialFolder.Desktop.Child("test.txt"), true)

// shows -43 as we created alias for non existing file
MessageBox str(e)
MessageBox m.AliasInfo.TargetName
```

Notes: Returns zero if successful, otherwise a negative Mac OS error code.

Version 16.0 can create alias for non existing files. In that case you can tell with function isDirectory whether the target should be a directory. Still returns fnfErr (-43) if file doesn't exist but the alias will still be created.

10.3.6 CreateAliasFromPath(targetPath as string, fromFilePath as String = "", isDirectory as boolean = false) as Integer

MBS MacClassic Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an alias given a POSIX style utf-8 path to the target.
Example:

```
Var m as new MacAliasMBS

Var e as Integer = m.CreateAliasFromPath("/Users/test", "", true)

// shows -43 as we created alias for non existing file
MessageBox str(e)
MessageBox m.AliasInfo.TargetName
```

Notes: Returns OS error code.

If the target file does not exist but the path up to the leaf does then fnfErr (-43) will be returned but the alias will still be created.

fromFilePath: The starting point for a relative search.
targetPath: POSIX style UTF-8 path to target.
IsDirectory: On input, if target does not exist, a flag to indicate whether or not the target is a directory.

10.3.7 CreateFSRef(relPath as memoryblock, target as memoryblock) as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an AliasRecord for a given file or folder.
Notes: The two memoryblocks are FSRefs which you can get by FolderItem.FSRef.
Returns zero if successful, otherwise a negative Mac OS error code.

10.3.8 CreateMinimal(target as FolderItem, isDirectory as boolean = false) as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an AliasRecord for a given file or folder. Returns zero if successful, otherwise a negative Mac OS error code.
Notes: Minimal creates an alias without path, so it is smaller.

Version 16.0 can create alias for non existing files. In that case you can tell with function isDirectory whether the target should be a directory. Still returns fnfErr (-43) if file doesn't exist but the alias will still be created.

10.3.9 CreateMinimalFSRef(target as memoryblock) as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a minimal AliasRecord for a given file or folder.
Notes: The memoryblock is a FSRefs which you can get by FolderItem.FSRef.
Returns zero if successful, otherwise a negative Mac OS error code.

10.3.10 GetRecord as String

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the AliasRecord in a String so that you can store it in a file, and pass it SetRecord for re-creating the AliasRecord (this string might contain any byte values, including zeros, so you can not display it or store it in a text file - you have to store it in a binary file or in a resource, instead!).
Notes: Attention: The length of the String is not fixed! When the Alias changes, its length usually changes, too. If you want to save this string into a binary file, you must also save its current length so that you know how much bytes to retrieve if you read it back from the file later. An easier way to store Aliases in a file is by using the Resource Manager. The sample code "FolderItems in Preferences.rbp" shows how to accomplish this.

10.3.11 PathString as String

MBS MacClassic Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries path of the alias.
Example:

```
Var m as new MacAliasMBS
Var f as FolderItem = SpecialFolder.Desktop

if m.Create(nil, f) = 0 then
MessageBox m.PathString
end if
```

10.3.12 Resolve(relPath as FolderItem, mode as Integer) as FolderItem

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Converts an AliasRecord back into a FolderItem. For values to the mode parameter see the class constants or pass in 0 for default searching (will not attempt to mount unavailable volumes).
Notes: After calling this method, the property needsUpdate tells you whether the target has been renamed or moved, which suggests that you call Update in order to reflect the change in the AliasRecord. See the demo "FolderItems in Preferences.rbp" for an example.

10.3.13 SetRecord(record as String)

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Use this method to revive an AliasRecord with the string you inquired from GetRecord earlier.

10.3.14 TargetName as String

MBS MacClassic Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries target name of the alias.
Example:

```
Var m as new MacAliasMBS
Var f as FolderItem = SpecialFolder.Desktop

if m.Create(nil, f) = 0 then
MessageBox m.TargetName
end if
```

10.3.15 Update(relPath as FolderItem, target as FolderItem) as Integer

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Updates an already created AliasRecord. Returns either a negative Mac OS error code, zero if the update didn't actually change the AliasRecord, or one if the record was changed (in this case you might want to update your record of the alias if you had stored it in a file).

10.3.16 VolumeName as String

MBS MacClassic Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries volume name of the alias.
Example:

```
Var m as new MacAliasMBS
Var f as FolderItem = SpecialFolder.Desktop

if m.Create(nil, f) = 0 then
MessageBox m.VolumeName
end if
```

10.3.17 Properties

10.3.18 needsUpdate as boolean

MBS MacClassic Plugin, Platform: macOS, Targets: Desktop, Console & Web.

Function: Does the Alias Record need no Update?
Notes: after having called Resolve successfullly, this property indicates whether the AliasRecord is still up to date:
true: the target of the Alias is still at the same location where it was last seen.
false: the target has been moved or renamed. The Update method should be invoked.
(Read only property)

10.3.19 Constants

Constants

Constant	Value	Description
allVols	8	One of the constants to use in Resolve. search on multiple volumes This is the old constant name used for compatibility to older Xojo code. Use BitwiseOr or Bitwise.Or to combine this constants values.
attemptMount	1	One of the constants to use in Resolve. mount the volume automatically This is the old constant name used for compatibility to older Xojo code. Use BitwiseOr or Bitwise.Or to combine this constants values.
exhaustive	&h200	One of the constants to use in Resolve. search further This is the old constant name used for compatibility to older Xojo code. Use BitwiseOr or Bitwise.Or to combine this constants values.
kARMMountVol	1	One of the constants to use in Resolve. mount the volume automatically Use BitwiseOr or Bitwise.Or to combine this constants values.
kARMMultVols	8	One of the constants to use in Resolve. search on multiple volumes Use BitwiseOr or Bitwise.Or to combine this constants values.
kARMNoUI	2	One of the constants to use in Resolve. no user interface allowed during resolution Use BitwiseOr or Bitwise.Or to combine this constants values.
kARMSearch	&h100	One of the constants to use in Resolve. search quickly Use BitwiseOr or Bitwise.Or to combine this constants values.
kARMSearchMore	&h200	One of the constants to use in Resolve. search further Use BitwiseOr or Bitwise.Or to combine this constants values.
kARMSearchRelFirst	&h400	One of the constants to use in Resolve. search target on a relative path first Use BitwiseOr or Bitwise.Or to combine this constants values.
kARMTryFileIDFirst	&h800	One of the constants to use in Resolve. search by file id before path Use BitwiseOr or Bitwise.Or to combine this constants values.
noDialogs	2	One of the constants to use in Resolve. no user interface allowed during resolution This is the old constant name used for compatibility to older Xojo code. Use BitwiseOr or Bitwise.Or to combine this constants values.
relFirst	&h400	One of the constants to use in Resolve. search target on a relative path first This is the old constant name used for compatibility to older Xojo code. Use BitwiseOr or Bitwise.Or to combine this constants values.

Chapter 11

Apple Remote

11.1 class AppleRemoteMBS

11.1.1 class AppleRemoteMBS

MBS MacExtras Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: A class to handle an Apple Remote device from Xojo.
Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

With Mac OS X 10.6 Apple made changes to the behavior of the driver so the exclusive mode does no longer work.

11.1.2 Methods

11.1.3 startListening

MBS MacExtras Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Starts listening to device.

11.1.4 stopListening

MBS MacExtras Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Stops listening to device.

11.1.5 Properties

11.1.6 ClickCountEnabledButtons as Integer

MBS MacExtras Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Which buttons to enable for click counting.
Notes: (Read and Write property)

11.1.7 ClickCountingEnabled as Boolean

MBS MacExtras Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Whether to do click counting.
Notes: Click counting makes it possible to recognize if the user has pressed a button repeatedly click counting does delay each event as it has to wait if there is another event (second click) therefore there is a slight time difference (maximumClickCountTimeDifference) between a single click of the user and the call of your delegate method click counting can be enabled individually for specific buttons. Use the property clickCountEnableButtons to set the buttons for which click counting shall be enabled
(Read and Write property)

11.1.8 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: The handle to the used AppleRemote Cocoa object.
Notes: (Read and Write property)

11.1.9 ListeningOnAppActivate as Boolean

MBS MacExtras Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Sets an NSApplication delegate which starts listening when application is becoming active and stops listening when application resigns being active.
Notes: If an NSApplication delegate has been already set all method calls will be forwarded to this delegate, too.
(Read and Write property)

11.1.10 ListeningToRemote as boolean

MBS MacExtras Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Whether object is currently listening to the devices.
Notes: True if yes and false if no.
(Read and Write property)

11.1.11 MaximumClickCountTimeDifference as Double

MBS MacExtras Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The maximum time difference till which clicks are recognized as multi clicks.
Notes: (Read and Write property)

11.1.12 OpenInExclusiveMode as boolean

MBS MacExtras Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Whether device should be opened in exclusive mode.
Notes: True if yes and False if no.
(Read and Write property)

11.1.13 ProcessesBacklog as Boolean

MBS MacExtras Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: When your application needs to much time on the main thread when processing an event other events may already be received which are put on a backlog.
Notes: As soon as your main thread has some spare time this backlog is processed and may flood your delegate with calls. Backlog processing is turned off by default.
(Read and Write property)

11.1.14 RemoteAvailable as boolean

MBS MacExtras Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Whether the needed drivers are installed to handle the device.
Notes: True if driver was found.
(Read only property)

11.1.15 remoteId as Integer

MBS MacExtras Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: The device ID.
Notes: (Read only property)

11.1.16 SimulatesPlusMinusHold as Boolean

MBS MacExtras Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Simulating plus/minus hold does deactivate sending of individual requests for plus/minus pressed down/released.
Notes: Instead special hold events are being triggered when the user is pressing and holding plus/minus for a small period. With simulating enabled the plus/minus buttons do behave as the left/right buttons.
(Read and Write property)

11.1.17 Events

11.1.18 ButtonPressed(ButtonID as Integer, PressedDown as boolean, clickCount as Integer)

MBS MacExtras Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: The event being called whenever a button is pressed or released.
Notes: ButtonID is one of the kRemote* constants in this class.
PressedDown is true if the button was pressed down. If false the button is now no longer pressed after holding it.

11.1.19 Constants

Constants

Constant	Value	Description
kRemoteButtonFullscreen2009	32768	The constant for the fullscreen button (older modell).
kRemoteButtonLeft	64	The constant for the left button.
kRemoteButtonLeftHold	256	The constant for the left button being hold.
kRemoteButtonMenu	8	The constant for the menu button.
kRemoteButtonMenuHold	512	The constant for the menu button being hold.
kRemoteButtonPlay	16	The constant for the play button.
kRemoteButtonPlay2009	16384	The constant for the play button (older model).
kRemoteButtonPlaySleep	1024	The constant for the play button being hold.
kRemoteButtonRight	32	The constant for the right button.
kRemoteButtonRightHold	128	The constant for the right button being hold.
kRemoteButtonVolumeMinus	4	The constant for the volume minus button.
kRemoteButtonVolumeMinus_Hold	8192	The constant for the volume minus button (hold).
kRemoteButtonVolumePlus	2	The constant for the volume plus button.
kRemoteButtonVolumePlus_Hold	4096	The constant for the volume plus button (hold).
kRemoteControlSwitched	2048	The constant for the device switch event.

Chapter 12

Apple Script

12.1 class AppleScriptErrorMBS

12.1.1 class AppleScriptErrorMBS

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for detailed error information.
Example:

```
// a simply example using the AppleScriptErrorMBS class:

Var s As new AppleScriptMBS
Var ASErr As AppleScriptErrorMBS

Var text As string = "seet x to 1" // intentional error

s.Compile text

if s.LastError<>0 Then
Var errorMsg As String = "Compile error: " + str(s.Lasterror) + EndOfLine
ASErr = s.Error
MessageBox errorMsg + "Details: " + ASErr.BriefMessage
end if
```

12.1.2 Properties

12.1.3 AppName as String

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the application.
Notes: Value is "" if no application is used (e.g. on compiling).
(Read and Write property)

12.1.4 AppSerial as MemoryBlock

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The application serial number.
Notes: Nil if no application is used.
You can create a ProcessMBS class using this serial.s
(Read and Write property)

12.1.5 BriefMessage as String

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The brief error message.
Example:

```
Var ASErr as AppleScriptErrorMBS
MessageBox "Details: " + ASErr.BriefMessage
```

Notes: (Read and Write property)

12.1.6 Errorcode as Integer

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The error code.
Example:

```
Var a as new AppleScriptMBS

a.Compile "hello"
a.Execute

MessageBox str(a.Error.Errorcode) // -2753
```

Notes: (Read and Write property)

12.1.7 ErrorCodeAvailable as Boolean

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: whether the error code is known in the ErrorCode property.
Example:

```
Var a as new AppleScriptMBS

a.Compile "hello"
a.Execute

MessageBox str(a.Error.ErrorCodeAvailable)
```

Notes: The error code property may be 0, but still there may be an error.
(Read and Write property)

12.1.8 Message as String

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The error message.
Example:

```
Var a as new AppleScriptMBS

a.Compile "hello"
a.Execute

MessageBox a.Error.Message
```

Notes: (Read and Write property)

12.1.9 RangeAvailable as Boolean

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: whether the rangestart and rangeend properties have valid values.
Example:

```
Var a as new AppleScriptMBS

a.Compile "hello"
a.Execute
```

```
MessageBox str(a.error.RangeAvailable)+": "+str(a.error.RangeStart)+"-"+str(a.error.RangeEnd)
```

Notes: (Read and Write property)

12.1.10 RangeEnd as Integer

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The end of the source text range.
Example:

```
Var a as new AppleScriptMBS

a.Compile "hello"
a.Execute

MessageBox str(a.error.RangeAvailable)+": "+str(a.error.RangeStart)+"-"+str(a.error.RangeEnd)
```

Notes: (Read and Write property)

12.1.11 RangeStart as Integer

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The start of the source text range.
Example:

```
Var a as new AppleScriptMBS

a.Compile "hello"
a.Execute

MessageBox str(a.error.RangeAvailable)+": "+str(a.error.RangeStart)+"-"+str(a.error.RangeEnd)
```

Notes: (Read and Write property)

12.2 class AppleScriptMBS

12.2.1 class AppleScriptMBS

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for compiling and executing Apple Scripts in RB.
Example:

```
Var a as new AppleScriptMBS
Var lines(-1) as string

lines.Add "tell application ""Finder"""
lines.Add " activate"
lines.Add " display dialog ""Now is "" & (current date)"
lines.Add "end tell"

a.Compile Join(lines, EndOfLine.Macintosh)
a.Execute
```

Notes: Your application may need the NSAppleEventsUsageDescription entry in info.plist to do any AppleScript usage:
https://developer.apple.com/documentation/bundleresources/information_property_list/nsappleeventsusagedescription

If you use hardened runtime, which you need for notarization, you may need the entitlement for Apple Events, too:
https://developer.apple.com/documentation/bundleresources/entitlements/com_apple_security_automation_apple-events

12.2.2 Methods

12.2.3 close

MBS MacClassic Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.
Example:

```
Var a as new AppleScriptMBS
// later
a.close
```

Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

12.2.4 Compile(text as string)

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compiles the given source code.
Example:

```
// the code below workarounds a limitation in AppleScript on processing unicode strings

Var theScript as new AppleScriptMBS
Var scripttext as string
Var chars(-1) as string
Var n as string
Var i,c as Integer

const text="Hello World" // add unicode characters here!

c=len(text)
for i=1 to c
n=hex(asc(mid(text,i,1)))
while len(n)<4
n="0"+n
wend
chars.Add n
next

scripttext="display dialog (√Ösdata utxt"+join(chars,"")+"√Öt as Unicode text)"

MessageBox scripttext
```

```
// must use unicode to avoid error -1753
scripttext=ConvertEncoding(scripttext,encodings.UTF16)
theScript.UnicodeText=true
theScript.compile ScriptText
theScript.execute
```

Notes: Lasterror is set.
Text should be in MacRoman or UTF16 text encoding for best results.

12.2.5 CountScriptProperties as Integer

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of properties in the script.
Example:

```
Var s as String
Var a as AppleScriptMBS
Var i,c,cc as Integer
Var z,t as String

s=s+"property hello : ""Hallo Leute""""+chr(13)
s=s+"property just : ""Just a test""""+chr(13)
s=s+"display dialog hello"+chr(13)
s=s+"return just"+chr(13)

MessageBox "The script:"+chr(13)+s
a=new AppleScriptMBS

a.Compile s

MessageBox str(a.CountScriptProperties)+" properties"
```

Notes: Lasterror is set.

12.2.6 Error as AppleScriptErrorMBS

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an AppleScriptError object for details error information.
Example:

```
Var a as AppleScriptMBS
Var e as AppleScriptErrorMBS
```

```
a=new AppleScriptMBS

a.Compile "tell application ""Finder""+chr(13)+"open file ""test""+chr(13)+"end tell"+chr(13)

// You may check for errors here.

a.Execute

e=a.Error

// in a breakpoint you can see an error message here.
```

Notes: Returns nil on any error.
The returned object may be empty.
The error information is changed whenever you compile or execute.

12.2.7 Execute

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Runs the current script.
Example:

```
Var a as new AppleScriptMBS

a.Compile "beep"
a.Execute
```

Notes: Lasterror is set.
If you use this method, please make sure your own Application's HandleAppleEvent method doesn't block executing by returning true for unknown events.

12.2.8 ExecuteEvent(eventname as string, parameters() as string)

MBS MacClassic Plugin, Plugin Version: 3.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Executes an event inside the current script with the given parameters.
Example:

```
Var a as new AppleScriptMBS
Var lines(-1) as string

lines.Add "on test(a,b,c)"
lines.Add "display dialog a"
```

```
lines.Add "display dialog b"
lines.Add "display dialog c"
lines.Add "end test"

a.Compile join(lines,EndOfLine.Macintosh)
a.Execute

Var s(2) as string
s(0)="Hello"
s(1)="World"
s(2)="!"

a.ExecuteEvent("test",s)
```

Notes: The eventname must be the name of the event in pure ASCII or MacRoman encoding (and lowercase!).
The parameters can be unicode. The array is based on 0, so string in parameters(0) is the first parameter.

Lasterror is set.

12.2.9 Result as string

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The result of the executed script as a string.
Example:

```
Var a as new AppleScriptMBS

a.Compile "return ""hello"""
a.Execute

MessageBox a.Result
```

Notes: Returns "" on any error.

If unicode is enabled, this string is unicode (UTF16).

12.2.10 ResultAsStringArray as string()

MBS MacClassic Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The result of the executed script as a string array.

Example:

```
Var a as new AppleScriptMBS

a.Compile "return { ""Hello"", ""World"" } "
a.Execute

MessageBox join(a.ResultAsStringArray,EndOfLine) // Shows Hello World in two lines

a.Compile "tell application ""Mail""""+EndOfLine.Macintosh+"return name of every mailbox"+EndOfLine.Macintosh+"end tell"
a.Execute

MessageBox join(a.ResultAsStringArray,EndOfLine) // shows your Mailboxes
```

Notes: On any error the array is empty.
If unicode is enabled, this strings are unicode (UTF16).

12.2.11 ResultDisplayString as string

MBS MacClassic Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The result of the executed script as a string.
Example:

```
Var a as new AppleScriptMBS

a.Compile "return ""hello""""
a.Execute

MessageBox a.ResultDisplayString
```

Notes: This is the same as Result, but a flag is set to tell AppleScript that the string is for display to a human. So it may not be good for input to the AppleScript compiler.

Returns "" on any error.
If unicode is enabled, this string is unicode (UTF16).

12.2.12 ScriptProperty(index as Integer) as string

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the property with the given index.
Example:

```
Var s as String
Var a as AppleScriptMBS
Var i,c,cc as Integer
Var z,t as String

s=s+"property hello : ""Hallo Leute""+chr(13)
s=s+"property just : ""Just a test""+chr(13)
s=s+"display dialog hello"+chr(13)
s=s+"return just"+chr(13)

MessageBox "The script:"+chr(13)+s
a=new AppleScriptMBS

a.Compile s

c=a.CountScriptProperties

cc=c-1
for i=0 to cc
z=a.ScriptProperty(i)
if z<>"" then
if i=0 then
t=z
elseif i=cc then
t=t+" and "+z
else
t=t+", "+z
end if
end if
next

MessageBox str(c)+" properties in the script: "+t

t=a.ScriptProperty(0)
z=a.ScriptPropertyValue(t)
MessageBox "Value of the property named "+t+" is: "+z

a.ScriptPropertyValue(t)="Hello World!"

z=a.ScriptPropertyValue(t)
MessageBox "The new value of the property named "+t+" is: "+z

a.Execute

MessageBox "The result is: "+a.Result
```

Notes: Index is from 0 to CountScriptProperties-1.

Lasterror is set.

12.2.13 Source as string

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Decompiles the current script and returns the source code.
Example:

```
Var a as new AppleScriptMBS

a.compile "beep"

MessageBox a.Source
```

12.2.14 SourceTextStyle as string

MBS MacClassic Plugin, Plugin Version: 3.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Decompiles the current script and returns the source code text style.
Example:

```
Var a as new AppleScriptMBS

a.compile "beep"

EditField1.SetTextAndStyle a.Source, a.SourceTextStyle
```

Notes: Doesn't work for unicode text.

12.2.15 Properties

12.2.16 AllowInteraction as Boolean

MBS MacClassic Plugin, Plugin Version: 17.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether to allow user interaction.
Notes: Default is false to disallow.
You can set to true to allow GUI.
(Read and Write property)

12.2.17 CanUnicodeText as Boolean

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: True if AppleScript can handle Unicode text.
Example:

```
Var a as new AppleScriptMBS

MessageBox str(a.CanUnicodeText)
```

Notes: This property is set to true if AppleScript 1.3 or newer is installed.
(AppleScript 1.3 was introduced around the time of Mac OS 8.6)
(Read only property)

12.2.18 Handle as Integer

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle of the used AppleScript component.
Example:

```
Var a as new AppleScriptMBS
MessageBox str(a.Handle)
```

Notes: (Read and Write property)

12.2.19 Lasterror as Integer

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code.
Example:

```
Var a as new AppleScriptMBS
MessageBox str(a.Lasterror)
```

Notes: Value is 0 for successful and -1 if function is not available.
All other values are normal Mac OS error codes.

Some common error codes for this class:

(Read and Write property)

OSASystemError	-1750	
OSAInvalidID	-1751	
OSABadStorageType	-1752	
OSAScriptError	-1753	
OSABadSelector	-1754	
OSASourceNotAvailable	-1756	
OSANoSuchDialect	-1757	
OSADataFormatObsolete	-1758	
OSADataFormatTooNew	-1759	
OSACorruptData	-1702	
OSARecordingIsAlreadyOn	-1732	
OSAComponentMismatch	-1761	Parameters are from 2 different components
OSACantOpenComponent	-1762	Can't connect to scripting system with that ID
OSACantCoerce	-1700	Signaled when a value can't be coerced to the desired type.
OSACantAccess	-1728	Signaled when an object is not found in a container
OSACantAssign	-10006	Signaled when an object cannot be set in a container.
OSAGeneralError	-2700	Signaled by user scripts or applications when no actual error code is to be returned.
OSADivideByZero	-2701	Signaled when there is an attempt to divide by zero
OSANumericOverflow	-2702	Signaled when integer or real value is too large to be represented
OSACantLaunch	-2703	Signaled when application can't be launched or when it is remote and program linking is not enabled
OSAAppNotHighLevelEventAware	-2704	Signaled when an application can't respond to AppleEvents
OSACorruptTerminology	-2705	Signaled when an application's terminology resource is not readable
OSAStackOverflow	-2706	Signaled when the runtime stack overflows
OSAInternalTableOverflow	-2707	Signaled when a runtime internal data structure overflows
OSADataBlockTooLarge	-2708	Signaled when an intrinsic limitation is exceeded for the size of a value or data structure.
OSACantGetTerminology	-2709	
OSACantCreate	-2710	

12.2.20 ResultID as Integer

MBS MacClassic Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal result ID for the current script.
Example:

```
Var a as new AppleScriptMBS

a.Compile "return ""hello"""
a.Execute

MessageBox str(a.ResultID)
```

Notes: May be useful for Toolbox calls.
(Read and Write property)

12.2.21 ScriptID as Integer

MBS MacClassic Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal script ID for the current script.
Example:

```
Var a as new AppleScriptMBS

a.compile "beep"

MessageBox str(a.ScriptID)
```

Notes: May be useful for Toolbox calls.
(Read and Write property)

12.2.22 UnicodeText as Boolean

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: True if you want to use unicode.
Example:

```
Var a as AppleScriptMBS

a=new AppleScriptMBS
a.UnicodeText=true

Var s as string="tell application ""iTunes""""+chr(13)+"set rating of (track ""Flintstones √°√©"""") to 40"+chr(13)+"end tell"
a.compile ConvertEncoding(s,Encodings.UTF16)
MessageBox str(a.Lasterror)

a.Execute
MessageBox str(a.Lasterror)

MessageBox a.Result
```

Notes: If this property is true, all functions try to get strings as 16 bit Unicode strings.
Strings you pass which are in 16 bit Unicode are passed in Unicode to AppleScript.
You may get trouble if the strings you give this class are not in the system encoding (MacRoman?) or 16 bit Unicode. UTF8 will not work!
(Read and Write property)

12.2.23 Binary as string

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The binary representation of the current compiled script.
Example:

```
// create our own compiled AppleScript file

Var a as AppleScriptMBS
Var b as BinaryStream
Var f as FolderItem
Var r as ResourceFork

a=new AppleScriptMBS

// compile a simply applescript:
a.Compile "beep"

// Mac OS X format
f=New FolderItem("My Apple Script X")

b=f.CreateBinaryFile("applescript")
b.Write a.Binary
b.Close

// Mac OS 9 format
f=New FolderItem("My Apple Script 9")

r=f.CreateResourceFork("applescript")
r.AddResource a.Binary,"scpt",128,""
r.Close
```

Notes: You can save and load this value to store scripts.
Lasterror is set.
(Read and Write computed property)

12.2.24 ScriptPropertyValue(name as string) as string

MBS MacClassic Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The value of a script property.
Example:

```
Sub NewEmailinMail(subject as string, body as string, sender as string, receiver as string)
// make a new email in Apple Mail using AppleScript
```

```
Var lines(-1) as string

lines.Add ""
lines.Add "property MySubject : ""My Subject"""
lines.Add "property MyBody : ""My Body"""
lines.Add "property MyReceiver : ""test@test.test"""
lines.Add "property MySender : ""test@test.test"""
lines.Add ""
lines.Add "tell application ""Mail"""
lines.Add " activate"
lines.Add " set NewMail to make new outgoing message with properties { visible:true, subject:MySubject,
content:MyBody } "
lines.Add " "
lines.Add " tell NewMail"
lines.Add " make new to recipient at beginning of to recipients with properties { address:MyReceiver } "
lines.Add " end tell"
lines.Add " "
lines.Add " set the sender of NewMail to MySender"
lines.Add "end tell"

Var a as new AppleScriptMBS

a.Compile Join(lines,EndOfLine.Macintosh)

// Change encoding
subject = ConvertEncoding(subject, encodings.MacRoman)
body = ConvertEncoding(body, encodings.MacRoman)
sender = ConvertEncoding(sender, encodings.MacRoman)
receiver = ConvertEncoding(receiver, encodings.MacRoman)

// replace line endings
subject = ReplaceLineEndings(subject, EndOfLine.Macintosh)
body = ReplaceLineEndings(body, EndOfLine.Macintosh)
sender = ReplaceLineEndings(sender, EndOfLine.Macintosh)
receiver = ReplaceLineEndings(receiver, EndOfLine.Macintosh)

// set properties in Script
a.ScriptPropertyValue("MySubject")=subject
a.ScriptPropertyValue("MyBody")=body
a.ScriptPropertyValue("MySender")=sender
a.ScriptPropertyValue("MyReceiver")=receiver

a.Execute
End Sub
```

Notes: If name or value are UTF16 encoding, than the plugin passes UTF16. Else it passes the bytes and

AppleScript may assume MacRoman encoding.
(Read and Write computed property)

12.2.25 Events

12.2.26 Periodic as Integer

MBS MacClassic Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: This event is called periodical on long operations like Compile or Execute.
Notes: Return 0 to continue or some other value to report an error.

12.3 control DesktopOSAScriptControlMBS

12.3.1 control DesktopOSAScriptControlMBS

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a OSAScriptView.
Notes: This control embeds a special OSAScriptView subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.
Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls

12.3.2 Properties

12.3.3 AcceptTabs as Boolean

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes: If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

12.3.4 Scrollview as Variant

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The scrollview for this textview.
Notes: (Read only property)

12.3.5 View as OSAScriptViewMBS

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

12.3.6 Events

12.3.7 BoundsChanged

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

12.3.8 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

12.3.9 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

12.3.10 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

12.3.11 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacExtras Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

12.3.12 FocusLost

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

12.3.13 FocusReceived

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

12.3.14 FrameChanged

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

12.3.15 MenuBarSelected

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

12.3.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

12.3.17 MouseDrag(x as Integer, y as Integer)

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

12.3.18 MouseUp(x as Integer, y as Integer)

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

12.3.19 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

12.3.20 ScaleFactorChanged(NewFactor as Double)

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

12.3.21 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when a text view needs to determine if text in a specified range should be changed.
Notes: affectedCharRange: The range of characters to be replaced.
replacementString: The characters that will replace the characters in affectedCharRange; nil if only text attributes are being changed.

Return true to allow the replacement, or false to reject the change.

12.3.22 textDidBeginEditing

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the text object has begun editing (that the user has begun changing it).

12.3.23 textDidChange

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the text object has changed its characters or formatting attributes.

12.3.24 textDidEndEditing

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the text object has finished editing (that it has resigned first responder status).

12.3.25 textShouldBeginEditing as boolean

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when a text object begins to change its text, this method requests permission to begin editing.

Notes: If the delegate returns false, the text object proceeds to make changes. If the delegate returns true, the text object abandons the editing operation. This method is also invoked when the user drags and drops a file onto the text object.

12.3.26 textShouldEndEditing as boolean

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked from a text object's implementation of resignFirstResponder, this method requests permission to end editing.
Notes: If the delegate returns false, the text object proceeds to finish editing and resign first responder status. If the delegate returns true, the text object selects all of its text and remains the first responder.

12.3.27 textViewDidChangeSelection

MBS MacExtras Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when the selection changes in the text view.

12.3.28 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacExtras Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

12.4 class NSAppleEventDescriptorMBS

12.4.1 class NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An instance of NSAppleEventDescriptor represents a descriptor—the basic building block for Apple events.
Example:

```
// build Apple event descriptors and read values back
Var text As NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString("Hello")
Var number As NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithInt32(42)

MessageBox "Text: " + text.stringValue + " (type " + text.descriptorType + ")" + EndOfLine + _
"Number: " + number.int32Value.ToString + " (type " + number.descriptorType + ")"

// results of OSAScriptMBS.execute and NSAppleScriptMBS are descriptors too
```

Notes: This class is a wrapper for the underlying Apple event descriptor data type, AEDesc. Scriptable Cocoa applications frequently work with instances of NSAppleEventDescriptor, but should rarely need to work directly with the AEDesc data structure.

A descriptor is a data structure that stores data and an accompanying four-character code. A descriptor can store a value, or it can store a list of other descriptors (which may also be lists). All the information in an Apple event is stored in descriptors and lists of descriptors, and every Apple event is itself a descriptor list that matches certain criteria.

Important: An instance of NSAppleEventDescriptor can represent any kind of descriptor, from a simple value descriptor, to a descriptor list, to a full-fledged Apple event.
Descriptors can be used to build arbitrarily complex containers, so that one Apple event can represent a script statement such as tell application "TextEdit" to get word 3 of paragraph 6 of document 3.

In working with Apple event descriptors, it can be useful to understand some of the underlying data types. You'll find terms such as descriptor, descriptor list, Apple event record, and Apple event defined in Building an Apple Event in Apple Events Programming Guide. You'll also find information on the four-character codes used to identify information within a descriptor. Apple event data types are defined in Apple Event Manager Reference. The values of many four-character codes used by Apple (and in some cases reused by developers) can be found in AppleScript Terminology and Apple Event Codes.

The most common reason to construct an Apple event with an instance of NSAppleEventDescriptor is to supply information in a return Apple event. The most common situation where you might need to extract information from an Apple event (as an instance of NSAppleEventDescriptor) is when an Apple event handler installed by your application is invoked, as described in "Installing an Apple Event Handler" in How Cocoa Applications Handle Apple Events. In addition, if you execute an AppleScript script using the

NSAppleScript class, you get an instance of NSAppleEventDescriptor as the return value, from which you can extract any required information.

When you work with an instance of NSAppleEventDescriptor, you can access the underlying descriptor directly, if necessary, with the aeDesc method. Other methods, including descriptorWithDescriptorType make it possible to create and initialize instances of NSAppleEventDescriptor without creating temporary instances of memoryblock.

Cocoa doesn't currently provide a mechanism for applications to directly send raw Apple events (though compiling and executing an AppleScript script with NSAppleScript may result in Apple events being sent). However, Cocoa applications have full access to the Apple Event Manager C APIs for working with Apple events. So, for example, you might use an instance of NSAppleEventDescriptor to assemble an Apple event and call the Apple Event Manager function AESend to send it.

If you need to send Apple events, or if you need more information on some of the Apple event concepts described here, see Apple Events Programming Guide and Apple Event Manager Reference.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

12.4.2 Methods

12.4.3 appleEventWithEventClass(eventClass as string, eventID as string, targetDescriptor as NSAppleEventDescriptorMBS, returnID as Int16, transactionID as UInt32) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor that represents an Apple event, initialized according to the specified information.
Notes: eventClass: The event class to be set in the returned descriptor.
eventID: The event ID to be set in the returned descriptor.
addressDescriptor: A pointer to a descriptor that identifies the target application for the Apple event. Passing nil results in an Apple event descriptor that has no keyAddressAttr attribute (it is valid for an Apple

event to have no target address attribute).
returnID: The return ID to be set in the returned descriptor. If you pass a value of kAutoGenerateReturnID, the Apple Event Manager assigns the created Apple event a return ID that is unique to the current session. If you pass any other value, the Apple Event Manager assigns that value for the ID.
transactionID: The transaction ID to be set in the returned descriptor. A transaction is a sequence of Apple events that are sent back and forth between client and server applications, beginning with the client's initial request for a service. All Apple events that are part of a transaction must have the same transaction ID. You can specify kAnyTransactionID if the Apple event is not one of a series of interdependent Apple events.

Returns a descriptor for an Apple event, initialized according to the specified parameter values, or nil if an error occurs.

Constants such as kAutoGenerateReturnID and kAnyTransactionID are defined in AE.framework, a sub-framework of ApplicationServices.framework.

12.4.4 attributeDescriptorForKeyword(keyword as string) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a descriptor for the receiver's Apple event attribute identified by the specified keyword.
Notes: keyword: A keyword (a four-character code) that identifies the descriptor to obtain.

Returns the attribute descriptor for the specified keyword, or nil if an error occurs.

12.4.5 coerceToDescriptorType(descriptorType as string) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a descriptor obtained by coercing the receiver to the specified type.
Notes: descriptorType: The descriptor type to coerce the receiver to.

Returns a descriptor of the specified type, or nil if an error occurs.

12.4.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

12.4.7 copy as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of the apple event descriptor.

12.4.8 currentProcessDescriptor as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Create and return an application address descriptor using the current process.
Example:

```
Var d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.currentProcessDescriptor
MessageBox "Process ID: "+str(d.processIDValue)
```

Notes: The result is suitable for use as the "targetDescriptor" parameter of appleEventWithEventClass.

12.4.9 descriptorAtIndex(index as Integer) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the descriptor at the specified (one-based) position in the receiving descriptor list.
Example:

```
Var n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.listDescriptor
Var d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString("Hello")
Var e as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString("World")

n.insertDescriptor(d,1)
n.insertDescriptor(e,2)

MessageBox str(n.numberOfItems)

Var x1 as NSAppleEventDescriptorMBS = n.descriptorAtIndex(1)
Var x2 as NSAppleEventDescriptorMBS = n.descriptorAtIndex(2)
MessageBox x1.stringValue+" "+x2.stringvalue
```

Notes: Index: The one-based descriptor list position of the descriptor to return.

Returns the descriptor from the specified position (one-based) in the descriptor list, or nil if the specified

descriptor cannot be obtained.

12.4.10 descriptorForKeyword(keyword as string) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's descriptor for the specified keyword.
Example:

```
Var n as new NSAppleScriptMBS("return system info")
Var r as NSAppleEventDescriptorMBS = n.execute

Var lines(-1) as string

Var u as Integer = r.numberOfItems
for i as Integer = 1 to u
Var keyword as string = r.keywordForDescriptorAtIndex(i)
Var value as string
Var p as NSAppleEventDescriptorMBS = r.descriptorForKeyword(keyword)
if p<>Nil then value = p.stringValue
lines.Add keyword+": "+value
next

MessageBox Join(lines,EndOfLine)
```

Notes: keyword: A keyword (a four-character code) that identifies the descriptor to obtain.

Returns a descriptor for the specified keyword, or nil if an error occurs.

12.4.11 descriptorWithAlias(item as folderitem) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor initialized with type typeAlias that stores the specified folderitem reference.
Example:

```
// pick a folderitem
Var folder as FolderItem = SpecialFolder.Desktop

// create value with file reference
Var d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithAlias(folder)

// convert back to FolderItem
Var file as FolderItem = d.FSRefValue
```

```
// show path
MessageBox file.NativePath
```

Notes: This type can be converted internally to FSRef descriptor.

12.4.12 descriptorWithApplicationURL(fileURL as string) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Create and return an application address descriptor using the file URL for an application.
Example:

```
Var f as FolderItem = SpecialFolder.Applications.Child("Stickies.app")
Var u as string = f.URLPath
Var d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithApplicationURL(u)
MessageBox d.applicationURLValue
```

Notes: The result is suitable for use as the "targetDescriptor" parameter of appleEventWithEventClass.
See also:

- 12.4.13 descriptorWithApplicationURL(item as folderitem) as NSAppleEventDescriptorMBS 2952

12.4.13 descriptorWithApplicationURL(item as folderitem) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Create and return an application address descriptor using the folderitem for an application.
Example:

```
Var f as FolderItem = SpecialFolder.Applications.Child("Stickies.app")
Var d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithApplicationURL(f)
MessageBox d.applicationURLValue
```

Notes: The result is suitable for use as the "targetDescriptor" parameter of appleEventWithEventClass.
See also:

- 12.4.12 descriptorWithApplicationURL(fileURL as string) as NSAppleEventDescriptorMBS 2952

12.4.14 descriptorWithBoolean(value as Boolean) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor initialized with type typeBoolean that stores the specified Boolean value.
Example:

```
Var a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithBoolean(true)
MessageBox a.stringValue // shows true
```

Notes: Returns a descriptor with the specified Boolean value, or nil if an error occurs.

12.4.15 descriptorWithBundleIdentifier(BundleID as String) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Create and return an application address descriptor using the bundle identifier.
Example:

```
Var d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithBundleIdentifier("com.apple.iCal")
MessageBox d.bundleIDValue
```

Notes: The result is suitable for use as the "targetDescriptor" parameter of appleEventWithEventClass.

12.4.16 descriptorWithCurrentProcessSerialNumber as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates descriptor with current process serial number.
Example:

```
Var n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithCurrentProcessSerialNumber
MessageBox n.stringValue // shows app name
```

12.4.17 descriptorWithDate(value as date) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor with a date value.
Example:

```
Var d as new date
Var n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithDate(d)

Var x as date = n.dateValue
MessageBox x.LongDate+" "+x.LongTime // shows today
```

12.4.18 descriptorWithDateTime(value as dateTime) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor with a date value.

12.4.19 descriptorWithDescriptorType(descriptorType as string, data as memoryblock) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor initialized with the specified event type that stores the specified data.
Notes: descriptorType: The descriptor type to be set in the returned descriptor.
data: The data, as a memoryblock, to be set in the returned descriptor.

Returns a descriptor with the specified type and data, or nil if an error occurs.

You can use this method to create a descriptor that you can build into a complete Apple event by calling methods such as setAttributeDescriptor, setDescriptor, and setParamDescriptor.
See also:

- 12.4.20 descriptorWithDescriptorType(descriptorType as string, data as memoryblock, offset as UInt32, length as UInt32) as NSAppleEventDescriptorMBS 2954

12.4.20 descriptorWithDescriptorType(descriptorType as string, data as memoryblock, offset as UInt32, length as UInt32) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor initialized with the specified event type that stores the specified data (from a series of bytes).

Notes: descriptorType: The descriptor type to be set in the returned descriptor.
bytes: The data, as a sequence of bytes, to be set in the returned descriptor.
offset: offset in memoryblock.
length: The length, in bytes, of the data to be set in the returned descriptor.

Returns a descriptor with the specified type and data, or nil if an error occurs.
See also:

- 12.4.19 descriptorWithDescriptorType(descriptorType as string, data as memoryblock) as NSAppleEventDescriptorMBS 2954

12.4.21 descriptorWithDouble(value as Double) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor with a double value.
Example:

```
Var a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithDouble(5)
MessageBox a.stringValue // shows 5
```

12.4.22 descriptorWithEnumCode(enumerator as string) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor initialized with type typeEnumerated that stores the specified enumerator data type value.
Notes: enumerator: A type code that identifies the type of enumerated data to be stored in the returned descriptor.

Returns a descriptor with the specified enumerator data type value, or nil if an error occurs.

12.4.23 descriptorWithFileURL(fileURL as string) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor for a file URL.
Example:

```
Var f as FolderItem = SpecialFolder.Applications.Child("Stickies.app")
```

```
Var u as string = f.URLPath
Var d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithFileURL(u)
MessageBox d.fileURLValue
```

See also:

- 12.4.24 descriptorWithFileURL(item as folderitem) as NSAppleEventDescriptorMBS 2956

12.4.24 descriptorWithFileURL(item as folderitem) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor for a file URL based on the folderitem.
Example:

```
Var f as FolderItem = SpecialFolder.Applications.Child("Stickies.app")
Var d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithFileURL(f)
MessageBox d.fileURLValue
```

See also:

- 12.4.23 descriptorWithFileURL(fileURL as string) as NSAppleEventDescriptorMBS 2955

12.4.25 descriptorWithInt16(value as Int16) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor initialized with Apple event type typeSInt16 that stores the specified integer value.
Example:

```
Var a as NSAppleEventDescriptorMBS

a = NSAppleEventDescriptorMBS.descriptorWithInt16(5)

MessageBox a.stringValue // shows 5
```

12.4.26 descriptorWithInt32(value as Int32) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor initialized with Apple event type typeSInt32 that stores the specified integer value.
Example:

```
Var a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithInt32(5)

MessageBox a.stringValue // shows 5
```

Notes: Returns a descriptor containing the specified integer value, or nil if an error occurs.

12.4.27 descriptorWithProcessIdentifier(PID as Integer) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Create and return an application address descriptor using the process identifier.
Example:

```
// get my PID
Var p as new ProcessMBS
p.GetCurrentProcess
Var pid as Integer = p.ProcessID

// make process ID descriptor
Var n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithProcessIdentifier(pid)

// show it
MessageBox "ProcessID: "+str(n.processIDValue) + EndOfLine + n.stringValue
```

Notes: The result is suitable for use as the "targetDescriptor" parameter of appleEventWithEventClass.

12.4.28 descriptorWithSingle(value as single) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor with a single value.
Example:

```
Var a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithSingle(5)
MessageBox a.stringValue // shows 5
```

12.4.29 descriptorWithString(text as string) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor initialized with type typeUnicodeText that stores the text from the specified string.
Example:

```
Var a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithString("Hello World")

MessageBox a.stringValue
```

Notes: Returns a descriptor that contains the text from the specified string, or nil if an error occurs.

12.4.30 descriptorWithTypeCode(typeCode as string) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor initialized with type typeType that stores the specified type value.
Notes: typeCode: The type value to be set in the returned descriptor.

Returns a descriptor with the specified type, or nil if an error occurs.

12.4.31 descriptorWithUInt32(value as UInt32) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a descriptor with an unsigned integer value.
Example:

```
Var a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithUInt32(5)
MessageBox a.stringValue // shows 5
```

12.4.32 insertDescriptor(descriptor as NSAppleEventDescriptorMBS, index as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Inserts a descriptor at the specified (one-based) position in the receiving descriptor list, replacing the existing descriptor, if any, at that position.
Notes: descriptor: The descriptor to insert in the receiver. Specifying an index of 0 or count + 1 causes appending to the end of the list.
Index: The one-based descriptor list position at which to insert the descriptor.

Because it actually replaces the descriptor, if any, at the specified position, this method might better be called replaceDescriptor. The receiver must be a list descriptor. The indices are one-based. Currently provides no indication if an error occurs.

12.4.33 keywordForDescriptorAtIndex(index as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the keyword for the descriptor at the specified (one-based) position in the receiver.
Example:

```
Var n as new NSAppleScriptMBS("return system info")
Var r as NSAppleEventDescriptorMBS = n.execute

Var lines(-1) as string

Var u as Integer = r.numberOfItems
for i as Integer = 1 to u
Var keyword as string = r.keywordForDescriptorAtIndex(i)
Var value as string
Var p as NSAppleEventDescriptorMBS = r.descriptorForKeyword(keyword)
if p<>Nil then value = p.stringValue
lines.Add keyword+": "+value
next

MessageBox Join(lines,EndOfLine)
```

Notes: Index: The one-based descriptor list position of the descriptor to get the keyword for.

Returns the keyword (a four-character code) for the descriptor at the one-based location specified by anIndex, or 0 if an error occurs.

12.4.34 listDescriptor as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and initializes an empty list descriptor.
Notes: Returns an empty list descriptor, or nil if an error occurs.

A list descriptor is a descriptor whose data consists of one or more descriptors. You can add items to the list by calling insertDescriptor or remove them with removeDescriptorAtIndex.

12.4.35 nullDescriptor as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and initializes a descriptor with no parameter or attribute values set.
Notes: Returns a descriptor with no parameter or attribute values set, or nil if an error occurs.

You don't typically call this method, as most NSAppleEventDescriptor instance methods can't be safely called on the returned empty descriptor.

12.4.36 paramDescriptorForKeyword(keyword as string) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a descriptor for the receiver's Apple event parameter identified by the specified keyword.
Notes: keyword: A keyword (a four-character code) that identifies the parameter descriptor to obtain.

Returns a descriptor for the specified keyword, or nil if an error occurs.

12.4.37 print

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Writes description for this event descriptor to the console.
Notes: You can see result in Console.app.

12.4.38 recordDescriptor as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and initializes a descriptor for an Apple event record whose data has yet to be set.
Notes: Returns an Apple event descriptor whose data has yet to be set, or nil if an error occurs.

An Apple event record is a descriptor whose data is a set of descriptors keyed by four-character codes. You can add information to the descriptor with methods such as setAttributeDescriptor, setDescriptor, and setParamDescriptor.

12.4.39 removeDescriptorAtIndex(index as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes the descriptor at the specified (one-based) position in the receiving descriptor list.
Notes: Index: The one-based position of the descriptor to remove.

The receiver must be a list descriptor. The indices are one-based. Currently provides no indication if an error occurs.

12.4.40 removeDescriptorWithKeyword(keyword as string)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes the receiver's descriptor identified by the specified keyword.
Notes: keyword: A keyword (a four-character code) that identifies the descriptor to remove.

The receiver must be an Apple event or Apple event record. Currently provides no indication if an error occurs.

12.4.41 removeParamDescriptorWithKeyword(keyword as string)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes the receiver's parameter descriptor identified by the specified keyword.
Notes: keyword: A keyword (a four-character code) that identifies the parameter descriptor to remove. Currently provides no indication if an error occurs.

The receiver must be an Apple event or Apple event record, both of which can contain parameters.

12.4.42 send(options as Integer, timeoutInSeconds as Double, byref error as NSErrorMBS) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sends an Apple event.
Example:

```
// pick a file
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
// make a descriptor for file
Var fd as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithFSRef(f)
```

```
// make a descriptor for target app. here by bundle id
Var bd as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithBundleIdentifier("com.apple.finder")
// make a descriptor for apple event, here OpenDocument event
Var ad as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.appleEventWithEventClass("aevt", "odoc", bd, fd.kAutoGenerateReturnID, fd.kAnyTransactionID)

// assign parameter
ad.setParamDescriptor(fd, "—-")

// now run
Var e as NSErrorMBS
Var rd as NSAppleEventDescriptorMBS = ad.send(ad.NSAppleEventSendDefaultOptions, 0.1, e)

// error sending?
if e <>nil then
MessageBox e.LocalizedDescription
end if

Break // inspect rd for success or failure of event?
```

12.4.43 setAttributeDescriptor(descriptor as NSAppleEventDescriptorMBS, keyword as string)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds a descriptor to the receiver as an attribute identified by the specified keyword.
Notes: descriptor: The attribute descriptor to add to the receiver.
keyword: A keyword (a four-character code) that identifies the attribute descriptor to add. If a descriptor with that keyword already exists in the receiver, it is replaced.

The receiver must be an Apple event. Currently provides no indication if an error occurs.

12.4.44 setDescriptor(descriptor as NSAppleEventDescriptorMBS, keyword as string)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds a descriptor, identified by a keyword, to the receiver.
Notes: descriptor: The descriptor to add to the receiver.
keyword: A keyword (a four-character code) that identifies the descriptor to add. If a descriptor with that keyword already exists in the receiver, it is replaced.

The receiver must be an Apple event or Apple event record. Currently provides no indication if an error occurs.

12.4.45 setParamDescriptor(descriptor as NSAppleEventDescriptorMBS, keyword as string)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds a descriptor to the receiver as an Apple event parameter identified by the specified keyword.
Notes: descriptor: The parameter descriptor to add to the receiver.
keyword: A keyword (a four-character code) that identifies the parameter descriptor to add. If a descriptor with that keyword already exists in the receiver, it is replaced.

The receiver must be an Apple event or Apple event record, both of which can contain parameters.

12.4.46 Properties

12.4.47 aeDesc as Ptr

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a pointer to the AEDesc structure that is encapsulated by the receiver, if it has one.
Notes: If the receiver has a valid AEDesc structure, returns a pointer to it; otherwise returns nil.
(Read only property)

12.4.48 applicationURLValue as String

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The application URL.
Example:

```
Var f as FolderItem = SpecialFolder.Applications.Child("Stickies.app")
Var u as string = f.URLPath
Var d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithApplicationURL(u)
MessageBox d.applicationURLValue
```

Notes: (Read only property)

12.4.49 booleanValue as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the contents of the receiver as a Boolean value, coercing (to typeBoolean) if necessary.
Example:

```
Var lines(-1) as string

lines.Add "set a to 1"
lines.Add "set b to 1"
lines.Add "return a = b" // return a boolean result

// compile, run and show value
Var source as string = Join(lines,EndOfLine)
Var n as new NSAppleScriptMBS(source)

Var error as Dictionary
Var d as NSAppleEventDescriptorMBS = n.execute(Error)

MessageBox str(d.booleanValue)
```

Notes: Returns the contents of the descriptor, as a Boolean value, or false if an error occurs.
(Read only property)

12.4.50 bundleIDValue as String

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the bundle identifier.
Example:

```
Var d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithBundleIdentifier("com.apple.iCal")
MessageBox d.bundleIDValue
```

Notes: (Read only property)

12.4.51 data as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's data as a memoryblock.
Notes: Returns an instance of memoryblock containing the receiver's data, or nil if an error occurs.

(Read only property)

12.4.52 dateTimeValue as DateTime

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the contents of the receiver as a date value.
Notes: (Read only property)

12.4.53 dateValue as date

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the contents of the receiver as a date value.
Example:

```
Var d as new date
Var n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithDate(d)

Var x as date = n.dateValue
MessageBox x.LongDate+" "+x.LongTime // shows today
```

Notes: (Read only property)

12.4.54 description as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The descriptor for this event.
Example:

```
Var n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString("Hello")
MessageBox n.description
```

Notes: This is a text representation for debugging.
(Read only property)

12.4.55 descriptorType as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the descriptor type of the receiver.
Notes: (Read only property)

12.4.56 doubleValue as Double

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the contents of the receiver as a double.
Example:

```
Var a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithString("5")
MessageBox str(a.doubleValue) // shows 5
```

Notes: (Read only property)

12.4.57 enumCodeValue as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the contents of the receiver as an enumeration type, coercing (to typeEnumerated) if necessary.
Notes: Returns the contents of the descriptor, as an enumeration type, or 0 if an error occurs.
(Read only property)

12.4.58 eventClass as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the event class for the receiver.
Notes: Returns the event class (a four-character code) for the receiver, or 0 if an error occurs.

The receiver must be an Apple event. An Apple event is identified by its event class and event ID, a pair of four-character codes stored as 32-bit integers. For example, most events in the Standard suite have the four-character code 'core' (defined as the constant kAECoreSuite in AE.framework, a subframework of ApplicationServices.framework). For more information on event classes and event IDs, see Building an Apple Event in Apple Events in Apple Events Programming Guide.
(Read only property)

12.4.59 eventID as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the event ID for the receiver.
Notes: The event ID (a four-character code) for the receiver, or 0 if an error occurs.

The receiver must be an Apple event. An Apple event is identified by its event class and event ID, a pair of four-character codes stored as 32-bit integers. For example, the open Apple event from the Standard suite has the four-character code 'odoc' (defined as the constant kAEOpen in AE.framework, a subframework of ApplicationServices.framework).
(Read only property)

12.4.60 fileURLValue as String

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The file URL.
Example:

```
Var f as FolderItem = SpecialFolder.Applications.Child("Stickies.app")
Var d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithFileURL(f)
MessageBox d.fileURLValue
```

Notes: (Read only property)

12.4.61 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the internal reference to the NSAppleEventDescriptor object.
Notes: (Read and Write property)

12.4.62 int16Value as Int16

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the contents of the receiver as an int16.
Example:

```
Var a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithString("5")
```

```
MessageBox str(a.int16Value) // shows 5
```

Notes: (Read only property)

12.4.63 int32Value as Int32

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the contents of the receiver as an integer, coercing (to typeSInt32) if necessary.
Example:

```
Var a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithString("5")
MessageBox str(a.int32Value) // shows 5
```

Notes: Returns the contents of the descriptor, as an integer value, or 0 if an error occurs.
(Read only property)

12.4.64 isRecordDescriptor as Boolean

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Return whether or not a descriptor is a record-like descriptor.
Notes: Record-like descriptors function as records, but may have a descriptorType other than AERecord, such as ObjectSpecifier.
(Read only property)

12.4.65 numberOfItems as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of descriptors in the receiver's descriptor list.
Example:

```
Var n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.listDescriptor
Var d as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString("Hello")
Var e as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString("World")

n.insertDescriptor(d,1)
n.insertDescriptor(e,2)

MessageBox str(n.numberOfItems)
```

```
Var x1 as NSAppleEventDescriptorMBS = n.descriptorAtIndex(1)
Var x2 as NSAppleEventDescriptorMBS = n.descriptorAtIndex(2)
MessageBox x1.stringValue+" "+x2.stringvalue
```

Notes: Returns the number of descriptors in the receiver's descriptor list (possibly 0); returns 0 if an error occurs.
(Read only property)

12.4.66 processIDValue as Integer

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the process ID.
Example:

```
// get my PID
Var p as new ProcessMBS
p.GetCurrentProcess
Var pid as Integer = p.ProcessID

// make process ID descriptor
Var n as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithProcessIdentifier(pid)

// show it
MessageBox "ProcessID: "+str(n.processIDValue) + EndOfLine + n.stringValue
```

Notes: (Read only property)

12.4.67 returnID as Int16

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's return ID (the ID for a reply Apple event).
Notes: Returns the receiver's return ID (an integer value), or 0 if an error occurs.
(Read only property)

12.4.68 singleValue as single

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the contents of the receiver as a single value.
Example:

```
Var a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithString("5")
MessageBox str(a.singleValue) // shows 5
```

Notes: (Read only property)

12.4.69 stringValue as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the contents of the receiver as a Unicode text string, coercing (to typeUnicodeText) if necessary.
Example:

```
Var a as NSAppleEventDescriptorMBS

a = NSAppleEventDescriptorMBS.descriptorWithString("Hello World")

MessageBox a.stringValue
```

Notes: Returns the contents of the descriptor, as a string, or "" if an error occurs.
(Read only property)

12.4.70 transactionID as Int32

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's transaction ID, if any.
Notes: Returns the receiver's transaction ID (an integer value), or 0 if an error occurs.

The receiver must be an Apple event. Currently provides no indication if an error occurs. For more information on transactions, see the description for appleEventWithEventClass.
(Read only property)

12.4.71 typeCodeValue as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the contents of the receiver as a type, coercing (to typeType) if necessary.
Notes: (Read only property)

12.4.72 UInt32Value as UInt32

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the contents of the receiver as an UInt32.
Example:

```
Var a as NSAppleEventDescriptorMBS
a = NSAppleEventDescriptorMBS.descriptorWithString("5")
MessageBox str(a.UInt32Value) // shows 5
```

Notes: (Read only property)

12.4.73 Constants

Constants

Constant	Value	Description
kAnyTransactionID	0	Special constant for transaction ID. no transaction is in use
kAutoGenerateReturnID	-1	Special constant for return ID. AECreateAppleEvent will generate a session-unique ID internally.

Send Options

Constant	Value	Description
NSAppleEventSendAlwaysInteract	&h30	Server should always interact with user where appropriate.
NSAppleEventSendCanInteract	&h20	Server may try to interact with user.
NSAppleEventSendCanSwitchLayer	&h40	Interaction may switch layer.
NSAppleEventSendDefaultOptions	&h23	Default options: WaitForReply with CanInteract.
NSAppleEventSendDontAnnotate	&h10000	Don't automatically add any sandbox or other annotations to the event
NSAppleEventSendDontExecute	&h2000	Don't execute this event; used for recording.
NSAppleEventSendDontRecord	&H1000	Don't record this event.
NSAppleEventSendNeverInteract	&h10	Server should not interact with user.
NSAppleEventSendNoReply	1	Sender doesn't want a reply to event.
NSAppleEventSendQueueReply	2	Sender wants a reply but won't wait.
NSAppleEventSendWaitForReply	3	Sender wants a reply and will wait.

12.5 class NSAppleEventHandlerMBS

12.5.1 class NSAppleEventHandlerMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for an apple event handler.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr3

12.5.2 Methods

12.5.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.

12.5.4 Destructor

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

12.5.5 Properties

12.5.6 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

12.5.7 Events

12.5.8 handleAppleEvent(theEvent as NSAppleEventDescriptorMBS, replyEvent as NSAppleEventDescriptorMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called when an event needs to be handled.

12.6 class NSAppleEventManagerMBS

12.6.1 class NSAppleEventManagerMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for the Apple Event Manager.
Example:

```
// handle "Get URL" Apple events, e.g. for your own URL scheme myapp://
// The URL scheme must be registered in the CFBundleURLTypes of the Info.plist.
// MyURLHandler is a subclass of NSAppleEventHandlerMBS with the handleAppleEvent event implemented.
// URLHandler is a property of the app: URLHandler As MyURLHandler
URLHandler = New MyURLHandler
Var manager As New NSAppleEventManagerMBS
manager.setEventHandler(URLHandler, "GURL", "GURL")

// in MyURLHandler:
Sub handleAppleEvent(theEvent As NSAppleEventDescriptorMBS, replyEvent As NSAppleEventDescriptorMBS) Handles handleAppleEvent
Var url As String = theEvent.paramDescriptorForKeyword("—-").stringValue // direct object
System.DebugLog "Opened with URL " + url
End Sub
```

Notes: Provides a mechanism for registering handler routines for specific types of Apple events and dispatching events to those handlers.

Cocoa provides built-in scriptability support that uses scriptability information supplied by an application to automatically convert Apple events into script command objects that perform the desired operation. However, some applications may want to perform more basic Apple event handling, in which an application registers handlers for the Apple events it can process, then calls on the Apple Event Manager to dispatch received Apple events to the appropriate handler. NSAppleEventManager supports these mechanisms by providing methods to register and remove handlers and to dispatch Apple events to the appropriate handler, if one exists. For related information, see How Cocoa Applications Handle Apple Events (on Apple Developer Website).

For information about the Apple Event Manager, see Apple Event Manager Reference and Apple Events Programming Guide (on Apple Developer Website).

- MBS Real Studio Plugins, version 12.5pr3

12.6.2 Methods

12.6.3 appleEventForSuspensionID(id as NSAppleEventManagerSuspensionIDMBS) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Given a suspensionID returned by an invocation of suspendCurrentAppleEvent, returns the descriptor for the event whose handling was suspended.

12.6.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.

12.6.5 currentAppleEvent as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the descriptor for currentAppleEvent if an Apple event is being handled on the current thread.
Notes: An Apple event is being handled on the current thread if a handler that was registered with setEventHandler is being messaged at this instant or setCurrentAppleEventAndReplyEventWithSuspensionID has just been invoked. Returns nil otherwise. The effects of mutating or retaining the returned descriptor are undefined, although it may be copied.

12.6.6 currentReplyAppleEvent as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the corresponding reply event descriptor if an Apple event is being handled on the current thread.
Notes: An Apple event is being handled on the current thread if currentAppleEvent does not return nil. Returns nil otherwise. This descriptor, including any mutations, will be returned to the sender of the current event when all handling of the event has been completed, if the sender has requested a reply. The effects of retaining the descriptor are undefined; it may be copied, but mutations of the copy are not returned to the sender of the current event.

12.6.7 NSAppleEventManagerWillProcessFirstEventNotification as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names you can use with NSNotificationObserverMBS.
Notes: Posted by NSAppleEventManager before it first dispatches an Apple event. Your application can use this notification to avoid registering any Apple event handlers until the first time at which they may be needed. The notification object is the NSAppleEventManager. This notification does not contain a userInfo dictionary.

12.6.8 removeEventHandlerForEventClass(eventClass as string, eventID as string)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: If an Apple event handler has been registered for the event specified by eventClass and eventID, removes it.

12.6.9 replyAppleEventForSuspensionID(id as NSAppleEventManagerSuspensionIDMBS) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Given a nonzero suspensionID returned by an invocation of suspendCurrentAppleEvent, returns the corresponding reply event descriptor.
Notes: This descriptor, including any mutations, will be returned to the sender of the suspended event when handling of the event is resumed, if the sender has requested a reply. The effects of retaining the descriptor are undefined; it may be copied, but mutations of the copy are returned to the sender of the suspended event. replyAppleEventForSuspensionID may be invoked in any thread, not just the one in which the corresponding invocation of suspendCurrentAppleEvent occurred.

12.6.10 resumeWithSuspensionID(id as NSAppleEventManagerSuspensionIDMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Given a suspensionID returned by an invocation of suspendCurrentAppleEvent, signal that handling of the suspended event may now continue.
Notes: This may result in the immediate sending of the reply event to the sender of the suspended event, if the sender has requested a reply. If suspensionID has been used in a previous invocation of setCurrentAppleEventAndReplyEventWithSuspensionID the effects of that invocation are completely undone. Redundant invocations of resumeWithSuspensionID are ignored. Subsequent invocations of other NSAppleEventManager methods using the same suspension ID are invalid. resumeWithSuspensionID may be invoked in any thread, not just the one in which the corresponding invocation of suspendCurrentAppleEvent occurred.

12.6.11 setCurrentAppleEventAndReplyEventWithSuspensionID(id as NSAppleEventManagerSuspensionIDMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Given a nonzero suspensionID returned by an invocation of suspendCurrentAppleEvent, sets the values that will be returned by subsequent invocations of currentAppleEvent and currentReplyAppleEvent to be the event whose handling was suspended and its corresponding reply event, respectively.
Notes: Redundant invocations of setCurrentAppleEventAndReplyEventWithSuspensionID are ignored.

12.6.12 setEventHandler(handler as NSAppleEventHandlerMBS, eventClass as string, eventID as string)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Registers the Apple event handler specified by handler for the event specified by eventClass and eventID.

12.6.13 suspendCurrentAppleEvent as NSAppleEventManagerSuspensionIDMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Suspends the handling of the current event and returns an ID that must be used to resume the handling of the event if an Apple event is being handled on the current thread.
Notes: An Apple event is being handled on the current thread if currentAppleEvent does not return nil. Returns zero otherwise. The suspended event is no longer the current event after this method returns.

12.6.14 Properties

12.6.15 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

12.7 class NSAppleEventManagerSuspensionIDMBS

12.7.1 class NSAppleEventManagerSuspensionIDMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Identifies an Apple event whose handling has been suspended.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr3

12.7.2 Methods

12.7.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

12.7.4 Properties

12.7.5 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

12.8 class NSAppleScriptMBS

12.8.1 class NSAppleScriptMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The NSAppleScriptMBS class provides the ability to load, compile, and execute scripts.
Example:

```
Var source as string = "tell Application ""iTunes"" to pause"
Var n as new NSAppleScriptMBS(source)
call n.execute
```

Notes: Your application may need the NSAppleEventsUsageDescription entry in info.plist to do any AppleScript usage:
https://developer.apple.com/documentation/bundleresources/information_property_list/nsappleeventsusagedescription

If you use hardened runtime, which you need for notarization, you may need the entitlement for Apple Events, too:
https://developer.apple.com/documentation/bundleresources/entitlements/com_apple_security_automation_apple-events

Important: You should access NSAppleScriptMBS only from the main thread.

This class provides applications with the ability to

- load a script from a URL or from a text string
- compile or execute a script or an individual Apple event
- obtain an NSAppleEventDescriptorMBS containing the reply from an executed script or event
- obtain an attributed string for a compiled script, suitable for display in a script editor
- obtain various kinds of information about any errors that may occur

Important: NSAppleScriptMBS provides the execute method so that you can send an Apple event to invoke a handler in a script. (In an AppleScript script, a handler is the equivalent of a function.) However, you cannot use this method to send Apple events to other applications.

When you create an instance of NSAppleScriptMBS object, you can use a URL or a folderitem to specify a script that can be in either text or compiled form, or you can supply the script as a string. Should an error occur when compiling or executing the script, several of the methods return a dictionary containing error information. The keys for obtaining error information, such as NSAppleScriptErrorMessage, are described

in the Constants section.

12.8.2 Methods

12.8.3 compile as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compiles the receiver, if it is not already compiled.
Example:

```
Var source as string = "tell application ""iTunes""""+EndOfLine+"pause"+EndOfLine+"end tell"
Var n as new NSAppleScriptMBS(source)

Var error as Dictionary
if n.compile then
MessageBox "OK"
else
MessageBox error.Value(n.NSAppleScriptErrorMessage)
end if
```

Notes: error: Optional, on return, if an error occurs, an error information dictionary.
Return Value

Returns true for success or if the script was already compiled, false otherwise.
See also:

- 12.8.4 compile(byref error as dictionary) as boolean 2981

12.8.4 compile(byref error as dictionary) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Compiles the receiver, if it is not already compiled.
Example:

```
Var source as string = "tell application ""iTunes""+EndOfLine+"pause"+EndOfLine+"end tell"
Var n as new NSAppleScriptMBS(source)

Var error as Dictionary
if n.compile(error) then
MessageBox "OK"
else
MessageBox error.Value(n.NSAppleScriptErrorMessage)
end if
```

Notes: error: Optional, on return, if an error occurs, an error information dictionary.
Return Value
Returns true for success or if the script was already compiled, false otherwise.
See also:

- 12.8.3 compile as boolean 2980

12.8.5 Constructor(file as folderitem, byref error as Dictionary)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a newly allocated script instance from the source identified by the passed folderitem.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("test.scpt")
Var error as Dictionary
Var n as new NSAppleScriptMBS(file, error)

if n.handle = 0 then
Var err as Integer = error.lookup(n.NSAppleScriptErrorNumber,0)
if err = -43 then
MessageBox "File not found."
else
MessageBox "Some other error. "+str(n)
end if
```

```
else
MessageBox n.source
end if
```

Notes: file: A folderitem that locates a script, in either text or compiled form.
error: On return, if an error occurs, the error information dictionary.

Handle is zero in case of error.

- 12.8.7 Constructor(sourceLines() as string) 2982
- 12.8.8 Constructor(URL as string, byref error as Dictionary) 2983

12.8.6 Constructor(source as string)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a newly allocated script instance from the passed source.
Example:

```
Var source as string = "beep"
Var n as new NSAppleScriptMBS(source)
```

Notes: Handle is zero in case of error.
See also:

- 12.8.5 Constructor(file as folderitem, byref error as Dictionary) 2981
- 12.8.7 Constructor(sourceLines() as string) 2982
- 12.8.8 Constructor(URL as string, byref error as Dictionary) 2983

12.8.7 Constructor(sourceLines() as string)

MBS MacCocoa Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a newly allocated script instance from the passed source.
Example:

```
Var lines() as string

lines.Add "property hello : ""Hallo Leute"""
lines.Add "property just : ""Just a test"""
lines.Add "display dialog hello"
```

```
lines.Add "return just"

Var a as new NSAppleScriptMBS(lines)

// compile
call a.Compile

// show names
Var names() as string = a.properties
MessageBox Join(names,EndOfLine)

// query value
MessageBox a.valueDescriptorForProperty("hello").stringValue

// change value
Var o as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString("just a test")
call a.setValueDescriptorForProperty("hello", o)

// and query again
MessageBox a.valueDescriptorForProperty("hello").stringValue
```

Notes: Handle is zero in case of error.
See also:

- 12.8.5 Constructor(file as folderitem, byref error as Dictionary) 2981
- 12.8.6 Constructor(source as string) 2982
- 12.8.8 Constructor(URL as string, byref error as Dictionary) 2983

12.8.8 Constructor(URL as string, byref error as Dictionary)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a newly allocated script instance from the source identified by the passed URL.
Notes: file: A folderitem that locates a script, in either text or compiled form.
error: On return, if an error occurs, the error information dictionary.

Handle is zero in case of error.
See also:

- 12.8.5 Constructor(file as folderitem, byref error as Dictionary) 2981
- 12.8.6 Constructor(source as string) 2982
- 12.8.7 Constructor(sourceLines() as string) 2982

12.8.9 copy as NSAppleScriptMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of this object.
Example:

```
Var source as string = "tell application ""iTunes""""+EndOfLine+"pause"+EndOfLine+"end tell"
Var n as new NSAppleScriptMBS(source)

Var copy as NSAppleScriptMBS = n.copy
call copy.execute
```

12.8.10 DeterminePermissionToAutomateTarget(target as NSAppleEventDescriptorMBS, theAEEventClass as string = "****", theAEEventID as String = "****", askUserIfNeeded as boolean) as Integer

MBS MacCocoa Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Determines whether the current application is able to send an AppleEvent with the given eventClass and eventID to the application described as target.
Example:

```
Var target as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithBundleIdentifier("com.apple.Safari")

// we ask for all apple events
Var e as integer = NSAppleScriptMBS.DeterminePermissionToAutomateTarget(target, "****", "****", true)

MessageBox str(e)
```

Notes: Mac OS 10.14 and later impose additional requirements on applications when they send AppleEvents to other applications in order to insure that users are aware of and consent to allowing such control or information exchange. Generally this involves the user being prompted in a secure fashion the first time an application attempts to send an AppleEvent to another application. If the user consents then this application can send events to the target. If the user does not consent then any future attempts to send AppleEvents will result in a failure with errAEEventNotPermitted (-1743) being returned.

Certain AppleEvents are allowed to be sent without prompting the user. Pass typeWildCard for the eventClass and eventID to determine if every event is allowed to be sent from this application to the target.

Applications can determine, without sending an AppleEvent to a target application, whether they are allowed to send AppleEvents to the target with this function. If askUserIfNeeded is true, and this application does not yet have permission to send AppleEvents to the target, then the user will be asked if permission can be granted; if askUserIfNeeded is false and permission has not been granted, then errAEEventWoul-

dRequireUserConsent (-1744) will be returned.
The target must refer to an already running application.

If the current application is permitted to send the given AppleEvent to the target, then noErr (0) will be returned. If the current application is not permitted to send the event, errAEEventNotPermitted (-1743) will be returned. If the target application is not running, then procNotFound (-600) will be returned. If askUserIfNeeded is false, and this application is not yet permitted to send AppleEvents to the target, then errAEEventWouldRequireUserConsent (-1744) will be returned.

Mac OS X threading: Thread safe since version 10.14. Do not call this function on your main thread because it may take arbitrarily long to return if the user needs to be prompted for consent.

target: The address descriptor. Before calling AEDeterminePermissionToAutomateTarget, you set the descriptor to identify the target application for the Apple event. The target address descriptor must refer to a running application. If the target application is on another machine, then Remote AppleEvents must be enabled on that machine for the user.
theAEEventClass: The event class of the Apple event to determine permission for.
theAEEventID: The event ID of the Apple event to determine permission for.
askUserIfNeeded: a Boolean; if true, and if this application does not yet have permission to send events to the target application, then prompt the user to obtain permission. If false, do not prompt the user.

Plugin returns -1 if the function is not available, e.g. older MacOS versions.

12.8.11 execute as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Executes the receiver, compiling it first if it is not already compiled.
Example:

```
Var source as string = "tell Application ""iTunes"" to pause"
Var n as new NSAppleScriptMBS(source)
call n.execute
```

Notes: error: Optional, on return, if an error occurs, an error information dictionary.
Returns the result of executing the event, or nil if an error occurs.
Any changes to property values caused by executing the script do not persist.
See also:

- 12.8.12 execute(byref error as dictionary) as NSAppleEventDescriptorMBS

12.8.12 execute(byref error as dictionary) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Executes the receiver, compiling it first if it is not already compiled.
Example:

```
Var source as string = "tello Application ""iTunes"" to play"
Var error as dictionary
Var n as new NSAppleScriptMBS(source)
Var p as NSAppleEventDescriptorMBS = n.execute(Error)
if p <>nil then
MessageBox "OK"
else
MessageBox error.Lookup(n.NSAppleScriptErrorMessage,"unknown error")
end if
```

Notes: error: Optional, on return, if an error occurs, an error information dictionary.
Returns the result of executing the event, or nil if an error occurs.
Any changes to property values caused by executing the script do not persist.
See also:

- 12.8.11 execute as NSAppleEventDescriptorMBS 2985

12.8.13 executeAppleEvent(event as NSAppleEventDescriptorMBS, byref error as dictionary) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Executes an Apple event in the context of the receiver, as a means of allowing the application to invoke a handler in the script.
Notes: event: The Apple event to execute.
error: On return, if an error occurs, an error information dictionary.

Returns the result of executing the event, or nil if an error occurs.

Compiles the receiver before executing it if it is not already compiled.

Important: You cannot use this method to send Apple events to other applications.

12.8.14 executeSubroutine(Name as String, parameters() as NSAppleEventDescriptorMBS, byref error as dictionary) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Calls a subroutine in a script.
Example:

```
// our script

Var CodeLines() as string

CodeLines.Add "on Add(Name1, Name2)"
CodeLines.Add "return Name1 & "" "" & Name2"
CodeLines.Add "end Add"

// now compile it
Var a as new NSAppleScriptMBS(CodeLines)
Var error as dictionary
Var CompileOkay As Boolean = a.Compile(error)

if CompileOkay then

// script name and parameters
Var ScriptFuncName As String = "Add"

Var ScriptParams() As NSAppleEventDescriptorMBS
ScriptParams.Add NSAppleEventDescriptorMBS.descriptorWithString("Hello")
ScriptParams.Add NSAppleEventDescriptorMBS.descriptorWithString("World")

// bow run it
Var p as NSAppleEventDescriptorMBS

p = a.executeSubroutine(ScriptFuncName, ScriptParams, Error)
if error = nil then
// show result
Var ScriptResult As String = p.stringValue

MessageBox "ScriptResult:" + EndOfLine + EndOfLine + ScriptResult
else
MessageBox "Error running script." + _
EndOfLine + EndOfLine + _
error.Lookup(a.NSAppleScriptErrorMessage, "Unknown error") + _
EndOfLine + EndOfLine + _
error.Lookup(a.NSAppleScriptErrorBriefMessage, "Unknown error") + _
EndOfLine + EndOfLine + _
error.Lookup(a.NSAppleScriptErrorNumber, "Unknown error")
```

```
end if
else
// Compile Error
MessageBox "Error loading script." + _
EndOfLine + EndOfLine + _
error.Lookup(a.NSAppleScriptErrorMessage, "Unknown error") + _
EndOfLine + EndOfLine + _
error.Lookup(a.NSAppleScriptErrorBriefMessage, "Unknown error") + _
EndOfLine + EndOfLine + _
error.Lookup(a.NSAppleScriptErrorNumber, "Unknown error")
end if
```

Notes: Similar to executeAppleEvent, but creates the apple event for you.

Name: The name of the subroutine to execute.
parameters: The parameters for the subroutine.
error: On return, if an error occurs, an error information dictionary.

Returns the result of executing the event, or nil if an error occurs.
Compiles the receiver before executing it if it is not already compiled.
Important: You cannot use this method to send Apple events to other applications.

12.8.15 NSAppleScriptErrorAppName as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys in the error dictionary.
Notes: Value for this key is a string that specifies the name of the application that generated the error.

12.8.16 NSAppleScriptErrorBriefMessage as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys in the error dictionary.
Example:

```
Var source as string = "tell application ""iTunes""""+EndOfLine+"pause"+EndOfLine+"end if"
Var n as new NSAppleScriptMBS(source)

Var error as Dictionary
if not n.compile(error) then
// shows error about missing tell where it found an if.
MessageBox error.Value(n.NSAppleScriptErrorBriefMessage)
```

```
end if
```

Notes: Value for this key is a string that provides a brief description of the error.

12.8.17 NSAppleScriptErrorMessage as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys in the error dictionary.
Example:

```
Var source as string = "tell application ""iTunes""""+EndOfLine+"pause"+EndOfLine+"end if"
Var n as new NSAppleScriptMBS(source)

Var error as Dictionary
if n.compile(error) then
MessageBox "OK"
else
// shows error about missing tell where it found an if.
MessageBox error.Value(n.NSAppleScriptErrorMessage)
end if
```

Notes: Value for this key is a NSRangeMBS object.

12.8.18 NSAppleScriptErrorNumber as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys in the error dictionary.
Example:

```
Var source as string = "tell application ""iTunes""""+EndOfLine+"pause"+EndOfLine+"end if"
Var n as new NSAppleScriptMBS(source)

Var error as Dictionary
if not n.compile(error) then
// error about missing tell where it found an if.
MessageBox error.Value(n.NSAppleScriptErrorNumber) // shows -2741
end if
```

Notes: Value for this key is a number that specifies the error number.

12.8.19 NSAppleScriptErrorRange as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys in the error dictionary.
Example:

```
Var source as string = "tell application ""iTunes""""+EndOfLine+"pause"+EndOfLine+"end if"
Var n as new NSAppleScriptMBS(source)

Var error as Dictionary
if not n.compile(error) then
// error about missing tell where it found an if.
Var r as NSRangeMBS = error.Value(n.NSAppleScriptErrorRange)
MessageBox r.String // { 36,2 } , the position of the if
end if
```

Notes: Value for this key is a string that supplies a detailed description of the error condition.

12.8.20 properties as string()

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the names of all properties in the script.
Example:

```
Var s as String
Var a as NSAppleScriptMBS
Var i,c,cc as Integer
Var z,t as String

s=s+"property hello : ""Hallo Leute""""+chr(13)
s=s+"property just : ""Just a test""""+chr(13)
s=s+"display dialog hello"+chr(13)
s=s+"return just"+chr(13)

MessageBox "The script:"+chr(13)+s
a=new NSAppleScriptMBS(s)

// compile
call a.Compile

// show names
Var names() as string = a.properties
MessageBox Join(names,EndOfLine)

// query value
```

```
MessageBox a.valueDescriptorForProperty("hello").stringValue

// change value
Var o as NSAppleEventDescriptorMBS = NSAppleEventDescriptorMBS.descriptorWithString("just a test")
call a.setValueDescriptorForProperty("hello", o)

// and query again
MessageBox a.valueDescriptorForProperty("hello").stringValue
```

12.8.21 setValueDescriptorForProperty(propertyName as string, value as NSAppleEventDescriptorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets a property value.

12.8.22 valueDescriptorForProperty(propertyName as string) as NSAppleEventDescriptorMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries a property value.

12.8.23 Properties

12.8.24 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference to the NSAppleScript object.
Notes: (Read and Write property)

12.8.25 isCompiled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value that indicates whether the receiver's script has been compiled.
Example:

```
Var source as string = "tell Application ""iTunes"" to play"
Var n as new NSAppleScriptMBS(source)
```

```
MessageBox "isCompiled: "+str(n.isCompiled)

call n.compile

MessageBox "isCompiled: "+str(n.isCompiled)
```

Notes: (Read only property)

12.8.26 richTextSource as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the syntax-highlighted source code of the receiver if the receiver has been compiled and its source code is available.
Example:

```
// init with some source
Var source as string = "tell Application ""iTunes"" to play"
Var n as new NSAppleScriptMBS(source)

// compile
call n.compile

// format text
Var richtext as NSAttributedStringMBS = n.richTextSource

if richtext = nil then
MessageBox "Failed to format source."
else
// write to RTF file
Var file as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var b as BinaryStream = file.CreateBinaryFile("")

b.Write richtext.RTF
b.close

file.Launch
end if
```

Notes: Returns nil otherwise. It is possible for an instance of NSAppleScript that has been instantiated with Construtor to be a script for which the source code is not available, but is nonetheless executable.
(Read only property)

12.8.27 source as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the script source for the receiver.
Notes: Returns the script source code of the receiver if it is available, "" otherwise.

It is possible for an NSAppleScript that has been instantiated with Constructor to be a script for which the source code is not available but is nonetheless executable.
(Read only property)

12.9 class OSALanguageInstanceMBS

12.9.1 class OSALanguageInstanceMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The class for a language instance.

12.9.2 Methods

12.9.3 Constructor(language as OSALanguageMBS)

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new language instance with given language.

12.9.4 languageInstanceWithLanguage(language as OSALanguageMBS) as OSALanguageInstanceMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new language instance with given language.

12.9.5 richTextFromDescriptor(descriptor as NSAppleEventDescriptorMBS) as NSAttributedStringMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Get source text for a descriptor using the language instance for context.

12.9.6 Properties

12.9.7 componentInstance as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The component instance handle.
Notes: If this is the shared instance for the language, this is the same as the language's component instance. (Read only property)

12.9.8 defaultTarget as NSAppleEventDescriptorMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The default target application for Apple event sending.
Notes: It also establishes the default target from which terminologies come. It is effectively like having an AppleScript "tell" statement around the entire program. When nil, the default target is the current application.
(Read and Write property)

12.9.9 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The internal object handle.
Notes: (Read and Write property)

12.9.10 language as OSALanguageMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The language for this instance.
Notes: (Read only property)

12.10 class OSALanguageMBS

12.10.1 class OSALanguageMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The class for a language.
Example:

```
// list the installed scripting languages, e.g. AppleScript and JavaScript
Var lines() As String
For Each lang As OSALanguageMBS In OSALanguageMBS.availableLanguages
lines.Add lang.Name + " " + lang.version + " (" + lang.Manufacturer + ")"
Next

MessageBox "Default: " + OSALanguageMBS.defaultLanguage.Name + EndOfLine + EndOfLine + String.FromArray(lines, EndOfLine)

// run a JavaScript for Automation script
Var js As OSALanguageMBS = OSALanguageMBS.languageForName("JavaScript")
If js <>Nil Then
Var script As New OSAScriptMBS("Math.sqrt(2)", js)
Var error As Dictionary
Var result As NSAppleEventDescriptorMBS = script.execute(error)
If result <>Nil Then MessageBox "sqrt(2) = " + result.stringValue
End If
```

12.10.2 Methods

12.10.3 availableLanguages as OSALanguageMBS()

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Queries available languages.
Notes: For 32-bit apps this is just AppleScript, but 64-bit apps see more entries.

12.10.4 Constructor(ComponentHandle as Integer)

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new object with given component handle.

12.10.5 defaultLanguage as OSALanguageMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The default language.
Example:

```
Var l as OSALanguageMBS = OSALanguageMBS.defaultLanguage
MessageBox l.Name+EndOfLine+l.Manufacturer+EndOfLine+l.Info
```

12.10.6 languageForName(name as String) as OSALanguageMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Finds language for given name.
Example:

```
Var l as OSALanguageMBS = OSALanguageMBS.languageForName("AppleScript")
MessageBox l.Name
```

12.10.7 languageForScriptDataDescriptor(Descriptor as NSAppleEventDescriptorMBS) as OSALanguageMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Queries language for an Apple Event descriptor.

12.10.8 setDefaultLanguage(Language as OSALanguageMBS)

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: sets the default language.

12.10.9 Properties

12.10.10 componentInstance as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Queries component instance handle.
Notes: (Read only property)

12.10.11 Features as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The language features.
Notes: (Read only property)

12.10.12 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

12.10.13 Info as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Queries info string.
Example:

```
Var l as OSALanguageMBS = OSALanguageMBS.defaultLanguage
MessageBox l.Name+EndOfLine+l.Manufacturer+EndOfLine+l.Info
```

Notes: (Read only property)

12.10.14 isThreadSafe as Boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Whether this language is thread safe.
Example:

```
Var l as OSALanguageMBS = OSALanguageMBS.defaultLanguage
MessageBox str(l.isThreadSafe)
```

Notes: (Read only property)

12.10.15 Manufacturer as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The manufacturer of the language.
Example:

```
Var l as OSALanguageMBS = OSALanguageMBS.defaultLanguage
MessageBox l.Name+EndOfLine+l.Manufacturer+EndOfLine+l.Info
```

Notes: (Read only property)

12.10.16 Name as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The name of the language.
Example:

```
Var l as OSALanguageMBS = OSALanguageMBS.defaultLanguage
MessageBox l.Name+EndOfLine+l.Manufacturer+EndOfLine+l.Info
```

Notes: (Read only property)

12.10.17 sharedLanguageInstance as OSALanguageInstanceMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The shared language instance if available.
Notes: (Read only property)

12.10.18 SubType as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The subtype.
Example:

```
Var l as OSALanguageMBS = OSALanguageMBS.defaultLanguage
MessageBox l.type+EndOfLine+l.SubType
```

Notes: (Read only property)

12.10.19 Type as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The type code.
Example:

```
Var l as OSALanguageMBS = OSALanguageMBS.defaultLanguage
MessageBox l.type+EndOfLine+l.SubType
```

Notes: (Read only property)

12.10.20 version as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The version of this language.
Example:

```
Var l as OSALanguageMBS = OSALanguageMBS.languageForName("AppleScript")
MessageBox l.version
```

Notes: (Read only property)

12.10.21 Constants

Features

Constant	Value	Description
OSASupportsAECoercion	8	Supports Apple Event coercion
OSASupportsAESending	16	Supports Apple Event sending
OSASupportsCompiling	2	Supports Compiling
OSASupportsConvenience	64	Supports Convenience
OSASupportsDialects	128	Supports Dialects
OSASupportsEventHandling	256	Supports Event handling
OSASupportsGetSource	4	Supports getting source
OSASupportsRecording	32	Supports Recording

12.11 class OSAScriptControllerMBS

12.11.1 class OSAScriptControllerMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The script controller.
Example:

```
// connect a script view and a result text view to compile and run AppleScript
// ScriptView is a property of the window: ScriptView As OSAScriptViewMBS
// ResultView is a property of the window: ResultView As NSTextViewMBS
// Controller is a property of the window: Controller As OSAScriptControllerMBS
ScriptView = New OSAScriptViewMBS(20, 120, 500, 250)
ScriptView.source = "return (current date) as string"
Self.NSWindowMBS.contentView.addSubview ScriptView

ResultView = New NSTextViewMBS(20, 20, 500, 80)
Self.NSWindowMBS.contentView.addSubview ResultView

Controller = New OSAScriptControllerMBS
Controller.scriptView = ScriptView
Controller.resultView = ResultView
Controller.language = OSALanguageMBS.languageForName("AppleScript")
Controller.runScript // compiles and shows the result in ResultView
```

12.11.2 Methods

12.11.3 compileScript

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Compiles the script.

12.11.4 Constructor

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

12.11.5 recordScript

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Records a script.

12.11.6 runScript

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Runs current script.

12.11.7 stopScript

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Stops the current script.

12.11.8 Properties

12.11.9 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

12.11.10 isCompiling as Boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Whether the view is currently compiling a script.
Notes: (Read only property)

12.11.11 language as OSALanguageMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The language to use.
Notes: (Read and Write property)

12.11.12 resultView as NSTextViewMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The view to show result of script run.
Notes: (Read and Write property)

12.11.13 script as OSAScriptMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The current script.
Notes: (Read and Write property)

12.11.14 scriptState as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The current script state.
Notes: Can be OSAScriptStopped, OSAScriptRunning or OSAScriptRecording.
(Read only property)

12.11.15 scriptView as OSAScriptViewMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The script view for this controller.
Notes: (Read and Write property)

12.11.16 Constants

States

Constant	Value	Description
OSAScriptRecording	2	Script is recording.
OSAScriptRunning	1	Script is running.
OSAScriptStopped	0	Script is stopped.

12.12 control OSAScriptControlMBS

12.12.1 control OSAScriptControlMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a OSAScriptView.
Notes: This control embeds a special OSAScriptView subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

- New desktop controls

12.12.2 Properties

12.12.3 AcceptTabs as Boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes: If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

12.12.4 Scrollview as Variant

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The scrollview for this textview.
Notes: (Read only property)

12.12.5 View as OSAScriptViewMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

12.12.6 Events

12.12.7 BoundsChanged

MBS MacExtras Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

12.12.8 Close

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

12.12.9 Closing

Plugin Version: 15.3, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

12.12.10 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacExtras Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

12.12.11 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacExtras Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

12.12.12 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacExtras Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

12.12.13 EnableMenuItems

MBS MacExtras Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

12.12.14 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

12.12.15 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

12.12.16 FrameChanged

MBS MacExtras Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

12.12.17 GotFocus

MBS MacExtras Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

12.12.18 LostFocus

MBS MacExtras Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

12.12.19 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

12.12.20 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacExtras Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

12.12.21 MouseDrag(x as Integer, y as Integer)

MBS MacExtras Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

12.12.22 MouseUp(x as Integer, y as Integer)

MBS MacExtras Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

12.12.23 Open

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

12.12.24 Opening

Plugin Version: 15.3, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

12.12.25 ScaleFactorChanged(NewFactor as Double)

MBS MacExtras Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

12.12.26 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Sent when a text view needs to determine if text in a specified range should be changed.
Notes: affectedCharRange: The range of characters to be replaced.
replacementString: The characters that will replace the characters in affectedCharRange; nil if only text attributes are being changed.

Return true to allow the replacement, or false to reject the change.

12.12.27 textDidBeginEditing

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Informs you that the text object has begun editing (that the user has begun changing it).

12.12.28 textDidChange

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Informs you that the text object has changed its characters or formatting attributes.

12.12.29 textDidEndEditing

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Informs you that the text object has finished editing (that it has resigned first responder status).

12.12.30 textShouldBeginEditing as boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Invoked when a text object begins to change its text, this method requests permission to begin editing.
Notes: If the delegate returns false, the text object proceeds to make changes. If the delegate returns true, the text object abandons the editing operation. This method is also invoked when the user drags and drops a file onto the text object.

12.12.31 textShouldEndEditing as boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Invoked from a text object's implementation of resignFirstResponder, this method requests permission to end editing.
Notes: If the delegate returns false, the text object proceeds to finish editing and resign first responder status. If the delegate returns true, the text object selects all of its text and remains the first responder.

12.12.32 textViewDidChangeSelection

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Sent when the selection changes in the text view.

12.12.33 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacExtras Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

12.13 class OSAScriptMBS

12.13.1 class OSAScriptMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The class for Open Scripting Architecture.
Example:

```
// compile and run an AppleScript and show the result
Var script As New OSAScriptMBS("tell application ""Finder"" to get name of startup disk")

Var error As Dictionary
If Not script.compile(error) Then
If error <>Nil Then MessageBox "Compile error: " + error.Lookup(OSAScriptMBS.OSAScriptErrorMessageKey, "").StringValue
Return
End If

Var result As NSAppleEventDescriptorMBS = script.execute(error)
If result = Nil Then
If error <>Nil Then MessageBox "Error: " + error.Lookup(OSAScriptMBS.OSAScriptErrorMessageKey, "").StringValue
Else
MessageBox "Startup disk: " + result.stringValue
End If
```

12.13.2 Methods

12.13.3 compile(byref error as dictionary) as boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Compiles the script.

12.13.4 compiledDataForType(type as string, options as Integer, byref error as dictionary) as MemoryBlock

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Compile data for a given type and options.

12.13.5 Constructor(Data as MemoryBlock, byref error as dictionary)

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates new script from compiled data.

- 12.13.16 Constructor(URL as String, languageInstance as OSALanguageInstanceMBS, storageOptions as Integer, byref error as NSErrorMBS) 3019

12.13.11 Constructor(Source as String)

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates new script from source code.
Example:

```
Var s as new OSAScriptMBS("display dialog ""Hello""")
MessageBox s.source
```

- 12.13.15 Constructor(URL as String, language as OSALanguageMBS, byref error as dictionary) 3019

12.13.17 copy as OSAScriptMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates a copy of the script.

12.13.18 execute(byref error as dictionary) as NSAppleEventDescriptorMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Executes the script.
Example:

```
Var s as new OSAScriptMBS("display dialog ""Hello""")
Var d as Dictionary
call s.execute(d)
```

12.13.19 executeAndReturnDisplayValue(byref displayValue as NSAttributedStringMBS, byref error as dictionary) as NSAppleEventDescriptorMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Executes the script and returns the display value of result.

12.13.20 executeAppleEvent(event as NSAppleEventDescriptorMBS, byref error as dictionary) as NSAppleEventDescriptorMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Executes an apple event in the script.

12.13.21 executeHandlerWithName(Name as String, arguments() as String, byref error as dictionary) as NSAppleEventDescriptorMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Executes an event handler in the script.

12.13.22 OSAScriptErrorAppAddressKey as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Error Dictionary key for error app address.

12.13.23 OSAScriptErrorAppNameKey as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the error dictionary.
Notes: String containing the target application name

12.13.24 OSAScriptErrorBriefMessageKey as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the error dictionary.
Example:

```
Var s as new OSAScriptMBS("display dialXXX ""Hello""")
Var d as Dictionary
call s.compile(d)

MessageBox d.Value(OSAScriptMBS.OSAScriptErrorBriefMessageKey)
```

Notes: String containing just the failure; may or may not be the same value as NSLocalizedFailureReasonErrorKey

12.13.25 OSAScriptErrorExpectedTypeKey as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the error dictionary.
Notes: Should be NSAppleEventDescriptorMBS object in dictionary.

12.13.26 OSAScriptErrorMessageKey as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the error dictionary.
Example:

```
Var s as new OSAScriptMBS("display dialXXX ""Hello""")
Var d as Dictionary
call s.compile(d)

MessageBox d.Value(OSAScriptMBS.OSAScriptErrorMessageKey)
```

Notes: String containing entire error message; may or may not be the same value as NSLocalizedDescriptionKey.

12.13.27 OSAScriptErrorNumberKey as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the error dictionary.
Example:

```
Var s as new OSAScriptMBS("display dialXXX ""Hello""")
Var d as Dictionary
call s.compile(d)

// shows -2740
MessageBox d.Value(OSAScriptMBS.OSAScriptErrorNumberKey)
```

Notes: Number containing an OSAError; may or may not be the same value as the NSError code

12.13.28 OSAScriptErrorOffendingObjectKey as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the error dictionary.
Notes: Should be NSAppleEventDescriptorMBS object in dictionary.

12.13.29 OSAScriptErrorPartialResultKey as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the error dictionary.
Notes: Should be NSAppleEventDescriptorMBS object in dictionary.

12.13.30 OSAScriptErrorRangeKey as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the error dictionary.
Example:

```
Var s as new OSAScriptMBS("display dialXXX ""Hello""")
Var d as Dictionary
call s.compile(d)

// shows { 0, 15 }
MessageBox d.Value(OSAScriptMBS.OSAScriptErrorRangeKey)
```

Notes: Value containing an range indicating the range of source characters where the error occurred

12.13.31 OSAStorageApplicationBundleType as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: One of the storage types.
Notes: Application Bundle

12.13.32 OSAStorageApplicationType as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: One of the storage types.
Notes: Application file

12.13.33 OSAStorageScriptBundleType as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: One of the storage types.
Notes: Script bundle file

12.13.34 OSAStorageScriptType as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: One of the storage types.
Notes: Script file

12.13.35 OSAStorageTextType as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: One of the storage types.
Notes: Text file

12.13.36 richTextFromDescriptor(descriptor as NSAppleEventDescriptorMBS) as NSAttributedStringMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Queries rich text for an Appleevent descriptor.

12.13.37 scriptDataDescriptorWithContentsOfFile(file as FolderItem) as NSAppleEventDescriptorMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Reads script from file into AppleEventDescriptor.

12.13.38 scriptDataDescriptorWithContentsOfURL(URL as String) as NSAppleEventDescriptorMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Reads script from file into AppleEventDescriptor.

12.13.39 writeToFile(File as FolderItem, type as String, byref error as dictionary) as boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Writes script to a file.
See also:

- 12.13.40 writeToFile(File as FolderItem, type as String, storageOptions as Integer, byref error as dictionary) as boolean 3025

12.13.40 writeToFile(File as FolderItem, type as String, storageOptions as Integer, byref error as dictionary) as boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Writes script to a file.
See also:

- 12.13.39 writeToFile(File as FolderItem, type as String, byref error as dictionary) as boolean 3025

12.13.41 writeToURL(URL as String, type as String, byref error as dictionary) as boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Writes script to a file.
See also:

- 12.13.42 writeToURL(URL as String, type as String, storageOptions as Integer, byref error as dictionary) as boolean 3025

12.13.42 writeToURL(URL as String, type as String, storageOptions as Integer, byref error as dictionary) as boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Writes script to a file.
See also:

- 12.13.41 writeToURL(URL as String, type as String, byref error as dictionary) as boolean 3025

12.13.43 Properties

12.13.44 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

12.13.45 isCompiled as Boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Queries if script is compiled.
Notes: (Read only property)

12.13.46 language as OSALanguageMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The language of script.
Example:

```
Var s as new OSAScriptMBS("display dialog ""Hello""")
MessageBox s.language.Name
```

Notes: (Read and Write property)

12.13.47 languageInstance as OSALanguageInstanceMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The language instance of script.
Notes: (Read and Write property)

12.13.48 richTextSource as NSAttributedStringMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Queries rich text of script.
Notes: (Read only property)

12.13.49 Source as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The source code of script.
Example:

```
Var s as new OSAScriptMBS("display dialog ""Hello""")
MessageBox s.Source
```

Notes: (Read only property)

12.13.50 URL as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The URL if script has a solution.
Notes: (Read only property)

12.13.51 Constants

Storage Options

Constant	Value	Description
OSACompileIntoContext	2	Compile in context. May be used when getting compiled data.
OSADontSetScriptLocation	&h01000000	Set script location. May be used when initing with a URL or fromURL.
OSANull	0	No option set.
OSAPreventGetSource	1	Prevent user from getting source. May be used when initing with a compiled script, writing or getting compile data.
OSAShowStartupScreen	&h20000000	Show startup screen. May be used when writing
OSAStayOpenApplet	&h10000000	Applet should stay open. May be used when writing

12.14 class OSAScriptViewMBS

12.14.1 class OSAScriptViewMBS

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The class for a script view.
Example:

```
// show an AppleScript editor view with syntax coloring in the window
// ScriptView is a property of the window: ScriptView As OSAScriptViewMBS
ScriptView = New OSAScriptViewMBS(20, 20, 500, 300)
ScriptView.source = "tell application ""Finder""" + EndOfLine + " get name of startup disk" + EndOfLine
+ "end tell"
ScriptView.usesScriptAssistant = True // code completion
ScriptView.usesTabs = True
Self.NSWindowMBS.contentView.addSubview ScriptView
```

Notes: Subclass of the NSTextViewMBS class.

12.14.2 Methods

12.14.3 Constructor

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new text field with size 100/100 and position 0/0
Example:

```
Var t as new OSAScriptViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 12.14.4 Constructor(Handle as Integer) 3029
- 12.14.5 Constructor(left as Double, top as Double, width as Double, height as Double) 3030

12.14.4 Constructor(Handle as Integer)

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given OSAScriptView handle.
Example:

```
Var t as new OSAScriptViewMBS(0, 0, 100, 100)
Var v as new OSAScriptViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a OSAScriptView and the plugin retains this handle.
See also:

- 12.14.3 Constructor 3029
- 12.14.5 Constructor(left as Double, top as Double, width as Double, height as Double) 3030

12.14.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new script view with the given size and position.
Example:

```
Var x as new OSAScriptViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 12.14.3 Constructor 3029
- 12.14.4 Constructor(Handle as Integer) 3029

12.14.6 Properties

12.14.7 indentsWrappedLines as Boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Whether to indent wrapped lines.
Notes: (Read and Write property)

12.14.8 indentWidth as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The indention width.
Notes: (Read and Write property)

12.14.9 source as String

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The source text of current script.
Notes: (Read and Write property)

12.14.10 tabWidth as Integer

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: The tab width.
Notes: (Read and Write property)

12.14.11 usesScriptAssistant as Boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Whether to use script assistant.
Notes: (Read and Write property)

12.14.12 usesTabs as Boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Whether to use tab character.
Notes: (Read and Write property)

12.14.13 wrapsLines as Boolean

MBS MacExtras Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop only.

Function: Whether to wrap lines.
Notes: (Read and Write property)

Chapter 13

Archive

13.1 class ArchiveEntryMBS

13.1.1 class ArchiveEntryMBS

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an archive entry.
Example:

```
Var data as string = "Hello World test file. Hello World again."

Var e as new ArchiveEntryMBS
e.PathName = "Hello World.txt"
e.Size = lenb(data)
e.Permissions = &o0644
e.FileType = e.kFileTypeRegular
```

13.1.2 Methods

13.1.3 Clear

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears entry for later use.

13.1.4 ClearACL

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears access control lists.

13.1.5 ClearXAttr

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears extended attributes.

13.1.6 Clone as ArchiveEntryMBS

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the entry.
Notes: Does a deep copy; all of the strings are copied too.

13.1.7 Constructor

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new archive entry.
See also:

- 13.1.8 Constructor(Archive as ArchiverMBS) 3035

13.1.8 Constructor(Archive as ArchiverMBS)

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new archive entry for a given archive.
Notes: This will pick the character set from the archive.
See also:

- 13.1.7 Constructor 3034

13.1.9 Destructor

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

13.1.10 GetFFlags(byref FlagsSet as UInt64, byref FlagsClear as UInt64)

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries file flags.

13.1.11 SetFFlags(FlagsSet as UInt64, FlagsClear as UInt64)

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the file flags.

13.1.12 SetLink(link as string)

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the link.
Notes: Update only. For a symlink, update the destination. Otherwise, make the entry a hardlink and alter the destination for that.

13.1.13 UnsetATime

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unsets the last access timestamp.

13.1.14 UnsetBTime

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unsets the birth timestamp.

13.1.15 UnsetCTime

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unsets the last modification timestamp.

13.1.16 UnsetGName

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unsets the group name.

13.1.17 UnsetHardLink

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unset the hard link field.

13.1.18 UnsetMTime

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unsets the modification timestamp.

13.1.19 UnsetPathName

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unsets the pathname field.

13.1.20 UnsetSize

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unsets the size.

13.1.21 UnsetSymLink

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unsets the symbolic link field.

13.1.22 UnsetUName

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unsets the user name field.

13.1.23 Properties

13.1.24 ADateTime as DateTime

MBS Compression Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last access timestamp.
Notes: For Xojo 2019r2 or newer.
(Read and Write property)

13.1.25 ATime as Date

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The last access timestamp.
Notes: (Read and Write property)

13.1.26 ATimeSet as Boolean

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether last access timestamp is set.
Notes: (Read only property)

13.1.27 BDateTime as DateTime

MBS Compression Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The birth timestamp.
Notes: This is the creation time.
For Xojo 2019r2 or newer.
(Read and Write property)

13.1.28 BTime as Date

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The birth timestamp.
Notes: This is the creation time.
(Read and Write property)

13.1.29 BTimeSet as Boolean

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the birth timestamp field is set.
Notes: (Read only property)

13.1.30 CDateTime as DateTime

MBS Compression Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The attribute modification timestamp.
Notes: Last time an inode property was changed.
For Xojo 2019r2 or newer.
(Read and Write property)

13.1.31 CTime as Date

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The attribute modification timestamp.
Notes: Last time an inode property was changed.
(Read and Write property)

13.1.32 CTimeSet as Boolean

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether last modification timestamp is set.
Notes: (Read only property)

13.1.33 Dev as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The device number.
Notes: (Read and Write property)

13.1.34 DevMajor as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minor part of the dev field.
Notes: (Read and Write property)

13.1.35 DevMinor as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The major part of the dev field.
Notes: (Read and Write property)

13.1.36 DevSet as Boolean

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether dev is set.
Notes: (Read only property)

13.1.37 FFlags as String

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file flags.
Notes: (Read and Write property)

13.1.38 FileName as String

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file name.
Notes: Taken from PathName property at runtime.
(Read only property)

13.1.39 FileType as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries file type.
Example:

```
Var e as new ArchiveEntryMBS
e.FileType = e.kFileTypeRegular
```

Notes: Check the kFileType* constants.
(Read and Write property)

13.1.40 FileTypeSet as Boolean

MBS Compression Plugin, Plugin Version: 24.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the FielType property is set.
Notes: (Read only property)

13.1.41 GID as Int64

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The group ID.
Notes: (Read and Write property)

13.1.42 GIDSet as Boolean

MBS Compression Plugin, Plugin Version: 24.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the GID property is set.
Notes: (Read only property)

13.1.43 GName as String

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The group name.
Notes: (Read and Write property)

13.1.44 Handle as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

13.1.45 HardLink as String

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Destination of the hardlink.
Notes: (Read and Write property)

13.1.46 HardLinkSet as Boolean

MBS Compression Plugin, Plugin Version: 24.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the hard link property is set.
Notes: (Read only property)

13.1.47 INo as Int64

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The inode number.
Notes: (Read and Write property)

13.1.48 INo64 as Int64

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The inode number.
Notes: (Read and Write property)

13.1.49 INoSet as Boolean

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether inode number is set.
Notes: (Read only property)

13.1.50 IsDataEncrypted as Boolean

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether data is encrypted.
Notes: (Read and Write property)

13.1.51 IsMetaDataEncrypted as Boolean

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether metadata is encrypted.
Notes: (Read and Write property)

13.1.52 MacMetadata as MemoryBlock

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Mac Metadata.
Notes: Storage for Mac OS-specific AppleDouble metadata information. Apple-format tar files store a separate binary blob containing encoded metadata with ACL, extended attributes, etc. This provides a place to store that blob.
(Read and Write property)

13.1.53 MDateTime as DateTime

MBS Compression Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The modification timestamp.
Notes: For Xojo 2019r2 or newer.
(Read and Write property)

13.1.54 Mode as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The permissions mode.
Notes: (Read and Write property)

13.1.55 ModeString as String

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The permissions mode as string.
Notes: (Read only property)

13.1.56 MTime as Date

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The modification timestamp.
Notes: (Read and Write property)

13.1.57 MTimeSet as Boolean

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the modification time stamp field is set.
Notes: (Read only property)

13.1.58 NLink as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of hardlinks.
Notes: (Read and Write property)

13.1.59 PathName as String

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Path in the archive.
Example:

```
Var e as new ArchiveEntryMBS
e.PathName = "Hello World.txt"
```

Notes: Text encoding works partly.
Best to use only ASCII file paths for compatibility.
If the archive is opened/created with UTF-8 support, you may use other characters.
On Windows text encoding conversion may require use of LoadIconvLibrary method to load iconv.dll.

Value is empty, if encoding conversion fails.
(Read and Write property)

13.1.60 Permissions as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The permissions.
Example:

```
Var e as new ArchiveEntryMBS
e.Permissions = &o0644
```

Notes: (Read and Write property)

13.1.61 PermissionsSet as Boolean

MBS Compression Plugin, Plugin Version: 24.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the permission property is set.
Notes: (Read only property)

13.1.62 RDev as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The device ID (if special file).
Notes: (Read and Write property)

13.1.63 RDevMajor as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The major part of RDev field.
Notes: (Read and Write property)

13.1.64 RDevMinor as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minor part of RDev field.
Notes: (Read and Write property)

13.1.65 RDevSet as Boolean

MBS Compression Plugin, Plugin Version: 24.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the RDev property is set.
Notes: (Read only property)

13.1.66 Size as UInt64

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of the file.
Notes: (Read and Write property)

13.1.67 SizeSet as Boolean

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether size field is set.
Notes: (Read only property)

13.1.68 SourcePath as String

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Path on the disk for use.
Notes: (Read and Write property)

13.1.69 Stat as MemoryBlock

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get and set stat structure.
Notes: Routines to bulk copy fields to/from a platform-native "struct stat."
Libarchive used to just store a struct stat inside of each archive entry object, but this created issues when trying to manipulate archives on systems different than the ones they were created on.
(Read and Write property)

13.1.70 SymLink as String

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Destination of the symbolic link..
Notes: (Read and Write property)

13.1.71 SymlinkType as Integer

MBS Compression Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of symlink for this entry.
Notes: (Read and Write property)

13.1.72 UID as UInt64

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The user ID.
Notes: (Read and Write property)

13.1.73 UIDSet as Boolean

MBS Compression Plugin, Plugin Version: 24.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the UID property is set.
Notes: (Read only property)

13.1.74 UName as String

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The user name.
Notes: (Read and Write property)

13.1.75 XAttrCount as Integer

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of extended attributes for this entry.
Notes: (Read only property)

13.1.76 Constants

File Types

Constant	Value	Description
kFileTypeBlock	&o0060000	Block device.
kFileTypeCharacter	&o0020000	Character device.
kFileTypeDirectory	&o0040000	Directory
kFileTypeIFO	&o0010000	Named pipe (fifo)
kFileTypeLink	&o0120000	Symbolic link
kFileTypeMT	&o0170000	MT?
kFileTypeRegular	&o0100000	Regular file.
kFileTypeSOCK	&o0140000	Socket

Symlink Types

Constant	Value	Description
kSymlinkTypeDirectory	2	Symlink is a directory.
kSymlinkTypeFile	1	Symlink is a file.
kSymlinkTypeUndefined	0	Symlink is of unknown type.

13.2 class ArchiveReadDiskMBS

13.2.1 class ArchiveReadDiskMBS

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The archive subclass class for reading files from disk.
Notes: Subclass of the ArchiveReaderMBS class.
Blog Entries

- MBS Xojo Plugins, version 20.3pr4
- MBS Xojo Plugins, version 18.6pr3

13.2.2 Methods

13.2.3 CanDescend as Boolean

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether you can descend into current item.
Notes: True if current item is a folder.

13.2.4 Constructor

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tbe constructor.

13.2.5 CurrentFileSystem as Integer

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries ID for current file system.
Notes: Lasterror is set.

13.2.6 CurrentFileSystemIsRemote as Integer

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether current file system is remote.
Notes: Lasterror is set.

13.2.7 CurrentFileSystemIsSynthetic as Integer

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether current file system is synthetic.
Notes: Lasterror is set.

13.2.8 Descend

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Request that current entry be visited.
Notes: If you invoke it on every directory, you'll get a physical traversal. This is ignored if the current entry isn't a directory or a link to a directory. So, if you invoke this on every returned path, you'll get a full logical traversal.
Lasterror is set.

13.2.9 Destructor

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: Lasterror is set.

13.2.10 GroupName(ID as Int64) as String

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries group name for given ID.
Notes: May invoke GroupLookup event.
Lasterror is set.

13.2.11 Open(Folder as FolderItem) as Boolean

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a folderitem.
Notes: Returns true on success and false on errors.
Lasterror is set.
See also:

- 13.2.12 Open(Path as String) as Boolean 3051

13.2.12 Open(Path as String) as Boolean

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a file path.
Notes: Returns true on success and false on errors.
Lasterror is set.
See also:

- 13.2.11 Open(Folder as FolderItem) as Boolean 3050

13.2.13 SetAccessTimeRestored

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Request that the access time of the entry visited by traversal be restored.
Notes: Lasterror is set.

13.2.14 SetStandardLookup

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets standard lookup for mapping user and group IDs to names.
Notes: "Standard" implementation uses getpwuid_r, getgrgid_r and caches the results for performance.
Lasterror is set.

13.2.15 SetSymlinkHybrid

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set to follow symlink initially, then not.
Notes: Lasterror is set.

13.2.16 SetSymlinkLogical

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets to follow all symlinks.
Notes: Lasterror is set.

13.2.17 SetSymlinkPhysical

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets to follow no symlinks.
Notes: Lasterror is set.

13.2.18 UserName(ID as Int64) as String

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries user name for given ID.
Notes: May invoke UserLookup event.
Lasterror is set.

13.2.19 Properties

13.2.20 BehaviorFlags as Integer

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Select optional behavior.
Notes: See kBehavior constants.
Setting the value sets Lasterror.

By default MBS Plugin sets kBehaviorRestoreAccessTime, kBehaviorRestoreHonorNoDump, kBehaviorRestoreMacCopyFile and kBehaviorRestoreNoTraverseMounts.
(Read and Write property)

13.2.21 Events

13.2.22 GroupLookup(ID as Int64) as String

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event to let you lookup manually the name for a group ID.

13.2.23 UserLookup(ID as Int64) as String

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event to let you lookup manually the name for a group ID.

13.2.24 Constants

Behavior Flags

Constant	Value	Description
kBehaviorRestoreAccessTime	1	Request that the access time of the entry visited by traversal be restored. This is the same as SetAccessTimeRestored.
kBehaviorRestoreHonorNoDump	2	Default: Do not skip an entry which has nodump flags.
kBehaviorRestoreMacCopyFile	4	Default: Skip a mac resource fork file whose prefix is "._" because of us copyfile.
kBehaviorRestoreNoACL	32	Default: ACLs are read from disk.
kBehaviorRestoreNoFFlags	64	Default: File flags are read from disk.
kBehaviorRestoreNoTraverseMounts	8	Default: Traverse mount points.
kBehaviorRestoreNoXAttr	16	Default: Xattrs are read from disk.

13.3 class ArchiveReaderMBS

13.3.1 class ArchiveReaderMBS

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to read archive content.
Example:

```
Var a as new ArchiveReaderMBS
a.SupportFilterAll
a.SupportFormatAll
a.SetOptions "hdrcharset=UTF-8" // for unicode file names

// open file

Var f as FolderItem = SpecialFolder.Desktop.Child("test.zip")

if not a.OpenFile(f) then
Break // path invalid?
end if

Var e as ArchiveEntryMBS = a.NextHeader
while e <>nil

print e.PathName

e = a.NextHeader
wend
```

Notes: Can be used to read zip, tar and other image formats.
Subclass of the ArchiverMBS class.
Blog Entries

- MBS Xojo Plugins, version 25.3pr6
- MBS Xojo Plugins, version 18.6pr3
- New Archive classes for handling zip and tar archives

13.3.2 Methods

13.3.3 AddPassphrase(passphrase as string)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a password to the archive.

13.3.4 AppendFilter(Filter as Integer)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a filter to the reader manually.
Notes: This is useful to bypass the bidding process when the format and filters to use is known in advance. Lasterror property is set.

13.3.5 AppendFilterProgram(Program as String)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a filter program.
Notes: Lasterror property is set.

13.3.6 Close

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Close the file and release most resources.
Notes: Lasterror property is set.

13.3.7 Constructor

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Example:

```
Var a as new ArchiveReaderMBS
a.SupportFilterAll
a.SupportFormatAll
a.SetOptions "hdrcharset=UTF-8" // for unicode file names
```

Notes: To create an archive:
1) Ask Constructor for an archive writer object.
2) Set any global properties. In particular, you should set the compression and format to use.
3) Call one of the open methods to open the file (most people will use OpenFile, which provide convenient canned I/O callbacks for you).

4) For each entry, construct an appropriate ArchiveEntryMBS object, call WriteHeader to write the header, call WriteData methods to write the entry data.
5) call close method to close the output

13.3.8 Destructor

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

13.3.9 Extract(Entry as ArchiveEntryMBS, DestArchive as ArchiverMBS)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience function to recreate the current entry (whose header has just been read) on disk.
Notes: This does quite a bit more than just copy data to disk. It also:

- Creates intermediate directories as required.
- Manages directory permissions: non-writable directories will be initially created with write permission enabled; when the archive is closed, dir permissions are edited to the values specified in the archive.
- Checks hardlinks: hardlinks will not be extracted unless the linked-to file was also extracted within the same session. (TODO)

Lasterror property is set.
See also:

- 13.3.10 Extract(Entry as ArchiveEntryMBS, flags as Integer = &h123F7) 3056

13.3.10 Extract(Entry as ArchiveEntryMBS, flags as Integer = &h123F7)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convenience function to recreate the current entry (whose header has just been read) on disk.
Notes: This does quite a bit more than just copy data to disk. It also:

- Creates intermediate directories as required.
- Manages directory permissions: non-writable directories will be initially created with write permission enabled; when the archive is closed, dir permissions are edited to the values specified in the archive.

- Checks hardlinks: hardlinks will not be extracted unless the linked-to file was also extracted within the same session. (TODO)

The "flags" argument selects optional behavior, 'OR' the flags you want.
Lasterror property is set.
See also:

- 13.3.9 Extract(Entry as ArchiveEntryMBS, DestArchive as ArchiverMBS) 3056

13.3.11 NextHeader(entry as ArchiveEntryMBS = nil) as ArchiveEntryMBS

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads next header.
Notes: If you pass in an existing entry, we can recycle the object.
Returns nil in case of error.
Lasterror property is set.

13.3.12 OpenData(Data as String) as Boolean

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens an archive from memory.
Notes: Returns true on success and false on failure.
Lasterror property is set.

13.3.13 OpenFile(File as FolderItem, BlockSize as Integer = 10240) as Boolean

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens an archive from a folderitem.
Notes: Returns true on success and false on failure.
Lasterror property is set.
See also:

- 13.3.14 OpenFile(Files() as FolderItem, BlockSize as Integer = 10240) as Boolean 3057

13.3.14 OpenFile(Files() as FolderItem, BlockSize as Integer = 10240) as Boolean

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Use this for reading multivolume files by filenames.
Notes: Returns true on success and false on errors.

Lasterror property is set.
See also:

- 13.3.13 OpenFile(File as FolderItem, BlockSize as Integer = 10240) as Boolean 3057

13.3.15 OpenPath(Path as String, BlockSize as Integer = 10240) as Boolean

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens the file at the given path.
Notes: Lasterror property is set.
See also:

- 13.3.16 OpenPath(Paths() as String, BlockSize as Integer = 10240) as Boolean 3058

13.3.16 OpenPath(Paths() as String, BlockSize as Integer = 10240) as Boolean

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Use this for reading multivolume files by filenames.
Notes: Returns true on success and false on errors.
Lasterror property is set.
See also:

- 13.3.15 OpenPath(Path as String, BlockSize as Integer = 10240) as Boolean 3058

13.3.17 ReadDataBlockMemory(byref offset as Int64) as MemoryBlock

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads next block of data.
Notes: Size is given by archive reader used.
Offset is given so you know where you are in the file currently.
Data returned as new memory block.
Lasterror property is set.

A zero-copy version of archive_read_data that also exposes the file offset of each returned block. Note that the client has no way to specify the desired size of the block. The API does guarantee that offsets will be strictly increasing and that returned blocks will not overlap.

13.3.18 ReadDataBlockString(byref offset as Int64) as String

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads next block of data.
Notes: Size is given by archive reader used.
Offset is given so you know where you are in the file currently.
Data returned as new string.
Lasterror property is set.

A zero-copy version of archive_read_data that also exposes the file offset of each returned block. Note that the client has no way to specify the desired size of the block. The API does guarantee that offsets will be strictly increasing and that returned blocks will not overlap.

13.3.19 ReadDataMemory(ByteCount as Integer) as MemoryBlock

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads data from current file into memoryblock.
Notes: Lasterror property is set.

13.3.20 ReadDataString(ByteCount as Integer) as String

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads data from current file into string.
Notes: Lasterror property is set.

13.3.21 Seek(Position as Int64, Mode as Integer = 0) as Int64

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Seek within the body of an entry.
Notes: See kSeekSet, kSeekCur or kSeekEnd constants.
Returns new position.
Lasterror property is set.

13.3.22 SetExtractSkipFile(DeviceID as Int64, FileNo as Int64)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Record the dev/ino of a file that will not be written.
Notes: This is generally set to the dev/ino of the archive being read.
Lasterror property is set.

13.3.23 SetFilterOption(Module as String, Option as String, Value as String)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply option to the filter only.
Notes: Lasterror property is set.

13.3.24 SetFormat(Format as Integer)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the format for the reader manually.
Notes: This is useful to bypass the bidding process when the format and filters to use is known in advance. Lasterror property is set.

13.3.25 SetFormatOption(Module as String, Option as String, Value as String)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply option to the format only.
Notes: Lasterror property is set.

13.3.26 SetOption(Module as String, Option as String, Value as String)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply option to both the format and the filter.
Notes: Lasterror property is set.

13.3.27 SetOptions(Options as String)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply option string to both the format and the filter.
Example:

```
Var a as new ArchiveReaderMBS
a.SupportFilterAll
a.SupportFormatAll
a.SetOptions "hdrcharset=UTF-8" // for unicode file names
```

Notes: Lasterror property is set.
For older non UTF-8 Japanese zip archives, you can try "hdrcharset=cp932" as encoding.
For older non UTF-8 Windows archives, you can use "hdrcharset=cp1252".

13.3.28 Skip

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Skips a file in the archive.

13.3.29 SupportFilterAll

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables all filters.
Notes: Lasterror property is set.

13.3.30 SupportFilterBZip2

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables bzip2 filter.
Notes: Lasterror property is set.

13.3.31 SupportFilterCompress

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables compress filter.
Notes: Lasterror property is set.

13.3.32 SupportFilterGRZip

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables GRZip filter.
Notes: Lasterror property is set.

13.3.33 SupportFilterGZip

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable gzip filter.
Notes: Lasterror property is set.

13.3.34 SupportFilterLRZip

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable LRZip filter.
Notes: Lasterror property is set.

13.3.35 SupportFilterLZip

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable LZip filter.
Notes: Lasterror property is set.

13.3.36 SupportFilterLzma

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable LZMA filter.
Notes: Lasterror property is set.

13.3.37 SupportFilterLzop

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable Lzop filter.
Notes: Lasterror property is set.

13.3.38 SupportFilterNone

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable none filter.
Notes: Lasterror property is set.

13.3.39 SupportFilterProgram(command as string)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable support for given filter program.
Notes: Lasterror property is set.

13.3.40 SupportFilterRpm

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable RPM filter.
Notes: Lasterror property is set.

13.3.41 SupportFilterUU

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable UU filter.
Notes: Lasterror property is set.

13.3.42 SupportFilterXz

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable XZ filter.
Notes: xz is a lossless data compression program and file format which incorporates the LZMA/LZMA2 compression algorithms.

13.3.43 SupportFormat7zip

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable 7zip format.
Notes: Lasterror property is set.
7zip support in MBS Plugin is very limited.

13.3.44 SupportFormatAll

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable all formats.
Notes: Lasterror property is set.

13.3.45 SupportFormatAr

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables At format.
Notes: Lasterror property is set.

13.3.46 SupportFormatByCode(FilterCode as Integer)

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables format with given code.
Notes: Lasterror property is set.

13.3.47 SupportFormatCab

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables cab format.
Notes: Lasterror property is set.

13.3.48 SupportFormatCpio

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables cpio format.
Notes: Lasterror property is set.

13.3.49 SupportFormatEmpty

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables empty format.
Notes: Lasterror property is set.

13.3.50 SupportFormatGnutar

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables gnutar format.
Notes: Lasterror property is set.

13.3.51 SupportFormatIso9660

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables iso 9660 format.
Notes: Lasterror property is set.

13.3.52 SupportFormatLha

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables lha format.
Notes: Lasterror property is set.

13.3.53 SupportFormatLZ4

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables support for LZ4 format.
Notes: Lasterror property is set.

13.3.54 SupportFormatMTree

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables mtree format.
Notes: Lasterror property is set.

13.3.55 SupportFormatRar

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables rar format.
Notes: Lasterror property is set.

13.3.56 SupportFormatRar5

MBS Compression Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables rar v5 format.
Notes: Lasterror property is set.

13.3.57 SupportFormatRaw

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables raw format.
Notes: Lasterror property is set.

13.3.58 SupportFormatTar

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables tape archive files format.
Notes: Lasterror property is set.

13.3.59 SupportFormatWArc

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables support for WArc format.
Notes: Lasterror property is set.

13.3.60 SupportFormatXar

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables xar format.
Notes: Lasterror property is set.

13.3.61 SupportFormatZip

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables zip format.
Notes: Enables both streamable and seekable zip readers.
Lasterror property is set.

13.3.62 SupportFormatZipSeekable

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allows only support for seekable zip archives.
Notes: Reads starting from central directory; requires seekable input.
Lasterror property is set.

13.3.63 SupportFormatZipStreamable

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables support only for streamable zip archives.
Notes: Reads Zip archives as stream from beginning to end. Doesn't correctly handle SFX ZIP files or ZIP archives that have been modified in-place.
Lasterror property is set.

13.3.64 Properties

13.3.65 FormatCapabilities as Integer

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a bitmask of capabilities that are supported by the archive format reader.
Notes: If the reader has no special capabilities, kFormatCapabilitiesNone is returned.
See also kFormatCapabilitiesEncryptMetaData and kFormatCapabilitiesEncryptData.
(Read only property)

13.3.66 HasEncryptedEntries as Integer

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns 1 if the archive contains at least one encrypted entry.
Notes: If the archive format not support encryption at all kEncryptionUnsupported is returned. If for any other reason (e.g. not enough data read so far) we cannot say whether there are encrypted entries, then kEncryptionDontKnow is returned. In general, this function will return values below zero when the reader is uncertain or totally uncapable of encryption support. When this function returns 0 you can be sure that the reader supports encryption detection but no encrypted entries have been found yet.

If the metadata/header of an archive is also encrypted, you cannot rely on the number of encrypted entries. That is why this function does not return the number of encrypted entries but# just shows that there are some.
(Read only property)

13.3.67 HeaderPosition as Int64

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current header position.
Notes: Retrieve the byte offset in uncompressed data where last-read header started.
(Read only property)

13.3.68 ReadDataBlockSupported as Boolean

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this reader supports block operations.
Notes: Some do and if you call ReadDataBlock on a reader which can't, it will return only errors.
(Read only property)

13.3.69 Events

13.3.70 ExtractProgress(entry as ArchiveEntryMBS)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Event called regularly while extracting to report progress.
Notes: Check properties of archive on how many bytes have been processed.
Called only by Extract methods.

13.3.71 Constants

Encryption Status constants.

Constant	Value	Description
kEncryptionDontKnow	-1	If the reader for some other reason (e.g. not enough bytes read) cannot say if there are encrypted entries, kEncryptionDontKnow is returned.
kEncryptionUnsupported	-2	In case the archive does not support encryption detection at all kEncryptionUnsupported is returned.

Extract Flags

Constant	Value	Description
kExtractACL	&h20	Default: Do not restore ACLs.
kExtractClearNoChangeFFlags	&h20000	Default: Do not clear no-change flags when unlinking object.
kExtractFileFlags	&h40	Default: Do not restore fflags.
kExtractHFSCompressionForced	&h8000	Default: Do not use HFS+ compression if it was not compressed. This has no effect except on Mac OS v10.6 or later.
kExtractMacMetadata	&h2000	Default: Do not restore Mac extended metadata. This has no effect except on Mac OS.
kExtractNoAutoDir	&h400	Default: Create parent directories as needed.
kExtractNoHFSCompression	&h4000	Default: Use HFS+ compression if it was compressed. This has no effect except on Mac OS v10.6 or later.
kExtractNoOverwrite	8	Default: Replace existing files.
kExtractNoOverwriteNewer	&h800	Default: Overwrite files, even if one on disk is newer.
kExtractOwner	1	Default: Do not try to set owner/group.
kExtractPermission	2	Default: Do obey umask, do not restore SUID/SGID/SVTX bits.
kExtractSecureNoAbsolutePath	&h10000	Default: Do not reject entries with absolute paths
kExtractSecureNoDotDot	&h200	Default: Do not reject entries with '..' as path elements.
kExtractSecureSymLinks	&h100	Default: Do not try to guard against extracts redirected by symlinks. Note: With kExtractUnlink, will remove any intermediate symlink.
kExtractSparse	&h1000	Detect blocks of 0 and write holes instead.
kExtractTime	4	Default: Do not restore mtime/atime.
kExtractUnlink	&h10	Default: Try create first, unlink only if create fails with EEXIST.
kExtractXAttr	&h80	Default: Do not restore xattrs.

Encryption Capabilities

Constant	Value	Description
kFormatCapabilitiesEncryptData	1	Reader can detect encrypted data.
kFormatCapabilitiesEncryptMetaData	2	Reader can detect encryptable metadata (pathname, mtime, etc.).
kFormatCapabilitiesNone	0	Current format supports no encryption.

Seek Modes

Constant	Value	Description
kSeekCur	1	Seek relative to current position.
kSeekEnd	2	Seek relative to end of file.
kSeekSet	0	Seek relative to begin of file.

13.4 class ArchiverMBS

13.4.1 class ArchiverMBS

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The abstract super class for common archiver methods.
Example:

```
// list the files in a zip or tar archive with the libarchive based classes
// ArchiverMBS is the base class of ArchiveReaderMBS and ArchiveWriterMBS.
Var reader As New ArchiveReaderMBS
reader.SupportFilterAll
reader.SupportFormatAll
If Not reader.OpenFile(SpecialFolder.Desktop.Child("test.zip")) Then
MessageBox "Can't open: " + reader.ErrorString
Return
End If

Var lines() As String
Do
Var entry As ArchiveEntryMBS = reader.NextHeader
If entry = Nil Then Exit
lines.Add entry.PathName + " (" + entry.Size.ToString + " bytes)"
reader.Skip
Loop
lines.Add "Format: " + reader.FormatName + ", library " + ArchiverMBS.LibVersionString
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Currently we build this library without lzma and lz4 support. That could be changed if needed.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- News from the MBS Xojo Plugins Version 20.4
- MBS Xojo Plugins, version 20.4pr9
- MBS Xojo Plugins, version 18.6pr3

13.4.2 Methods

13.4.3 ClearError

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears error.

13.4.4 Constructor

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

13.4.5 CopyError(source as ArchiverMBS)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies error state from one archive object to other.

13.4.6 Destructor

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

13.4.7 FilterBytes(FilterIndex as Integer) as Int64

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current byte count for the filter with given index.
Notes: Pass index of filter, e.g. 0 to FilterCount-1.
Pass -1 to query last filter.

13.4.8 FilterCode(FilterIndex as Integer) as Integer

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries ID of filter.
Notes: Pass index of filter, e.g. 0 to FilterCount-1.
Pass -1 to query last filter.

13.4.9 FilterName(FilterIndex as Integer) as String

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries name of filter.
Notes: Pass index of filter, e.g. 0 to FilterCount-1.

Pass -1 to query last filter.

13.4.10 LoadIconvLibrary(path as String, byref Error as String) as boolean

MBS Compression Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the iconv library.
Notes: The Archive classes may use libiconv for text encoding conversion.
If you explicitly need, you can load the library on start of solution.

MBS Plugin may try to load iconv.dll/dylib/so automatically when first iconv function is called.

13.4.11 NewReader as ArchiveReaderMBS

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new archive reader.

13.4.12 NewWriter as ArchiveWriterMBS

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new archive writer.

13.4.13 SetCurrentWorkingDirectory(path as folderitem) as boolean

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets current working directory for the application.
Notes: Returns true on success or false on failure.
See also:

- 13.4.14 SetCurrentWorkingDirectory(path as String) as boolean 3073

13.4.14 SetCurrentWorkingDirectory(path as String) as boolean

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets current working directory for the application.
Notes: Returns true on success or false on failure.

See also:

- 13.4.13 SetCurrentWorkingDirectory(path as folderitem) as boolean 3073

13.4.15 Properties

13.4.16 BZLibVersion as String

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The bzlib version used in this plugin.
Example:

MessageBox ArchiverMBS.BZLibVersion

Notes: This is empty if we compiled plugin without this library.
(Read only property)

13.4.17 Compression as Integer

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The ID of the compression algorithm.
Notes: This is an alias for FilterCode(0).
(Read only property)

13.4.18 CompressionName as String

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the compression algorithm.
Notes: This is an alias for FilterName(0).
(Read only property)

13.4.19 ErrNo as Integer

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Last error's errno value.
Notes: The unix error code.
(Read only property)

13.4.20 ErrorString as String

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error string.
Notes: (Read only property)

13.4.21 FileCount as Integer

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file count.
Notes: May not be known before all files have been seen/processed.
(Read only property)

13.4.22 FilterCount as Integer

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of filters currently in use.
Notes: An archive may have several filters, e.g. tar to archive and gzip to compress.
(Read only property)

13.4.23 Format as Integer

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The ID of the current format.
Notes: (Read only property)

13.4.24 FormatName as String

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the current format.
Notes: (Read only property)

13.4.25 Handle as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

13.4.26 Lasterror as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: See kArchive constants.
(Read only property)

13.4.27 LibVersion as Integer

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of the archive C++ library.
Example:

MessageBox str(ArchiverMBS.LibVersion)

Notes: e.g. 3001002 for version 3.1.2.
(Read only property)

13.4.28 LibVersionDetails as String

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The detailed version string for libArchive.
Example:

MessageBox ArchiverMBS.LibVersionDetails

Notes: Detailed textual name/version of the library and its dependencies.

This has the form:
"libarchive x.y.z zlib/a.b.c liblzma/d.e.f ... etc ..."

the list of libraries described here will vary depending on how libarchive was compiled.
(Read only property)

13.4.29 LibVersionString as String

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of the archive C++ library as text.
Example:

MessageBox ArchiverMBS.LibVersionString

Notes: e.g. "libarchive 3.1.2"
(Read only property)

13.4.30 LZ4Version as String

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The lz4 version used in this plugin.
Example:

MessageBox ArchiverMBS.LZ4Version

Notes: This is empty if we compiled plugin without this library.
(Read only property)

13.4.31 LzmaVersion as String

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The lzma version used in this plugin.
Example:

MessageBox ArchiverMBS.LzmaVersion

Notes: This is empty if we compiled plugin without this library.
(Read only property)

13.4.32 Open as Boolean

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether an archive is currently open.
Notes: (Read only property)

13.4.33 PositionCompressed as Int64

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The position in the archive compressed.
Notes: This is an alias for FilterBytes(-1).
(Read only property)

13.4.34 PositionUncompressed as Int64

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The position in the archive uncompressed.
Notes: This is an alias for FilterBytes(0).
(Read only property)

13.4.35 Yield as Boolean

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to yield on extract methods.
Notes: Set true to pass CPU time to other Xojo threads.
(Read and Write property)

13.4.36 ZLibVersion as String

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The zlib version used in this plugin.
Example:

MessageBox ArchiverMBS.ZLibVersion

Notes: This is empty if we compiled plugin without this library.
(Read only property)

13.4.37 ZStdVersion as String

MBS Compression Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The zlib version used in this plugin.
Example:

MessageBox ArchiverMBS.ZStdVersion

Notes: This is empty if we compiled plugin without this library.
(Read only property)

13.4.38 Events

13.4.39 Passphrase(byref password as String) as Boolean

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event to query for passphrase.
Notes: Please set password property and return true if you have one.

13.4.40 Constants

Error Codes

Constant	Value	Description
kArchiveEOF	1	Found end of archive.
kArchiveFailed	-25	Current operation cannot complete. But if writeHeader is "fatal," then this archive is dead and useless.
kArchiveFatal	-30	No more operations are possible.
kArchiveOK	0	Operation was successful.
kArchiveRetry	-10	Retry might succeed.
kArchiveWarn	-20	Partial success. For example, if writeHeader "fails", then you can't push data.

Filters

Constant	Value	Description
kFilterBZip2	2	bzip2 filter
kFilterCompress	3	compress filter.
kFilterGRZip	12	GRZip filter.
kFilterGZip	1	gzip filter.
kFilterLRZip	10	LRZip filter.
kFilterLZ4	13	LZ4 Filter.
kFilterLZip	9	LZip filter.
kFilterLZMA	5	LZMA filter.
kFilterLZOP	11	Lzop filter.
kFilterNone	0	No filter.
kFilterProgram	4	Program filter.
kFilterRPM	8	RPM filter.
kFilterUU	7	UU filter.
kFilterXZ	6	XZ filter.

Formats

Constant	Value	Description
kFormat7Zip	&he0000	7Zip
kFormatAr	&h70000	Unix Archive format, base type.
kFormatArBsd	&h70002	Archive, BSD format.
kFormatArGnu	&h70001	Archive, GNU format.
kFormatBaseMask	&hff0000	Mask for Base Type.
kFormatCab	&hc0000	Windows CAB format.
kFormatCpio	&h10000	CPIO base format.
kFormatCpioAfioLarge	&h10006	CPIO format, AFIO large variant.
kFormatCpioBinBe	&h10003	CPIO format, BIN BE variant.
kFormatCpioBinLe	&h10002	CPIO format, BIN LE variant.
kFormatCpioPosix	&h10001	CPIO format, Posix variant.
kFormatCpioSvr4Crc	&h10005	CPIO format, SVR4 CRC variant.
kFormatCpioSvr4Nocrc	&h10004	CPIO format, SVR4 no CRC variant.
kFormatEmpty	&h60000	Empty format.
kFormatIso9660	&h40000	iOS 9660 base type.
kFormatIso9660Rockridge	&h40001	iOS 9660, Rockridge variant.
kFormatLha	&hb0000	LHA format.
kFormatMtree	&h80000	MTree format.
kFormatRar	&hd0000	RAR format.
kFormatRARv5	&h10000	Rar v5 format
kFormatRaw	&h90000	Raw format.
kFormatShar	&h20000	SHAR base format.
kFormatSharBase	&h20001	SHAR base format, base variant.
kFormatSharDump	&h20002	SHAR base format, dump variant.
kFormatTar	&h30000	Tar base format.
kFormatTarGnutar	&h30004	Tar format, GNU variant.
kFormatTarPaxInterchange	&h30002	Tar format, Pax Interchange variant.
kFormatTarPaxRestricted	&h30003	Tar format, Pax Restricted variant.
kFormatTarUstar	&h30001	Tar format, US variant.
kFormatWarc	&hf0000	WArc format.
kFormatXar	&ha0000	Xar format
kFormatZip	&h50000	Zip format.

13.5 class ArchiveWriteDiskMBS

13.5.1 class ArchiveWriteDiskMBS

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The archive subclass class for writing files to disk.
Notes: To create objects on disk:

1) Ask Constructor for a new ArchiveWriteDiskMBS object.
2) Set any global properties. In particular, you probably want to set the options.
3) For each entry: construct an appropriate ArchiveEntryMBS object, use WriteHeader to create the file/dir/etc on disk, use WriteData to write the entry data
4) Release object to cleanup the writer and release resources

In particular, you can use this in conjunction with ArchiveReaderMBS to pull entries out of an archive and create them on disk.
Subclass of the ArchiveWriterMBS class.
Blog Entries

- MBS Xojo Plugins, version 18.6pr3

13.5.2 Methods

13.5.3 Constructor

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Connects GroupLookup and UserLookup events if set.

13.5.4 Destructor

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

13.5.5 GID(GroupName as string, DefaultGID as Int64) as Int64

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Query ID of group.
Notes: Returns default ID if name not found.
This may invoke GroupLookup event.
Lasterror property is set.

13.5.6 SetSkipFile(DeviceID as Int64, FileNo as Int64)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Record the dev/ino of a file that will not be written.
Notes: This is generally set to the dev/ino of the archive being written.
Lasterror property is set.

13.5.7 SetStandardLookup

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets standard lookup for mapping user and group names to IDs.
Notes: Lasterror property is set.

The lookup functions are given uname/uid (or gname/gid) pairs and return a uid (gid) suitable for this system. These are used for restoring ownership and for setting ACLs. The default functions are naive, they just return the uid/gid. These are small, so reasonable for applications that don't need to preserve ownership; they are probably also appropriate for applications that are doing same-system backup and restore.

The "standard" lookup functions use common system calls to lookup the uname/gname, falling back to the uid/gid if the names can't be found. They cache lookups and are reasonably fast, but can be very large, so they are not used unless you ask for them. In particular, these match the specifications of POSIX "pax" and old POSIX "tar".

13.5.8 UID(UserName as string, DefaultUID as Int64) as Int64

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Query ID of user.
Notes: Returns default ID if name not found.
This may invoke UserLookup event.
Lasterror property is set.

13.5.9 WriteDataBlock(data as MemoryBlock, offset as Int64) as Int64

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes data block to file.
Notes: Returns number of bytes written.
Lasterror property is set.
See also:

- 13.5.10 WriteDataBlock(data as Ptr, Size as Int64, offset as Int64) as Int64 3084
- 13.5.11 WriteDataBlock(data as string, offset as Int64) as Int64 3084

13.5.10 WriteDataBlock(data as Ptr, Size as Int64, offset as Int64) as Int64

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes data block to file.
Notes: Returns number of bytes written.
Lasterror property is set.
See also:

- 13.5.9 WriteDataBlock(data as MemoryBlock, offset as Int64) as Int64 3084
- 13.5.11 WriteDataBlock(data as string, offset as Int64) as Int64 3084

13.5.11 WriteDataBlock(data as string, offset as Int64) as Int64

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes data block to file.
Notes: Returns number of bytes written.
Lasterror property is set.
See also:

- 13.5.9 WriteDataBlock(data as MemoryBlock, offset as Int64) as Int64 3084
- 13.5.10 WriteDataBlock(data as Ptr, Size as Int64, offset as Int64) as Int64 3084

13.5.12 Properties

13.5.13 Options as Integer

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The options flags set.
Notes: Setting options sets lasterror property.

See ArchiveReaderMBS.kExtract* constants.
(Read and Write property)

13.5.14 Events

13.5.15 GroupLookup(Name as String, GID as Int64) as Int64

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event to let you lookup manually the ID for a group name.
Notes: If you can't find the group, you can just pass through the given default ID.

If neither the default (naive) nor the standard (big) functions suit your needs, you can write your own in this event.

13.5.16 UserLookup(Name as String, GID as Int64) as Int64

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event to let you lookup manually the ID for a user name.
Notes: If you can't find the user, you can just pass through the given default ID.

If neither the default (naive) nor the standard (big) functions suit your needs, you can write your own in this event.

13.6 class ArchiveWriterMBS

13.6.1 class ArchiveWriterMBS

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to write archive content.
Example:

```
Var a as new ArchiveWriterMBS

a.SetFormatZip
a.ZipSetCompressionDeflate

Var f as FolderItem = SpecialFolder.Desktop.Child("test.zip")
if not a.CreateFile(f) then
break // failed

else

Var data as string = "Hello World test file. Hello World again."

Var e as new ArchiveEntryMBS
e.PathName = "Hello World.txt"
e.Size = lenb(data)
e.Permissions = &o0644
e.FileType = e.kFileTypeRegular

a.WriteHeader e
call a.WriteData data

a.FinishEntry

a.Close
end if
```

Notes: Can be used to write zip, tar and other image formats.
Subclass of the ArchiverMBS class.

- New Archive classes for handling zip and tar archives

Xojo Developer Magazine

- 19.4, page 81: Archives in Xojo, How to Use Zip Archives by Stefanie Juchmes

13.6.2 Methods

13.6.3 AddFilter(FilterCode as Integer)

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds filter by code number.
Notes: Lasterror property is set.

13.6.4 AddFilterB64encode

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds base 64 filter.
Notes: Lasterror property is set.

13.6.5 AddFilterByName(Name as String)

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds filter by name.
Notes: Lasterror property is set.

13.6.6 AddFilterBZip2

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add bzip2 filter.
Notes: Lasterror property is set.

13.6.7 AddFilterCompress

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add compress filter.
Notes: Lasterror property is set.

13.6.8 AddFilterGRZip

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add grzip filter.
Notes: Lasterror property is set.

13.6.9 AddFilterGZip

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add gzip filter.
Notes: Lasterror property is set.

13.6.10 AddFilterLRZip

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add lrzip filter.
Notes: Lasterror property is set.

13.6.11 AddFilterLZ4

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add support for LZ4 compression.
Notes: Lasterror property is set.

13.6.12 AddFilterLZip

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add lzip filter.
Notes: Lasterror property is set.

13.6.13 AddFilterLZMA

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add lzma filter.
Notes: Lasterror property is set.

13.6.14 AddFilterLZOp

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add lzop filter.
Notes: Lasterror property is set.

13.6.15 AddFilterNone

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add none filter.
Notes: Lasterror property is set.

13.6.16 AddFilterProgram(Command as String)

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a filter calling external application.
Notes: Lasterror property is set.

13.6.17 AddFilterUUEncode

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add uu filter.
Notes: Lasterror property is set.

13.6.18 AddFilterXZ

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add xy filter.
Notes: Lasterror property is set.

13.6.19 Close

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes the archive.
Notes: Lasterror property is set.

13.6.20 Constructor

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

13.6.21 CreateFile(File as FolderItem) as boolean

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new archive file.
Notes: Returns true on success.

13.6.22 CreateMemoryFile as boolean

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates in memory output file.
Notes: Please use later MemoryData, MemoryString, MemoryPointer, or MemorySize later to get data after closing archive.
Lasterror property is set.

13.6.23 Destructor

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

13.6.24 Fail

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Marks archive as failed.
Notes: We will not close the archive properly and you can delete file.

13.6.25 FinishEntry

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finishes an entry.
Notes: Lasterror property is set.

13.6.26 SetFilterOption(Module as String, Option as String, Value as String)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply option to the filter only.
Notes: Lasterror property is set.

13.6.27 SetFormat(FormatCode as Integer)

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format by code.
Notes: Lasterror property is set.

13.6.28 SetFormat7Zip

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to 7zip.
Notes: Lasterror property is set.
7zip support in MBS Plugin is very limited.

13.6.29 SetFormatArBsd

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to ar bsd.
Notes: Lasterror property is set.

13.6.30 SetFormatArSvr4

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to ar svr4.
Notes: Lasterror property is set.

13.6.31 SetFormatByExtension(FileName as String, defaultExtension as String = "")

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set file format by extension of filename.
Notes: e.g. pass "test.zip" for file name and ".zip" for default extension (if filename has none).
Lasterror property is set.

13.6.32 SetFormatByName(Name as String)

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format by name.
Notes: Lasterror property is set.

13.6.33 SetFormatCpio

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to cpio.
Notes: Lasterror property is set.

13.6.34 SetFormatCpioNewc

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to cpio newc.
Notes: Lasterror property is set.

13.6.35 SetFormatGnutar

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to gnu tape archive files.
Notes: Lasterror property is set.

13.6.36 SetFormatIso9660

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to iso 9660.
Notes: Lasterror property is set.

13.6.37 SetFormatMTree

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to mtree.
Notes: Lasterror property is set.

13.6.38 SetFormatMTreeClassic

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to mtree classic.
Notes: Lasterror property is set.

13.6.39 SetFormatOption(Module as String, Option as String, Value as String)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply option to the format only.
Notes: Lasterror property is set.

13.6.40 SetFormatPax

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to pax.
Notes: Lasterror property is set.

13.6.41 SetFormatPaxRestricted

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to pax restricted.
Notes: Lasterror property is set.

13.6.42 SetFormatRaw

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets raw format.
Notes: Lasterror property is set.

13.6.43 SetFormatShar

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to shar.
Notes: Lasterror property is set.

13.6.44 SetFormatSharDump

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to shar dump.
Notes: Lasterror property is set.

13.6.45 SetFormatUstar

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to Unix Standard TAR.
Notes: Lasterror property is set.

13.6.46 SetFormatV7tar

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to v7 tape archive files.
Notes: Lasterror property is set.

13.6.47 SetFormatWArc

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to web archive.
Notes: Lasterror property is set.

13.6.48 SetFormatXar

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to xar.
Notes: Lasterror property is set.

13.6.49 SetFormatZip

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets format to zip.
Example:

```
Var a as new ArchiveWriterMBS

a.SetFormatZip
a.ZipSetCompressionDeflate

Var f as FolderItem = SpecialFolder.Desktop.Child("test.zip")
if not a.CreateFile(f) then
break // failed

else

Var data as string = "Hello World test file. Hello World again."

Var e as new ArchiveEntryMBS
e.PathName = "Hello World.txt"
e.Size = lenb(data)
```

```
e.Permissions = &o0644
e.FileType = e.kFileTypeRegular

a.WriteHeader e
call a.WriteData data

a.FinishEntry

a.Close
end if
```

Notes: Lasterror property is set.

13.6.50 SetOption(Module as String, Option as String, Value as String)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply option to both the format and the filter.
Notes: Lasterror property is set.

13.6.51 SetOptions(Options as String)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Apply option string to both the format and the filter.
Example:

```
Var a as new ArchiveWriterMBS
a.SetOptions "hdrcharset=UTF-8" // for unicode file names
```

Notes: Lasterror property is set.

The options to pass to writer.
This is a comma-separated list of options. Option names can be prefixed with module name.

Sample options:
compression=9
zip:encryption=zipcrypt
zip:encryption=aes128
zip:encryption=aes256
zip64
gzip:compression-level=9

hdrcharset=UTF-8

13.6.52 SetPassphrase(Password as String)

MBS Compression Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the passphrase to use.
Example:

```
Var a as new ArchiveWriterMBS

a.SetFormatZip
a.ZipSetCompressionDeflate

a.SetOptions "zip:encryption=zipcrypt" // enable encryption
a.SetPassphrase "HelloWorld" // set password
```

Notes: Alternatively you can use the Passphrase event.
Lasterror property is set.

13.6.53 SetSkipFile(DeviceID as Int64, FileNo as Int64)

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Record the dev/ino of a file that will not be written.
Notes: This is generally set to the dev/ino of the archive being written.
Lasterror property is set.

13.6.54 WriteData(data as MemoryBlock) as Int64

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes data to current file.
Notes: Returns number of bytes written.
Lasterror property is set.
See also:

- 13.6.55 WriteData(data as Ptr, Size as Int64) as Int64 3098
- 13.6.56 WriteData(data as string) as Int64 3098
- 13.6.57 WriteData(SourceArchive as ArchiveReaderMBS) as Int64 3098

13.6.55 WriteData(data as Ptr, Size as Int64) as Int64

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes data to current file.
Notes: Returns number of bytes written.
Lasterror property is set.
See also:

- 13.6.54 WriteData(data as MemoryBlock) as Int64 3097
- 13.6.56 WriteData(data as string) as Int64 3098
- 13.6.57 WriteData(SourceArchive as ArchiveReaderMBS) as Int64 3098

13.6.56 WriteData(data as string) as Int64

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes data to current file.
Notes: Returns number of bytes written.
Lasterror property is set.
See also:

- 13.6.54 WriteData(data as MemoryBlock) as Int64 3097
- 13.6.55 WriteData(data as Ptr, Size as Int64) as Int64 3098
- 13.6.57 WriteData(SourceArchive as ArchiveReaderMBS) as Int64 3098

13.6.57 WriteData(SourceArchive as ArchiveReaderMBS) as Int64

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes data to current file.
Notes: Loops over blocks in source archive entry and copies them all to current archive.
Returns number of bytes written.
Lasterror property is set.
See also:

- 13.6.54 WriteData(data as MemoryBlock) as Int64 3097
- 13.6.55 WriteData(data as Ptr, Size as Int64) as Int64 3098
- 13.6.56 WriteData(data as string) as Int64 3098

13.6.58 WriteHeader(Entry as ArchiveEntryMBS)

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes an archive item.
Notes: Lasterror property is set.

13.6.59 ZipSetCompressionBZip2

MBS Compression Plugin, Plugin Version: 25.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets compression for zip to bzip2.
Notes: Lasterror property is set.

13.6.60 ZipSetCompressionDeflate

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets compression for zip to deflate.
Notes: Lasterror property is set.

13.6.61 ZipSetCompressionStore

MBS Compression Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets compression for zip to store.
Notes: Store is no compression.
Lasterror property is set.

13.6.62 ZipSetCompressionZStd

MBS Compression Plugin, Plugin Version: 25.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets compression for zip to zstd.
Notes: Lasterror property is set.

13.6.63 Properties

13.6.64 MemoryData as MemoryBlock

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies data in memory buffer as MemoryBlock.
Notes: (Read only property)

13.6.65 MemoryPointer as Ptr

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries pointer for memory block.
Notes: Only valid till more data is added, which may reallocate the buffer to grow it.
(Read only property)

13.6.66 MemorySize as Int64

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The memory size.
Notes: Current memory used for memory output in bytes.
(Read only property)

13.6.67 MemoryString as String

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies data in memory buffer as String.
Notes: (Read only property)

13.6.68 WriteDataBlockSupported as Boolean

MBS Compression Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this writer supports block operations.
Notes: Some do and if you call WriteDataBlock on a writer which can't, it will return only errors.
(Read only property)

Chapter 14

Atomic

14.1 class AtomicDictionaryEntryMBS

14.1.1 class AtomicDictionaryEntryMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a dictionary entry.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 26.3
- MBS Xojo Plugins, version 26.3pr1

14.1.2 Methods

14.1.3 Constructor(Key as Variant, Value as Variant)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor for the entry.

14.1.4 Properties

14.1.5 Key as Variant

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The key value.
Notes: (Read only property)

14.1.6 Value as Variant

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current value.
Notes: (Read only property)

14.2 class AtomicDictionaryIteratorMBS

14.2.1 class AtomicDictionaryIteratorMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for the dictionary iterator.
Example:

```
// iterate over a thread safe dictionary
Var d As New AtomicDictionaryMBS
d.Value("apples") = 5
d.Value("pears") = 3

Var it As AtomicDictionaryIteratorMBS = AtomicDictionaryIteratorMBS(d.Iterator)
While it.MoveNext
Var entry As AtomicDictionaryEntryMBS = it.Current
System.DebugLog entry.Key.StringValue + " = " + entry.Value.StringValue
Wend
```

Notes: Iterators perform the actual task of yielding values from the Iterable object.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 26.3
- MBS Xojo Plugins, version 26.3pr1

Interfaces: Iterator

14.2.2 Methods

14.2.3 Constructor(Keys() as Variant, Values() as Variant)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor to make a new iterator object with given keys and values.s

14.2.4 MoveNext as Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the Iterator to the next item.
Notes: Return False when there are no more items, otherwise return True.

14.2.5 Value as Variant

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The value of the current item in the Iterator.
Notes: The Value is invalid when MoveNext returns False. It is also invalid before the first call to MoveNext.

Return the value of the current item in the Iterator.

14.2.6 Properties

14.2.7 Current as AtomicDictionaryEntryMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current dictionary entry.
Notes: (Read only property)

14.2.8 Keys as Variant

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The keys array.
Notes: Just for the debugger to inspect.
(Read only property)

14.2.9 Values as Variant

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The values array.
Notes: Just for the debugger to inspect.
(Read only property)

14.3 class AtomicDictionaryMBS

14.3.1 class AtomicDictionaryMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An object that contains a list of key-value pairs.
Example:

```
Var a As New AtomicDictionaryMBS
a.Value("Hello") = 1
```

Notes: This is a layer on top of a Xojo Dictionary to make it thread safe.

Please use special methods to get/compare/increment and set to benefit most of the thread safety. This avoids some other thread to make modifications between you query a value and putting in the new value.

A thread-safe dictionary is useful when multiple threads may read and write the same dictionary at the same time and you need to avoid:

- data corruption
- race conditions
- inconsistent reads
- crashes/exceptions from concurrent modification

Common uses are:

- object cache
- session tokens
- producer/consumer pattern
- store data for games where network, rendering, AI and physics threads access it
- event subscriber lists
- shared preferences

You may use the normal dictionary if

- only one thread accesses it

- access is already protected by a mutex
- immutable data is used
- the threads are cooperative

- AtomicDictionaryMBS –Thread-Safe Dictionaries for Xojo
- MBS Xojo Plugins, version 26.3pr1

Interfaces: Iterable

14.3.2 Methods

14.3.3 Clear

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes all entries from the Dictionary.
Notes: Since API 2, Xojo prefers RemoveAll instead of Clear.

14.3.4 CompareAndSet(key As Variant, expectedValue as Variant, newValue as Variant) as Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compare a value and set it.
Example:

```
Var a As New AtomicDictionaryMBS
a.Value(1) = 2

Var r1 As Boolean = a.CompareAndSet(1, 2, 3) // works
Var r2 As Boolean = a.CompareAndSet(1, 2, 5) // value doesn't match
Var r3 As Boolean = a.CompareAndSet(1, 3, 4) // works

a.Value("test") = "Hello"

Var t1 As Boolean = a.CompareAndSet("test", "abc", "World") // value doesn't match
```

```
Var t2 As Boolean = a.CompareAndSet("test", "Hello", "found") // works

Break // inspect in debugger
```

Notes: If the value for key matches the expectedValue parameter, this functions set the entry to the new value and returns true. Otherwise it returns false.

This allows you to do a comparison and then exchange if the value matches.
Currently we only compare strings, numbers and booleans by value and others by reference.

14.3.5 Constructor(Clone as AtomicDictionaryMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a copy of the atomic dictionary.
Example:

```
Var a As New AtomicDictionaryMBS

a.Value("Hello") = "World"
a.Value("test") = 2

Var c As New AtomicDictionaryMBS(a)
MessageBox c.Value("Hello")
```

See also:

- 14.3.6 Constructor(values as Dictionary = nil) 3107

14.3.6 Constructor(values as Dictionary = nil)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new dictionary.
Example:

```
Var a As New Dictionary

a.Value("Hello") = "World"
a.Value("test") = 2

Var c As New AtomicDictionaryMBS(a)
MessageBox c.Value("Hello")
```

Notes: Optionally pass in an existing dictionary to copy the content.
See also:

- 14.3.5 Constructor(Clone as AtomicDictionaryMBS) 3107

14.3.7 ExecuteLocked(theDelegate as DictionaryActionMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Runs the delegate while the dictionary is locked.
Example:

```
Sub UpdateDic(a as AtomicDictionaryMBS)
a.Value("Hello") = a.Value("Hello") + 1
End Sub

Sub Test
Var a As New AtomicDictionaryMBS

a.Value("Hello") = 1

a.ExecuteLocked AddressOf UpdateDic

Var v As Variant = a.Value("Hello")

Break
End Sub
```

14.3.8 GetAndSet(key As Variant, newValue as Variant, defaultValue as Variant = nil) as Variant

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets a value and sets a new value.
Example:

```
Var a As New AtomicDictionaryMBS

a.Value(1) = 1

Var r1 As Boolean = a.GetAndSet(1, 2) // gets 1, sets 2
Var r2 As Boolean = a.GetAndSet(2, 3) // sets 3

MessageBox a.Value(1)+" "+a.Value(2) // 2 3
```

14.3.9 GetOrSet(key As Variant, defaultValue as Variant = nil) as Variant

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets a value or sets it.
Example:

```
Var a As New AtomicDictionaryMBS

a.Value(1) = 1

var r1 as Boolean = a.GetOrSet(1, 2) // gets 1, doesn't set 2
Var r2 As Boolean = a.GetOrSet(2, 3) // sets 3

MessageBox a.Value(1)+" "+a.Value(2) // 1 3
```

14.3.10 HasKey(key As Variant) As Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns True if key is in the Dictionary and False if it is not.
Example:

```
Var a As New AtomicDictionaryMBS
a.Value(1) = 2

Var r1 As Boolean = a.HasKey(1) // found
Var r2 As Boolean = a.HasKey(2) // key not found

Break
```

14.3.11 Increment(key As Variant, Value as Integer = 1) as Integer

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Increments the integer value for the given key.
Example:

```
Var a As New AtomicDictionaryMBS

var r1 as integer = a.Increment("test")
Var r2 As Integer = a.Increment("test")
Var r3 As Integer = a.Increment("test", 2)

MessageBox a.Value("test").StringValue // shows 4
```

Notes: Returns the new value.

14.3.12 Iterator as Iterator

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an iterator for the ¬¥for each¬¥ loops.
Notes: Returns AtomicDictionaryIteratorMBS object.

14.3.13 Key(Index as Integer) as Variant

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the value of key for the item in the Dictionary at the index passed.
Example:

```
Var a As New AtomicDictionaryMBS

a.Value("Hello") = 1
a.Value("World") = 2
a.Value(123) = 3

var u as integer = a.KeyCount-1
For i As Integer = 0 To u
MessageBox a.key(i)
Next
```

Notes: Keys are not case-sensitive, but they are encoding-sensitive. If there is no item in the Dictionary at the index passed, a call generates an OutOfBoundsException error.

14.3.14 Keys as Variant()

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns an array of keys allowing you to iterate through all the key/value pairs in the Dictionary.
Example:

```
Var a As New AtomicDictionaryMBS

a.Value("Hello") = 1
a.Value("World") = 2
a.Value(123) = 3
```

```
Var keys() As Variant = a.keys

Break // inspect in debugger
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each or For...Next to loop through all the keys. Keys are not case-sensitive, but they are encoding-sensitive.

14.3.15 Lookup(key As Variant, defaultValue As Variant = nil) As Variant

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Looks up the passed value of Key.
Example:

```
Var a As New AtomicDictionaryMBS

a.Value("Hello") = "World"

Var v1 As Variant = a.Lookup("Hello", Nil)
Var v2 As Variant = a.Lookup("test", "test")

Break
```

Notes: If Key is found, it returns the corresponding value. If key is not found, it returns the passed defaultValue.

14.3.16 Remove(key As Variant)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes the value-key pair from the Dictionary with the given key.
Example:

```
Var a As New AtomicDictionaryMBS

a.Value(1) = 1
a.Value(2) = 2
a.Value(3) = 3

a.Remove 2

MessageBox a.KeyCount.ToString // 2
```

Notes: If key is not in the Dictionary, it raises a KeyNotFoundException error.

14.3.17 RemoveAll

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes all entries from the Dictionary.
Example:

```
Var a As New AtomicDictionaryMBS
a.Value(1) = 2
a.Value(2) = 3
Print a.KeyCount.ToString+" entries"
a.RemoveAll
Print a.KeyCount.ToString+" entries after clear"
```

Notes: This invalidates all iterators that were created from the Dictionary.

14.3.18 SetIfAbsent(key As Variant, Value as Variant) as Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets value if absent.
Example:

```
Var a As New AtomicDictionaryMBS

a.Value(1) = 1

var r1 as Boolean = a.SetIfAbsent(1, 2)
Var r2 As Boolean = a.SetIfAbsent(2, 3)

MessageBox a.Value(1)+" "+a.Value(2) // 1 3
```

Notes: Returns true on success or false on failure.
e.g. for a Job queue to add a job, if it isn't already in the queue.

14.3.19 SetValues(keys() As Variant, values() As Variant)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets a lot of values for given keys in the dictionary.
Example:

```
Var d As New AtomicDictionaryMBS

Var keys() As Variant
keys.Add "a"
keys.Add "b"
keys.Add "c"
Var values() As Variant
values.Add "Apple"
values.Add "Berry"
values.Add "Citron"

d.SetValues keys, values

MessageBox d.KeyCount.ToString+" keys. b = "+d.Lookup("b").StringValue
```

Notes: Both arrays should have the same size.

14.3.20 Value(key As Variant) As Variant

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: etrieves a value to the key item in the Dictionary.
Example:

```
Var a As New AtomicDictionaryMBS

a.Value(1) = 1

var v as Variant = a.Value(1)

MessageBox v.StringValue
```

Notes: If you attempt to read a value for a key that is not in the Dictionary, a KeyNotFoundException error is raised. To avoid the exception, use the Lookup method to provide a default value if the key is not found or use the HasKey method to check if the key exists.
See also:

- 14.3.21 Value(key As Variant, Assigns value As Variant) 3113

14.3.21 Value(key As Variant, Assigns value As Variant)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Assigns a value to the key item in the Dictionary.
Example:

```
Var a As New AtomicDictionaryMBS

a.Value(1) = 1

var v as Variant = a.Value(1)

MessageBox v.StringValue
```

See also:

- 14.3.20 Value(key As Variant) As Variant 3113

14.3.22 Values as Variant()

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns all the values in the Dictionary as an array of Variants.
Example:

```
Var a As New AtomicDictionaryMBS

a.Value(1) = "Hello"
a.Value(2) = "World"
a.Value(3) = 123

Var values() As Variant = a.Values

Break // inspect in debugger
```

Notes: The order is stable and matches the order returned by Keys at least until the Dictionary is modified. Use this method with For Each to loop through all the values.

14.3.23 Properties

14.3.24 BinCount as Integer

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of bins the hash table uses. This is a measure of the hash table size, independent of the number of items the Dictionary contains.
Example:

```
Var a As New AtomicDictionaryMBS
Var b As Integer = a.BinCount
```

```
Break // See initial bincount in b, e.g. 61
```

Notes: (Read only property)

14.3.25 Clone as Dictionary

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a copy of the contents of the Dictionary allowing it to be manipulated independently of the original.
Example:

```
Var a As New AtomicDictionaryMBS
a.Value(1) = 2
a.Value(2) = 3
Var d As Dictionary = a.Clone
Break // inspect clone in debugger
```

Notes: Because any Dictionary items that are objects are really just references to the object, while the references themselves are duplicated, the objects they reference are not. Changing an object in one will change it in the other.

Great to view entries in Xojo debugger.
(Read only property)

14.3.26 KeyCount as Integer

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of key-value pairs in the Dictionary.
Example:

```
Var a As New AtomicDictionaryMBS

a.Value("Hello") = 1
MessageBox a.KeyCount.ToString

a.Value("World") = 2
MessageBox a.KeyCount.ToString
```

Notes: (Read only property)

14.3.27 Delegates

14.3.28 DictionaryActionMBS(dic As AtomicDictionaryMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The delegate used to execute an action on a locked dictionary.

14.4 class AtomicFlagMBS

14.4.1 class AtomicFlagMBS

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for an atomic flag.
Example:

```
Var f As New AtomicFlagMBS

// lock
Var b As Boolean = f.TestAndSet
If Not b Then
// got lock
Break

// unlock
f.Clear
Else
// failed to lock
Break
End If
```

Notes: This is an lock-free atomic boolean type.
Can be used to make your own semaphore or critical section class.

See also AtomicIntegerMBS class.

14.4.2 Methods

14.4.3 Clear

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Clears the flag.

14.4.4 Constructor

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Example:

```
Var a As New AtomicFlagMBS

Messagebox "Value: "+a.Value.ToString
```

Notes: Sets flag to false.
See also:

- 14.4.5 Constructor(value as AtomicFlagMBS) 3118
- 14.4.6 Constructor(value as Boolean) 3118

14.4.5 Constructor(value as AtomicFlagMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The copy constructor.
Example:

```
Var a As New AtomicFlagMBS(True)
Var c As New AtomicFlagMBS(a)

Messagebox "Value: "+c.Value.ToString
```

Notes: Copies the flag value.
See also:

- 14.4.4 Constructor 3118
- 14.4.6 Constructor(value as Boolean) 3118

14.4.6 Constructor(value as Boolean)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Example:

```
Var a As New AtomicFlagMBS(True)

Messagebox "Value: "+a.Value.ToString
```

Notes: Sets flag to true or false depending on the parameter.
See also:

- 14.4.4 Constructor 3118
- 14.4.5 Constructor(value as AtomicFlagMBS) 3118

14.4.7 Operator_Compare(other as AtomicFlagMBS) as Integer

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares two atomic flags.
Example:

```
Var a As AtomicFlagMBS = True
Var b As AtomicFlagMBS = False

If a >b Then
// works
Break
Else
// failed
Break
End If
```

14.4.8 Operator_Convert as Boolean

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts the flag to a boolean.
See also:

- 14.4.9 Operator_Convert(value as Boolean) 3119

14.4.9 Operator_Convert(value as Boolean)

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts a boolean to be the new value.
See also:

- 14.4.8 Operator_Convert as Boolean 3119

14.4.10 Test as Boolean

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks current value and reports back.

14.4.11 TestAndSet as Boolean

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Tests value and sets flag.
Example:

```
Var f As New AtomicFlagMBS

// lock
Var b As Boolean = f.TestAndSet
If Not b Then
// got lock
Break

// unlock
f.Clear
Else
// failed to lock
Break
End If
```

Notes: Atomically changes the state of a flag to set (true) and returns the value it held before.

14.4.12 Properties

14.4.13 Value as Boolean

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current value.
Notes: (Read and Write property)

14.5 class AtomicIntegerMBS

14.5.1 class AtomicIntegerMBS

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for an atomic integer.
Example:

```
// this should be a property
Var a As New AtomicIntegerMBS

// try to get new unique ID
Do
Var Expected As Int64 = a
Var newCount As Int64 = Expected+1
Var r As Boolean = a.CompareExchange(Expected, newCount)

If r Then
// We got our new ID, so continue
Exit
Else
// some other thread was quicker, so try again!
continue
End If
Loop
```

Notes: This class is to have one object as counter or flag to get/set from multiple threads.

See also AtomicFlagMBS class.

14.5.2 Methods

14.5.3 Add(Value as Int64) as Int64

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds an integer.
Notes: Atomically replaces the current value with the result of arithmetic addition of the value and argument.

Returns the value immediately preceding the effects of this function.

14.5.4 BitwiseAnd(Value as Int64) as Int64

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a thread safe bitwise and operation.
Notes: Atomically replaces the current value with the result of bitwise AND of the value and argument.

Returns the value immediately preceding the effects of this function.

14.5.5 BitwiseOr(Value as Int64) as Int64

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a thread safe bitwise or operation.
Example:

```
Var a As New AtomicIntegerMBS

// put in some value
a = 2

Var x As Int64 = a.BitwiseOr(4)

// later read the value
Var Value As Int64 = a

// Value is 2 or 4 = 6

Break
```

Notes: Atomically replaces the current value with the result of bitwise OR of the value and argument.

Returns the value immediately preceding the effects of this function.

14.5.6 BitwiseXOr(Value as Int64) as Int64

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Performs a thread safe bitwise xor operation.
Notes: Atomically replaces the current value with the result of bitwise XOR of the value and argument.

Returns the value immediately preceding the effects of this function.

14.5.7 CompareExchange(byref expected as Int64, desired as Int64) as Boolean

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares value and sets to new value.
Example:

```
Var a As New AtomicIntegerMBS

// put in some value
a = 3

// we check if value is 4, we set to 5
Var Expected1 As Int64 = 4
Var r1 As Boolean = a.CompareExchange(Expected1, 5)

// we check if value is 3, we set to 6
Var Expected2 As Int64 = 3
Var r2 As Boolean = a.CompareExchange(Expected2, 6)

// later read the value
Var Value As Int64 = a

Break
```

Notes: On success returns true.
On failure returns false and assigns current value to expected parameter.

14.5.8 Constructor

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
Example:

```
Var a As New AtomicIntegerMBS
Messagebox "Value: "+a.Value.ToString
```

See also:

- 14.5.9 Constructor(value as AtomicIntegerMBS) 3124
- 14.5.10 Constructor(value as Int64) 3124

14.5.9 Constructor(value as AtomicIntegerMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The copy constructor.
Example:

```
Var a As New AtomicIntegerMBS(123)
var c as new AtomicIntegerMBS(a)
MessageBox "Value: "+c.Value.ToString
```

See also:

- 14.5.8 Constructor 3124
- 14.5.10 Constructor(value as Int64) 3124

14.5.10 Constructor(value as Int64)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The value constructor.
Example:

```
Var a As New AtomicIntegerMBS(123)
Messagebox "Value: "+a.Value.ToString
```

See also:

- 14.5.8 Constructor 3124
- 14.5.9 Constructor(value as AtomicIntegerMBS) 3124

14.5.11 Decrement as Int64

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Decrements the value.
Notes: Returns new value.

14.5.12 Exchange(Value as Int64) as Int64

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Exchanges current value with new value.
Example:

```
Var a As New AtomicIntegerMBS

// put in some value
a = 3

// later read the value
Var oldValue As Int64 = a.Exchange(5)
Var NewValue As Int64 = a

Break
```

Notes: Returns old value.

14.5.13 Increment as Int64

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Increments the value.
Example:

```
Var a As New AtomicIntegerMBS

// put in some value
a.Value = 3

// increment it from multiple threads
Call a.Increment

// later read the value
Var v As Int64 = a.Value
MessageBox v.ToString
```

Notes: Returns new value.

14.5.14 Operator_Add(other as Int64) as Int64

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a value.

14.5.15 Operator_Compare(other as AtomicIntegerMBS) as Integer

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares two atomic integers.
Example:

```
Var a As AtomicIntegerMBS = 123
Var b As AtomicIntegerMBS = 234

If a <b Then
// works
Break
Else
// failed
Break
End If

If a >b Then
// failed
Break
Else
// works
Break
End If
```

14.5.16 Operator_Convert as Int64

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts value to integer.
Example:

```
Var a As New AtomicIntegerMBS
```

```
// put in some value
a = 3

// later read the value
Var v As Int64 = a
MessageBox v.ToString
```

See also:

- 14.5.17 Operator_Convert(value as Int64) 3127

14.5.17 Operator_Convert(value as Int64)

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts value on assignment.
See also:

- 14.5.16 Operator_Convert as Int64 3126

14.5.18 Operator_Subtract(other as Int64) as Int64

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Subtracts a value.

14.5.19 Subtract(Value as Int64) as Int64

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Subtracts a value.
Notes: Atomically replaces the current value with the result of arithmetic addition of the value and argument.

Returns the value immediately preceding the effects of this function.

14.5.20 Properties

14.5.21 Value as Int64

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get or set current value.
Notes: Atomically reads or replaces the current value.
(Read and Write property)

14.6 class AtomicQueueMBS

14.6.1 class AtomicQueueMBS

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for an atomic queue.
Example:

```
Var f As New AtomicQueueMBS

// one can add jobs
f.Push New MyJob
f.Push New MyJob

// someone else can pop them from the queue
Do
Var job As MyJob = f.PopLast // or f.PopFirst

job.Process

Loop Until f.count = 0
```

Notes: This can be used for e.g. a job queue, where multiple threads add or remove jobs.

14.6.2 Methods

14.6.3 Add(value as Variant)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Appends value to the array.
Example:

```
Var f As New AtomicQueueMBS

f.Add("Hello")
f.Add("World")

MessageBox f.FirstValue + " " + f.TopValue
// shows Hello World
```

See also:

- 14.6.4 Add(values as AtomicQueueMBS) 3130
- 14.6.5 Add(values() as Variant) 3130

14.6.4 Add(values as AtomicQueueMBS)

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds the values of the other queue to this queue.
Example:

```
Var a As New AtomicQueueMBS

a.Push 123
a.Push 234

Var b As New AtomicQueueMBS
b.Add a

// this uses Operator_Convert
Var values() As Variant = b

Break
```

See also:

- 14.6.3 Add(value as Variant) 3129
- 14.6.5 Add(values() as Variant) 3130

14.6.5 Add(values() as Variant)

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds the given values to the queue.
Example:

```
Var a As New AtomicQueueMBS

Var newValues() As Variant
newValues.Add 123
newValues.Add 234

a.Add newValues

Var values() As Variant = a
// check in debugger

Break
```

Notes: Like if you push each of the value in the array.
See also:

- 14.6.3 Add(value as Variant) 3129
- 14.6.4 Add(values as AtomicQueueMBS) 3130

14.6.6 AddIfAbsent(Value as Variant)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Appends the value if it doesn't exist already.
Example:

```
Var f As New AtomicQueueMBS

f.Add("Hello")
f.Add("World")

Var c1 As Integer = f.Count

f.AddIfAbsent "Hello"
// not added since it was already there

Var c2 As Integer = f.Count

f.AddIfAbsent "Hallo"

Var c3 As Integer = f.Count

Break // check in debugger
```

14.6.7 Clear

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Clears the list.
Example:

```
Var f As New AtomicQueueMBS

// put a value on the queue
f.Push 123
Var c As Integer = f.Count

// clear it
f.Clear

MessageBox c.ToString + " ->" + f.Count.ToString
```

14.6.8 Clone as AtomicQueueMBS

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Clones the queue into a new one.
Example:

```
Var f As New AtomicQueueMBS

f.Add("Hello")
f.Add("World")

var c as AtomicQueueMBS = f.Clone

MessageBox c.FirstValue + " " + c.TopValue
// shows Hello World
```

Notes: Copies the variant references.

14.6.9 Constructor

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.
See also:

- 14.6.10 Constructor(value as AtomicQueueMBS)

• 14.6.11 Constructor(values() as Variant) 3133

14.6.10 Constructor(value as AtomicQueueMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor to create a copy of the queue.
See also:

• 14.6.9 Constructor 3132

• 14.6.11 Constructor(values() as Variant) 3133

14.6.11 Constructor(values() as Variant)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor to create a new queue with the given values.
Example:

```
var f() as Variant

f.Add("Hello")
f.Add("World")

Var q As New AtomicQueueMBS(f)

Break // check in debugger
```

See also:

• 14.6.9 Constructor 3132

• 14.6.10 Constructor(value as AtomicQueueMBS) 3133

14.6.12 Contains(value as Variant) as Boolean

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks whether an item is already inside the object.
Example:

```
Var f As New AtomicQueueMBS

f.Add("Hello")
f.Add("World")
```

```
var r1 as Boolean = f.Contains("Hello")
Var r2 As Boolean = f.Contains("Test")
var r3 as Boolean = f.Contains(123)

If r1 And Not r2 and not r3 Then
MessageBox "Okay"
Else
MessageBox "Failed"
end if
```

Notes: Returns true to returns if value is found.

Compares integers and strings. Everything else is compared by pointer.

14.6.13 Insert(value as Variant)

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Inserts a new value on bottom of the queue.
Example:

```
Var f As New AtomicQueueMBS

f.Add("Hello")
f.Add("World")
f.Insert 123 // new first value

Break // check in debugger
```

Notes: Inserts value at position 0 in the array.
See also:

- 14.6.14 Insert(values as AtomicQueueMBS) 3134
- 14.6.15 Insert(values() as Variant) 3135

14.6.14 Insert(values as AtomicQueueMBS)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Inserts the value in the queue into the queue at the beginning.
Example:

```
Var f As New AtomicQueueMBS
```

```
f.Add("Hello")
f.Add("World")

Var q As New AtomicQueueMBS

q.Add "123"
q.Insert f

Break // check in debugger
```

Notes: Inserts value at position 0 in the array.
See also:

- 14.6.13 Insert(value as Variant) 3134
- 14.6.15 Insert(values() as Variant) 3135

14.6.15 Insert(values() as Variant)

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Inserts the value in the array into the queue at the beginning.
Example:

```
var f() as Variant

f.Add("Hello")
f.Add("World")

Var q As New AtomicQueueMBS

q.Add "123"
q.Insert f

Break // check in debugger
```

Notes: Inserts value at position 0 in the array.
See also:

- 14.6.13 Insert(value as Variant) 3134
- 14.6.14 Insert(values as AtomicQueueMBS) 3134

14.6.16 Operator_Add(value as Variant) as AtomicQueueMBS

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a value to the queue.
Example:

```
Var a As New AtomicQueueMBS

a = a + 123
a = a + 234

Var values() As Variant = a

Break
```

14.6.17 Operator_Compare(other as AtomicQueueMBS) as Integer

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares two queues.
Notes: Two queues are equal if

- you compare same object against itself
- both have same sizes and each of the variant pointers are the same.

This allows you to compare a copy of the queue or one with the same objects.

14.6.18 Operator_Convert as Variant()

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Converts the queue to an array.
Example:

```
Var q As New AtomicQueueMBS

q.Push New MyJob
q.Push New MyJob
q.Push New MyJob
q.Push New MyJob
q.Push New MyJob

Var other As New AtomicQueueMBS
other.add(q)

If other = q Then
```

```
Break // equal
Else
Var qv() As Variant = q.Values
Var ov() As Variant = other.values
// not equal, so check arrays in debugger

Break
End If
```

Notes: Same as calling values function.

14.6.19 PopFirst as Variant

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the first item and removes it from the queue.
Example:

```
Var q As New AtomicQueueMBS

q.Push 1
q.Push 2
q.Push 3
q.Push 4
q.Push 5

Var f As Variant = q.PopFirst // 1
Var l As Variant = q.PopLast // 5
Var c As Integer = q.Count // 3 remaining

Break
```

Notes: This is for a first-in-first-out queue.

14.6.20 PopLast as Variant

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the last item and removes it from the queue.
Notes: This is for a first-in-last-out queue, also known as a stack.

14.6.21 Push(value as Variant)

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Pushes a new value on top of the queue.
Notes: Appends value to the array.

14.6.22 Values as Variant()

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries array of all values.

14.6.23 Properties

14.6.24 Count as Integer

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the number of values.
Example:

```
Var f As New AtomicQueueMBS

f.Push 123
MessageBox f.Count.ToString

f.Push 234
MessageBox f.Count.ToString
```

Notes: (Read only property)

14.6.25 FirstValue as Variant

MBS Util Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The first value.
Example:

```
Var f As New AtomicQueueMBS

f.Add("Hello")
f.Add("World")
```

MessageBox f.FirstValue // shows Hello

Notes: Or nil if there is no value.
(Read only property)

14.6.26 TopValue as Variant

MBS Util Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Looks up the top value.
Notes: Does not remove the top value, but keeps it in the queue.
(Read and Write property)

Chapter 15

Audio

15.1 class AUPlayerMBS

15.1.1 class AUPlayerMBS

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The audio unit player.
Notes: This is a better Core Audio based player which has a lot of features like pitch, rate, volume, equalizer and other features.
Beside playing audio you can also use this class to get sample data from audio files.

Currently only stereo is supported (2 channels maximum).

15.1.2 Methods

15.1.3 ChannelMap as Integer()

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Queries current channel map.
Notes: The map should have an entry for each input channel and inside the number of the output channel or -1 to keep it silent.

15.1.4 Data as Memoryblock

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Copies the data to play.
Notes: The other data properties define what format this data has.
Typically 4 byte floats per sample interleaved for all channels.

15.1.5 LoadFile(file as folderitem, InputChannels as Integer = 2, OutputChannels as Integer = 2) as boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Loads an audio file.
Notes: InputChannels is the number of channels we want to get back from file reader.
OutputChannels is the number of channels we want to have for output.
Returns true on success or false on failure.

15.1.6 LoadFileMT(file as folderitem, InputChannels as Integer = 2, OutputChannels as Integer = 2) as boolean

MBS MacOSX Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Loads an audio file.
Notes: The work is performed on a preemptive thread, so this function does not block the application and

can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

InputChannels is the number of channels we want to get back from file reader.
OutputChannels is the number of channels we want to have for output.
Returns true on success or false on failure.

15.1.7 Pause

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Pauses playback.
Notes: Lasterror is set.

15.1.8 Play

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Starts playback.
Notes: Lasterror is set.

15.1.9 Reset

MBS MacOSX Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Resets audio units.
Notes: Useful after changing options.

15.1.10 setChannelMap(values() as Integer)

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Sets a new channel map.
Notes: The map should have an entry for each input channel and inside the number of the output channel or -1 to keep it silent.

15.1.11 updateEQ(eqBands() as Double)

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Updates equalizer.
Notes: Please pass array of 32 values from -12 to 12.
Lasterror is set.
See also:

- 15.1.12 updateEQ(eqBands() as single) 3144

15.1.12 updateEQ(eqBands() as single)

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Updates equalizer.
Notes: Please pass array of 32 values from -12 to 12.
Lasterror is set.
See also:

- 15.1.11 updateEQ(eqBands() as Double) 3143

15.1.13 Properties

15.1.14 ClientFormatString as String

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The input format description string.
Notes: (Read only property)

15.1.15 ConverterHandle as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The handle to the converter audio unit.
Notes: (Read only property)

15.1.16 CurrentDeviceID as UInt32

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Get or set the current device.
Notes: Please check OutputDevices dictionary for which devices are available.
(Read and Write property)

15.1.17 CurrentTime as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The current time in seconds.
Notes: Lasterror is set.
(Read and Write property)

15.1.18 DataIsFloat as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether data is floating point.
Notes: (Read only property)

15.1.19 DataIsInterleaved as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether data is interleaved.
Notes: (Read only property)

15.1.20 DataIsNativeEndian as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether data is native endian.
Notes: (Read only property)

15.1.21 DataIsPCM as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether data is PCM format.
Notes: Linear PCM.
(Read only property)

15.1.22 DataIsSignedInteger as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether data is signed integers.
Notes: (Read only property)

15.1.23 DataNumberChannels as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Number of channels.
Notes: (Read only property)

15.1.24 DataNumberChannelStreams as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Number of channels.
Notes: (Read only property)

15.1.25 DataNumberInterleavedChannels as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Number of interleaved channels.
Notes: (Read only property)

15.1.26 DataSampleWordSize as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The size of a sample word.
Notes: (Read only property)

15.1.27 DefaultDeviceID as UInt32

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Queries the Core Audio ID of the default device.
Notes: (Read only property)

15.1.28 EnablePeakLocking as Boolean

MBS MacOSX Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Whether peak locking is enabled.
Notes: Default value is true.
Only if UseNewTimePitchUnit is set to true.
(Read and Write property)

15.1.29 EqualizerHandle as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The handle to the equalizer audio unit.
Notes: (Read only property)

15.1.30 File as FolderItem

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The reference to the folderitem used to load audio file.
Notes: (Read only property)

15.1.31 GraphHandle as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The handle to the audio graph.
Notes: (Read only property)

15.1.32 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The last error code.
Notes: Zero is no error.
(Read and Write property)

15.1.33 LoopIn as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The position where loop starts.
Notes: (Read and Write property)

15.1.34 Looping as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether to loop.
Notes: (Read and Write property)

15.1.35 LoopOut as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The position where loop ends.
Notes: (Read and Write property)

15.1.36 MaximumFramesPerSlice as Integer

MBS MacOSX Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: The maximum number of frames per slice.
Notes: Default seems to be 1156 by Core Audio.
(Read and Write property)

15.1.37 MeterLevel as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Queries meter level.
Notes: Lasterror is set.
Value is smaller than -120 if unknown.
(Read only property)

15.1.38 MixerHandle as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The handle to the mixer audio unit.
Notes: (Read only property)

15.1.39 OutputDevices as Dictionary

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Queries a dictionary with output devices.
Example:

```
Var a As New AUPlayerMBS
Var d As Dictionary = a.OutputDevices

For Each key As String In d.keys
Var name as string = d.Value(key)

MessageBox key+": "+name
Next
```

Notes: Key is the ID and value is the name of the device.
e.g. ID 84 for a MacBook Pro Speaker, but the number is certainly different for your computer.

Changed from regular to shared property in version 22.3.
(Read only property)

15.1.40 OutputFormatString as String

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The output format description string.
Notes: (Read only property)

15.1.41 OutputHandle as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The handle to the output audio unit.
Notes: (Read only property)

15.1.42 OutputUnit as Integer

MBS MacOSX Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Which output unit to use.
Notes: Apple offer various output units and here you can decide which one to use.
Setting takes effect the next time you call LoadFile.
(Read and Write property)

15.1.43 OutputVolume as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The output volume.
Notes: Lasterror is set.
From 0.0 to 1.0.
(Read and Write property)

15.1.44 Overlap as Double

MBS MacOSX Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Defines the overlap.
Notes: Range is 3.0 to 32.0 and default is 8.0.
Only if UseNewTimePitchUnit is set to true.
(Read and Write property)

15.1.45 Pan as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The output pan.
Notes: From -1.0 to 1.0.
Lasterror is set.
(Read and Write property)

15.1.46 PitchRate as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The pitch rate.
Notes: Lasterror is set.
(Read and Write property)

15.1.47 Playing as Boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether the player is playing.
Notes: (Read and Write property)

15.1.48 SampleRate as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The sample rate of the audio file.
Notes: (Read only property)

15.1.49 Tag as Variant

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The tag value.
Notes: You can use this property to store whatever you like.
(Read and Write property)

15.1.50 TimePitchHandle as Integer

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The handle to the time audio unit.
Notes: (Read only property)

15.1.51 TimePitchUnit as Integer

MBS MacOSX Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Which time pitch unit to use.
Notes: Apple offer various time pitch units and here you can decide which one to use.
Setting takes effect the next time you call LoadFile.
(Read and Write property)

15.1.52 TimeRate as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The time rate.
Notes: Lasterror is set.
(Read and Write property)

15.1.53 TrackLength as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Length of the audio track in seconds.
Notes: Lasterror is set.
(Read only property)

15.1.54 VariSpeedHandle as Integer

MBS MacOSX Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The handle to the vari speed audio unit.
Notes: (Read only property)

15.1.55 InputEnabled(inputNum as UInt32) as boolean

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Enable or disable input.
Notes: Lasterror is set.
(Read and Write computed property)

15.1.56 InputVolume(inputNum as UInt32) as Double

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The input volume.
Notes: Lasterror is set.
(Read and Write computed property)

15.1.57 Constants

Output Units

Constant	Value	Description
OutputUnitDefault	0	Plugin default, currently HALOutput.
OutputUnitDefaultOutput	3	A specialisation of AUHAL that is used to track the user's selection of the default device as set in the Sound Prefs
OutputUnitGenericOutput	1	A generic output unit provides the start/stop API, and provides the basic services to convert Linear PCM formats.
OutputUnitHALOutput	2	The audio unit that interfaces to any audio device. The user specifies which audio device to track. The audio unit can do input from the device as well as output to the device. Bus 0 is used for the output side, bus 1 is used to get audio input from the device.
OutputUnitSystemOutput	4	A specialisation of AUHAL that is used to track the user's selection of the device to use for sound effects, alerts and other UI sounds.

Time Pitch Units

Constant	Value	Description
TimePitchUnitDefault	0	Default, plugin chooses one. (normal TimePitch)
TimePitchUnitTimePitch	1	An audio unit that can be used to have independent control of both playback rate and pitch.
TimePitchUnitVarispeed	2	An audio unit that can be used to control playback rate (as the rate is faster, the pitch is higher).

15.2 class CAPlayThroughMBS

15.2.1 class CAPlayThroughMBS

MBS MacOSX Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class to do active play through on Mac OS X using CoreAudio.
Notes: This class uses newer code than the AudioPlayThruMBS class and may work better for some people.
Blog Entries

15.2.2 Methods

15.2.3 Constructor(InputDeviceID as Integer, OutputDeviceID as Integer)

MBS MacOSX Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: Lasterror is set.
Device IDs are the IDs you get in the CoreAudio classes.

15.2.4 IsRunning as boolean

MBS MacOSX Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether playthrough is running.

15.2.5 Start

MBS MacOSX Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Starts play through.
Notes: Lasterror is set.

15.2.6 Stop

MBS MacOSX Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stops play through.
Notes: Lasterror is set.

15.2.7 Properties

15.2.8 ExtraLatency as Integer

MBS MacOSX Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Extra latency.
Notes: When the latency is calculated, we add this value.
Unit is bytes.

Calculation of the buffer size is like this:

if (UseMinimumLatency)
InToOutSampleOffset = ExtraLatency + InputDevice.SafetyOffset + OutputDevice.SafetyOffset
else
InToOutSampleOffset = ExtraLatency + InputDevice.SafetyOffset + InputDevice.BufferSizeFrames + OutputDevice.SafetyOffset + OutputDevice.BufferSizeFrames
(Read and Write property)

15.2.9 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code reported.
Notes: (Read and Write property)

15.2.10 OutputUnitHandle as Integer

MBS MacOSX Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the handle for the output Audio Unit.
Notes: (Read only property)

15.2.11 UseMinimumLatency as Boolean

MBS MacOSX Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether to reduce latency to the absolute minimum.
Notes: By default a large latency is used to ensure a smoother playthrough.
But you can have it set to the absolute minimum.

Calculation of the buffer size is like this:

if (UseMinimumLatency)
InToOutSampleOffset = ExtraLatency + InputDevice.SafetyOffset + OutputDevice.SafetyOffset
else
InToOutSampleOffset = ExtraLatency + InputDevice.SafetyOffset + InputDevice.BufferSizeFrames + OutputDevice.SafetyOffset + OutputDevice.BufferSizeFrames
(Read and Write property)

15.2.12 Volume as Double

MBS MacOSX Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get or set the volume of the output audio unit.
Notes: Lasterror is set.
Range is from 0.0 to 1.0.
(Read and Write computed property)

15.3 class CoreAudioListenerMBS

15.3.1 class CoreAudioListenerMBS

MBS MacOSX Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The class to watch for changes to CoreAudio property.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo / Real Studio plug-ins in version 15.0
- MBS Xojo / Real Studio Plugins, version 15.0pr7

15.3.2 Methods

15.3.3 Constructor(ObjectID as UInt32, PropertySelector as UInt32, PropertyScope as UInt32, PropertyElement as UInt32)

MBS MacOSX Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The constructor.
Notes: Please pass object ID and property selector values (see example project).
Lasterror is zero on success.

15.3.4 Destructor

MBS MacOSX Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The destructor.

15.3.5 Properties

15.3.6 LastError as Integer

MBS MacOSX Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The last error code.
Notes: (Read only property)

15.3.7 ObjectID as UInt32

MBS MacOSX Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The object ID used in constructor.
Notes: (Read only property)

15.3.8 PropertyElement as UInt32

MBS MacOSX Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The element ID used in constructor.
Notes: (Read only property)

15.3.9 PropertyScope as UInt32

MBS MacOSX Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The scope value used in constructor.
Notes: (Read only property)

15.3.10 PropertySelector as UInt32

MBS MacOSX Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The selector value used in constructor.
Notes: (Read only property)

15.3.11 Events

15.3.12 Changed

MBS MacOSX Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The watched property changed.

15.4 class CoreAudioMBS

15.4.1 class CoreAudioMBS

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: A class for low level CoreAudio calls.
Notes: Currently not finished for the 4.0 release.
Blog Entries

- MBS Xojo Plugins, version 23.0pr8
- MBS Real Studio Plugins, version 11.4pr2

- MBS Real Studio Plugins, version 11.1pr11

15.4.2 Methods

15.4.3 AudioDeviceGetPropertyCFString(AudioDeviceID as Integer, channel as Integer, isinput as boolean, propertyID as string) as string

MBS MacOSX Plugin, Plugin Version: 10.2, Platform: macOS, Targets: All.

Function: Gets a property value from the Audio Device.
Example:

```
Var c As New CoreAudioMBS

Var DefaultInputDeviceMem As MemoryBlock = c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDefaultInputDevice)
Var DefaultInputDeviceID As Integer = DefaultInputDeviceMem.Long(0)
Var DefaultInputDeviceCFName As CFStringMBS = c.AudioDeviceGetPropertyCFString(DefaultInputDeviceID, 0, True, c.kAudioDevicePropertyDeviceNameCFString)
Var DefaultInputDeviceName As String = DefaultInputDeviceCFName.Str

MessageBox DefaultInputDeviceName
```

Notes: Lasterror is set.
The property you query must be one of the CFString properties.

15.4.4 AudioDeviceGetPropertyInfo(AudioDeviceID as Integer, channel as Integer, isinput as boolean, propertyID as string, byref size as Integer, byref writeable as boolean)

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Gets property information from an Audio Unit.
Example:

```
Var c As New CoreAudioMBS

Var DefaultInputDeviceMem As MemoryBlock = c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDefaultInputDevice)
Var DefaultInputDeviceID As Integer = DefaultInputDeviceMem.Long(0)

Var size As Integer
Var writeable As Boolean

c.AudioDeviceGetPropertyInfo(DefaultInputDeviceID, 0, True, c.kAudioDevicePropertyDeviceName, size, writeable)

If writeable Then
MessageBox "Writeable, "+size.ToString+" bytes"
Else
MessageBox "Read only, "+size.ToString+" bytes"
End If
```

Notes: Lasterror is set.

15.4.5 AudioDeviceGetPropertyMemory(AudioDeviceID as Integer, channel as Integer, isinput as boolean, propertyID as string) as memoryblock

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Gets a property value from the Audio Device.
Example:

```
Var c As New CoreAudioMBS

Var DefaultOutputDeviceMem As MemoryBlock = c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDefaultOutputDevice)
Var DefaultOutputDeviceID As Integer = DefaultOutputDeviceMem.Long(0)

Var mem1 As MemoryBlock = c.AudioDeviceGetPropertyMemory(DefaultOutputDeviceID, 0, False, c.kAudioDevicePropertyVolumeDecibels)
Var VolumeDecibels As Single = mem1.SingleValue(0)
```

Var mem2 As MemoryBlock = c.AudioDeviceGetPropertyMemory(DefaultOutputDeviceID, 0, False, c.kAudioDevicePropertyVolumeScalar)
Var VolumeScalar As Single = mem2.SingleValue(0)

Break

Notes: Lasterror is set.

15.4.6 AudioDeviceGetPropertyString(AudioDeviceID as Integer, channel as Integer, isinput as boolean, propertyID as string) as string

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Gets a property value from the Audio Device.
Example:

Var c As New CoreAudioMBS

Var DefaultInputDeviceMem As MemoryBlock = c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDefaultInputDevice)
Var DefaultInputDeviceID As Integer = DefaultInputDeviceMem.Long(0)
Var DefaultInputDeviceName As String = c.AudioDeviceGetPropertyString(DefaultInputDeviceID, 0, True, c.kAudioDevicePropertyDeviceName)

MessageBox DefaultInputDeviceName

Notes: Lasterror is set.

15.4.7 AudioDeviceSetPropertyMemory(AudioDeviceID as Integer, when as memoryblock, channel as Integer, isinput as boolean, propertyID as string, data as memoryblock, offset as Integer, length as Integer)

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Sets a property value for the Audio Device.
Example:

Var c As New CoreAudioMBS

Var DefaultOutputDeviceMem As MemoryBlock = c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDefaultOutputDevice)
Var DefaultOutputDeviceID As Integer = DefaultOutputDeviceMem.Long(0)

```
Var mem1 As MemoryBlock = c.AudioDeviceGetPropertyMemory(DefaultOutputDeviceID, 0, False, c.kAudioDevicePropertyVolumeScalar)
Var VolumeScalar As Single = mem1.SingleValue(0)

// set volume to 50%
Var VolumeScalar2 As Single = 0.5
Var mem2 As New MemoryBlock(4)
mem2.SingleValue(0) = VolumeScalar2

c.AudioDeviceSetPropertyMemory(DefaultOutputDeviceID, Nil, 0, False, c.kAudioDevicePropertyVolumeScalar, mem2, 0, mem2.Size)

// now query again
Var mem3 As MemoryBlock = c.AudioDeviceGetPropertyMemory(DefaultOutputDeviceID, 0, False, c.kAudioDevicePropertyVolumeScalar)
Var VolumeScalar3 As Single = mem3.SingleValue(0)

Break
```

Notes: Lasterror is set.

15.4.8 AudioDeviceSetPropertyString(AudioDeviceID as Integer, when as memoryblock, channel as Integer, isinput as boolean, propertyID as string, data as string)

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Sets a property value for the Audio Device.
Notes: Lasterror is set.

15.4.9 AudioHardwareGetPropertyCFString(propertyID as string) as string

MBS MacOSX Plugin, Plugin Version: 10.2, Platform: macOS, Targets: All.

Function: Gets a property value from the Audio Hardware.
Notes: Lasterror is set.
The property you query must be one of the CFString properties.

15.4.10 AudioHardwareGetPropertyInfo(propertyID as string, byref size as Integer, byref writeable as boolean)

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Gets property information from the Audio Hardware.
Example:

```
Var c As New CoreAudioMBS

Var writeable As Boolean
Var size As Integer
c.AudioHardwareGetPropertyInfo(c.kAudioHardwarePropertyDefaultOutputDevice, size, writeable)

If writeable Then
MessageBox "Writeable, "+size.ToString+" bytes"
else
MessageBox "Read only, "+size.ToString+" bytes"
End If
```

Notes: Lasterror is set.

15.4.11 AudioHardwareGetPropertyMemory(propertyID as string) as memoryblock

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Gets a property value from the Audio Hardware.
Example:

```
Var c As New CoreAudioMBS

Var DefaultInputDeviceMem As MemoryBlock = c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDefaultInputDevice)
Var DefaultInputDeviceID As Integer = DefaultInputDeviceMem.Long(0)
Var DefaultInputDeviceName As String = c.AudioDeviceGetPropertyString(DefaultInputDeviceID, 0, True, c.kAudioDevicePropertyDeviceName)

MessageBox DefaultInputDeviceName
```

Notes: Lasterror is set.

15.4.12 AudioHardwareGetPropertyString(propertyID as string) as string

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Gets a property value from the Audio Hardware.
Notes: Lasterror is set.

15.4.13 AudioHardwareSetPropertyMemory(propertyID as string, data as memoryblock, offset as Integer, length as Integer)

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Sets a property value for the Audio Hardware.
Notes: Lasterror is set.

15.4.14 AudioHardwareSetPropertyString(propertyID as string, data as string)

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Sets a property value for the Audio Hardware.
Notes: Lasterror is set.

15.4.15 AudioObjectGetPropertyData(inObjectID as Integer, AddressSelector as UInt32, AddressScope as UInt32, AddressElement as UInt32, QualifierData as memoryblock = nil, InputData as Memoryblock = nil) as memoryblock

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Queries an AudioObject to get the data of the given property and places it in the provided buffer.
Notes: The plugin queries size and creates a buffer for the result.

inObjectID: The AudioObject to query.
AddressSelector, AddressScope or AddressElement: An audio object property address indicating which property is being queried.
QualifierData: A buffer of data to be used in determining the data of the property being queried. Note that not all properties require qualification, in which case this value will be nil.

If InputData is nil, we query size and allocate buffer of required size.
If InputData is not nil, we use this memoryblock with its size. Result is InputData on success.

Lasterror is set.

15.4.16 AudioObjectGetPropertyDataSize(inObjectID as Integer, AddressSelector as UInt32, AddressScope as UInt32, AddressElement as UInt32, QualifierData as memoryblock = nil) as UInt32

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Queries an AudioObject to find the size of the data for the given property.
Notes: inObjectID: The AudioObject to query.
AddressSelector, AddressScope or AddressElement: An audio object property address indicating which property is being queried.
QualifierData: A buffer of data to be used in determining the data of the property being queried. Note that not all properties require qualification, in which case this value will be nil.

Returns an UInt32 indicating how many bytes the data for the given property occupies.
Lasterror is set.

15.4.17 AudioObjectSetPropertyData(inObjectID as Integer, AddressSelector as UInt32, AddressScope as UInt32, AddressElement as UInt32, Data as Memoryblock, QualifierData as memoryblock = nil)

MBS MacOSX Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Tells an AudioObject to change the value of the given property using the provided data.
Notes: inObjectID: The AudioObject to query.
AddressSelector, AddressScope or AddressElement: An audio object property address indicating which property is being queried.
QualifierData: A buffer of data to be used in determining the data of the property being queried. Note that not all properties require qualification, in which case this value will be nil.

Lasterror is set.

15.4.18 AudioOutputUnitStart(componenthandle as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: Starts the Audio Unit.
Notes: Errorcode is returned.

15.4.19 AudioOutputUnitStop(componenthandle as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: Stops the AudioUnit.
Notes: Errorcode is returned.

15.4.20 AudioStreamGetPropertyCFString(AudioStreamID as Integer, channel as Integer, propertyID as string) as string

MBS MacOSX Plugin, Plugin Version: 10.2, Platform: macOS, Targets: All.

Function: Gets a property value from the Audio Stream.
Notes: Lasterror is set.
The property you query must be one of the CFString properties.

15.4.21 AudioStreamGetPropertyInfo(AudioStreamID as Integer, channel as Integer, propertyID as string, byref size as Integer, byref writeable as boolean)

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Gets property information from an Audio Stream.
Notes: Lasterror is set.

15.4.22 AudioStreamGetPropertyMemory(AudioStreamID as Integer, channel as Integer, propertyID as string) as memoryblock

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Gets a property value from the Audio Stream.
Notes: Lasterror is set.

15.4.23 AudioStreamGetPropertyString(AudioStreamID as Integer, channel as Integer, propertyID as string) as string

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Gets a property value from the Audio Stream.
Notes: Lasterror is set.

15.4.24 AudioStreamSetPropertyMemory(AudioStreamID as Integer, when as memoryblock, channel as Integer, propertyID as string, data as memoryblock, offset as Integer, length as Integer)

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Sets a property value for the Audio Stream.
Notes: Lasterror is set.

15.4.25 AudioStreamSetPropertyString(AudioStreamID as Integer, when as memoryblock, channel as Integer, propertyID as string, data as string)

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Sets a property value for the Audio Stream.
Notes: Lasterror is set.

15.4.26 AudioUnitGetParameter(AudioUnit as Integer, ParameterID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer) as single

MBS MacOSX Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Gets an audio unit parameter.

15.4.27 AudioUnitGetPropertyCFString(AudioUnit as Integer, propertyID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer) as string

MBS MacOSX Plugin, Plugin Version: 10.2, Platform: macOS, Targets: All.

Function: Gets a property of an Audio Unit.
Notes: Lasterror is set.
Constants for AudioUnitScope:

kAudioUnitScope_Global	= 0
kAudioUnitScope_Input	= 1
kAudioUnitScope_Output	= 2
kAudioUnitScope_Group	= 3
kAudioUnitScope_Part	= 4

The property you query must be one of the CFString properties.

15.4.28 AudioUnitGetPropertyInfo(AudioUnit as Integer, propertyID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer, byref size as Integer, byref writeable as boolean)

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Gets property information from the Audio Unit.
Notes: Lasterror is set.
Constants for AudioUnitScope:

kAudioUnitScope_Global	= 0
kAudioUnitScope_Input	= 1
kAudioUnitScope_Output	= 2
kAudioUnitScope_Group	= 3
kAudioUnitScope_Part	= 4

15.4.29 AudioUnitGetPropertyMemory(AudioUnit as Integer, propertyID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer) as memoryblock

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Gets a property of an Audio Unit.
Notes: Lasterror is set.
Constants for AudioUnitScope:

kAudioUnitScope_Global	= 0
kAudioUnitScope_Input	= 1
kAudioUnitScope_Output	= 2
kAudioUnitScope_Group	= 3
kAudioUnitScope_Part	= 4

15.4.30 AudioUnitGetPropertyString(AudioUnit as Integer, propertyID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer) as string

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Gets a property of an Audio Unit.
Notes: Lasterror is set.
Constants for AudioUnitScope:

kAudioUnitScope_Global	= 0
kAudioUnitScope_Input	= 1
kAudioUnitScope_Output	= 2
kAudioUnitScope_Group	= 3
kAudioUnitScope_Part	= 4

15.4.31 AudioUnitInitialize(componenthandle as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: Initializes the Audio Unit.
Notes: Errorcode is returned.

15.4.32 AudioUnitReset(componenthandle as Integer, scope as Integer, element as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: Resets the Audio Unit.
Notes: Errorcode is returned.

Useful constants:

kAudioUnitScope_Global	= 0
kAudioUnitScope_Input	= 1
kAudioUnitScope_Output	= 2
kAudioUnitScope_Group	= 3
kAudioUnitScope_Part	= 4

15.4.33 AudioUnitSetParameter(AudioUnit as Integer, ParameterID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer, value as single, BufferOffsetInFrames as Integer)

MBS MacOSX Plugin, Plugin Version: 4.2, Platform: macOS, Targets: All.

Function: Sets an audio unit parameter.

15.4.34 AudioUnitSetPropertyMemory(AudioUnit as Integer, propertyID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer, data as memoryblock, offset as Integer, length as Integer)

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Sets a property of an Audio Unit.
Notes: Lasterror is set.
Constants for AudioUnitScope:

kAudioUnitScope_Global	= 0
kAudioUnitScope_Input	= 1
kAudioUnitScope_Output	= 2
kAudioUnitScope_Group	= 3
kAudioUnitScope_Part	= 4

15.4.35 AudioUnitSetPropertyString(AudioUnit as Integer, propertyID as Integer, AudioUnitScope as Integer, AudioUnitElement as Integer, data as string)

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: Sets a property value for the Audio Unit.
Notes: Lasterror is set.
Constants for AudioUnitScope:

kAudioUnitScope_Global	= 0
kAudioUnitScope_Input	= 1
kAudioUnitScope_Output	= 2
kAudioUnitScope_Group	= 3
kAudioUnitScope_Part	= 4

15.4.36 AudioUnitUninitialize(componenthandle as Integer) as Integer

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: Desktop only.

Function: Uninitializes the Audio Unit.
Notes: Errorcode is returned.

15.4.37 CloseComponent(componenthandle as Integer)

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: All.

Function: Closes a component.
Notes: Do not use the componenthandle any more after this call!

15.4.38 CoreAudioConvertHostTimeToNanosMBS(inHostTime as UInt64) as UInt64

MBS MacOSX Plugin, Plugin Version: 7.0, Platform: macOS, Targets: All.

Function: Convert the given host time to a time in Nanoseconds.
Example:

```
Var value1 As UInt64 = CoreAudioMBS.CoreAudioGetCurrentHostTimeMBS
Var value2 As UInt64 = CoreAudioMBS.CoreAudioGetCurrentHostTimeMBS
Var value3 As UInt64 = CoreAudioMBS.CoreAudioGetCurrentHostTimeMBS

Var time1 As UInt64 = CoreAudioMBS.CoreAudioConvertHostTimeToNanosMBS(value1)
Var time2 As UInt64 = CoreAudioMBS.CoreAudioConvertHostTimeToNanosMBS(value2)
Var time3 As UInt64 = CoreAudioMBS.CoreAudioConvertHostTimeToNanosMBS(value3)

// HostTime and Nanoseconds can be same on Intel Macs
// on Apple Silicon they are not the same!

Break
```

Notes: Returns 0 on any error.

15.4.39 CoreAudioConvertNanosToHostTimeMBS(inNanos as UInt64) as UInt64

MBS MacOSX Plugin, Plugin Version: 7.0, Platform: macOS, Targets: All.

Function: Convert the given Nanoseconds time to a time in the host clock's time base.
Notes: Returns 0 on any error.

15.4.40 CoreAudioGetCurrentHostTimeMBS as UInt64

MBS MacOSX Plugin, Plugin Version: 7.0, Platform: macOS, Targets: All.

Function: Retrieve the current host time value.
Example:

```
Var value1 As UInt64 = CoreAudioMBS.CoreAudioGetCurrentHostTimeMBS
Var value2 As UInt64 = CoreAudioMBS.CoreAudioGetCurrentHostTimeMBS
Var value3 As UInt64 = CoreAudioMBS.CoreAudioGetCurrentHostTimeMBS

Break // you see how it changes and how long a function call can take
```

Notes: Returns 0 on any error.

15.4.41 CoreAudioGetHostClockFrequencyMBS as Double

MBS MacOSX Plugin, Plugin Version: 7.0, Platform: macOS, Targets: All.

Function: Retrieve the number of ticks per second of the host clock.
Example:

```
Var value As Double = CoreAudioMBS.CoreAudioGetHostClockFrequencyMBS
MessageBox value.ToString // 1 billion
```

15.4.42 GetHostClockMinimumTimeDeltaMBS as Integer

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: Retrieve the smallest number of ticks difference between two succeeding values of the host clock.
Example:

```
Var value As Integer = CoreAudioMBS.GetHostClockMinimumTimeDeltaMBS
MessageBox value.ToString // 1
```

Notes: For instance, if this value is 5 and the first value of the host clock is X then the next time after X will be at greater than or equal X+5.
Returns an unsigned integer value.

15.4.43 OpenDefaultComponent(type as string, subtype as string) as Integer

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: All.

Function: Opens the default component for the given type and subtype string.
Example:

```
Var c As New CoreAudioMBS

Const kAudioUnitComponentType = "aunt"
Const kAudioUnitSubType_Output = "out "
```

```
// open default output component
Var n As Integer = c.OpenDefaultComponent(kAudioUnitComponentType, kAudioUnitSubType_Output)

If n = 0 Then
Break // failed
Else
Break
// okay, so close
c.CloseComponent(n)
End If
```

Notes: You can check the "QT Components list" example project for which components are installed.
Returns 0 on any error.
type and subtype must be 4 letter codes.

useful constans:

```
kAudioUnitComponentType                = "aunt"
kAudioUnitSubType_Output               = "out "
kAudioUnitID_HALOutput                 = "ahal"
kAudioUnitID_DefaultOutput             = "def "
kAudioUnitID_SystemOutput              = "sys "
kAudioUnitID_GenericOutput             = "genr"
kAudioUnitSubType_MusicDevice          = "musd"
kAudioUnitID_DLSSynth                  = "dls "
kAudioUnitSubType_SampleRateConverter  = "srcv"
kAudioUnitID_PolyphaseSRC              = "poly"
kAudioUnitSubType_FormatConverter      = "fmtc"
kAudioUnitID_Interleaver               = "inlv"
kAudioUnitID_Deinterleaver             = "dnlv"
kAudioUnitID_AUConverter               = "conv"
kAudioUnitSubType_Effect               = "efct"
kAudioUnitID_MatrixReverb              = "mrev"
kAudioUnitID_Delay                     = "dely"
kAudioUnitID_LowPassFilter             = "lpas"
kAudioUnitID_HighPassFilter            = "hpas"
kAudioUnitID_BandPassFilter            = "bpas"
kAudioUnitID_PeakLimiter               = "lmtr"
kAudioUnitID_DynamicsProcessor         = "dcmp"
kAudioUnitSubType_Mixer                = "mixr"
kAudioUnitID_StereoMixer               = "smxr"
kAudioUnitID_3DMixer                   = "3dmx"
```

15.4.44 Properties

15.4.45 kAudioDeviceProcessorOverload as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.46 kAudioDevicePropertyActualSampleRate as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Example:

```
Var c As New CoreAudioMBS

// find our default output device
Var m As MemoryBlock = c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDefaultOutputDevice)
Var deviceID As Integer = m.Int32Value(0)

// and grab sample rate
m = c.AudioDeviceGetPropertyMemory(deviceID, 0, False, c.kAudioDevicePropertyActualSampleRate)
Var rate As Double = m.DoubleValue(0)

// e.g. 48000

Break
```

Notes: (Read only property)

15.4.47 kAudioDevicePropertyAvailableNominalSampleRates as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.48 kAudioDevicePropertyBufferFrameSize as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.49 kAudioDevicePropertyBufferFrameSizeRange as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.50 kAudioDevicePropertyBufferSize as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.51 kAudioDevicePropertyBufferSizeRange as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.52 kAudioDevicePropertyClockSource as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.53 kAudioDevicePropertyClockSourceNameForID as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.54 kAudioDevicePropertyClockSourceNameForIDCFString as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.55 kAudioDevicePropertyClockSources as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.56 kAudioDevicePropertyDataSource as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.57 kAudioDevicePropertyDataSourceNameForID as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.58 kAudioDevicePropertyDataSourceNameForIDCFString as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.59 kAudioDevicePropertyDataSources as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.60 kAudioDevicePropertyDeviceCanBeDefaultDevice as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.61 kAudioDevicePropertyDeviceCanBeDefaultSystemDevice as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.62 kAudioDevicePropertyDeviceIsAlive as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.63 kAudioDevicePropertyDeviceIsRunning as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.64 kAudioDevicePropertyDeviceIsRunningSomewhere as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.65 kAudioDevicePropertyDeviceManufacturer as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Example:

```
Var c As New CoreAudioMBS

Var DefaultInputDeviceMem As MemoryBlock
Var DefaultInputDeviceID As Integer
Var DefaultInputDeviceManufacturerMem As MemoryBlock
Var DefaultInputDeviceManufacturerName As String

DefaultInputDeviceMem = c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDefaultInput-
Device)
DefaultInputDeviceID = DefaultInputDeviceMem.Long(0)
DefaultInputDeviceManufacturerMem = c.AudioDeviceGetPropertyMemory(DefaultInputDeviceID, 0, True,
c.kAudioDevicePropertyDeviceManufacturer)
DefaultInputDeviceManufacturerName = DefaultInputDeviceManufacturerMem.CString(0)

If DefaultInputDeviceManufacturerName.Encoding = Nil Then // fix it, if it is not set
DefaultInputDeviceManufacturerName = DefineEncoding(DefaultInputDeviceManufacturerName, encodings.UTF8)
End If

MessageBox DefaultInputDeviceManufacturerName
```

Notes: (Read only property)

15.4.66 kAudioDevicePropertyDeviceManufacturerCFString as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Example:

```
Var c As New CoreAudioMBS

Var DefaultInputDeviceMem As MemoryBlock
Var DefaultInputDeviceID As Integer
Var DefaultInputDeviceManufacturerCFName As CFStringMBS
Var DefaultInputDeviceManufacturerName As String
```

DefaultInputDeviceMem = c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDefaultInputDevice)
DefaultInputDeviceID = DefaultInputDeviceMem.Long(0)
DefaultInputDeviceManufacturerCFName = c.AudioDeviceGetPropertyCFString(DefaultInputDeviceID, 0, True, c.kAudioDevicePropertyDeviceManufacturerCFString)
DefaultInputDeviceManufacturerName = DefaultInputDeviceManufacturerCFName.Str

MessageBox DefaultInputDeviceManufacturerName

Notes: (Read only property)

15.4.67 kAudioDevicePropertyDeviceName as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.68 kAudioDevicePropertyDeviceNameCFString as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Example:

Var c As New CoreAudioMBS

Var DefaultInputDeviceMem As MemoryBlock = c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDefaultInputDevice)
Var DefaultInputDeviceID As Integer = DefaultInputDeviceMem.Long(0)
Var DefaultInputDeviceCFName As CFStringMBS = c.AudioDeviceGetPropertyCFString(DefaultInputDeviceID, 0, True, c.kAudioDevicePropertyDeviceNameCFString)
Var DefaultInputDeviceName As String = DefaultInputDeviceCFName.Str

MessageBox DefaultInputDeviceName

Notes: (Read only property)

15.4.69 kAudioDevicePropertyDeviceUID as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.70 kAudioDevicePropertyDriverShouldOwniSub as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.71 kAudioDevicePropertyHogMode as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.72 kAudioDevicePropertyIOProcStreamUsage as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.73 kAudioDevicePropertyJackIsConnected as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.74 kAudioDevicePropertyLatency as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.75 kAudioDevicePropertyMute as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.76 kAudioDevicePropertyNominalSampleRate as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.77 kAudioDevicePropertyPlayThru as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.78 kAudioDevicePropertyPlugIn as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.79 kAudioDevicePropertyPreferredChannelsForStereo as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.80 kAudioDevicePropertyRegisterBufferList as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.81 kAudioDevicePropertySafetyOffset as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.82 kAudioDevicePropertyStreamConfiguration as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.83 kAudioDevicePropertyStreamFormat as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.84 kAudioDevicePropertyStreamFormatMatch as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.85 kAudioDevicePropertyStreamFormats as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.86 kAudioDevicePropertyStreamFormatSupported as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.87 kAudioDevicePropertyStreams as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.88 kAudioDevicePropertySubMute as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.89 kAudioDevicePropertySubVolumeDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.90 kAudioDevicePropertySubVolumeDecibelsToScalar as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.91 kAudioDevicePropertySubVolumeRangeDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.92 kAudioDevicePropertySubVolumeScalar as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.93 kAudioDevicePropertySubVolumeScalarToDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.94 kAudioDevicePropertySupportsMixing as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.95 kAudioDevicePropertyTransportType as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.96 kAudioDevicePropertyUsesVariableBufferFrameSizes as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.97 kAudioDevicePropertyVolumeDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.98 kAudioDevicePropertyVolumeDecibelsToScalar as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.99 kAudioDevicePropertyVolumeRangeDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.100 kAudioDevicePropertyVolumeScalar as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Example:

```
Var c As New CoreAudioMBS

Var DefaultOutputDeviceMem As MemoryBlock = c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDefaultOutputDevice)
Var DefaultOutputDeviceID As Integer = DefaultOutputDeviceMem.Long(0)

Var mem1 As MemoryBlock = c.AudioDeviceGetPropertyMemory(DefaultOutputDeviceID, 0, False, c.kAudioDevicePropertyVolumeScalar)
Var VolumeScalar As Single = mem1.SingleValue(0)

// set volume to 50%
Var VolumeScalar2 As Single = 0.5
Var mem2 As New MemoryBlock(4)
mem2.SingleValue(0) = VolumeScalar2

c.AudioDeviceSetPropertyMemory(DefaultOutputDeviceID, Nil, 0, False, c.kAudioDevicePropertyVolumeScalar,
```

```
mem2, 0, mem2.Size)

// now query again
Var mem3 As MemoryBlock = c.AudioDeviceGetPropertyMemory(DefaultOutputDeviceID, 0, False, c.kAudioDevicePropertyVolumeScalar)
Var VolumeScalar3 As Single = mem3.SingleValue(0)

Break
```

Notes: (Read only property)

15.4.101 kAudioDevicePropertyVolumeScalarToDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.102 kAudioHardwarePropertyBootChimeVolumeDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: A Float32 that represents the value of the boot chime volume control in dB. This property is implemented by an AudioControl object that is a subclass of AudioBootChimeVolumeControl.
(Read only property)

15.4.103 kAudioHardwarePropertyBootChimeVolumeDecibelsToScalar as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.104 kAudioHardwarePropertyBootChimeVolumeRangeDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.105 kAudioHardwarePropertyBootChimeVolumeScalar as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.106 kAudioHardwarePropertyBootChimeVolumeScalarToDecibels as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.107 kAudioHardwarePropertyDefaultInputDevice as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Example:

```
Var c As New CoreAudioMBS

Var DefaultInputDeviceMem As MemoryBlock = c.AudioHardwareGetPropertyMemory(c.kAudioHardware-
PropertyDefaultInputDevice)
Var DefaultInputDeviceID As Integer = DefaultInputDeviceMem.Long(0)
Var DefaultInputDeviceName As String = c.AudioDeviceGetPropertyString(DefaultInputDeviceID, 0, True,
c.kAudioDevicePropertyDeviceName)

MessageBox DefaultInputDeviceName
```

Notes: (Read only property)

15.4.108 kAudioHardwarePropertyDefaultOutputDevice as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Example:

```
Var c As New CoreAudioMBS

Var DefaultOutputDeviceMem As MemoryBlock = c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDefaultOutputDevice)
Var DefaultOutputDeviceID As Integer = DefaultOutputDeviceMem.Long(0)
Var DefaultOutputDeviceName As String = c.AudioDeviceGetPropertyString(DefaultOutputDeviceID, 0, True, c.kAudioDevicePropertyDeviceName)

MessageBox DefaultOutputDeviceName
```

Notes: (Read only property)

15.4.109 kAudioHardwarePropertyDefaultSystemOutputDevice as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.110 kAudioHardwarePropertyDeviceForUID as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.111 kAudioHardwarePropertyDevices as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Example:

```
Var c As New CoreAudioMBS

Var m As MemoryBlock = c.AudioHardwareGetPropertyMemory(c.kAudioHardwarePropertyDevices)
```

```
Var count As Integer = m.Size / 4
Var IDs() As String

For i As Integer = 0 To count-1
Ids.Add m.Int32Value(i * 4).ToString
Next

MessageBox "Device IDs: "+string.FromArray(Ids)
```

Notes: (Read only property)

15.4.112 kAudioHardwarePropertyRunLoop as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.113 kAudioHardwarePropertySleepingIsAllowed as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.114 kAudioHardwarePropertyUnloadingIsAllowed as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.115 kAudioPropertyWildcardChannel as Integer

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.116 kAudioPropertyWildcardPropertyID as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.117 kAudioPropertyWildcardSection as Integer

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.118 kAudioStreamPropertyDirection as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.119 kAudioStreamPropertyOwningDevice as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.120 kAudioStreamPropertyPhysicalFormat as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.121 kAudioStreamPropertyPhysicalFormatMatch as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.122 kAudioStreamPropertyPhysicalFormats as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.123 kAudioStreamPropertyPhysicalFormatSupported as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.124 kAudioStreamPropertyStartingChannel as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.125 kAudioStreamPropertyTerminalType as String

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: One of the constants for CoreAudio.
Notes: (Read only property)

15.4.126 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 4.1, Platform: macOS, Targets: All.

Function: The last error code returned.
Notes: 0 for success.
(Read and Write property)

15.5 class CoreAudioPlayerMBS

15.5.1 class CoreAudioPlayerMBS

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: A class to play sounds from a memoryblock using CoreAudio.
Notes: This class uses an internal buffer of around 100000 samples which when played with a samplerate of 8000 will play for 10 seconds.
The music stops playing after this object is destroyed.
Mac OS X is required.

- MBS Real Studio Plugins, version 11.4pr2

15.5.2 Methods

15.5.3 AddAudio(Data as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Adds integer audio.
Notes: Data: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset.

You need to set NumberOfChannels before calling this method.
NumberOfChannels can be 1 or 2. For 2 channels, sound data must be interleaved.

Values for bitsize:

7	signed byte
8	unsigned byte
15	signed short
16	unsigned short
24	unsigned medium
31	signed integer
32	unsigned integer

This method only copies the data to the internal queue. It returns directly.
If ClearBuffers is true the buffer list is cleared before this new data is added.

15.5.4 AddAudioStereo(Data1 as memoryblock, Data2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Adds integer audio.
Notes: This is a special version of PlayAudio which takes samples from both memoryblocks and interleaves them.

Data1: a memoryblock with the sound data
Data2: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset.

You need to set NumberOfChannels before calling this method.
NumberOfChannels must be 2 for this method.

Values for bitsize:

7	signed byte
8	unsigned byte
15	signed short
16	unsigned short
24	unsigned medium
31	signed integer
32	unsigned integer

This method only copies the data to the internal queue. It returns directly.
If ClearBuffers is true the buffer list is cleared before this new data is added.

15.5.5 AddFloatAudio(FloatData as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Adds float audio.
Notes: FloatData: a memoryblock with the sound data filled with single values.
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset.

The samples are stored in 32bit float values (memoryblock.SingleValue)

You need to set NumberOfChannels before calling this method.
NumberOfChannels can be 1 or 2. For 2 channels, sound data must be interleaved.

This method only copies the data to the internal queue. It returns directly.
If ClearBuffers is true the buffer list is cleared before this new data is added.

15.5.6 AddFloatAudioStereo(FloatData1 as memoryblock, FloatData2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Adds float audio.
Notes: This is a special version of PlayFloatAudio which takes samples from both memoryblocks and interleaves them.

FloatData1: a memoryblock with the sound data filled with single values.
FloatData2: a memoryblock with the sound data filled with single values.
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset.

The samples are stored in 32bit float values (memoryblock.SingleValue)

You need to set NumberOfChannels before calling this method.
NumberOfChannels must be 2 for this method.

This method only copies the data to the internal queue. It returns directly.
If ClearBuffers is true the buffer list is cleared before this new data is added.

15.5.7 Close

MBS MacOSX Plugin, Plugin Version: 5.1, Platform: macOS, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

15.5.8 FreeSpace as Integer

MBS MacOSX Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the number of buffer entries available in the queue.
Notes: The size of the buffers is not limited except your available memory.

15.5.9 HardwareNumberOfChannels as Integer

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: All.

Function: Returns the actual number of channels in the default device; to set the number of channels being output, use numberOfChannels.
Notes: This class can only play stereo to 2 channel devices or mono to all channels.
Returns 0 on any error.

15.5.10 HardwareSampleRate as single

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: All.

Function: The hardware sample rate.
Notes: Today this is normally 44100 Hz. Or 0 on any error.

15.5.11 HasFreeSpace as boolean

MBS MacOSX Plugin, Plugin Version: 4.0, Platform: macOS, Targets: All.

Function: Returns true if the internal sound buffer is not full.
Notes: Returns true if freespace returns a value greater than zero.

This function was named IsQueueEmpty in plugin version 7.4.

15.5.12 PlayAudio(Data as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Adds integer audio and starts playback.
Notes: Data: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset.

You need to set NumberOfChannels before calling this method.
NumberOfChannels can be 1 or 2. For 2 channels, sound data must be interleaved.

Values for bitsize:

7	signed byte
8	unsigned byte
15	signed short
16	unsigned short
24	unsigned medium
31	signed integer
32	unsigned integer

This method only copies the data to the internal queue. It returns directly.
If ClearBuffers is true the buffer list is cleared before this new data is added.

15.5.13 PlayAudioStereo(Data1 as memoryblock, Data2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Adds integer audio and starts playback.
Notes: This is a special version of PlayAudio which takes samples from both memoryblocks and interleaves them.

Data1: a memoryblock with the sound data
Data2: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)

countBytes: the number of bytes to play from offset.

You need to set NumberOfChannels before calling this method.
NumberOfChannels must be 2 for this method.

Values for bitsize:

7	signed byte
8	unsigned byte
15	signed short
16	unsigned short
24	unsigned medium
31	signed integer
32	unsigned integer

This method only copies the data to the internal queue. It returns directly.
If ClearBuffers is true the buffer list is cleared before this new data is added.

15.5.14 PlayFloatAudio(FloatData as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Adds float audio and starts playback.
Notes: FloatData: a memoryblock with the sound data filled with single values.
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset.

The samples are stored in 32bit float values (memoryblock.SingleValue)

You need to set NumberOfChannels before calling this method.
NumberOfChannels can be 1 or 2. For 2 channels, sound data must be interleaved.

This method only copies the data to the internal queue. It returns directly.
If ClearBuffers is true the buffer list is cleared before this new data is added.

15.5.15 PlayFloatAudioStereo(FloatData1 as memoryblock, FloatData2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Adds float audio and starts playback.
Notes: This is a special version of PlayFloatAudio which takes samples from both memoryblocks and interleaves them.

FloatData1: a memoryblock with the sound data filled with single values.
FloatData2: a memoryblock with the sound data filled with single values.
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset.

The samples are stored in 32bit float values (memoryblock.SingleValue)

You need to set NumberOfChannels before calling this method.
NumberOfChannels must be 2 for this method.

This method only copies the data to the internal queue. It returns directly.
If ClearBuffers is true the buffer list is cleared before this new data is added.

15.5.16 Start as boolean

MBS MacOSX Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Starts playback.
Notes: use AddAudio, AddAudioStereo, AddFloatAudio and AddFloatAudioStereo first to fill buffers.

15.5.17 Stop

MBS MacOSX Plugin, Plugin Version: 5.1, Platform: macOS, Targets: All.

Function: Stops playback.

15.5.18 Properties

15.5.19 HadUnderflow as Boolean

MBS MacOSX Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: A flag set if a data underflow was found while NoUnderflow is true.
Notes: You may want to set this to false after your application recovered from a data underflow.
(Read and Write property)

15.5.20 IsRunning as Boolean

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: All.

Function: Whether the class is playing something.
Notes: Returns true while playing.
(Read only property)

15.5.21 NoUnderflow as Boolean

MBS MacOSX Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Whether underflows should be prevented.
Notes: If no audio data is there and NoUnderflow=true, the flag HadUnderflow is set to true and 0 values (Silence) is played.

Switching from sound to no sound and back may add some noise.
(Read and Write property)

15.5.22 NumberOfChannels as Integer

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: All.

Function: The number of output channels.
Notes: Currently only 1 (default) and 2 are supported.
(Read and Write property)

15.5.23 OutputDeviceID as Integer

MBS MacOSX Plugin, Plugin Version: 5.1, Platform: macOS, Targets: All.

Function: The output device to use.
Notes: 0 for the default output device.
If you set this property to a bad value you risk a crash.
(Read and Write property)

15.5.24 OutputPosition as Double

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: All.

Function: The current position in the playing stream.
Notes: May point between samples.
(Read only property)

15.5.25 OutputPositionRelative as Double

MBS MacOSX Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The current position in the playing buffer.
Notes: May point between samples.
Will reset to 0 when a new buffer is used.
(Read only property)

15.5.26 SampleRate as Single

MBS MacOSX Plugin, Plugin Version: 4.3, Platform: macOS, Targets: All.

Function: The sample rate to use.
Notes: You can use any value between 4000 and 100000.
Default is 44100 Hz.
(Read and Write property)

15.6 class PortAudioDeviceInfoMBS

15.6.1 class PortAudioDeviceInfoMBS

MBS Audio Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class providing information and capabilities of PortAudio devices.
Example:

```
// list audio devices with channels and sample rate using PortAudio
Var pa As New PortAudioMBS
Var lines() As String
For i As Integer = 0 To pa.CountDevices - 1
Var d As PortAudioDeviceInfoMBS = pa.DeviceInfo(i)
lines.Add d.Name + ": " + d.MaxInputChannels.ToString + " in, " + d.MaxOutputChannels.ToString + "
out, " + d.DefaultSampleRate.ToString + " Hz" + _
If(i = pa.DefaultOutputDeviceID, " (default output)", "")
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Devices may support input, output or both input and output.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 12.1pr1

15.6.2 Methods

15.6.3 Constructor

MBS Audio Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

15.6.4 Properties

15.6.5 DefaultHighInputLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default latency values for robust non-interactive applications (eg. playing sound files).
Notes: (Read only property)

15.6.6 DefaultHighOutputLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default latency values for robust non-interactive applications (eg. playing sound files).
Notes: (Read only property)

15.6.7 DefaultLowInputLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default latency values for interactive performance.
Notes: (Read only property)

15.6.8 DefaultLowOutputLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default latency values for interactive performance.
Notes: (Read only property)

15.6.9 DefaultSampleRate as Double

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default sample rate.
Notes: (Read only property)

15.6.10 HostApiIndex as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The host API index for this device.
Notes: (Read only property)

15.6.11 Index as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The index of this device.
Notes: (Read only property)

15.6.12 MaxInputChannels as Integer

MBS Audio Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of input channels.
Notes: Returns 0 on any error.
(Read only property)

15.6.13 MaxOutputChannels as Integer

MBS Audio Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of output channels for this device.
Notes: 0 on any error.

Seems like an iMac returns two here, but the internal microphone has only one channel. So be aware that the memoryblocks in the events do have the actual size of the data that is coming in. So stereo has there a larger buffer.
(Read only property)

15.6.14 Name as String

MBS Audio Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of this device.
Notes: Returns "" on any error.
(Read only property)

15.7 class PortAudioHostApiInfoMBS

15.7.1 class PortAudioHostApiInfoMBS

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class containing information about a particular host API.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 12.1pr1

15.7.2 Methods

15.7.3 Constructor

MBS Audio Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

15.7.4 Properties

15.7.5 defaultInputDevice as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default input device for this host API.
Notes: The value will be a device index ranging from 0 to (PortAudioHostApiInfoMBS.deviceCount-1), or paNoDevice (-1) if no default input device is available.
(Read only property)

15.7.6 defaultOutputDevice as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default output device for this host API.
Notes: The value will be a device index ranging from 0 to (PortAudioHostApiInfoMBS.deviceCount-1), or paNoDevice (-1) if no default output device is available.
(Read only property)

15.7.7 deviceCount as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of devices belonging to this host API.
Notes: This field may be used in conjunction with HostApiDeviceIndexToDeviceIndex() to enumerate all devices for this host API.
(Read only property)

15.7.8 Index as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The index of this host API.
Notes: (Read only property)

15.7.9 Name as String

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A textual description of the host API for display on user interfaces.
Notes: (Read only property)

15.7.10 Type as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The well known unique identifier of this host API.
Notes: Useful constants for the different types:

(Read only property)

paInDevelopment	=0
paDirectSound	=1
paMME	=2
paASIO	=3
paSoundManager	=4
paCoreAudio	=5
paOSS	=7
paALSA	=8
paAL	=9
paBeOS	=10
paWDMKS	=11
paJACK	=12
paWASAPI	=13
paAudioScienceHPI	=14

15.8 class PortAudioHostErrorInfoMBS

15.8.1 class PortAudioHostErrorInfoMBS

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class used to return information about a host error condition.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 12.1pr1

15.8.2 Methods

15.8.3 Constructor

MBS Audio Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

15.8.4 Properties

15.8.5 ErrorCode as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: the error code returned.
Notes: (Read only property)

15.8.6 ErrorText as String

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A textual description of the error if available, otherwise a zero-length string.
Notes: (Read only property)

15.8.7 HostApiType as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The host API which returned the error code.
Notes: (Read only property)

15.9 class PortAudioMBS

15.9.1 class PortAudioMBS

MBS Audio Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to run the opensource PortAudio library in Xojo.
Example:

```
// list all audio devices with their channels and the default devices
// PortAudio is a property of the window: PortAudio As PortAudioMBS (initializes the library)
PortAudio = New PortAudioMBS

Var lines() As String
For i As Integer = 0 To PortAudio.CountDevices - 1
Var info As PortAudioDeviceInfoMBS = PortAudio.DeviceInfo(i)
lines.Add i.ToString + ": " + info.Name + " (in " + info.MaxInputChannels.ToString + ", out " + info.Max-
OutputChannels.ToString + ", " + info.DefaultSampleRate.ToString + " Hz)"
Next

MessageBox PortAudioMBS.VersionText + EndOfLine + _
"Default input: " + PortAudio.DefaultInputDeviceID.ToString + ", default output: " + PortAudio.Default-
OutputDeviceID.ToString + EndOfLine + EndOfLine + _
String.FromArray(lines, EndOfLine)
```

Notes: Constants for error codes:

Initialization and Termination of the PortAudio library are done in background automatically.

Requires libasound.so.2 on Linux to be installed.

15.9.2 Methods

15.9.3 ASIOGetAvailableBufferSizes(DeviceIndex as Integer, byref minBufferSizeFrames as Integer, byref maxBufferSizeFrames as Integer, byref preferredBufferSizeFrames as Integer, byref granularity as Integer) as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve legal native buffer sizes for the specificed device, in sample frames.
Notes: device: The global index of the device about which the query is being made.

minBufferSizeFrames: The minimum buffer size value.
maxBufferSizeFrames: The maximum buffer size value.
preferredBufferSizeFrames: The preferred buffer size value.
granularity: The "granularity". This value determines the step size used to compute the legal values between minBufferSizeFrames and maxBufferSizeFrames.

If granularity is -1 then available buffer size values are powers of two.

see ASIOGetBufferSize in the ASIO SDK.

15.9.4 ASIOGetInputChannelName(DeviceIndex as Integer, ChannelIndex as Integer) as String

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries name of input channel.
Example:

```
Var po As New PortAudioMBS

// find ASIO device
Var defaultASIOInputDevice As Integer

Var hc As Integer = po.HostApiCount
For hi As Integer = 0 To hc
Var host As PortAudioHostApiInfoMBS = po.HostApiInfo(hi)
If host<>Nil And host.Type = po.kHostApiASIO Then
defaultASIOInputDevice = host.defaultInputDevice
End If
Next

// show channel names
D2im names As String
Var de As PortAudioDeviceInfoMBS = po.DeviceInfo(defaultASIOInputDevice)
For i As Integer = 0 To de.maxInputChannels-1
names.Append po.ASIOGetInputChannelName(defaultASIOInputDevice,i)
Next

MessageBox Join(names, EndOfLine)
```

Notes: The string will be no longer than 32 characters.

15.9.5 ASIOGetOutputChannelName(DeviceIndex as Integer, ChannelIndex as Integer) as String

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries name of output channel.

Example:

```
Var po As New PortAudioMBS

// find ASIO device
Var defaultASIOOutputDevice As Integer

Var hc As Integer = po.HostApiCount
For hi As Integer = 0 To hc
Var host As PortAudioHostApiInfoMBS = po.HostApiInfo(hi)
If host<>Nil And host.Type = po.kHostApiASIO Then
defaultASIOOutputDevice = host.defaultOutputDevice
End If
Next

// show channel names
D2im names As String
Var de As PortAudioDeviceInfoMBS = po.DeviceInfo(defaultASIOOutputDevice)
For i As Integer = 0 To de.maxOutputChannels-1
names.Append po.ASIOGetOutputChannelName(defaultASIOOutputDevice,i)
Next

MessageBox Join(names, EndOfLine)
```

Notes: The string will be no longer than 32 characters.

15.9.6 ASIOGetSampleRate(byref rate as double) as Integer

MBS Audio Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current sample rate.
Example:

```
Var d As Double
Var n As Integer

n = PortAudioMBS.ASIOGetSampleRate(d)

If n = 0 Then
MessageBox Str(d)
Else
MessageBox "Error: "+Str(n)
End If
```

Notes: Rate will hold the current sample rate on return.
Returns error code.

If sample rate is unknown, sampleRate will be 0 and ASE_NoClock will be returned.
If no input/output is present ASE_NotPresent (-1000) will be returned.

15.9.7 ASIOShowControlPanel(device as integer, parentWindow as DesktopWindow) as Integer

MBS Audio Plugin, Plugin Version: 22.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Display the ASIO control panel for the specified device.
Notes: device: The global index of the device whose control panel is to be displayed.
parentWindow: On Windows, the calling application's main window handle or nil.
See also:

- 15.9.8 ASIOShowControlPanel(device as integer, parentWindow as window = nil) as Integer 3213

15.9.8 ASIOShowControlPanel(device as integer, parentWindow as window = nil) as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Display the ASIO control panel for the specified device.
Example:

```
Var po As New PortAudioMBS

// find ASIO device
Var defaultASIOOutputDevice As Integer

Var hc As Integer = po.HostApiCount
For hi As Integer = 0 To hc
Var host As PortAudioHostApiInfoMBS = po.HostApiInfo(hi)
If host<>Nil And host.Type = po.kHostApiASIO Then
defaultASIOOutputDevice = host.defaultOutputDevice
End If
Next

// show dialog
Call po.ASIOShowControlPanel(defaultASIOOutputDevice, Window1)
```

Notes: device: The global index of the device whose control panel is to be displayed.
parentWindow: On Windows, the calling application's main window handle or nil.
See also:

- 15.9.7 ASIOShowControlPanel(device as integer, parentWindow as DesktopWindow) as Integer 3213

15.9.9 CountDevices as Integer

MBS Audio Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve the number of available devices.
Example:

```
Var pa as new PortAudioMBS

Var c as Integer = pa.CountDevices
MessageBox str(c)+" devices found"

for i as Integer = 0 to c-1
MessageBox pa.DeviceInfo(i).Name
next
```

Notes: The number of available devices may be zero.

Returns a non-negative value indicating the number of available devices or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.

15.9.10 DefaultHostApiIndexd as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve the index of the default host API.
Example:

```
Var pa as new PortAudioMBS

Var DefaultHostApiIndexd as Integer = pa.DefaultHostApiIndexd

if DefaultHostApiIndexd>=0 then
Var d as PortAudioHostApiInfoMBS = pa.HostApiInfo(DefaultHostApiIndexd)
MessageBox "Default host API is: "+d.Name
else
MessageBox "No default host API."
end if
```

Notes: The default host API will be the lowest common denominator host API on the current platform and is unlikely to provide the best performance.

Returns a non-negative value ranging from 0 to (HostApiCount-1)indicating the default host API index or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.

15.9.11 DefaultInputDeviceID as Integer

MBS Audio Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve the index of the default input device.
Example:

```
Var pa as new PortAudioMBS

Var DefaultInputDeviceID as Integer = pa.DefaultInputDeviceID

if DefaultInputDeviceID>=0 then
Var d as PortAudioDeviceInfoMBS = pa.DeviceInfo(DefaultInputDeviceID)
MessageBox "Default input device is: "+d.Name
else
MessageBox "No default input device."
end if
```

Notes: The result can be used in the inputDevice parameter to OpenStream().

Returns the default input device index for the default host API, or paNoDevice (-1) if no default input device is available or an error was encountered.

15.9.12 DefaultOutputDeviceID as Integer

MBS Audio Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve the index of the default output device.
Example:

```
Var pa as new PortAudioMBS

Var DefaultOutputDeviceID as Integer = pa.DefaultOutputDeviceID

if DefaultOutputDeviceID>=0 then
Var d as PortAudioDeviceInfoMBS = pa.DeviceInfo(DefaultOutputDeviceID)
MessageBox "Default output device is: "+d.Name
else
MessageBox "No default output device."
end if
```

Notes: The result can be used in the outputDevice parameter to OpenStream().

Returns the default output device index for the defualt host API, or paNoDevice (-1) if no default output device is available or an error was encountered.

On the PC, the user can specify a default device by setting an environment variable. For example, to use device #1.
set PA_RECOMMENDED_OUTPUT_DEVICE=1
The user should first determine the available device ids by using the supplied application "pa_devs".

15.9.13 DeviceInfo(DeviceIndex as Integer) as PortAudioDeviceInfoMBS

MBS Audio Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve an object containing information about the specified device.
Example:

```
Var pa as new PortAudioMBS

Var u as Integer = pa.CountDevices-1
for i as Integer = 0 to u
Var d as PortAudioDeviceInfoMBS = pa.DeviceInfo(i)
MessageBox d.Name+" with default "+str(D.DefaultSampleRate)+" Hz"
next
```

Notes: Returns an object of class PortAudioDeviceInfoMBS with the requested information. If the device parameter is out of range the function returns nil.

DeviceIndex: A valid device index in the range 0 to (PortAudioMBS.CountDevices-1)

15.9.14 DisableHostAPI(API as string) as boolean

MBS Audio Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Disables a PortAudio Host API.
Example:

```
if PortAudioMBS.DisableHostAPI("Core Audio") then // for Mac
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: This must be called before using any PortAudio function.
It removes the API from the list of APIs to be used when PortAudio initializes. This way you can avoid loading interfaces you don't need.
API name can be "MME", "Windows DirectSound", "Windows WASAPI", "ASIO", "Core Audio", "ALSA",

"OSS".
Returns true on success.

15.9.15 ErrorText(ErrorNumber as Integer) as string

MBS Audio Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Translate the error number into a human readable message.

15.9.16 GetSampleSize(Format as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the sample size in bytes of the given format.
Example:

```
Var pa as new PortAudioMBS

const paFloat32 = 1

MessageBox str(pa.GetSampleSize(paFloat32))+" bytes per sample"
```

15.9.17 HostApiCount as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve the number of available host APIs.
Example:

```
Var pa as new PortAudioMBS

Var c as Integer = pa.HostApiCount
MessageBox str(c)+" host APIs found"
```

Notes: Even if a host API is available it may have no devices available.

Returns a non-negative value indicating the number of available host APIs or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.

15.9.18 HostApiDeviceIndexToDeviceIndex(hostApiIndex as Integer, hostApiDeviceIndex as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert a host-API-specific device index to standard PortAudio device index.
Notes: This function may be used in conjunction with the deviceCount field of PaHostApiInfo to enumerate all devices for the specified host API.

hostApiIndex: A valid host API index ranging from 0 to (HostApiCount-1)
hostApiDeviceIndex: A valid per-host device index in the range 0 to (HostApiInfo(hostApi).deviceCount-1)

Returns a non-negative device index ranging from 0 to (DeviceCount-1) or, an error code (which are always negative) if PortAudio is not initialized or an error is encountered.

A paInvalidHostApi (-9978) error code indicates that the host API index specified by the hostApi parameter is out of range.

A paInvalidDevice (-9996) error code indicates that the hostApiDeviceIndex parameter is out of range.

15.9.19 HostApiInfo(hostApiIndex as Integer) as PortAudioHostApiInfoMBS

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve an PortAudioHostApiInfoMBS object containing information about a specific host Api.
Example:

```
Var pa as new PortAudioMBS
Var u as Integer = pa.HostApiCount - 1

for i as Integer = 0 to u
Var d as PortAudioHostApiInfoMBS = pa.HostApiInfo(i)
MessageBox d.name
next
```

Notes: hostApiIndex: A valid host API index ranging from 0 to (HostApiCount-1)

Returns the information object. If the hostApi parameter is out of range or an error is encountered, the function returns nil.

15.9.20 HostApiTypeIdToHostApiIndex(type as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert a static host API unique identifier, into a runtime host API index.
Example:

```
Var IndexDirectSound as Integer
Var p as new PortAudioMBS
const paDirectSound=1
IndexDirectSound=p.HostApiTypeIdToHostApiIndex(paDirectSound)
```

Notes: type: A unique host API identifier. See PortAudioHostApiInfoMBS.Type for the list of constants.

Returns a valid PaHostApiIndex ranging from 0 to (HostApiCount-1) or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.

The paHostApiNotFound (-9979) error code indicates that the host API specified by the type parameter is not available.

15.9.21 HostError as PortAudioHostErrorInfoMBS

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return information about the last host error encountered.
Notes: This function is provided as a last resort, primarily to enhance debugging by providing clients with access to all available error information.

Returns an object constaining information about the host error. The values in this structure will only be valid if a PortAudio function has previously returned the paUnanticipatedHostError.

15.9.22 IsFormatSupported(input as PortAudioStreamParametersMBS, output as PortAudioStreamParametersMBS, sampleRate as Double) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether it would be possible to open a stream with the specified parameters.
Notes: input: An object that describes the input parameters used to open a stream. The suggestedLatency field is ignored. inputParameters must be nil for output-only streams.

output: An object that describes the output parameters used to open a stream. The suggestedLatency field

is ignored. outputParameters must be nil for input-only streams.

sampleRate: The required sampleRate. For full-duplex streams it is the sample rate for both input and output

Returns 0 if the format is supported, and an error code indicating why the format is not supported otherwise. The constant paFormatIsSupported (0) is provided to compare with the return value for success.

15.9.23 MacCoreAudioChannelName(DeviceIndex as Integer, ChannelIndex as Integer, Input as Boolean) as String

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries channel name.

15.9.24 MacCoreAudioGetBufferSizeRange(DeviceIndex as Integer, byref minBufferSizeFrames as Integer, byref maxBufferSizeFrames as Integer) as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve the range of legal native buffer sizes for the specificed device, in sample frames.
Notes: device: The global index of the PortAudio device about which the query is being made.
minBufferSizeFrames: The minimum buffer size value.
maxBufferSizeFrames: The maximum buffer size value.

see kAudioDevicePropertyBufferFrameSizeRange in the CoreAudio SDK.

15.9.25 SampleSize(theFormat as Integer) as Integer

MBS Audio Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return size in bytes of a single sample in a given sample format or paSampleFormatNotSupported (-9994).
Notes: Returns 0 on any error.

Constants for sample format:

The standard formats paFloat32, paInt16, paInt32, paInt24, paInt8 and aUInt8 are usually implemented by

const paFloat32	= 1
const paInt32	= 2
const paInt24	= 4
const paInt16	= 8
const paInt8	= 16
const paUInt8	= 32
const paCustomFormat	= 65536
const paNonInterleaved	= negative sign

all implementations.

The floating point representation (paFloat32) uses +1.0 and -1.0 as the maximum and minimum respectively.

paUInt8 is an unsigned 8 bit format where 128 is considered "ground"

The paNonInterleaved flag indicates that a multichannel buffer is passed as a set of non-interleaved pointers.

15.9.26 SetDebugLogFile(File as FolderItem) as boolean

MBS Audio Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the debug file to log all PortAudio calls with parameters.
Notes: Pass nil to stop logging.
Returns true on success or false on failure.

15.9.27 Sleep(msec as Integer)

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Put the caller to sleep for at least 'msec' milliseconds.
Notes: This function is provided only as a convenience for authors of portable code (such as the tests and examples in the PortAudio distribution.)
The function may sleep longer than requested so don't rely on this for accurate musical timing.

15.9.28 Version as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve the release number of the currently running PortAudio build.
Notes: e.g. 1900

15.9.29 VersionControlRevision as String

MBS Audio Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve a version control revision text.

15.9.30 VersionText as String

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve a textual description of the current PortAudio build.
Notes: e.g. "PortAudio V19-devel 13 October 2002"

15.9.31 WinDefaultChannelMask(numChannels as Integer) as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: Map a channel count to a speaker channel mask for Windows.

15.9.32 Constants

Constants

Constant	Value	Description
kNoDevice	-1	The constant for no device.

Errors

Constant	Value	Description
kErrorBadBufferPtr	-9972	Bad buffer pointer.
kErrorBadIODeviceCombination	-9993	Bad IO Device combination
kErrorBadStreamPtr	-9988	Bad stream pointer
kErrorBufferTooBig	-9991	Buffer too big
kErrorBufferTooSmall	-9990	Buffer too small
kErrorCanNotReadFromACallbackStream	-9977	Can not read from a callback stream.
kErrorCanNotReadFromAnOutputOnlyStream	-9975	Can not read from an output only stream.
kErrorCanNotWriteToACallbackStream	-9976	Can not write to a callback stream.
kErrorCanNotWriteToAnInputOnlyStream	-9974	Can not write to an input only stream.
kErrorDeviceUnavailable	-9985	Device unavailable.
kErrorHostApiNotFound	-9979	Host API not found.
kErrorIncompatibleHostApiSpecificStreamInfo	-9984	Incompatible host api for specific stream info.
kErrorIncompatibleStreamHostApi	-9973	Incompatible stream for host api.
kErrorInputOverflowed	-9981	Input overflowed.
kErrorInsufficientMemory	-9992	Insufficient memory
kErrorInternalError	-9986	Internal error
kErrorInvalidChannelCount	-9998	Invalid Channel Count
kErrorInvalidDevice	-9996	Invalid Device
kErrorInvalidFlag	-9995	Invalid flag
kErrorInvalidHostApi	-9978	Invalid host API
kErrorInvalidSampleRate	-9997	Invalid sample rate
kErrorNoError	0	No error
kErrorNotInitialized	-10000	Not initialized.
kErrorNullCallback	-9989	Null callback.
kErrorOutputUnderflowed	-9980	Output underflowed.
kErrorSampleFormatNotSupported	-9994	Sampleformat not supported.
kErrorStreamIsNotStopped	-9982	Stream is not stopped.
kErrorStreamIsStopped	-9983	Stream is stopped.
kErrorTimedOut	-9987	Timed out
kErrorUnanticipatedHostError	-9999	Unanticipated Host Error. See HostError function.

Host APIs

Constant	Value	Description
kHostApiAL	9	AL
kHostApiALSA	8	Linux ALSA
kHostApiASIO	3	ASIO
kHostApiAudioScienceHPI	14	AudioScienceHPI
kHostApiBeOS	10	BeOS, not used in MBS Plugin.
kHostApiCoreAudio	5	CoreAudio-specific PortAudio API extension
kHostApiDirectSound	1	Windows DirectSound-specific PortAudio API extension
kHostApiInDevelopment	0	Internally only.
kHostApiJACK	12	Linux Jack
kHostApiMME	2	Windos Multimedia Extension.
kHostApiOSS	7	OSS
kHostApiSoundManager	4	SoundManager (old MacOS Classic)
kHostApiWASAPI	13	WASAPI-specific PortAudio API extension
kHostApiWDMKS	11	WDM Kernel Streaming-specific PortAudio API extension

15.10 class PortAudioStreamBaseMBS

15.10.1 class PortAudioStreamBaseMBS

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The base class for the portaudio streams.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- News from the MBS Xojo Plugins Version 20.1
- MBS Xojo Plugins, version 20.1pr1
- New in the MBS Xojo Plugins 20.0

15.10.2 Methods

15.10.3 Abort as Integer

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Terminates audio processing immediately without waiting for pending buffers to complete.

15.10.4 AsioSetStreamSampleRate(sampleRate as double) as integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the sample rate of an open ASIO stream.
Notes: sampleRate: The new sample rate.

Note that this function may fail if the stream is already running and the ASIO driver does not support switching the sample rate of a running stream.

Returns kErrorIncompatibleStreamHostApi if stream is not a paASIO stream.

15.10.5 Close as Integer

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes an audio stream.
Notes: If the audio stream is active it discards any pending buffers as if Abort() had been called.

15.10.6 Constructor

MBS Audio Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

15.10.7 HostError as PortAudioHostErrorInfoMBS

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return information about the last host error encountered.
Notes: This function is provided as a last resort, primarily to enhance debugging by providing clients with access to all available error information.

Returns an object constaining information about the host error. The values in this structure will only be valid if a PortAudio function has previously returned the paUnanticipatedHostError.

15.10.8 Info as PortAudioStreamInfoMBS

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve a PortAudioStreamInfoMBS object containing information about the specified stream.
Notes: If the stream parameter invalid, or an error is encountered, the function returns nil.

15.10.9 Read(Buffer as Ptr, frameCount as integer) as integer

MBS Audio Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read samples from an input stream.
Notes: The function doesn't return until the entire buffer has been filled - this may involve waiting for the operating system to supply the data.

buffer: A buffer of sample frames. The buffer contains samples in the format specified by the input.sampleFormat field used to open the stream, and the number of channels specified by input.numChannels. If non-interleaved samples were requested, buffer is a pointer to the first element of an array of non-interleaved buffer pointers, one for each channel.

frameCount: The number of frames to be read into buffer. This parameter is not constrained to a specific range, however high performance applications will want to match this parameter to the framesPerBuffer parameter used when opening the stream.

Returns on success PaNoError will be returned, or PaInputOverflowed (-9981) if input data was discarded by PortAudio after the previous call and before this call.

15.10.10 Start as Integer

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Commences audio processing.
Notes: Returns an error code.
(0 for success, -1 for no stream)

15.10.11 Stop as Integer

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Terminates audio processing.
Notes: It waits until all pending audio buffers have been played before it returns.

15.10.12 WinMMEStreamInputHandle(index as Integer) as Ptr

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve a wave in handle used by a PortAudio WinMME stream.
Notes: handleIndex: The zero based index of the wave in handle to retrieve. This should be in the range [0, WinMMEStreamInputHandleCount-1] .

Returns a valid wave in handle, or nil if an error occurred.

15.10.13 WinMMEStreamInputHandleCount as integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve the number of wave in handles used by a PortAudio WinMME stream.
Notes: Returns zero if the stream is output only.

A non-negative value indicating the number of wave in handles or, an error code (which are always negative) if PortAudio is not initialized or an error is encountered.

15.10.14 WinMMEStreamOutputHandle(index as Integer) as Ptr

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve a wave out handle used by a PortAudio WinMME stream.
Notes: handleIndex: The zero based index of the wave out handle to retrieve.
This should be in the range [0, WinMMEStreamOutputHandleCount - 1] .

Returns a valid wave out handle, or nil if an error occurred.

15.10.15 WinMMEStreamOutputHandleCount as integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve the number of wave out handles used by a PortAudio WinMME stream.
Notes: Returns zero if the stream is input only.

A non-negative value indicating the number of wave out handles or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.

15.10.16 Write(Buffer as Ptr, frameCount as integer) as integer

MBS Audio Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Write samples to an output stream.
Notes: This function doesn't return until the entire buffer has been consumed - this may involve waiting for the operating system to consume the data.

buffer: A buffer of sample frames. The buffer contains samples in the format specified by the outputParameters.sampleFormat field used to open the stream, and the number of channels specified by outputParameters.numChannels. If non-interleaved samples were requested, buffer is a pointer to the first element of an array of non-interleaved buffer pointers, one for each channel.

frameCount: The number of frames to be written from buffer. This parameter is not constrained to a specific range, however high performance applications will want to match this parameter to the framesPerBuffer parameter used when opening the stream.

On success PaNoError (0) will be returned, or paOutputUnderflowed (-9980) if additional output data was inserted after the previous call and before this call.

15.10.17 Properties

15.10.18 CPULoad as Double

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve CPU usage information for the specified stream.
Notes: The "CPU Load" is a fraction of total CPU time consumed by a callback stream's audio processing routines including, but not limited to the client supplied stream callback. This function does not work with blocking read/write streams.

This function may be called from the stream callback function or the application.

Returns a floating point value, typically between 0.0 and 1.0, where 1.0 indicates that the stream event is consuming the maximum number of CPU cycles possible to maintain real-time operation. A value of 0.5 would imply that PortAudio and the stream event was consuming roughly 50% of the available CPU time. The return value may exceed 1.0. A value of 0.0 will always be returned for a blocking read/write stream, or if an error occurrs.
(Read only property)

15.10.19 IsStreamActive as Integer

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether the stream is active.
Notes: A stream is active after a successful call to Start(), until it becomes inactive either as a result of a call to Stop() or Abort(), or as a result of a return value other than paContinue from the stream callback. In the latter case, the stream is considered inactive after the last buffer has finished playing.

Returns one (1) when the stream is active (ie playing or recording audio), zero (0) when not playing or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.
(Read only property)

15.10.20 IsStreamStopped as Integer

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether the stream is stopped.
Notes: A stream is considered to be stopped prior to a successful call to Start and after a successful call to

Stop or Abort.
If a stream value returns a value other than paContinue (0) the stream is NOT considered to be stopped.

Returns one (1) when the stream is stopped, zero (0) when the stream is running or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.
(Read only property)

15.10.21 MacCoreAudioStreamInputDevice as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve the AudioDeviceID of the input device assigned to an open stream.
Notes: Returns a valid AudioDeviceID, or 0 if an error occurred.
(Read only property)

15.10.22 MacCoreAudioStreamOutputDevice as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve the AudioDeviceID of the output device assigned to an open stream.
Notes: Returns a valid AudioDeviceID, or 0 if an error occurred.
(Read only property)

15.10.23 ReadAvailable as Integer

MBS Audio Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve the number of frames that can be read from the stream without waiting.
Notes: Returns a non-negative value representing the maximum number of frames that can be read from the stream without blocking or busy waiting or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.
(Read only property)

15.10.24 Time as Double

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine the current time for the stream according to the same clock used to generate buffer timestamps.
Notes: This time may be used for syncronising other events to the audio stream, for example synchronizing audio to MIDI.

Returns the stream's current time in seconds, or 0 if an error occurred.
(Read only property)

15.10.25 WriteAvailable as Integer

MBS Audio Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve the number of frames that can be written to the stream without waiting.
Notes: Returns a non-negative value representing the maximum number of frames that can be written to the stream without blocking or busy waiting or, a PaErrorCode (which are always negative) if PortAudio is not initialized or an error is encountered.
(Read only property)

15.10.26 UseSafeThreading as boolean

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables or disables thread safe event handling.
Notes: Xojo works normally only on one preemptive thread as the framework is not reentrant and not in general preemptive thread safe.
Still newer Xojo versions get better so you can switch it off and get a better performance.
For most usages you need to turn it off. See the examples. A lot of pragma lines are needed to disable everything which can slow down processing. Also you are limited in a preemptive thread to do only math and no object creating/deleting.
(Read and Write computed property)

15.10.27 Constants

Flags

Constant	Value	Description
kFlagsClipOff	1	Disable default clipping of out of range samples.
kFlagsDitherOff	2	Disable default dithering.
kFlagsNeverDropInput	4	Flag requests that where possible a full duplex strear flowed input samples without calling the stream callbac for full duplex callback streams and only when used i paFramesPerBufferUnspecified (0) framesPerBuffer pa incorrectly results in a paInvalidFlag error being retu and OpenDefaultStream.
kFlagsNoFlag	0	No flags.
kFlagsPlatformSpecificFlags	&hFFFF0000	A mask specifying the platform specific bits.
kFlagsPrimeOutputBuffersUsingStreamCallback	8	Call the stream callback to fill initial output buffers, behavior of priming the buffers with zeros (silence). T input-only and blocking read/write streams.

15.11 class PortAudioStreamBufferedMBS

15.11.1 class PortAudioStreamBufferedMBS

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A portaudio stream class to use an internal buffer to feed its callback.
Example:

```
// play a one second 440 Hz tone through the default output device
// PortAudio is a property of the window: PortAudio As PortAudioMBS
// Stream is a property of the window: Stream As PortAudioStreamBufferedMBS
PortAudio = New PortAudioMBS
Stream = New PortAudioStreamBufferedMBS

Var sampleRate As Integer = 44100
Var e As Integer = Stream.OpenDefaultStream(1, sampleRate) // mono
If e <>0 Then
MessageBox "Error: " + PortAudio.ErrorText(e)
Return
End If

// 16 bit samples
Var samples As New MemoryBlock(sampleRate * 2)
For i As Integer = 0 To sampleRate - 1
samples.Int16Value(i * 2) = Sin(2 * 3.14159265 * 440 * i / sampleRate) * 10000
Next

Call Stream.PlayAudio(samples)
Call Stream.Start
```

Notes: Currently this class allows you to add 200 buffers to the internal playlist. The buffer size is not limited. FreeSpace returns you the number of buffers you have currently. Buffers are freed after they are played.
Subclass of the PortAudioStreamBaseMBS class.

15.11.2 Methods

15.11.3 AddAudio(Data as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds audio to the queue.
Notes: Data: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock's size property is used.

You need to set numOutputChannels to 1 or 2 when opening the stream. For 2 channels, sound data must be interleaved.

Values for bitsize:

7	signed byte
8	unsigned byte
15	signed short
16	unsigned short
24	unsigned medium
31	signed integer
32	unsigned integer

This method copies the data to the internal queue. It returns directly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.

Returns true on success and false on failure (e.g. out of memory).

15.11.4 AddAudioStereo(Data1 as memoryblock, Data2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds audio to the queue.
Notes: This is a special version of AddAudio which takes samples from both memoryblocks and interleaves them.

Data1: a memoryblock with the sound data
Data2: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock's size property is used.

The stream must use 2 channels for this method to work correctly.

Values for bitsize:

7	signed byte
8	unsigned byte
15	signed short
16	unsigned short
24	unsigned medium
31	signed integer
32	unsigned integer

This method copies the data to the internal queue. It returns directly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.

Returns true on success and false on failure (e.g. out of memory).

15.11.5 AddFloatAudio(FloatData as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds audio to the queue.
Notes: FloatData: a memoryblock with the sound data filled with single values.
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock's size property is used.

You need to set numOutputChannels to 1 or 2 when opening the stream. For 2 channels, sound data must be interleaved.

The samples are stored in 32bit float values (memoryblock.SingleValue)

This method copies the data to the internal queue. It returns directly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.

Returns true on success and false on failure (e.g. out of memory).

15.11.6 AddFloatAudioStereo(FloatData1 as memoryblock, FloatData2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds audio to the queue.
Notes: This is a special version of AddFloatAudio which takes samples from both memoryblocks and interleaves them.

FloatData1: a memoryblock with the sound data filled with single values.
FloatData2: a memoryblock with the sound data filled with single values.
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock's size property is used.

The samples are stored in 32bit float values (memoryblock.SingleValue)

This method copies the data to the internal queue. It returns directly.

The stream must use 2 channels for this method to work correctly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.

Returns true on success and false on failure (e.g. out of memory).

15.11.7 Constructor

MBS Audio Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

15.11.8 FreeSpace as Integer

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of buffer entries available in the queue.
Notes: The size of the buffers is not limited except your available memory.

15.11.9 HasFreeSpace as boolean

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the internal sound buffer has free space.
Notes: Returns true if freespace returns a value greater than zero.

This function was named IsQueueEmpty in plugin version 7.4.

15.11.10 OpenDefaultStream(numOutputChannels as Integer, sampleRate as Double) as Integer

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A simplified version of OpenStream() that opens the default input and/or output devices.
Notes: Sampleformat is always 32bit float in this class. All data you add the queue is converted to float internally.

numOutputChannels: The number of channels of sound to be delivered to the stream callback or passed to Write. It can range from 1 to the value of maxOutputChannels in the PortAudioDeviceInfoMBS object for the default output device. If 0 the stream is opened as an output-only stream.

sampleRate: Same as OpenStream parameter of the same name.

Returns an error code.

15.11.11 OpenStream(outputParameters as PortAudioStreamParametersMBS, sampleRate as Double, framesPerBuffer as Integer, streamFlags as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a stream for either input, output or both.
Notes: Sampleformat is always 32bit float in this class. All data you add the queue is converted to float internally.

outputParameters: A object that describes the output parameters used by the opened stream. See PortAudioStreamParametersMBS for a description of these parameters.

sampleRate: The desired sampleRate. For full-duplex streams it is the sample rate for both input and output

framesPerBuffer: The number of frames passed to the stream callback function, or the preferred block granularity for a blocking read/write stream. The special value paFramesPerBufferUnspecified (0) may be used to request that the stream callback will receive an optimal (and possibly varying) number of frames based on host requirements and the requested latency settings.
Note: With some host APIs, the use of non-zero framesPerBuffer for a callback stream may introduce an additional layer of buffering which could introduce additional latency. PortAudio guarantees that the additional latency will be kept to the theoretical minimum however, it is strongly recommended that a non-zero framesPerBuffer value only be used when your algorithm requires a fixed number of frames per stream callback.

const paFramesPerBufferUnspecified=0

streamFlags: Flags which modify the behaviour of the streaming process. This parameter may contain a combination of flags ORed together. Some flags may only be relevant to certain buffer formats.

Upon success OpenStream() returns paNoError and places a pointer to a valid PaStream in the stream argument. The stream is inactive (stopped).
If a call to OpenStream() fails, a non-zero error code is returned (see PaError for possible error codes) and the value of stream is invalid.

const paNoFlag	= 0	no flags
const paClipOff	= 1	Disable default clipping of out of range samples.
const paDitherOff	= 2	Flag requests that where possible a full duplex stream will not discard overflowed input samples without calling the stream callback. This flag is only valid for full duplex callback streams and only when used in combination with the paFramesPerBufferUnspecified (0) framesPerBuffer parameter. Using this flag incorrectly results in a paInvalidFlag error being returned from OpenStream and OpenDefaultStream.
const paNeverDropInput	= 4	Flag requests that where possible a full duplex stream will not discard overflowed input samples without calling the stream callback. This flag is only valid for full duplex callback streams and only when used in combination with the paFramesPerBufferUnspecified (0) framesPerBuffer parameter. Using this flag incorrectly results in a paInvalidFlag error being returned from OpenStream and OpenDefaultStream.
const paPrimeOutputBuffersUsingStreamCallback	= 8	Call the stream callback to fill initial output buffers, rather than the default behavior of priming the buffers with zeros (silence). This flag has no effect for input-only and blocking read/write streams.

15.11.12 PlayAudio(Data as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds audio to the queue and starts playback.
Notes: Data: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock's size property is used.

You need to set numOutputChannels to 1 or 2 when opening the stream. For 2 channels, sound data must be interleaved.

Values for bitsize:

7	signed byte
8	unsigned byte
15	signed short
16	unsigned short
24	unsigned medium
31	signed integer
32	unsigned integer

This method copies the data to the internal queue. It returns directly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.

15.11.13 PlayAudioStereo(Data1 as memoryblock, Data2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, BitSize as Integer=16, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds audio to the queue and starts playback.
Notes: This is a special version of AddAudio which takes samples from both memoryblocks and interleaves them.

Data1: a memoryblock with the sound data
Data2: a memoryblock with the sound data
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock's size property is used.

The stream must use 2 channels for this method to work correctly.

Values for bitsize:

7	signed byte
8	unsigned byte
15	signed short
16	unsigned short
24	unsigned medium
31	signed integer
32	unsigned integer

This method copies the data to the internal queue. It returns directly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.#

15.11.14 PlayFloatAudio(FloatData as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds audio to the queue and starts playback.
Notes: FloatData: a memoryblock with the sound data filled with single values.
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock's size property is used.

You need to set numOutputChannels to 1 or 2 when opening the stream. For 2 channels, sound data must be interleaved.

The samples are stored in 32bit float values (memoryblock.SingleValue)

This method copies the data to the internal queue. It returns directly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.#

15.11.15 PlayFloatAudioStereo(FloatData1 as memoryblock, FloatData2 as memoryblock, offsetBytes as Integer=0, countBytes as Integer=0, ClearBuffers as boolean=false) as boolean

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds audio to the queue and starts playback.
Notes: This is a special version of AddFloatAudio which takes samples from both memoryblocks and interleaves them.

FloatData1: a memoryblock with the sound data filled with single values.
FloatData2: a memoryblock with the sound data filled with single values.
offsetBytes: the number of the bytes to start playing (0=first)
countBytes: the number of bytes to play from offset. If countBytes is zero, the memoryblock's size property is used.

The samples are stored in 32bit float values (memoryblock.SingleValue)

This method copies the data to the internal queue. It returns directly.

The stream must use 2 channels for this method to work correctly.

If ClearBuffers is true, the buffer list will be cleared before this new data is added. This allows to have the next minute in the buffers and still do a change in the stream quick.

15.11.16 Properties

15.11.17 HadUnderflow as Boolean

MBS Audio Plugin, Plugin Version: 7.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: A flag set if a data underflow was found while NoUnderflow is true.
Notes: You may want to set this to false after your application recovered from a data underflow.
(Read and Write property)

15.11.18 NoUnderflow as Boolean

MBS Audio Plugin, Plugin Version: 7.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether underflows should be prevented.
Notes: If no audio data is there and NoUnderflow=true, the flag HadUnderflow is set to true and 0 values (Silence) is played.

Switching from sound to no sound and back may add some noise.
(Read and Write property)

15.11.19 OutputPosition as Double

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current position in the playing stream.
Notes: May point between samples.
(Read only property)

15.11.20 OutputPositionRelative as Double

MBS Audio Plugin, Plugin Version: 7.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The current position in the playing buffer.
Notes: May point between samples.

Will reset to 0 when a new buffer is used.
(Read only property)

15.11.21 Events

15.11.22 Finished

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This event is implemented by PortAudio clients.
Notes: Once registered they are called when the stream becomes inactive (ie once a call to Stop() will not block).
A stream will become inactive after the stream callback returns non-zero, or when Stop or Abort is called. For a stream providing audio output, if the stream callback returns paComplete, or Stop is called, the stream finished callback will not be called until all generated sample data has been played.

15.12 class PortAudioStreamInfoMBS

15.12.1 class PortAudioStreamInfoMBS

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to hold time information of the current stream.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 12.1pr1

15.12.2 Methods

15.12.3 Constructor

MBS Audio Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

15.12.4 Properties

15.12.5 InputLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input latency of the stream in seconds.
Notes: This value provides the most accurate estimate of input latency available to the implementation. It may differ significantly from the suggestedLatency value passed to OpenStream().
The value of this field will be zero (0.) for output-only streams.
(Read only property)

15.12.6 OutputLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output latency of the stream in seconds.
Notes: This value provides the most accurate estimate of output latency available to the implementation. It may differ significantly from the suggestedLatency value passed to OpenStream().
The value of this field will be zero (0.) for input-only streams.
(Read only property)

15.12.7 SampleRate as Double

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sample rate of the stream in Hertz (samples per second).
Notes: In cases where the hardware sample rate is inaccurate and PortAudio is aware of it, the value of this field may be different from the sampleRate parameter passed to OpenStream(). If information about the actual hardware sample rate is not available, this field will have the same value as the sampleRate parameter passed to OpenStream().
(Read only property)

15.13 class PortAudioStreamMBS

15.13.1 class PortAudioStreamMBS

MBS Audio Plugin, Plugin Version: 6.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A single PortAudioStreamMBS can provide multiple channels of real-time streaming audio input and output to a client application.
Notes: A stream provides access to audio hardware represented by one or more devices. Depending on the underlying Host API, it may be possible to open multiple streams using the same device, however this behavior is implementation defined. Portable applications should assume that a device may be simultaneously used by at most one PortAudioStreamMBS.

You can use this class in two ways:

- with Callback event: Get event call when new data is needed or received.
- without Callback event: Use read/write methods to access buffers and move samples.

Subclass of the PortAudioStreamBaseMBS class.

15.13.2 Methods

15.13.3 Constructor

MBS Audio Plugin, Plugin Version: 20.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

15.13.4 OpenDefaultStream(numInputChannels as Integer, numOutputChannels as Integer, sampleFormat as Integer, sampleRate as Double, framesPerBuffer as Integer, Flags as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A simplified version of OpenStream() that opens the default input and/or output devices.
Notes: numInputChannels: The number of channels of sound that will be supplied to the stream callback

or returned by ReadStream. It can range from 1 to the value of maxInputChannels in the PaDeviceInfo record for the default input device. If 0 the stream is opened as an output-only stream.

numOutputChannels: The number of channels of sound to be delivered to the stream callback or passed to Write. It can range from 1 to the value of maxOutputChannels in the PaDeviceInfo record for the default output dvice. If 0 the stream is opened as an output-only stream.

sampleFormat: The sample format of both the input and output buffers provided to the callback or passed to and from Read and Write.
sampleFormat may be any of the formats described by the PaSampleFormat enumeration.

sampleRate: Same as OpenStream parameter of the same name.
framesPerBuffer: Same as OpenStream parameter of the same name.

constants for the flags value:

const paNoFlag	= 0	no flags
const paClipOff	= 1	Disable default clipping of out of range samples.
const paDitherOff	= 2	Flag requests that where possible a full duplex stream will not discard overflowed input samples without calling the stream callback. This flag is only valid for full duplex callback streams and only when used in combination with the paFramesPerBufferUnspecified (0) framesPerBuffer parameter. Using this flag incorrectly results in a paInvalidFlag error being returned from OpenStream and OpenDefaultStream.
const paNeverDropInput	= 4	Flag requests that where possible a full duplex stream will not discard overflowed input samples without calling the stream callback. This flag is only valid for full duplex callback streams and only when used in combination with the paFramesPerBufferUnspecified (0) framesPerBuffer parameter. Using this flag incorrectly results in a paInvalidFlag error being returned from OpenStream and OpenDefaultStream.
const paPrimeOutputBuffersUsingStreamCallback	= 8	Call the stream callback to fill initial output buffers, rather than the default behavior of priming the buffers with zeros (silence). This flag has no effect for input-only and blocking read/write streams.

Returns an error code.

15.13.5 OpenStream(inputParameters as PortAudioStreamParametersMBS, outputParameters as PortAudioStreamParametersMBS, sampleRate as Double, framesPerBuffer as Integer, streamFlags as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a stream for either input, output or both.
Notes: inputParameters: A object that describes the input parameters used by the opened stream. See PortAudioStreamParametersMBS for a description of these parameters. inputParameters must be nil for output-only streams.

outputParameters: A object that describes the output parameters used by the opened stream. See PortAudioStreamParametersMBS for a description of these parameters. outputParameters must be nil for input-only streams.

sampleRate: The desired sampleRate. For full-duplex streams it is the sample rate for both input and output

framesPerBuffer: The number of frames passed to the stream callback function, or the preferred block granularity for a blocking read/write stream. The special value paFramesPerBufferUnspecified (0) may be used to request that the stream callback will receive an optimal (and possibly varying) number of frames based on host requirements and the requested latency settings.
Note: With some host APIs, the use of non-zero framesPerBuffer for a callback stream may introduce an additional layer of buffering which could introduce additional latency. PortAudio guarantees that the additional latency will be kept to the theoretical minimum however, it is strongly recommended that a non-zero framesPerBuffer value only be used when your algorithm requires a fixed number of frames per stream callback.

const paFramesPerBufferUnspecified=0

streamFlags: Flags which modify the behaviour of the streaming process. This parameter may contain a combination of flags ORed together. Some flags may only be relevant to certain buffer formats.

const paNoFlag	= 0	no flags
const paClipOff	= 1	Disable default clipping of out of range samples.
const paDitherOff	= 2	Flag requests that where possible a full duplex stream will not discard overflowed input samples without calling the stream callback. This flag is only valid for full duplex callback streams and only when used in combination with the paFramesPerBufferUnspecified (0) framesPerBuffer parameter. Using this flag incorrectly results in a paInvalidFlag error being returned from OpenStream and OpenDefaultStream.
const paNeverDropInput	= 4	Flag requests that where possible a full duplex stream will not discard overflowed input samples without calling the stream callback. This flag is only valid for full duplex callback streams and only when used in combination with the paFramesPerBufferUnspecified (0) framesPerBuffer parameter. Using this flag incorrectly results in a paInvalidFlag error being returned from OpenStream and OpenDefaultStream.
const paPrimeOutputBuffersUsingStreamCallback	= 8	Call the stream callback to fill initial output buffers, rather than the default behavior of priming the buffers with zeros (silence). This flag has no effect for input-only and blocking read/write streams.

If this the callback event is left empty the stream will be opened in 'blocking read/write' mode. In blocking mode, the client can receive sample data using Read and write sample data using Write, the number of samples that may be read or written without blocking is returned by ReadAvailable and WriteAvailable respectively.

Upon success OpenStream() returns paNoError and places a pointer to a valid PaStream in the stream

argument. The stream is inactive (stopped).
If a call to OpenStream() fails, a non-zero error code is returned (see PaError for possible error codes) and the value of stream is invalid.

15.13.6 Events

15.13.7 Callback(InputBuffer as memoryblock, outputBuffer as memoryblock, FrameCount as Integer, inputBufferAdcTime as Double, currentTime as Double, outputBufferDacTime as Double, statusFlags as Integer) as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called when new data is needed or received.
Notes: This event is implemented by PortAudio clients. They consume, process or generate audio in response to requests from an active PortAudio stream.

InputBuffer and outputBuffer are arrays of interleaved samples, the format, packing and number of channels used by the buffers are determined by parameters to OpenStream().

frameCount: The number of sample frames to be processed by the stream callback.

inputBufferAdcTime, currentTimeTiming and outputBufferDacTime: The time in seconds when the first sample of the input buffer was received at the audio input, the time in seconds when the first sample of the output buffer will begin being played at the audio output, and the time in seconds when the stream callback was called.

statusFlags: Flags indicating whether input and/or output buffers have been inserted or will be dropped to overcome underflow or overflow conditions.

Returns the stream callback should return one of the values in the PaStreamCallbackResult enumeration. To ensure that the callback continues to be called, it should return paContinue (0). Either paComplete or paAbort can be returned to finish stream processing, after either of these values is returned the callback will not be called again. If paAbort is returned the stream will finish as soon as possible. If paComplete is returned, the stream will continue until all buffers generated by the callback have been played.
This may be useful in applications such as soundfile players where a specific duration of output is required. However, it is not necessary to utilise this mechanism as Stop(), Abort() or Close() can also be used to stop the stream. The callback must always fill the entire output buffer irrespective of its return value.

With the exception of CpuLoad() it is not permissable to call PortAudio API functions from within the stream callback.

Flag bit constants for the statusFlags to Callback:

paInputUnderflow = 1
In a stream opened with paFramesPerBufferUnspecified, indicates that input data is all silence (zeros) because no real data is available. In a stream opened without paFramesPerBufferUnspecified, it indicates that one or more zero samples have been inserted into the input buffer to compensate for an input underflow.

paInputOverflow = 2
In a stream opened with paFramesPerBufferUnspecified, indicates that data prior to the first sample of the input buffer was discarded due to an overflow, possibly because the stream callback is using too much CPU time. Otherwise indicates that data prior to one or more samples in the input buffer was discarded.

paOutputUnderflow = 4
Indicates that output data (or a gap) was inserted, possibly because the stream callback is using too much CPU time.

paOutputOverflow = 8
Indicates that output data will be discarded because no room is available.

paPrimingOutput = 16
Some of all of the output data will be used to prime the stream, input data may be zero.

Allowable return values for the callback: (PaStreamCallbackResult)

```
const paContinue   = 0
const paComplete   = 1
const paAbort      = 2
```

15.13.8 Finished

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This event is implemented by PortAudio clients.
Notes: Once registered they are called when the stream becomes inactive (ie once a call to Stop() will not block).
A stream will become inactive after the stream callback returns non-zero, or when Stop or Abort is called. For a stream providing audio output, if the stream callback returns paComplete, or Stop is called, the stream finished callback will not be called until all generated sample data has been played.

15.14 class PortAudioStreamParametersMBS

15.14.1 class PortAudioStreamParametersMBS

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parameters for one direction (input or output) of a stream.
Blog Entries

- MBS Xojo Plugins, version 20.1pr6

15.14.2 Properties

15.14.3 ASIOFlags as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The flags for ASIO stream.
Notes: Can include kAsioUseChannelSelectors constant.
(Read and Write property)

15.14.4 ChannelCount as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The requested channel count.
Notes: The number of channels of sound to be delivered to the stream callback or accessed by Read() or Write(). It can range from 1 to the value of maxInputChannels in the DeviceInfo object for the device specified by the device parameter.
(Read and Write property)

15.14.5 Device as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The device ID to be used.
Notes: A valid device index in the range 0 to (PortAudioMBS.CountDevices-1) specifying the device to be used or the special constant paUseHostApiSpecificDeviceSpecification which indicates that the actual device(s) to use are specified in hostApiSpecificStreamInfo.
This field must not be set to paNoDevice (-1).
(Read and Write property)

15.14.6 MacCoreAudioChannelMapSize as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Channel map for HAL channel mapping.
Notes: Should be number of values.
(Read and Write property)

15.14.7 MacCoreAudioFlags as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The flags for CoreAudio.
Notes: (Read and Write property)

15.14.8 SampleFormat as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sample format of the buffer provided to the stream callback, Read() or Write().
Notes: Constants for sample format:

```
const paFloat32          = 1
const paInt32            = 2
const paInt24            = 4
const paInt16            = 8
const paInt8             = 16
const paUInt8            = 32
const paCustomFormat     = 65536
const paNonInterleaved   = negative sign
```

The standard formats paFloat32, paInt16, paInt32, paInt24, paInt8 and aUInt8 are usually implemented by all implementations.

The floating point representation (paFloat32) uses +1.0 and -1.0 as the maximum and minimum respectively.

paUInt8 is an unsigned 8 bit format where 128 is considered ”ground”

The paNonInterleaved flag indicates that a multichannel buffer is passed as a set of non-interleaved pointers.
(Read and Write property)

15.14.9 SuggestedLatency as Double

MBS Audio Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The desired latency in seconds.
Notes: Where practical, implementations should configure their latency based on these parameters, otherwise they may choose the closest viable latency instead. Unless the suggested latency is greater than the absolute upper limit for the device implementations should round the suggestedLatency up to the next practial value - ie to provide an equal or higher latency than suggestedLatency wherever possibe.
Actual latency values for an open stream may be retrieved using the inputLatency and outputLatency fields of the PortAudioStreamInfoMBS object returned by PortAudioStreamMBS.Info().
(Read and Write property)

15.14.10 WASChannelMask as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Support for WAVEFORMATEXTENSIBLE channel masks.
Notes: If flags contains kWinWasapiUseChannelMask this allows you to specify which speakers to address in a multichannel stream. Will be used only if kWinWasapiUseChannelMask flag is specified.

See kWinChannelMask* constants.
(Read and Write property)

15.14.11 WASFlags as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The flags.
Notes: Can be e.g. kWinWasapiUseChannelMask to use channel mask.
(Read and Write property)

15.14.12 WASStreamCategory as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Stream category.
Notes: See constants.
(Read and Write property)

15.14.13 WASStreamOption as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Stream option.
Notes: See constants.
(Read and Write property)

15.14.14 WASThreadPriority as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies thread priority explicitly. Will be used only if paWinWasapiThreadPriority flag is specified.
Notes: Please note, if Input/Output streams are opened simultaniously (Full-Duplex mode) you shall specify same value for threadPriority or othervise one of the values will be used to setup thread priority.
(Read and Write property)

15.14.15 WinDirectSoundChannelMask as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The channel mask.
Notes: support for WAVEFORMATEXTENSIBLE channel masks. If flags contains kWinDirectSoundUseChannelMask this allows you to specify which speakers to address in a multichannel stream.

See kWinChannelMask* constants.
(Read and Write property)

15.14.16 WinDirectSoundFlags as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The flags for Direct Sound.
Notes: Enable other features of this parameters.
(Read and Write property)

15.14.17 WinDirectSoundFramesPerBuffer as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Low-level latency setting support.
Notes: Sets the size of the DirectSound host buffer.
When flags contains the kWinDirectSoundUseLowLevelLatencyParameters this size will be used instead of interpreting the generic latency parameters to Pa_OpenStream(). If the flag is not set this value is ignored.

If the stream is a full duplex stream the implementation requires that the values of framesPerBuffer for input and output match (if both are specified).
(Read and Write property)

15.14.18 WinMMEBufferCount as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of buffers.
Notes: (Read and Write property)

15.14.19 WinMMEChannelMask as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The channel mask.
Notes: Support for WAVEFORMATEXTENSIBLE channel masks. If flags contains kWinMmeUseChannelMask this allows you to specify which speakers to address in a multichannel stream.

See kWinChannelMask* constants.
(Read and Write property)

15.14.20 WinMMEDeviceCount as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The device count.
Notes: (Read and Write property)

15.14.21 WinMMEFlags as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The field for flags for Win MME.
Notes: (Read and Write property)

15.14.22 WinMMEFramesPerBuffer as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Low-level latency setting support.
Notes: These settings control the number and size of host buffers in order to set latency. They will be used instead of the generic parameters to OpenStream() if flags contains the kWinMmeUseLowLevelLatencyParameters flag.

If PortAudioStreamParametersMBS object with kWinMmeUseLowLevelLatencyParameters are supplied for both input and output in a full duplex stream, then the input and output framesPerBuffer must be the same, or the larger of the two must be a multiple of the smaller, otherwise a kErrorIncompatibleHostApiSpecificStreamInfo error will be returned from OpenStream().
(Read and Write property)

15.14.23 WinWDMKSChannelMask as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The channel mask for WDM/KS.
Notes: If kWinWDMKSUseGivenChannelMask bit is set in flags, use this as channelMask instead of default.

See kWinChannelMask* constants.
(Read and Write property)

15.14.24 WinWDMKSFlags as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flags indicate which fields are valid.
Notes: (Read and Write property)

15.14.25 WinWDMKSNoOfPackets as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of packets to use for WaveCyclic devices, range is [2, 8] .
Notes: Set to zero for default value of 2.

(Read and Write property)

15.14.26 ASIOChannelSelectors(Index as Integer) as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Support for opening only specific channels of an ASIO device.
Notes: If the kAsioUseChannelSelectors flag is set, channelSelectors is a pointer to an array of integers specifying the device channels to use.
When used, the length of the channelSelectors array must match the corresponding channelCount parameter to OpenStream() otherwise a crash may result.
The values in the selectors array must specify channels within the range of supported channels for the device or kErrorInvalidChannelCount will result.
(Read and Write computed property)

15.14.27 MacCoreAudioChannelMap(Index as Integer) as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Channel map size for HAL channel mapping.
Example:

```
Var pasp As New PortAudioStreamParametersMBS
pasp.ChannelCount = 1 // we produce one channel
pasp.MacCoreAudioChannelMap(0) = 0 // put our mono channel on Left
pasp.MacCoreAudioChannelMap(1) = 0 // put our mono channel on Right
pasp.MacCoreAudioChannelMapSize = 2
```

Notes: This property is used to map input channels from an input (source) to a destination. The number of channels represented in the channel map is the number of channels of the destination. The channel map entries contain a channel number of the source that should be mapped to that destination channel. If -1 is specified, then that destination channel will not contain any channel from the source (so it will be silent)

Please set MacCoreAudioChannelMapSize to make this map to have effect.
(Read and Write computed property)

15.14.28 WinMMEDevicesChannelCount(Index as Integer) as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiple devices per direction support.
Notes: If flags contains the PaWinMmeUseMultipleDevices flag, this functionality will be used, otherwise

the device parameter to OpenStream() will be used instead.
If devices are specified here, the corresponding device parameter to OpenStream() should be set to kUseHostApiSpecificDeviceSpecification, otherwise an kErrorInvalidDevice error will result.
The total number of channels across all specified devices must agree with the corresponding channelCount parameter to OpenStream() otherwise a kErrorInvalidChannelCount error will result.

Please always set WinMMEDevicesChannelCount and WinMMEDevicesDevice together.
(Read and Write computed property)

15.14.29 WinMMEDevicesDevice(Index as Integer) as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiple devices per direction support.
Notes: If flags contains the PaWinMmeUseMultipleDevices flag, this functionality will be used, otherwise the device parameter to OpenStream() will be used instead.
If devices are specified here, the corresponding device parameter to OpenStream() should be set to kUseHostApiSpecificDeviceSpecification, otherwise an kErrorInvalidDevice error will result.
The total number of channels across all specified devices must agree with the corresponding channelCount parameter to OpenStream() otherwise a kErrorInvalidChannelCount error will result.

Please always set WinMMEDevicesChannelCount and WinMMEDevicesDevice together.
(Read and Write computed property)

15.14.30 Constants

Constants

Constant	Value	Description
kAsioUseChannelSelectors	1	One of the ASIO flags. Set to enable channel selectors.

Stream Category

Constant	Value	Description
kWASAudioCategoryAlerts	4	Alert sounds.
kWASAudioCategoryCommunications	3	Real-time communications, such as VOIP or chat.
kWASAudioCategoryGameChat	8	Game chat audio. Similar to kWASAudioCategoryCommunications except kWASAudioCategoryGameChat will not attenuate other streams.
kWASAudioCategoryGameEffects	6	Game sound effects.
kWASAudioCategoryGameMedia	7	Background audio for games.
kWASAudioCategoryMedia	11	Stream that includes audio without dialog.
kWASAudioCategoryMovie	10	Stream that includes audio with dialog.
kWASAudioCategoryOther	0	Other audio stream.
kWASAudioCategorySoundEffects	5	Sound effects.
kWASAudioCategorySpeech	9	Speech.

WAS Flags

Constant	Value	Description
kWASFlagExclusive	1	Puts WASAPI into exclusive mode.
kWASFlagPolling	8	selects non-Event driven method of data read/write Note: WASAPI Event driven core is capable of 2ms latency!!!, but Polling method can only provide 15-20ms latency.
kWASFlagRedirectHostProcessor	2	Allows to skip internal PA processing completely.
kWASFlagThreadPriority	16	forces custom thread priority setting, must be used if kWasapiStreamInfo::threadPriority is set to a custom value.
kWASFlagUseChannelMask	4	Assigns custom channel mask.

Stream Options

Constant	Value	Description
kWASStreamOptionMatchFormat	2	Force WASAPI Audio Engine into a stream format, supported since Windows 10
kWASStreamOptionNone	0	Default
kWASStreamOptionRaw	1	Bypass WASAPI Audio Engine DSP effects, supported since Windows 8.1

Thread Priorities

Constant	Value	Description
kWASThreadPriorityAudio	1	Audio. Default for Shared mode.
kWASThreadPriorityCapture	2	Capture
kWASThreadPriorityDistribution	3	Distribution
kWASThreadPriorityGames	4	Games
kWASThreadPriorityNone	0	
kWASThreadPriorityPlayback	5	Playback
kWASThreadPriorityProAudio	6	ProAudio. Default for Exclusive mode.
kWASThreadPriorityWindowManager	7	Window Manager

Windows Channel Mask

Constant	Value	Description
kWinChannelMask5Point1	63	5.1 Speakers without side speakers.
kWinChannelMask5Point1Surround	1551	5.1 Speakers with side speakers.
kWinChannelMask7Point1	255	7.1 Speakers without side speakers.
kWinChannelMask7Point1Surround	1599	7.1 Speakers with side speakers.
kWinChannelMaskAll	2147483648	Used to specify that any possible permutation of speaker configur
kWinChannelMaskBackCenter	256	Back Center.
kWinChannelMaskBackLeft	16	Back Left.
kWinChannelMaskBackRight	32	Back Right.
kWinChannelMaskDirectout	0	no speakers
kWinChannelMaskFrontCenter	4	Front center.
kWinChannelMaskFrontLeft	1	Front left
kWinChannelMaskFrontLeftOfCenter	64	Front Left or Center.
kWinChannelMaskFrontRight	2	Front right.
kWinChannelMaskFrontRightOfCenter	128	Front Right or Center.
kWinChannelMaskGroundFrontCenter	4	DVD Speaker Positions: Ground Front Center
kWinChannelMaskGroundFrontLeft	1	DVD Speaker Positions: Ground Front Left
kWinChannelMaskGroundFrontRight	2	DVD Speaker Positions: Ground Front Right
kWinChannelMaskGroundRearLeft	16	DVD Speaker Positions: Ground Rear Left
kWinChannelMaskGroundRearRight	32	DVD Speaker Positions: Ground Rear Right
kWinChannelMaskLowFrequency	8	Low frequency speaker (bass)
kWinChannelMaskMono	4	Mono goes to center speaker, or if not available to left and right.
kWinChannelMaskQuad	51	Left and right in front and back.
kWinChannelMaskReserved	2147221504	Bit mask locations reserved for future use.
kWinChannelMaskSideLeft	512	Side speaker on left
kWinChannelMaskSideRight	1024	Side speaker on right.
kWinChannelMaskStereo	3	Left and right speakers.
kWinChannelMaskSuperWoofer	8	DVD Speaker Positions: Super Woofer
kWinChannelMaskSurround	263	Front left and right, front and back center.
kWinChannelMaskTopBackCenter	65536	Top back center.
kWinChannelMaskTopBackLeft	32768	Top back left.
kWinChannelMaskTopBackRight	131072	Top back right.
kWinChannelMaskTopCenter	2048	Top center
kWinChannelMaskTopFrontCenter	8192	Top front center
kWinChannelMaskTopFrontLeft	4096	Top front left.
kWinChannelMaskTopFrontRight	16384	Top front right.
kWinChannelMaskTopMiddle	2048	DVD Speaker Positions: Top Middle

Direct Sound Flags

Constant	Value	Description
kWinDirectSoundUseChannelMask	4	The flag indicates that the WinDirectSoundChannelMask fie
kWinDirectSoundUseLowLevelLatencyParameters	1	Indicates WinDirectSoundFramesPerBuffer field is set.

Win MME Flags

Constant	Value	Description
kWinMmeDontThrottleOverloadedProcessingThread	8	By default, the mme implementation drops the processi to THREAD_PRIORITY_NORMAL and sleeps the thre exceeds 100% This flag disables any priority throttling. Th will always run at THREAD_PRIORITY_TIME_CRITI
kWinMmeUseChannelMask	4	Use channel mask.
kWinMmeUseLowLevelLatencyParameters	1	Use low level latency.
kWinMmeUseMultipleDevices	2	Use multiple devices.
kWinMmeWaveFormatDolbyAc3Spdif	16	Flags for non-PCM spdif passthrough.
kWinMmeWaveFormatWmaSpdif	32	Flags for non-PCM spdif passthrough.

Flags for Win WDM/KS

Constant	Value	Description
kWinWDMKSOverrideFramesize	1	Makes WDMKS use the supplied latency figures instead of relying on the f size reported by the WaveCyclic device. Use at own risk!
kWinWDMKSUseGivenChannelMask	2	Makes WDMKS (output stream) use the given channelMask instead o default.

Sample Formats

Constant	Value	Description
paCustomFormat	65536	Custom format. Not supported by plugin.
paFloat32	1	Uses +1.0 and -1.0 as the maximum and minimum respectively.
paInt16	8	Signed 16 bit.
paInt24	4	Packed 24 bit format
paInt32	2	Signed 32 bit.
paInt8	16	8 bit integer.
paNonInterleaved	&h80000000	Non interleaved. The paNonInterleaved flag indicates that audio data is passed as an array of pointers to separate buffers, one buffer for each channel. Usually, when this flag is not used, audio data is passed as a single buffer with all channels interleaved.
paNonInterleavedFloat32	&h80000001	Non interleaved, Uses +1.0 and -1.0 as the maximum and minimum respectively.
paNonInterleavedInt16	&h80000008	Non interleaved, signed 16 bit.
paNonInterleavedInt24	&h80000004	Non interleaved, Packed 24 bit format
paNonInterleavedInt32	&h80000002	Non interleaved, signed 32 bit.
paNonInterleavedInt8	&h80000010	Non interleaved, 8 bit integer.
paNonInterleavedUInt8	&h80000020	Non interleaved, unsigned 8 bit format where 128 is considered ”ground”.
paUInt8	32	unsigned 8 bit format where 128 is considered ”ground”

15.15 class PortAudioStreamRecorderMBS

15.15.1 class PortAudioStreamRecorderMBS

MBS Audio Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A portaudio stream class to use an internal buffer to record audio.
Example:

```
// record from the default microphone and measure the peak level
// PortAudio is a property of the window: PortAudio As PortAudioMBS
// Recorder is a property of the window: Recorder As PortAudioStreamRecorderMBS
PortAudio = New PortAudioMBS
Recorder = New PortAudioStreamRecorderMBS(44100 * 10) // buffer for 10 seconds

If Recorder.OpenDefaultStream(1, 44100) = 0 Then
Call Recorder.Start
End If

// later, e.g. in a timer: read what was recorded so far
Var buffer As New MemoryBlock(44100 * 4) // floats
Var count As Integer = Recorder.ReadFrames(buffer, buffer.Size)
Var peak As Double
For i As Integer = 0 To count - 1
peak = Max(peak, Abs(buffer.SingleValue(i * 4)))
Next
System.DebugLog count.ToString + " samples, peak " + Format(peak, "0.00")
```

Notes: This class has a ring buffer to store the audio samples which they are being recorded. Your application can in a timer or thread process this samples.
Subclass of the PortAudioStreamBaseMBS class.
Blog Entries

- MBS Xojo Plugins, version 24.1pr1
- MBS Xojo / Real Studio Plugins, version 16.1pr2

15.15.2 Methods

15.15.3 Constructor(BufferSize as Integer)

MBS Audio Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new object using a buffer of the given size.
Notes: The buffer must be a power of 2. For example one Megabyte (2^20). This defines the ring buffer used to buffer samples between data coming from sound device and you call ReadFrames method.

Automatically we take paFloat32 as format for sample buffer.

At 44100 Hz, and 4 bytes per value and 2 channels, you will need 352800 bytes per second on storage.

15.15.4 Flush

MBS Audio Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the buffer and discards all current samples.

15.15.5 OpenDefaultStream(numInputChannels as Integer, sampleRate as Double) as Integer

MBS Audio Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A simplified version of OpenStream() that opens the default input devices.
Notes: Sampleformat is always 32bit float in this class. (use memoryblock.singlevalue)

numInputChannels: The number of channels of sound to be delivered. It can range from 1 to the value of maxInputChannels in the PortAudioDeviceInfoMBS object for the default output device. If 0 the stream is opened as an output-only stream.

sampleRate: Same as OpenStream parameter of the same name.

Returns an error code.
Error -2 is from the plugin and reports that the buffer was not created before.

15.15.6 OpenStream(inputParameters as PortAudioStreamParametersMBS, sampleRate as Double, framesPerBuffer as Integer, streamFlags as Integer) as Integer

MBS Audio Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a stream for input.
Notes: Sampleformat is always 32bit float in this class. (use memoryblock.singlevalue)

outputParameters: A object that describes the input parameters used by the opened stream. See PortAudioStreamParametersMBS for a description of these parameters.

sampleRate: The desired sampleRate.

framesPerBuffer: The number of frames passed to the stream callback function, or the preferred block granularity for a blocking read/write stream. The special value paFramesPerBufferUnspecified (0) may be used to request that the stream callback will receive an optimal (and possibly varying) number of frames based on host requirements and the requested latency settings.
Note: With some host APIs, the use of non-zero framesPerBuffer for a callback stream may introduce an additional layer of buffering which could introduce additional latency. PortAudio guarantees that the additional latency will be kept to the theoretical minimum however, it is strongly recommended that a non-zero framesPerBuffer value only be used when your algorithm requires a fixed number of frames per stream callback.

const paFramesPerBufferUnspecified=0

streamFlags: Flags which modify the behaviour of the streaming process. This parameter may contain a combination of flags ORed together. Some flags may only be relevant to certain buffer formats.

const paNoFlag	= 0	no flags
const paClipOff	= 1	Disable default clipping of out of range samples.
const paDitherOff	= 2	Flag requests that where possible a full duplex stream will not discard overflowed input samples without calling the stream callback. This flag is only valid for full duplex callback streams and only when used in combination with the paFramesPerBufferUnspecified (0) framesPerBuffer parameter. Using this flag incorrectly results in a paInvalidFlag error being returned from OpenStream and OpenDefaultStream.
const paNeverDropInput	= 4	Call the stream callback to fill initial output buffers, rather than the default behavior of priming the buffers with zeros (silence). This flag has no effect for input-only and blocking read/write streams.
const paPrimeOutputBuffersUsingStreamCallback	= 8	Call the stream callback to fill initial output buffers, rather than the default behavior of priming the buffers with zeros (silence). This flag has no effect for input-only and blocking read/write streams.

Upon success OpenStream() returns paNoError and places a pointer to a valid PaStream in the stream argument. The stream is inactive (stopped).
If a call to OpenStream() fails, a non-zero error code is returned (see PaError for possible error codes) and the value of stream is invalid.

Error -2 is from the plugin and reports that the buffer was not created before.

15.15.7 ReadFrames(mem as memoryblock, SizeInBytes as Integer) as Integer

MBS Audio Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads frames into the memoryblock.
Example:

```
Var s as PortAudioStreamRecorderMBS
Var m as memoryblock

m=newmemoryblock(1024*1024)
// initialize

Var frames as Integer

frames=s.ReadFrames(m,m.size)

MessageBox "we got "+str(frames)+" frames."
```

Notes: You pass a memoryblock and the size of this memoryblock in bytes.
Values are stored in floats (memoryblock.singlevalue) so you get at maximum SizeInBytes/4 values. And if you use more than one channel, you will receive them interlaced.

ReadFrames uses a mutex to access share data, so this call is expensive. Use a big buffer.

15.15.8 ResizeBuffer(BufferSize as Integer)

MBS Audio Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resizes the buffer.
Notes: Do not resize while you are recording (this can crash).

The buffer must be a power of 2. For example one Megabyte (2^20).

At 44100 Hz, and 4 bytes per value and 2 channels, you will need 352800 bytes per second on storage.

15.15.9 Properties

15.15.10 Buffer as Memoryblock

MBS Audio Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a memoryblock which points to the ring buffer used in the recorder object.
Notes: This memoryblock has no size.
It is only for debugging and only valid as long as the PortAudioStreamRecorderMBS object is living.
(Read only property)

15.15.11 BufferReadIndex as Integer

MBS Audio Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The read index inside the ring buffer.
Notes: Only for debugging.
(Read only property)

15.15.12 BufferSize as Integer

MBS Audio Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of the ring buffer in bytes.
Notes: (Read only property)

15.15.13 BufferWriteIndex as Integer

MBS Audio Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The write index inside the ring buffer.
Notes: Only for debugging.
(Read only property)

15.15.14 FramesAvailable as Integer

MBS Audio Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of frames available in the buffer.
Notes: FramesAvailable uses a mutex to access share data, so this call is expensive. Do not call it to decide whether to call ReadFrames. ReadFrames calls FramesAvailable itself.
(Read only property)

15.15.15 NumInputChannels as Integer

MBS Audio Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of input channels used with the OpenStream function.
Notes: (Read only property)

15.16 Globals

15.16.1 GetSoundMuteMBS as boolean

MBS Util Plugin, Plugin Version: 6.2, Platforms: macOS, Windows, Targets: All.

Function: Checks the mute state of the sound output.
Example:

```
if GetSoundMuteMBS then
Title="on"
else
Title="off"
end if
```

Notes: Returns false on any error.

15.16.2 GetSoundVolumeLeftMBS as Double

MBS Util Plugin, Plugin Version: 7.1, Platforms: macOS, Windows, Targets: All.

Function: Gets the current volume for the left channel.
Example:

```
// show the volume of the left and right channel
MessageBox "Left: " + Format(GetSoundVolumeLeftMBS, "0") + "%, right: " + Format(GetSoundVolumeRightMBS, "0") + "%"
```

Notes: Same as GetSoundVolumeMBS, but only for the left channel.

15.16.3 GetSoundVolumeMBS as Double

MBS Util Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, iOS, Targets: All.

Function: Gets the current volume.
Example:

```
Var d as Double

d=GetSoundVolumeMBS
```

Notes: Volume is from 0 to 1.0
Uses QuickTime on Mac OS Classic, CoreAudio on Mac OS X and the Mixer on Windows.

Added iOS support with version 24.5, but it requires an active audio session to get volume.

15.16.4 GetSoundVolumeRightMBS as Double

MBS Util Plugin, Plugin Version: 7.1, Platforms: macOS, Windows, Targets: All.

Function: Gets the current volume for the right channel.
Example:

```
// show the volume of the right channel
MessageBox "Right: " + Format(GetSoundVolumeRightMBS, "0") + "%"
```

Notes: Same as GetSoundVolumeMBS, but only for the right channel.

15.16.5 SetSoundMuteMBS(mute as boolean)

MBS Util Plugin, Plugin Version: 6.2, Platforms: macOS, Windows, Targets: All.

Function: Sets sound mute to the give state.
Example:

```
SetSoundMuteMBS true // set mute on
```

15.16.6 SetSoundVolumeLeftMBS(percent as Double)

MBS Util Plugin, Plugin Version: 7.1, Platforms: macOS, Windows, Targets: All.

Function: Sets the volume on the left channel.
Example:

```
// set the balance more to the left
SetSoundVolumeLeftMBS(80)
SetSoundVolumeRightMBS(40)
```

Notes: Volume is from 0 to 1.0
Uses QuickTime on Mac OS Classic, CoreAudio on Mac OS X and the Mixer on Windows.

15.16.7 SetSoundVolumeMBS(percent as Double)

MBS Util Plugin, Plugin Version: 5.0, Platforms: macOS, Windows, Targets: All.

Function: Sets the volume.
Example:

```
SetSoundVolumeMBS 1.0
```

Notes: Volume is from 0 to 1.0
Uses QuickTime on Mac OS Classic, CoreAudio on Mac OS X and the Mixer on Windows.

15.16.8 SetSoundVolumeRightMBS(percent as Double)

MBS Util Plugin, Plugin Version: 7.1, Platforms: macOS, Windows, Targets: All.

Function: Sets the volume on the right channel.
Example:

```
// mute the right channel
SetSoundVolumeRightMBS(0)
```

Notes: Volume is from 0 to 1.0
Uses QuickTime on Mac OS Classic, CoreAudio on Mac OS X and the Mixer on Windows.

15.17 class SoundFileInfoMBS

15.17.1 class SoundFileInfoMBS

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the file info of a sound file.
Example:

```
// show format, sample rate, channels and duration of an audio file
Var sound As SoundFileMBS = SoundFileMBS.Open(SpecialFolder.Desktop.Child("test.wav"))
If sound = Nil Then Return

Var info As SoundFileInfoMBS = sound.Info
MessageBox info.FormatName + " (" + info.FormatSubName + ")" + EndOfLine + _
info.SampleRate.ToString + " Hz, " + info.Channels.ToString + " channels" + EndOfLine + _
"Duration: " + Format(info.Frames / info.SampleRate, "0.00") + " seconds"
```

Notes: When you open a sound file, the library will fill this and provide you the file format details.
When writing a sound file, you need to build valid format.

15.17.2 Properties

15.17.3 Channels as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of channels.
Notes: (Read and Write property)

15.17.4 Format as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The format ID.
Notes: See kFormat constants.
(Read and Write property)

15.17.5 FormatEndianName as String

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The endian description for the format.
Notes: (Read only property)

15.17.6 FormatName as String

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The format description for the format.
Notes: (Read only property)

15.17.7 FormatSubName as String

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sub format description for the format.
Notes: (Read only property)

15.17.8 Frames as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of frames.
Notes: (Read and Write property)

15.17.9 IsValid as Boolean

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether format is valid.
Notes: Returns true if valid.
(Read only property)

15.17.10 SampleRate as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sample rate in Hz.
Notes: (Read and Write property)

15.17.11 Sections as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of sections.
Notes: (Read and Write property)

15.17.12 Seekable as Boolean

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether format is seekable.
Notes: (Read and Write property)

15.17.13 Constants

Formats

Constant	Value	Description
kFormatAIFF	&h020000	Apple/SGI AIFF format (big endian).
kFormatAU	&h030000	Sun/NeXT AU format (big endian).
kFormatAVR	&h120000	Audio Visual Research
kFormatCAF	&h180000	Core Audio File format
kFormatEndianMask	&h30000000	Bitmask for the endian format.
kFormatFLAC	&h170000	FLAC lossless file format
kFormatHTK	&h100000	HMM Tool Kit format
kFormatIRCAM	&h0A0000	Berkeley/IRCAM/CARL
kFormatMAT4	&h0C0000	Matlab (tm) V4.2 / GNU Octave 2.0
kFormatMAT5	&h0D0000	Matlab (tm) V5.0 / GNU Octave 2.1
kFormatMPC2K	&h210000	Akai MPC 2000 sampler
kFormatNIST	&h070000	Sphere NIST format.
kFormatOGG	&h200000	Xiph OGG container
kFormatPAF	&h050000	Ensoniq PARIS file format.
kFormatPVF	&h0E0000	Portable Voice Format
kFormatRAW	&h040000	RAW PCM data.
kFormatRF64	&h220000	RF64 WAV file
kFormatSD2	&h160000	Sound Designer 2
kFormatSDS	&h110000	Midi Sample Dump Standard
kFormatSubMask	&h0000FFFF	Bitmask for the sub format.
kFormatSVX	&h060000	Amiga IFF / SVX8 / SV16 format.
kFormatTypeMask	&h0FFF0000	Bitmask for the type format.
kFormatVOC	&h080000	VOC files.
kFormatW64	&h0B0000	Sonic Foundry's 64 bit RIFF/WAV
kFormatWAV	&h010000	Microsoft WAV format (little endian default).
kFormatWAVEX	&h130000	MS WAVE with WAVEFORMATEX
kFormatWVE	&h190000	Psion WVE format
kFormatXI	&h0F0000	Fasttracker 2 Extended Instrument

Sub Formats

Constant	Value	Description
kFormatALAC16	&h0070	Apple Lossless Audio Codec (16 bit).
kFormatALAC20	&h0071	Apple Lossless Audio Codec (20 bit).
kFormatALAC24	&h0072	Apple Lossless Audio Codec (24 bit).
kFormatALAC32	&h0073	Apple Lossless Audio Codec (32 bit).
kFormatALAW	&h0011	A-Law encoded.
kFormatDouble	&h0007	64 bit float data
kFormatDPCM_16	&h0051	16 bit differential PCM (XI only)
kFormatDPCM_8	&h0050	8 bit differential PCM (XI only)
kFormatDWVW_12	&h0040	12 bit Delta Width Variable Word encoding.
kFormatDWVW_16	&h0041	16 bit Delta Width Variable Word encoding.
kFormatDWVW_24	&h0042	24 bit Delta Width Variable Word encoding.
kFormatDWVW_N	&h0043	N bit Delta Width Variable Word encoding.
kFormatFloat	&h0006	32 bit float data
kFormatG721_32	&h0030	32kbs G721 ADPCM encoding.
kFormatG723_24	&h0031	24kbs G723 ADPCM encoding.
kFormatG723_40	&h0032	40kbs G723 ADPCM encoding.
kFormatGSM610	&h0020	GSM 6.10 encoding.
kFormatIMA_ADPCM	&h0012	IMA ADPCM.
kFormatMS_ADPCM	&h0013	Microsoft ADPCM.
kFormatPCM16	&h0002	Signed 16 bit data
kFormatPCM24	&h0003	Signed 24 bit data
kFormatPCM32	&h0004	Signed 32 bit data
kFormatPCMS8	&h0001	Signed 8 bit data
kFormatPCMU8	&h0005	Unsigned 8 bit data (WAV and RAW only)
kFormatULAW	&h0010	U-Law encoded.
kFormatVORBIS	&h0060	Xiph Vorbis encoding.
kFormatVOX_ADPCM	&h0021	OKI / Dialogix ADPCM

Endian Formats

Constant	Value	Description
kFormatEndianBig	&h20000000	Force big endian-ness.
kFormatEndianCPU	&h30000000	Force CPU endian-ness.
kFormatEndianFile	&h00000000	Default file endian-ness.
kFormatEndianLittle	&h10000000	Force little endian-ness.

15.18 class SoundFileMBS

15.18.1 class SoundFileMBS

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A cross platform class to use sndfile library to read/write audio samples.
Example:

```
// load the sndfile library and show the format of an audio file
Var libFile As FolderItem
#If TargetMacOS Then
libFile = SpecialFolder.Desktop.Child("libsndfile.dylib")
#ElseIf TargetWindows Then
libFile = SpecialFolder.Desktop.Child("sndfile.dll")
#Else
libFile = SpecialFolder.Desktop.Child("libsndfile.so")
#EndIf

If Not SoundFileMBS.LoadLibrary(libFile) Then
MessageBox "Failed to load library: " + SoundFileMBS.LoadErrorMessage
Return
End If

Var file As FolderItem = SpecialFolder.Desktop.Child("test.wav")
Var sound As SoundFileMBS = SoundFileMBS.Open(file)

If sound = Nil Then
MessageBox "Failed to open audio file."
Return
End If

Var info As SoundFileInfoMBS = sound.Info
MessageBox info.Channels.ToString + " channels, " + info.SampleRate.ToString + " Hz, " + info.Frames.ToString
+ " frames"
sound.Close
```

Notes: As sndfile library is LGPL, you need to include library within your app folder and load it at runtime.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

15.18.2 Methods

15.18.3 Close

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes file now.
Notes: Same as destructor, but you can call it early.

15.18.4 Constructor

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Private constructor.

15.18.5 Create(file as folderitem, Info as SoundFileInfoMBS) as SoundFileMBS

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new audio file with given format.
Notes: On success returns new sound file object.

15.18.6 ErrorMessage(errorNumber as integer) as string

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries error message for error number.
See also:

- 15.18.38 ErrorMessage as String 3282

15.18.7 GetString(type as Integer) as string

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries one of the strings.
Notes: See kString* constants.

Returns "" in case of error.

15.18.8 Loaded as Boolean

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether library is loaded.

15.18.9 LoadErrorMessage as String

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error message from loading library.

15.18.10 LoadLibrary(file as folderitem) as boolean

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads sndfile library.
Notes: Returns true on success.

15.18.11 Open(data as MemoryBlock) as SoundFileMBS

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens an audio file from in memory data.
Notes: On success returns the sound file object.
See also:

- 15.18.12 Open(data as String) as SoundFileMBS 3276
- 15.18.13 Open(file as folderitem, readwrite As Boolean = False) as SoundFileMBS 3277

15.18.12 Open(data as String) as SoundFileMBS

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens an audio file from in memory data.
Notes: On success returns the sound file object.
See also:

- 15.18.11 Open(data as MemoryBlock) as SoundFileMBS 3276
- 15.18.13 Open(file as folderitem, readwrite As Boolean = False) as SoundFileMBS 3277

15.18.13 Open(file as folderitem, readwrite As Boolean = False) as SoundFileMBS

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens an audio file.
Notes: On success returns the sound file object.
Pass readwrite = true to write to the file.
See also:

- 15.18.11 Open(data as MemoryBlock) as SoundFileMBS 3276
- 15.18.12 Open(data as String) as SoundFileMBS 3276

15.18.14 ReadDouble(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads data as double values, converts if necessary.
Notes: Pointer should point to memmoryblock with 8 * Items in size.
Returns number of items read.

15.18.15 ReadDoubleFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads frames as double values, converts if necessary.
Notes: Pointer should point to memmoryblock with 8 * Items * Channels in size.
Returns number of items read.

15.18.16 ReadInt(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads data as Int32 values, converts if necessary.
Notes: Pointer should point to memmoryblock with 4 * Items in size.
Returns number of items read.

15.18.17 ReadIntFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads frames as Int32 values, converts if necessary.
Notes: Pointer should point to memmoryblock with 4 * Items * Channels in size.
Returns number of items read.

15.18.18 ReadRaw(p as ptr, bytes as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Read raw data.
Notes: Pointer should point to memmoryblock with Bytes in size.
Returns number of bytes read.

15.18.19 ReadShort(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads data as Int16 values, converts if necessary.
Notes: Pointer should point to memmoryblock with 2 * Items in size.
Returns number of items read.

15.18.20 ReadShortFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads frames as Int16 values, converts if necessary.
Notes: Pointer should point to memmoryblock with 2 * Items * Channels in size.
Returns number of items read.

15.18.21 ReadSingle(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads data as single values, converts if necessary.
Notes: Pointer should point to memmoryblock with 4 * Items in size.
Returns number of items read.

15.18.22 ReadSingleFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads frames as single values, converts if necessary.
Notes: Pointer should point to memmoryblock with 4 * Items * Channels in size.
Returns number of items read.

15.18.23 Seek(frames as Int64, whence as Integer) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Seeks within the audio file.
Notes: See kSeek* constants for whence parameter.

15.18.24 SetString(type as Integer, data as Memoryblock) as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets one of the strings.
Notes: See kString* constants.
Returns zero on success.
See also:

- 15.18.25 SetString(type as Integer, text as string) as Integer 3279

15.18.25 SetString(type as Integer, text as string) as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets one of the strings.
Notes: See kString* constants.
Returns zero on success.
See also:

- 15.18.24 SetString(type as Integer, data as Memoryblock) as Integer 3279

15.18.26 Version as string

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries version of the library.

15.18.27 WriteDouble(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes data to file in double format.
Notes: Pointer should point to memmoryblock with 8 * Items in size.
Returns number of items written.

15.18.28 WriteDoubleFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes frames to file in double format.
Notes: Pointer should point to memmoryblock with 8 * Items * Channels in size.
Returns number of items written.

15.18.29 WriteInt(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes data to file in Int32 format.
Notes: Pointer should point to memmoryblock with 4 * Items in size.
Returns number of items written.

15.18.30 WriteIntFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes frames to file in Int32 format.
Notes: Pointer should point to memmoryblock with 4 * Items * Channels in size.
Returns number of items written.

15.18.31 WriteRaw(p as ptr, bytes as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes raw data to file.
Notes: Pointer should point to memmoryblock with Bytes in size.
Returns number of bytes written.

15.18.32 WriteShort(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes data to file in Int16 format.
Notes: Pointer should point to memmoryblock with 2 * Items in size.
Returns number of items written.

15.18.33 WriteShortFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes frames to file in Int16 format.
Notes: Pointer should point to memmoryblock with 2 * Items * Channels in size.
Returns number of items written.

15.18.34 WriteSingle(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes data to file in single format.
Notes: Pointer should point to memmoryblock with 4 * Items in size.
Returns number of items written.

15.18.35 WriteSingleFrames(p as ptr, items as Int64) as Int64

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes frames to file in single format.
Notes: Pointer should point to memmoryblock with 4 * Items * Channels in size.
Returns number of items written.

15.18.36 WriteSync

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes recent changes in file to disk.

15.18.37 Properties

15.18.38 ErrorMessage as String

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error message.
Notes: (Read only property)
See also:

- 15.18.6 ErrorMessage(errorNumber as integer) as string 3275

15.18.39 ErrorNumber as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error number.
Notes: (Read only property)

15.18.40 Handle as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

15.18.41 Info as SoundFileInfoMBS

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current format.
Notes: (Read only property)

15.18.42 Constants

Seek Mode

Constant	Value	Description
kSeekCurrent	1	Seek relative to current position.
kSeekEnd	2	Seek relative to end.
kSeekSet	0	Seek relative to begin.

Strings

Constant	Value	Description
kStringAlbum	7	Album
kStringArtist	4	Artist
kStringComment	5	Comment
kStringCopyright	2	Copyright
kStringDate	6	Date
kStringGenre	10	Genre
kStringLicense	8	License
kStringSoftware	3	Software
kStringTitle	1	Title
kStringTrackNumber	9	Track Number.

15.19 class TagLibAudioPropertiesMBS

15.19.1 class TagLibAudioPropertiesMBS

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for audio properties.

15.19.2 Properties

15.19.3 Bitrate as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The bit rate for the sound.
Notes: Returns the most appropriate bit rate for the file in kb/s. For constant bitrate formats this is simply the bitrate of the file. For variable bitrate formats this is either the average or nominal bitrate.
(Read and Write property)

15.19.4 Channels as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of channels.
Notes: (Read and Write property)

15.19.5 Length as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The length of the file in second.
Notes: (Read and Write property)

15.19.6 SampleRate as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sample rate in Hz.
Notes: (Read and Write property)

15.20 class TagLibFileRefMBS

15.20.1 class TagLibFileRefMBS

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for file loading in TagLib.
Example:

```
// read and change the tags of a MP3 file
Var f As New TagLibFileRefMBS(SpecialFolder.Desktop.Child("test.mp3"))
Var tag As TagLibTagMBS = f.tags
Var audio As TagLibAudioPropertiesMBS = f.audioProperties

MessageBox "Title: " + tag.Title + EndOfLine + _
"Artist: " + tag.Artist + EndOfLine + _
"Album: " + tag.Album + " (" + tag.Year.ToString + ")" + EndOfLine + _
"Length: " + audio.Length.ToString + " seconds, " + audio.Bitrate.ToString + " kbit/s"

tag.Comment = "Checked with MyApp"
If Not f.Save Then MessageBox "Failed to save."
```

Notes: Uses TagLib, an open source library to read metadata from audio files, e.g. ID3 tags.
Currently it supports both ID3v1 and ID3v2 for MP3 files, Ogg Vorbis comments and ID3 tags and Vorbis comments in FLAC, MPC, Speex, WavPack, TrueAudio, WAV, AIFF, MP4 and ASF files.

- MBS Xojo Plugins, version 19.3pr4
- MBS Xojo Plugins, version 19.3pr3

15.20.2 Methods

15.20.3 Constructor(file as folderitem)

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Please point to valid audio file.
May raise error exception.

Uses TagLib, an open source library to read metadata from audio files, e.g. ID3 tags.
Currently it supports both ID3v1 and ID3v2 for MP3 files, Ogg Vorbis comments and ID3 tags and Vorbis comments in FLAC, MPC, Speex, WavPack, TrueAudio, WAV, AIFF, MP4 and ASF files.

15.20.4 CoverArt as Memoryblock

MBS Tools Plugin, Plugin Version: 22.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns cover art.
Example:

```
// for testing a test file on desktop
Var ff as FolderItem = SpecialFolder.Desktop.Child("test.mp3")

Var f As New TagLibFileRefMBS(ff)

// show cover art
Var cover As MemoryBlock = f.CoverArt
If cover <>Nil Then
Var p As Picture = picture.FromData(cover)

If p <>Nil Then
Var pw As New PicWindow
pw.Backdrop = p
End If
End If
```

Notes: Should work for MP3, MP4 and FLAC files.
May return JPEG, PNG, GIF or BMP depending on what the file contains.
Result is nil, if there is no art found.

15.20.5 CoverArts as Memoryblock()

MBS Tools Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns cover arts.
Notes: Should work for MP3, MP4 and FLAC files.
May return JPEG, PNG, GIF or BMP depending on what the file contains.
Result is empty array, if there is no art found.

15.20.6 ID3v2Tags as Dictionary

MBS Tools Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all ID3v2 tags as Dictionary.
Example:

```
Var f As New FolderItem("/Users/cs/test.mp3", FolderItem.PathModes.Native)
Var t As New TagLibFileRefMBS(f)
Var d As Dictionary = t.ID3v2Tags
Break // check in debugger
```

Notes: Returns nil, if no ID3v2 tags exist.

15.20.7 Save as Boolean

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves changes to the file.

15.20.8 SetProperties(Dic as Dictionary)

MBS Tools Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets audio tags for audio file.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("test.mp3")

Var tag As New TagLibFileRefMBS(file)
Var dic As Dictionary = tag.Properties

Break // inspect dictionary
```

```
dic.Value("ARTIST") = "John Doe"
dic.Value("ALBUM") = Nil // clear this one

tag.SetProperties(dic)

If tag.Save Then
MessageBox "OK"
Else
MessageBox "Failed to save"
End If
```

Notes: Please provide dictionary with new tags.
If tags are nil values, we remove them. If they are text values, we update the text.

15.20.9 Properties

15.20.10 audioProperties as TagLibAudioPropertiesMBS

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries audio properties of the audio file.
Notes: (Read only property)

15.20.11 Handle as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

15.20.12 Properties as Dictionary

MBS Tools Plugin, Plugin Version: 19.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries properties for this file.
Notes: Builds and returns a dictionary with all the properties found by the file handler.
This may include IDv3 tags.

List of ID3v2 tag names:
ALBUM, ALBUMARTIST, ALBUMARTISTSORT, ALBUMSORT, ARTIST, ARTISTSORT, ARTIST-WEBPAGE, AUDIOSOURCEWEBPAGE, BPM, COMMENT, COMPOSER, CONDUCTOR, CONTENT-

GROUP, COPYRIGHT, COPYRIGHTURL, DATE, DISCNUMBER, ENCODEDBY, ENCODING, ENCODINGTIME, FILETYPE, FILEWEBPAGE, GENRE, INITIALKEY, INVOLVEDPEOPLE, ISRC, LABEL, LANGUAGE, LENGTH, LYRICIST, LYRICS, MEDIA, MOOD, MUSICIANCREDITS, ORIGINALALBUM, ORIGINALARTIST, ORIGINALDATE, ORIGINALFILENAME, ORIGINALLYRICIST, OWNER, PAYMENTWEBPAGE, PLAYLISTDELAY, PODCAST, PODCASTCATEGORY, PODCASTDESC, PODCASTID, PODCASTURL, PRODUCEDNOTICE, PUBLISHERWEBPAGE, RADIOSTATION, RADIOSTATIONOWNER, RADIOSTATIONWEBPAGE, RELEASEDATE, REMIXER, SUBTITLE, TAGGINGDATE, TITLE, TITLESORT, TRACKNUMBER, URL.
(Read only property)

15.20.13 tags as TagLibTagMBS

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tags in that file.
Notes: (Read only property)

15.21 class TagLibTagMBS

15.21.1 class TagLibTagMBS

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for tags.
Example:

```
// read and change the tags of a MP3 file with TagLib
Var f As New TagLibFileRefMBS(SpecialFolder.Desktop.Child("song.mp3"))
Var tag As TagLibTagMBS = f.tags
If tag = Nil Then Return

MessageBox tag.Artist + " - " + tag.Title + EndOfLine + tag.Album + " (" + tag.Year.ToString +
"), track " + tag.Track.ToString + ", " + tag.Genre
tag.Comment = "Checked with Xojo"
If Not f.Save Then MessageBox "Can't save tags."
```

Notes: We do have common values in properties like title, comment and track.
Other properties can be found in tags dictionary.

Please use TagLibFileRefMBS to load file and query it for the tags.

This is an attempt to abstract away the difference in the meta data formats of various audio codecs and tagging schemes. As such it is generally a subset of what is available in the specific formats but should be suitable for most applications. This is meant to compliment the generic APIs found in TagLibAudioPropertiesMBS and TagLibFileRefMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

15.21.2 Methods

15.21.3 Constructor

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

15.21.4 setTags(Values as Dictionary) as Dictionary

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the tags.
Notes: Returns a new dictionary with values which are not supported.

15.21.5 Properties

15.21.6 Album as String

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the album.
Notes: (Read and Write property)

15.21.7 Artist as String

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the artist.
Notes: (Read and Write property)

15.21.8 Comment as String

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The comment field.
Notes: (Read and Write property)

15.21.9 Genre as String

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The genre.
Notes: (Read and Write property)

15.21.10 Handle as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

15.21.11 isEmpty as Boolean

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this tag set is empty.
Notes: (Read only property)

15.21.12 Tags as Dictionary

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of properties.
Notes: You get a copy as a dictionary with all keys and values.
Values could be strings or array of strings.
(Read only property)

15.21.13 Title as String

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The title.
Notes: (Read and Write property)

15.21.14 Track as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The track number.
Notes: (Read and Write property)

15.21.15 Year as Integer

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The year.
Notes: (Read and Write property)

15.22 class WindowsAudioMixerMBS

15.22.1 class WindowsAudioMixerMBS

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: The Windows Audio Mixer is a device to control the volume and mute state of all attached audio devices.
Example:

```
// read and change the wave output volume of the first mixer device on Windows
Var mixer As New WindowsAudioMixerMBS
MessageBox mixer.DeviceCount.ToString + " mixer devices, wave out volume " + Format(mixer.Source-
WaveOutVolume * 100, "0") + "%"
mixer.SourceWaveOutVolume = 0.5 // values from 0 to 1
mixer.SourceWaveOutMute = False
```

Notes: Not all devices are present on all Windows machines.
What device is source and destination is a bit unlogic from Microsoft.

15.22.2 Methods

15.22.3 DeviceCount as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platform: Windows, Targets: All.

Function: Number of Mixer devices found in the system.

15.22.4 DeviceName(index as Integer) as string

MBS Audio Plugin, Plugin Version: 7.0, Platform: Windows, Targets: All.

Function: Name of the device with the given index.
Notes: Index goes from 0 to DeviceCount-1.
Returns "" on invalid index.

15.22.5 Properties

15.22.6 DeviceIndex as Integer

MBS Audio Plugin, Plugin Version: 7.0, Platform: Windows, Targets: All.

Function: The index of the current used device.
Notes: Default is 0.
(Read and Write property)

15.22.7 Lasterror as Integer

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: The last error code reported.
Notes: (Read and Write property)

15.22.8 DestinationDigitalMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether digital device is muted.
Notes: Audio line is a digital destination (for example, digital input to a DAT or CD audio device).

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.9 DestinationDigitalVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of digital device.
Notes: Audio line is a digital destination (for example, digital input to a DAT or CD audio device).

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.10 DestinationHeadPhonesMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether head phones are muted.

Notes: Audio line is an adjustable (gain and/or attenuation) destination intended to drive headphones. Most audio cards use the same audio destination line for speakers and headphones, in which case the mixer device simply uses the DestinationSpeakers.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.11 DestinationHeadPhonesVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of head phones.
Notes: Audio line is an adjustable (gain and/or attenuation) destination intended to drive headphones. Most audio cards use the same audio destination line for speakers and headphones, in which case the mixer device simply uses the DestinationSpeakers.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.12 DestinationLineMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether line is muted.
Notes: Audio line is a line level destination (for example, line level input from a CD audio device) that will be the final recording source for the analog-to-digital converter (ADC). Because most audio cards for personal computers provide some sort of gain for the recording audio source line, the mixer device will use the DestinationWaveIn.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.13 DestinationLineVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of line.
Notes: Audio line is a line level destination (for example, line level input from a CD audio device) that will be the final recording source for the analog-to-digital converter (ADC). Because most audio cards for personal computers provide some sort of gain for the recording audio source line, the mixer device will use the DestinationWaveIn.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.14 DestinationMonitorMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether audio monitor is muted.
Notes: Audio line is a destination used for a monitor.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.15 DestinationMonitorVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of audio monitor.
Notes: Audio line is a destination used for a monitor.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.16 DestinationSpeakersMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether speakers are muted.
Notes: Audio line is an adjustable (gain and/or attenuation) destination intended to drive speakers. This

is the typical component type for the audio output of audio cards for personal computers.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.17 DestinationSpeakersVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of speakers.
Notes: Audio line is an adjustable (gain and/or attenuation) destination intended to drive speakers. This is the typical component type for the audio output of audio cards for personal computers.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.18 DestinationTelephoneMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether telephone is muted.
Notes: Audio line is a destination that will be routed to a telephone line.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.19 DestinationTelephoneVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of telephone.
Notes: Audio line is a destination that will be routed to a telephone line.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.

On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.20 DestinationVoiceInMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether voice input is muted.
Notes: Audio line is a destination that will be the final recording source for voice input. This component type is exactly like DestinationWaveIn but is intended specifically for settings used during voice recording/recognition. Support for this line is optional for a mixer device. Many mixer devices provide only DestinationWaveIn.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.21 DestinationVoiceInVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of voice input.
Notes: Audio line is a destination that will be the final recording source for voice input. This component type is exactly like DestinationWaveIn but is intended specifically for settings used during voice recording/recognition. Support for this line is optional for a mixer device. Many mixer devices provide only DestinationWaveIn.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.22 DestinationWaveInMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether wave in is muted.
Notes: Audio line is a destination that will be the final recording source for the waveform-audio input (ADC). This line typically provides some sort of gain or attenuation. This is the typical component type for the recording line of most audio cards for personal computers.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.23 DestinationWaveInVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of wave input device.
Notes: Audio line is a destination that will be the final recording source for the waveform-audio input (ADC). This line typically provides some sort of gain or attenuation. This is the typical component type for the recording line of most audio cards for personal computers.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.24 SourceAnalogMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether analog device is muted.
Notes: Audio line is an analog source (for example, analog output from a video-cassette tape).

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.25 SourceAnalogVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of analog device.
Notes: Audio line is an analog source (for example, analog output from a video-cassette tape).

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.

(Read and Write computed property)

15.22.26 SourceAuxiliaryMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether auxiliary is muted.
Notes: Audio line is a source originating from the auxiliary audio line. This line type is intended as a source with gain or attenuation that can be routed to the DestinationSpeakers destination and/or recorded from the DestinationWaveIn destination.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.27 SourceAuxiliaryVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of auxiliary.
Notes: Audio line is a source originating from the auxiliary audio line. This line type is intended as a source with gain or attenuation that can be routed to the DestinationSpeakers destination and/or recorded from the DestinationWaveIn destination.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.28 SourceCompactDiscMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether the CD device is muted.
Notes: Audio line is a source originating from the output of an internal audio CD. This component type is provided for audio cards that provide an audio source line intended to be connected to an audio CD (or CD-ROM playing an audio CD).

Lasterror is set.
Value is true if device is muted, else false.

On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.29 SourceCompactDiscVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of CD device.
Notes: Audio line is a source originating from the output of an internal audio CD. This component type is provided for audio cards that provide an audio source line intended to be connected to an audio CD (or CD-ROM playing an audio CD).

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.30 SourceDigitalMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether digital is muted.
Notes: Audio line is a digital source (for example, digital output from a DAT or audio CD).

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.31 SourceDigitalVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of digital device.
Notes: Audio line is a digital source (for example, digital output from a DAT or audio CD).

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.32 SourceLineMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether line is muted.
Notes: Audio line is a line-level source (for example, line-level input from an external stereo) that can be used as an optional recording source. Because most audio cards for personal computers provide some sort of gain for the recording source line, the mixer device will use the SourceAuxiliary type.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.33 SourceLineVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of line.
Notes: Audio line is a line-level source (for example, line-level input from an external stereo) that can be used as an optional recording source. Because most audio cards for personal computers provide some sort of gain for the recording source line, the mixer device will use the SourceAuxiliary type.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.34 SourceMicrophoneMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether microphone is muted.
Notes: Audio line is a microphone recording source. Most audio cards for personal computers provide at least two types of recording sources: an auxiliary audio line and microphone input. A microphone audio line typically provides some sort of gain. Audio cards that use a single input for use with a microphone or auxiliary audio line should use the SourceMicrophone component type.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.35 SourceMicrophoneVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of microphone.
Notes: Audio line is a microphone recording source. Most audio cards for personal computers provide at least two types of recording sources: an auxiliary audio line and microphone input. A microphone audio line typically provides some sort of gain. Audio cards that use a single input for use with a microphone or auxiliary audio line should use the SourceMicrophone component type.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.36 SourcePCSpeakerMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether PC Speaker is muted.
Notes: Audio line is a source originating from personal computer speaker. Several audio cards for personal computers provide the ability to mix what would typically be played on the internal speaker with the output of an audio card. Some audio cards support the ability to use this output as a recording source.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.37 SourcePCSpeakerVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of PC Speakers.
Notes: Audio line is a source originating from personal computer speaker. Several audio cards for personal computers provide the ability to mix what would typically be played on the internal speaker with the output of an audio card. Some audio cards support the ability to use this output as a recording source.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.38 SourceSynthesizerMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether synthesizer is muted.
Notes: Audio line is a source originating from the output of an internal synthesizer. Most audio cards for personal computers provide some sort of MIDI synthesizer (for example, an Adlib®-compatible or OPL/3 FM synthesizer).

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.39 SourceSynthesizerVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of synthesizer.
Notes: Audio line is a source originating from the output of an internal synthesizer. Most audio cards for personal computers provide some sort of MIDI synthesizer (for example, an Adlib®-compatible or OPL/3 FM synthesizer).

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.40 SourceTelephoneMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Whether telephone is muted.
Notes: Audio line is a source originating from an incoming telephone line.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.41 SourceTelephoneVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of telephone.
Notes: Audio line is a source originating from an incoming telephone line.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.22.42 SourceWaveOutMute as boolean

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of wave device.
Notes: Audio line is a source originating from the waveform-audio output digital-to-analog converter (DAC). Most audio cards for personal computers provide this component type as a source to the DestinationSpeakers destination. Some cards also allow this source to be routed to the DestinationWaveIn destination.

Lasterror is set.
Value is true if device is muted, else false.
On any error or non Windows platforms value is always false.
(Read and Write computed property)

15.22.43 SourceWaveOutVolume as Double

MBS Audio Plugin, Plugin Version: 6.2, Platform: Windows, Targets: All.

Function: Volume of wave out device.
Notes: Audio line is a source originating from the waveform-audio output digital-to-analog converter (DAC). Most audio cards for personal computers provide this component type as a source to the DestinationSpeakers destination. Some cards also allow this source to be routed to the DestinationWaveIn destination.

Lasterror is set.
Range is from 0 for no volume to 1.0 for maximum volume.
On any error or non Windows platforms the value is always 0.
(Read and Write computed property)

15.23 class WindowsMCIMBS

15.23.1 class WindowsMCIMBS

MBS Audio Plugin, Platform: Windows, Targets: All.

Function: Access to the Video for Windows API.
Example:

```
// open the CD Device and set time format to Track:Minute:Second:Frame

Var v as new WindowsMCIMBS
v.Command="open cdaudio"
v.run

v.Command="set cdaudio time format TMSF"
v.run
```

Notes: Without QuickTime you can't play a movie in Windows with the Movieplayer control. This class allows you to play movies.

Possible devices:

vcr (ME, 98)
videodisc (ME, 98)
overlay
cdaudio (2000, ME, 98)
dat
scanner
animation
digitalvideo
waveaudio (2000, ME, 98)
sequencer (2000, ME, 98)
avivideo (2000, ME, 98)
mpegvideo (2000, ME, 98)

(I added on which OS I find the devices on my installation.)

On Windows 2000 we have this connection between devices and file extensions:

You can find this list in the Registry on Windows 2000 at "HKEY_LOCAL_MACHINE\Software\Microsoft\Windows NT\Currentversion\MCI Extensions".

Possible states of a device:

vcr:
videodisc:
overlay:
cdaudio: cda.
dat:
scanner:
animation:
digitalvideo:
waveaudio: wav.
sequencer: mdi, midi, rmi.
avivideo: avi.
mpegvideo: aif*, asx, asf, au, dat, ivf, m1v, m3z, mov, mp*, qt, snd, wax, wm, wma, wmv, wvx.

not ready
stopped
playing
recording
seeking
paused
open

Possible time units:

milliseconds - Default
hms - Hour:Minute:Second
msf - Minute:Second:Frame
frames
smpte 24
smpte 25
smpte 30
smpte 30 drop
bytes
samples
tmsf - Track:Minute:Second:Frame ->use for CD

A list of all commands can be found on the Microsoft Website at:

http://msdn.microsoft.com/library/en-us/multimed/mmcmdstr_85uz.asp

15.23.2 Methods

15.23.3 Run

MBS Audio Plugin, Platform: Windows, Targets: All.

Function: Executes a command.
Example:

```
Var v as new WindowsMCIMBS

v.command="pause cdaudio" // pauses the CD
v.run
```

15.23.4 Properties

15.23.5 Command as string

MBS Audio Plugin, Platform: Windows, Targets: All.

Function: Here you can store the next Command for the MCI.
Example:

```
Var v as new WindowsMCIMBS

v.command="pause cdaudio" // pauses the CD
v.run
```

Notes: (Read and Write property)

15.23.6 Errorcode as Integer

MBS Audio Plugin, Platform: Windows, Targets: All.

Function: The error code for the last error.
Example:

```
Var v as new WindowsMCIMBS

MessageBox str(v.errorcode)+" "+v.errorstring
```

Notes: This property can be set to make a list of possible error messages like in the example "List MCI Errormessages".
(Read and Write property)

15.23.7 Errorstring as string

MBS Audio Plugin, Platform: Windows, Targets: All.

Function: The error description for the last error.
Example:

```
Var v as new WindowsMCIMBS

MessageBox str(v.errorcode)+" "+v.errorstring
```

Notes: Here is a list of some error messages:

(Read and Write property)

15.23.8 Result as string

MBS Audio Plugin, Platform: Windows, Targets: All.

Function: The result of the last operation.
Example:

```
Var v as WindowsMCIMBS

// get the current position, track and track count to display for the CD Audio.

v.Command="Status cdaudio Current Track"
v.run
MessageBox v.result

v.command="Status cdaudio Number of Tracks"
v.run
MessageBox v.result

v.command="Status cdaudio position"
v.run
MessageBox v.result
```

Notes: (Read and Write property)

0 The specified command was carried out.
1 Undefined external error.
2 A device ID has been used that is out of range for your system.
3 The driver was not enabled.
4 The specified device is already in use. Wait until it is free, and then try again.
5 The specified device handle is invalid.
6 There is no driver installed on your system.
7 There is not enough memory available for this task. Quit one or more applications to increase available memory, and then try again.
8 This function is not supported. Use the Capabilities function to determine which functions and messages the driver supports.
9 An error number was specified that is not defined in the system.
10 An invalid flag was passed to a system function.
11 An invalid parameter was passed to a system function.
12 Handle being used simultaneously on another thread (eg callback).
13 Specified alias not found in WIN.INI.
14 The registry database is corrupt.
15 The specified registry key was not found.
16 The registry could not be opened or could not be read.
17 The registry could not be written to.
18 The specified registry key could not be deleted.
19 The specified registry key value could not be found.
20 The driver did not generate a valid OPEN callback.
32 The specified format is not supported or cannot be translated. Use the Capabilities function to determine the supported formats.
33 Cannot perform this operation while media data is still playing. Reset the device, or wait until the data is finished playing.
34 The wave header was not prepared. Use the Prepare function to prepare the header, and then try again.
35 Cannot open the device without using the WAVE_ALLOWSYNC flag. Use the flag, and then try again.
64 The MIDI header was not prepared. Use the Prepare function to prepare the header, and then try again.
65 Cannot perform this operation while media data is still playing. Reset the device, or wait until the data is finished playing.
66 A MIDI map was not found. There may be a problem with the driver, or the MIDIMAP.CFG file may be corrupt or missing.
67 The port is transmitting data to the device. Wait until the data has been transmitted, and then try again.
68 The current MIDI Mapper setup refers to a MIDI device that is not installed on the system. Use MIDI Mapper to edit the setup.
69 The current MIDI setup is damaged. Copy the original MIDIMAP.CFG file to the Windows SYSTEM directory, and then try again.
70 A MIDI call was made which is invalid with the current open mode. Reopen the device with the correct mode.
71 Driver condition - do not callback this input event
257 Invalid MCI device ID. Use the ID returned when opening the MCI device.
259 The driver cannot recognize the specified command parameter.

15.24 class WindowsPlayerDeviceMBS

15.24.1 class WindowsPlayerDeviceMBS

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: This class describes the capabilities of a waveform-audio output device.
Example:

```
// This example needs a window with PopupMenu1.
// fill devices into a popupmenu
Var c As Integer = WindowsPlayerMBS.DeviceCount
For i As Integer = 0 To c-1
Var d As WindowsPlayerDeviceMBS = WindowsPlayerMBS.Device(i)

PopupMenu1.AddRow d.Name+" "+Str(d.Channels)
PopupMenu1.RowTag(i) = d
Next
```

- MBS Xojo Plugins, version 20.0pr7

15.24.2 Properties

15.24.3 Channels as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: Number specifying whether the device supports mono (1) or stereo (2) output.
Notes: (Read only property)

15.24.4 DriverVersion as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: Version number of the device driver for the device.
Notes: The high-order byte is the major version number, and the low-order byte is the minor version number.
(Read only property)

15.24.5 Formats as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: Standard formats that are supported.
Notes: Combination of kFormat* constants.
(Read only property)

15.24.6 Index as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: The device index.
Notes: (Read only property)

15.24.7 ManufacturerID as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: Manufacturer identifier for the device driver for the device.
Notes: Manufacturer identifiers are defined in Manufacturer and Product Identifiers:
https://docs.microsoft.com/en-us/previous-versions/ms709440%28v%3dvs.85%29
(Read only property)

15.24.8 Name as String

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: Product name.
Notes: (Read only property)

15.24.9 ProductID as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: Product identifier for the device.
Notes: (Read only property)

15.24.10 Support as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: Optional functionality supported by the device.
Notes: Combination of kSupport* constants.
(Read only property)

15.24.11 Constants

Format Constants

Constant	Value	Description
kFormat1M08	&h00000001	11.025 kHz, mono, 8-bit
kFormat1M16	&h00000004	11.025 kHz, mono, 16-bit
kFormat1S08	&h00000002	11.025 kHz, stereo, 8-bit
kFormat1S16	&h00000008	11.025 kHz, stereo, 16-bit
kFormat2M08	&h00000010	22.05 kHz, mono, 8-bit
kFormat2M16	&h00000040	22.05 kHz, stereo, 8-bit
kFormat2S08	&h00000020	22.05 kHz, mono, 16-bit
kFormat2S16	&h00000080	22.05 kHz, stereo, 16-bit
kFormat44M08	&h00000100	44.1 kHz, mono, 8-bit
kFormat44M16	&h00000400	44.1 kHz, mono, 16-bit
kFormat44S08	&h00000200	44.1 kHz, stereo, 8-bit
kFormat44S16	&h00000800	44.1 kHz, stereo, 16-bit
kFormat48M08	&h00001000	48 kHz, mono, 8-bit
kFormat48M16	&h00004000	48 kHz, mono, 16-bit
kFormat48S08	&h00002000	48 kHz, stereo, 8-bit
kFormat48S16	&h00008000	48 kHz, stereo, 16-bit
kFormat96M08	&h00010000	96 kHz, mono, 8-bit
kFormat96M16	&h00040000	96 kHz, mono, 16-bit
kFormat96S08	&h00020000	96 kHz, stereo, 8-bit
kFormat96S16	&h00080000	96 kHz, stereo, 16-bit
kFormatInvalid	0	Invalid value.

Support Flags

Constant	Value	Description
kSupportLRVolume	8	Supports separate left and right volume control.
kSupportPitch	1	Supports pitch control.
kSupportPlaybackRate	2	Supports playback rate control.
kSupportSampleAccurate	32	Returns sample-accurate position information.
kSupportSync	16	The driver is synchronous and will block while playing a buffer.
kSupportVolume	4	Supports volume control.

15.25 class WindowsPlayerMBS

15.25.1 class WindowsPlayerMBS

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: The Windows MP3 Player class.
Example:

```
// play a MP3 file on Windows
// Player is a property of the window: Player As WindowsPlayerMBS
Player = New WindowsPlayerMBS(SpecialFolder.Desktop.Child("test.mp3"))
Player.Volume = 0.8
Player.Play

MessageBox "Playing " + Format(Player.Duration, "0.0") + " seconds, " + _
Player.SampleRate.ToString + " Hz, " + Player.ChannelCount.ToString + " channels"

// later: Player.Stop
```

Notes: This is a little class to play a MP3 file (or data in memory).
Written for 44100 Hz, 2 channel MP3 files.

With plugin version 16.1 this class should work fine with any sample rate, any channel count and other formats as long as Microsoft drivers support them. Like ASF, WMF and WMV.

15.25.2 Methods

15.25.3 Constructor(data as MemoryBlock)

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: Initializes the class with given data.
See also:

- 15.25.4 Constructor(data as String) 3316
- 15.25.5 Constructor(file as folderitem) 3316

15.25.4 Constructor(data as String)

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: Initializes the class with given data.
See also:

- 15.25.3 Constructor(data as MemoryBlock) 3316
- 15.25.5 Constructor(file as folderitem) 3316

15.25.5 Constructor(file as folderitem)

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: Initializes the class with a given file.
See also:

- 15.25.3 Constructor(data as MemoryBlock) 3316
- 15.25.4 Constructor(data as String) 3316

15.25.6 Device(index as Integer) as WindowsPlayerDeviceMBS

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: Retrieves the capabilities of a given audio output device.
Example:

```
// This example needs a window with PopupMenu1.
// fill devices into a popupmenu
Var c As Integer = WindowsPlayerMBS.DeviceCount
For i As Integer = 0 To c-1
Var d As WindowsPlayerDeviceMBS = WindowsPlayerMBS.Device(i)
```

```
PopupMenu1.AddRow d.Name+" "+Str(d.Channels)
PopupMenu1.RowTag(i) = d
Next
```

Notes: Index in range from 0 to DeviceCount-1.
You can use index -1 for the wave mapper.

15.25.7 GetVolume(byref VolumeLeft as Double, byref VolumeRight as Double)

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: Queries left and right volume.
Notes: Range is from 0.0 for no sound to 1.0 for full sound.

15.25.8 Pause

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: Pauses current playback.

15.25.9 Play(offset as Double = 0.0)

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: Starts playing the sound.
Notes: With offset you can define the start point in seconds from beginning of sound. Range from 0 seconds to duration-1.

15.25.10 Resume

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: Resumes current playback.

15.25.11 SetVolume(VolumeLeft as Double, VolumeRight as Double)

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: Sets the left and right volume independent.
Notes: Range is from 0.0 for no sound to 1.0 for full sound.

15.25.12 Stop

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: Stops current playback.

15.25.13 Properties

15.25.14 Buffer as MemoryBlock

MBS Audio Plugin, Plugin Version: 16.1, Platform: Windows, Targets: All.

Function: The buffer with audio samples.
Notes: You get a copy of the buffer as memoryblock.
Please use BufferLength, SampleRate and ChannelCount to read it.
Data is always 16 bit with 2 * ChannelCount * SampleRate bytes per second.
(Read only property)

15.25.15 BufferLength as Integer

MBS Audio Plugin, Plugin Version: 16.1, Platform: Windows, Targets: All.

Function: The buffer length for audio samples.
Notes: (Read only property)

15.25.16 ChannelCount as Integer

MBS Audio Plugin, Plugin Version: 16.1, Platform: Windows, Targets: All.

Function: The channel count of the audio file.
Notes: (Read only property)

15.25.17 ChannelMask as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: The channel mask.
Example:

```
Var p as WindowsPlayerMBS // your player
p.DeviceID = 3 // 4th device
p.ChannelMask = 1 // left channel
```

Notes: 1 is left, 2 is right, 3 is center and so on.
Default is zero for automatic.

see list here:
https://docs.microsoft.com/en-us/previous-versions/ms713496%28v%3dvs.85%29
(Read and Write property)

15.25.18 DeviceCount as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: Retrieves the number of audio output devices present in the system.
Notes: A return value of zero means that no devices are present or that an error occurred.
(Read only property)

15.25.19 DeviceID as Integer

MBS Audio Plugin, Plugin Version: 20.0, Platform: Windows, Targets: All.

Function: The device ID to use.
Example:

```
Var p as WindowsPlayerMBS // your player
p.DeviceID = 3 // 4th device
p.ChannelMask = 1 // left channel
```

Notes: Please set before calling Play method.
Default is -1 to use WAVE MAPPER device.
(Read and Write property)

15.25.20 Duration as Double

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: Returns duration of sound in seconds.

Notes: (Read only property)

15.25.21 Lasterror as Integer

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

15.25.22 Pitch as Double

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: The pitch for the waveform-audio output device.
Notes: Default 1.0.
pass e.g. 0.5 for half pitch or 2.0 to double pitch.
(Read and Write property)

15.25.23 Position as Double

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: Returns current position.
Notes: (Read only property)

15.25.24 Rate as Double

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: The rate for the waveform-audio output device.
Notes: Default 1.0.
pass e.g. 0.5 for half speed or 2.0 to double speed.
(Read and Write property)

15.25.25 SampleRate as Integer

MBS Audio Plugin, Plugin Version: 16.1, Platform: Windows, Targets: All.

Function: The sample rate of the audio file.
Notes: (Read only property)

15.25.26 Volume as Double

MBS Audio Plugin, Plugin Version: 15.0, Platform: Windows, Targets: All.

Function: The volume setting.
Notes: Range is from 0.0 for no sound to 1.0 for full sound.
(Read and Write property)

Chapter 16

AuthenticationServices

16.1 control ASAuthorizationAppleIDButtonControlMBS

16.1.1 control ASAuthorizationAppleIDButtonControlMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The control to host a Apple ID button on a Xojo iOS window.
Blog Entries

- News from the MBS Xojo Plugins Version 25.3
- MBS Xojo Plugins, version 25.3pr5

16.1.2 Properties

16.1.3 AcceptTabs as Boolean

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes: If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

16.1.4 Style as Integer

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The style of the button.
Notes: Default is StyleWhite constant in ASAuthorizationAppleIDButtonMBS class.
(Read and Write property)

16.1.5 Type as Integer

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The type of the button.
Notes: Default is TypeSignIn constant in ASAuthorizationAppleIDButtonMBS class.
(Read and Write property)

16.1.6 View as ASAuthorizationAppleIDButtonMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The used view.
Notes: (Read only property)

16.1.7 Events

16.1.8 Action

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The action event to react on a click on the button.

16.1.9 BoundsChanged

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

16.1.10 Close

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

16.1.11 Closing

Plugin Version: 25.3, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

16.1.12 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

16.1.13 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

16.1.14 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

16.1.15 EnableMenuItems

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

16.1.16 FocusLost

Plugin Version: 25.3, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

16.1.17 FocusReceived

Plugin Version: 25.3, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

16.1.18 FrameChanged

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

16.1.19 GotFocus

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

16.1.20 LostFocus

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

16.1.21 MenuBarSelected

Plugin Version: 25.3, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

16.1.22 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

16.1.23 MouseDrag(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

16.1.24 MouseUp(x As Integer, y As Integer)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

16.1.25 Open

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

16.1.26 Opening

Plugin Version: 25.3, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

16.1.27 ScaleFactorChanged(NewFactor as double)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

16.1.28 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

16.2 control ASAuthorizationAppleIDButtonIOSControlMBS

16.2.1 control ASAuthorizationAppleIDButtonIOSControlMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: iOS, Targets: iOS only.

Function: The control to host a Apple ID button on a Xojo iOS screen.
Blog Entries

- News from the MBS Xojo Plugins Version 25.3
- MBS Xojo Plugins, version 25.3pr5

16.2.2 Properties

16.2.3 Style as Integer

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: iOS, Targets: iOS only.

Function: The style of the button.
Notes: Default is StyleWhite constant in ASAuthorizationAppleIDButtonMBS class.
(Read and Write property)

16.2.4 Type as Integer

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: iOS, Targets: iOS only.

Function: The type of the button.
Notes: Default is TypeSignIn constant in ASAuthorizationAppleIDButtonMBS class.
(Read and Write property)

16.2.5 View as ASAuthorizationAppleIDButtonMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: iOS, Targets: iOS only.

Function: The used view.
Notes: (Read only property)

16.2.6 Events

16.2.7 Action

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: iOS, Targets: Desktop & iOS.

Function: The action event to react on a touch on the button.

16.2.8 Close

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: iOS, Targets: Desktop & iOS.

Function: The control is about to close.

16.2.9 GotFocus

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: iOS, Targets: Desktop & iOS.

Function: The control itself got focus.
Notes: This only fires if the control itself got focus and not a sub control.

16.2.10 LostFocus

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: iOS, Targets: Desktop & iOS.

Function: The control lost focus.
Notes: This only fires if the control itself lost focus and not a sub control.

16.2.11 Open

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: iOS, Targets: Desktop & iOS.

Function: The control is about to was created and you can initialize it.

16.3 class ASAuthorizationAppleIDButtonMBS

16.3.1 class ASAuthorizationAppleIDButtonMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A control you add to your interface that enables users to initiate the Sign In with Apple flow.
Example:

```
// show a black "Sign in with Apple" button in the window
// The app needs the Sign in with Apple entitlement. Start the sign in with ASAuthorizationControllerMBS when clicked.
Var button As New ASAuthorizationAppleIDButtonMBS(ASAuthorizationAppleIDButtonMBS.TypeSignIn, ASAuthorizationAppleIDButtonMBS.StyleBlack)
button.cornerRadius = 8
button.frame = NSMakeRectMBS(20, 20, 220, 44)
Self.NSWindowMBS.contentView.addSubview button
```

Notes: Choose one of the built-in button styles and types, and change the corner radius of the button by setting the cornerRadius property, but don,Äôt otherwise modify the style of the button. Don,Äôt use an Apple ID authorization button for any purpose other than to initiate the Sign In with Apple flow.

After the user taps the button, create a request using the provider, and then use an instance of ASAuthorizationControllerMBS to execute the request.
Subclass of the NSControlMBS class.

- MBS Xojo Plugins, version 25.3pr6

16.3.2 Methods

16.3.3 button(Type as Integer, Style as Integer) as ASAuthorizationAppleIDButtonMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Creates a new Sign In with Apple authorization button with the given type and style.
Notes: type: The type of the button.
style: The style of the button.

16.3.4 Constructor(Type as Integer, Style as Integer)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Creates a new Sign In with Apple authorization button with the given type and style.
Notes: type: The type of the button.
style: The style of the button.

16.3.5 Properties

16.3.6 cornerRadius as double

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The radius, in points, for the rounded corners on the Apple ID sign-in button.
Notes: (Read and Write property)

16.3.7 Constants

Button Styles

Constant	Value	Description
StyleBlack	2	A black button.
StyleWhite	0	A white button.
StyleWhiteOutline	1	A button with a white outline.

Button Types

Constant	Value	Description
TypeContinue	1	A button type that continues the Sign in with Apple authorization process.
TypeDefault	2	A default button type for the Sign in with Apple authorization process.
TypeSignIn	0	A button type that performs authorization using Sign in with Apple.
TypeSignUp	2	A button type that allows the user to sign up for Sign in with Apple.

16.4 class ASAuthorizationAppleIDCredentialMBS

16.4.1 class ASAuthorizationAppleIDCredentialMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: A credential that results from a successful Apple ID authentication.
Example:

```
// let the user sign in with Apple and get name and email
// MyAuthController is a subclass of ASAuthorizationControllerMBS with the didCompleteWithAuthorization event implemented.
// Controller is a property of the window: Controller As MyAuthController
Var provider As New ASAuthorizationAppleIDProviderMBS
Var request As ASAuthorizationAppleIDRequestMBS = provider.createRequest
Var scopes() As String = Array(ASAuthorizationMBS.ASAuthorizationScopeFullName, ASAuthorizationMBS.ASAuthorizationScopeEmail)
request.setRequestedScopes scopes

Var requests() As ASAuthorizationRequestMBS
requests.Add request
Controller = New MyAuthController(requests)
Controller.performRequests

// in MyAuthController:
Sub didCompleteWithAuthorization(authorization As ASAuthorizationMBS) Handles didCompleteWithAuthorization
If authorization.credential IsA ASAuthorizationAppleIDCredentialMBS Then
Var c As ASAuthorizationAppleIDCredentialMBS = ASAuthorizationAppleIDCredentialMBS(authorization.credential)
// name and email are only provided the first time the user signs in
System.DebugLog "User " + c.User + ", email " + c.Email
End If
End Sub
```

Notes: Subclass of the ASAuthorizationCredentialMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Sign In with Apple in Xojo

- MBS Xojo Plugins, version 25.3pr5

16.4.2 Methods

16.4.3 authorizedScopes as String()

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The contact information the user authorized your app to access.

16.4.4 Properties

16.4.5 authorizationCode as MemoryBlock

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: A token that the app uses to interact with the server.
Notes: Your app uses this short-lived token as proof that it has authorization to interact with the server. The system encodes the object as a string using UTF-8.
(Read only property)

16.4.6 Email as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The user,Äôs email address.
Notes: (Read only property)

16.4.7 fullName as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The user,Äôs full name from their Apple ID or a user-submitted value provided from the Sign in with Apple UI.
Notes: The dictionary contains keys namePrefix, givenName, middleName, familyName, nameSuffix and nickname if available.

Optionally there is phoneticRepresentation key with a dictionary having the same keys to provide details on the phonetic representation.
(Read only property)

16.4.8 identityToken as MemoryBlock

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: A JSON Web Token (JWT) that securely communicates information about the user to the app.
Notes: The system encodes the object as a string using UTF-8.
(Read only property)

16.4.9 realUserStatus as Integer

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: A value that indicates whether the user appears to be a real person.
Example:

```
Var c As ASAuthorizationAppleIDCredentialMBS // your credentials

Var realUserStatus As String

Select Case c.realUserStatus
Case c.UserDetectionStatusLikelyReal
realUserStatus = "LikelyReal "
Case c.UserDetectionStatusUnknown
realUserStatus = "Unknown"
Case c.UserDetectionStatusUnsupported
realUserStatus = "Unsupported"
Else
realUserStatus = c.realUserStatus.ToString
End Select

Log "realUserStatus: "+realUserStatus
```

Notes: Use this property,Äôs value as one piece of data when trying to prevent fraud. A value of ASUserDetectionStatusLikelyReal is a hint that the system has a reasonably high confidence that the user is a real person, as opposed to an automated agent, but this isn,Äôt a guarantee.
(Read only property)

16.4.10 State as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: An arbitrary string that your app provides to the request that generates the credential.
Notes: (Read only property)

16.4.11 User as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: An identifier for the authenticated user.
Notes: (Read only property)

16.4.12 userAgeRange as Integer

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Check this property to determine whether the current user is a child.
Example:

```
Var c As ASAuthorizationAppleIDCredentialMBS // your credentials
Var userAgeRange as string

Select Case c.userAgeRange
Case c.UserAgeRangeChild
userAgeRange = "Child"
Case c.UserAgeRangeNotChild
userAgeRange = "NotChild"
Case c.UserAgeRangeUnknown
userAgeRange = "Unknown"
Else
userAgeRange = c.userAgeRange.ToString
end Select

Log "userAgeRange: "+userAgeRange
```

Notes: (Read only property)

16.4.13 Constants

User Age Range

Constant	Value	Description
UserAgeRangeChild	1	A child account.
UserAgeRangeNotChild	2	Not a child
UserAgeRangeUnknown	0	Unknown age

User Detection Status

Constant	Value	Description
UserDetectionStatusLikelyReal	2	The user appears to be a real person.
UserDetectionStatusUnknown	1	The system hasn,Äôt determined whether the user might be a real person.
UserDetectionStatusUnsupported	0	The system can,Äôt determine this user,Äôs status as a real person.

16.5 class ASAuthorizationAppleIDProviderMBS

16.5.1 class ASAuthorizationAppleIDProviderMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: A mechanism for generating requests to authenticate users based on their Apple ID.
Example:

```
Var provider As New ASAuthorizationAppleIDProviderMBS
Var request As ASAuthorizationAppleIDRequestMBS = provider.createRequest
Var controller As New ASAuthorizationControllerMBS(Array(request))
Break
```

Notes: You use a provider to create a request (ASAuthorizationAppleIDRequestMBS), which you then use to initialize a controller (ASAuthorizationControllerMBS) that performs the request.

On success, the controller,Äôs delegate receives an authorization (ASAuthorizationMBS) containing a credential (ASAuthorizationAppleIDCredentialMBS) that has an opaque user identifier. You can use that identifier to later check the user,Äôs credential state—for example, to see if authorization has been revoked—by calling the getCredentialState method.

You need to have a code signed application with the entitlement com.apple.developer.applesignin and a matching mobile provision profile for the application. The easiest way to setup a profile may be to make a dummy applicaiton in Xcode with the same name, bundle identifier and entitlements.
Subclass of the ASAuthorizationProviderMBS class.

- MBS Xojo Plugins, version 25.3pr5

16.5.2 Methods

16.5.3 AuthorizationAppleIDProviderCredentialRevokedNotification as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: A notification that indicates the user,Äôs credentials have been revoked and they should be signed out.
Notes: See NotificationObserverMBS class.

16.5.4 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on iOS 13.0, macOS 10.15 or higher.

16.5.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Creates a new provider.

16.5.6 createRequest as ASAuthorizationAppleIDRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Creates a new Apple ID authorization request.
Notes: Returns an Apple ID authorization request that you can configure and execute.

16.5.7 getCredentialStateForUserID(userID as String, theDelegate as CredentialStateCompletedMBS)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Returns the credential state for the given user in a completion handler.
Notes: userID: An opaque string associated with the Apple ID that your app receives in the credential,Äôs user property after performing a successful authentication request.

theDelegate: the method called to report the state and an optional error condition.

16.5.8 Constants

Credential States

Constant	Value	Description
AuthorizationAppleIDProviderCredentialAuthorized	1	The user is authorized.
AuthorizationAppleIDProviderCredentialNotFound	2	The user hasn,Äôt established a relationship with Sign in
AuthorizationAppleIDProviderCredentialRevoked	0	The given user,Äôs authorization has been revoked and th out.
AuthorizationAppleIDProviderCredentialTransferred	3	The app has been transferred to a different team, and you user,Äôs identifier.

16.5.9 Delegates

16.5.10 CredentialStateCompletedMBS(userID as String, credentialState as Integer, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The delegate to run when getCredentialState completes.

16.6 class ASAuthorizationAppleIDRequestMBS

16.6.1 class ASAuthorizationAppleIDRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: An OpenID authorization request that relies on the user,Äôs Apple ID.
Example:

```
Var provider As New ASAuthorizationAppleIDProviderMBS
Var request As ASAuthorizationAppleIDRequestMBS = provider.createRequest
Var controller As New ASAuthorizationControllerMBS(Array(request))
Break
```

Notes: Subclass of the ASAuthorizationOpenIDRequestMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- News from the MBS Xojo Plugins Version 25.3
- MBS Xojo Plugins, version 25.3pr5

16.6.2 Properties

16.6.3 user as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: An identifier associated with the user,Äôs Apple ID.
Notes: Typically you leave this property set to nil the first time you authenticate a user. Otherwise, if you previously received an authorization containing an ASAuthorizationAppleIDCredential instance, set this property to the value from the credential,Äôs user property.

The value is an arbitrary string that,Äôs portable among apps from a single developer, but not between apps from different developers.
(Read and Write property)

16.7 class ASAuthorizationControllerMBS

16.7.1 class ASAuthorizationControllerMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: A controller that manages authorization requests that a provider creates.
Example:

```
Var provider As New ASAuthorizationAppleIDProviderMBS

// we create the request
var request as ASAuthorizationAppleIDRequestMBS = provider.createRequest

// we ask for email and full name
Var RequestedScopes() As String
RequestedScopes.add ASAuthorizationMBS.ASAuthorizationScopeEmail
RequestedScopes.add ASAuthorizationMBS.ASAuthorizationScopeFullName

request.setRequestedScopes RequestedScopes

// create our controller
controller = New ASAuthorizationController(array(request))

// set context window for dialog
controller.presentationContext = Self

// and show dialog now
controller.performRequests
```

Notes: Create authorization requests for the credential types your app supports, such as ASAuthorizationAppleIDRequest for Sign in with Apple, or ASAuthorizationPasswordRequest for password credentials. Create an authorization controller using Constructor, supplying the authorization requests you create. Implement the authorization controller,Äôs events to receive responses when requests succeed or fail, and set its presentationContextProvider so that the authorization controller can present UI.

Call performAutoFillAssistedRequests to present inline UI to request credentials, or performRequests to request credentials using modal UI. ASAuthorizationController calls your delegate,Äôs methods when the request completes.

Set the content type of text fields in your app,Äôs login UI so that ASAuthorizationController can detect when to offer AutoFill suggestions. Use UITextContentTypeUsername as the content type for user name text fields, and UITextContentTypePassword for password fields.

16.7.2 Methods

16.7.3 ASAuthorizationErrorDomain as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The domain of authorization errors.

16.7.4 authorizationRequests as ASAuthorizationRequestMBS()

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The authorization requests that the controller manages.
Notes: Use an authorization provider, like ASAuthorizationAppleIDProviderMBS, ASAuthorizationPasswordProviderMBS, or ASAuthorizationSingleSignOnProviderMBS, to create a request for a particular purpose.

16.7.5 cancel

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Cancels any active authorization requests.
Notes: If calling this method cancels an active authorization request, the authorization controller calls the didCompleteWithError event.

16.7.6 Constructor(requests() as ASAuthorizationRequestMBS)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Creates a controller from a collection of authorization requests.

16.7.7 Destructor

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The destructor.

16.7.8 HasEntitlement(Name as String) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: Checks whether the application has the entitlement.
Example:

```
If Not ASAuthorizationController.HasEntiltement("com.apple.developer.applesignin") Then
Log "Your application misses the com.apple.developer.applesignin entitlement."
end if
```

16.7.9 performAutoFillAssistedRequests

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: iOS only.

Function: Initiates the authorization flows for requests that support AutoFill presentation.
Notes: The authorization controller presents a user interface when a text field with the appropriate text content type obtains focus.

Upon completion, the authorization controller calls its delegate to report success or failure.

16.7.10 performRequests

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Starts the specified authorization flows during controller initialization.
Notes: When authorization succeeds, the system relays that information to the controller,Äôs events by calling the didCompleteWithAuthorization event with an authorization instance. If authorization fails, the system calls the didCompleteWithError event instead.

Some authorization flows require a presentation context to ask the user for information or consent. Set the presentationContext property to specify which window to use.

- 16.7.11 performRequests(options as Integer) 3346

16.7.11 performRequests(options as Integer)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Starts the specified authorization flows during controller initialization.
Notes: The only option currently is AuthorizationControllerRequestOptionPreferImmediatelyAvailableCredentials.
See also:

- 16.7.10 performRequests 3345

16.7.12 Properties

16.7.13 Description as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The debug description.
Notes: (Read only property)

16.7.14 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The internal property reference.
Notes: (Read and Write property)

16.7.15 presentationContext as Variant

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Which window it should present content to the user.
Notes: (Read and Write property)

16.7.16 Events

16.7.17 didCompleteWithAuthorization(authorization as ASAuthorizationMBS)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Called when authorization completes successfully.
Example:

```
Sub didCompleteWithAuthorization(authorization as ASAuthorizationMBS) Handles didCompleteWithAuthorization
Log CurrentMethodName

Log "authorization: "+authorization.Description

Var c As ASAuthorizationCredentialMBS = authorization.Credential
log "credentials: "+c.Description

End Sub
```

Notes: authorization: An encapsulation of the successful authorization.

16.7.18 didCompleteWithError(error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Called when authorization fails, and provides an error explaining why.
Example:

```
Sub didCompleteWithError(error as NSErrorMBS) Handles didCompleteWithError
Log CurrentMethodName

If error <>Nil Then
log error.LocalizedDescription
End If

End Sub
```

Notes: error: An error that explains the failure.

16.7.19 presentationAnchorRequested

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The framework asked for the presentation context.
Notes: Your chance to update the presentationContext property with the view/window to use as host.

16.7.20 Constants

Constants

Constant	Value	Description
AuthorizationControllerRequestOptionPreferImmediatelyAvailableCredentials	1	One of the option constants for p Tells the authorization controlle available on the local device.

Errors

Constant	Value	Description
ErrorCanceled	1001	The user canceled the authorization attempt.
ErrorCredentialExport	1008	The credential export request failed.
ErrorCredentialImport	1007	The credential import request failed.
ErrorFailed	1004	The authorization attempt failed.
ErrorInvalidResponse	1002	The authorization request received an invalid response.
ErrorMatchedExcludedCredential	1006	This error should only be returned when specifying @c excludedCredentials o a public key credential registration request.
ErrorNotHandled	1003	The authorization request wasn,Äôt handled.
ErrorNotInteractive	1005	Not interactive.
ErrorUnknown	1000	The authorization attempt failed for an unknown reason.

16.8 class ASAuthorizationCredentialMBS

16.8.1 class ASAuthorizationCredentialMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: An interface that all credentials share.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 25.3pr5

16.8.2 Methods

16.8.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

16.8.4 copy as ASAuthorizationCredentialMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Creates a copy of the credentials.

16.8.5 Properties

16.8.6 Description as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The debug description.
Notes: (Read only property)

16.8.7 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The internal property reference.
Notes: (Read and Write property)

16.9 class ASAuthorizationMBS

16.9.1 class ASAuthorizationMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The encapsulation of a successful authorization by a controller.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 25.3pr5

16.9.2 Methods

16.9.3 ASAuthorizationScopeEmail as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: A scope that includes the user,Äôs email address.

16.9.4 ASAuthorizationScopeFullName as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: A scope that includes the user,Äôs full name.

16.9.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

16.9.6 Properties

16.9.7 credential as ASAuthorizationCredentialMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Information provided about a user after successful authentication.
Notes: (Read only property)

16.9.8 Description as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The debug description.
Notes: (Read only property)

16.9.9 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The internal property reference.
Notes: (Read and Write property)

16.9.10 provider as ASAuthorizationProviderMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The provider that created the request that resulted in the successful authorization.
Notes: (Read only property)

16.10 class ASAuthorizationOpenIDRequestMBS

16.10.1 class ASAuthorizationOpenIDRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: An OpenID authorization request.
Notes: Subclass of the ASAuthorizationRequestMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 26.1pr1
- MBS Xojo Plugins, version 25.3pr5

16.10.2 Methods

16.10.3 AuthorizationOperationImplicit as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: An operation that depends on the particular kind of credential provider.

16.10.4 AuthorizationOperationLogin as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: An operation used to authenticate a user.

16.10.5 AuthorizationOperationLogout as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: An operation that ends an authenticated session.

16.10.6 AuthorizationOperationRefresh as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: An operation that refreshes the logged-in user,Äôs credentials.

16.10.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

16.10.8 requestedScopes as String()

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The contact information to be requested from the user during authentication.

16.10.9 setRequestedScopes(requestedScopes() as String)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Sets the contact information to be requested from the user during authentication.

16.10.10 Properties

16.10.11 nonce as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: A string value to pass to the identity provider.
Notes: You can verify this value with the identity token provided as part of a successful ASAuthorization response.

The nonce size may depend on the actual technology used, and an error might be returned by the request execution.
(Read and Write property)

16.10.12 requestedOperation as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The OpenID authentication operation you want this request to perform.
Notes: (Read and Write property)

16.10.13 state as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Data that,Äôs returned to you unmodified in the corresponding credential after a successful authentication.
Notes: (Read and Write property)

16.11 class ASAuthorizationPasswordProviderMBS

16.11.1 class ASAuthorizationPasswordProviderMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: A mechanism for generating requests to perform keychain credential sharing.
Notes: Subclass of the ASAuthorizationProviderMBS class.
Blog Entries

- News from the MBS Xojo Plugins Version 25.3

16.11.2 Methods

16.11.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Creates a new password provider.

16.11.4 createRequest as ASAuthorizationPasswordRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Creates a new password authorization request.
Notes: A password authorization request that you can execute with an instance of ASAuthorizationControllerMBS.

16.12 class ASAuthorizationPasswordRequestMBS

16.12.1 class ASAuthorizationPasswordRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: An authorization request that uses credentials stored in the keychain.
Notes: Subclass of the ASAuthorizationRequestMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- News from the MBS Xojo Plugins Version 25.3

16.13 class ASAuthorizationProviderMBS

16.13.1 class ASAuthorizationProviderMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: An interface that authorization providers must implement.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 25.3pr5

16.13.2 Methods

16.13.3 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on iOS 13.0, macOS 10.15 or higher.

16.13.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

16.13.5 Properties

16.13.6 Description as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The debug description.
Notes: (Read only property)

16.13.7 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The internal property reference.
Notes: (Read and Write property)

16.14 class ASAuthorizationRequestMBS

16.14.1 class ASAuthorizationRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: A base class for different kinds of authorization requests.
Notes: Use one of the concrete requests, like ASAuthorizationAppleIDRequestMBS, ASAuthorizationPasswordRequestMBS, or ASAuthorizationSingleSignOnRequest.
You typically generate one of these using the corresponding provider, which is an instance of ASAuthorizationAppleIDProviderMBS, ASAuthorizationPasswordProviderMBS, or ASAuthorizationSingleSignOnProvider, respectively.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

16.14.2 Methods

16.14.3 Constructor

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

16.14.4 copy as ASAuthorizationRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Creates a copy of this request.

16.14.5 Properties

16.14.6 Description as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The debug description.
Notes: (Read only property)

16.14.7 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The internal property reference.
Notes: (Read and Write property)

16.14.8 provider as ASAuthorizationProviderMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The provider to provider the credentials.
Notes: (Read only property)

16.15 class ASPasswordCredentialMBS

16.15.1 class ASPasswordCredentialMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: A password credential.
Notes: Subclass of the ASAuthorizationCredentialMBS class.

16.15.2 Methods

16.15.3 Constructor(user as string, password as string)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Initializes a password credential.
Notes: user: The username associated with the credential.
password: The password associated with the credential.

16.15.4 credential(user as string, password as string) as ASPasswordCredentialMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Creates a password credential instance with a given user name and password.
Notes: user: The username for the credential.
password: The password for the credential.

16.15.5 Properties

16.15.6 Password as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The password for a password credential object.
Notes: (Read only property)

16.15.7 User as String

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: The user for a password credential object.
Notes: (Read only property)

16.16 control DesktopASAuthorizationAppleIDButtonControlMBS

16.16.1 control DesktopASAuthorizationAppleIDButtonControlMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The control to host a Apple ID button on a Xojo iOS window.
Blog Entries

- News from the MBS Xojo Plugins Version 25.3
- MBS Xojo Plugins, version 25.3pr5

16.16.2 Properties

16.16.3 AcceptTabs as Boolean

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes: If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

16.16.4 Style as Integer

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The style of the button.
Notes: Default is StyleWhite constant in ASAuthorizationAppleIDButtonMBS class.
(Read and Write property)

16.16.5 Type as Integer

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The type of the button.
Notes: Default is TypeSignIn constant in ASAuthorizationAppleIDButtonMBS class.
(Read and Write property)

16.16.6 View as ASAuthorizationAppleIDButtonMBS

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The used view.
Notes: (Read only property)

16.16.7 Events

16.16.8 Action

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The action event to react on a click on the button.

16.16.9 BoundsChanged

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

16.16.10 Closing

Plugin Version: 25.3, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

16.16.11 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 25.3, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

16.16.12 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 25.3, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

16.16.13 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

16.16.14 FocusLost

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

16.16.15 FocusReceived

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

16.16.16 FrameChanged

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

16.16.17 MenuBarSelected

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

16.16.18 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

16.16.19 MouseDrag(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

16.16.20 MouseUp(x As Integer, y As Integer)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

16.16.21 Opening

Plugin Version: 25.3, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

16.16.22 ScaleFactorChanged(NewFactor as double)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

16.16.23 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

Chapter 17

Authorization

17.1 class AuthorizationItemMBS

17.1.1 class AuthorizationItemMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: A class for an autorization right.

17.1.2 Properties

17.1.3 Flags as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Flags for this item.
Notes: Flags returned in the flags field of ItemSet Items when calling Authorize:
kAuthorizationFlagCanNotPreAuthorize = 1
(Read and Write property)

17.1.4 Name as String

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: The name of the item.
Notes: (Read and Write property)

17.1.5 Value as String

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: The value of the item.
Notes: (Read and Write property)

17.2 class AuthorizationItemSetMBS

17.2.1 class AuthorizationItemSetMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: A class for a set of autorization rights.

17.2.2 Methods

17.2.3 Append(item as AuthorizationItemMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Adds a new item to the list.

17.2.4 Remove(index as Integer)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Removes the item with the given index.

17.2.5 Properties

17.2.6 Count as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Returns the number of items in the list.
Notes: (Read and Write property)

17.2.7 Item(index as Integer) as AuthorizationItemMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Returns an item from the list.
Notes: (Read and Write computed property)

17.3 class AuthorizationMBS

17.3.1 class AuthorizationMBS

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: A class to run a root shell on Mac OS X.
Example:

```
// run a command line tool as root after asking the user for an admin password
Var auth As New AuthorizationMBS
auth.SimpleAuthorize
If Not auth.Authorized Then Return // user cancelled

Var parameters() As String = Array("-flushcache")
auth.Execute("/usr/bin/dscacheutil", parameters, True)

Var output As String
While Not auth.EOFStream
output = output + auth.ReadStream(1000)
Wend
Call auth.Wait
MessageBox "Done. " + output
```

Notes: Some notes from Ilija Injac on this usage of this class:

The main problem for the execution of the perl script was, that perl is not able to find the required perl-modules at execution with the option "-U" (this switch is set for security reasons).
It was also necessary to include the perl-modules from inside the perl script which has to be executed.
Inside the Xojo code i created a AuthorizationItemMBS with the value "/usr/bin/perl":
...
i = new AuthorizationItemMBS

```
i.name  = a.kAuthorizationItemRightExecute
i.value = "/usr/bin/perl"
```

...
Actually it is the same source as in Christians "Authorization 1" example within the "test1" function. And it works !
Blog Entries

- MBS Xojo Plugins, version 17.3pr5

- MBS Xojo Plugins, version 17.3pr4
- MBS Xojo / Real Studio Plugins, version 14.2pr5

17.3.2 Methods

17.3.3 Authorize(rights as AuthorizationItemSetMBS, flags as Integer)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Short for Authorize without the resulting rights set.
Example:

```
Var a as AuthorizationMBS
Var s as AuthorizationItemSetMBS
Var i as AuthorizationItemMBS
Var Flags as Integer

// check whether use is admin

a=new AuthorizationMBS

s=new AuthorizationItemSetMBS
i=new AuthorizationItemMBS
i.Name="com.mycompany.myapplication.command1"
s.Append i

if a.NewAuthorization(nil,a.kAuthorizationFlagDefaults) then // create
Flags=BitwiseOr(a.kAuthorizationFlagExtendRights,a.kAuthorizationFlagInteractionAllowed)

a.Authorize(s,flags)
MessageBox str(a.LastError)
// -60006 for cancel = no admin
// 0 on success
end if
```

See also:

- 17.3.4 Authorize(rights as AuthorizationItemSetMBS, flags as Integer, byref outrights as AuthorizationItemSetMBS) 3373

17.3.4 Authorize(rights as AuthorizationItemSetMBS, flags as Integer, byref outrights as AuthorizationItemSetMBS)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Tries to extend authorization to have root rights.
Notes: The Authorizated property is set if this function was successful.
Lasterror is set.
outrights is on return a list of the rights which are authorized.

Extends the rights of the class.

When the kAuthorizationFlagInteractionAllowed flag is set, user interaction will happen when required. Failing to set this flag will result in this call failing with a errAuthorizationInteractionNotAllowed status when interaction is required.

Setting the kAuthorizationFlagExtendRights flag will extend the currently available rights.

Setting the kAuthorizationFlagPartialRights flag will cause this call to succeed if only some of the requested rights are being granted by the system. Unless this flag is set this API will fail if not all the requested rights could be obtained.

Setting the kAuthorizationFlagDestroyRights flag will prevent any additional rights obtained during this call from being preserved after returning from this API.

Setting the kAuthorizationFlagPreAuthorize flag will pre authorize the requested rights so that at a later time – by calling GetExternalForm() follow by NewAuthorizationFromExternalForm() – the obtained rights can be used in a different process. Rights that can't be preauthorized will be treated as if they were authorized for the sake of returning an error (in other words if all rights are either authorized or could not be preauthorized this call will still succeed).

The rights which could not be preauthorized are not currently authorized and may fail to authorize when a later call to Authorize() is made, unless the kAuthorizationFlagExtendRights and kAuthorizationFlagInteractionAllowed flags are set. Even then they might still fail if the user does not supply the correct credentials.

The reason for passing in this flag is to provide correct audit trail information and to avoid unnecessary user interaction.

Error codes:

errAuthorizationSuccess	0	No error.
errAuthorizationInvalidRef	-60002	The authorization parameter is invalid.
errAuthorizationInvalidSet	-60001	The rights parameter is invalid.
errAuthorizationInvalidPointer	-60004	The authorizedRights parameter is invalid.

See also:

• 17.3.3 Authorize(rights as AuthorizationItemSetMBS, flags as Integer) 3373

17.3.5 Available as boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Returns true if the Authorization Framework was loaded correctly.
Notes: Returns false on any error.

17.3.6 close

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The destructor.
Notes: Strings made with the ExternalForm function will become invalid!

There is no need to call this method except you want to free all resources used by this object now without waiting for Xojo to do it for you.

17.3.7 closeStream

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Closes the stream.

17.3.8 EOFStream as boolean

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Returns true if the Stream is at the end.

17.3.9 Execute(toolpath as string, parameters() as string)

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Executes a command line application in the background.
Notes: You may make some small shell script which you launch in background. This script can change some other utility to run as root (Setuid), so you can do admin stuff using the normal shell class.
Lasterror is set.
Currently this function is not available to RB versions before 3.5.

Note that the parameters parameter is an array of strings and not just one.
toolpath should use an absolute path in unix style.

Lasterror is set to -1 if the path is empty or you are not using Mac OS X.
See also:

- 17.3.10 Execute(toolpath as string, parameters() as string, openstream as boolean) 3376

17.3.10 Execute(toolpath as string, parameters() as string, openstream as boolean)

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Same as Execute, but you can specify if the stream to the command line application should be opened.
Notes: Currently this function is not available to RB versions before 3.5.
Note that the parameters parameter is an array of strings and not just one.
toolpath should use an absolute path in unix style.

Lasterror is set to -1 if the path is empty or you are not using Mac OS X.
See also:

- 17.3.9 Execute(toolpath as string, parameters() as string) 3375

17.3.11 ExternalForm as string

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Returns a string with binary data about this Authorization object.
Notes: This external representation depends on your process. You can't save it to disk or keep it longer than the Authorization object exists.
If the Authorization object is destroyed, your application quits or the authorization times out, this external form becomes invalid.

17.3.12 FlushStream

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Flushs the stream to the background application.

17.3.13 Info as AuthorizationItemSetMBS

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Returns the list of currently authorized rights.
Notes: Returns nil on any error.

17.3.14 MakeStreamAsyncron

MBS MacCF Plugin, Plugin Version: 6.3, Platform: macOS, Targets: Desktop only.

Function: Modifies the Stream created in the Execute method to run non blocking.

17.3.15 NewAuthorization(rights as AuthorizationItemSetMBS, flags as Integer) as Boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Creates a new Authorization object.
Notes: Lasterror is set. Returns true if successful.

Create a new autorization object which can be used in other authorization calls.

When the kAuthorizationFlagInteractionAllowed flag is set, user interaction will happen when required. Failing to set this flag will result in this call failing with a errAuthorizationInteractionNotAllowed status in the lasterror property when interaction is required.

Setting the kAuthorizationFlagExtendRights flag will extend the currently available rights. If this flag is set the class will grant all the rights requested when errAuthorizationSuccess is returned in the lasterror property. If this flag is not set the operation will almost certainly succeed, but no attempt will be made to make the requested rights available.

Call the Info function to figure out which of the requested rights are granted by the system.

Setting the kAuthorizationFlagPartialRights flag will cause this call to succeed if only some of the requested rights are being granted by the system. Unless this flag is set this API will fail if not all the requested rights could be obtained.

Setting the kAuthorizationFlagPreAuthorize flag will pre authorize the requested rights so that at a later time – by calling GetExternalForm() follow by NewAuthorizationFromExternalForm() in a different object – the obtained rights can be used in a different process. Rights that can't be preauthorized will be treated as if they were authorized for the sake of returning an error (in other words if all rights are either authorized or could not be preauthorized this call will still succeed).

The rights which could not be preauthorized are not currently authorized and may fail to authorize when a later call to Authorize() is made, unless the kAuthorizationFlagExtendRights and kAuthorizationFlagInteractionAllowed flags are set. Even then they might still fail if the user does not supply the correct credentials.

The reason for passing in this flag is to provide correct audit trail information and to avoid unnecessary user interaction.

rights (input/optional):
An AuthorizationItemSet containing rights for which authorization is being requested. If nil are specified the class will authorize nothing at all.

flags (input) options specified using the different constants from this class.

Error codes:

errAuthorizationSuccess	0	Authorization or all requested rights succeeded.
errAuthorizationDenied	-60005	The authorization for one or more of the requested rights was denied.
errAuthorizationCanceled	-60006	The authorization was cancled by the user.
errAuthorizationInteractionNotAllowed	-60007	The authorization was denied since no interaction with the user was allowed.

17.3.16 NewAuthorizationFromExternalForm(s as string) as Boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Creates a new Authorization object from data inside a string.
Notes: You can store an authorization in a string for use in a subprocess. For example your application can ask the user for Root rights and you pass this string to a launched terminal application which will use it without having it's own interface.
Lasterror is set. Returns true if successful.

17.3.17 ReadStream(count as Integer) as string

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Reads bytes from the output stream of the executing app.
Example:

```
Var s(0) as String
Var a as AuthorizationMBS
Var e as Integer

s(0)="-show"
```

```
a=new AuthorizationMBS

if a.SimpleNewAuthorization then // create

a.Execute("/usr/sbin/dsconfigad",s,true) // and run it

if a.LastError<>0 then
MessageBox "Lasterror on Execute: "+str(a.LastError)
else
e=a.Wait // wait for process to terminate. Returns PID
if a.LastError<>0 then
MessageBox "Lasterror on Wait: "+str(a.LastError)
end if
end if
MessageBox a.ReadStream(1024)
end if
```

Notes: Tries to read count bytes.

Lasterror is set.
The returned string will be as long as the number of strings read.

Lasterror is set to -1 by the plugin if the stream is not open, or you are not using Mac OS X or the memory allocation failed.

17.3.18 SimpleAuthorize

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Just asks for the Authorization.
Notes: This is the function from MBS Plugin 3.0.

17.3.19 SimpleNewAuthorization as Boolean

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new authorization handle.
Example:

```
// uses chmod on test.pdf on the desktop to make
// it read-, write- and executable by everyone.
```

```
Var s(1) as String
Var a as AuthorizationMBS

a=new AuthorizationMBS

if a.SimpleNewAuthorization then
s(0)="777"
s(1)=SpecialFolder.Desktop.Child("test.pdf").NativePath

MessageBox s(1)
a.execute("/bin/chmod",s)
MessageBox "Executed:"+str(a.lasterror)
end if
```

Notes: This is the function from MBS Plugin 3.0.

17.3.20 Wait as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Waits till the background application is done.
Notes: Returns the Process ID or -1 on an error.
Lasterror is set.

17.3.21 WriteStream(s as string) as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: Writes the given bytes in the string to the stream.

17.3.22 Properties

17.3.23 Authorized as Boolean

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: Set to true if the last call to Authorizate was successful.
Notes: (Read and Write property)

17.3.24 Handle as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The handle to the Mac OS authorization object.
Notes: The C type is AuthorizationRef.
(Read and Write property)

17.3.25 KeepRights as Boolean

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: whether the destructor will keep the rights alive for the next use.
Notes: Normally the rights will be destroyed in the destructor so on the next use of the class the user has to reenter the password. If KeepRights=true the rights will not be destroyed.
(Read and Write property)

17.3.26 LastError as Integer

MBS MacCF Plugin, Plugin Version: 2.8, Platform: macOS, Targets: Desktop only.

Function: The last error code reported.
Notes: Lasterror is -1 if the function is not supported (e.g. on Windows).

Authorization error codes:

errAuthorizationSuccess	0,	The operation completed successfully.
errAuthorizationInvalidSet	-60001,	The set parameter is invalid.
errAuthorizationInvalidRef	-60002,	The authorization parameter is invalid.
errAuthorizationInvalidTag	-60003,	The tag parameter is invalid.
errAuthorizationInvalidPointer	-60004,	The authorizedRights parameter is invalid.
errAuthorizationDenied	-60005,	The authorization was denied.
errAuthorizationCanceled	-60006,	The authorization was cancled by the user.
errAuthorizationInteractionNotAllowed	-60007,	The authorization was denied since no user interaction was possible.
errAuthorizationInternal	-60008,	something else went wrong
errAuthorizationExternalizeNotAllowed	-60009,	authorization externalization denied
errAuthorizationInternalizeNotAllowed	-60010,	authorization internalization denied
errAuthorizationInvalidFlags	-60011,	invalid option flag(s)
errAuthorizationToolExecuteFailure	-60031,	cannot execute privileged tool
errAuthorizationToolEnvironmentError	-60032	privileged tool environment error

Other Mac OS error codes like -50 for wrong parameters are also possible.
(Read and Write property)

17.3.27 StreamHandle as Integer

MBS MacCF Plugin, Plugin Version: 3.1, Platform: macOS, Targets: Desktop only.

Function: The handle to the stream for the terminal running in the background with your command line application.
Notes: (Read and Write property)

17.3.28 Constants

Constants

Constant	Value	Description
kAuthorizationEmptyEnvironment	nil	Indicates an empty environment. You should pass this constant in functi with an environment parameter if you have no environment data to provid
kAuthorizationExternalFormLength	32	Indicates, in number of bytes, the length of the array in the Authorization ternalForm structure.

Error Codes

Constant	Value	Description
errAuthorizationCanceled	-60006	The authorization was cancelled by the user.
errAuthorizationDenied	-60005	The authorization was denied.
errAuthorizationExternalizeNotAllowed	-60009	The authorization is not allowed to be converted to an external forma
errAuthorizationInteractionNotAllowed	-60007	The authorization was denied since no user interaction was possible.
errAuthorizationInternal	-60008	Unable to obtain authorization for this operation.
errAuthorizationInternalizeNotAllowed	-60010	The authorization is not allowed to be created from an external forma
errAuthorizationInvalidFlags	-60011	The provided option flag(s) are invalid for this authorization operatio
errAuthorizationInvalidPointer	-60004	The returned authorization is invalid.
errAuthorizationInvalidRef	-60002	The authorization reference is invalid.
errAuthorizationInvalidSet	-60001	The authorization rights are invalid.
errAuthorizationInvalidTag	-60003	The authorization tag is invalid.
errAuthorizationSuccess	0	No error.
errAuthorizationToolEnvironmentError	-60032	An invalid status was returned during execution of a privileged tool.
errAuthorizationToolExecuteFailure	-60031	The specified program could not be executed.

Flag values

Constant	Value	Description
kAuthorizationFlagCanNotPreAuthorize	1	Indicates the Security Server could not preauthorize the right.
kAuthorizationFlagDefaults	0	If no bits are set, none of the following features are available.
kAuthorizationFlagDestroyRights	8	If the bit specified by this mask is set, the Security Server revokes au tion from the process as well as from any other process that is sha authorization. If the bit specified by this mask is not set, the Securit revokes authorization from the process but not from other processes th the authorization.
kAuthorizationFlagExtendRights	2	If the bit specified by this mask is set, the Security Server attempts the rights requested. Once the Security Server denies one right, it ign remaining requested rights.
kAuthorizationFlagInteractionAllowed	1	If the bit specified by this mask is set, you permit the Security Server to with the user when necessary.
kAuthorizationFlagPartialRights	4	If the bit specified by this mask and the kAuthorizationFlagExtendRigh are set, the Security Server grants or denies rights on an individual b all rights are checked.
kAuthorizationFlagPreAuthorize	16	If the bit specified by this mask is set, the Security Server preauthor rights requested.

Chapter 18

AVFoundation

18.1 class AVAssetExportSessionMBS

18.1.1 class AVAssetExportSessionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The AVFoundation class for media export.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
Var p as string = AVAssetExportSessionMBS.AVAssetExportPresetAppleM4VCellular
Var e as new AVAssetExportSessionMBS(a, p)

Var FileTypes() as string = e.supportedFileTypes
e.outputFileType = FileTypes(0)
e.OutputFile = SpecialFolder.Desktop.Child("small.m4v")
e.exportAsynchronously

// instead of waiting for event, we simply wait for it to finish
do
app.YieldToNextThread
loop until e.status <>e.AVAssetExportSessionStatusExporting
```

Notes: An AVAssetExportSession object transcodes the contents of an AVAsset source object to create an output of the form described by a specified export preset.

Prior to initializing an instance of AVAssetExportSession, you can use allExportPresets to get the complete list of presets available. Use exportPresetsCompatibleWithAsset to get a list of presets that are compatible with a specific asset.

After you have initialized an export session with the asset that contains the source media, the export preset name (presetName), and the output file type (outputFileType), you can start the export running by invoking exportAsynchronously. Because the export is performed asynchronously, this method returns immediately—you can use progress to check on the progress. Depending on the capabilities of the device, some exports may be queued when multiple exports are attempted. When this happens, the status of a queued export will indicate that it's waiting (AVAssetExportSessionStatusWaiting).

The exportAsynchronouslyCompleted event on AVFoundationMBS is called whether the export fails, completes, or is cancelled. Upon completion, the status property indicates whether the export has completed successfully. If it has failed, the value of the error property supplies additional information about the reason for the failure.
Available in OS X v10.7 and later.

18.1.2 Methods

18.1.3 allExportPresets as string()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns all available export preset names.
Notes: Returns an array containing a string constant for each of the available preset names.

18.1.4 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.1.5 AVAssetExportPreset1280x720 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: Specifies output at 1280x720 pixels.

18.1.6 AVAssetExportPreset1920x1080 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: Specifies output at 1920x1080 pixels.

18.1.7 AVAssetExportPreset3840x2160 as string

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: Specifies output at 3840x2160 pixels (4K video).

18.1.8 AVAssetExportPreset640x480 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: Specifies output at 640x480 pixels.

18.1.9 AVAssetExportPreset960x540 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: Specifies output at 960x540 pixels.

18.1.10 AVAssetExportPresetAppleM4A as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use this export option to produce an audio-only .m4a file with appropriate iTunes gapless playback data.
Notes: Specifies an audio-only .m4a file with appropriate iTunes gapless playback data.

18.1.11 AVAssetExportPresetAppleM4V1080pHD as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the export option presets to produce files that can be played on the specific Apple devices.
Notes: Specifies a 1080p High Definition format suitable for playing on Apple devices.

18.1.12 AVAssetExportPresetAppleM4V480pSD as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the export option presets to produce files that can be played on the specific Apple devices.
Notes: Specifies a 480p Standard Definition format suitable for playing on Apple devices.

18.1.13 AVAssetExportPresetAppleM4V720pHD as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the export option presets to produce files that can be played on the specific Apple devices.
Notes: Specifies a 720p High Definition format suitable for playing on Apple devices.

18.1.14 AVAssetExportPresetAppleM4VAppleTV as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the export option presets to produce files that can be played on the specific Apple devices.
Notes: Specifies a format suitable for playing on AppleTV.

18.1.15 AVAssetExportPresetAppleM4VCellular as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the export option presets to produce files that can be played on the specific Apple devices.
Notes: Specifies a format suitable for playing on Apple devices when streamed over a cellular network.

18.1.16 AVAssetExportPresetAppleM4ViPod as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the export option presets to produce files that can be played on the specific Apple devices.
Notes: Specifies a format suitable for playing on an iPod.

18.1.17 AVAssetExportPresetAppleM4VWiFi as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the export option presets to produce files that can be played on the specific Apple devices.
Notes: Specifies a format suitable for playing on Apple devices when streamed over a WiFi network.

18.1.18 AVAssetExportPresetAppleProRes422LPCM as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the export option presets to produce files that can be played on the specific Apple devices.
Notes: Specifies a QuickTime movie with Apple ProRes 422 video and LPCM audio.

18.1.19 AVAssetExportPresetHEVC1920x1080 as string

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: These export options can be used to produce movie files with the specified video size.
The export will not scale the video up from a smaller size. The video will be compressed using
HEVC and the audio will be compressed using AAC. Some devices cannot support some sizes.

18.1.20 AVAssetExportPresetHEVC3840x2160 as string

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: These export options can be used to produce movie files with the specified video size.
The export will not scale the video up from a smaller size. The video will be compressed using
HEVC and the audio will be compressed using AAC. Some devices cannot support some sizes.

18.1.21 AVAssetExportPresetHEVCHighestQuality as string

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: These export options can be used to produce movie files with video size appropriate to the device. The export will not scale the video up from a smaller size. The video will be compressed using HEVC and the audio will be compressed using AAC.

18.1.22 AVAssetExportPresetHighestQuality as string

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: These export options can be used to produce movie files with video size appropriate to the device. The export will not scale the video up from a smaller size. The video will be compressed using H.264 and the audio will be compressed using AAC.

18.1.23 AVAssetExportPresetLowQuality as string

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: These export options can be used to produce movie files with video size appropriate to the device. The export will not scale the video up from a smaller size. The video will be compressed using H.264 and the audio will be compressed using AAC.

18.1.24 AVAssetExportPresetMediumQuality as string

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: You use these export options to produce QuickTime .mov files with a specified video size.
Notes: These export options can be used to produce movie files with video size appropriate to the device. The export will not scale the video up from a smaller size. The video will be compressed using H.264 and the audio will be compressed using AAC.

18.1.25 AVAssetExportPresetPassthrough as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use this export option to let all tracks pass through.
Notes: Specifies that all tracks pass through, unless it is not possible.

18.1.26 cancelExport

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Cancels the execution of an export session.

18.1.27 Constructor(asset as AVAssetMBS, presetName as string)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes an asset export session with a specified asset and preset.
Notes: asset: The asset you want to export.
presetName: A string constant specifying the name of the preset template for the export.

18.1.28 determineCompatibilityOfExportPreset(presetName as string, asset as AVAssetMBS, outputFileType as string, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Reports the compatibility of an export present, asset, and output file type to the event.
Notes: Calls later AVAssetExportSessionMBS.determineCompatibilityOfExportPresetCompleted event.

presetName: The name of the preset template for the export operation. For possible values, see "Export Preset Names for Device-Appropriate QuickTime Files," "Export Preset Names for QuickTime Files of a Given Size," AVAssetExportSessionStatusCancelled, "Export Preset Name for iTunes Audio," and "Export Preset Name for Pass-Through."
asset: The asset object that you are planning to export.
outputFileType: The UTI string corresponding to the file type. For example, to specify a QuickTime movie file format, you could specify the constant AVFileTypeQuickTimeMovie. For a list of constants specifying UTIs for standard file types, see AV Foundation Constants Reference.

Because not all export presets are compatible with all assets and file types, you can use this method to query the compatibility of specific combos before using them. To ensure that the export operation succeeds, you should not make any significant changes to the asset between the time of calling this method and performing the export operation.

This method performs its checks asynchronously on a secondary thread and returns immediately. The results are similarly reported to the event later.

Available in OS X v10.9 and later.

With tag you can pass any value you like to the event later. This can be for example an object reference or

a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

18.1.29 determineCompatibleFileTypes(tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Reports the compatible file types for the current export session to the event.
Notes: calls later AVFoundationMBS.determineCompatibleFileTypesCompleted event.

This method operates on the asset object and preset information that was used to initialize the export session. It uses this information to determine the file types that the export session can write.

This method performs its checks asynchronously on a secondary thread and returns immediately. The results are similarly reported to the specified block on a secondary thread. Because this method actually inspects the asset's tracks, the tracks are loaded if they have not been already.
Available in OS X v10.9 and later.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

18.1.30 exportAsynchronously(tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Starts the asynchronous execution of an export session.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
Var p as string = AVAssetExportSessionMBS.AVAssetExportPresetAppleM4VCellular
Var e as new AVAssetExportSessionMBS(a, p)

Var FileTypes() as string = e.supportedFileTypes
e.outputFileType = FileTypes(0)
e.OutputFile = SpecialFolder.Desktop.Child("small.m4v")
e.exportAsynchronously

// instead of waiting for event, we simply wait for it to finish
do
app.YieldToNextThread
loop until e.status <>e.AVAssetExportSessionStatusExporting
```

Notes: This method starts an asynchronous export operation and returns immediately. status signals the terminal state of the export session, and if a failure occurs, error describes the problem.

This method calls AVFoundationMBS.exportAsynchronouslyCompleted event later. Tag is passed so you can pass information needed to finish work.

If internal preparation for export fails, event is invoked synchronously. The event may also be called asynchronously, after the method returns, in the following cases:

- If a failure occurs during the export, including failures of loading, re-encoding, or writing media data to the output.
- If cancelExport is invoked.
- After the export session succeeds, having completely written its output to the outputURL.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

18.1.31 exportMT

MBS AVFoundation Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Starts the synchronous execution of an export session.
Notes: Same as exportAsynchronously, but run synchronous, so the plugin waits.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

18.1.32 exportPresetsCompatibleWithAsset(asset as AVAssetMBS) as string()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the identifiers compatible with a given asset.
Notes: asset: An asset that is ready to be exported.

Returns an array of strings representing the identifiers compatible with asset.

The array is a complete list of the valid identifiers that can be used with exportSessionWithAsset with the specified asset.

Not all export presets are compatible with all assets. For example, a video-only asset is not compatible with an audio-only preset. This method returns only the identifiers for presets that are compatible with the given asset.

In order to ensure that the setup and running of an export operation will succeed using a given preset, you should not make significant changes to the asset (such as adding or deleting tracks) between retrieving compatible identifiers and performing the export operation.

If the asset's tracks are not currently loaded, they may be loaded by this method before any checks are performed.

18.1.33 exportSessionWithAsset(asset as AVAssetMBS, presetName as string) as AVAssetExportSessionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an asset export session configured with a specified asset and preset.
Notes: asset: The asset you want to export.
presetName: A string constant specifying the name of the preset template for the export.

Returns an asset export session initialized to export asset using preset presetName.

18.1.34 metadata as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the metadata to be written to the output file by the export session.

18.1.35 outputFileExtension as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Convenience method to query the preferred file extension for current output file type.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
Var p as string = AVAssetExportSessionMBS.AVAssetExportPresetAppleM4VCellular
```

```
Var e as new AVAssetExportSessionMBS(a, p)
Var filetypes() as string = e.supportedFileTypes
e.outputFileType = FileTypes(0)

// shows the output file extension
MessageBox "outputFileExtension: "+e.outputFileExtension
```

18.1.36 setMetadata(items() as AVMetadataItemMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sets the metadata to be written to the output file by the export session.
Example:

```
Var e as AVAssetExportSessionMBS // your export session
Var asset as AVAssetMBS // your asset

// query metadata
Var a() as AVMetadataItemMBS = asset.metadata

// make new
Var m as new AVMutableMetadataItemMBS

// add common key with author
m.keySpace = AVFoundationMBS.AVMetadataKeySpaceCommon
m.key = AVFoundationMBS.AVMetadataCommonKeyAuthor
m.Value = "Hello World"

// append to array and use as metadata:
a.Add m
e.setMetadata a
```

Notes: If the array is empty, any existing metadata in the exported asset will be translated as accurately as possible into the appropriate metadata key space for the output file and written to the output.

18.1.37 supportedFileTypes as string()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The types of files the session can write. (read-only)
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
Var p as string = AVAssetExportSessionMBS.AVAssetExportPresetAppleM4VCellular
```

```
Var e as new AVAssetExportSessionMBS(a, p)
// shows supported file types
MessageBox join(e.supportedFileTypes, EndOfLine)
```

Notes: The types of files the session can write are determined by the asset and and export preset with which the session was initialized. If you need to determine the compatible file formats before initiating the export operation, use the determineCompatibleFileTypesWithCompletionHandler: method.

18.1.38 Properties

18.1.39 asset as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The asset with which the export session was initialized. (read-only)
Notes: (Read only property)

18.1.40 audioMix as AVAudioMixMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether non-default audio mixing is enabled for export, and supplies the parameters for audio mixing.
Notes: (Read and Write property)

18.1.41 audioTimePitchAlgorithm as String

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Indicates the processing algorithm used to manage audio pitch for scaled audio edits.
Notes: An exception (NSInvalidArgumentException) is raised if this property is set to a value other than the constants defined in Time_Pitch_Algorithm_Settings.

The default value is AVAudioTimePitchAlgorithmSpectral.
Available in OS X v10.9 and later.
(Read and Write property)

18.1.42 canPerformMultiplePassesOverSourceMediaData as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Determines whether the export session can perform multiple passes over the source media to achieve better results.
Notes: When the value for this property is true, the export session can produce higher quality results at the expense of longer export times. Setting this property to true may also require the export session to write temporary data to disk during the export. To control the location of temporary data, use the property directoryForTemporaryFiles.

The default value is false. Not all export session configurations can benefit from performing multiple passes over the source media. In these cases, setting this property to true has no effect.

This property cannot be set after the export has started.

Available in Mac OS X 10.10 and newer.
(Read and Write property)

18.1.43 customVideoCompositor as AVVideoCompositingMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Indicates the custom video compositor instance used, if any. (read-only)
Notes: The custom video compositor instance that is used during image generation is accessible via this property after the value of videoComposition is set to an AVVideoComposition instance that specifies a custom video compositor class. Any additional communication between the application and that instance of the custom video compositor, if any is required for configuration or other purposes, can only occur once that has happened.

If the value of videoComposition is changed from an AVVideoComposition that specifies a custom video compositor class to another instance of AVVideoComposition that specifies the same custom video compositor class, the instance of the custom video compositor that was previously created will receive the renderContextChanged: message and remain in use for subsequent image generation.

This property is nil if there is no video compositor, or if the internal video compositor is in use.
Available in OS X v10.9 and later.
(Read only property)

18.1.44 directoryForTemporaryFiles as FolderItem

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Specifies a directory that is suitable for containing temporary files generated during the export process.
Notes: AVAssetExportSession may need to write temporary files when configured in certain ways, such as

when canPerformMultiplePassesOverSourceMediaData is set to true. This property can be used to control where in the filesystem those temporary files are created. All temporary files will be deleted when the export is completed, is canceled, or fails.

When the value of this property is nil, the export session will choose a suitable location when writing temporary files. The default value is nil.

This property cannot be set after the export has started. The export will fail if the URL points to a location that is not a directory, does not exist, is not on the local file system, or if a file cannot be created in this directory (for example, due to insufficient permissions or sandboxing restrictions).

Available in Mac OS X 10.10 and newer.
(Read and Write property)

18.1.45 directoryForTemporaryFilesURL as String

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Specifies a directory that is suitable for containing temporary files generated during the export process.
Notes: AVAssetExportSession may need to write temporary files when configured in certain ways, such as when canPerformMultiplePassesOverSourceMediaData is set to true. This property can be used to control where in the filesystem those temporary files are created. All temporary files will be deleted when the export is completed, is canceled, or fails.

When the value of this property is empty, the export session will choose a suitable location when writing temporary files. The default value is nil.

This property cannot be set after the export has started. The export will fail if the URL points to a location that is not a directory, does not exist, is not on the local file system, or if a file cannot be created in this directory (for example, due to insufficient permissions or sandboxing restrictions).

Available in Mac OS X 10.10 and newer.
(Read and Write property)

18.1.46 error as NSErrorMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Describes the error that occurred if the export status is AVAssetExportSessionStatusFailed or AVAssetExportSessionStatusCancelled. (read-only)

Notes: If there is no error to report, the value of this property is nil.
(Read only property)

18.1.47 estimatedOutputFileLength as Int64

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Indicates the estimated size in bytes of the exported file. (read-only)
Notes: Available in OS X v10.9 and later.
(Read only property)

18.1.48 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.1.49 metadataItemFilter as AVMetadataItemFilterMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Specifies a filter object to be used during export to determine which metadata items should be transferred from the source asset.
Notes: If the value of this key is nil, no filter will be applied. This is the default.

The filter will not be applied to metadata set with via the metadata property. To apply the filter to metadata before it is set on the metadata property, see AVMetadataItem.

Available in OS X v10.9 and later.
(Read and Write property)

18.1.50 OutputFile as folderitem

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The file of the export session's output.
Notes: (Read and Write property)

18.1.51 outputFileType as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The type of file to be written by the session.
Notes: The value is a UTI string corresponding to the file type to use when writing the asset. For a list of constants specifying UTIs for standard file types, see AV Foundation Constants Reference.
(Read and Write property)

18.1.52 outputURL as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The URL of the export session's output.
Notes: (Read and Write property)

18.1.53 presetName as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The name of the preset with which the session was initialized. (read-only)
Notes: (Read only property)

18.1.54 progress as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The progress of the export on a scale from 0 to 1. (read-only)
Notes: A value of 0 means the export has not yet begun, 1 means the export is complete.
(Read only property)

18.1.55 shouldOptimizeForNetworkUse as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the movie should be optimized for network use.
Notes: (Read and Write property)

18.1.56 status as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The status of the export session. (read-only)
Notes: (Read only property)

18.1.57 videoComposition as AVVideoCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether video composition is enabled for export, and supplies the instructions for video composition.
Notes: (Read and Write property)

18.1.58 timeRange as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time range to be exported from the source.
Example:

```
Var a as AVAssetMBS // your asset to export
Var preset as string = AVAssetExportSessionMBS.AVAssetExportPresetPassthrough // your settings
Var e as new AVAssetExportSessionMBS(a, preset)

Var t as CMTimeMBS = CMTimeMBS.MakeWithSeconds(5) // start at 5
Var d as CMTimeMBS = CMTimeMBS.MakeWithSeconds(10) // duration 10
Var r as CMTimeRangeMBS = CMTimeRangeMBS.Make(t,d)

e.timeRange = r // or your time range!
e.shouldOptimizeForNetworkUse = true

Var filetypes() as string = e.supportedFileTypes
e.outputFileType = FileTypes(0)
e.OutputFile = SpecialFolder.Desktop.Child("test."+e.outputFileExtension)

e.exportAsynchronously(nil)

// keep e and check for events

// or instead of waiting for event, we simply wait for it to finish
do
app.YieldToNextThread
loop until e.status <>e.AVAssetExportSessionStatusExporting
```

Notes: The default time range of an export session is kCMTimeZero to kCMTimePositiveInfinity, meaning that (modulo a possible limit on file length) the full duration of the asset will be exported.
(Read and Write computed property)

18.1.59 Constants

Status Constants

Constant	Value	Description
AVAssetExportSessionStatusCancelled	5	Indicates that the export session was cancelled.
AVAssetExportSessionStatusCompleted	3	Indicates that the export session completed successfully.
AVAssetExportSessionStatusExporting	2	Indicates that the export session is in progress.
AVAssetExportSessionStatusFailed	4	Indicates that the export session failed.
AVAssetExportSessionStatusUnknown	0	Indicates that the status is unknown.
AVAssetExportSessionStatusWaiting	1	Indicates that the session is waiting to export more data.

18.2 class AVAssetImageGeneratorMBS

18.2.1 class AVAssetImageGeneratorMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVAssetImageGenerator object provides thumbnail or preview images of assets independently of playback.
Example:

```
// get a thumbnail picture of a video at 5 seconds
Var file As FolderItem = SpecialFolder.Movies.Child("test.mov")
Var asset As AVAssetMBS = AVAssetMBS.assetWithFile(file)

Var generator As New AVAssetImageGeneratorMBS(asset)
generator.appliesPreferredTrackTransform = True // respect rotation

Var actualTime As CMTimeMBS
Var error As NSErrorMBS
Var image As CGImageMBS = generator.CGImageAtTime(CMTimeMBS.MakeWithSeconds(5), actual-
Time, error)

If image <>Nil Then
Var pic As Picture = image.Picture
// show pic in a Canvas or ImageViewer
ElseIf error <>Nil Then
MessageBox error.localizedDescription
End If
```

Notes: AVAssetImageGenerator uses the default enabled video track(s) to generate images. Generating a single image in isolation can require the decoding of a large number of video frames with complex interdependencies. If you require a series of images, you can achieve far greater efficiency using the asynchronous method, CGImageAtTime, which employs decoding efficiencies similar to those used during playback.

You create an asset generator using initWithAsset: or assetImageGeneratorWithAsset. These methods may succeed even if the asset possesses no visual tracks at the time of initialization. You can test whether an asset has any tracks with the visual characteristic using tracksWithMediaCharacteristic (AVAsset).

The actual time of a generated image is within the range [requestedTime-requestedTimeToleranceBefore, requestedTime+requestedTimeToleranceAfter] and may differ from the requested time for efficiency.

Assets that represent mutable compositions or mutable movies may gain visual tracks after initialization of an associated image generator.
Xojo Developer Magazine

- 12.2, page 45: Moving to AVFoundation, Leaving QuickTime behind by Christian Schmitz

18.2.2 Methods

18.2.3 assetImageGeneratorWithAsset(asset as AVAssetMBS) as AVAssetImageGeneratorMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an image generator for use with a specified asset.
Notes: asset: The asset from which images will be extracted.

Returns an image generator for use with asset.
This method may succeed even if the asset possesses no visual tracks at the time of initialization.

18.2.4 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.2.5 AVAssetImageGeneratorApertureModeCleanAperture as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to specify the aperture mode.
Notes: Both pixel aspect ratio and clean aperture will be applied..

18.2.6 AVAssetImageGeneratorApertureModeEncodedPixels as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to specify the aperture mode.
Notes: Neither pixel aspect ratio nor clean aperture will be applied.

18.2.7 AVAssetImageGeneratorApertureModeProductionAperture as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to specify the aperture mode.
Notes: Only pixel aspect ratio will be applied.

18.2.8 cancelAllCGImageGeneration

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Cancels all pending image generation requests.
Notes: This method calls the AVFoundationMBS.generateCGImagesAsynchronouslyForTimesCompleted event with AVAssetImageGeneratorCancelled for each image time in every previous invocation of generateCGImagesAsynchronouslyForTimes for which images have not yet been supplied.

18.2.9 CGImageAtTime(time as CMTimeMBS, byref actualTime as CMTimeMBS, byref error as NSErrorMBS) as Variant

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a CGImage for the asset at or near a specified time.
Example:

```
// open asset
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
Var a as AVAssetMBS = AVAssetMBS.assetWithFile(f)

// prepare generator
Var g as new AVAssetImageGeneratorMBS(a)
Var timeRequested as CMTimeMBS = CMTimeMBS.MakeWithSeconds(5, 30)
Var actualTime as CMTimeMBS
Var error as NSErrorMBS
// ask for an image
Var c as CGImageMBS = g.CGImageAtTime(timeRequested, actualTime, error)
// and show it
Var p as Picture = c.Picture
Window1.backdrop = p
```

Notes: requestedTime: The time at which the image of the asset is to be created.
actualTime: Upon return, contains the time at which the image was actually generated.
Error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns a CGImageMBS for the asset at or near a specified time, or nil if the image could not be created.
This method returns the image synchronously.

18.2.10 Constructor(asset as AVAssetMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes an image generator for use with a specified asset.

Notes: asset: The asset from which images will be extracted.
This method may succeed even if the asset possesses no visual tracks at the time of initialization.

18.2.11 generateCGImagesAsynchronouslyForTimes(times() as CMTimeMBS, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a series of CGImage objects for an asset at or near specified times.
Notes: requestedTimes: An array of CMTimeMBS, specifying the asset times at which an image is requested.

This method uses an efficient "batch mode" to get images in time order.

The client receives exactly one event call to AVFoundationMBS.generateCGImagesAsynchronouslyForTimesCompleted for each requested time in requestedTimes. Changes to the generator's properties (snap behavior, maximum size, and so on) do not affect pending asynchronous image generation requests.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

18.2.12 Properties

18.2.13 apertureMode as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Specifies the aperture mode for the generated image.
Notes: (Read and Write property)

18.2.14 appliesPreferredTrackTransform as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Specifies whether to apply the track matrix (or matrices) when extracting an image from the asset.
Notes: The default is false. AVAssetImageGenerator only supports rotation by 90, 180, or 270 degrees.
This property is ignored if you set a value for the videoComposition property.
(Read and Write property)

18.2.15 asset as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The asset with which the export session was initialized. (read-only)
Notes: Available in OS X v10.8 and later.
(Read only property)

18.2.16 customVideoCompositor as AVVideoCompositingMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Indicates the custom video compositor instance used, if any. (read-only)
Notes: The custom video compositor instance that is used during image generation is accessible via this property after the value of videoComposition is set to an AVVideoComposition instance that specifies a custom video compositor class. Any additional communication between the application and that instance of the custom video compositor, if any is required for configuration or other purposes, can only occur once that has happened.

If the value of videoComposition is changed from an AVVideoComposition that specifies a custom video compositor class to another instance of AVVideoComposition that specifies the same custom video compositor class, the instance of the custom video compositor that was previously created will receive the renderContextChanged message and remain in use for subsequent image generation.

This property is nil if there is no video compositor, or if the internal video compositor is in use.
Available in OS X v10.9 and later.
(Read only property)

18.2.17 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.2.18 videoComposition as AVVideoCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The video composition to use when extracting images from assets with multiple video tracks.
Notes: If no video composition is specified, only the first enabled video track will be used. If a video composition is specified, the appliesPreferredTrackTransform property is ignored.

(Read and Write property)

18.2.19 maximumSize as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Specifies the maximum dimensions for generated image.
Notes: The default value is CGSizeZero, which specifies the asset's unscaled dimensions.

AVAssetImageGenerator scales images such that they fit within the defined bounding box. Images are never scaled up. The aspect ratio of the scaled image is defined by the apertureMode property.
(Read and Write computed property)

18.2.20 requestedTimeToleranceAfter as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The maximum length of time after a requested time for which an image may be generated.
Notes: The default value is kCMTimePositiveInfinity.

Set the values of requestedTimeToleranceBefore and requestedTimeToleranceAfter to kCMTimeZero to request frame-accurate image generation; this may incur additional decoding delay.
(Read and Write computed property)

18.2.21 requestedTimeToleranceBefore as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The maximum length of time before a requested time for which an image may be generated.
Notes: The default value is kCMTimePositiveInfinity.

Set the values of requestedTimeToleranceBefore and requestedTimeToleranceAfter to kCMTimeZero to request frame-accurate image generation; this may incur additional decoding delay.
(Read and Write computed property)

18.2.22 Constants

Result Constants

Constant	Value	Description
AVAssetImageGeneratorCancelled	2	Indicates that generation was cancelled.
AVAssetImageGeneratorFailed	1	Indicates that generation failed.
AVAssetImageGeneratorSucceeded	0	Indicates that generation succeeded.

18.3 class AVAssetMBS

18.3.1 class AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVAsset is an abstract class to represent timed audiovisual media such as videos and sounds.
Example:

```
// show the duration, tracks and title of a movie file
Var asset As AVAssetMBS = AVAssetMBS.assetWithFile(SpecialFolder.Desktop.Child("movie.mov"))
Var lines() As String
lines.Add "Duration: " + Format(asset.duration.Seconds, "0.0") + " seconds, playable: " + asset.isPlayable.ToString

For Each track As AVAssetTrackMBS In asset.tracks
lines.Add "Track " + track.trackID.ToString + ": " + track.mediaType
Next
For Each item As AVMetadataItemMBS In asset.commonMetadata
If item.commonKey = AVFoundationMBS.AVMetadataCommonKeyTitle Then lines.Add "Title: " + item.stringValue
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Each asset contains a collection of tracks that are intended to be presented or processed together, each of a uniform media type, including but not limited to audio, video, text, closed captions, and subtitles.

An AVAsset object defines the collective properties of the tracks that comprise the asset. (You can access the instances of AVAssetTrack representing tracks of the collection, so you can examine each of these independently if you need to.) You often instantiate an asset using a concrete subclass of AVAsset; for example, you can initialize an instance of AVURLAsset using an URL that refers to an audiovisual media file, such as a QuickTime movie file or an MP3 files (amongst other types). You can also instantiate an asset using other concrete subclasses that extend the basic model for audiovisual media in useful ways, as AVComposition does for temporal editing. To assemble audiovisual constructs from one or more source assets, you can insert assets into instances of AVMutableComposition.

You often instantiate an asset using AVURLAsset—a concrete subclass of AVAsset—with URLs that refer to audiovisual media resources, such as streams (including HTTP live streams), QuickTime movie files, MP3 files, and files of other types. You can also instantiate an asset using other concrete subclasses that extend the basic model for audiovisual media in useful ways, as AVComposition does for temporal editing.

Properties of assets as a whole are defined by AVAsset. Additionally, references to instances of AVAssetTrack representing tracks of the collection can be obtained, so that each of these can be examined independently.

Because of the nature of timed audiovisual media, upon successful initialization of an asset some or all of the values for its keys may not be immediately available. The value of any key can be requested at any

time, and asset will always return its value synchronously, although it may have to block the calling thread in order to do so. In order to avoid blocking, you can register your interest in particular keys and to become notified when their values become available. For further details, see AVAsynchronousKeyValueLoading.

To play an instance of AVAsset, initialize an instance of AVPlayerItem with it, use the player item tem to set up its presentation state (such as whether only a limited timeRange of the asset should be played, etc.), and provide the player item to an AVPlayer object according to whether the items is to be played by itself or together with a collection of other items.

You can insert AVAsset objects can also be inserted into an AVMutableComposition object in order to assemble audiovisual constructs from one or more source assets.

Subclassing Notes
It is not currently possible to subclass AVAsset to handle streaming protocols or file formats that are not supported by the framework.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.3.2 Methods

18.3.3 assetWithData(Data as MemoryBlock, Options as Dictionary = nil) as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMovie object from a movie header stored in an data parameter.
Notes: data: An Memoryblock/String containing a movie header. We make a copy of that.
options: Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.
Returns An AVMovie object or nil in case of error.

You can use this method to operate on movie headers that are not stored in files; this might include movie headers on the pasteboard (which do not contain media data). In general you should avoid loading an entire movie file with its media data into an instance of Memoryblock/String! By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.
See also:

- 18.3.4 assetWithData(Data as String, Options as Dictionary = nil) as AVAssetMBS 3412

18.3.4 assetWithData(Data as String, Options as Dictionary = nil) as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates an AVMovie object from a movie header stored in an data parameter.
Example:

```
// load movie in memory
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var b as BinaryStream = BinaryStream.Open(f)

// now open it from memory
Var s as string = b.Read(b.Length)
Var m as AVAssetMBS = AVAssetMBS.movieWithData(s)

MessageBox str(m.duration.Seconds)+" seconds."
```

Notes: data: An Memoryblock/String containing a movie header. We make a copy of that.
options: Dictionary object that contains keys for specifying options for the initialization of the AVMovie object. Currently no keys are defined.
Returns An AVMovie object or nil in case of error.
You can use this method to operate on movie headers that are not stored in files; this might include movie headers on the pasteboard (which do not contain media data). In general you should avoid loading an entire movie file with its media data into an instance of Memoryblock/String! By default, the defaultMediaDataStorage property will be nil and each associated AVMovieTrack's mediaDataStorage property will be nil.
If you want to create an AVMutableMovie from an NSData object and then append sample buffers to any of its tracks, you must first set one of these properties to indicate where the sample data should be written.
See also:

- 18.3.3 assetWithData(Data as MemoryBlock, Options as Dictionary = nil) as AVAssetMBS 3411

18.3.5 assetWithFile(file as folderitem) as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an asset for inspection of a media resource.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
Var a as AVAssetMBS = AVAssetMBS.assetWithFile(f)

MessageBox str(a.duration.Seconds)+" seconds"
```

18.3.6 assetWithURL(URL as string) as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an asset for inspection of a media resource.

18.3.7 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.3.8 availableChapterLocales as NSLocaleMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The locales available for chapters in the asset. (read-only)

18.3.9 availableMediaCharacteristicsWithMediaSelectionOptions as string()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An array of media characteristics for which a media selection option is available. (read-only)
Notes: The value of this property is an array of strings, each string indicating a media characteristic for which a media selection option is available.

18.3.10 availableMetadataFormats as string()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An array of strings, each representing a metadata format that's available to the asset. (read-only)
Notes: Metadata formats may include ID3, iTunes metadata, and so on. For more details, see AVMetadataItem.

18.3.11 cancelLoading

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Cancels the loading of all values for all observers.
Notes: Deallocation of an instance of the asset will implicitly invoke this method if any loading requests are still outstanding.

18.3.12 chapterMetadataGroupsBestMatchingPreferredLanguages as AVTimedMetadataGroupMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an array of chapters whose locale best matches the list of preferred languages.
Notes: preferredLanguages: Optional, an array of strings, each of which contains a canonicalized IETF BCP 47 language identifier. The order of the identifiers in the array reflects the preferred language order, with the most preferred language being first in the array. Typically, you pass the user's preferred languages by retrieving this array from the preferredLanguages class method of NSLocale. If you don't pass an array, the plugin automatically passes NSLocaleMBS.preferredLanguages.

Returns an array of AVTimedMetadataGroup objects.

Each object in the returned array contains an AVMetadataItem object representing the chapter title. The time range property of the AVTimedMetadataGroup object is equal to the time range of the chapter title item.

All of the available chapter metadata is included in the metadata groups, including items with the common key AVMetadataCommonKeyArtwork, if such items are present. Items not carrying chapter titles are added to an existing AVTimedMetadataGroup object if the time range (timestamp and duration) of the metadata item and that of the metadata group overlaps. The locale of such items need not match the locale of the chapter titles.

You can use the metadataItemsFromArray:filteredAndSortedAccordingToPreferredLanguages: method to further filter the metadata items in each group. You can also filter the returned items based on locale using the metadataItemsFromArray:withLocale: method.

Special Considerations

Becomes callable without blocking when the data in the availableChapterLocales property is already loaded.
See also:

- 18.3.13 chapterMetadataGroupsBestMatchingPreferredLanguages(preferredLanguages() as string) as AVTimedMetadataGroupMBS() 3415

18.3.13 chapterMetadataGroupsBestMatchingPreferredLanguages(preferredLanguages() as string) as AVTimedMetadataGroupMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an array of chapters whose locale best matches the list of preferred languages.
Notes: preferredLanguages: Optional, an array of strings, each of which contains a canonicalized IETF BCP 47 language identifier. The order of the identifiers in the array reflects the preferred language order, with the most preferred language being first in the array. Typically, you pass the user's preferred languages by retrieving this array from the preferredLanguages class method of NSLocale. If you don't pass an array, the plugin automatically passes NSLocaleMBS.preferredLanguages.

Returns an array of AVTimedMetadataGroup objects.

Each object in the returned array contains an AVMetadataItem object representing the chapter title. The time range property of the AVTimedMetadataGroup object is equal to the time range of the chapter title item.

All of the available chapter metadata is included in the metadata groups, including items with the common key AVMetadataCommonKeyArtwork, if such items are present. Items not carrying chapter titles are added to an existing AVTimedMetadataGroup object if the time range (timestamp and duration) of the metadata item and that of the metadata group overlaps. The locale of such items need not match the locale of the chapter titles.

You can use the metadataItemsFromArray:filteredAndSortedAccordingToPreferredLanguages: method to further filter the metadata items in each group. You can also filter the returned items based on locale using the metadataItemsFromArray:withLocale: method.

Special Considerations
Becomes callable without blocking when the data in the availableChapterLocales property is already loaded.
See also:

- 18.3.12 chapterMetadataGroupsBestMatchingPreferredLanguages as AVTimedMetadataGroupMBS() 3414

18.3.14 chapterMetadataGroupsWithTitleLocale(locale as NSLocaleMBS, commonKeys() as string) as AVTimedMetadataGroupMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an array of chapters with a given title locale and containing specified keys.
Notes: locale: The locale of the metadata items carrying chapter titles to be returned (the method supports the IETF BCP 47 specification of locales).
commonKeys: An array of common keys of AVMetadataItem to include in the returned array. AVMetadataCommonKeyArtwork is the only supported key.

Returns an array of AVTimedMetadataGroup objects.

Each object in the returned array contains an AVMetadataItem object representing the chapter title, and the time range property of the AVTimedMetadataGroup object is equal to the time range of the chapter title item.

An AVMetadataItem with the specified common key is added to an existing AVTimedMetadataGroup object if the time range (timestamp and duration) of the metadata item and the metadata group overlap.

The locale of items not carrying chapter titles need not match the specified locale parameter. You can filter the returned items based on locale using metadataItemsFromArray.

18.3.15 commonMetadata as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An array of metadata items for each common metadata key for which a value is available. (read-only)
Notes: The value is an array of AVMetadataItem objects, one for each common metadata key for which a value is available. You can filter the array by locale using metadataItemsFromArray (AVMetadataItem) or by key using metadataItemsFromArray (AVMetadataItem).

18.3.16 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.3.17 copy as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

18.3.18 duration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The duration of the asset. (read-only)
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
Var a as AVAssetMBS = AVAssetMBS.assetWithFile(f)

MessageBox str(a.duration.Seconds)+" seconds"
```

Notes: If providesPreciseDurationAndTiming is false, a best-available estimate of the duration is returned. You can set the degree of precision required for timing-related properties at initialization time for assets initialized with URLs (see AVURLAssetPreferPreciseDurationAndTimingKey in AVURLAsset).

18.3.19 loadValuesAsynchronouslyForKeys(keys() as string, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Tells the asset to load the values of any of the specified keys that are not already loaded.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var a as AVAssetMBS = AVAssetmbs.assetWithFile(f)

if a = nil then
MessageBox "failed to read file at all"
Return
end if

// request duration property
a.loadValuesAsynchronouslyForKeys array("duration")

Var e as NSErrorMBS
Var Status as Integer = a.statusOfValueForKey("duration", e)
while status <a.AVKeyValueStatusLoaded
// wait for loading in background
```

```
status = a.statusOfValueForKey("duration", e)
wend

// got it?
if status <>a.AVKeyValueStatusLoaded then
MessageBox "Failed to load duration."
if e <>nil then
MessageBox e.LocalizedDescription
end if

else
MessageBox str(a.duration.Seconds)+" seconds long."
end if
```

Notes: keys: An array containing the required keys.

Calls AVFoundationMBS.AssetLoadValuesAsynchronouslyForKeysFinished on completion.
The completion event will be invoked exactly once per invocation of this method:

- Synchronously if an I/O error or other format-related error occurs immediately.
- Asynchronously at a subsequent time if a loading error occurs at a later stage of processing, or if cancelLoading is invoked on an AVAsset instance.

The completion states of the keys you specify in keys are not necessarily the same—some may be loaded, and others may have failed. You must check the status of each key individually.

If you want to receive error reporting for loading that's still pending, you can call this method at any time—even after an asset has begun to load data for operations in progress or already completed. If a fatal error has already occurred, the completion event is invoked synchronously.

18.3.20 mediaSelectionGroupForMediaCharacteristic(mediaCharacteristic as string) as AVMediaSelectionGroupMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an AVMediaSelectionGroup object that contains one or more options with the specified media characteristic.
Notes: mediaCharacteristic: A media characteristic for which you wish to obtain the available media selection options.
Only AVMediaCharacteristicAudible and AVMediaCharacteristicLegible are currently supported.
Pass AVMediaCharacteristicAudible to obtain the group of available options for audio media in various languages and for various purposes, such as descriptive audio.

Pass AVMediaCharacteristicLegible to obtain the group of available options for subtitles in various languages and for various purposes.

Returns an AVMediaSelectionGroup object that contains one or more options with the media characteristic specified by mediaCharacteristic, or nil if none could be found.

You can invoke this method without blocking when the key availableMediaCharacteristicsWithMediaSelectionOptions has been loaded.
You can filter the options in the returned media selection group according to playability, locale, and additional media characteristics can be accomplished using the filtering methods defined in the AVMediaSelectionGroup class.

18.3.21 metadata as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Provides access to an array of AVMetadataItems for all metadata identifiers for which a value is available.
Example:

```
// load file and look for cover art

Var file As FolderItem = SpecialFolder.Desktop.Child("test.m4a")
Var a As AVURLAssetMBS = AVURLAssetMBS.URLAssetWithFile(file)

Var iTunesMetadataKeyCoverArtString As String = AVFoundationMBS.AVMetadataiTunesMetadataKeyCoverArt
Var iTunesMetadataKeyCoverArtNumber As Integer = OSTypeFromStringMBS(iTunesMetadataKeyCoverArtString)

Var items() As AVMetadataItemMBS = a.metadata

For Each item As AVMetadataItemMBS In items

Var key As Variant = item.key
Var Val As Variant = item.value

If key.IntegerValue = iTunesMetadataKeyCoverArtNumber Or key.StringValue = iTunesMetadataKeyCoverArtString Then

Var v As MemoryBlock = Val
Window1.Backdrop = picture.FromData(v)
End If

Next
```

Notes: Available in Mac OS X 10.10.

18.3.22 metadataForFormat(Format as string) as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an array of AVMetadataItem objects, one for each metadata item in the container of the specified format.
Notes: format: The metadata format for which you want items.

Returns an array of AVMetadataItem objects, one for each metadata item in the container of the specified format, or nil if there is no metadata of the specified format.

You can filter the array by locale using metadataItemsFromArray (AVMetadataItem) or by key using metadataItemsFromArray (AVMetadataItem).
Becomes callable without blocking when availableMetadataFormats has been loaded.

18.3.23 naturalSize as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The encoded or authored size of the visual portion of the asset.

18.3.24 preferredTransform as CGAffineTransformMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The preferred transform to apply to the visual content of the asset for presentation or processing. (read-only)
Notes: The value is often, but not always, the identity transform.

18.3.25 readTimeCodeObjects as AVTimeCodeMBS()

MBS AVFoundation Plugin, Plugin Version: 17.5, Platform: macOS, Targets: All.

Function: Reads time codes from asset.
Notes: Raises exception if not possible.
Returns empty array if nothing found.

Provides details on time codes.

18.3.26 readTimeCodes as String()

MBS AVFoundation Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Reads time codes from asset.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
Var timecodes() as string = a.readTimeCodes

break // see in debugger
```

Notes: Raises exception if not possible.
Returns empty array if nothing found.

Format is 2 digit hours, double colon, 2 digit minutes, double colon, 2 digit seconds, double colon, 2 digit frames.
e.g. "01:02:03:04"

Please use readTimeCodeObjects for more options.

18.3.27 statusOfValueForKey(key as string, byref error as NSErrorMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Reports whether the value for a given key is immediately available without blocking. (required)
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var a as AVAssetMBS = AVAssetmbs.assetWithFile(f)

if a = nil then
MessageBox "failed to read file at all"
Return
end if

// request duration property
a.loadValuesAsynchronouslyForKeys array("duration")
```

```
Var e as NSErrorMBS
Var Status as Integer = a.statusOfValueForKey("duration", e)
while status <a.AVKeyValueStatusLoaded
// wait for loading in background
status = a.statusOfValueForKey("duration", e)
wend

// got it?
if status <>a.AVKeyValueStatusLoaded then
MessageBox "Failed to load duration."
if e <>nil then
MessageBox e.LocalizedDescription
end if

else
MessageBox str(a.duration.Seconds)+" seconds long."
end if
```

Notes: key: The key whose status you want.
error: If the status of the value for the key is AVKeyValueStatusFailed, upon return contains an NSError object that describes the failure that occurred.

Returns the current loading status of the value for key. For possible values, see "Protocol Methods."

You use this method to determine the availability of the value for a key. This method does not cause an asset to load the value of a key that's not yet available. To request values for keys that may not already be loaded without blocking, use loadValuesAsynchronouslyForKeys and wait for invocation of the completion handler to be informed of availability.

18.3.28 trackGroups as AVAssetTrackGroupMBS()

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: An array containing all of the track groups in the asset. (read-only)
Notes: This is an array of AVAssetTrackGroup instances, each representing a different grouping of tracks in the asset.
Available in OS X v10.9 and later.

18.3.29 tracks as AVAssetTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The tracks contained by the asset. (read-only)

Notes: Tracks are instances of AVAssetTrack.

18.3.30 tracksWithMediaCharacteristic(mediaCharacteristic as string) as AVAssetTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an array of AVAssetTrack objects of the asset that present media with a specified characteristic.
Notes: mediaCharacteristic: The media characteristic according to which receiver filters its asset tracks.
Return san array of AVAssetTrack objects that present media with mediaCharacteristic, or nil if no tracks with the specified characteristic are available.
You can call this method without blocking when tracks has been loaded.

18.3.31 tracksWithMediaType(mediaType as string) as AVAssetTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an array of the asset tracks of the asset that present media of a specified type.
Notes: mediaType: The media type according to which the asset filters its tracks.
Media types are defined in AVAssetTrack.

Returns an array of AVAssetTrack objects of the asset that present media of mediaType.
You can call this method without blocking when tracks has been loaded.

18.3.32 trackWithTrackID(PersistentTrackID as Integer) as AVAssetTrackMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the track with a specified track ID.
Notes: trackID: The trackID of the requested asset track.

Returns the track with track ID trackID, or nil if no track with the specified ID is available.
You can call this method without blocking when tracks has been loaded.

18.3.33 unusedTrackID as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an ID that is currently unused by any of the tracks in the asset.

18.3.34 Properties

18.3.35 ClassName as String

MBS AVFoundation Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Returns the class name for the Objective-C class.
Notes: Sometimes useful for debugging.
(Read only property)

18.3.36 creationDate as AVMetadataItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the creation date of the asset. (read-only)
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
Var a as AVAssetMBS = AVAssetMBS.assetWithFile(f)

Var creationDate as date = a.creationDate.dateValue
MessageBox creationDate.LongDate + " " + creationDate.LongTime
```

Notes: The value of this property may be nil.

If a creation date has been stored by the asset in a form that can be converted to an Date object, the dateValue property of the metadata item will provide an instance of NSDate. Otherwise the creation date is available only as a string value, using the AVMetadataItem stringValue method.
(Read only property)

18.3.37 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.3.38 hasProtectedContent as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the asset has protected content. (read-only)
Notes: (Read only property)

18.3.39 isComposable as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the asset can be used within a segment of an AVCompositionTrack object. (read-only)
Notes: (Read only property)

18.3.40 isExportable as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the asset can be exported using AVAssetExportSession. (read-only)
Notes: (Read only property)

18.3.41 isPlayable as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the asset, or its URL, can be used to initialize an instance of AVPlayerItem. (read-only)
Notes: (Read only property)

18.3.42 isReadable as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the asset's media data can be extracted using AVAssetReader. (read-only)
Notes: (Read only property)

18.3.43 lyrics as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The lyrics of the asset suitable for the current locale. (read-only)
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
Var a as AVAssetMBS = AVAssetMBS.assetWithFile(f)

MessageBox "Lyrics: "+a.lyrics
```

Notes: (Read only property)

18.3.44 preferredRate as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The natural rate at which the asset is to be played. (read-only)
Notes: This value is often, but not always, 1.0.
(Read only property)

18.3.45 preferredVolume as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The preferred volume at which the audible media of asset is to be played. (read-only)
Notes: This value is often, but not always, 1.0.
(Read only property)

18.3.46 providesPreciseDurationAndTiming as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the asset provides precise timing. (read-only)
Example:

```
Var options as new Dictionary
options.value(AVFoundationMBS.AVURLAssetPreferPreciseDurationAndTimingKey) = true
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
Var a as AVAssetMBS = AVURLAssetMBS.URLAssetWithFile(f, options)

MessageBox str(a.duration.Seconds)+" seconds with precision: "+str(a.providesPreciseDurationAndTiming)
```

Notes: You can set the degree of precision required for timing-related properties at initialization time for assets initialized with URLs (see AVURLAssetPreferPreciseDurationAndTimingKey in AVURLAsset).

(Read only property)

18.3.47 referenceRestrictions as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The reference restrictions being used by the receiver. (read-only)
Notes: For AVURLAsset, this property reflects the value passed in for AVURLAssetReferenceRestrictionsKey, if any.

The default value for this property is AVAssetReferenceRestrictionForbidNone. See AVURLAssetReferenceRestrictionsKey for a full discussion of reference restrictions.
(Read only property)

18.3.48 Constants

Reference Restriction Modes

Constant	Value	Description
AVAssetReferenceRestrictionForbidAll	&hFFFF	Indicates that only references to media data sto file should be allowed.
AVAssetReferenceRestrictionForbidCrossSiteReference	4	Indicates that references from a remote asset a different site should not be followed.
AVAssetReferenceRestrictionForbidLocalReferenceToLocal	8	Indicates that references from a local asset to the asset's container file should not be followed
AVAssetReferenceRestrictionForbidLocalReferenceToRemote	2	Indicates that references from a local asset to be followed.
AVAssetReferenceRestrictionForbidNone	0	Indicates that all types of references should be
AVAssetReferenceRestrictionForbidRemoteReferenceToLocal	1	Indicates that references from a remote asset (URL) to local media data (for example, store followed.

Load Status Constants

Constant	Value	Description
AVKeyValueStatusCancelled	4	Indicates that the attempt to load the property was cancelled.
AVKeyValueStatusFailed	3	Indicates that the attempt to load the property failed.
AVKeyValueStatusLoaded	2	Indicates that the property is ready for use.
AVKeyValueStatusLoading	1	Indicates that the property is not fully loaded.
AVKeyValueStatusUnknown	0	Indicates that the property status is unknown.

18.4 class AVAssetReaderAudioMixOutputMBS

18.4.1 class AVAssetReaderAudioMixOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVAssetReaderAudioMixOutput is a concrete subclass of AVAssetReaderOutput that defines an interface for reading audio samples that result from mixing the audio from one or more tracks of an AVAssetReader object's asset.
Example:

```
// read the audio of all audio tracks of a movie mixed together as 16-bit PCM
Var asset As AVAssetMBS = AVAssetMBS.assetWithFile(SpecialFolder.Desktop.Child("movie.mov"))
Var tracks() As AVAssetTrackMBS = asset.tracksWithMediaType(AVFoundationMBS.AVMediaTypeAu-
dio)
If tracks.Count = 0 Then Return

Var settings As New Dictionary
settings.Value(AVFoundationMBS.AVFormatIDKey) = OSTypeFromStringMBS("lpcm")
settings.Value(AVFoundationMBS.AVLinearPCMBitDepthKey) = 16

Var error As NSErrorMBS
Var reader As New AVAssetReaderMBS(asset, error)
Var output As New AVAssetReaderAudioMixOutputMBS(tracks, settings)
reader.addOutput output
reader.startReading

Var bytes As Integer
While reader.status = AVAssetReaderMBS.AVAssetReaderStatusReading
Var buffer As CMSampleBufferMBS = output.NextSampleBuffer
If buffer = Nil Then Exit
bytes = bytes + buffer.TotalSampleSize
Wend
MessageBox bytes.ToString + " bytes of PCM audio"
```

Notes: You can read the audio data mixed from one or more asset tracks by adding an instance of AVAssetReaderAudioMixOutput to an asset reader using addOutput. The samples can be read in a default format or can be converted to a different format.
Subclass of the AVAssetReaderOutputMBS class.

18.4.2 Methods

18.4.3 assetReaderAudioMixOutputWithAudioTracks(audioTracks() as AVAssetTrackMBS, outputSettings as dictionary) as AVAssetReaderAudioMixOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an instance of AVAssetReaderAudioMixOutput for reading mixed audio from the specified audio tracks, with optional audio settings.
Notes: audioTracks: An array of AVAssetTrack objects from which the created object should read sample buffers to be mixed.
Each track must be one of the tracks owned by the target AVAssetReader object's asset and must be of media type AVMediaTypeAudio.
audioSettings: The audio settings to be used for audio output; the dictionary must contain values for keys in AVAudioSettings.h (linear PCM only). Pass nil if you want to receive decoded samples in a convenient uncompressed format, with properties determined according to the properties of the specified audio tracks.

Returns an instance of AVAssetReaderAudioMixOutput for reading mixed audio from audioTracks, with audio settings specified by audioSettings.
Initialization will fail if audioSettings cannot be used with audioTracks.

18.4.4 audioSettings as dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The audio settings used for audio output. (read-only)
Notes: The dictionary must contain values for keys in AVAudioSettings.h (linear PCM only).
nil indicates that the samples will be returned in the default format.

18.4.5 audioTracks as AVAssetTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The tracks from which the receiver reads mixed audio. (read-only)
Notes: The value is an array of AVAssetTrack objects owned by the target AVAssetReader object's asset.

18.4.6 Constructor(audioTracks() as AVAssetTrackMBS, outputSettings as dictionary)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes an instance of AVAssetReaderAudioMixOutput for reading mixed audio from the specified audio tracks, with optional audio settings.
Notes: audioTracks: An array of AVAssetTrack objects from which the created object should read sample buffers to be mixed.
Each track must be one of the tracks owned by the target AVAssetReader object's asset and must be of media type AVMediaTypeAudio.
audioSettings: The audio settings to be used for audio output; the dictionary must contain values for keys in AVAudioSettings.h (linear PCM only).
Pass nil if you want to receive decoded samples in a convenient uncompressed format, with properties determined according to the properties of the specified audio tracks.

Returns an instance of AVAssetReaderAudioMixOutput initialized for reading mixed audio from audioTracks, with audio settings specified by audioSettings.

Initialization will fail if audioSettings cannot be used with audioTracks. So please check handle property.

18.4.7 Properties

18.4.8 audioMix as AVAudioMixMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The output's audio mix.
Notes: You use the audio mix to specify how the volume of audio samples read from each source track will change over the timeline of the source asset.
(Read and Write property)

18.4.9 audioTimePitchAlgorithm as String

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The processing algorithm used to manage audio pitch for scaled audio edits.
Notes: The supported constants are defined in Time Pitch Algorithm Settings.
An NSInvalidArgumentException will be raised if this property is set to a value other than the defined constants.
Available in OS X v10.9 and later.
(Read and Write property)

18.5 class AVAssetReaderMBS

18.5.1 class AVAssetReaderMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use an AVAssetReader object to obtain media data of an asset, whether the asset is file-based or represents an assemblage of media data from multiple sources (as with an AVComposition object).
Example:

```
// read all audio samples of a movie file and count them
Var file As FolderItem = SpecialFolder.Desktop.Child("test.mov")
Var asset As AVAssetMBS = AVAssetMBS.assetWithFile(file)
Var tracks() As AVAssetTrackMBS = asset.tracksWithMediaType(AVFoundationMBS.AVMediaTypeAu-
dio)
If tracks.Count = 0 Then
MessageBox "No audio track."
Return
End If

Var error As NSErrorMBS
Var reader As New AVAssetReaderMBS(asset, error)
If error <>Nil Then
MessageBox error.localizedDescription
Return
End If

// Nil for output settings gives the samples as stored in the file
Var output As New AVAssetReaderTrackOutputMBS(tracks(0), Nil)
reader.addOutput output
reader.startReading

Var count As Integer
While reader.status = AVAssetReaderMBS.AVAssetReaderStatusReading
Var buffer As CMSampleBufferMBS = output.NextSampleBuffer
If buffer = Nil Then Exit
count = count + buffer.NumberOfSamples
Wend

MessageBox count.ToString + " samples read."
```

Notes: AVAssetReader lets you:

Read raw un-decoded media samples directly from storage, obtain samples decoded into renderable forms.
Mix multiple audio tracks of the asset and compose multiple video tracks (by using AVAssetReaderAudioMixOutput and AVAssetReaderVideoCompositionOutput).
AVAssetReader's pipelines are multithreaded internally. After you initiate reading with initWithAsset:error:,

a reader loads and processes a reasonable amount of sample data ahead of use so that retrieval operations such as copyNextSampleBuffer (AVAssetReaderOutput) can have very low latency. Note, however, that AVAssetReader is not intended for use with real-time sources, and its performance is not guaranteed for real-time operations.

18.5.2 Methods

18.5.3 addOutput(output as AVAssetReaderOutputMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Adds a given output to the receiver.
Notes: output: The reader output to add.

Outputs are created with a reference to one or more AVAssetTrack objects. Adding an output to an asset reader indicates to the reader that it should source from those tracks. The tracks must be owned by the asset returned by the reader's asset property.
You cannot add an output after reading has started.

18.5.4 asset as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The asset with which the receiver was initialized. (read-only)
Notes: Concrete instances of AVAssetReader with specific AVAssetTrack instances must obtain those tracks from the asset returned by this property.

18.5.5 assetReaderWithAsset(item as AVAssetMBS, byref error as NSErrorMBS) as AVAssetReaderMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an asset reader for reading media data from a specified asset.
Notes: asset: The asset from which media data is to be read.
Error: If initialization of the reader fails, upon return contains an error that describes the problem.

Returns an asset reader, initialized for reading media data from asset.

18.5.6 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.5.7 canAddOutput(output as AVAssetReaderOutputMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given output can be added to the receiver.
Notes: output: The reader output to be tested.

Returns true if output can be added to the receiver, otherwise false.
You cannot add an output that reads from a track of an asset other than the asset used to initialize the receiver.

18.5.8 cancelReading

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Cancels any background work and prevents the receiver's outputs from reading more samples.
Notes: If you want to stop reading samples from the receiver before reaching the end of its time range, you should call this method to stop any background read ahead operations that the may have been in progress.

18.5.9 Constructor(item as AVAssetMBS, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes an asset reader for reading media data from a specified asset.
Notes: asset: The asset from which media data is to be read.
Error: If initialization of the reader fails, upon return contains an error that describes the problem.

18.5.10 error as NSErrorMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Describes the error that occurred if the status is AVAssetReaderStatusFailed. (read-only)
Notes: This property is thread safe.

The value of this property describes what caused the reader to no longer be able to read its asset. If the reader's status is not AVAssetReaderStatusFailed, the value of this property is nil.

18.5.11 outputs as AVAssetReaderOutputMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The outputs from which clients of reader can read media data. (read-only)
Notes: The array contains concrete instances of AVAssetReaderOutput associated with the reader.

18.5.12 startReading

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Prepares the receiver for obtaining sample buffers from the asset.
Notes: Returns true if the reader is able to start reading, otherwise false.

This method validates the entire collection of settings for outputs for tracks, for audio mixdown, and for video composition and initiates reading of all outputs.

status signals the terminal state of the asset reader, and if a failure occurs, error describes the failure.

18.5.13 status as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The status of the reading of sample buffers from the asset. (read-only)
Notes: This property is thread safe. For possible values, see "Reader Status Constants."

The value of this property indicates whether reading is in progress, has completed successfully, has been canceled, or has failed. You should check the value of this property copyNextSampleBuffer (AVAssetReader-Output) returns nil to determine why no more samples could be read.

18.5.14 Properties

18.5.15 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.5.16 timeRange as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time range of the asset that should be read.
Notes: The intersection of the value of this property and CMTimeRangeMake(kCMTimeZero, asset.duration) determines the time range of the asset from which media data will be read.

The default value is CMTimeRangeMake(kCMTimeZero, kCMTimePositiveInfinity). You cannot change the value of this property after reading has started.
(Read and Write computed property)

18.5.17 Constants

Status Values

Constant	Value	Description
AVAssetReaderStatusCancelled	4	Indicates that reading was cancelled using cancelReading.
AVAssetReaderStatusCompleted	2	Indicates that the reader has provided all available sample buffers to all of its outputs.
AVAssetReaderStatusFailed	3	Indicates that reading failed.
AVAssetReaderStatusReading	1	Indicates that the reader is ready to provide more sample buffers to its outputs.
AVAssetReaderStatusUnknown	0	Indicates that startReading has not yet been invoked.

18.6 class AVAssetReaderOutputMBS

18.6.1 class AVAssetReaderOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVAssetReaderOutput is an abstract class that defines an interface for reading a single collection of samples of a common media type from an AVAssetReader object.
Notes: There are several subclasses of AVAssetReaderOutput for specific tasks, such as AVAssetReaderTrackOutput or AVAssetReaderVideoCompositionOutput.

You can read the media data of an asset by adding one or more concrete instances of AVAssetReaderOutput to an AVAssetReader object using addOutput.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.6.2 Methods

18.6.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.6.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.6.5 NextSampleBuffer as CMSampleBufferMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Synchronously copies the next sample buffer for the output.
Notes: The output sample buffer, or nil if there are no more sample buffers available for the output within the time range specified by the asset reader's timeRange property.

If this method returns nil, you should check the value of the associated AVAssetReader object's status property to determine why no more samples could be read.

18.6.6 Properties

18.6.7 alwaysCopiesSampleData as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the data in buffers gets copied before being vended.
Notes: When the value of this property is true, the output always vends a buffer with copied data—you can freely modify data in such buffers.

When the value of this property is false, the buffers vended may not be copied—such buffers may still be referenced by other entities. The result of modifying a buffer whose data hasn't been copied is undefined. Requesting buffers whose data hasn't been copied when possible can lead to performance improvements.
The default value of this property is true.
Available in OS X v10.8 and later.
(Read and Write property)

18.6.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.6.9 mediaType as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A string representing the media type of the track (or tracks) represented by the output. (read-only)
Notes: The value of this property is one of the media type strings defined in AVMediaFormat.h.
(Read only property)

18.6.10 supportsRandomAccess as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Indicates whether the asset reader output supports reconfiguration of the time ranges to read.
Notes: When the value of this property is true, the time ranges read by the asset reader output can be reconfigured during reading using the -resetForReadingTimeRanges method. This also prevents the attached AVAssetReader from progressing to AVAssetReaderStatusCompleted until markConfigurationAsFinal has

been invoked.

The default value is false, which means that the asset reader output may not be reconfigured once reading has begin. When the value of this property is false, AVAssetReader may be able to read media data more efficiently, particularly when multiple asset reader outputs are attached.

This property may not be set after startReading has been called on the attached asset reader.
(Read and Write property)

18.7 class AVAssetReaderOutputMetadataAdaptorMBS

18.7.1 class AVAssetReaderOutputMetadataAdaptorMBS

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Creates a new timed metadata group adaptor for retrieving timed metadata group objects from an asset reader output.
Example:

```
// read timed metadata, e.g. GPS positions recorded with a video
Var asset As AVAssetMBS = AVAssetMBS.assetWithFile(SpecialFolder.Desktop.Child("drive.mov"))
Var tracks() As AVAssetTrackMBS = asset.tracksWithMediaType(AVFoundationMBS.AVMediaTypeMetadata)
If tracks.Count = 0 Then Return

Var error As NSErrorMBS
Var reader As New AVAssetReaderMBS(asset, error)
Var trackOutput As New AVAssetReaderTrackOutputMBS(tracks(0), Nil)
reader.addOutput trackOutput
Var adaptor As New AVAssetReaderOutputMetadataAdaptorMBS(trackOutput)
reader.startReading

Do
Var group As AVTimedMetadataGroupMBS = adaptor.nextTimedMetadataGroup
If group = Nil Then Exit
For Each item As AVMetadataItemMBS In group.items
System.DebugLog item.keySpace + " " + item.key + " = " + item.stringValue
Next
Loop
```

Notes: assetReaderOutput: An instance of AVAssetReaderTrackOutput that vends sample buffers containing metadata, e.g. an AVAssetReaderTrackOutput object initialized with a track of media type AVMediaTypeMetadata and nil outputSettings.

Returns an instance of AVAssetReaderOutputMetadataAdaptor

It is an error to create a timed metadata group adaptor with an asset reader output that does not vend metadata. It is also an error to create a timed metadata group adaptor with an asset reader output whose asset reader has already started reading, or an asset reader output that already has been used to initialize another timed metadata group adaptor.

Clients should not mix calls to AVAssetReaderTrackOutput.NextSampleBuffer and AVAssetReaderOutputMetadataAdaptor.nextTimedMetadataGroup. Once an AVAssetReaderTrackOutput instance has been used to initialize an AVAssetReaderOutputMetadataAdaptor, calling NextSampleBuffer on that instance will re-

sult in an exception being thrown.

Available on Mac OS X 10.10 or newer.

18.7.2 Methods

18.7.3 assetReaderOutputMetadataAdaptorWithAssetReaderTrackOutput(trackOutput as AVAssetReaderTrackOutputMBS) as AVAssetReaderOutputMetadataAdaptorMBS

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Creates a new timed metadata group adaptor for retrieving timed metadata group objects from an asset reader output.
Notes: Parameter: an instance of AVAssetReaderTrackOutput that vends sample buffers containing metadata, e.g. an AVAssetReaderTrackOutput object initialized with a track of media type AVMediaTypeMetadata and nil outputSettings.

Returns an instance of AVAssetReaderOutputMetadataAdaptor

It is an error to create a timed metadata group adaptor with an asset reader output that does not vend metadata. It is also an error to create a timed metadata group adaptor with an asset reader output whose asset reader has already started reading, or an asset reader output that already has been used to initialize another timed metadata group adaptor.

Clients should not mix calls to AVAssetReaderTrackOutput.NextSampleBuffer and AVAssetReaderOutputMetadataAdaptor.nextTimedMetadataGroup. Once an AVAssetReaderTrackOutput instance has been used to initialize an AVAssetReaderOutputMetadataAdaptor, calling NextSampleBuffer on that instance will result in an exception being thrown.

18.7.4 available as boolean

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true on Mac OS X 10.10 and newer.

18.7.5 Constructor(trackOutput as AVAssetReaderTrackOutputMBS)

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Creates a new timed metadata group adaptor for retrieving timed metadata group objects from an asset reader output.
Notes: assetReaderOutput: An instance of AVAssetReaderTrackOutput that vends sample buffers containing metadata, e.g. an AVAssetReaderTrackOutput object initialized with a track of media type AVMediaTypeMetadata and nil outputSettings.

Returns an instance of AVAssetReaderTrackOutputTimedMetadataGroupAdaptor

It is an error to create a timed metadata group adaptor with an asset reader output that does not vend metadata. It is also an error to create a timed metadata group adaptor with an asset reader output whose asset reader has already started reading, or an asset reader output that already has been used to initialize another timed metadata group adaptor.

Clients should not mix calls to AVAssetReaderTrackOutput.NextSampleBuffer and AVAssetReaderOutputMetadataAdaptor.nextTimedMetadataGroup. Once an AVAssetReaderTrackOutput instance has been used to initialize an AVAssetReaderOutputMetadataAdaptor, calling NextSampleBuffer on that instance will result in an exception being thrown.

18.7.6 nextTimedMetadataGroup as AVTimedMetadataGroupMBS

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Returns the next timed metadata group for the asset reader output, synchronously.
Notes: Returns an instance of AVTimedMetadataGroup, representing the next logical segment of metadata coming from the source asset reader output.

This method will return nil when all timed metadata groups have been read from the asset reader output, or if there is an error that prevents the timed metadata group adaptor from reading more timed metadata groups. When this method returns nil, clients should check the value of the associated AVAssetReader's status property to determine why no more samples could be read.

Before calling this method, you must ensure that the output which underlies the receiver is attached to an AVAssetReader via a prior call to addOutput and that startReading has been called on the asset reader.

18.7.7 Properties

18.7.8 assetReaderTrackOutput as AVAssetReaderTrackOutputMBS

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: The asset reader track output from which the receiver pulls timed metadata groups.

Notes: (Read only property)

18.7.9 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.8 class AVAssetReaderSampleReferenceOutputMBS

18.8.1 class AVAssetReaderSampleReferenceOutputMBS

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: AVAssetReaderSampleReferenceOutput is a concrete subclass of AVAssetReaderOutput that defines an interface for reading sample references from a single AVAssetTrack of an AVAssetReader's AVAsset.
Notes: Clients can extract information about the location (file URL and offset) of samples in a track by adding an instance of AVAssetReaderSampleReferenceOutput to an AVAssetReader using the AVAssetReader.addOutput method. No actual sample data can be extracted using this class. The location of the sample data is described by the kCMSampleBufferAttachmentKey_SampleReferenceURL and kCMSampleBufferAttachmentKey_SampleReferenceByteOffset attachments on the extracted sample buffers. More information about sample buffers describing sample references can be found in the CMSampleBuffer documentation.

Sample buffers extracted using this class can also be appended to an AVAssetWriterInput to create movie tracks that are not self-contained and reference data in the original file instead. Currently, only instances of AVAssetWriter configured to write files of type AVFileTypeQuickTimeMovie can be used to write tracks that are not self-contained.

Since no sample data is ever returned by instances of AVAssetReaderSampleReferenceOutput, the value of the alwaysCopiesSampleData property is ignored.

Available on Mac OS X 10.10 or newer.
Subclass of the AVAssetReaderOutputMBS class.

18.8.2 Methods

18.8.3 assetReaderSampleReferenceOutputWithTrack(track as AVAssetTrackMBS) as AVAssetReaderSampleReferenceOutputMBS

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Returns an instance of AVAssetReaderSampleReferenceOutput for supplying sample references.
Notes: Track: The AVAssetTrack for which the resulting AVAssetReaderSampleReferenceOutput should provide sample references.

Returns an instance of AVAssetReaderSampleReferenceOutput.
The track must be one of the tracks contained by the target AVAssetReader's asset.

18.8.4 Constructor(Track as AVAssetTrackMBS)

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Returns an instance of AVAssetReaderSampleReferenceOutput for supplying sample references.
Notes: Track: The AVAssetTrack for which the resulting AVAssetReaderSampleReferenceOutput should provide sample references.

The track must be one of the tracks contained by the target AVAssetReader's asset.

18.8.5 Properties

18.8.6 track as AVAssetTrackMBS

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: The track from which the receiver extracts sample references.
Notes: The value of this property is an AVAssetTrack owned by the target AVAssetReader's asset.
(Read only property)

18.9 class AVAssetReaderTrackOutputMBS

18.9.1 class AVAssetReaderTrackOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVAssetReaderTrackOutput defines an interface for reading media data from a single AVAsset-Track object of an asset reader's asset.
Notes: You can read the media data of an asset track by adding an instance of AVAssetReaderTrackOutput to an asset reader using the AVAssetReader's addOutput method. The samples in the track can be read in read in the format in which they are stored in the asset, or can be converted to a different format.
Subclass of the AVAssetReaderOutputMBS class.
Blog Entries

- MBS Xojo Plugins, version 23.3pr5

18.9.2 Methods

18.9.3 assetReaderTrackOutputWithTrack(track as AVAssetTrackMBS, output-Settings as dictionary) as AVAssetReaderTrackOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an asset reader wrapping a specified track, with optional output settings.
Notes: track: The track from which the reader should source sample buffers.
outputSettings: A dictionary of output settings to be used for sample output. Pass nil to receive samples as stored in the track.
You use keys from one of AVAudioSettings.h, AVVideoSettings.h, or <CoreVideo/CVPixelBuffer.h>, depending on the media type and the output format you want.
Initialization fails if the output settings cannot be used with the specified track.
Those keys are available in AVFoundationMBS class.

18.9.4 Constructor(track as AVAssetTrackMBS, outputSettings as dictionary)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes an asset reader to wrap a specified track, with optional output settings.
Notes: track: The track from which the reader should source sample buffers.
outputSettings: A dictionary of output settings to be used for sample output. Pass nil to receive samples as stored in the track.
You use keys from one of AVAudioSettings.h, AVVideoSettings.h, or <CoreVideo/CVPixelBuffer.h>, depending on the media type and the output format you want.
Initialization fails if the output settings cannot be used with the specified track.
Those keys are available in AVFoundationMBS class.

18.9.5 outputSettings as dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The output settings used by the output. (read-only)
Notes: The value is a dictionary that contains values for keys from either AVAudioSettings.h (linear PCM only) for audio tracks or <CoreVideo/CVPixelBuffer.h>for video tracks. A value of nil indicates that the output will return samples in their original format as stored in the target track.
Those keys are available in AVFoundationMBS class.

18.9.6 track as AVAssetTrackMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The track from which the receiver reads sample buffers. (read-only)

18.9.7 Properties

18.9.8 audioTimePitchAlgorithm as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The processing algorithm used to manage audio pitch for scaled audio edits.
Notes: The supported constants are defined in Time Pitch Algorithm Settings.
An NSInvalidArgumentException will be raised if this property is set to a value other than the defined constants.
Available in OS X v10.9 and later.
(Read and Write computed property)

18.10 class AVAssetReaderVideoCompositionOutputMBS

18.10.1 class AVAssetReaderVideoCompositionOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVAssetReaderVideoCompositionOutput is a subclass of AVAssetReaderOutput you use to read video frames that have been composited together from the frames in one or more tracks of an AVAssetReader object's asset.
Example:

```
// read the frames of a movie as they look with its video composition
Var asset As AVAssetMBS = AVAssetMBS.assetWithFile(SpecialFolder.Desktop.Child("movie.mov"))
Var tracks() As AVAssetTrackMBS = asset.tracksWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
If tracks.Count = 0 Then Return

Var error As NSErrorMBS
Var reader As New AVAssetReaderMBS(asset, error)
Var output As New AVAssetReaderVideoCompositionOutputMBS(tracks, Nil)
output.videoComposition = AVVideoCompositionMBS.videoCompositionWithPropertiesOfAsset(asset)
reader.addOutput output
reader.startReading

Var frames As Integer
While reader.status = AVAssetReaderMBS.AVAssetReaderStatusReading
If output.NextSampleBuffer = Nil Then Exit
frames = frames + 1
Wend
MessageBox frames.ToString + " frames"
```

Notes: You can read the video frames composited from one or more asset tracks by adding an instance of AVAssetReaderVideoCompositionOutput to an AVAssetReader object using the addOutput method.
Subclass of the AVAssetReaderOutputMBS class.

18.10.2 Methods

18.10.3 assetReaderVideoCompositionOutputWithVideoTracks(videoTracks() as AVAssetTrackMBS, videoSettings as dictionary) as AVAssetReaderVideoCompositionOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an instance of AVAssetReaderVideoCompositionOutput for reading composited video from the specified video tracks, using optional video settings.
Notes: videoTracks: An array of AVAssetTrack objects from which the created object should read video

frames for compositing.
It is an error to include tracks of media types other than AVMediaTypeVideo.
videoSettings: A dictionary of video settings to be used for sample output, or nil if you want to receive decoded samples in a convenient uncompressed format, with properties determined according to the properties of the specified video tracks.
You use keys from <CoreVideo/CVPixelBuffer.h>, depending on the output format you want.
Initialization will fail if the video settings cannot be used with the specified video tracks.

Return san instance of AVAssetReaderVideoCompositionOutput wrapping videoTracks, using the settings specified by videoSettings, or nil if initialization failed.

18.10.4 Constructor(videoTracks() as AVAssetTrackMBS, videoSettings as dictionary)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an instance of AVAssetReaderVideoCompositionOutput for reading composited video from the specified video tracks, using optional video settings.
Notes: videoTracks: An array of AVAssetTrack objects from which the created object should read video frames for compositing.
It is an error to include tracks of media types other than AVMediaTypeVideo.
videoSettings: A dictionary of video settings to be used for sample output, or nil if you want to receive decoded samples in a convenient uncompressed format, with properties determined according to the properties of the specified video tracks.
You use keys from <CoreVideo/CVPixelBuffer.h>, depending on the output format you want.
Initialization will fail if the video settings cannot be used with the specified video tracks.
In that case handle property will be 0.

18.10.5 customVideoCompositor as AVVideoCompositingMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Returns the custom video compositor instance used by the receiver, if any. (read-only)
Notes: The custom video compositor instance that is used during image generation is accessible via this property after the value of videoComposition is set to an AVVideoComposition instance that specifies a custom video compositor class. Any additional communication between the application and that instance of the custom video compositor, if any is required for configuration or other purposes, can only occur once that has happened.

If the value of videoComposition is changed from an AVVideoComposition that specifies a custom video compositor class to another instance of AVVideoComposition that specifies the same custom video compositor class, the instance of the custom video compositor that was previously created will receive the renderContextChanged message and remain in use for subsequent image generation.

This property is nil if there is no video compositor, or if the internal video compositor is in use.
Available in OS X v10.9 and later.

18.10.6 videoSettings as dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The video settings used by the output. (read-only)
Notes: A value of nil indicates that the receiver will return video frames in a convenient uncompressed format, with properties determined according to the properties of the receiver's video tracks.

The dictionary's keys are from <CoreVideo/CVPixelBuffer.h>.

18.10.7 videoTracks as AVAssetTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The tracks from which the output reads composited video. (read-only)
Notes: The array contains AVAssetTrack objects owned by the target asset reader's asset.

18.10.8 Properties

18.10.9 videoComposition as AVVideoCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The video composition to use for the output.
Notes: The value is an AVVideoComposition object that can be used to specify the visual arrangement of video frames read from each source track over the timeline of the source asset.

See AVVideoComposition for options for configuring a video composition.
(Read and Write computed property)

18.11 class AVAssetResourceLoaderMBS

18.11.1 class AVAssetResourceLoaderMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The asset resource loader class.
Notes: An AVAssetResourceLoader object mediates resource requests from an AVURLAsset object with a delegate object that you provide. When a request arrives, the resource loader asks your delegate if it is able to handle the request and reports the results back to the asset.

You do not create resource loader objects yourself. Instead, you retrieve a resource loader from the resourceLoader property of an AVURLAsset object and use it to assign your custom delegate object.

The delegate you associate with this object must adopt the AVAssetResourceLoaderDelegate protocol. For more information, see AVAssetResourceLoaderDelegate Protocol Reference.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.11.2 Methods

18.11.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9 and newer.

18.11.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The private constructor.

18.11.5 Properties

18.11.6 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.12 class AVAssetResourceLoadingContentInformationRequestMBS

18.12.1 class AVAssetResourceLoadingContentInformationRequestMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The AVAssetResourceLoadingContentInformationRequest class represents a query for essential information about a resource referenced by an asset resource loading request.
Notes: The event AVFoundationMBS.resourceLoaderShouldWaitForLoadingOfRequestedResource is invoked and accepts responsibility for loading the resource it must check whether the contentInformationRequest property of the AVAssetResourceLoadingRequest is not nil. Whenever the value is not nil, the request includes a query for the information that AVAssetResourceLoadingContentInformationRequest encapsulates. In response to such queries, the resource loading delegate should set the values of the content information request's properties appropriately before invoking the AVAssetResourceLoadingRequest method finishLoading.

When finishLoading is invoked, the values of the properties of its contentInformationRequest property will, in part, determine how the requested resource is processed. For example, if the requested resource's URL is the URL of an AVURLAsset and contentType is set by the resource loading delegate to a value that the underlying media system doesn't recognize as a supported media file type, operations on the AVURLAsset, such as playback, are likely to fail.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.12.2 Methods

18.12.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9 and newer.

18.12.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The private constructor.

18.12.5 Properties

18.12.6 ByteRangeAccessSupported as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether random access to arbitrary ranges of bytes of the resource is supported.
Notes: Before finishing loading an AVAssetResourceLoadingRequest instance, if its contentInformationRequest property is not nil, set the value of this property to true if it supports random access to arbitrary ranges of bytes of the resource.

If this property is not true for resources that must be loaded incrementally, loading of the resource may fail. Such resources include anything that contains media data.

If byte range access is supported portions of the resource can be requested more than once.
Available in OS X v10.9 and later.
(Read and Write property)

18.12.7 contentLength as Int64

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The length, in bytes, of the requested resource.
Notes: Before finishing loading an AVAssetResourceLoadingRequest instance, if its contentInformationRequest property is not nil, set the value of the contentLength property to the number of bytes contained by the requested resource.
Available in OS X v10.9 and later.
(Read and Write property)

18.12.8 contentType as String

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The UTI that specifies the type of data contained by the requested resource.
Notes: Before finishing loading an AVAssetResourceLoadingRequest instance, if its contentInformationRequest property is not nil, set the value of this property to a UTI indicating the type of data contained by the requested resource.
Available in OS X v10.9 and later.
(Read and Write property)

18.12.9 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.13 class AVAssetResourceLoadingDataRequestMBS

18.13.1 class AVAssetResourceLoadingDataRequestMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Use the AVAssetResourceLoadingDataRequest class to request data from a resource referenced by an AVAssetResourceLoadingRequest instance.
Notes: The AVAssetResourceLoaderDelegate uses the AVAssetResourceLoadingDataRequest class to do the actual data reading, and its methods will be invoked, as necessary, to acquire data for the AVAssetResourceLoadingRequest instance.

When the resource loading delegate, which implements the AVAssetResourceLoaderDelegate protocol, receives an instance of AVAssetResourceLoadingRequest as the second parameter of the delegate's resourceLoader:shouldWaitForLoadingOfRequestedResource: method, it has the option of accepting responsibility for loading the referenced resource. If it accepts that responsibility, by returning YES, it must check whether the dataRequest property of the AVAssetResourceLoadingRequest instance is not nil. If it is not nil, the resource loading delegate is informed of the range of bytes within the resource that are required by the underlying media system. In response, the data is provided by one or more invocations of respondWithData: as required to provide the requested data. The data can be provided in increments determined by the resource loading delegate according to convenience or efficiency.

When the AVAssetResourceLoadingRequest method finishLoading is invoked, the data request is considered fully satisfied. If the entire range of bytes requested has not yet been provided, the underlying media system assumes that the resource's length is limited to the provided content.

Available in OS X v10.9 and later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.13.2 Methods

18.13.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Whether this class is available.

18.13.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The private constructor.

18.13.5 respondWithData(data as MemoryBlock)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Provides data to the loading request.
Notes: data: An instance of NSData containing some or all of the requested bytes.

This method may be invoked multiple times on the same instance of AVAssetResourceLoadingDataRequest to provide the full range of requested data incrementally. Upon each invocation, the value of the currentOffset property is updated to match the amount of data provided.

Available in OS X v10.9 and later.

18.13.6 Properties

18.13.7 currentOffset as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The position within the resource of the next byte. (read-only)
Notes: When incrementally loading data you should begin loading at this offset, returning the data by invoking the respondWithData: method. Bytes previous to this value have already been provided.

Available in OS X v10.9 and later.
(Read only property)

18.13.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.13.9 requestedLength as Int64

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The length, in bytes, of the data requested. (read-only)

Notes: If the content length of the resource is unknown, the sum of the requestedLength and requestedOffset properties may be greater than the actual content length. When this situation occurs, an application must attempt to provide as much of the requested data beginning at the requestedOffset property as the resource contains. The application must then invoke either the AVAssetResourceLoadingRequest instance's finishLoading method upon success, or the finishLoadingWithError: method if an error is encountered during the loading.
Available in OS X v10.9 and later.
(Read only property)

18.13.10 requestedOffset as Int64

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The position within the resource of the first byte requested. (read-only)
Notes: When all of the requested bytes that can be provided have been loaded—including the possible contentInformationRequest data in the AVAssetResourceLoadingRequest instance that contains the receiver—the delegate should respond by invoking finishLoading.

If the requestedOffset value is beyond the content length of the resource, the AVAssetResourceLoadingRequest instance is sent a finishLoading message without any prior invocations of respondWithData.
Available in OS X v10.9 and later.
(Read only property)

18.14 class AVAssetResourceLoadingRequestMBS

18.14.1 class AVAssetResourceLoadingRequestMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: An AVAssetResourceLoadingRequest object encapsulates information about a resource request issued from a resource loader object.
Notes: When an AVURLAsset object needs help loading a resource, it asks its AVAssetResourceLoader object to assist. The resource loader encapsulates the request information by creating an instance of this object, which it then hands to its delegate object for processing. The delegate uses the information in this object to perform the request and report on the success or failure of the operation.
Available on Mac OS X 10.9 and later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.14.2 Methods

18.14.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Whether this class is available.

18.14.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The private constructor.

18.14.5 finishLoading

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Causes the receiver to treat the processing of the request as complete.
Notes: If a dataRequest is present and the resource does not contain the full extent of the data that has been requested according to the values of the requestedOffset and requestedLength properties of the request, invoke finishLoading after providing as much of the requested data as the resource contains.

Available in OS X v10.9 and later.
See also:

- 18.14.6 finishLoading(error as NSErrorMBS) 3459

18.14.6 finishLoading(error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Causes the receiver to handle the failure to load a resource for which a resource loader's delegate took responsibility.
Notes: error: An error object indicating the reason for the failure.
When a resource loader's delegate takes responsibility for loading a resource, it calls this method when a failure occurred when loading the resource. This method marks the loading request as finished and notifies the resource loader object that the resource could not be loaded.
Available in OS X v10.9 and later.
See also:

- 18.14.5 finishLoading 3458

18.14.7 streamingContentKeyRequestDataForApp(appIdentifier as Memoryblock, contentIdentifier as Memoryblock, options as Dictionary, byref error as NSErrorMBS) as Memoryblock

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Obtains key request data for a specific combination of application and content.
Notes: appIdentifier: An opaque content identifier for the application. The value of this identifier depends on the particular system used to provide the decryption key.
contentIdentifier: An opaque identifier for the content. The value of this identifier depends on the particular system used to provide the decryption key.
options: Additional information necessary to obtain the key, or nil if no additional information is required.
Error: If an error occurs while obtaining the streaming content key, the pointer is set to an appropriate error object on output.

Returns the key request data that must be transmitted to the key vendor to obtain the content key.
Available in OS X v10.9 and later.

18.14.8 Properties

18.14.9 contentInformationRequest as AVAssetResourceLoadingContentInformationRequestMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Information about the requested resource. (read-only)
Notes: An instance of AVAssetResourceLoadingContentInformationRequest that you populate with information about the resource. The value of this property is nil if no such information is being requested.
Available in OS X v10.9 and later.

(Read only property)

18.14.10 dataRequest as AVAssetResourceLoadingDataRequestMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The range of requested resource data. (read-only)
Notes: An instance of AVAssetResourceLoadingDataRequest that indicates the range of resource data that's being requested. The value of this property is nil if no data is being requested.
Available in OS X v10.9 and later.
(Read only property)

18.14.11 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.14.12 isCancelled as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the request has been cancelled. (read-only)
Notes: True when the resource loader cancels the loading of a request, just prior to sending the message resourceLoaderDidCancelLoadingRequest to the delegate.
(Read only property)

18.14.13 isFinished as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether loading of the resource has finished. (read-only)
Notes: The value of this property is NO initially. The value changes to YES when the delegate object handling the request calls the finishLoadingWithResponse or finishLoadingWithError method.
Available in OS X v10.9 and later.
(Read only property)

18.14.14 redirect as Variant

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: An URL request instance if the loading request was redirected.
Notes: Value is NSURLRequestMBS. We use variant to reduce dependency to other plugins.
Set this property to an instance of NSURLRequest indicating a redirection of the loading request to another URL.
If no redirection is needed, the value of this property must be nil, which is the default.
Available in OS X v10.9 and later.
(Read only property)

18.14.15 request as Variant

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The URL request object for the resource. (read-only)
Notes: Value is NSURLRequestMBS. We use variant to reduce dependency to other plugins.
Use the value in this property to identify the requested resource and to formulate an appropriate response object.
Available in OS X v10.9 and later.
(Read only property)

18.14.16 response as Variant

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The URL response for the loading request.
Notes: Value is NSURLResponseMBS. We use variant to reduce dependency to other plugins.
The value of this property to an instance of NSURLResponse, indicating a response to the loading request.
If no response is needed, the value of this property is nil.
Available in OS X v10.9 and later
(Read only property)

18.15 class AVAssetTrackGroupMBS

18.15.1 class AVAssetTrackGroupMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The AVAssetTrackGroup class encapsulates a single group of related tracks in an asset.
Notes: Instances of AVAssetTrackGroup describe a single group of related alternate tracks, only one of which should be played at a time. Groups of alternate tracks typically contain variations of the same content, such as subtitles in multiple translations.

Clients can inspect the track groups contained in an asset (AVAsset) instance by loading and obtaining the value of the asset's trackGroups property.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.15.2 Methods

18.15.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9 and newer.

18.15.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The private constructor.

18.15.5 copy as AVAssetTrackGroupMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Creates a copy of the track group.

18.15.6 trackIDs as Integer()

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The IDs of the tracks in the group. (read-only)
Notes: The value of this property is an array of NSNumber instances that are interpreted as CMPersistentTrackID values, one for each track in the group.
Available in OS X v10.9 and later.

18.15.7 Properties

18.15.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.16 class AVAssetTrackMBS

18.16.1 class AVAssetTrackMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVAssetTrack object provides provides the track-level inspection interface for all assets.
Example:

```
// show video size, frame rate and data rate of the video track
Var asset As AVAssetMBS = AVAssetMBS.assetWithFile(SpecialFolder.Desktop.Child("movie.mov"))
Var tracks() As AVAssetTrackMBS = asset.tracksWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
If tracks.Count = 0 Then Return

Var video As AVAssetTrackMBS = tracks(0)
MessageBox "Size: " + Format(video.naturalSize.width, "0") + " x " + Format(video.naturalSize.height,
"0") + EndOfLine + _
"Frame rate: " + Format(video.nominalFrameRate, "0.00") + " fps" + EndOfLine + _
"Data rate: " + Format(video.estimatedDataRate / 1000000, "0.0") + " MBit/s"
```

Notes: AVAssetTrack adopts the AVAsynchronousKeyValueLoading protocol. You should use methods in the protocol to access a track's properties without blocking the current thread. To cancel load requests for all keys of AVAssetTrack you must message the parent AVAsset object (for example, [track.asset cancelLoading]).
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Automated video editing with Xojo
- MBS Xojo / Real Studio Plugins, version 15.4pr1

18.16.2 Methods

18.16.3 associatedTracksOfType(trackAssociationType as string) as AVAssetTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: An array containing other tracks associated with the track using the specified association type.
Notes: trackAssociationType: The association type for which associated tracks are requested.

Returns an array of AVAssetTrack objects associated with the track by trackAssociationType. May be empty if no tracks are associated through the specified association type.

You can call this method without blocking after availableTrackAssociationTypes has been loaded.

Available in OS X v10.9 and later.

18.16.4 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.16.5 availableMetadataFormats as string()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An array containing the metadata formats available for the track. (read-only)
Notes: The array contains String objects, one for each metadata format that's available for the track (such as QuickTime user data). For possible values, see AVMetadataItem.

18.16.6 availableTrackAssociationTypes as string()

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: An array of association types used to associate other tracks with the track. (read-only)
Notes: The array contains strings, one for each type of association for which the track has associated tracks. For possible values, see "Track Association Types" in Apple's documentation.
Available in OS X v10.9 and later.

18.16.7 commonMetadata as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An array of AVMetadataItem objects for each common metadata key for which a value is available. (read-only)

18.16.8 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.16.9 copy as AVAssetTrackMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

18.16.10 formatDescriptions as CMFormatDescriptionMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The formats of media samples referenced by the track. (read-only)
Notes: The array contains CMFormatDescriptions, each of which indicates the format of media samples referenced by the track. A track that presents uniform media (for example, encoded according to the same encoding settings) will provide an array with a count of 1.

18.16.11 hasMediaCharacteristic(mediaCharacteristic as string) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the track references media with the specified media characteristic.
Notes: mediaCharacteristic: The media characteristic of interest.
For possible values, see "Media Characteristics" in AV Foundation Constants Reference, for example AVMediaCharacteristicVisual, AVMediaCharacteristicAudible, or AVMediaCharacteristicLegible.

Returns true if the track references media with the specified characteristic, otherwise false.

18.16.12 loadValuesAsynchronouslyForKeys(keys() as string, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Tells the asset to load the values of any of the specified keys that are not already loaded.
Notes: keys: An array containing the required keys.

Calls AVFoundationMBS.AssetTrackLoadValuesAsynchronouslyForKeysFinished on completion.
The completion event will be invoked exactly once per invocation of this method:

- Synchronously if an I/O error or other format-related error occurs immediately.

- Asynchronously at a subsequent time if a loading error occurs at a later stage of processing, or if cancelLoading is invoked on an AVAsset instance.

The completion states of the keys you specify in keys are not necessarily the same—some may be loaded, and others may have failed. You must check the status of each key individually.

If you want to receive error reporting for loading that's still pending, you can call this method at any time—even after an asset has begun to load data for operations in progress or already completed. If a fatal error has already occurred, the completion event is invoked synchronously.

18.16.13 metadataForFormat(Format as string) as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An array of metadata items, one for each metadata item in the container of the specified format.
Notes: format: The metadata format for which items are requested.

Returns an array of AVMetadataItem objects, one for each metadata item in the container of the format specified by format, or empty array if there is no metadata of the specified format.

You can call this method without blocking after availableMetadataFormats has been loaded.

18.16.14 preferredTransform as CGAffineTransformMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The transform specified in the track's storage container as the preferred transformation of the visual media data for display purposes. (read-only)
Notes: The value of this property is often, but not always, CGAffineTransformIdentity.

18.16.15 samplePresentationTimeForTrackTime(trackTime as CMTimeMBS) as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Maps the specified track time through the appropriate time mapping and returns the resulting sample presentation time.
Notes: trackTime: The track time for which a sample presentation time is requested.
Returns the sample presentation time corresponding to trackTime; the value will be invalid if trackTime is out of range.

18.16.16 segmentForTrackTime(trackTime as CMTimeMBS) as AVAssetTrackSegmentMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The track segment that corresponds to the specified track time.
Notes: trackTime: The track time for which you want the segment.
Returns the track segment from the segments array that corresponds to trackTime, or nil if trackTime is out of range.

18.16.17 segments as AVAssetTrackSegmentMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time mappings from the track's media samples to the timeline of the track. (read-only)
Notes: The array contains instances of AVAssetTrackSegment.

Empty edits (that is, time ranges for which no media data is available to be presented) have source.start and source.duration equal to kCMTimeInvalid.

18.16.18 statusOfValueForKey(key as string, byref error as NSErrorMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Reports whether the value for a given key is immediately available without blocking. (required)
Notes: key: The key whose status you want.
error: If the status of the value for the key is AVKeyValueStatusFailed, upon return contains an NSError object that describes the failure that occurred.

Returns the current loading status of the value for key. For possible values, see "Protocol Methods."

You use this method to determine the availability of the value for a key. This method does not cause an asset to load the value of a key that's not yet available. To request values for keys that may not already be loaded without blocking, use loadValuesAsynchronouslyForKeys and wait for invocation of the completion handler to be informed of availability.

18.16.19 timeRange as CMTimeRangeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time range of the track within the overall timeline of the asset. (read-only)
Notes: A track with CMTimeCompare(timeRange.start, kCMTimeZero) == 1 will initially present an empty time range.

18.16.20 trackSamples(formatOptions as Dictionary) as MemoryBlock

MBS AVFoundation Plugin, Plugin Version: 15.4, Platform: macOS, Targets: All.

Function: Queries the track Samples
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
Var tracks() as AVAssetTrackMBS = a.tracksWithMediaType(AVFoundationMBS.AVMediaTypeAudio)
Var track as AVAssetTrackMBS = tracks(0)

Var d as new Dictionary
Var n as Integer = OSTypeFromStringMBS(AVFoundationMBS.kAudioFormatLinearPCM)
d.Value(AVFoundationMBS.AVFormatIDKey) = n
d.Value(AVFoundationMBS.AVLinearPCMBitDepthKey) = 16
d.Value(AVFoundationMBS.AVLinearPCMIsBigEndianKey) = false
d.Value(AVFoundationMBS.AVLinearPCMIsFloatKey) = false
d.Value(AVFoundationMBS.AVLinearPCMIsNonInterleaved) = false

Var SampleData as MemoryBlock = track.trackSamples(d)

Window1.Backdrop = RenderSamplesMBS(SampleData, SampleData.Size / 2, 1, Window1.Width, Window1.Height, 1, &c88B5C4, &c274C5A, &c203F4E, 15)
```

Notes: Returns nil in case of errors.
Track should be an audio or muxed track.

18.16.21 Properties

18.16.22 asset as AVAssetMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The asset of which the track is a part. (read-only)
Notes: (Read only property)

18.16.23 estimatedDataRate as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The estimated data rate of the media data referenced by the track, in bits per second. (read-only)
Notes: (Read only property)

18.16.24 extendedLanguageTag as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The language tag associated with the track, as an RFC 4646 language tag. (read-only)
Notes: The value may be nil if no language tag is indicated.
(Read only property)

18.16.25 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.16.26 isEnabled as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the track is enabled according to state stored in its container or construct. (read-only)
Notes: (Read only property)

18.16.27 isPlayable as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the track is playable in the current environment. (read-only)
Notes: If the value of this property is true, an AVPlayerItemTrack of an AVPlayerItem initialized with the track's asset can be enabled for playback.
Available in OS X v10.8 and later.
(Read only property)

18.16.28 isSelfContained as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the track references sample data only within its storage container. (read-only)
Notes: The value is true if the track references sample data only within its storage container, otherwise it is false.
(Read only property)

18.16.29 languageCode as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The language associated with the track, as an ISO 639-2/T language code. (read-only)
Notes: The value may be "" if no language is indicated.
(Read only property)

18.16.30 mediaType as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The media type for the track. (read-only)
Notes: For possible values, see "Media Types" in AV Foundation Constants Reference.
(Read only property)

18.16.31 naturalSize as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The natural dimensions of the media data referenced by the track. (read-only)
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.m4v")
Var m as new AVMovieMBS(f, nil)

Var videotracks() as AVMovieTrackMBS = m.movieTracksWithMediaCharacteristic(AVFoundationMBS.AV-
MediaCharacteristicFrameBased)

for each videotrack as AVMovieTrackMBS in videotracks
Var s as CGSizeMBS = videotrack.naturalSize
MessageBox str(s.Width)+" x "+ str(s.Height)
next
```

Notes: (Read only property)

18.16.32 naturalTimeScale as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A timescale in which time values for the track can be operated upon without extraneous numerical conversion. (read-only)
Notes: (Read only property)

18.16.33 nominalFrameRate as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The frame rate of the track, in frames per second. (read-only)
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mp4")
Var a as AVAssetMBS = AVAssetMBS.assetWithFile(f)
Var tracks() as AVAssetTrackMBS = a.tracksWithMediaCharacteristic(AVFoundationMBS.AVMediaCharacteristicFrameBased)

for each t as AVAssetTrackMBS in tracks
MessageBox str(t.nominalFrameRate)
next
```

Notes: (Read only property)

18.16.34 preferredVolume as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The volume specified in the track's storage container as the preferred volume of the audible media data. (read-only)
Notes: (Read only property)

18.16.35 totalSampleDataLength as Int64

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The total number of bytes of sample data required by the track. (read-only)

Notes: (Read only property)

18.16.36 trackID as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The persistent unique identifier for this track of the asset. (read-only)
Notes: (Read only property)

18.16.37 Constants

Load Status Constants

Constant	Value	Description
AVKeyValueStatusCancelled	4	Indicates that the attempt to load the property was cancelled.
AVKeyValueStatusFailed	3	Indicates that the attempt to load the property failed.
AVKeyValueStatusLoaded	2	Indicates that the property is ready for use.
AVKeyValueStatusLoading	1	Indicates that the property is not fully loaded.
AVKeyValueStatusUnknown	0	Indicates that the property status is unknown.

18.17 class AVAssetTrackSegmentMBS

18.17.1 class AVAssetTrackSegmentMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVAssetTrackSegment object represents a segment of an AVAssetTrack object, comprising of a time mapping from the source to the asset track timeline.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.17.2 Methods

18.17.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.17.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.17.5 isEmpty as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the segment is an empty segment (read-only)
Notes: True if the segment is empty, otherwise false.

18.17.6 timeMapping as CMTimeMappingMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time range of the track of the container file of the media presented by the segment. (read-only)

18.17.7 Properties

18.17.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.18 class AVAssetWriterInputGroupMBS

18.18.1 class AVAssetWriterInputGroupMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The AVAssetWriterInputGroup class associates tracks corresponding to inputs with each other in a mutually exclusive relationship.
Notes: This class is used to associate tracks corresponding to multiple AVAssetWriterInput instances as mutually exclusive to each other for playback or other processing.

For example, if you are creating an asset with multiple audio tracks using different spoken languages–and only one track should be played at a time–group the inputs corresponding to those tracks into a single instance of AVAssetWriterInputGroup and add the group to the AVAssetWriter instance using the AVAssetWriter method addInputGroup:. If the output format supports mutually exclusive relationships among tracks, the AVAssetWriter marks the tracks as mutually exclusive to each other.

Because the AVAssetWriterInputGroup class is a subclass of the AVMediaSelectionGroup class, clients can examine the media selection options that are available on the output asset before the asset is written. The best results for examining the options of the AVAssetWriterInputGroup are obtained after associating the AVAssetWriterInput instances of the AVAssetTrack objects as appropriate using the AVAssetWriterInput method addTrackAssociationWithTrackOfInput and by initializing each AVAssetWriterInput with a source format hint, where appropriate.
Subclass of the AVMediaSelectionGroupMBS class.

18.18.2 Methods

18.18.3 assetWriterInputGroupWithInputs(inputs() as AVAssetWriterInputMBS, defaultInput as AVAssetWriterInputMBS) as AVAssetWriterInputGroupMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Creates and initializes an instance of an asset writer input group.
Notes: inputs: An array of AVAssetWriterInput instances to be grouped together.
defaultInput: The instance of AVAssetWriterInput to designate as the default input for the group.

Returns an initialized instance of AVAssetWriterInputGroup.
When the input group is added to an AVAssetWriter instance using the addInputGroup: method, the AVAssetWriterInput property marksOutputTrackAsEnabled is automatically set to true for defaultInput and false for all of the other inputs in the group.
Available in OS X v10.9 and later.

18.18.4 Constructor(inputs() as AVAssetWriterInputMBS, defaultInput as AVAssetWriterInputMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Initializes an instance of an asset writer input group.
Notes: inputs: An array of AVAssetWriterInput instances to be grouped together.
defaultInput: The instance of AVAssetWriterInput to designate as the default input for the group.

Returns an initialized instance of AVAssetWriterInputGroup.

When the input group is added to an AVAssetWriter instance using the addInputGroup method, the AVAssetWriterInput property marksOutputTrackAsEnabled is automatically set to true for defaultInput and false for all of the other inputs in the group.
Available in OS X v10.9 and later.

18.18.5 inputs as AVAssetWriterInputMBS()

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: the inputs array. (read-only)
Notes: Available in OS X v10.9 and later.

18.18.6 Properties

18.18.7 defaultInput as AVAssetWriterInputMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: the default input object. (read-only)
Notes: Available in OS X v10.9 and later.
(Read only property)

18.19 class AVAssetWriterInputMBS

18.19.1 class AVAssetWriterInputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use an AVAssetWriterInput to append media samples packaged as CMSampleBuffer objects, or collections of metadata, to a single track of the output file of an AVAssetWriter object.
Example:

```
// define an input for H.264 video with 1920x1080 for an asset writer
Var settings As New Dictionary
settings.Value(AVFoundationMBS.AVVideoCodecKey) = AVFoundationMBS.AVVideoCodecH264
settings.Value(AVFoundationMBS.AVVideoWidthKey) = 1920
settings.Value(AVFoundationMBS.AVVideoHeightKey) = 1080

Var input As New AVAssetWriterInputMBS(AVFoundationMBS.AVMediaTypeVideo, settings)
input.expectsMediaDataInRealTime = False // we write from a file, not from a camera

Var error As NSErrorMBS
Var writer As AVAssetWriterMBS = AVAssetWriterMBS.assetWriterWithFile(SpecialFolder.Desktop.Child("out.mov"),
AVFoundationMBS.AVFileTypeQuickTimeMovie, error)
If writer <>Nil And writer.canAddInput(input) Then
writer.addInput input
// now start writing and append sample buffers, see AVAssetWriterMBS
End If
```

Notes: When there are multiple inputs, AVAssetWriter tries to write media data in an ideal interleaving pattern for efficiency in storage and playback. Each of its inputs signals its readiness to receive media data for writing according to that pattern via the value of readyForMoreMediaData. If readyForMoreMediaData is true, an input can accept additional media data while maintaining appropriate interleaving. If media data is appended to an input after readyForMoreMediaData becomes false, AVAssetWriter may need to write media data to its output without regard for ideal interleaving.

You can only append media data to an input while its readyForMoreMediaData property is true.

- If you're writing media data from a non-real-time source, such as an instance of AVAssetReader, you should hold off on generating or obtaining more media data to append to an input when the value of readyForMoreMediaData is false. To help with control of the supply of non-real-time media data, you can use requestMediaDataWhenReadyOnQueue:usingBlock: to specify a block that the input should invoke whenever it's ready for input to be appended.
- If you're writing media data from a real-time source, you should set the input's expectsMediaDataInRealTime property to true to ensure that the value of readyForMoreMediaData is calculated appropriately. When expectsMediaDataInRealTime is true, readyForMoreMediaData will become false only when the input cannot process media samples as quickly as they are being provided by the client. If

readyForMoreMediaData becomes false for a real-time source, the client may need to drop samples or consider reducing the data rate of appended samples.

The value of readyForMoreMediaData will often change from false to true asynchronously, as previously-supplied media data is processed and written to the output. It is possible for all of an asset writer's inputs temporarily to return false for readyForMoreMediaData.
Xojo Developer Magazine

- 12.2, page 47: Moving to AVFoundation, Leaving QuickTime behind by Christian Schmitz

18.19.2 Methods

18.19.3 addTrackAssociationWithTrackOfInput(input as AVAssetWriterInputMBS, trackAssociationType as string)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Associates the track corresponding to the specified input with the track corresponding with the receiver.
Notes: input: The instance of AVAssetWriterInput with a corresponding track to associate with track corresponding with the receiver.
trackAssociationType: The type of track association to add. Common track association types, such as AVTrackAssociationTypeTimecode are defined in Track Association Types.

If the type of association requires tracks of specific media types that don't match the media types of the inputs, or if the output file type does not support track associations, an NSInvalidArgumentException is raised.

Note: Track associations cannot be added after writing on the receiver's AVAssetWriter instance has started.
Available in OS X v10.9 and later.

18.19.4 appendSampleBuffer(sampleBuffer as CMSampleBufferMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Appends samples to the receiver.
Notes: sampleBuffer: The CMSampleBuffer to be appended.

Returns true if sampleBuffer as appended successfully, otherwise false.

The timing information in the sample buffer, considered relative to the time passed to the asset writer's startSessionAtSourceTime: will be used to determine the timing of those samples in the output file.

Do not modify sampleBuffer or its contents after you have passed it to this method.

18.19.5 assetWriterInputWithMediaType(MediaType as string, outputSettings as dictionary = nil) as AVAssetWriterInputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new input of the specified media type to receive sample buffers for writing to the output file.
Notes: mediaType: The media type of samples that will be accepted by the input.
Media types are defined in AVMediaFormat.h.
outputSettings: The settings used for encoding the media appended to the output. Pass nil to specify that appended samples should not be re-encoded.
Audio output settings keys are defined in AVAudioSettings.h. Video output settings keys are defined in AVVideoSettings.h. Video output settings with keys from <CoreVideo/CVPixelBuffer.h>are not currently supported.

Returns a new input of the specified media type to receive sample buffers for writing to the output file.

Each new input accepts data for a new track of the asset writer's output file. You add an input to an asset writer using the AVAssetWriter method addInput:.

Passing nil for outputSettings instructs the input to pass through appended samples, doing no processing before they are written to the output file. This is useful if, for example, you are appending buffers that are already in a desirable compressed format. However, passthrough is currently supported only when writing to QuickTime Movie files (i.e. the AVAssetWriter was initialized with AVFileTypeQuickTimeMovie). For other file types, you must specify non-nil output settings.
See also:

- 18.19.6 assetWriterInputWithMediaType(MediaType as string, outputSettings as dictionary, sourceFormatHint as CMFormatDescriptionMBS) as AVAssetWriterInputMBS 3480

18.19.6 assetWriterInputWithMediaType(MediaType as string, outputSettings as dictionary, sourceFormatHint as CMFormatDescriptionMBS) as AVAssetWriterInputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new input of the specified media type to receive sample buffers for writing to the output file.
See also:

- 18.19.5 assetWriterInputWithMediaType(MediaType as string, outputSettings as dictionary = nil) as

18.19.7 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.19.8 canAddTrackAssociationWithTrackOfInput(input as AVAssetWriterInputMBS, trackAssociationType as string) as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Whether an association between the tracks corresponding to a pair of inputs is valid.
Notes: input: The instance of AVAssetWriterInput with a corresponding track to associate with track corresponding with the receiver.
trackAssociationType: The type of track association to test. Common track association types, such as AVTrackAssociationTypeTimecode are defined in Track Association Types.

Returns true if the track association can be added; otherwise false.

If the type of association requires tracks of specific media types that don't match the media types of the inputs, or if the output file type does not support track associations, returns NO.
Available in OS X v10.9 and later.

18.19.9 Constructor(MediaType as string, outputSettings as dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initialized a new input of the specified media type to receive sample buffers for writing to the output file.
Notes: mediaType: The media type of samples that will be accepted by the input.
Media types are defined in AVMediaFormat.h.
outputSettings: The settings used for encoding the media appended to the output. Pass nil to specify that appended samples should not be re-encoded.
Audio output settings keys are defined in AVAudioSettings.h. Video output settings keys are defined in AVVideoSettings.h. Video output settings with keys from <CoreVideo/CVPixelBuffer.h>are not currently supported.

Returns an input of the specified media type initialized to receive sample buffers for writing to the output file.

Each new input accepts data for a new track of the asset writer's output file. You add an input to an asset writer using the AVAssetWriter method addInput:.

Passing nil for outputSettings instructs the input to pass through appended samples, doing no processing before they are written to the output file. This is useful if, for example, you are appending buffers that are already in a desirable compressed format. However, passthrough is currently supported only when writing to QuickTime Movie files (i.e. the AVAssetWriter was initialized with AVFileTypeQuickTimeMovie). For other file types, you must specify non-nil output settings.
See also:

- 18.19.10 Constructor(MediaType as string, outputSettings as dictionary, sourceFormatHint as CMFormatDescriptionMBS) 3482

18.19.10 Constructor(MediaType as string, outputSettings as dictionary, sourceFormatHint as CMFormatDescriptionMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initialized a new input of the specified media type to receive sample buffers for writing to the output file.
See also:

- 18.19.9 Constructor(MediaType as string, outputSettings as dictionary = nil) 3481

18.19.11 markAsFinished

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Tells the writer that no more buffers will be appended to this input.
Notes: If you are monitoring each input's expectsMediaDataInRealTime value to keep the output file well interleaved, it is important to call this method when you have finished adding buffers to a track. This is necessary to prevent other inputs from stalling, as they may otherwise wait forever for that input's media data, attempting to complete the ideal interleaving pattern.

18.19.12 metadata as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The collection of track-level metadata for association with the asset and for carriage in the output file.
Notes: The array contains AVMetadataItem objects representing the collection of track-level metadata to be written in the output file.
See also setMetadata method.

18.19.13 outputSettings as dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The settings used for encoding the media appended to the output. (read-only)
Notes: A value of nil specifies that appended samples should not be re-encoded.

18.19.14 requestMediaDataWhenReadyOnQueue(assetWriterInput as AVAssetWriterInputMBS, AssetReaderOutput as AVAssetReaderOutputMBS, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Instructs the receiver to invoke an event repeatedly, at its convenience, in order to gather media data for writing to the output.
Notes: This is a special version of that method where the plugin does the required work.
The plugin provides the block to do the work to copy samples from input to output.
You receive AVFoundationMBS.requestMediaDataWhenReadyOnQueueProgress events and on the end an AVFoundationMBS.requestMediaDataWhenReadyOnQueueFinished event, when assetReaderOutput.NextSampleBuffer does not provide the next buffer.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.
See also:

- 18.19.15 requestMediaDataWhenReadyOnQueue(tag as Variant = nil) 3483

18.19.15 requestMediaDataWhenReadyOnQueue(tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Instructs the receiver to invoke an event repeatedly, at its convenience, in order to gather media data for writing to the output.
Notes: Calls later AVFoundationMBS.requestMediaDataWhenReadyOnQueueCompleted event.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.
See also:

- 18.19.14 requestMediaDataWhenReadyOnQueue(assetWriterInput as AVAssetWriterInputMBS, AssetReaderOutput as AVAssetReaderOutputMBS, tag as Variant = nil) 3483

18.19.16 setMetadata(items() as AVMetadataItemMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sets the collection of track-level metadata for association with the asset and for carriage in the output file.
Notes: The array contains AVMetadataItem objects representing the collection of track-level metadata to be written in the output file.
You cannot set this property after writing on the receiver's asset writer has started.

18.19.17 sourceFormatHint as CMFormatDescriptionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A hint about the format of buffers that will be appended.
Notes: An AVAssetWriterInput object may be able to use this hint to fill in missing output settings or perform more upfront validation. To guarantee successful file writing, if you set this property you should ensure that subsequently-appended buffers are of the specified format. An NSInvalidArgumentException will be thrown if the media type of the format description does not match the media type of the writer input.

18.19.18 Properties

18.19.19 expectsMediaDataInRealTime as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the input should tailor its processing of media data for real-time sources.
Notes: If you are appending media data to an input from a real-time source, such as an AVCaptureOutput, you should set expectsMediaDataInRealTime to true. This will ensure that readyForMoreMediaData is calculated appropriately for real-time usage.
(Read and Write property)

18.19.20 extendedLanguageTag as String

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Language tag to associate with the track corresponding to the receiver.
Notes: The value is specified as an RFC 4646 language tag; can be nil in which case no tag is written to the track.

Extended language tags are normally set only when an ISO 639-2/T language code by itself is ambiguous, as in cases in which media data should be distinguished not only by language but also by the regional dialect

in use or the writing system employed.
Available in OS X v10.9 and later.
(Read and Write property)

18.19.21 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.19.22 isReadyForMoreMediaData as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the readiness of the input to accept more media data. (read-only)
Notes: This property is observable using key-value observing (see Key-Value Observing Programming Guide). Observers should not assume that they will be notified of changes on a specific thread.
(Read only property)

18.19.23 languageCode as String

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Language to associate with the track corresponding to the receiver.
Notes: The value is specified as an ISO 639-2/T language code; can be nil in which case no language code is written to the track..
Available in OS X v10.9 and later.
(Read and Write property)

18.19.24 marksOutputTrackAsEnabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Returns whether the receiver's track is enabled.
Notes: For file types that support enabled and disabled tracks, such as QuickTime Movie files, specifies whether the track corresponding to the receiver should be enabled by default for playback and processing.

The default value is true.
Available in OS X v10.9 and later.

(Read and Write property)

18.19.25 mediaTimeScale as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Specifies the media time scale to be used.
Notes: For file types that support media time scales, such as QuickTime Movie files, specifies the media time scale to be used.
The default value is 0, which indicates that you should choose a convenient value, if applicable.
You cannot set this property after writing has started.
(Read and Write property)

18.19.26 mediaType as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The media type of the samples that can be appended to the input. (read-only)
Notes: The value of this property is one of the media type strings defined in AVMediaFormat.
(Read only property)

18.19.27 naturalSize as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Size specified in the output file as the natural dimensions of the visual media data for display.
Notes: If the default value, (0,0), is specified, the naturalSize of the track corresponding to the receiver is set according to dimensions indicated by the format descriptions that are ultimately written to the output track.

Note: This property cannot be set after writing on the receiver's AVAssetWriter has started.
Available in OS X v10.9 and later.
(Read only property)

18.19.28 preferredVolume as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Preferred volume level to be stored in the output file.
Notes: The value for this property should typically be in the range of 0.0 to 1.0.
The default value is 1.0, which is equivalent to a "normal" volume level.

Note: This property cannot be set after writing on the receiver's AVAssetWriter has started.
Available in OS X v10.9 and later.
(Read and Write property)

18.19.29 transform as CGAffineTransformMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The transform specified in the output file as the preferred transformation of the visual media data for display purposes.
Notes: If no value is specified, the identity transform is used.
(Read and Write computed property)

18.20 class AVAssetWriterInputPixelBufferAdaptorMBS

18.20.1 class AVAssetWriterInputPixelBufferAdaptorMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use an AVAssetWriterInputPixelBufferAdaptor to append video samples packaged as CVPixelBuffer objects to a single AVAssetWriterInput object.
Notes: Instances of AVAssetWriterInputPixelBufferAdaptor provide a CVPixelBufferPool that you can use to allocate pixel buffers for writing to the output file. Using the provided pixel buffer pool for buffer allocation is typically more efficient than appending pixel buffers allocated using a separate pool.

18.20.2 Methods

18.20.3 appendPicture(pic as picture, presentationTime as CMTimeMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Appends a picture to the receiver.
Notes: Internally creates a copy of the picture to create a PixelBuffer and calls appendPixelBuffer.
Works in Cocoa and Carbon. Using appendPixelBuffer directly with PixelBuffer objects may be more efficient depending on what your app does.

18.20.4 appendPixelBuffer(pixelBuffer as CVPixelBufferMBS, presentationTime as CMTimeMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Appends a pixel buffer to the receiver.
Notes: pixelBuffer: The CVPixelBuffer to be appended.
presentationTime: The presentation time for the pixel buffer to be appended. This time will be considered relative to the time passed to AVAssetWriter.startSessionAtSourceTime to determine the timing of the frame

in the output file.

Returns true if the pixel buffer was successfully appended, otherwise false.

If the operation was unsuccessful, you might invoke the AVAssetWriter object's finishWriting method in order to save a partially completed asset.
Do not modify a CVPixelBuffer or its contents after you have passed it to this method.

18.20.5 assetWriterInput as AVAssetWriterInputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The asset writer input to which the adaptor should append pixel buffers. (read-only)

18.20.6 assetWriterInputPixelBufferAdaptorWithAssetWriterInput(input as AVAssetWriterInputMBS, sourcePixelBufferAttributes as dictionary) as AVAssetWriterInputPixelBufferAdaptorMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a new pixel buffer adaptor to receive pixel buffers for writing to the output file.
Notes: input: The asset writer input to which the receiver should append pixel buffers.
Currently, only asset writer inputs that accept media data of type AVMediaTypeVideo can be used to initialize a pixel buffer adaptor.
It is an error to pass a sample buffer input that is already attached to another instance of AVAssetWriterInputPixelBufferAdaptor.

sourcePixelBufferAttributes: The attributes of pixel buffers that will be vended by the input's CVPixelBufferPool.
Pixel buffer attributes keys for the pixel buffer pool are defined in <CoreVideo/CVPixelBuffer.h>. To take advantage of the improved efficiency of appending buffers created from the adaptor's pixel buffer pool, you should specify pixel buffer attributes that most closely accommodate the source format of the video frames being appended.
Pass nil if you do not need a pixel buffer pool for allocating buffers.

Returns a new pixel buffer adaptor to receive pixel buffers for writing to the output file.

To specify the pixel format type, the pixelBufferAttributes dictionary should contain a value for kCVPixelBufferPixelFormatTypeKey. For example, use kCVPixelFormatType_32BGRA as Integer for 8-bit-per-channel BGRA, or use kCVPixelFormatType_420YpCbCr8BiPlanarVideoRange as Integer for 2-plane YCbCr.

18.20.7 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.20.8 Constructor(input as AVAssetWriterInputMBS, sourcePixelBufferAttributes as dictionary)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a new pixel buffer adaptor to receive pixel buffers for writing to the output file.
Notes: input: The asset writer input to which the receiver should append pixel buffers.
Currently, only asset writer inputs that accept media data of type AVMediaTypeVideo can be used to initialize a pixel buffer adaptor.
It is an error to pass a sample buffer input that is already attached to another instance of AVAssetWriterInputPixelBufferAdaptor.

sourcePixelBufferAttributes: The attributes of pixel buffers that will be vended by the input's CVPixelBufferPool.
Pixel buffer attributes keys for the pixel buffer pool are defined in <CoreVideo/CVPixelBuffer.h>. To take advantage of the improved efficiency of appending buffers created from the adaptor's pixel buffer pool, you should specify pixel buffer attributes that most closely accommodate the source format of the video frames being appended.
Pass nil if you do not need a pixel buffer pool for allocating buffers.

Returns a new pixel buffer adaptor to receive pixel buffers for writing to the output file.

To specify the pixel format type, the pixelBufferAttributes dictionary should contain a value for kCVPixelBufferPixelFormatTypeKey. For example, use kCVPixelFormatType_32BGRA as Integer for 8-bit-per-channel BGRA, or use kCVPixelFormatType_420YpCbCr8BiPlanarVideoRange as Integer for 2-plane YCbCr.

18.20.9 sourcePixelBufferAttributes as Dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The pixel buffer attributes of pixel buffers that will be vended by the adaptor's CVPixelBufferPool. (read-only)
Notes: The value of this property is a dictionary containing pixel buffer attributes keys defined in <CoreVideo/CVPixelBuffer.h>.

18.20.10 Properties

18.20.11 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.21 class AVAssetWriterMBS

18.21.1 class AVAssetWriterMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use an AVAssetWriter object to write media data to a new file of a specified audiovisual container type, such as a QuickTime movie file or an MPEG-4 file, with support for automatic interleaving of media data for multiple concurrent tracks.
Example:

```
// copy the audio track of a movie into a new M4A file without re-encoding
// MyAVFoundation is a subclass of AVFoundationMBS with the events implemented.
// AV is a property of the window: AV As MyAVFoundation
// Writer is a property of the window: Writer As AVAssetWriterMBS
// Reader is a property of the window: Reader As AVAssetReaderMBS
AV = New MyAVFoundation

Var asset As AVAssetMBS = AVAssetMBS.assetWithFile(SpecialFolder.Desktop.Child("test.mov"))
Var tracks() As AVAssetTrackMBS = asset.tracksWithMediaType(AVFoundationMBS.AVMediaTypeAu-
dio)
If tracks.Count = 0 Then Return

Var error As NSErrorMBS
Reader = New AVAssetReaderMBS(asset, error)
Var output As New AVAssetReaderTrackOutputMBS(tracks(0), Nil)
Reader.addOutput output

Writer = AVAssetWriterMBS.assetWriterWithFile(SpecialFolder.Desktop.Child("audio.m4a"), AVFounda-
tionMBS.AVFileTypeAppleM4A, error)
If Writer = Nil Then
MessageBox error.localizedDescription
Return
End If
Var input As New AVAssetWriterInputMBS(AVFoundationMBS.AVMediaTypeAudio, Nil) // Nil = pass
through
Writer.addInput input

Reader.startReading
Call Writer.startWriting
Writer.startSessionAtSourceTime(CMTimeMBS.Make(0, 1))

// the plugin moves all sample buffers from output to input in the background
input.requestMediaDataWhenReadyOnQueue(input, output, Writer) // writer as tag for the event

// in MyAVFoundation:
Sub requestMediaDataWhenReadyOnQueueFinished(assetWriterInput As AVAssetWriterInputMBS, asse-
tReaderOutput As AVAssetReaderOutputMBS, tag As Variant) Handles requestMediaDataWhenReadyOn-
```

```
QueueFinished
assetWriterInput.markAsFinished
AVAssetWriterMBS(tag).finishWritingWithCompletionHandler
End Sub

Sub finishWritingCompleted(writer As AVAssetWriterMBS, tag As Variant) Handles finishWritingCompleted
System.DebugLog "Done."
End Sub
```

Notes: You can get the media data for one or more assets from instances of AVAssetReader or even from outside the AV Foundation API set. Media data is presented to AVAssetWriter for writing in the form of CMSampleBuffers. Sequences of sample data appended to the asset writer inputs are considered to fall within "sample-writing sessions." You must call startSessionAtSourceTime to begin one of these sessions.

Using AVAssetWriter, you can optionally re-encode media samples as they are written. You can also optionally write metadata collections to the output file.

You can only use a given instance of AVAssetWriter once to write to a single file. If you want to write to files multiple times, you must use a new instance of AVAssetWriter each time.

18.21.2 Methods

18.21.3 addInput(input as AVAssetWriterInputMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Adds an input to the receiver.
Notes: input: The asset writer input to be added.

Inputs are created with a media type and output settings. These both must be compatible with the receiver. You cannot add inputs after writing has started.

18.21.4 addInputGroup(inputGroup as AVAssetWriterInputGroupMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Adds an asset writer input group instance to the asset writer.
Notes: inputGroup: The asset writer input group to be added.

The asset writer will mark the tracks associated with grouped inputs as mutually exclusive to each other for playback or other processing, if the output container format supports mutually exclusive relationships among tracks.
When an input group is added to an asset writer, the value of marksOutputTrackAsEnabled for the AVAssetWriterInput instance set as the default input will automatically be set to true and all other inputs in the group will be set to false.
Input groups cannot be added after writing has started.
Available in OS X v10.9 and later.

18.21.5 assetWriterWithFile(outputFile as folderitem, outputFileType as string, byref error as NSErrorMBS) as AVAssetWriterMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an asset writer for writing to the file identified by a given folderitem in a format specified by a given UTI.
Notes: outputFile: The location of the file to be written.
outputFileType: The UTI-identified format of the file to be written.
For example, AVFileTypeQuickTimeMovie for a QuickTime movie file, AVFileTypeMPEG4 for an MPEG-4 file, and AVFileTypeAMR for an adaptive multi-rate audio format file.
Error: If initialization of the asset writer fails, upon return contains an error object that describes the problem.

Returns an asset writer for writing to the file identified by URL in the format specified by outputFileType, or nil if the writer could not be initialized.
Writing will fail if a file already exists at URL. UTIs for container formats that can be written are declared in AVMediaFormat.h.

18.21.6 assetWriterWithURL(outputURL as string, outputFileType as string, byref error as NSErrorMBS) as AVAssetWriterMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an asset writer for writing to the file identified by a given URL in a format specified by a given UTI.
Notes: outputURL: The location of the file to be written. The URL must be a file URL.
outputFileType: The UTI-identified format of the file to be written.
For example, AVFileTypeQuickTimeMovie for a QuickTime movie file, AVFileTypeMPEG4 for an MPEG-4 file, and AVFileTypeAMR for an adaptive multi-rate audio format file.
Error: If initialization of the asset writer fails, upon return contains an error object that describes the problem.

Returns an asset writer for writing to the file identified by URL in the format specified by outputFileType,

or nil if the writer could not be initialized.
Writing will fail if a file already exists at URL. UTIs for container formats that can be written are declared in AVMediaFormat.h.

18.21.7 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.21.8 availableMediaTypes as string()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The media types for which inputs can be added (read-only)
Notes: Some media types may not be accepted within the type of file with which the writer was initialized.

18.21.9 canAddInput(input as AVAssetWriterInputMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given input can be added to the receiver.
Notes: input: The asset writer input to be tested.

Returns true if input can be added, otherwise false.
You cannot add an input that accepts media data of a type that is not compatible with the receiver, or with output settings that are not compatible with the receiver.

18.21.10 canAddInputGroup(input as AVAssetWriterInputGroupMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Returns whether an input group can be added to the receiver.
Notes: inputGroup: The asset writer input group to be added.
Returns true if inputGroup can be added to the inputGroups, otherwise false.

If outputFileType specifies a container format that does not support mutually exclusive relationships among tracks, or if the specified instance of AVAssetWriterInputGroup contains inputs with media types that cannot be related, the group cannot be added.

Available in OS X v10.9 and later.

18.21.11 canApplyOutputSettings(outputSettings as dictionary, mediaType as string) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether give output settings are supported for a specified media type.
Notes: outputSettings: The output settings to validate.
mediaType: The media type for which the output settings are validated.

Returns true if the output settings in outputSettings are supported for mediaType, otherwise false.
You can use this method to test, for example, whether video output settings that specify H.264 compression will fail (as would be the case if the container format for which the writer was initialized does not support the carriage of H.264-compressed video).

18.21.12 cancelWriting

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Instructs the writer to cancel writing.
Notes: This method blocks until writing is canceled.

18.21.13 Constructor(outputFile as folderitem, outputFileType as string, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes an asset writer for writing to the file identified by a given URL in a format specified by a given UTI.
Notes: outputFile: The location of the file to be written.
outputFileType: The UTI-identified format of the file to be written.
For example, AVFileTypeQuickTimeMovie for a QuickTime movie file, AVFileTypeMPEG4 for an MPEG-4 file, and AVFileTypeAMR for an adaptive multi-rate audio format file.
Error: If initialization of the asset writer fails, upon return contains an error object that describes the problem.

Returns an asset writer for writing to the file identified by URL in the format specified by outputFileType, or nil if the writer could not be initialized.

Writing will fail if a file already exists at URL. UTIs for container formats that can be written are declared in AVMediaFormat.h.
See also:

- 18.21.14 Constructor(outputURL as string, outputFileType as string, byref error as NSErrorMBS) 3497

18.21.14 Constructor(outputURL as string, outputFileType as string, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes an asset writer for writing to the file identified by a given URL in a format specified by a given UTI.
Notes: outputURL: The location of the file to be written. The URL must be a file URL.
outputFileType: The UTI-identified format of the file to be written.
For example, AVFileTypeQuickTimeMovie for a QuickTime movie file, AVFileTypeMPEG4 for an MPEG-4 file, and AVFileTypeAMR for an adaptive multi-rate audio format file.
Error: If initialization of the asset writer fails, upon return contains an error object that describes the problem.

Returns an asset writer for writing to the file identified by URL in the format specified by outputFileType, or nil if the writer could not be initialized.

Writing will fail if a file already exists at URL. UTIs for container formats that can be written are declared in AVMediaFormat.h.
See also:

- 18.21.13 Constructor(outputFile as folderitem, outputFileType as string, byref error as NSErrorMBS) 3496

18.21.15 endSessionAtSourceTime(endTime as CMTimeMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Concludes an explicit sample-writing session.
Notes: endTime: The ending asset time for the sample-writing session, in the timeline of the source samples.

You may invoke this method to complete a session you began by invoking startSessionAtSourceTime.

You do not need to call this method; if you call finishWriting without calling this method, the session's effective end time will be the latest end timestamp of the session's samples (that is, no samples will be edited out at the end).

The endTime defines the moment on the timeline of source samples at which the session ends. In the case of the QuickTime movie file format, each sample-writing session's startTime,Ä¶endTime pair corresponds to a period of movie time into which the session's samples are inserted. Samples with later timestamps will be still be added to the media but will be edited out of the movie. So if the first session has duration D1 = endTime - startTime, it will be inserted into the movie at movie time 0 through D1; the second session would be inserted into the movie at movie time D1 through D1+D2, and so on.

It is legal to have a session with no samples; this will cause creation of an empty edit of the prescribed duration.

18.21.16 error as NSErrorMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: If the receiver's status is AVAssetWriterStatusFailed, describes the error that caused the failure. (read-only)
Notes: The value of this property is an error object that describes what caused the receiver to no longer be able to write to its output file. If the receiver's status is not AVAssetWriterStatusFailed, the value of this property is nil.

18.21.17 finishWriting as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Completes the writing of the output file.
Notes: Returns true if writing can be finished, otherwise false.

This method blocks until writing is finished. When this method returns successfully, the file being written by the receiver is complete and ready to use. You can check the values of the status and error properties for more information on why writing could not be finished.

18.21.18 finishWritingWithCompletionHandler(tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Marks all unfinished inputs as finished and completes the writing of the output file.
Notes: Calls later AVFoundationMBS.finishWritingCompleted event.

This method returns immediately and causes its work to be performed asynchronously. To determine whether the operation succeeded, you can check the value of the status property within the handler parameter. If the status is AVAssetWriterStatusFailed, then the error property will contain an instance of NSError that

describes the failure.

To guarantee that all sample buffers are successfully written, you must ensure that all calls to appendSampleBuffer and appendPixelBuffer have returned before invoking this method.

Available in OS X v10.9 and later.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

18.21.19 inputGroups as AVAssetWriterInputGroupMBS()

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: An array of asset writer input groups that have been added to the asset writer. (read-only)
Notes: The value of this property is an array containing concrete instances of AVAssetWriterInputGroup. Input groups are added to the receiver using the addInputGroup method.
Available in OS X v10.9 and later.

18.21.20 inputs as AVAssetWriterInputMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The asset writer inputs associated with the asset writer. (read-only)
Notes: The array contains AVAssetWriterInput objects.

18.21.21 metadata as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The collection of metadata for association with the asset and for carriage in the output file.
Notes: The array contains AVMetadataItem objects.
See also SetMetaData.

18.21.22 movieFragmentInterval as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time to elapse between writing movie fragments.
Notes: This property only applies to the QuickTime movie file type.

Sometimes a write operation may be unexpectedly interrupted (because a process crashes, for example). By using movie fragments, such a partially-written QuickTime movie file can be successfully opened and played up to the largest multiple of movieFragmentInterval smaller than the point at which the write operation was interrupted.

The default value is kCMTimeInvalid, which means that movie fragments should not be used, that only a movie atom describing all of the media in the file should be written.

You cannot set the value after writing has started.

18.21.23 movieTimeScale as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Specifies the asset-level time scale to be used.
Notes: For file types that contain a moov atom, such as QuickTime Movie files, specifies the asset-level time scale to be used.
The default value is 0, which indicates that you should choose a convenient value, if applicable.
You cannot set the value after writing has started.

18.21.24 outputFileType as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The file format of the writer's output. (read-only)
Notes: The format is identified by the UTI, specified when the writer is initialized.

18.21.25 outputURL as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The URL to which output is directed. (read-only)
Notes: The URL is the same as that specified when the writer is initialized.

18.21.26 setMetadata(items() as AVMetadataItemMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Set the collection of metadata for association with the asset and for carriage in the output file.
Notes: The array contains AVMetadataItem objects.
You cannot set the value after writing has started.

18.21.27 shouldOptimizeForNetworkUse as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the output file should be written in way that makes it more suitable for playback over a network.
Notes: When the value of this property is true, the output file will be written in such a way that playback can start after only a small amount of the file is downloaded.

The default value is false.
You cannot set the value after writing has started.

18.21.28 startSessionAtSourceTime(startTime as CMTimeMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initiates a sample-writing session for the output asset.
Notes: startTime: The starting asset time for the sample-writing session, in the timeline of the source samples.

Sequences of sample data appended to the asset writer inputs are considered to fall within "sample-writing sessions." You must call this method to begin one of these sessions.

Each writing session has a start time which, where allowed by the file format being written, defines the mapping from the timeline of source samples onto the file's timeline. In the case of the QuickTime movie file format, the first session begins at movie time 0, so a sample appended with timestamp T will be played at movie time (T-startTime). Samples with timestamps before startTime will still be added to the output media but will be edited out of the movie. If the earliest buffer for an input is later than startTime, an empty edit will be inserted to preserve synchronization between tracks of the output asset.

It is an error to invoke this method twice in a row without invoking endSessionAtSourceTime in between.

18.21.29 startWriting as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Tells the writer to start writing its output.
Notes: Returns true if writing can be started, otherwise false.

You must call this method after all inputs have added and other configuration properties have been set to tell the receiver to prepare for writing. After invoking this method, you can start writing sessions using startSessionAtSourceTime and can write media samples using the methods provided by each of the writer's inputs.

status signals the terminal state of the asset reader, and if a failure occurs, error describes the failure.

18.21.30 status as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The status of writing samples to the receiver's output file. (read-only)
Notes: The value of this property is an AVAssetWriterStatus constant that indicates whether writing is in progress, has completed successfully, has been canceled, or has failed. If an attempt to append samples fails, you can check the value of this property to determine why no more samples could be written.

18.21.31 Properties

18.21.32 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.21.33 Constants

Status Constants

Constant	Value	Description
AVAssetWriterStatusCancelled	4	Cancelled
AVAssetWriterStatusCompleted	2	Completed
AVAssetWriterStatusFailed	3	Failed
AVAssetWriterStatusUnknown	0	Unknown
AVAssetWriterStatusWriting	1	Writing

18.22 class AVAsynchronousVideoCompositionRequestMBS

18.22.1 class AVAsynchronousVideoCompositionRequestMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: An AVAsynchronousVideoCompositionRequest instance contains the information necessary for a video compositor to render an output pixel buffer.
Notes: The video compositor must implement the AVVideoCompositing protocol.
Available in OS X v10.9 and later.

18.22.2 Methods

18.22.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.9.

18.22.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The constructor.

18.22.5 copy as AVAsynchronousVideoCompositionRequestMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

18.22.6 finishCancelledRequest

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Invoked by the custom compositor when the composition request was canceled.
Notes: Available in OS X v10.9 and later.

18.22.7 finishWithComposedVideoFrame(composedVideoFrame as CVPixelBufferMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Invoked by the custom compositor when the composition request succeeded.
Notes: composedVideoFrame: The successfully composed pixel buffer.
Available in OS X v10.9 and later.

18.22.8 finishWithError(error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Invoked by the custom compositor when the composition request failed.
Notes: error: Returns the error encountered during the compositing.
Available in OS X v10.9 and later.

18.22.9 sourceFrameByTrackID(trackID as Integer) as CVPixelBufferMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Returns the source pixel buffer for the specified track ID.
Notes: trackID: The track ID for the requested source frame.
Returns the source CVPixelBufferRef for trackID.
Available in OS X v10.9 and later.

18.22.10 sourceTrackIDs as Integer()

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The track IDs of all the source buffers that are available to compose the frame. (read-only)
Notes: Available in OS X v10.9 and later.

18.22.11 Properties

18.22.12 compositionTime as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The time for which the frame should be composed. (read-only)
Notes: Available in OS X v10.9 and later.

(Read only property)

18.22.13 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.22.14 renderContext as AVVideoCompositionRenderContextMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The video composition render context making the request. (read-only)
Notes: Available in OS X v10.9 and later.
(Read only property)

18.22.15 videoCompositionInstruction as AVVideoCompositionInstructionMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The video composition instruction to use to compose the frame. (read-only)
Notes: Available in OS X v10.9 and later.
(Read only property)

18.23 class AVAudioMixInputParametersMBS

18.23.1 class AVAudioMixInputParametersMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVAudioMixInputParameters object represents the parameters that should be applied to an audio track when it is added to a mix.
Example:

```
// check the volume ramp of an audio mix at the start of a movie
// mix is an AVAudioMixMBS, e.g. from AVMutableAudioMixMBS, see AVMutableAudioMixInputParametersMBS
Var mix As AVAudioMixMBS // your mix
If mix = Nil Then Return

For Each p As AVAudioMixInputParametersMBS In mix.inputParameters
Var startVolume, endVolume As Double
Var range As CMTimeRangeMBS
If p.getVolumeRampForTime(CMTimeMBS.Make(0, 1), startVolume, endVolume, range) Then
System.DebugLog "Track " + p.trackID.ToString + ": volume " + startVolume.ToString + " to " + endVolume.ToString
End If
Next
```

Notes: Audio volume is currently supported as a time-varying parameter. AVAudioMixInputParameters has a mutable subclass, AVMutableAudioMixInputParameters.

You use an instance AVAudioMixInputParameters to apply audio volume ramps for an input to an audio mix. Mix parameters are associated with audio tracks via the trackID property.

Before the first time at which a volume is set, a volume of 1.0 used; after the last time for which a volume has been set, the last volume is used. Within the time range of a volume ramp, the volume is interpolated between the start volume and end volume of the ramp. For example, setting the volume to 1.0 at time 0 and also setting a volume ramp from a volume of 0.5 to 0.2 with a timeRange of [4.0, 5.0] results in an audio volume parameters that hold the volume constant at 1.0 from 0.0 sec to 4.0 sec, then cause it to jump to 0.5 and descend to 0.2 from 4.0 sec to 9.0 sec, holding constant at 0.2 thereafter.

18.23.2 Methods

18.23.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.23.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The default constructor.

18.23.5 copy as AVAudioMixInputParametersMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

18.23.6 getVolumeRampForTime(time as CMTimeMBS, byref startVolume as Double, byref endVolume as Double, byref timeRange as CMTimeRangeMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Obtains the volume ramp that includes the specified time.
Notes: time: If a ramp with a time range that contains the specified time has been set, information about the effective ramp for that time is supplied. Otherwise, information about the first ramp that starts after the specified time is supplied.
startVolume: A variable to receive the starting volume value for the volume ramp.
endVolume: A variable to receive the ending volume value for the volume ramp.
timeRange: A variable to a CMTimeRange to receive the time range of the volume ramp.

Returns true if the values were retrieved successfully, otherwise false. Returns false if time is beyond the duration of the last volume ramp that has been set.

18.23.7 mutableCopy as AVMutableAudioMixInputParametersMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates an editable copy of the object.

18.23.8 trackID as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The ID of the audio track to which the parameters should be applied. (read-only)

18.23.9 Properties

18.23.10 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.24 class AVAudioMixMBS

18.24.1 class AVAudioMixMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVAudioMix object manages the input parameters for mixing audio tracks.
Notes: It allows custom audio processing to be performed on audio tracks during playback or other operations.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo / Real Studio Plugins, version 15.1pr1

18.24.2 Methods

18.24.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.24.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.24.5 copy as AVAudioMixMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

18.24.6 inputParameters as AVAudioMixInputParametersMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The parameters for inputs to the mix (read-only)
Notes: The array contains instances of AVAudioMixInputParameters. Note that an instance of AVAudioMixInputParameters is not required for each audio track that contributes to the mix; audio for those

without associated AVAudioMixInputParameters objects will be included in the mix, processed according to default behavior.

18.24.7 mutableCopy as AVMutableAudioMixMBS

MBS AVFoundation Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Creates a mutable copy.

18.24.8 Properties

18.24.9 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.25 class AVAudioPlayerMBS

18.25.1 class AVAudioPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An instance of the AVAudioPlayer class, called an audio player, provides playback of audio data from a file or memory.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mp3")
Var e as NSErrorMBS
Var u as new AVAudioPlayerMBS(f,e)
if e<>nil then
MessageBox e.localizedDescription
else
MessageBox str(u.duration)+" seconds"
end if
```

Notes: Apple recommends that you use this class for audio playback unless you are playing audio captured from a network stream or require very low I/O latency. For an overview of audio technologies, see Audio & Video Starting Point and "Using Audio" in Multimedia Programming Guide.

Using an audio player you can:

- Play sounds of any duration
- Play sounds from files or memory buffers
- Loop sounds
- Play multiple sounds simultaneously, one sound per audio player, with precise synchronization
- Control relative playback level, stereo positioning, and playback rate for each sound you are playing
- Seek to a particular point in a sound file, which supports such application features as fast forward and rewind
- Obtain data you can use for playback-level metering

The AVAudioPlayer class lets you play sound in any audio format available in OS X. The plugin provides the events for this audio player in AVFoundationMBS class.

To play, pause, or stop an audio player, call one of its playback control methods, described in "Configuring and Controlling Playback."

To configure an appropriate audio session for playback, refer to AVAudioSession Class Reference and AVAudioSessionDelegate Protocol Reference. To learn how your choice of file formats impacts the simultaneous playback of multiple sounds, refer to "iPhone Hardware and Software Audio Codecs" in Multimedia Programming Guide.

18.25.2 Methods

18.25.3 audioPlayerWithData(Data as MemoryBlock, byref error as NSErrorMBS) as AVAudioPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player for playing a designated memory buffer.
Notes: data: A block of data containing a sound to play. The audio data must be in a format supported by Core Audio. For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.
Error: Pass in the address of a nil-initialized NSError object. If an error occurs, upon return the NSError object describes the error. If you do not want error information, pass in NULL.

On success, you get an initialized AVAudioPlayer object. Else the handle property is 0 and the Error parameter contains a code that describes the problem.
See also:

- 18.25.4 audioPlayerWithData(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS 3513
- 18.25.5 audioPlayerWithData(Data as String, byref error as NSErrorMBS) as AVAudioPlayerMBS 3513
- 18.25.6 audioPlayerWithData(Data as String, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS 3514

18.25.4 audioPlayerWithData(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player using the specified data and file type hint.
Notes: data: The data object containing the audio.
fileTypeHintUtiString: A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs.
error: If an error occurs, upon return the NSError object describes the error.

The utiString file type hint tells the parser what kind of sound data to expect so that data that may possibly be corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without filetypehint on older versins.

- 18.25.6 audioPlayerWithData(Data as String, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS 3514

18.25.5 audioPlayerWithData(Data as String, byref error as NSErrorMBS) as AVAudioPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player for playing a designated memory buffer.
Notes: data: A block of data containing a sound to play. The audio data must be in a format supported by Core Audio. For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.
Error: Pass in the address of a nil-initialized NSError object. If an error occurs, upon return the NSError object describes the error. If you do not want error information, pass in NULL.

On success, you get an initialized AVAudioPlayer object. Else the handle property is 0 and the Error parameter contains a code that describes the problem.

- 18.25.4 audioPlayerWithData(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS 3513

- 18.25.6 audioPlayerWithData(Data as String, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS 3514

18.25.6 audioPlayerWithData(Data as String, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player using the specified data and file type hint.
Notes: data: The data object containing the audio.
fileTypeHintUtiString: A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs.
error: If an error occurs, upon return the NSError object describes the error.

The utiString file type hint tells the parser what kind of sound data to expect so that data that may possibly be corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without filetypehint on older versins.

- 18.25.4 audioPlayerWithData(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS 3513
- 18.25.5 audioPlayerWithData(Data as String, byref error as NSErrorMBS) as AVAudioPlayerMBS 3513

18.25.7 audioPlayerWithFile(File as folderitem, byref error as NSErrorMBS) as AVAudioPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player for playing a designated sound file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mp3")
Var e as NSErrorMBS
Var u as AVAudioPlayerMBS.audioPlayerWithFile(f,e)
if e<>nil then
MessageBox e.localizedDescription
else
MessageBox str(u.duration)+" seconds"
end if
```

Notes: File: A folderitem identifying the sound file to play. The audio data must be in a format supported by Core Audio. For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.
Error: If an error occurs, upon return the NSError object describes the error..

On success, you have an initialized AVAudioPlayer object. On failure, the Error parameter contains a code that describes the problem.
See also:

- 18.25.8 audioPlayerWithFile(File as folderitem, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS 3515

18.25.8 audioPlayerWithFile(File as folderitem, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player using the specified URL and file type hint.
Notes: url: A URL identifying the sound file to play. The audio data must be in a format supported by Core Audio.
utiString: A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs. See AVFileType* strings.
Error: If an error occurs, upon return the NSError object describes the error.

The utiString file type hint tells the parser what kind of sound data to expect so that files which are not self identifying, or possibly even corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without hint for older versions.
See also:

- 18.25.7 audioPlayerWithFile(File as folderitem, byref error as NSErrorMBS) as AVAudioPlayerMBS 3514

18.25.9 audioPlayerWithURL(URL as string, byref error as NSErrorMBS) as AVAudioPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player for playing a designated sound file.
Notes: url: A URL identifying the sound file to play. The audio data must be in a format supported by Core Audio. For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.
Error: If an error occurs, upon return the NSError object describes the error..

On success, you have an initialized AVAudioPlayer object. On failure, the Error parameter contains a code that describes the problem.

See also:

- 18.25.10 audioPlayerWithURL(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS 3516

18.25.10 audioPlayerWithURL(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS) as AVAudioPlayerMBS

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player using the specified URL and file type hint.
Notes: url: A URL identifying the sound file to play. The audio data must be in a format supported by Core Audio.
utiString: A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs. See AVFileType* strings.
Error: If an error occurs, upon return the NSError object describes the error.

The utiString file type hint tells the parser what kind of sound data to expect so that files which are not self identifying, or possibly even corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without hint for older versions.
See also:

- 18.25.9 audioPlayerWithURL(URL as string, byref error as NSErrorMBS) as AVAudioPlayerMBS 3515

18.25.11 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.25.12 averagePowerForChannel(channel as Integer) as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the average power for a given channel, in decibels, for the sound being played.
Notes: channelNumber: The audio channel whose average power value you want to obtain. Channel numbers are zero-indexed. A monaural signal, or the left channel of a stereo signal, has channel number 0.

Returns a floating-point representation, in decibels, of a given audio channel's current average power. A return value of 0 dB indicates full scale, or maximum power; a return value of -160 dB indicates minimum

power (that is, near silence).

If the signal provided to the audio player exceeds ¬±full scale, then the return value may exceed 0 (that is, it may enter the positive range).

To obtain a current average power value, you must call the updateMeters method before calling this method.

18.25.13 Constructor(Data as MemoryBlock, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player for playing a designated memory buffer.
Notes: data: A block of data containing a sound to play. The audio data must be in a format supported by Core Audio. For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.
Error: Pass in the address of a nil-initialized NSError object. If an error occurs, upon return the NSError object describes the error. If you do not want error information, pass in NULL.

On success, you get an initialized AVAudioPlayer object. Else the handle property is 0 and the Error parameter contains a code that describes the problem.

- 18.25.15 Constructor(File as folderitem, byref error as NSErrorMBS) 3518
- 18.25.16 Constructor(File as folderitem, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3519
- 18.25.17 Constructor(URL as string, byref error as NSErrorMBS) 3519
- 18.25.18 Constructor(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3520

18.25.14 Constructor(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player using the specified data and file type hint.
Notes: data: The data object containing the audio.
fileTypeHintUtiString: A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs.
error: If an error occurs, upon return the NSError object describes the error.

The utiString file type hint tells the parser what kind of sound data to expect so that data that may possibly be corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without filetypehint on older versins.
See also:

- 18.25.13 Constructor(Data as MemoryBlock, byref error as NSErrorMBS) 3517
- 18.25.15 Constructor(File as folderitem, byref error as NSErrorMBS) 3518
- 18.25.16 Constructor(File as folderitem, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3519
- 18.25.17 Constructor(URL as string, byref error as NSErrorMBS) 3519
- 18.25.18 Constructor(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3520

18.25.15 Constructor(File as folderitem, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player for playing a designated sound file.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mp3")
Var e as NSErrorMBS
Var u as new AVAudioPlayerMBS(f,e)
if e<>nil then
MessageBox e.localizedDescription
else
MessageBox str(u.duration)+" seconds"
end if
```

Notes: File: A folderitem identifying the sound file to play. The audio data must be in a format supported by Core Audio. For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.
Error: If an error occurs, upon return the NSError object describes the error..

On success, you have an initialized AVAudioPlayer object. On failure, the Error parameter contains a code that describes the problem.
See also:

- 18.25.13 Constructor(Data as MemoryBlock, byref error as NSErrorMBS) 3517
- 18.25.14 Constructor(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3517
- 18.25.16 Constructor(File as folderitem, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3519

- 18.25.17 Constructor(URL as string, byref error as NSErrorMBS) 3519
- 18.25.18 Constructor(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3520

18.25.16 Constructor(File as folderitem, fileTypeHintUtiString as string, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player using the specified URL and file type hint.
Notes: url: A URL identifying the sound file to play. The audio data must be in a format supported by Core Audio.
utiString: A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs. See AVFileType* strings.
Error: If an error occurs, upon return the NSError object describes the error.

The utiString file type hint tells the parser what kind of sound data to expect so that files which are not self identifying, or possibly even corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without hint for older versions.
See also:

- 18.25.14 Constructor(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3517
- 18.25.15 Constructor(File as folderitem, byref error as NSErrorMBS) 3518
- 18.25.17 Constructor(URL as string, byref error as NSErrorMBS) 3519
- 18.25.18 Constructor(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3520

18.25.17 Constructor(URL as string, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player for playing a designated sound file.
Notes: url: A URL identifying the sound file to play. The audio data must be in a format supported by Core Audio. For a list of supported formats, see "Using Audio" in Multimedia Programming Guide.
Error: If an error occurs, upon return the NSError object describes the error..

On success, you have an initialized AVAudioPlayer object. On failure, the Error parameter contains a code that describes the problem.
See also:

- 18.25.13 Constructor(Data as MemoryBlock, byref error as NSErrorMBS) 3517

- 18.25.14 Constructor(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3517
- 18.25.15 Constructor(File as folderitem, byref error as NSErrorMBS) 3518
- 18.25.16 Constructor(File as folderitem, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3519
- 18.25.18 Constructor(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3520

18.25.18 Constructor(URL as string, fileTypeHintUtiString as string, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Initializes and returns an audio player using the specified URL and file type hint.
Notes: url: A URL identifying the sound file to play. The audio data must be in a format supported by Core Audio.
utiString: A UTI that is used as a file type hint. The supported UTIs are defined in File Format UTIs. See AVFileType* strings.
Error: If an error occurs, upon return the NSError object describes the error.

The utiString file type hint tells the parser what kind of sound data to expect so that files which are not self identifying, or possibly even corrupt, can be successfully parsed.

Available in OS X v10.9 and later, but plugin calls variant without hint for older versions.
See also:

- 18.25.13 Constructor(Data as MemoryBlock, byref error as NSErrorMBS) 3517
- 18.25.14 Constructor(Data as MemoryBlock, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3517
- 18.25.15 Constructor(File as folderitem, byref error as NSErrorMBS) 3518
- 18.25.16 Constructor(File as folderitem, fileTypeHintUtiString as string, byref error as NSErrorMBS) 3519
- 18.25.17 Constructor(URL as string, byref error as NSErrorMBS) 3519

18.25.19 pause

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Pauses playback; sound remains ready to resume playback from where it left off.
Notes: Calling pause leaves the audio player prepared to play; it does not release the audio hardware that was acquired upon calling play or prepareToPlay.

18.25.20 peakPowerForChannel(channel as Integer) as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the peak power for a given channel, in decibels, for the sound being played.
Notes: channelNumber: The audio channel whose peak power value you want to obtain. Channel numbers are zero-indexed. A monaural signal, or the left channel of a stereo signal, has channel number 0.

Returns a floating-point representation, in decibels, of a given audio channel's current peak power. A return value of 0 dB indicates full scale, or maximum power; a return value of -160 dB indicates minimum power (that is, near silence).

If the signal provided to the audio player exceeds ¬±full scale, then the return value may exceed 0 (that is, it may enter the positive range).

To obtain a current peak power value, you must call the updateMeters method before calling this method.

18.25.21 play as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Plays a sound asynchronously.
Notes: Returns true on success, or false on failure.
Calling this method implicitly calls the prepareToPlay method if the audio player is not already prepared to play.

18.25.22 playAtTime(time as Double = 0.0) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Plays a sound asynchronously, starting at a specified point in the audio output device's timeline.
Example:

```
Var p as AVAudioPlayerMBS // your player

if p.playAtTime(p.deviceCurrentTime + 5.0) then
// playing in 5 seconds
else
// failed
end if
```

Notes: time: The number of seconds to delay playback, relative to the audio output device's current time.

Returns true on success, or false on failure.

To learn about the virtual audio output device's timeline, read the description for the deviceCurrentTime property.
Calling this method implicitly calls the prepareToPlay method if the audio player is not already prepared to play.

18.25.23 prepareToPlay as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Prepares the audio player for playback by preloading its buffers.
Notes: Returns true on success, or false on failure.

Calling this method preloads buffers and acquires the audio hardware needed for playback, which minimizes the lag between calling the play method and the start of sound output.
Calling the stop method, or allowing a sound to finish playing, undoes this setup.

18.25.24 stop

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Stops playback and undoes the setup needed for playback.
Notes: Calling this method, or allowing a sound to finish playing, undoes the setup performed upon calling the play or prepareToPlay methods.

The stop method does not reset the value of the currentTime property to 0. In other words, if you call stop during playback and then call play, playback resumes at the point where it left off.

18.25.25 updateMeters

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Refreshes the average and peak power values for all channels of an audio player.
Notes: To obtain current audio power values, you must call this method before calling averagePowerForChannel or peakPowerForChannel.

18.25.26 Properties

18.25.27 currentDevice as String

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The UID of the current audio device (as a string).
Notes: Available on MacOS 10.13 or newer.
Settable in v20.0 or newer.
(Read and Write property)

18.25.28 currentTime as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The playback point, in seconds, within the timeline of the sound associated with the audio player.
Notes: If the sound is playing, currentTime is the offset of the current playback position, measured in seconds from the start of the sound. If the sound is not playing, currentTime is the offset of where playing starts upon calling the play method, measured in seconds from the start of the sound.

By setting this property you can seek to a specific point in a sound file or implement audio fast-forward and rewind functions.
(Read and Write property)

18.25.29 data as MemoryBlock

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The data object containing the sound associated with the audio player. (read-only)
Notes: Returns nil if the audio player has no data (that is, if it was not initialized with an Memoryblock).
(Read only property)

18.25.30 deviceCurrentTime as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time value, in seconds, of the audio output device. (read-only)
Notes: The value of this property increases monotonically while an audio player is playing or paused.

If more than one audio player is connected to the audio output device, device time continues incrementing as long as at least one of the players is playing or paused.

If the audio output device has no connected audio players that are either playing or paused, device time reverts to 0.

Use this property to indicate "now" when calling the playAtTime instance method. By configuring multiple audio players to play at a specified offset from deviceCurrentTime, you can perform precise synchronization—as described in the discussion for that method.
(Read only property)

18.25.31 duration as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the total duration, in seconds, of the sound associated with the audio player. (read-only)
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mp3")
Var e as NSErrorMBS
Var u as new AVAudioPlayerMBS(f,e)
if e<>nil then
MessageBox e.localizedDescription
else
MessageBox str(u.duration)+" seconds"
end if
```

Notes: (Read only property)

18.25.32 enableRate as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A Boolean value that specifies whether playback rate adjustment is enabled for an audio player.
Notes: To enable adjustable playback rate for an audio player, set this property to YES after you initialize the player and before you call the prepareToPlay instance method for the player.
Available in OS X v10.8 and later.
(Read and Write property)

18.25.33 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.25.34 isPlaying as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the audio player is playing (true) or not (false). (read-only)
Notes: To find out when playback has stopped, use the AVFoundationMBS.audioPlayerDidFinishPlaying event.

Important: Do not poll this property (that is, do not use it inside of a loop) in an attempt to discover when playback has stopped.
(Read only property)

18.25.35 meteringEnabled as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value that specifies the audio-level metering on/off state for the audio player.
Notes: The default value for the meteringEnabled property is off (Boolean false). Before using metering for an audio player, you need to enable it by setting this property to true.
(Read and Write property)

18.25.36 Name as String

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: All.

Function: The name of the audio file.
Notes: This uses the URL to pull the display name if possible, so you can show it to user or identify the player when debugging.
(Read only property)

18.25.37 numberOfChannels as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The number of audio channels in the sound associated with the audio player. (read-only)
Notes: (Read only property)

18.25.38 numberOfLoops as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The number of times a sound will return to the beginning, upon reaching the end, to repeat playback.
Notes: A value of 0, which is the default, means to play the sound once. Set a positive integer value to specify the number of times to return to the start and play again. For example, specifying a value of 1 results in a total of two plays of the sound. Set any negative integer value to loop the sound indefinitely until you call the stop method.
(Read and Write property)

18.25.39 pan as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The audio player's stereo pan position.
Notes: By setting this property you can position a sound in the stereo field. A value of –1.0 is full left, 0.0 is center, and 1.0 is full right.
(Read and Write property)

18.25.40 rate as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The audio player's playback rate.
Example:

```
Var s as sound // your sound
Var a as AVAudioPlayerMBS = s.AVAudioPlayerMBS
a.rate = 0.5
```

Notes: This property's default value of 1.0 provides normal playback rate. The available range is from 0.5 for half-speed playback through 2.0 for double-speed playback.

To set an audio player's playback rate, you must first enable rate adjustment as described in the enableRate property description.
Available in OS X v10.8 and later.
(Read and Write property)

18.25.41 settings as Dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The audio player's settings dictionary, containing information about the sound associated with the player. (read-only)
Notes: An audio player's settings dictionary contains keys for the following information about the player's associated sound:

Channel layout (AVChannelLayoutKey)
Encoder bit rate (AVEncoderBitRateKey)
Audio data format (AVFormatIDKey)
Channel count (AVNumberOfChannelsKey)
Sample rate (AVSampleRateKey)

The settings keys are described in AV Foundation Audio Settings Constants.
(Read only property)

18.25.42 URL as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The URL for the sound associated with the audio player. (read-only)
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mp3")
Var e as NSErrorMBS
Var u as new AVAudioPlayerMBS(f,e)
if e<>nil then
MessageBox e.localizedDescription
else
MessageBox u.URL
end if
```

Notes: Returns "" if the audio player was not initialized with a URL.
(Read only property)

18.25.43 volume as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The playback gain for the audio player, ranging from 0.0 through 1.0.
Notes: (Read and Write property)

18.26 class AVAudioRecorderMBS

18.26.1 class AVAudioRecorderMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An instance of the AVAudioRecorder class, called an audio recorder, provides audio recording capability in your application.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.caf")
Var recordSetting as new Dictionary

Var n as Integer = OSTypeFromStringMBS(AVFoundationMBS.kAudioFormatLinearPCM)
recordSetting.Value(AVFoundationMBS.AVFormatIDKey) = n
recordSetting.Value(AVFoundationMBS.AVSampleRateKey) = 44100.0
recordSetting.Value(AVFoundationMBS.AVNumberOfChannelsKey) = 2
recordSetting.Value(AVFoundationMBS.AVLinearPCMBitDepthKey) = 16
recordSetting.Value(AVFoundationMBS.AVLinearPCMIsBigEndianKey) = false
recordSetting.Value(AVFoundationMBS.AVLinearPCMIsFloatKey) = false

Var error as NSErrorMBS
Var recorder as new AVAudioRecorderMBS(f, recordSetting, error)

if error<>Nil then
MessageBox error.LocalizedDescription
Return
end if

if recorder.recordForDuration(10) then
// ok
else
MessageBox "Failed to start recording."
end if
```

Notes: Using an audio recorder you can:

- Record until the user stops the recording
- Record for a specified duration
- Pause and resume a recording
- Obtain input audio-level data that you can use to provide level metering

In OS X, the audio comes from the system's default audio input device as set by a user in System Preferences.

You can implement a subclass of AVFoundationMBS to respond to audio interruptions and audio decoding errors, and to the completion of a recording.

To configure a recording, including options such as bit depth, bit rate, and sample rate conversion quality, configure the audio recorder's settings dictionary. Use the settings keys described in AV Foundation Audio Settings Constants.

To configure an appropriate audio session for recording, refer to AVAudioSession Class Reference and AVAudioSessionDelegate Protocol Reference.

The AVAudioRecorder class is intended to allow you to make audio recordings with very little programming overhead. Other classes that can be used for recording audio in OS X include AVCaptureAudioDataOutput and the Audio Queue services described in the Audio Queue Services Programming Guide.

In OS X, you can also use the AVCaptureAudioFileOutput class to record audio.
Available in OS X v10.7 and later.

Calls audioRecorderEncodeErrorDidOccur and audioRecorderDidFinishRecording events on AVFoundationMBS class.

18.26.2 Methods

18.26.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.26.4 averagePowerForChannel(channelNumber as Integer) as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the average power for a given channel, in decibels, for the sound being recorded.
Notes: channelNumber: The number of the channel that you want the average power value for.
Returns the current average power, in decibels, for the sound being recorded. A return value of 0 dB indicates full scale, or maximum power; a return value of -160 dB indicates minimum power (that is, near silence).

If the signal provided to the audio recorder exceeds ¬±full scale, then the return value may exceed 0 (that is, it may enter the positive range).

To obtain a current average power value, you must call the updateMeters method before calling this method.

18.26.5 Constructor(file as folderitem, settings as Dictionary, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes an audio recorder.
Notes: url: The file system location to record to. The file type to record to is inferred from the file extension included in this parameter's value.
settings: Settings for the recording session. For information on the settings available for an audio recorder, see AV Foundation Audio Settings Constants.
Error: Pass in the address of a nil-initialized NSError object. If an error occurs, upon return the NSError object describes the error. If you do not want error information, pass in NULL.
See also:

- 18.26.6 Constructor(URL as string, settings as Dictionary, byref error as NSErrorMBS) 3531

18.26.6 Constructor(URL as string, settings as Dictionary, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes an audio recorder.
Notes: url: The file system location to record to. The file type to record to is inferred from the file extension included in this parameter's value.
settings: Settings for the recording session. For information on the settings available for an audio recorder, see AV Foundation Audio Settings Constants.
Error: Pass in the address of a nil-initialized NSError object. If an error occurs, upon return the NSError object describes the error. If you do not want error information, pass in NULL.
See also:

- 18.26.5 Constructor(file as folderitem, settings as Dictionary, byref error as NSErrorMBS) 3531

18.26.7 currentTime as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The time, in seconds, since the beginning of the recording. (read-only)
Notes: When the audio recorder is stopped, calling this method returns a value of 0.
Available in OS X v10.7 and later.

18.26.8 deleteRecording as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Deletes a recorded audio file.
Notes: Returns true on success, or false on failure.
The audio recorder must be stopped before you call this method.

18.26.9 pause

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Pauses a recording.
Notes: Call record to resume recording.

18.26.10 peakPowerForChannel(channelNumber as Integer) as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the peak power for a given channel, in decibels, for the sound being recorded.
Notes: channelNumber: The number of the channel that you want the peak power value for.

Returns the current peak power, in decibels, for the sound being recorded. A return value of 0 dB indicates full scale, or maximum power; a return value of -160 dB indicates minimum power (that is, near silence).

If the signal provided to the audio recorder exceeds ¬±full scale, then the return value may exceed 0 (that is, it may enter the positive range).

To obtain a current peak power value, call the updateMeters method immediately before calling this method.

18.26.11 prepareToRecord as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates an audio file and prepares the system for recording.
Notes: Returns true on success, or false on failure.

Creates an audio file at the location specified by the url parameter in the Constructor method. If a file already exists at that location, this method overwrites it.
The preparation invoked by this method takes place automatically when you call record. Use prepareToRecord when you want recording to start as quickly as possible upon calling record.

18.26.12 record as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Starts or resumes recording.
Notes: Returns true on success, or false on failure.
Calling this method implicitly calls prepareToRecord, which creates (or erases) an audio file and prepares the system for recording.

18.26.13 recordForDuration(duration as Double) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Records for a specified duration of time.
Notes: duration: The maximum duration, in seconds, for the recording.
Returns true on success, or false on failure.

The recorder stops when the duration of recorded audio reaches the value in the duration parameter.

Calling this method implicitly calls prepareToRecord, which creates (or erases) an audio file and prepares the system for recording.

18.26.14 Recording as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the audio recorder is recording (true), or not (false). (read-only)

18.26.15 settings as Dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The audio settings for the audio recorder. (read-only)
Notes: Audio recorder settings are in effect only after you explicitly call the prepareToRecord method, or after you call it implicitly by starting recording. The audio settings keys are described in AV Foundation Audio Settings Constants.

18.26.16 stop

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Stops recording and closes the audio file.

18.26.17 updateMeters

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Refreshes the average and peak power values for all channels of an audio recorder.
Notes: To obtain current audio power values, you must call this method before you call averagePowerForChannel or peakPowerForChannel.

18.26.18 url as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The URL for the audio file associated with the audio recorder. (read-only)

18.26.19 Properties

18.26.20 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.26.21 MeteringEnabled as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether audio-level metering is enabled (true), or not (false).
Notes: By default, audio level metering is off for an audio recorder. Because metering uses computing resources, turn it on only if you intend to use it.
Available in OS X v10.7 and later.
(Read and Write computed property)

18.27 class AVCaptureAudioChannelMBS

18.27.1 class AVCaptureAudioChannelMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: You use an AVCaptureAudioChannel to monitor the average and peak power levels in an audio channel in a capture connection (see AVCaptureConnection).
Notes: An AVCaptureConnection object from an input producing audio to an output receiving audio exposes an array of AVCaptureAudioChannel objects, one for each channel of audio available. You can poll for audio levels by iterating through these audio channel objects.
You cannot create instances of AVCaptureAudioChannel directly.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.27.2 Methods

18.27.3 averagePowerLevel as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The instantaneous average power level, in dB. (read-only)

18.27.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.27.5 peakHoldLevel as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The peak hold power level, in dB. (read-only)

18.27.6 Properties

18.27.7 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.27.8 Enabled as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the channel is currently enabled for data capture.
Notes: By default, all AVCaptureAudioChannel objects exposed by a connection are enabled. You may set enabled to false to stop the flow of data for a particular channel.
(Read and Write computed property)

18.27.9 volume as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current volume (gain) of the channel.
Notes: The volume property indicates the current volume or gain of the receiver as a floating point value between 0.0 and 1.0. If you want to boost the gain in software, you may specify a a value greater than 1.0.
(Read and Write computed property)

18.28 class AVCaptureAudioDataOutputMBS

18.28.1 class AVCaptureAudioDataOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVCaptureAudioDataOutput is a concrete sub-class of AVCaptureOutput that you use, via its delegate, to process audio sample buffers from the audio being captured.
Notes: Subclass of the AVCaptureOutputMBS class.

18.28.2 Methods

18.28.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The constructor.
Notes: Enables events on the new object.

18.28.4 EnableEvents

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Enables the event for an existing audio data output object.
Notes: For the audio data output, the plugin will with enabled events call captureOutputDidOutputSampleBuffer event.

18.28.5 Properties

18.28.6 audioSettings as dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The settings used to decode or re-encode audio before it is output.
Notes: The value of this property is a dictionary containing values for audio settings keys defined in AVAudioSettings.h.
If the value of this property is nil, samples are output in their device native format.
(Read and Write computed property)

18.29 class AVCaptureAudioFileOutputMBS

18.29.1 class AVCaptureAudioFileOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: AVCaptureMovieFileOutput is a concrete sub-class of AVCaptureFileOutput that writes captured audio to any audio file type supported by CoreAudio.
Example:

```
// record audio from the default microphone into an M4A file
// MyAVFoundation is a subclass of AVFoundationMBS with the captureOutputDidFinishRecordingToOutputFileAtURL event implemented.
// AV is a property of the window: AV As MyAVFoundation
// Session is a property of the window: Session As AVCaptureSessionMBS
// AudioOutput is a property of the window: AudioOutput As AVCaptureAudioFileOutputMBS
AV = New MyAVFoundation
Var error As NSErrorMBS
Var mic As AVCaptureDeviceMBS = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeAudio)
Var input As AVCaptureDeviceInputMBS = AVCaptureDeviceInputMBS.deviceInputWithDevice(mic, error)
If input = Nil Then Return

Session = New AVCaptureSessionMBS
Session.addInput input
AudioOutput = New AVCaptureAudioFileOutputMBS
Session.addOutput AudioOutput
Session.startRunning

AudioOutput.startRecordingToOutputFile(SpecialFolder.Desktop.Child("recording.m4a"), AVFoundationMBS.AVFileTypeAppleM4A)
// stop later with AudioOutput.stopRecording

// in MyAVFoundation:
Sub captureOutputDidFinishRecordingToOutputFileAtURL(captureOutput As AVCaptureFileOutputMBS, outputFileURL As String, connections() As AVCaptureConnectionMBS, error As NSErrorMBS) Handles captureOutputDidFinishRecordingToOutputFileAtURL
If error <>Nil Then
System.DebugLog error.localizedDescription
Else
System.DebugLog "Saved " + outputFileURL
End If
End Sub
```

Notes: AVCaptureAudioFileOutput implements the complete file recording interface declared by AVCaptureFileOutput for writing media data to audio files. In addition, you can configure options specific to the

audio file formats, including writing metadata collections to each file and specifying audio encoding options. AVCaptureAudioFileOutput does not, however, support startRecordingToOutputFileURL use startRecordingToOutputFileURL with outputfiletype parameter instead.
Subclass of the AVCaptureFileOutputMBS class.

18.29.2 Methods

18.29.3 availableOutputFileTypes as string()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns array containing UTIs identifying the file types AVCaptureAudioFileOutput can write.

18.29.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.

18.29.5 EnableEvents

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Enables the events for this output.
Notes: Those are normally handled automatically, but if you add event with AddHandler you need to call this method.

18.29.6 metadata as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A collection of metadata to be written to the receiver's output files.
Notes: The value of this property is an array of AVMetadataItem objects representing the collection of top-level metadata to be written in each output file. Only ID3 v2.2, v2.3, or v2.4 style metadata items are supported.

18.29.7 setMetadata(items() as AVMetadataItemMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the metadata array.

18.29.8 startRecordingToOutputFile(file as folderitem, outputFileType as string)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Tells the receiver to start recording to a new file of the specified format, and specifies a delegate that will be notified when recording is finished.
Notes: file: The output file. If a file already exists when capturing starts, recording to the new file will fail.
fileType: A UTI indicating the format of the file to be written. UTIs for common audio file types are declared in AVMediaFormat.h.

You do not need not to call stopRecording before calling this method while another recording is in progress. If this method is invoked while an existing output file was already being recorded, no media samples will be discarded between the old file and the new file.

When recording is stopped—by calling stopRecording, by changing files using this method, or because of an error—the remaining data that needs to be included to the file will be written in the background. Therefore, you must specify a delegate that will be notified when all data has been written to the file using the captureOutputDidFinishRecordingToOutputFileAtURL method. The recording delegate can also optionally implement methods that inform it when data starts being written, when recording is paused and resumed, and when recording is about to be finished.

On OS X, if this method is called within the captureOutputDidOutputSampleBuffer event method, the first samples written to the new file are guaranteed to be those contained in the sample buffer passed to that method.

18.29.9 startRecordingToOutputFileURL(URL as string, outputFileType as string)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Tells the receiver to start recording to a new file of the specified format, and specifies a delegate that will be notified when recording is finished.
Notes: URL: The URL of the output file. This method throws an NSInvalidArgumentException if the URL is not a valid file URL. If a file at the given URL already exists when capturing starts, recording to the new file will fail.
fileType: A UTI indicating the format of the file to be written. UTIs for common audio file types are declared in AVMediaFormat.h.

You do not need not to call stopRecording before calling this method while another recording is in progress. If this method is invoked while an existing output file was already being recorded, no media samples will be discarded between the old file and the new file.

When recording is stopped—by calling stopRecording, by changing files using this method, or because of an error—the remaining data that needs to be included to the file will be written in the background. Therefore, you must specify a delegate that will be notified when all data has been written to the file using the captureOutputDidFinishRecordingToOutputFileAtURL method. The recording delegate can also optionally implement methods that inform it when data starts being written, when recording is paused and resumed, and when recording is about to be finished.

On OS X, if this method is called within the captureOutputDidOutputSampleBuffer event method, the first samples written to the new file are guaranteed to be those contained in the sample buffer passed to that method.

18.29.10 Properties

18.29.11 audioSettings as dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The settings used to decode or re-encode audio before it is output by the receiver.
Notes: The value of this property is a dictionary containing values for audio settings keys defined in AVAudioSettings.h. If you set the value of this property to nil, the output vends samples in their device native format.
(Read and Write computed property)

18.30 class AVCaptureAudioPreviewOutputMBS

18.30.1 class AVCaptureAudioPreviewOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: AVCaptureAudioPreviewOutput is a concrete subclass of AVCaptureOutput that you use to preview audio being captured.
Notes: Instances of AVCaptureAudioPreviewOutput are associated with a Core Audio output device that can be used to play audio being captured by the capture session. You can obtain the unique ID of a Core Audio device using its kAudioDevicePropertyDeviceUID property.
Subclass of the AVCaptureOutputMBS class.

18.30.2 Methods

18.30.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The default constructor.

18.30.4 Properties

18.30.5 outputDeviceUniqueID as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the unique ID of the Core Audio output device being used to play preview audio.
Notes: The value of this property is an string containing the unique ID of the Core Audio device to be used for output, or "" if the default system output should be used.
(Read and Write computed property)

18.30.6 volume as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the preview volume of the output.
Notes: The value of this property is the preview volume of the receiver, where 1.0 is the maximum volume and 0.0 is muted.
(Read and Write computed property)

18.31 class AVCaptureConnectionMBS

18.31.1 class AVCaptureConnectionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVCaptureConnection object represents a connection between capture input and capture output objects associated with a capture session.
Example:

```
// record a mirrored video like a selfie camera
// Session is a property of the window: Session As AVCaptureSessionMBS (with a camera input, see AVCaptureSessionMBS)
// MovieOutput is a property of the window: MovieOutput As AVCaptureMovieFileOutputMBS (added to the session)
Var connection As AVCaptureConnectionMBS = MovieOutput.connectionWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
If connection <>Nil Then
If connection.VideoMirroringSupported Then connection.VideoMirrored = True
System.DebugLog "Connection active: " + connection.Active.ToString
End If
```

Notes: Capture inputs (instances of AVCaptureInput) have one or more input ports (instances of AVCaptureInputPort). Capture outputs (instances of AVCaptureOutput) can accept data from one or more sources (for example, an AVCaptureMovieFileOutput object accepts both video and audio data).

You can only add an AVCaptureConnection instance to a session using addConnection: if canAddConnection: returns true. When using addInput or addOutput, connections are formed automatically between all compatible inputs and outputs. You only need to add connections manually when adding an input or output with no connections. You can also use connections to enable or disable the flow of data from a given input or to a given output.

18.31.2 Methods

18.31.3 audioChannels as AVCaptureAudioChannelMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An array of AVCaptureAudioChannel objects. (read-only)
Notes: This property is only applicable to connections involving audio.

18.31.4 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.31.5 connectionWithInputPort(port as AVCaptureInputPortMBS, layer as AVCaptureVideoPreviewLayerMBS) as AVCaptureConnectionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a capture connection describing a connection between the specified input port and the specified video preview layer.
Notes: port: An AVCaptureInputPort object associated with an AVCaptureInput object.
layer: An AVCaptureVideoPreviewLayer object.

Returns a capture connection describing a connection between the port and layer.

You can add the connection returned by this method to an AVCaptureSession instance using addConnection:.

When using addInput or addOutput, connections are automatically formed between all compatible inputs and outputs. You do not need to manually create and add connections to the session unless you use the primitive addInputWithNoConnections or addOutputWithNoConnections methods.

18.31.6 connectionWithInputPorts(ports() as AVCaptureInputPortMBS, output as AVCaptureOutputMBS) as AVCaptureConnectionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a capture connection describing a connection between the specified input ports and the specified output.
Notes: ports: An array of AVCaptureInputPort objects associated with AVCaptureInput objects.
output: An AVCaptureOutput object.

Returns a capture connection describing a connection between inputPorts and the output.

You can add the connection returned by this method to an AVCaptureSession instance using addConnection.

When using addInput or addOutput, connections are automatically formed between all compatible inputs and outputs. You do not need to manually create and add connections to the session unless you use the

primitive addInputWithNoConnections or addOutputWithNoConnections methods.

18.31.7 Constructor(port as AVCaptureInputPortMBS, layer as AVCaptureVideoPreviewLayerMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes a capture connection to describe a connection between the specified input port and the specified video preview layer.
Notes: port: An AVCaptureInputPort object associated with an AVCaptureInput object.
layer: An AVCaptureVideoPreviewLayer object.

Returns a capture connection describing a connection between the port and layer.

You can add the connection returned by this method to an AVCaptureSession instance using addConnection.

When using addInput or addOutput, connections are automatically formed between all compatible inputs and outputs. You do not need to manually create and add connections to the session unless you use the primitive addInputWithNoConnections or addOutputWithNoConnections methods.
See also:

- 18.31.8 Constructor(ports() as AVCaptureInputPortMBS, output as AVCaptureOutputMBS) 3545

18.31.8 Constructor(ports() as AVCaptureInputPortMBS, output as AVCaptureOutputMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes a capture connection to describe a connection between the specified input ports and the specified output.
Notes: ports: An array of AVCaptureInputPort objects associated with AVCaptureInput objects.
output: An AVCaptureOutput object.

Returns acapture connection initialized to describe a connection between inputPorts and the output.

You can add the connection returned by this method to an AVCaptureSession instance using addConnection.

When using addInput or addOutput, connections are automatically formed between all compatible inputs and outputs. You do not need to manually create and add connections to the session unless you use the primitive addInputWithNoConnections or addOutputWithNoConnections methods.
See also:

- 18.31.7 Constructor(port as AVCaptureInputPortMBS, layer as AVCaptureVideoPreviewLayerMBS) 3545

18.31.9 inputPorts as AVCaptureInputPortMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The connection's input ports. (read-only)
Notes: Input ports are instances of AVCaptureInputPort.

18.31.10 Properties

18.31.11 Active as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the connection is active. (read-only)
Notes: (Read only property)

18.31.12 automaticallyAdjustsVideoMirroring as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the value of videoMirrored can change based on configuration of the session.
Notes: For some session configurations, video data flowing through the connection will be mirrored by default. When the value of this property is true, the value of videoMirrored may change depending on the configuration of the session, for example after switching to a different capture device input.

The default value is true.
(Read and Write property)

18.31.13 Enabled as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the connection is enabled.
Notes: (Read and Write property)

18.31.14 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.31.15 output as AVCaptureOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The connection's output port. (read-only)
Notes: (Read only property)

18.31.16 videoFieldMode as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An indicator of how interlaced video flowing through the connection should be treated.
Notes: This property is only applicable to connections involving video.
You can only set this value if supportsVideoFieldMode is true.
(Read and Write property)

18.31.17 VideoFieldModeSupported as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A Boolean value that indicates whether the connection supports setting the videoFieldMode property. (read-only)
Notes: This property is only applicable to connections involving video.
(Read only property)

18.31.18 videoMaxFrameDuration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The maximum time interval between which the receiver should output consecutive video frames.
Notes: The value of this property specifies the maximum duration of each video frame output by the connection, placing an upper bound on the amount of time that should separate consecutive frames. The value is equivalent to the reciprocal of the minimum frame rate.
A value of kCMTimeZero or kCMTimeInvalid indicates an unlimited minimum frame rate.
The default value is kCMTimeInvalid.

You can only set this value if supportsVideoMaxFrameDuration is true.
Available in OS X v10.9 and later.
(Read and Write property)

18.31.19 VideoMaxFrameDurationSupported as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the connection supports setting the videoMaxFrameDuration property. (read-only)
Notes: This property is only applicable to connections involving video.
Available in OS X v10.9 and later.
(Read only property)

18.31.20 videoMinFrameDuration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The minimum time interval between which the receiver should output consecutive video frames.
Notes: The value of this property specifies the minimum duration of each video frame output by the connection, placing a lower bound on the amount of time that should separate consecutive frames. The value is equivalent to the reciprocal of the maximum frame rate.

A value of kCMTimeZero or kCMTimeInvalid indicates an unlimited maximum frame rate.

The default value is kCMTimeInvalid.

You can only set this value if supportsVideoMinFrameDuration is true.
(Read and Write property)

18.31.21 VideoMinFrameDurationSupported as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the connection supports setting the videoMinFrameDuration property. (read-only)
Notes: This property is only applicable to connections involving video.
(Read only property)

18.31.22 VideoMirrored as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the video flowing through the connection should be mirrored about its vertical axis.
Notes: This property is only applicable to connections involving video.

if the value of supportsVideoMirroring is true, you can set videoMirrored to true to flip the video about its vertical axis and produce a mirror-image effect.
(Read and Write property)

18.31.23 VideoMirroringSupported as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the connection supports video mirroring. (read-only)
Notes: (Read only property)

18.31.24 videoOrientation as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The orientation of the video.
Notes: This property is only applicable to connections involving video.

If the value of supportsVideoOrientation is true, you can set videoOrientation to rotate the video buffers being consumed by the connection's output. Setting videoOrientation does not necessarily result in a physical rotation of video buffers. For example, a video connection to an AVCaptureMovieFileOutput object handles orientation using a Quicktime track matrix; using an AVCaptureStillImageOutput object, orientation is handled using Exif tags.
(Read and Write property)

18.31.25 VideoOrientationSupported as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the connection supports changing the orientation of the video. (read-only)
Notes: (Read only property)

18.31.26 videoPreviewLayer as AVCaptureVideoPreviewLayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The video preview layer associated with the connection. (read-only)
Notes: This property is the set if you initialized the connection using Constructor or connectionWithInputPort.
(Read only property)

18.31.27 Constants

Video Orientation Constants

Constant	Value	Description
AVCaptureVideoOrientationLandscapeLeft	4	Indicates that video should be oriented horizontally, top on th
AVCaptureVideoOrientationLandscapeRight	3	Indicates that video should be oriented horizontally, top on th
AVCaptureVideoOrientationPortrait	1	Indicates that video should be oriented vertically, top at the t
AVCaptureVideoOrientationPortraitUpsideDown	2	Indicates that video should be oriented vertically, top at the b

Video Field Modes

Constant	Value	Description
AVVideoFieldModeBoth	0	Indicates that both top and bottom video fields in interlaced content should be passed through.
AVVideoFieldModeBottomOnly	2	Indicates that the bottom video field only in interlaced content should be passed through.
AVVideoFieldModeDeinterlace	3	Indicates that top and bottom video fields in interlaced content should be deinterlaced.
AVVideoFieldModeTopOnly	1	Indicates that only the top video field in interlaced content should be passed through.

18.32 class AVCaptureDeviceFormatMBS

18.32.1 class AVCaptureDeviceFormatMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The class for device format information.
Notes: An AVCaptureDeviceFormat object wraps a CMFormatDescription (see CMFormatDescriptionRef) and other format-related information, such as minimum and maximum frame rate.

An AVCaptureDeviceFormat object is immutable. AVCaptureDevice uses AVCaptureDeviceFormat objects to describe supported formats and the active format of an instance.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo / Real Studio Plugins, version 13.2pr4

18.32.2 Methods

18.32.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.32.4 DisplayName as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The display text for this object.
Notes: The plugin formats a string with the device format for displaying.

18.32.5 formatDescription as CMFormatDescriptionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A CMFormatDescription describing an AVCaptureDevice active or supported format. (read-only).

18.32.6 mediaType as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An string describing the media type of an AVCaptureDevice active or supported format. (read-only)
Notes: Supported media types are listed in AVMediaFormat.h.

18.32.7 videoSupportedFrameRateRanges as AVFrameRateRangeMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the format's supported frame rate ranges/ (read-only)
Notes: The value is an array of AVFrameRateRange objects, one for each of the format's supported video frame rate ranges.

18.32.8 Properties

18.32.9 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.32.10 videoMaxZoomFactor as Double

MBS AVFoundation Plugin, Plugin Version: 22.2, Platform: macOS, Targets: iOS only.

Function: Indicates the maximum zoom factor allowed for the format.
Notes: A maximum factor of 1.0 indicates that the format isn,Äôt capable of zooming.
(Read only property)

18.33 class AVCaptureDeviceInputMBS

18.33.1 class AVCaptureDeviceInputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVCaptureDeviceInput is a concrete sub-class of AVCaptureInput you use to capture data from an AVCaptureDevice object.
Notes: Subclass of the AVCaptureInputMBS class.

18.33.2 Methods

18.33.3 Constructor(Device as AVCaptureDeviceMBS, byref error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes an input to use a specified device.
Notes: device: The device from which to capture input.
Error: If an error occurs during initialization, upon return contains an NSErrorMBS object describing the problem.

18.33.4 device as AVCaptureDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The device with which the input is associated. (read-only)

18.33.5 deviceInputWithDevice(device as AVCaptureDeviceMBS, byref error as NSErrorMBS) as AVCaptureDeviceInputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an input initialized to use a specified device.
Notes: device: The device from which to capture input.
Error: If an error occurs during initialization, upon return contains an NSError object describing the problem.

Returns an input initialized to use device.

18.34 class AVCaptureDeviceInputSourceMBS

18.34.1 class AVCaptureDeviceInputSourceMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An AVCaptureDeviceInputSource object represents a distinct input source on an AVCaptureDevice object.
Notes: An AVCaptureDevice object may optionally present an array of input sources, representing distinct mutually exclusive inputs to the device. For example, an audio capture device might have ADAT optical and analog input sources; a video capture device might have an HDMI input source, or a component input source.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.34.2 Methods

18.34.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

18.34.4 inputSourceID as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The input source ID. (read-only)
Notes: The ID is unique among the input sources exposed by a given AVCaptureDevice object.

18.34.5 localizedName as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A localized, human-readable, name for the input source. (read-only)
Notes: You can use this property to display the name of the capture device input source in a user interface.

18.34.6 Properties

18.34.7 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

18.35 class AVCaptureDeviceMBS

18.35.1 class AVCaptureDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVCaptureDevice object represents a physical capture device and the properties associated with that device.
Example:

Var device as AVCaptureDeviceMBS = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox device.localizedName

Notes: You use a capture device to configure the properties of the underlying hardware. A capture device also provides input data (such as audio or video) to an AVCaptureSession object.

You use the methods of the AVCaptureDevice class to enumerate the available devices, query their capabilities, and be informed about when devices come and go. Before you attempt to set properties of a capture device (its focus mode, exposure mode, and so on), you must first acquire a lock on the device using the lockForConfiguration method. You can then set the properties and release the lock using the unlockForConfiguration method. You may hold the lock if you want all settable device properties to remain unchanged. However, holding the device lock unnecessarily may degrade capture quality in other applications sharing the device and is not recommended.

May work for all built-in cameras and microphones as well as external USB webcams, as far as Apple supports them.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.35.2 Methods

18.35.3 authorizationStatusForMediaType(mediaType as string) as Integer

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Returns the client's authorization status for accessing the underlying hardware that supports a given media type.
Notes: Mediatype: The media type, either AVMediaTypeVideo or AVMediaTypeAudio.
Returns the authorization status of the client

This method returns the AVAuthorizationStatus of the client for accessing the underlying hardware supporting the media type. Media type constants are defined in AVFoundationMBS. If any media type other than AVMediaTypeVideo or AVMediaTypeAudio is supplied, an NSInvalidArgumentException will be thrown. If the status is AVAuthorizationStatusNotDetermined, you may use the requestAccessForMediaType method to request access by prompting the user.

see
https://developer.apple.com/documentation/avfoundation/cameras_and_media_capture/requesting_authorization_for_media_capture_on_macos?language=objc

18.35.4 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.35.5 availableReactionTypes as String()

MBS AVFoundation Plugin, Plugin Version: 23.5, Platform: macOS, Targets: All.

Function: Returns a list of reaction types which can be passed to performEffectForReaction.
Example:

```
Var device as AVCaptureDeviceMBS // your device
```

MessageBox Join(device.availableReactionTypes, EndOfLine)

Notes: The list may differ between devices, or be affected by changes to active format.

Requires macOS 14.0 or iOS 17.0.

List seen on macOS 14.0:

ReactionBalloons
ReactionFireworks
ReactionThumbsUp
ReactionRain
ReactionThumbsDown
ReactionLasers
ReactionConfetti
ReactionHeart

You may check AVCaptureReactionEffectStateMBS.available for whether this is available.

18.35.6 AVCaptureDeviceTypeBuiltInDualCamera as String

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: macOS, Targets: All.

Function: One of the device type constants.
Notes: A device that consists of two fixed focal length cameras, one wide and one telephoto. Note that devices of this type may only be discovered using the discoverDevices function.

A device of this device type supports the following features:

- Auto switching from one camera to the other when zoom factor, light level, and focus position allow this.
- Higher quality zoom for still captures by fusing images from both cameras.
- Depth data delivery by measuring the disparity of matched features between the wide and telephoto cameras.
- Delivery of photos from constituent devices (wide and telephoto cameras) via a single photo capture request.

A device of this device type does not support the following features:

- AVCaptureExposureModeCustom and manual exposure bracketing.
- Locking focus with a lens position other than AVCaptureLensPositionCurrent.
- Locking auto white balance with device white balance gains other than AVCaptureWhiteBalanceGainsCurrent.

Even when locked, exposure duration, ISO, aperture, white balance gains, or lens position may change when the device switches from one camera to the other. The overall exposure, white balance, and focus position however should be consistent.

18.35.7 AVCaptureDeviceTypeBuiltInDualWideCamera as String

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: macOS, Targets: All.

Function: One of the device type constants.
Notes: A device that consists of two fixed focal length cameras, one ultra wide and one wide angle. Note that devices of this type may only be discovered using an AVCaptureDeviceDiscoverySession or - [AVCaptureDevice defaultDeviceWithDeviceType:mediaType:position:] .

A device of this device type supports the following features:

- Auto switching from one camera to the other when zoom factor, light level, and focus position allow this.
- Depth data delivery by measuring the disparity of matched features between the ultra wide and wide cameras.
- Delivery of photos from constituent devices (ultra wide and wide) via a single photo capture request.

A device of this device type does not support the following features:

- AVCaptureExposureModeCustom and manual exposure bracketing.
- Locking focus with a lens position other than AVCaptureLensPositionCurrent.
- Locking auto white balance with device white balance gains other than AVCaptureWhiteBalanceGainsCurrent.

Even when locked, exposure duration, ISO, aperture, white balance gains, or lens position may change when the device switches from one camera to the other. The overall exposure, white balance, and focus position however should be consistent.

18.35.8 AVCaptureDeviceTypeBuiltInLiDARDepthCamera as String

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: macOS, Targets: All.

Function: One of the device type constants.
Notes: A device that consists of two cameras, one YUV and one LiDAR. The LiDAR camera provides high quality, high accuracy depth information by measuring the round trip of an artificial light signal emitted by a laser. The depth is synchronized and perspective corrected to frames produced by the paired YUV camera. While the resolution of the depth data and YUV frames may differ, their field of view and aspect ratio always match. Note that devices of this type may only be discovered using the discoverDevices function.

18.35.9 AVCaptureDeviceTypeBuiltInTelephotoCamera as String

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: macOS, Targets: All.

Function: One of the device type constants.
Notes: A built-in camera device with a longer focal length than a wide angle camera. Note that devices of this type may only be discovered using an AVCaptureDeviceDiscoverySession.

18.35.10 AVCaptureDeviceTypeBuiltInTripleCamera as String

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: macOS, Targets: All.

Function: One of the device type constants.
Notes: A device that consists of three fixed focal length cameras, one ultra wide, one wide angle, and one telephoto. Note that devices of this type may only be discovered using an AVCaptureDeviceDiscoverySession or - [AVCaptureDevice defaultDeviceWithDeviceType:mediaType:position:] .

A device of this device type supports the following features:

- Auto switching from one camera to the other when zoom factor, light level, and focus position allow this.
- Delivery of photos from constituent devices (ultra wide, wide and telephoto cameras) via a single photo capture request.

A device of this device type does not support the following features:

- AVCaptureExposureModeCustom and manual exposure bracketing.
- Locking focus with a lens position other than AVCaptureLensPositionCurrent.
- Locking auto white balance with device white balance gains other than AVCaptureWhiteBalanceGainsCurrent.

Even when locked, exposure duration, ISO, aperture, white balance gains, or lens position may change when the device switches from one camera to the other. The overall exposure, white balance, and focus position however should be consistent.

18.35.11 AVCaptureDeviceTypeBuiltInTrueDepthCamera as String

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: macOS, Targets: All.

Function: One of the device type constants.
Notes: A device that consists of two cameras, one YUV and one Infrared. The infrared camera provides high quality depth information that is synchronized and perspective corrected to frames produced by the YUV camera. While the resolution of the depth data and YUV frames may differ, their field of view and aspect ratio always match. Note that devices of this type may only be discovered using the discoverDevices function.

18.35.12 AVCaptureDeviceTypeBuiltInUltraWideCamera as String

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: macOS, Targets: All.

Function: One of the device type constants.
Notes: A built-in camera device with a shorter focal length than a wide angle camera. Note that devices of this type may only be discovered using an AVCaptureDeviceDiscoverySession.

18.35.13 AVCaptureDeviceTypeBuiltInWideAngleCamera as String

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: macOS, Targets: All.

Function: One of the device type constants.
Notes: A built-in wide angle camera device. These devices are suitable for general purpose use.

18.35.14 AVCaptureDeviceTypeContinuityCamera as String

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: macOS, Targets: All.

Function: One of the device type constants.
Notes: A continuity camera device. These devices are suitable for general purpose use. Note that devices of this type may only be discovered using the discoverDevices function.

18.35.15 AVCaptureDeviceTypeDeskViewCamera as String

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: macOS, Targets: All.

Function: One of the device type constants.
Notes: A distortion corrected cut out from an ultra wide camera, made to approximate an overhead camera pointing at a desk. Supports multicam operation.

18.35.16 AVCaptureDeviceTypeExternal as String

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: macOS, Targets: All.

Function: One of the device type constants.
Notes: An external device type. On iPad, external devices are those that conform to the UVC (USB Video Class) specification.

18.35.17 AVCaptureDeviceTypeMicrophone as String

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: macOS, Targets: All.

Function: One of the device type constants.
Notes: A microphone. On iOS and tvOS, only one AVCaptureDevice of type AVCaptureDeviceTypeMicrophone is exposed to the system. The audio routing subsystem decides which physical microphone to use, be it a built in microphone, a wired headset, an external microphone, etc. The microphone device's 'localizedName' will change as the audio subsystem switches to a different physical device.

18.35.18 AVCaptureMaxAvailableTorchLevel as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The maximum torch level.
Notes: This constant always represents the maximum available torch level, independent of the actual maximum value currently supported by the device. Thus, pass this constant to the setTorchModeOnWithLevel:error: in situations where you want to specify the maximum torch level without having to worry about whether the device is overheating and might not accept a value of 1.0 as the maximum.
Available in OS X v10.9 and later.

18.35.19 cancelVideoZoomRamp

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: iOS, Targets: iOS only.

Function: Eases out of any video zoom transitions initiated by rampToVideoZoomFactor.
Notes: This method is equivalent to calling rampToVideoZoomFactor using the current zoom factor target and a rate of 0. This allows a smooth stop to any changes in zoom which were in progress.

18.35.20 constituentDevices as AVCaptureDeviceMBS()

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: iOS, Targets: iOS only.

Function: An array of constituent physical devices comprising a virtual device.
Notes: When called on a device for which virtualDevice = false, an empty array is returned.

18.35.21 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.35.22 defaultDeviceWithMediaType(mediaType as string) as AVCaptureDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the default device used to capture data of a given media type.
Example:

```
Var device as AVCaptureDeviceMBS = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeAudio)
MessageBox device.localizedName
```

Notes: mediaType: A media type identifier.
For possible values, see AV Foundation Constants Reference.

18.35.23 devices as AVCaptureDeviceMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an array of the available capture devices on the system.
Example:

```
Var devices() as AVCaptureDeviceMBS = AVCaptureDeviceMBS.devices
Var names() as string
```

```
for each d as AVCaptureDeviceMBS in devices
names.Add d.localizedName
next

// show all names in a message dialog
MessageBox Join(names, EndOfLine)
```

18.35.24 devicesWithMediaType(mediaType as string) as AVCaptureDeviceMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an array of the devices able to capture data of a given media type.
Example:

```
Var devices() as AVCaptureDeviceMBS = AVCaptureDeviceMBS.devicesWithMediaType(AVFoundation-
MBS.AVMediaTypeAudio)
Var names() as string

for each d as AVCaptureDeviceMBS in devices
names.Add d.localizedName
next

// show all names of audio devices in a message dialog
MessageBox Join(names, EndOfLine)
```

Notes: mediaType: A media type identifier.
For possible values, see AV Foundation Constants Reference.

18.35.25 deviceWithUniqueID(deviceUniqueID as string) as AVCaptureDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the device with a given ID.
Notes: deviceUniqueID: The ID of a capture device.

18.35.26 discoverDevices(deviceTypes() as String, mediaType as String = ””, position as Integer = 0) as AVCaptureDeviceMBS()

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: Discovers matching capture devices.
Notes: This function allows clients to discover devices by providing certain search criteria. The objective

of this class is to help find devices by device type and optionally by media type or position.

deviceTypes: An array specifying the device types to include in the list of discovered devices.

mediaType: The media type, such as AVMediaTypeVideo, AVMediaTypeAudio, or AVMediaTypeMuxed, to include in the list of discovered devices. Pass "" to search for devices with any media type.

position: The position to include in the list of discovered devices. Pass AVCaptureDevicePositionUnspecified (0) to search for devices with any position.

The list of device types is mandatory. This is used to make sure that clients only get access to devices of types they expect. This prevents new device types from automatically being included in the list of devices.

18.35.27 formats as AVCaptureDeviceFormatMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An array of AVCaptureDeviceFormat objects representing the formats supported by the device (read-only)
Notes: You can use this property to enumerate the formats natively supported by the receiver.
You can set modelID to any of the formats in this array.
You can observe changes to the value of this property using key-value observing.

18.35.28 hasMediaType(mediaType as string) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the device provides media with a given type.
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.hasMediaType(AVFoundationMBS.AVMediaTypeVideo)) // true
MessageBox str(device.hasMediaType(AVFoundationMBS.AVMediaTypeAudio)) // false
```

Notes: mediaType: A media type, such as AVMediaTypeVideo, AVMediaTypeAudio, or AVMediaTypeMuxed. For a complete list of supported media type constants, see AV Foundation Constants Reference.

Returns true if the device provides media of type mediaType, otherwise false.

18.35.29 inputSources as AVCaptureDeviceInputSourceMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An array of AVCaptureDeviceInputSource objects representing the input sources supported by the device. (read-only)
Notes: Some devices can capture data from one of multiple data sources (different input jacks on the same audio device, for example). For devices with multiple possible data sources, you can use this property to enumerate the possible choices.

You can observe changes to the value of this property using key-value observing.

18.35.30 isExposureModeSupported(exposureMode as Integer) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the given exposure mode is supported.
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.isExposureModeSupported(device.AVCaptureExposureModeAutoExpose))
```

Notes: exposureMode: An exposure mode. See "AVCaptureExposureMode" for possible values.
Returns true if exposureMode is supported, otherwise false.

18.35.31 isFlashModeSupported(FlashMode as Integer) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the given flash mode is supported.
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.isFlashModeSupported(device.AVCaptureFlashModeAuto))
```

Notes: flashMode: A flash mode. See "AVCaptureFlashMode" for possible values.
Returns true if flashMode is supported, otherwise false.

18.35.32 isFocusModeSupported(focusMode as Integer) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the given focus mode is supported.
Example:

Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.isFocusModeSupported(device.AVCaptureFocusModeContinuousAutoFocus))

Notes: focusMode: A focus mode. See "AVCaptureFocusMode" for possible values.

Returns true if focusMode is supported, otherwise false.

18.35.33 isTorchModeSupported(torchMode as Integer) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the device supports the specified torch mode.
Example:

Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.isTorchModeSupported(device.AVCaptureTorchModeAuto))

Notes: torchMode: The desired torch mode. For a list of possible values, see "AVCaptureTorchMode."
Returns true if torchMode is supported, otherwise false.

18.35.34 isWhiteBalanceModeSupported(mode as Integer) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the given white balance mode is supported.
Example:

Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.isWhiteBalanceModeSupported(device.AVCaptureWhiteBalanceModeAutoWhiteBalance))

Notes: whiteBalanceMode: A focus mode. See "AVCaptureWhiteBalanceMode" for possible values.
Returns true if whiteBalanceMode is supported, otherwise false.

18.35.35 linkedDevices as AVCaptureDeviceMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: An array of AVCaptureDevice objects representing the devices physically linked to the receiver. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeAudio)

Var linkedDevices() as AVCaptureDeviceMBS
linkedDevices = device.linkedDevices

for each d as AVCaptureDeviceMBS in linkedDevices
MessageBox device.localizedName+" ,Üí "+d.localizedName
next
```

Notes: The value of this property is an array of AVCaptureDevice objects that are a part of the same physical device as the receiver. For example, for an external iSight camera, the array contains an AVCaptureDevice instance representing the external iSight microphone.

18.35.36 lockForConfiguration(byref error as NSErrorMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Requests exclusive access to the device's hardware properties.
Notes: Error: If a lock cannot be acquired, this pointer contains an NSError object that describes the problem.

Returns true if a lock was acquired or false if it was not.

You must call this method before attempting to configure the hardware related properties of the device. This method returns true when it successfully locks the device for configuration by your code. After configuring the device properties, call unlockForConfiguration to release the configuration lock and allow other apps to make changes.

You may hold onto a lock (instead of releasing it) if you require the device properties to remain unchanged. However, holding the device lock unnecessarily may degrade capture quality in other apps sharing the device.

18.35.37 performEffectForReaction(reactionType as String)

MBS AVFoundation Plugin, Plugin Version: 23.5, Platform: macOS, Targets: All.

Function: Triggers a specified reaction on the video stream.
Example:

```
Var device as AVCaptureDeviceMBS // your device

device.performEffectForReaction AVCaptureReactionEffectStateMBS.AVCaptureReactionTypeBalloons
```

Notes: reactionType: Indicates which reaction to perform.

The entries in reactionEffectsInProgress may not reflect one-to-one against calls to this method. Depending on reaction style or resource limits, triggering multiple overlapping reactions of the same type may be coalesced into extending an existing reaction rather than overlaying a new one.

The reactionType requested must be one of those listed in availableReactionTypes or an exception will be thrown. Performing a reaction when canPerformReactionEffects is false is ignored, and VoIP applications are encouraged to transmit and display such reactions outside of the video feed.

Requires macOS 14.0 or iOS 17.0.
You may check AVCaptureReactionEffectStateMBS.available for whether this is available.

18.35.38 rampToVideoZoomFactor(factor as double, rate as double)

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: iOS, Targets: iOS only.

Function: Provides smooth changes in zoom factor.
Notes: This method provides a change in zoom by compounding magnification at the specified rate over time. Although the zoom factor will grow exponentially, this yields a visually linear zoom in the image over time.

The zoom transition will stop at the specified factor, which must be in the valid range for videoZoomFactor. Assignments to videoZoomFactor while a ramp is in progress will cancel the ramp and snap to the assigned value.

The zoom factor is continuously scaled by pow(2,rate * time). A rate of 0 causes no change in zoom factor, equivalent to calling cancelVideoZoomRamp. A rate of 1 will cause the magnification to double every second (or halve every second if zooming out), and similarly larger or smaller values will zoom faster or slower respectively. Only the absolute value of the rate is significant–sign is corrected for the direction of the target. Changes in rate will be smoothed by an internal acceleration limit.

When depth data delivery is enabled, rampToVideoZoomFactor sets the videoZoomFactor to the nearest supportedVideoZoomFactor from AVCaptureDeviceFormat.supportedVideoZoomFactorsForDepthDataDelivery with a disruptive reconfiguration of the capture render pipeline.

rampToVideoZoomFactor throws an NSGenericException if called without first obtaining exclusive access to the receiver using lockForConfiguration:.

18.35.39 reactionEffectsInProgress as AVCaptureReactionEffectStateMBS()

MBS AVFoundation Plugin, Plugin Version: 23.5, Platform: macOS, Targets: All.

Function: Contains an array of reaction effects that are currently being performed by the device, sorted by timestamp.
Example:

```
Var device as AVCaptureDeviceMBS // your device

Var effects() as AVCaptureReactionEffectStateMBS = device.reactionEffectsInProgress

for each effect as AVCaptureReactionEffectStateMBS in effects
MessageBox effect.reactionType
next
```

Notes: If observing old and new values in the KVO callback, the reaction effects which are still running in the new array will have kCMTimeInvalid as their endTime property. Reaction effects which have ended will only be in the old array, and will have their endTime property set to the presentation time of the first frame where the reaction effect was no longer present.

Reaction effects which are triggered by either a call to performEffectForReaction or by the automatic gesture detection will be reflected in this array. It is key-value observable to be notified when reaction effects begin or end.

Requires macOS 14.0 or iOS 17.0.
You may check AVCaptureReactionEffectStateMBS.available for whether this is available.

18.35.40 requestAccessForMediaType(mediaType as string, tag as variant = nil)

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Requests access to the underlying hardware for the media type, showing a dialog to the user if necessary.

Notes: mediaType: The media type, either AVMediaTypeVideo or AVMediaTypeAudio

Use this function to request access to the hardware for a given media type. Media type constants are defined in AVFoundationMBS
If any media type other than AVMediaTypeVideo or AVMediaTypeAudio is supplied, an NSInvalidArgumentException will be thrown.

This call will not block while the user is being asked for access, allowing the client to continue running. Until access has been granted, any AVCaptureDevices for the media type will vend silent audio samples or black video frames. The user is only asked for permission the first time the client requests access. Later calls use the permission granted by the user.

Note that the authorization dialog will automatically be shown if the status is AVAuthorizationStatusNotDetermined when creating an AVCaptureDeviceInput.

Invoking this method with AVMediaTypeAudio is equivalent to calling AVAudioSessionMBS.requestRecordPermission.

Call returns directly as request is performed on thread.
The requestAccessForMediaTypeCompleted event is called later in your AVFoundationMBS subclass with results on main thread.
The granted value will always true for MacOS 10.13 or older.

see
https://developer.apple.com/documentation/avfoundation/cameras_and_media_capture/requesting_authorization_for_media_capture_on_macos?language=objc

18.35.41 setTransportControlsPlaybackMode(mode as Integer, speed as Double)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the transport control's playback mode and speed.
Notes: mode: An AVCaptureDeviceTransportControlsPlaybackMode constant indicating whether the deck should be put into play mode.
speed: A float value indicating the speed at which to wind or play the tape.

Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device's configuration properties. If you do not, this method raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

18.35.42 supportsAVCaptureSessionPreset(preset as string) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the receiver can be used in an capture session configured with the given preset.
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.supportsAVCaptureSessionPreset(AVFoundationMBS.AVCaptureSessionPreset1280x720))
```

Notes: preset: A capture session preset.

Returns true if the receiver can be used with preset, otherwise false.
An AVCaptureSession instance can be associated with a preset that configures its inputs and outputs to fulfill common use cases. You can use this method to determine if the receiver can be used in a capture session with the given preset. For a list of preset constants, see AVCaptureSession Class Reference.

18.35.43 systemPreferredCamera as AVCaptureDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: Specifies the best camera to use as determined by the system.
Example:

```
Var a As New AVFoundationMBS
Var d As AVCaptureDeviceMBS = AVCaptureDeviceMBS.systemPreferredCamera

MessageBox d.localizedName
```

Notes: Apple chooses the default value. This property incorporates userPreferredCamera as well as other factors, such as camera suspension and Apple cameras appearing that should be automatically chosen. The property may change spontaneously, such as when the preferred camera goes away. This property always returns a device that is present. If no camera is available nil is returned.

Applications that adopt this API should always key-value observe this property and update their AVCaptureSession,Äôs input device to reflect changes to the systemPreferredCamera. The application can still offer users the ability to pick a camera by setting userPreferredCamera, which will cause the systemPreferredCamera API to put the user,Äôs choice first until either another Apple-preferred device becomes available or the machine is rebooted (after which it reverts to its original behavior of returning the internally determined best camera to use).

If the application wishes to offer users a fully manual camera selection mode in addition to automatic camera

selection, it is recommended to call setUserPreferredCamera: each time the user makes a camera selection, but ignore key-value observer updates to systemPreferredCamera while in manual selection mode.

18.35.44 unlockForConfiguration

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Relinquishes exclusive control over the device's configuration.
Notes: Call this method to release the lock acquired using the lockForConfiguration method when you are done configuring the device.

18.35.45 virtualDeviceSwitchOverVideoZoomFactors as Double()

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: iOS, Targets: iOS only.

Function: An array of video zoom factors at or above which a virtual device (such as the Dual Camera) may switch to its next constituent device.
Notes: This array contains zoom factors at which one of the constituent device's field of view matches the next constituent device's full field of view. The number of switch over video zoom factors is always one less than the count of the constituentDevices property, and the factors progress in the same order as the devices listed in that property. On non-virtual devices this property returns an empty array.

18.35.46 Properties

18.35.47 activeFormat as AVCaptureDeviceFormatMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The currently active format of the receiver.
Notes: You use this property to get or set the currently active device format.

To set the format, you must first obtain exclusive access to the receiver using focusMode. If you do not obtain exclusive access, setActiveFormat throws an NSGenericException.

The set method, setActiveFormat, throws an NSInvalidArgumentException if you pass a format not present in the supportsAVCaptureSessionPreset array.

You can observe changes to the value of this property using key-value observing.
(Read and Write property)

18.35.48 activeInputSource as AVCaptureDeviceInputSourceMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The currently active input source.
Notes: You use this property to get or set the currently active input source.

To set the format, you must first obtain exclusive access to the receiver using focusMode. If you do not obtain exclusive access, setActiveInputSource throws an NSGenericException.

The set method, setActiveInputSource, throws an NSInvalidArgumentException if you pass a format not present in the activeInputSource array.

You can observe changes to the value of this property using key-value observing.
(Read and Write property)

18.35.49 activeVideoMaxFrameDuration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The currently active maximum frame duration.
Notes: A device's maximum frame duration is the reciprocal of its minimum frame rate. You can set the value of this property to limit the minimum frame rate during a capture session. The capture device automatically chooses a default maximum frame duration based on its active format. After changing the value of this property, you can return to the default maximum frame duration by setting this property's value to kCMTimeInvalid. Choosing a new preset for the capture session also resets this property to its default value.

Attempting to set this property to a value not found in the active format's videoSupportedFrameRateRanges array raises an exception (NSInvalidArgumentException).

Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device's configuration properties. Otherwise, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

You can observe changes to the value of this property using Key-value observing.
Available in OS X v10.9 and later.
(Read and Write property)

18.35.50 activeVideoMinFrameDuration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The currently active minimum frame duration.
Notes: You use this property to get or set the currently active minimum frame duration.

The value of this property is the reciprocal of its maximum frame rate. To limit the maximum frame rate, you can set the value of this property to a value supported by the receiver's modelID (see videoSupportedFrameRateRanges).

Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device's configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

The device object throws NSInvalidArgumentException if you try to assign an unsupported value to this property.

You can observe changes to the value of this property using key-value observing.
(Read and Write property)

18.35.51 AutoVideoFrameRateEnabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: Indicates whether the receiver should enable auto video frame rate.
Example:

```
Var a As New AVFoundationMBS
Var d As AVCaptureDeviceMBS = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)

MessageBox "AutoVideoFrameRateEnabled: "+d.AutoVideoFrameRateEnabled.ToString
```

Notes: When enabled the receiver automatically adjusts the active frame rate, depending on light level. Under low light conditions, frame rate is decreased to properly expose the scene. For formats with a maximum frame rate of 30 fps, the frame rate switches between 30 - 24. For formats with a maximum frame rate of 60 fps, the frame rate switches between 60 - 30 - 24.

Setting this property throws an NSInvalidArgumentException if the active format's AutoVideoFrameRateSupported returns false. Changing the device's active format resets AutoVideoFrameRateEnabled to its default value of false.

When autoVideoFrameRateEnabled is true, setting activeVideoMinFrameDuration or activeVideoMaxFrameDuration throws an NSInvalidArgumentException.
(Read and Write property)

18.35.52 BackgroundReplacementActive as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: Indicates whether Background Replacement is currently active on a particular AVCaptureDevice.
Notes: (Read only property)

18.35.53 BackgroundReplacementEnabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: Indicates whether the format supports the Background Replacement feature.
Notes: This property returns true if the format supports Background Replacement background replacement.
(Read only property)

18.35.54 canPerformReactionEffects as Boolean

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: Indicates whether reactions can be performed on a particular AVCaptureDevice.
Example:

```
Var device as AVCaptureDeviceMBS // your device
if device <>nil then
MessageBox "canPerformReactionEffects: "+device.canPerformReactionEffects.ToString
end if
```

Notes: This requires reactionEffectsEnabled to be true, as well as using a AVCaptureDeviceFormat with reactionEffectsSupported.

This readonly property returns YES when resources for reactions are available on the device instance. When true, calls to performEffectForReaction: will render on the video feed, otherwise those calls are ignored. It is key-value observable.

Requires macOS 14.0 or iOS 17.0.

You may check AVCaptureReactionEffectStateMBS.available for whether this is available.
(Read only property)

18.35.55 centerStageControlMode as Integer

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: A class property indicating the current mode of Center Stage control (user, app, or cooperative).
Notes: This class property determines how the Center Stage feature is controlled. When set to the default value of AVCaptureCenterStageControlModeUser, centerStageEnabled may not be set programmatically and throws an NSInvalidArgumentException. In User mode, the feature may only be set by the user in Control Center. If you wish to take Center Stage control away from the user and exclusively enable / disable it programmatically, set this property to AVCaptureCenterStageControlModeApp. When under exclusive app control, Center Stage user control is disallowed (for instance, the toggle is grayed out in Control Center). If you wish to take control of Center Stage, but also cooperate with the user by listening for and appropriately reacting to their changes to the centerStageEnabled property, set this property to AVCaptureCenterStageControlModeCooperative. Note that in this mode, the onus is on you, the app developer, to honor user intent and conform your AVCaptureSession configuration to make Center Stage active (see the AVCaptureDevice instance property centerStageActive). In cooperative mode, the centerStageEnabled property may change at any time (such as when the user enables / disables the feature in Control Center).
(Read and Write property)

18.35.56 centerStageEnabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: A class property indicating whether the Center Stage feature is currently enabled or disabled (such as in Control Center or programmatically via your app).
Notes: This property may only be set if centerStageControlMode is AVCaptureCenterStageControlModeApp or AVCaptureCenterStageControlModeCooperative, and otherwise throws an NSInvalidArgumentException. When centerStageControlMode is AVCaptureCenterStageControlModeUser or AVCaptureCenterStageControlModeCooperative, this property may change according to user desire (such as enabling / disabling the feature in Control Center), so you should key-value observe it.
(Read only property)

18.35.57 centerStageRectOfInterest as CGRectMBS

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: Specifies the effective region within the output pixel buffer that will be used to perform Center Stage framing.
Notes: Applications that wish to apply additional processing (such as cropping) on top of Center Stage's

output can use this property to guide Center Stage's framing.

The rectangle's origin is top left and is relative to the coordinate space of the output pixel buffer. The default value of this property is the value CGRectMake(0, 0, 1, 1), where { 0,0 } represents the top left of the picture area, and { 1,1 } represents the bottom right on an unrotated picture. This rectangle of interest is applied prior to rotation, mirroring or scaling.

Pixels outside of this rectangle of interest will be blackened out.

Setting this property has no impact on objects specified in the metadata output.

Setting this throws an NSGenericException if called without first obtaining exclusive access to the receiver using lockForConfiguration. Set CenterStageRectOfInterest throws an NSInvalidArgumentException if none of the AVCaptureDeviceFormats supported by the receiver support CenterStage. Set CenterStageRectOfInterest throws an NSInvalidArgumentException if centerStageEnabled is false on the AVCaptureDevice class. set CenterStageRectOfInterest throws an NSInvalidArgumentException if the provided rectOfInterest goes outside the normalized (0-1) coordinate space.
(Read and Write property)

18.35.58 companionDeskViewCamera as AVCaptureDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: A reference to the Desk View Camera that is associated with and derived from this camera.
Notes: The companionDeskViewCamera property allows you to discover if the receiver has a paired Desk View Camera which derives its desk framing from the receiver's ultra wide frame. In the presence of multiple Continuity Cameras, this property allows you to pair a particular Continuity Camera with its associated Desk View Camera.
(Read only property)

18.35.59 continuityCamera as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: A property that reports YES if the receiver is a Continuity Camera.
Notes: Access this property to discover if the receiver is a Continuity Camera (external iPhone webcam).
(Read only property)

18.35.60 deviceType as String

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: The type of the capture device.
Notes: A capture device's type never changes.
(Read only property)

18.35.61 displayVideoZoomFactorMultiplier as Double

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: A multiplier that can be used with the receiver's videoZoomFactor property for displaying a video zoom factor in a user interface.
Notes: In some system user interfaces, like the macOS Video Effects Menu, the video zoom factor value is displayed in a way most appropriate for visual representation and might differ from the videoZoomFactor property value on the receiver by a fixed ratio. For example, if the videoZoomFactor property value is 1.0 and the displayVideoZoomFactorMultiplier property value is 0.5, then multiplying 1.0 and 0.5 produces 0.5 which can be displayed in the UI. Client applications can key value observe this property to update the display video zoom factor values in their UI to stay consistent with Apple's system UIs.
(Read only property)

18.35.62 exposureMode as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The exposure mode for the device.
Notes: Before changing the value of this property, you must call lockForConfiguration: to acquire exclusive access to the device's configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

You can observe changes to the value of this property using key-value observing.
See "AVCaptureExposureMode" for possible values.
(Read and Write property)

18.35.63 exposurePointOfInterest as CGPointMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The point of interest for exposure.
Notes: Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device's configuration properties. If you do not, setting the value of this property raises an

exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.
(Read and Write property)

18.35.64 flashMode as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The current flash mode.
Notes: Before changing the value of this property, you must call lockForConfiguration: to acquire exclusive access to the device's configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

You can observe changes to the value of this property using key-value observing.

See "AVCaptureFlashMode" for possible values.
(Read and Write property)

18.35.65 focusMode as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The device's focus mode.
Notes: Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device's configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

You can observe changes to the value of this property using key-value observing.

See "AVCaptureFocusMode" for possible values.
(Read and Write property)

18.35.66 focusPointOfInterest as CGPointMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The point of interest for focusing.
Notes: This property represents a CGPoint where { 0,0 } corresponds to the top left of the picture area, and { 1,1 } corresponds to the bottom right in landscape mode with the home button on the right—this

applies even if the device is in portrait mode.

Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device's configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.
(Read and Write property)

18.35.67 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.35.68 hasFlash as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the capture device has a flash. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.hasFlash)
```

Notes: You can observe changes to the value of this property using key-value observing.
(Read only property)

18.35.69 hasTorch as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A Boolean value that specifies whether the capture device has a torch. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.hasTorch)
```

Notes: A torch is a light source, such as an LED flash, that is available on the device and used for illuminating captured content or providing general illumination. This property reflects whether the current device

has such illumination hardware built-in.

Even if the device has a torch, that torch might not be available for use. Thus, you should also check the value of the torchAvailable property before using it.

You can observe changes to the value of this property using key-value observing.
(Read only property)

18.35.70 isAdjustingExposure as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The transport type of the receiver. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.isAdjustingExposure)
```

Notes: The value of this property represents the transport type of the device (USB, PCI, etc). Transport types are defined in <IOKit/audio/IOAudioTypes.h>as kIOAudioDeviceTransportType*.
(Read only property)

18.35.71 isAdjustingFocus as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the device is currently adjusting its focus setting. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.isAdjustingFocus)
```

Notes: You can observe changes to the value of this property using key-value observing.
(Read only property)

18.35.72 isAdjustingWhiteBalance as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the devise is currently adjusting the white balance. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.isAdjustingWhiteBalance)
```

Notes: You can observe changes to the value of this property using key-value observing.
(Read only property)

18.35.73 isCenterStageActive as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: Indicates whether Center Stage is currently active on a particular AVCaptureDevice.
Notes: This readonly property returns true when Center Stage is currently active on the receiver. When active, the camera automatically adjusts to keep people optimally framed within the field of view. The field of view may pan, tighten or widen as needed. Certain restrictions come into play when Center Stage is active:

- The device's minAvailableVideoZoomFactor and maxAvailableVideoZoomFactor become restricted (see AVCaptureDeviceFormat's videoMinZoomFactorForCenterStage and videoMaxZoomFactorForCenterStage).
- The device's activeVideoMinFrameDuration and activeVideoMaxFrameDuration are limited (see AVCaptureDeviceFormat's videoFrameRateRangeForCenterStage).

Center Stage may be enabled via user control or application control, depending on the current +AVCaptureDevice.centerStageControlMode. When +AVCaptureDevice.centerStageEnabled is true, a particular AVCaptureDevice instance may return true for this property, depending whether it supports the feature in its current configuration. Some device features are mutually exclusive to Center Stage:

- If depth data delivery is enabled on any output, such as AVCaptureDepthDataOutput, or AVCapturePhotoOutput.depthDataDeliveryEnabled, Center Stage is deactivated.
- If geometricDistortionCorrectionSupported is true, geometricDistortionCorrectionEnabled must also be true, or Center Stage is deactivated.

(Read only property)

18.35.74 isCenterStageRectOfInterestSupported as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: Indicates whether the device supports the Center Stage Rect of Interest feature.
Notes: This property returns true if the device supports Center Stage Rect of Interest.
(Read only property)

18.35.75 isConnected as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the device is currently connected. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.isConnected)
```

Notes: The value of this property indicates whether the device represented by the receiver is connected and available for use as a capture device. When the value of this property becomes false for a given instance, however, it will not become true again. If the same physical device again becomes available to the system, it will be represented using a new instance of AVCaptureDevice.

You can observe the value of this property using key-value observing to be notified when a device is no longer available.
(Read only property)

18.35.76 isExposurePointOfInterestSupported as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the device supports a point of interest for exposure. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.isExposurePointOfInterestSupported)
```

Notes: You can observe changes to the value of this property using key-value observing.
(Read only property)

18.35.77 isFocusPointOfInterestSupported as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the device supports a point of interest for focus. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.isFocusPointOfInterestSupported)
```

Notes: You can observe changes to the value of this property using key-value observing.
(Read only property)

18.35.78 isInUseByAnotherApplication as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the device is in use by another application. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.isInUseByAnotherApplication)
```

Notes: You can observe changes to the value of this property using key-value observing.
(Read only property)

18.35.79 isRampingVideoZoom as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.2, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether a zoom transition is in progress.
Notes: (Read only property)

18.35.80 isSuspended as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the device is suspended. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.isSuspended)
```

Notes: Some devices disallow data capture due to a feature on the device.

For example, isSuspended returns true for an external iSight camera when its privacy iris is closed, or for the internal iSight camera on a notebook when the notebook's display is closed.

You can observe changes to the value of this property using key-value observing.
(Read only property)

18.35.81 isVirtualDevice as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.1, Platform: iOS, Targets: All.

Function: A property indicating whether the receiver is a virtual device consisting of constituent physical devices.
Notes: Two examples of virtual devices are:

The Dual Camera, which supports seamlessly switching between a wide and telephoto camera while zooming and generating depth data from the disparities between the different points of view of the physical cameras.

The TrueDepth Camera, which generates depth data from disparities between a YUV camera and an Infrared camera pointed in the same direction.
(Read only property)

18.35.82 localizedName as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A localized human-readable name for the receiver. (read-only)
Example:

Var device as AVCaptureDeviceMBS = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeAudio)
MessageBox device.localizedName

Notes: You can use this property to display the name of a capture device in a user interface.
(Read only property)

18.35.83 manufacturer as String

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The human-readable manufacturer name for the receiver.
Notes: This property can be used to identify capture devices from a particular manufacturer. All Apple devices return "Apple Inc.". Devices from third party manufacturers may return an empty string.
Available on Mac OS X 10.9 or later.
(Read only property)

18.35.84 maxAvailableVideoZoomFactor as Double

MBS AVFoundation Plugin, Plugin Version: 22.2, Platform: iOS, Targets: iOS only.

Function: The maximum zoom factor allowed in the current capture configuration.
Notes: On single-camera devices, this value is always equal to the device format,Äôs videoMaxZoomFactor value. On a dual-camera device, the allowed range of video zoom factors can change if the device is delivering depth data to one or more capture outputs.
Setting the videoZoomFactor property to (or calling the rampToVideoZoomFactor:withRate method with) a value greater than the device format,Äôs videoMaxZoomFactor value always raises an exception. Setting the video zoom factor to a value between the maximum available zoom factor and the device format,Äôs maximum clamps the zoom setting to the maximum available value.
(Read only property)

18.35.85 minAvailableVideoZoomFactor as Double

MBS AVFoundation Plugin, Plugin Version: 22.2, Platform: iOS, Targets: iOS only.

Function: The minimum zoom factor allowed in the current capture configuration.
Notes: On single-camera devices, this value is always 1.0. On a dual-camera device, the allowed range of video zoom factors can change if the device is delivering depth data to one or more capture outputs.

Setting the videoZoomFactor property to (or calling the rampToVideoZoomFactor method with) a value less than 1.0 always raises an exception. Setting the video zoom factor to a value between 1.0 and the minimum available zoom factor clamps the zoom setting to the minimum.
(Read only property)

18.35.86 modelID as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The model ID of the device. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
```

MessageBox "modelID: "+device.modelID

Notes: The value of this property is an identifier unique to all devices of the same model. The value is persistent across device connections and disconnections, and across different systems. For example, the model ID of the camera built in to two identical iPhone models will be the same even though they are different physical devices.
(Read only property)

18.35.87 position as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the physical position of the device hardware on the system. (read-only)
Notes: You can observe changes to the value of this property using key-value observing.
See "AVCaptureDevicePosition" for possible values.
(Read only property)

18.35.88 reactionEffectGesturesEnabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 23.5, Platform: macOS, Targets: All.

Function: A class property indicating whether gesture detection will trigger reaction effects on the video stream.
Example:

```
If AVCaptureDeviceMBS.reactionEffectGesturesEnabled Then
MessageBox "reaction effects enabled"
Else
MessageBox "reaction effects not enabled."
End If
```

Notes: Gesture detection will only run when the device's activeFormat.reactionEffectsSupported is also true, which will be reflected by canPerformReactionEffects.

This property changes to reflect the Gestures state in Control Center.
Clients can call performEffectForReaction independently of whether gesture detection is enabled, reaction effects from either source will be intermixed.

Requires macOS 14.0 or iOS 17.0.
You may check AVCaptureReactionEffectStateMBS.available for whether this is available.
(Read only property)

18.35.89 reactionEffectsEnabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 23.5, Platform: macOS, Targets: All.

Function: A class property indicating whether the application is suitable for reaction effects, either by automatic gesture detection, or by calls to performEffectForReaction().
Example:

```
If AVCaptureDeviceMBS.reactionEffectsEnabled Then
MessageBox "reaction effects enabled"
Else
MessageBox "reaction effects not enabled."
End If
```

Notes: Reactions are only rendered when the device's activeFormat.reactionEffectsSupported is also true, which will be reflected by canPerformReactionEffects when the feature is both enabled and supported.

On macOS, Reaction Effects are enabled by default for all applications. On iOS, Reaction Effects are enabled by default for video conferencing applications (apps that use "voip" as one of their UIBackgroundModes). Non video conferencing applications may opt in for Reaction Effects by adding the following key to their Info.plist:

```
<key>NSCameraReactionEffectsEnabled</key>
<true/>
```

Requires macOS 14.0 or iOS 17.0.
You may check AVCaptureReactionEffectStateMBS.available for whether this is available.
(Read only property)

18.35.90 StudioLightActive as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: Indicates whether Studio Light is currently active on a particular AVCaptureDevice.
Notes: This readonly property returns true when Studio Light is currently active on the receiver. When active, the subject's face is artificially lit to simulate the presence of a studio light near the camera.
(Read only property)

18.35.91 StudioLightEnabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: A class property indicating whether the Studio Light feature is currently enabled in Control

Center.
Notes: This property changes to reflect the Studio Light state in Control Center. It is key-value observable. On iOS, Studio Light only applies to video conferencing apps by default (apps that use "voip" as one of their UIBackgroundModes). Non video conferencing apps may opt in for Studio Light by adding the following key to their Info.plist:

<key>NSCameraStudioLightEnabled</key>
<true/>
(Read only property)

18.35.92 torchMode as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The current torch mode.
Notes: Setting the value of this property also sets the torch level to its maximum current value.

Before setting the value of this property, call the isTorchModeSupported method to make sure the device supports the desired mode. Setting the device to an unsupported torch mode results in the raising of an exception. For a list of possible values for this property, see "AVCaptureTorchMode."

Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device's configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

You can observe changes to the value of this property using key-value observing.
(Read and Write property)

18.35.93 transportControlsPlaybackMode as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The current playback mode. (read-only)
Notes: This property is only valid for devices that support transport control.
You can observe changes to the value of this property using key-value observing.
(Read only property)

18.35.94 transportControlsSpeed as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current playback speed. (read-only)
Notes: For devices that support transport control, the value of this property indicates the current playback speed of the deck. The following table gives examples of the meaning of values:

Value	Meaning
0.0	Stopped
1.0	Forward at normal speed.
-1.0	Reverse at normal speed.
2.0	Forward at 2x normal speed.

You can observe changes to the value of this property using key-value observing.
(Read only property)

18.35.95 transportControlsSupported as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the device supports transport control commands. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
MessageBox str(device.transportControlsSupported)
```

Notes: For devices with transport controls, such as AVC tape-based camcorders or pro capture devices with RS422 deck control, the value of this property is true. If transport controls are not supported, none of the associated transport control methods and properties are available on the receiver.

You can observe changes to the value of this property using key-value observing.
(Read only property)

18.35.96 transportType as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The transport type of the receiver. (read-only)
Notes: The value of this property represents the transport type of the device (USB, PCI, etc). Transport

types are defined in <IOKit/audio/IOAudioTypes.h>as kIOAudioDeviceTransportType*.
(Read only property)

18.35.97 uniqueID as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An ID unique to the model of device corresponding to the receiver. (read-only)
Example:

```
Var device as AVCaptureDeviceMBS
device = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
Var u as string = device.uniqueID
MessageBox "uniqueID: "+u
```

Notes: Every available capture device has a unique ID that persists on one system across device connections and disconnections, application restarts, and reboots of the system itself. You can store the value returned by this property to recall or track the status of a specific device in the future.
(Read only property)

18.35.98 userPreferredCamera as AVCaptureDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 25.1, Platforms: macOS, iOS, Targets: All.

Function: Settable property that specifies a user preferred camera.
Example:

```
Var a As New AVFoundationMBS
Var d As AVCaptureDeviceMBS = AVCaptureDeviceMBS.userPreferredCamera

MessageBox d.localizedName
```

Notes: Setting this property allows an application to persist its user,Äôs preferred camera across app launches and reboots. The property internally maintains a short history, so if your user,Äôs most recent preferred camera is not currently connected, it still reports the next best choice. This property always returns a device that is present. If no camera is available nil is returned. Setting the property to nil has no effect.
(Read and Write property)

18.35.99 videoZoomFactor as Double

MBS AVFoundation Plugin, Plugin Version: 22.2, Platform: iOS, Targets: iOS only.

Function: A value that controls the cropping and enlargement of images captured by the device.
Notes: This value is a multiplier. For example, a value of 2.0 doubles the size of an image,Äôs subject (and halves the field of view). Allowed values range from 1.0 (full field of view) to the value of the active format,Äôs videoMaxZoomFactor property. Setting the value of this property jumps immediately to the new zoom factor. For a smooth transition, use the rampToVideoZoomFactor method.
(Read and Write property)

18.35.100 whiteBalanceMode as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The current white balance mode.
Notes: Before changing the value of this property, you must call lockForConfiguration to acquire exclusive access to the device's configuration properties. If you do not, setting the value of this property raises an exception. When you are done configuring the device, call unlockForConfiguration to release the lock and allow other devices to configure the settings.

You can observe changes to the value of this property using key-value observing.
See "AVCaptureWhiteBalanceMode" for possible values.
(Read and Write property)

18.35.101 Constants

Authorization

Constant	Value	Description
AVAuthorizationStatusAuthorized	3	The client is authorized to access the hardware supporting a media type is default for MacOS 10.13 or older.
AVAuthorizationStatusDenied	2	The user explicitly denied access to the hardware supporting a media ty the client.
AVAuthorizationStatusNotDetermined	0	Indicates that the user has not yet made a choice regarding whether the can access the hardware.
AVAuthorizationStatusRestricted	1	The client is not authorized to access the hardware for the media type user cannot change the client's status, possibly due to active restriction as parental controls being in place.

Center Stage Control Modes

Constant	Value	Description
AVCaptureCenterStageControlModeApp	1	The application controls center stage.
AVCaptureCenterStageControlModeCooperative	2	The user and the app control center stage together.
AVCaptureCenterStageControlModeUser	0	The user controls center stage.

Device Position Modes

Constant	Value	Description
AVCaptureDevicePositionBack	1	The capture device is on the back of the unit.
AVCaptureDevicePositionFront	2	The capture device is on the front of the unit.
AVCaptureDevicePositionUnspecified	0	The capture device's position relative to the system hardware is unspecifi

Transport Control Modes

Constant	Value	Description
AVCaptureDeviceTransportControlsNotPlayingMode	0	Indicates that the tape transport is not threaded through
AVCaptureDeviceTransportControlsPlayingMode	1	Indicates that the tape transport is threaded through the

Exposure Mode Constants

Constant	Value	Description
AVCaptureExposureModeAutoExpose	1	The device continuously monitors exposure levels and auto essary.
AVCaptureExposureModeContinuousAutoExposure	2	The device performs an auto-expose operation now.
AVCaptureExposureModeLocked	0	The exposure setting is locked.

Flash Modes

Constant	Value	Description
AVCaptureFlashModeAuto	2	The capture device continuously monitors light levels and uses the flash when necessary.
AVCaptureFlashModeOff	0	The capture device flash is always off.
AVCaptureFlashModeOn	1	The capture device flash is always on.

Focus Modes

Constant	Value	Description
AVCaptureFocusModeAutoFocus	1	The capture device performs an autofocus operation now.
AVCaptureFocusModeContinuousAutoFocus	2	The capture device continuously monitors focus and auto focuses sary.
AVCaptureFocusModeLocked	0	The focus is locked.

Torch Modes

Constant	Value	Description
AVCaptureTorchModeAuto	2	The capture device continuously monitors light levels and uses the torch when necessary.
AVCaptureTorchModeOff	0	The capture device torch is always off.
AVCaptureTorchModeOn	1	The capture device torch is always on.

White Balance Modes

Constant	Value	Description
AVCaptureWhiteBalanceModeAutoWhiteBalance	1	The device performs an auto white balance opera
AVCaptureWhiteBalanceModeContinuousAutoWhiteBalance	2	The device continuously monitors white balance a
AVCaptureWhiteBalanceModeLocked	0	The white balance setting is locked.

18.36 class AVCaptureFileOutputMBS

18.36.1 class AVCaptureFileOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVCaptureFileOutput is an abstract sub-class of AVCaptureOutput that describes a file output destination to an AVCaptureSession.
Example:

```
// record a movie from the camera with the capture view's record button and watch the size
// MyCaptureView is a subclass of DesktopAVCaptureViewControlMBS with the startRecordingToFileOutput event implemented, placed on the window as MyCaptureView1.
Var output As AVCaptureFileOutputMBS = MyCaptureView1.fileOutput
If output <>Nil And output.isRecording Then
System.DebugLog "Recorded " + output.recordedFileSize.ToString + " bytes, " + Format(output.recordedDuration.Seconds, "0.0") + " s"
End If

// in MyCaptureView:
Sub startRecordingToFileOutput(fileOutput As AVCaptureFileOutputMBS) Handles startRecordingToFileOutput
fileOutput.startRecordingToOutputFile SpecialFolder.Movies.Child("Recording.mov")
End Sub
```

Notes: For example, you use an instance of its concrete subclass, AVCaptureMovieFileOutput, to save capture output to a QuickTime movie file. The concrete subclasses of AVCaptureFileOutput are AVCaptureMovieFileOutput, which records media to a QuickTime movie file, and AVCaptureAudioFileOutput, which writes audio media to a variety of audio file formats.

This abstract superclass defines the interface for outputs that record media samples to files. File outputs can start recording to a new file using startRecordingToOutputFileURL method.

In OS X, on successive invocations of this method the output file can be changed dynamically without losing media samples. A file output can stop recording using the stopRecording method. Because files are recorded in the background, you need to specify a delegate for each new file to be notified when recorded files are finished.

In OS X, you can also set a delegate on the file output itself that can be used to control recording along exact media sample boundaries using the captureOutputDidOutputSampleBuffer event in AVFoundationMBS.
Subclass of the AVCaptureOutputMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.36.2 Methods

18.36.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.36.4 EnableEvents

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Enables the events for this output.
Notes: Those are normally handled automatically, but if you add event with AddHandler you need to call this method.

18.36.5 isRecording as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether recording is in progress.
Notes: The value of this property is true when the file output currently has a file to which it is writing new samples, false otherwise.

18.36.6 isRecordingPaused as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether recording to the current output file is paused.
Notes: This property indicates recording to the file returned by outputFileURL has been previously paused using the pauseRecording method. When a recording is paused, captured samples are not written to the output file, but new samples can be written to the same file in the future by calling resumeRecording.

18.36.7 outputFileURL as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The URL to which output is directed. (read-only)

18.36.8 pauseRecording

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Pauses recording to the current output file.
Notes: This method causes the receiver to stop writing captured samples to the current output file returned by outputFileURL, but leaves the file open so that samples can be written to it in the future, if resumeRecording is called. This allows you to record multiple media segments that are not contiguous in time to a single file.

In OS X, if this method is called within the AVFoundationMBS captureOutputDidFinishRecordingToOutputFileAtURL event, the last samples written to the current file are guaranteed to be those that were output immediately before those in the sample buffer passed to that method.

18.36.9 recordedDuration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the duration of the media recorded to the current output file. (read-only)
Notes: If recording is in progress, this property returns the total time recorded so far.

18.36.10 recordedFileSize as Int64

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the size, in bytes, of the data recorded to the current output file. (read-only)
Notes: If a recording is in progress, this property returns the size in bytes of the data recorded so far.

18.36.11 resumeRecording

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Resumes recording to the current output file after it was previously paused using pauseRecording.
Notes: This method causes the receiver to resume writing captured samples to the current output file returned by outputFileURL, after recording was previously paused using pauseRecording. This allows you to record multiple media segments that are not contiguous in time to a single file.

In OS X, if this method is called within the AVFoundationMBS captureOutputDidFinishRecordingToOutputFileAtURL event, the first samples written to the current file are guaranteed to be those contained in the sample buffer passed to that method.

18.36.12 startRecordingToOutputFile(file as folderitem)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Starts recording to a given file.
Notes: Same as startRecordingToOutputFileURL, but with folderitem.

18.36.13 startRecordingToOutputFileURL(URL as string)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Starts recording to a given URL.
Notes: URL: The URL of the output file. This method throws an NSInvalidArgumentException if the URL is not a valid file URL.

The method sets the file URL to which the receiver is currently writing output media. If a file at the given URL already exists when capturing starts, recording to the new file will fail.

In OS X, you do not need to call stopRecording before calling this method while another recording is in progress. If this method is invoked while an existing output file was already being recorded, no media samples will be discarded between the old file and the new file.

In iOS, this frame accurate file switching is not supported. You must call stopRecording before calling this method again to avoid any errors.

When recording is stopped either by calling stopRecording, by changing files using this method, or because of an error, the remaining data that needs to be included to the file will be written in the background. Therefore, you must specify a delegate that will be notified when all data has been written to the file using the AVFoundationMBS captureOutputDidFinishRecordingToOutputFileAtURL event. The recording delegate can also optionally implement methods that inform it when data starts being written, when recording is paused and resumed, and when recording is about to be finished.

In OS X, if this method is called within the AVFoundationMBS captureOutputDidOutputSampleBuffer event, the first samples written to the new file are guaranteed to be those contained in the sample buffer passed to that method.

Note: AVCaptureAudioFileOutput does not support startRecordingToOutputFileURL without filetype.

18.36.14 stopRecording

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Tells the receiver to stop recording to the current file.
Notes: You can call this method when they want to stop recording new samples to the current file, and do not want to continue recording to another file. If you want to switch from one file to another, you should not call this method. Instead you should simply call startRecordingToOutputFileURL with the new file URL.

When recording is stopped either by calling this method, by changing files using startRecordingToOutputFileURL, or because of an error, the remaining data that needs to be included to the file will be written in the background. Therefore, before using the file, you must wait until the delegate that was specified in startRecordingToOutputFileURL is notified when all data has been written to the file using the AVFoundationMBS.captureOutputDidFinishRecordingToOutputFileAtURL method.

In OS X, if this method is called within the AVFoundationMBS captureOutputDidOutputSampleBuffer event, the last samples written to the current file are guaranteed to be those that were output immediately before those in the sample buffer passed to that method.

18.36.15 Properties

18.36.16 maxRecordedDuration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The longest duration allowed for the recording.
Notes: This property specifies a hard limit on the duration of recorded files. Recording is stopped when the limit is reached and the AVFoundationMBS.captureOutputDidFinishRecordingToOutputFileAtURL event is invoked with an appropriate error. The default value of this property is kCMTimeInvalid, which indicates no limit.
(Read and Write computed property)

18.36.17 maxRecordedFileSize as Int64

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The maximum size, in bytes, of the data that should be recorded by the receiver.
Notes: This property specifies a hard limit on the data size of recorded files. Recording is stopped when the limit is reached and the AVFoundationMBS captureOutputDidFinishRecordingToOutputFileAtURL event is invoked with an appropriate error. The default value of this property is 0, which indicates no limit.
(Read and Write computed property)

18.36.18 minFreeDiskSpaceLimit as Int64

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The minimum amount of free space, in bytes, required for recording to continue on a given volume.
Notes: This property specifies a hard lower limit on the amount of free space that must remain on a target volume for recording to continue. Recording is stopped when the limit is reached and the AVFoundationMBS captureOutputDidFinishRecordingToOutputFileAtURL event is invoked with an appropriate error.
(Read and Write computed property)

18.37 class AVCaptureInputMBS

18.37.1 class AVCaptureInputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVCaptureInput is an abstract base-class describing an input data source to an AVCaptureSession object.
Notes: To associate an AVCaptureInput object with a session, call addInput on the session.

AVCaptureInput objects have one or more ports (instances of AVCaptureInputPort), one for each data stream they can produce. For example, an AVCaptureDevice object presenting one video data stream has one port.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.37.2 Methods

18.37.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.37.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.37.5 ports as AVCaptureInputPortMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The capture input's ports. (read-only)
Notes: The array contains one or more instances of AVCaptureInputPort.

Each individual AVCaptureInputPort instance posts an AVCaptureInputPortFormatDescriptionDidChangeNotification when the formatDescription of that port changes.

18.37.6 portWithMediaType(mediaType as string) as AVCaptureInputPortMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Finds the port in the ports array with given mediatype.
Notes: Returns nil if not found.

18.37.7 Properties

18.37.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.38 class AVCaptureInputPortMBS

18.38.1 class AVCaptureInputPortMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVCaptureInputPort represents a stream of data from a capture input.
Notes: Instances of AVCaptureInput have one or more input ports, one for each data stream they can produce. For example, an AVCaptureDeviceInput presenting one video data stream has one port.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.38.2 Methods

18.38.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.38.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.38.5 formatDescription as CMFormatDescriptionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A description of the port format. (read-only)

18.38.6 input as AVCaptureInputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The port's input. (read-only)

18.38.7 mediaType as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The port's media type. (read-only)

18.38.8 Properties

18.38.9 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.38.10 Enabled as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the port is enabled.
Notes: (Read and Write computed property)

18.39 class AVCaptureMetadataOutputMBS

18.39.1 class AVCaptureMetadataOutputMBS

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: iOS, Targets: iOS only.

Function: A capture output for processing timed metadata produced by a capture session.
Notes: Available for iOS only!

An AVCaptureMetadataOutput object intercepts metadata objects emitted by its associated capture connection and forwards them to a delegate object for processing. You can use instances of this class to process specific types of metadata included with the input data. You use this class the way you do other output objects, typically by adding it as an output to an AVCaptureSessionMBS object.
Subclass of the AVCaptureOutputMBS class.
Blog Entries

- News from the MBS Xojo Plugins Version 21.2
- MonkeyBread Software Releases the MBS Xojo Plugins in version 21.2
- MBS Xojo Plugins, version 21.2pr7

18.39.2 Methods

18.39.3 availableMetadataObjectTypes as string()

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: iOS, Targets: iOS only.

Function: An array of strings identifying the types of metadata objects that can be captured.
Notes: Each string in the array corresponds to a possible value in the type property of the AVMetadataObjectMBS objects reported by the receiver. The available types are dependent on the capabilities of the AVCaptureInputPortMBS to which the receiver,Äôs connection is attached.

18.39.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: iOS, Targets: iOS only.

Function: The constructor.

18.39.5 EnableEvents

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: iOS, Targets: iOS only.

Function: Enables events, if you use addHandler to connect them.

18.39.6 metadataObjectTypes as String()

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: iOS, Targets: iOS only.

Function: An array of strings identifying the types of metadata objects to process.
Notes: This property is used to filter the metadata objects reported by the receiver. Only metadata objects whose type matches one of the strings in this property are forwarded to the captureOutput:didOutputMetadataObjects event for processing.

When assigning a new array to this property, each of the type strings must be present in the array returned by the availableMetadataObjectTypes property; otherwise, the receiver raises an NSExceptionMBS.
The default is an empty array, and as a result, no metadata objects are forwarded to the event. The same result can be achieved by setting the property to nil. This default behavior maximizes both performance and battery life.

18.39.7 SetMetadataObjectTypes(items() as String = nil)

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: iOS, Targets: iOS only.

Function: Sets the array of strings identifying the types of metadata objects to process.
Example:

```
Var o As New AVCaptureMetadataOutputMBS
Var types() As String

Var availableTypes() As String = o.availableMetadataObjectTypes

// check if we can do EAN 13 and then add it
If availableTypes.IndexOf(AVMetadataObjectMBS.AVMetadataObjectTypeEAN13Code) >= 0 Then
types.Add(AVMetadataObjectMBS.AVMetadataObjectTypeEAN13Code)
End If

o.SetMetadataObjectTypes types
```

Notes: This property is used to filter the metadata objects reported by the receiver. Only metadata objects whose type matches one of the strings in this property are forwarded to the captureOutput:didOutputMetadataObjects event for processing.

When assigning a new array to this property, each of the type strings must be present in the array returned by the availableMetadataObjectTypes property; otherwise, the receiver raises an NSExceptionMBS.
The default is an empty array, and as a result, no metadata objects are forwarded to the event. The same

result can be achieved by setting the property to nil. This default behavior maximizes both performance and battery life.

18.39.8 Properties

18.39.9 rectOfInterest as CGRectMBS

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: iOS, Targets: iOS only.

Function: A rectangle of interest for limiting the search area for visual metadata.
Notes: The value of this property is a CGRect value that determines the object,Äôs rectangle of interest for each frame of video.
The rectangle's origin is top left and is relative to the coordinate space of the device providing the metadata.
Specifying a rectangle of interest may improve detection performance for certain types of metadata. Metadata objects whose bounds do not intersect with the rectOfInterest will not be returned.
The default value of this property is a rectangle of (0.0, 0.0, 1.0, 1.0).
(Read and Write property)

18.40 class AVCaptureMovieFileOutputMBS

18.40.1 class AVCaptureMovieFileOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVCaptureMovieFileOutput is a concrete sub-class of AVCaptureFileOutput you use to capture data to a QuickTime movie.
Example:

```
// record from a running capture session into a movie file
// Session is a property of the window: Session As AVCaptureSessionMBS (running, with camera input)
// Output is a property of the window: Output As AVCaptureMovieFileOutputMBS

Output = New AVCaptureMovieFileOutputMBS
Session.addOutput Output

Output.startRecordingToOutputFile SpecialFolder.Desktop.Child("recording.mov")

// later
// If Output.isRecording Then Output.stopRecording
```

Notes: The timeMapping.target.start of the first track segment must be kCMTimeZero, and the timeMapping.target.start of each subsequent track segment must equal CMTimeRangeGetEnd(<#the previous AVCompositionTrackSegment's timeMapping.target#>). You can use validateTrackSegments to ensure that an array of track segments conforms to this rule.
Subclass of the AVCaptureFileOutputMBS class.

18.40.2 Methods

18.40.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The constructor.

18.40.4 EnableEvents

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Enables the events for this output.
Notes: Those are normally handled automatically, but if you add event with AddHandler you need to call this method.

18.40.5 metadata as AVMetadataItemMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The metadata for the output file.
Notes: The array contains AVMetadataItem objects. You use this array to add metadata such as copyright, creation date, and so on, to the recorded movie file.

18.40.6 setMetadata(items() as AVMetadataItemMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sets the metadata for the output file.
Notes: The array contains AVMetadataItem objects. You use this array to add metadata such as copyright, creation date, and so on, to the recorded movie file.

18.40.7 Properties

18.40.8 movieFragmentInterval as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the number of seconds of output that are written per fragment.
Notes: The default is 10 seconds. Set to kCMTimeInvalid to disable movie fragment writing (not typically recommended).

A QuickTime movie is comprised of media samples and a sample table identifying their location in the file. A movie file without a sample table is unreadable.

In a processed file, the sample table typically appears at the beginning of the file. It may also appear at the end of the file, in which case the header contains a pointer to the sample table at the end. When a new movie file is being recorded, it is not possible to write the sample table since the size of the file is not yet known. Instead, the table is must be written when recording is complete. If no other action is taken, this means that if the recording does not complete successfully (for example, in the event of a crash), the file data is unusable (because there is no sample table). By periodically inserting "movie fragments" into the movie file, the sample table can be built up incrementally. This means that if the file is not written completely, the movie file is still usable (up to the point where the last fragment was written).
(Read and Write computed property)

18.40.9 outputSettingsForConnection(connection as AVCaptureConnectionMBS) as Dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the options the receiver uses to re-encode media from the given connection as it is being recorded.
Notes: connection: The connection delivering the media to be re-encoded.
Returns an Dictionary of output settings.

See AVAudioSettings.h for audio connections or AVVideoSettings.h for video connections for more information on how to construct an output settings dictionary. If the returned value is an empty dictionary (i.e. new dictionary, the format of the media from the connection will not be changed before being written to the file. If setOutputSettings was called with a nil dictionary, this method returns a non-nil dictionary reflecting the settings used by the AVCaptureSession's current sessionPreset.
(Read and Write computed property)

18.41 class AVCaptureOutputMBS

18.41.1 class AVCaptureOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVCaptureOutput is an abstract base-class describing an output destination of an AVCaptureSession object.
Notes: AVCaptureOutput provides an abstract interface for connecting capture output destinations, such as files and video previews, to an capture session (an instance of AVCaptureSession). A capture output can have multiple connections represented by AVCaptureConnection objects, one for each stream of media that it receives from a capture input (an instance of AVCaptureInput). A capture output does not have any connections when it is first created. When you add an output to a capture session, connections are created that map media data from that session's inputs to its outputs.

You can add concrete AVCaptureOutput instances to an capture session using addOutput.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.41.2 Methods

18.41.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.41.4 connections as AVCaptureConnectionMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The capture output object's connections. (read-only)
Notes: The value of this property is an array of AVCaptureConnection objects, each describing the mapping between the receiver and the capture input ports (see AVCaptureInputPort) of one or more capture inputs (see AVCaptureInput).

18.41.5 connectionWithMediaType(mediaType as string) as AVCaptureConnectionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the first connection in the connections array with an input port of a specified media type.
Notes: mediaType: An AVMediaType constant from AVMediaFormat.h, for example, AVMediaTypeVideo.

Returns the first capture connection in the connections array that has an AVCaptureInputPort with media type mediaType, or nil if no connection with the specified media type is found.

18.41.6 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.41.7 Properties

18.41.8 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.42 class AVCaptureReactionEffectStateMBS

18.42.1 class AVCaptureReactionEffectStateMBS

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: Reports the state of a reaction performed on an AVCaptureDeviceMBS.
Example:

```
Var device as AVCaptureDeviceMBS // your device

Var effects() as AVCaptureReactionEffectStateMBS = device.reactionEffectsInProgress

for each effect as AVCaptureReactionEffectStateMBS in effects
MessageBox effect.reactionType
next
```

Notes: AVCaptureReactionEffectStateMBS may be obtained by calling reactionEffectsInProgress in AVCaptureDeviceMBS. When canPerformReactionEffects in AVCaptureDeviceMBS returns true, new entries are added either by calling performReactionEffect, or by gesture detection in the capture stream when AVCaptureDevice.reactionEffectGesturesEnabled. The effect rendering is done before frames are given to the capture client, and these status objects let you know when these effects are performed.

Requires macOS 14.0 or iOS 17.0.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- News from the MBS Xojo Plugins Version 23.5
- MonkeyBread Software Releases the MBS Xojo Plugins in version 23.5
- MBS Xojo Plugins, version 23.5pr6

18.42.2 Methods

18.42.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: Whether this class is available.
Example:

```
If AVCaptureReactionEffectStateMBS.available Then
MessageBox "available"
Else
MessageBox "not available."
```

End If

Notes: Returns true on macOS 14.0 or iOS 17.0.

18.42.4 AVCaptureReactionTypeBalloons as String

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: One of the rection types that can be performed in an effect.
Notes: Indicates a reaction which features balloons rising through the scene.

18.42.5 AVCaptureReactionTypeConfetti as String

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: One of the rection types that can be performed in an effect.
Notes: Indicates a reaction which features festive spots of color falling through the scene.

18.42.6 AVCaptureReactionTypeFireworks as String

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: One of the rection types that can be performed in an effect.
Notes: Indicates a reaction which features fireworks bursting in the background.

18.42.7 AVCaptureReactionTypeHeart as String

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: One of the rection types that can be performed in an effect.
Notes: Indicates a reaction which features one or more heart symbols.

18.42.8 AVCaptureReactionTypeLasers as String

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: One of the rection types that can be performed in an effect.
Notes: Indicates a reaction which features a bright laser display projecting into the scene.

18.42.9 AVCaptureReactionTypeRain as String

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: One of the rection types that can be performed in an effect.
Notes: Indicates a reaction which features a dark and stormy night.

18.42.10 AVCaptureReactionTypeThumbsDown as String

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: One of the rection types that can be performed in an effect.
Notes: Indicates a reaction which features a thumbs-down symbol.

18.42.11 AVCaptureReactionTypeThumbsUp as String

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: One of the rection types that can be performed in an effect.
Notes: Indicates a reaction which features a thumbs-up symbol.

18.42.12 Constructor

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

18.42.13 ReactionSystemImageNameForType(reactionType as String) as String

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: Returns the name for NSImage systemImageNamed method to obtain the recommended iconography for a specified reaction type.
Example:

```
// loads image into canvas
Var effect as string = AVCaptureReactionEffectStateMBS.AVCaptureReactionTypeBalloons
Var name as string = AVCaptureReactionEffectStateMBS.ReactionSystemImageNameForType(effect)
Var image as NSImageMBS = NSImageMBS.imageWithSystemSymbolName(name)

// change size to match
image.setSize Canvas1.Width, Canvas1.Height
```

```
// and render picture
Canvas1.Backdrop = image.CopyPictureWithAlpha
```

18.42.14 Properties

18.42.15 endTime as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: Provides the presentation time of the frame following the last frame where the effect is seen.
Notes: Will be CMTimeMBS.kCMTimeInvalid while the effect is in progress, but will be updated to a valid time when the reaction effect completes and the AVCaptureReactionEffectState is removed from reactionEffectsInProgress array.
(Read only property)

18.42.16 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.42.17 reactionType as String

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: Indicates the reaction which is running.
Notes: There may be multiple reactions of the same type at a given time.
Some may come from gesture detection, some may come from calls to performReactionEffect method in AVCaptureDeviceMBS class.
(Read only property)

18.42.18 startTime as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: All.

Function: Provides the presentation time of the first frame where the effect is being rendered.
Notes: (Read only property)

18.43 class AVCaptureScreenInputMBS

18.43.1 class AVCaptureScreenInputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: AVCaptureScreenInput is a concrete subclass of AVCaptureInput that provides an interface for capturing media from a screen or a portion of a screen.
Example:

```
// record the main screen into a movie file
// Session is a property of the window: Session As AVCaptureSessionMBS
// Output is a property of the window: Output As AVCaptureMovieFileOutputMBS
Var screen As New AVCaptureScreenInputMBS(CGDisplayMBS.MainDisplay)
screen.capturesCursor = True
screen.capturesMouseClicks = True
screen.scaleFactor = 0.5 // half size

Session = New AVCaptureSessionMBS
If Not Session.canAddInput(screen) Then Return
Session.addInput screen

Output = New AVCaptureMovieFileOutputMBS
Session.addOutput Output
Session.startRunning

Output.startRecordingToOutputFile SpecialFolder.Desktop.Child("screen.mov")

// later
// Output.stopRecording
// Session.stopRunning
```

Notes: Instances of AVCaptureScreenInput are input sources for AVCaptureSession objects that provide media data from one of the screens connected to the system, represented by CGDirectDisplayIDs.
Subclass of the AVCaptureInputMBS class.
Blog Entries

- MBS Xojo Plugins, version 18.4pr1

18.43.2 Methods

18.43.3 Constructor(CGDisplay as Variant)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a capture screen input that provides media data from a given display.

Notes: CGDisplay: The display from which to capture video. Must be CGDisplayMBS object.
Handle is non zero on success.

18.43.4 Properties

18.43.5 capturesCursor as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A property indicating whether the cursor should be rendered to the captured output.
Notes: By default, AVCaptureScreenInput draws the cursor in its captured output. If this property is set to false, the captured output contains only the windows on the screen. Cursor is omitted. Note that cursor position and mouse button state at the time of capture is preserved in CMSampleBuffers emitted from AVCaptureScreenInput. See the inline documentation for kCMIOSampleBufferAttachmentKey_MouseAndKeyboardModifiers in <CoreMediaIO/CMIOSampleBuffer.h>

Available in Mac OS X 10.8 and newer.
(Read and Write computed property)

18.43.6 capturesMouseClicks as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether mouse clicks should be highlighted in the captured output.
Notes: By default, AVCaptureScreenInput does not highlight mouse clicks in its captured output.

If you set this property is set to true, mouse clicks are highlighted (a circle is drawn around the mouse for the duration of the click) in the captured output.
(Read and Write computed property)

18.43.7 cropRect as CGRectMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the bounding rectangle of the screen area to be captured, in pixels.
Notes: By default, AVCaptureScreenInput captures the entire area of the displayID with which it is associated.

Set the value of this property to limit the capture rectangle to a subsection of the screen.

The rectangle should define a smaller section of the screen in the screen's coordinate system. The origin (0,0) is the bottom-left corner of the screen.
(Read and Write computed property)

18.43.8 minFrameDuration as CMTimeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The screen input's minimum frame duration.
Notes: The minFrameDuration is the reciprocal of its maximum frame rate.

You use this property to request a maximum frame rate at which the input produces video frames. The requested rate may not be achievable due to overall bandwidth, so actual frame rates may be lower.
(Read and Write computed property)

18.43.9 removesDuplicateFrames as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A property indicating whether duplicate frames should be removed by the input.
Notes: By default, AVCaptureScreenInput performs frame differencing and when it detects duplicate frames, it drops them. If this property is set to false, the captured output receives all frames from the input.

Available in Mac OS X 10.8 and newer.
(Read and Write computed property)

18.43.10 scaleFactor as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the factor by which video buffers captured from the screen are to be scaled.
Notes: By default, AVCaptureScreenInput captures the video buffers from the display at a scale factor of 1.0 (no scaling). Set this property to scale the buffers by a given factor; for example a 320x240 capture area with a scaleFactor of 2.0 produces video buffers at 640x480.
(Read and Write computed property)

18.44 class AVCaptureSessionMBS

18.44.1 class AVCaptureSessionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVCaptureConnection object represents a connection between capture input and capture output objects associated with a capture session.
Example:

```
// capture video from the default camera and record it to a movie file
// Your app needs camera permission (NSCameraUsageDescription in Info.plist).
// Session and Output are properties of the window:
// Session As AVCaptureSessionMBS
// Output As AVCaptureMovieFileOutputMBS

Var camera As AVCaptureDeviceMBS = AVCaptureDeviceMBS.defaultDeviceWithMediaType(AVFoundationMBS.AVMediaTypeVideo)
If camera = Nil Then
MessageBox "No camera found."
Return
End If

Var error As NSErrorMBS
Var input As New AVCaptureDeviceInputMBS(camera, error)
If error <>Nil Then
MessageBox error.localizedDescription
Return
End If

Session = New AVCaptureSessionMBS
If Session.canAddInput(input) Then Session.addInput input

Output = New AVCaptureMovieFileOutputMBS
Session.addOutput Output

Session.startRunning
Output.startRecordingToOutputFile SpecialFolder.Desktop.Child("capture.mov")

// later
// Output.stopRecording
// Session.stopRunning
```

Notes: Capture inputs (instances of AVCaptureInput) have one or more input ports (instances of AVCaptureInputPort). Capture outputs (instances of AVCaptureOutput) can accept data from one or more sources (for example, an AVCaptureMovieFileOutput object accepts both video and audio data).

You can only add an AVCaptureConnection instance to a session using addConnection if canAddConnection returns true. When using addInput or addOutput, connections are formed automatically between all compatible inputs and outputs. You only need to add connections manually when adding an input or output with no connections. You can also use connections to enable or disable the flow of data from a given input or to a given output.

18.44.2 Methods

18.44.3 addConnection(connection as AVCaptureConnectionMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Adds a given capture connection to the session.
Notes: connection: The capture connection to add to the session.

You can only add an AVCaptureConnection instance to a session using this method if canAddConnection returns true.
When using addInput or addOutput, connections are formed automatically between all compatible inputs and outputs. Manually adding connections is only necessary when adding an input or output with no connections.

18.44.4 addInput(connection as AVCaptureInputMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Adds a given input to the session.
Notes: input: An input to add to the session.

You can only add an input to a session using this method if canAddInput returns true.
You can invoke this method while the session is running.

18.44.5 addInputWithNoConnections(input as AVCaptureInputMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Adds an capture input to the session without forming any connections.
Notes: input: The capture input to add to the session.
You can invoke this method while the session is running.
Typically you should use addInput to add an input to a session. You use this method if you need fine-grained control over which inputs are connected to which outputs.

18.44.6 addOutput(connection as AVCaptureOutputMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Adds a given output to the session.
Notes: output: An output to add to the session.
You can only add an output to a session using this method if canAddOutput returns true.
You can invoke this method while the session is running.

18.44.7 addOutputWithNoConnections(output as AVCaptureOutputMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Adds an capture output to the session without forming any connections.
Notes: output: The capture output to add to the session.

You can invoke this method while the session is running.
Typically you should use addOutput to add an output to a session. You use this method if you need fine-grained control over which inputs are connected to which outputs.

18.44.8 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.44.9 beginConfiguration

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the start of a set of configuration changes to be made atomically.
Notes: You use beginConfiguration and commitConfiguration to batch multiple configuration operations on a running session into an atomic update.

After calling beginConfiguration, you can for example add or remove outputs, alter the sessionPreset, or configure individual capture input or output properties. No changes are actually made until you invoke commitConfiguration, at which time they are applied together.

18.44.10 canAddConnection(connection as AVCaptureConnectionMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given connection can be added to the receiver.
Notes: connection: An AVCaptureConnection instance.
Returns true if connection can be added to the receiver, otherwise false.

18.44.11 canAddInput(input as AVCaptureInputMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given input can be added to the session.
Notes: input: An input that you want to add to the session.
Returns true if input can be added to the session, otherwise false.

18.44.12 canAddOutput(input as AVCaptureOutputMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given output can be added to the session.
Notes: output: An output that you want to add to the session.
Returns true if output can be added to the session, otherwise false.

18.44.13 canSetSessionPreset(preset as string) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the receiver can use the given preset.
Notes: preset: A preset you would like to set for the receiver. For possible values, see AVFoundationMBS.
Returns true if the receiver can use preset, otherwise false.

18.44.14 commitConfiguration

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Commits a set of configuration changes.
Notes: For discussion, see beginConfiguration.

18.44.15 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The constructor.

18.44.16 inputs as AVCaptureInputMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The capture session's inputs. (read-only)
Notes: The array contains instances of subclasses of AVCaptureInput.

18.44.17 isRunning as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the receiver is running. (read-only)
Notes: You can observe the value of this property using key-value observing.

18.44.18 outputs as AVCaptureOutputMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The capture session's outputs. (read-only)
Notes: The array contains instances of subclasses of AVCaptureOutput.

18.44.19 removeConnection(connection as AVCaptureConnectionMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Removes a capture connection from the session.
Notes: connection: The capture connection to remove from the session.
You can invoke this method while the session is running.

18.44.20 removeInput(connection as AVCaptureInputMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Removes a given input.
Notes: input: An input to remove from the receiver.
You can invoke this method while the session is running.

18.44.21 removeOutput(connection as AVCaptureOutputMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Removes a given output.
Notes: output: An output to remove from the receiver.
You can invoke this method while the session is running.

18.44.22 startRunning

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Tells the receiver to start running.
Notes: startRunning and stopRunning are asynchronous operations. If an error occurs occur during a capture session, you receive an AVCaptureSessionRuntimeErrorNotification.

18.44.23 stopRunning

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Tells the receiver to stop running.
Notes: startRunning and stopRunning are asynchronous operations. If an error occurs occur during a capture session, you receive an AVCaptureSessionRuntimeErrorNotification.

18.44.24 Properties

18.44.25 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

18.44.26 sessionPreset as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A constant value indicating the quality level or bitrate of the output.
Notes: You use this property to customize the quality level or bitrate of the output. For possible values of sessionPreset, see AVFoundationMBS. The default value is AVCaptureSessionPresetHigh.

You can set this value while the session is running.
You can only set a preset if canSetSessionPreset: returns true for that preset.
(Read and Write computed property)

18.45 class AVCaptureStillImageOutputMBS

18.45.1 class AVCaptureStillImageOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVCaptureStillImageOutput is a concrete sub-class of AVCaptureOutput that you use to capture a high-quality still image with accompanying metadata.
Notes: Subclass of the AVCaptureOutputMBS class.
Blog Entries

- News from the MBS Xojo Plugins Version 25.3
- MBS Xojo Plugins, version 25.3pr1
- MBS Xojo / Real Studio Plugins, version 14.4pr6

18.45.2 Methods

18.45.3 availableImageDataCodecTypes as string()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The supported image codec formats that can be specified in outputSettings. (read-only)
Example:

```
Var a as new AVCaptureStillImageOutputMBS
MessageBox join(a.availableImageDataCodecTypes)
```

Notes: The value of this property is an array of Strings that you can use as values for the AVVideoCodecKey in the outputSettings property.

18.45.4 availableImageDataCVPixelFormatTypes as Integer()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The supported image pixel formats that can be specified in outputSettings. (read-only)
Example:

```
Var a as new AVCaptureStillImageOutputMBS
Var availableImageDataCVPixelFormatTypes() as Integer = a.availableImageDataCVPixelFormatTypes
break // check array in debugger
```

Notes: The value of this property is an array of numbers that you can use as values for the kCVPixelBuffer-PixelFormatTypeKey in the outputSettings property.

Currently only "jpeg".
Available in OS X v10.7 and later.

18.45.5 captureStillImageAsynchronously(connection as AVCaptureConnectionMBS, prepareJpegStillImage as boolean, tag as Variant = nil)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initiates a still image capture and returns immediately.
Notes: connection: The connection from which to capture the image.

Pass true for prepareJpegStillImage to have the plugin prepare jpeg data for you.

The buffer attachments may contain metadata appropriate to the image data format. For example, a buffer containing JPEG data may carry a kCGImagePropertyExifDictionary as an attachment. See ImageIO/CGImageProperties.h for a list of keys and value types.
error
If the request could not be completed, an NSError object that describes the problem; otherwise nil.

This method returns immediately after it is invoked, later calling the AVFoundationMBS.captureStillImageAsynchronouslyCompleted event when image data is ready. If the request could not be completed, the error parameter will contain an NSError object describing the failure.

Available in OS X v10.7 and later.

With tag you can pass any value you like to the event later. This can be for example an object reference or a number in an array. Be aware that the reference to this tag value is kept until the event is called and can cause memory reference cycles.

18.45.6 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The constructor.

18.45.7 jpegStillImageNSDataRepresentation(jpegSampleBuffer as CMSampleBufferMBS) as memoryblock

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an memoryblock representation of a still image data and metadata attachments in a JPEG sample buffer.
Notes: jpegSampleBuffer: The sample buffer carrying JPEG image data, optionally with Exif metadata sample buffer attachments.
This method throws an NSInvalidArgumentException if jpegSampleBuffer is nil or not in the JPEG format.

Returns memoryblock representation of jpegSampleBuffer.

This method merges the image data and Exif metadata sample buffer attachments without re-compressing the image.
The returned memoryblock object is suitable for writing to disk.

Available in OS X v10.7 and later.

18.45.8 Properties

18.45.9 automaticallyEnablesStillImageStabilizationWhenAvailable as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.3, Platform: iOS, Targets: All.

Function: Indicates whether the receiver should automatically use still image stabilization when necessary.
Notes: On a receiver where isStillImageStabilizationSupported returns true, image stabilization may be applied to reduce blur commonly found in low light photos. When stabilization is enabled, still image captures incur additional latency. The default value is true when supported, NO otherwise. Setting this property throws an NSInvalidArgumentException if isStillImageStabilizationSupported returns false.
(Read and Write property)

18.45.10 isCapturingStillImage as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: A boolean value that becomes true when a still image is being captured.
Notes: The value of this property is a BOOL that becomes true when a still image is being captured, and false when no still image capture is underway. This property is key-value observable.
(Read only property)

18.45.11 isHighResolutionStillImageOutputEnabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.3, Platforms: macOS, iOS, Targets: All.

Function: Indicates whether the receiver should emit still images at the highest resolution supported by its

source AVCaptureDevice's activeFormat.
Notes: By default, AVCaptureStillImageOutput emits images with the same dimensions as its source AVCaptureDevice's activeFormat.formatDescription. However, if you set this property to true, the receiver emits still images at its source AVCaptureDevice's activeFormat.highResolutionStillImageDimensions.
Note that if you enable video stabilization (see AVCaptureConnection's preferredVideoStabilizationMode) for any output, the high resolution still images emitted by AVCaptureStillImageOutput may be smaller by 10 or more percent.

Requires macOS 10.14 or iOS 8.0.
(Read and Write property)

18.45.12 isStillImageStabilizationActive as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.3, Platform: iOS, Targets: iOS only.

Function: Indicates whether still image stabilization is in use for the current capture.
Notes: On a receiver where isStillImageStabilizationSupported returns true, and automaticallyEnablesStillImageStabilizationWhenAvailable is set to true, this property may be key-value observed, or queried from inside your key-value observation callback for the capturingStillImage property, to find out if still image stabilization is being applied to the current capture.
(Read only property)

18.45.13 isStillImageStabilizationSupported as Boolean

MBS AVFoundation Plugin, Plugin Version: 25.3, Platform: iOS, Targets: iOS only.

Function: Indicates whether the receiver supports still image stabilization.
Notes: The receiver's automaticallyEnablesStillImageStabilizationWhenAvailable property can only be set if this property returns true. Its value may change as the session's sessionPreset or input device's activeFormat changes.
(Read only property)

18.45.14 outputSettings as dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The compression settings for the output.
Notes: You specify the compression settings using keys from AVVideoSettings.h, or a dictionary of pixel buffer attributes using keys from CVPixelBuffer.h.

Currently the only supported keys are AVVideoCodecKey and kCVPixelBufferPixelFormatTypeKey. The recommended values are kCMVideoCodecType_JPEG, kCVPixelFormatType_420YpCbCr8BiPlanarFull-

Range and kCVPixelFormatType_32BGRA.

Available in OS X v10.7 and later.
(Read and Write computed property)

18.46 class AVCaptureVideoDataOutputMBS

18.46.1 class AVCaptureVideoDataOutputMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVCaptureVideoDataOutput is a concrete sub-class of AVCaptureOutput you use to process uncompressed frames from the video being captured, or to access compressed frames.
Notes: An instance of AVCaptureVideoDataOutput produces video frames you can process using other media APIs. You can access the frames with the AVFoundationMBS.captureOutputDidOutputSampleBuffer event.
Subclass of the AVCaptureOutputMBS class.

18.46.2 Methods

18.46.3 availableVideoCodecTypes as string()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the supported video codec formats that can be specified in videoSettings. (read-only)
Notes: The value of this property is an array of String objects you can use as values for the AVVideoCodecKey in the videoSettings property. The first format in the returned list is the most efficient output format.

18.46.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The constructor.
See also:

- 18.46.5 Constructor(CIDetector as Variant) 3634

18.46.5 Constructor(CIDetector as Variant)

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: This allows you to use a CIDetectorMBS object with AVCaptureVideoDataOutputMBS.
The plugin will run the detector in a helper thread, so you have more time on the main thread for your application and better performance.
See also:

- 18.46.4 Constructor 3634

18.46.6 EnableEvents

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Enables the events for this output.
Notes: Those are normally handled automatically, but if you add event with AddHandler you need to call this method.

18.46.7 Properties

18.46.8 Detector as Variant

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The CIDetectorMBS object used here.
Notes: Value is a CIDetectorMBS. We use variant to reduce dependency to other plugins.
(Read only property)

18.46.9 PrepareCIImage as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Whether CIImageMBS should be created on preemptive thread.
Notes: If enabled, the plugin will do the work to create CIImage on the preemptive thread before calling AVFoundationMBS.captureOutputDidOutputSampleBuffer event on main thread. This may make your app more responsive on the main thread.
(Read and Write property)

18.46.10 PrepareJPEGData as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Whether JPEGData should be created on preemptive thread.
Notes: If enabled, the plugin will do the work to create JPEGData on the preemptive thread before calling AVFoundationMBS.captureOutputDidOutputSampleBuffer event on main thread. This may make your app more responsive on the main thread.
(Read and Write property)

18.46.11 PrepareNSImage as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Whether NSImageMBS should be created on preemptive thread.
Notes: If enabled, the plugin will do the work to create NSImage on the preemptive thread before calling AVFoundationMBS.captureOutputDidOutputSampleBuffer event on main thread. This may make your app more responsive on the main thread.
(Read and Write property)

18.46.12 alwaysDiscardsLateVideoFrames as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether video frames are dropped if they arrive late.
Notes: When the value of this property is true, the object immediately discards frames that are captured while the dispatch queue handling existing frames is blocked in the AVFoundationMBS.captureOutputDidOutputSampleBuffer event.

When the value of this property is false, delegates are allowed more time to process old frames before new frames are discarded, but application memory usage may increase significantly as a result.

The default is true.
(Read and Write computed property)

18.46.13 videoSettings as dictionary

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The compression settings for the output.
Notes: The dictionary contains values for compression settings keys defined in AVVideoSettings.h, or pixel buffer attributes keys defined in <CoreVideo/CVPixelBuffer.h>(see CVPixelBufferRef). The only key currently supported is the kCVPixelBufferPixelFormatTypeKey key.
(The plugin defines such keys in AVFoundationMBS)

To get possible values for the supported video pixel formats (kCVPixelBufferPixelFormatTypeKey) and video codec formats (AVVideoCodecKey), see availableVideoCVPixelFormatTypes and availableVideoCodecTypes respectively.

To receive samples in their device native format, set this property to nil:

If you set this property to nil and then subsequently query it, you will get a dictionary reflecting the settings used by the capture sessions's current sessionPreset.
(Read and Write computed property)

18.47 class AVCaptureVideoPreviewLayerMBS

18.47.1 class AVCaptureVideoPreviewLayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: AVCaptureVideoPreviewLayer is a subclass of CALayer that you use to display video as it is being captured by an input device.
Example:

```
// This example needs a window with Canvas1.
// show the live camera picture of a capture session in a canvas
// Session is a property of the window: Session As AVCaptureSessionMBS (running, with camera input)
Var view As NSViewMBS = Canvas1.NSViewMBS
view.wantsLayer = True
Var root As CALayerMBS = view.layer

Var preview As New AVCaptureVideoPreviewLayerMBS(Session)
preview.frame = root.bounds
root.addSublayer preview
```

Notes: You use the videoGravity property to influence how content is viewed relative to the layer bounds. On some hardware configurations, you can manipulate the orientation of the layer using orientation and mirrored.
Subclass of the CALayerMBS class.

18.47.2 Methods

18.47.3 captureDevicePointOfInterestForPoint(pointInLayer as CGPointMBS) as CGPointMBS

MBS AVFoundation Plugin, Plugin Version: 22.2, Platform: macOS, Targets: All.

Function: Converts a point in layer coordinates to a point of interest in the coordinate space of the capture device providing input to the layer.
Notes: pointInLayer: A CGPoint in layer coordinates.

Returns a CGPoint in the coordinate space of the capture device providing input to the layer.

AVCaptureDevice pointOfInterest is expressed as a CGPoint where { 0,0 } represents the top left of the picture area, and { 1,1 } represents the bottom right on an unrotated picture. This convenience method converts a point in the coordinate space of the receiver to a point of interest in the coordinate space of the AVCaptureDevice providing input to the receiver. The conversion takes frameSize and videoGravity into consideration.

18.47.4 connection as AVCaptureConnectionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The capture connection describing the AVCaptureInputPort to which the preview layer is connected. (read-only)
Notes: If you invoke Constructor, layerWithSession, or set session with a valid AVCaptureSession instance, a connection is formed to the first eligible video AVCaptureInput object. If the preview layer is detached from a session, the connection property becomes nil.

18.47.5 Constructor(session as AVCaptureSessionMBS, WithConnection as boolean = true)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes a preview layer with a given capture session.
Notes: Only pass WithConnection=false here if you intend to manually form a connection between a desired AVCaptureInputPort object and the receiver using addConnection.

18.47.6 layerWithSession(session as AVCaptureSessionMBS) as AVCaptureVideoPreviewLayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a preview layer initialized with a given capture session.
Notes: session: The capture session from which to derive the preview.

Returns a preview layer initialized to use session.

18.47.7 layerWithSessionWithNoConnection(session as AVCaptureSessionMBS) as AVCaptureVideoPreviewLayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a preview layer using a given capture session but without making any connections.
Notes: session: The capture session to be previewed.
Return a preview layer initialized with session but with no connections to any of the session's eligible video inputs

Only use this method if you intend to manually form a connection between a desired AVCaptureInputPort object and the receiver using addConnection.

18.47.8 metadataOutputRectOfInterestForRect(rectInLayerCoordinates as CGRectMBS) as CGRectMBS

MBS AVFoundation Plugin, Plugin Version: 22.2, Platform: macOS, Targets: All.

Function: Converts a rectangle in layer coordinates to a rectangle of interest in the coordinate space of an AVCaptureMetadataOutput whose capture device is providing input to the layer.
Notes: rectInLayerCoordinates: A CGRect in layer coordinates.

Returns a CGRect in the coordinate space of the metadata output whose capture device is providing input to the layer.

AVCaptureMetadataOutput rectOfInterest is expressed as a CGRect where { 0,0 } represents the top left of the picture area, and { 1,1 } represents the bottom right on an unrotated picture. This convenience method converts a rectangle in the coordinate space of the receiver to a rectangle of interest in the coordinate space of an AVCaptureMetadataOutput whose AVCaptureDevice is providing input to the receiver. The conversion takes frame size and videoGravity into consideration.

18.47.9 pointForCaptureDevicePointOfInterest(captureDevicePointOfInterest as CGPointMBS) as CGPointMBS

MBS AVFoundation Plugin, Plugin Version: 22.2, Platform: macOS, Targets: All.

Function: Converts a point of interest in the coordinate space of the capture device providing input to the layer to a point in layer coordinates.
Notes: captureDevicePointOfInterest: A CGPoint in the coordinate space of the capture device providing input to the layer.

Returns a CGPoint in layer coordinates.

AVCaptureDevice pointOfInterest is expressed as a CGPoint where { 0,0 } represents the top left of the picture area, and { 1,1 } represents the bottom right on an unrotated picture. This convenience method converts a point in the coordinate space of the AVCaptureDevice providing input to the coordinate space of

the receiver. The conversion takes frame size and videoGravity into consideration.

18.47.10 rectForMetadataOutputRectOfInterest(rectInMetadataOutputCoordinates as CGRectMBS) as CGRectMBS

MBS AVFoundation Plugin, Plugin Version: 22.2, Platform: macOS, Targets: All.

Function: Converts a rectangle of interest in the coordinate space of an AVCaptureMetadataOutput whose capture device is providing input to the layer to a rectangle in layer coordinates.
Notes: rectInMetadataOutputCoordinates: A CGRect in the coordinate space of the metadata output whose capture device is providing input to the layer.

Returns a CGRect in layer coordinates.

AVCaptureMetadataOutput rectOfInterest is expressed as a CGRect where { 0,0 } represents the top left of the picture area, and { 1,1 } represents the bottom right on an unrotated picture. This convenience method converts a rectangle in the coordinate space of an AVCaptureMetadataOutput whose AVCaptureDevice is providing input to the coordinate space of the receiver. The conversion takes frame size and videoGravity into consideration.

18.47.11 setSessionWithNoConnection(session as AVCaptureSessionMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Attaches the receiver to a given session without implicitly forming a connection.
Notes: This method attaches the receiver to a given session without implicitly forming a connection to the first eligible video AVCaptureInputPort object. You should only use this method if you intend to manually form a connection between a desired AVCaptureInputPort object and the receiver using addConnection.

18.47.12 Properties

18.47.13 session as AVCaptureSessionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The capture session instance being previewed.
Notes: (Read and Write computed property)

18.47.14 videoGravity as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates how the video is displayed within a player layer's bounds rect.
Notes: Options are AVLayerVideoGravityResizeAspect, AVLayerVideoGravityResizeAspectFill and AVLayerVideoGravityResize. The default is AVLayerVideoGravityResizeAspect.

This property is animatable.
(Read and Write computed property)

18.48 control AVCaptureViewControlMBS

18.48.1 control AVCaptureViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The capture control for Mac.
Notes: AVCaptureView is a subclass of NSView that can be used to display standard user interface controls for capturing media data.
MBS Plugin wraps this as a control for Xojo.
Please notice this is 64-bit only and requires MacOS 10.9 or newer.

18.48.2 Methods

18.48.3 Available as Boolean

MBS AVFoundation Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: Whether this control is available.

18.48.4 setSession(session as AVCaptureSessionMBS, showVideoPreview as boolean, showAudioPreview as boolean)

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Sets the session represented by this view.
Notes: session: The session to be represented.
showVideoPreview: Whether or not video preview should be shown. If YES, capture inputs for video media data will be added, removed, or modified depending on device availability and user selection.
showAudioPreview: Whether or not audio preview should be shown. If YES, capture inputs for audio media data will be added, removed, or modified depending on device availability and user selection.

The view must either show audio preview or video preview or both. Furthermore, the view may modify the capture session, for example, to access media data for preview or when the user select a new capture source. Only the default session is started and stopped automatically. The provided session must be manually started and stopped.

18.48.5 Properties

18.48.6 controlsStyle as Integer

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The style of the capture controls pane associated with the view.
Notes: (Read and Write property)

18.48.7 fileOutput as AVCaptureFileOutputMBS

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: A capture file output used to record media data.
Notes: The value of this property is the first instance of AVCaptureFileOutput contained in the session's outputs array or nil if no such instance is found. In the latter case the capture view's start recording button will be disabled. However, the controls for choosing input sources may still be enabled.
(Read only property)

18.48.8 session as AVCaptureSessionMBS

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: A capture session represented by this view.
Notes: Modifying the capture session will impact its visual representation in the view. The default value is

a session configured for movie file recordings of audio and video media data. Use setSession() to change the value of this property.
(Read only property)

18.48.9 videoGravity as String

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: A string defining how the video is displayed within the views bounds rect.
Notes: Options are AVLayerVideoGravityResize, AVLayerVideoGravityResizeAspect and AVLayerVideoGravityResizeAspectFill. AVLayerVideoGravityResizeAspect is default. See <AVFoundation/AVAnimation.h>for a description of these options.
(Read and Write property)

18.48.10 View as NSViewMBS

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The reference to the AVCaptureView object.
Notes: (Read only property)

18.48.11 Events

18.48.12 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

18.48.13 Close

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

18.48.14 Closing

Plugin Version: 18.3, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

18.48.15 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

18.48.16 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

18.48.17 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

18.48.18 EnableMenuItems

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

18.48.19 FocusLost

Plugin Version: 18.3, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

18.48.20 FocusReceived

Plugin Version: 18.3, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

18.48.21 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

18.48.22 GotFocus

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

18.48.23 LostFocus

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

18.48.24 MenuBarSelected

Plugin Version: 18.3, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

18.48.25 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

18.48.26 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the

mouse has really moved.

18.48.27 MouseUp(x As Integer, y As Integer)

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

18.48.28 Open

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

18.48.29 Opening

Plugin Version: 18.3, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

18.48.30 ScaleFactorChanged(NewFactor as double)

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

18.48.31 startRecordingToFileOutput(fileOutput as AVCaptureFileOutputMBS)

MBS AVFoundation Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Informs you that a new media recording should be started.
Notes: If captureFileOutput is an instance of AVCaptureMovieFileOutput this can be achieved by calling

startRecordingToOutputFileURL on the captureFileOutput.

18.48.32 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

18.48.33 Constants

Constants Groups

Constant	Value	Description
ControlsStyleDefault	0	The default controls pane is associated with the view.
ControlsStyleFloating	1	The floating controls pane for media recordings is associated with the view.
ControlsStyleInline	0	The inline controls pane for media recording is associated with the view.
ControlsStyleInlineDeviceSelection	2	The inline controls pane for selection capture devices is associated with tl view.

18.49 class AVCompositionMBS

18.49.1 class AVCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVComposition object combines media data from multiple file-based sources in a custom temporal arrangement, in order to present or process media data from multiple sources together.
Notes: All file-based audiovisual assets are eligible to be combined, regardless of container type. The tracks in an AVComposition object are fixed; to change the tracks, you use an instance of its subclass, AVMutableComposition.

At its top-level, AVComposition is a collection of tracks, each presenting media of a specific media type, e.g. audio or video, according to a timeline. Each track is represented by an instance of AVCompositionTrack. Each track is comprised of an array of track segments, represented by instances of AVCompositionTrackSegment. Each segment presents a portion of the media data stored in a source container, specified by URL, a track identifier, and a time mapping. The URL specifies the source container, and the track identifier indicates the track of the source container to be presented.

The time mapping specifies the temporal range of the source track that's to be presented and also specifies the temporal range of its presentation in the composition track. If the durations of the source and destination ranges of the time mapping are the same, the media data for the segment will be presented at its natural rate. Otherwise, the segment will be presented at a rate equal to the ratio source.duration / target.duration.

You can access the track segments of a track using the segments property (an array of AVCompositionTrackSegment objects) of AVCompositionTrack. The collection of tracks with media type information for each, and each with its array of track segments (URL, track identifier, and time mapping), form a complete low-level representation of a composition. This representation can be written out by clients in any convenient form, and subsequently the composition can be reconstituted by instantiating a new AVMutableComposition with AVMutableCompositionTrack objects of the appropriate media type, each with its segments property set according to the stored array of URL, track identifier, and time mapping.

A higher-level interface for constructing compositions is also presented by AVMutableComposition and AVMutableCompositionTrack, offering insertion, removal, and scaling operations without direct manipulation of the trackSegment arrays of composition tracks. This interface makes use of higher-level constructs such as AVAsset and AVAssetTrack, allowing the client to make use of the same references to candidate sources that it would have created in order to inspect or preview them prior to inclusion in a composition.
Subclass of the AVAssetMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.49.2 Methods

18.49.3 CompositionTracks as AVCompositionTrackMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An array of AVCompositionTrack objects contained by the composition. (read-only)

18.49.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.49.5 mutableCopy as AVMutableCompositionMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates an editable copy of the object.

18.49.6 naturalSize as CGSizeMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates the authored size of the visual portion of the composition. (read-only)

18.50 class AVCompositionTrackMBS

18.50.1 class AVCompositionTrackMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The class for a composition track.
Notes: An AVCompositionTrack object provides the low-level representation of tracks a track in an AVComposition object, comprising a media type, a track identifier, and an array of AVCompositionTrackSegment objects, each comprising a URL, and track identifier, and a time mapping.

The timeMapping.target.start of the first track segment in a composition track is kCMTimeZero, and the timeMapping.target.start of each subsequent track segment equals CMTimeRangeGetEnd(<#previousTrackSegment#>.timeMapping.target).

The AVFoundation framework also provides a mutable subclass, AVMutableCompositionTrack.
Subclass of the AVAssetTrackMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

18.50.2 Methods

18.50.3 CompositionTrackSegments as AVCompositionTrackSegmentMBS()

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The composition track's track segments. (read-only)

18.50.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

18.51 class AVCompositionTrackSegmentMBS

18.51.1 class AVCompositionTrackSegmentMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An AVCompositionTrackSegment object represents a segment of an AVCompositionTrack object, comprising a URL, and track identifier, and a time mapping from the source track to the composition track.
Notes: You typically use this class to save the low-level representation of a composition to storage formats of your choosing and to reconstitute them from storage.
Subclass of the AVAssetTrackSegmentMBS class.

18.51.2 Methods

18.51.3 compositionTrackSegmentWithTimeRange(timeRange as CMTimeRangeMBS) as AVCompositionTrackSegmentMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a composition track segment that presents an empty track segment.
Notes: timeRange: The time range of the empty composition track segment.

Returns an composition track segment that presents an empty track segment.

This method invokes Constructor with an empty URL, a trackID of kCMPersistentTrackID_Invalid, a time mapping with source.start and source.duration equal to kCMTimeInvalid, and with a target equal to timeRange.

This is the standard low-level representation of an empty track segment.

18.51.4 Constructor(timeRange as CMTimeRangeMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes a track segment that presents an empty track segment.
Notes: timeRange: The time range of the empty track segment.

This method invokes Constructor with an empty URL, a trackID of kCMPersistentTrackID_Invalid, a time mapping with source.start and source.duration equal to kCMTimeInvalid, and with a target equal to timeRange.

This is the standard low-level representation of an empty track segment.

18.51.5 isEmpty as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Indicates whether the segment is empty. (read-only)
Notes: An empty segment has a valid target time range but sourceURL is nil and the source start time is kCMTimeInvalid; all other fields are undefined.

18.51.6 sourceTrackID as Integer

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The track ID of the container file of the media presented by the track segment. (read-only)

18.51.7 sourceURL as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The container file of the media presented by the track segment. (read-only)

18.52 class AVEdgeWidthsMBS

18.52.1 class AVEdgeWidthsMBS

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Defines the thickness of the edge processing region, in pixels.

18.52.2 Properties

18.52.3 Bottom as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The thickness, in pixels, of the bottom-edge processing region of theedgeWidths property.
Notes: (Read only property)

18.52.4 Left as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The thickness, in pixels, of the left-edge processing region of theedgeWidths property.
Notes: (Read only property)

18.52.5 Right as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The thickness, in pixels, of the right-edge processing region of theedgeWidths property.
Notes: (Read only property)

18.52.6 Top as Double

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The thickness, in pixels, of the top-edge processing region of theedgeWidths property.
Notes: (Read only property)

18.53 class AVFoundationMBS

18.53.1 class AVFoundationMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The central AVFoundation class for receiving events and getting constants.
Notes: All events from AVFoundation classes (delegates, notifications) are routed to your subclass of AVFoundationMBS.
Events received on a helper thread a routed to main thread in order to allow you to use Xojo code which is not thread safe.
Please use available property on classes to check if they are available. Some classes are only for Mac OS X 10.8 or future versions.

If you need some new methods/classes in AVFoundation from Mac OS X 10.10 or newer, please email us.

18.53.2 Methods

18.53.3 available as boolean

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Whether AVFoundation is available.
Notes: Returns true on Mac OS X 10.7 and newer.

18.53.4 AVAudioBitRateStrategy_Constant as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the values for the AVEncoderBitRateStrategyKey encoder setting.
Notes: Available in OS X v10.9 and later.

18.53.5 AVAudioBitRateStrategy_LongTermAverage as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the values for the AVEncoderBitRateStrategyKey encoder setting.
Notes: Available in OS X v10.9 and later.

18.53.6 AVAudioBitRateStrategy_Variable as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the values for the AVEncoderBitRateStrategyKey encoder setting.
Notes: Available in OS X v10.9 and later.

18.53.7 AVAudioBitRateStrategy_VariableConstrained as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the values for the AVEncoderBitRateStrategyKey encoder setting.
Notes: Available in OS X v10.9 and later.

18.53.8 AVAudioFileTypeKey as string

MBS AVFoundation Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The audio file type key.
Notes: Value is an integer (audio file type) from AudioFile.h
Available on MacOS 10.13 or newer.

18.53.9 AVAudioTimePitchAlgorithmSpectral as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the values for the time pitch algorithms.
Notes: Highest quality, most computationally expensive. Suitable for music. Variable rate from 1/32 to 32.
Available in OS X v10.9 and later.
Default for Mac OS X.

18.53.10 AVAudioTimePitchAlgorithmTimeDomain as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the values for the time pitch algorithms.
Notes: Modest quality pitch algorithm that is less computationally intensive. Suitable for voice. Variable rate from 1/32 to 32.
Available in OS X v10.9 and later.

18.53.11 AVAudioTimePitchAlgorithmVarispeed as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the values for the time pitch algorithms.
Notes: High quality, no pitch correction. Pitch varies with rate. Variable rate from 1/32 to 32.
Available in OS X v10.9 and later.

18.53.12 AVCaptureDeviceWasConnectedNotification as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Notification that is posted when a new device becomes available.

18.53.13 AVCaptureDeviceWasDisconnectedNotification as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Notification that is posted when an existing device becomes unavailable.

18.53.14 AVCaptureInputPortFormatDescriptionDidChangeNotification as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Posted if the formatDescription of the capture input port changes.

18.53.15 AVCaptureSessionDidStartRunningNotification as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Posted when a capture session starts.

18.53.16 AVCaptureSessionDidStopRunningNotification as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Posted when a capture session stops.

18.53.17 AVCaptureSessionErrorKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Key to retrieve information from a notification from a capture session.
Notes: Key to retrieve the error object from the user info dictionary of an AVCaptureSessionRuntimeErrorNotification.

18.53.18 AVCaptureSessionPreset1280x720 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for 720p quality (1280x720pixel) video output.

18.53.19 AVCaptureSessionPreset320x240 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for 320x240 pixel video output.

18.53.20 AVCaptureSessionPreset352x288 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for CIF quality (352x288 pixel) video output.

18.53.21 AVCaptureSessionPreset640x480 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for VGA quality (640x480 pixel) video output.

18.53.22 AVCaptureSessionPreset960x540 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for quarter HD quality (960x540 pixel) video output.

18.53.23 AVCaptureSessionPresetHigh as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for high quality video and audio output.

18.53.24 AVCaptureSessionPresetiFrame1280x720 as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings to achieve 1280x720 quality iFrame H.264 video at about 40 Mbits/sec with AAC audio.
QuickTime movies captured in iFrame format are optimal for editing applications.
Available in OS X v10.9 and later.

18.53.25 AVCaptureSessionPresetiFrame960x540 as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings to achieve 960x540 quality iFrame H.264 video at about 30 Mbits/sec with AAC audio.
QuickTime movies captured in iFrame format are optimal for editing applications.
Available in OS X v10.9 and later.

18.53.26 AVCaptureSessionPresetLow as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for output video and audio bitrates suitable for sharing over 3G.

18.53.27 AVCaptureSessionPresetMedium as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for output video and audio bitrates suitable for sharing over WiFi.

18.53.28 AVCaptureSessionPresetPhoto as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to define capture setting presets using the sessionPreset property.
Notes: Specifies capture settings suitable for high resolution photo quality output.

18.53.29 AVCaptureSessionRuntimeErrorNotification as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Posted if an error occurred during a capture session.
Notes: You retrieve the underlying error from the notification's user info dictionary using the key AVCaptureSessionErrorKey.

18.53.30 AVChannelLayoutKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Key to retrieve channel layout information for playback.
Example:

```
const channels = 2
Var channelLayout as new QTAudioChannelLayoutMBS
channelLayout.ChannelLayoutTag = QTAudioChannelLayoutMBS.kAudioChannelLayoutTag_Stereo

Var outputSettings as new Dictionary

outputSettings.Value(AVFoundationMBS.AVSampleRateKey) = 44100.0
outputSettings.Value(AVFoundationMBS.AVNumberOfChannelsKey) = channels
outputSettings.Value(AVFoundationMBS.AVChannelLayoutKey) = channelLayout.Memory
```

Notes: The corresponding value is an Memoryblock containing an AudioChannelLayout structure.

18.53.31 AVCoreAnimationBeginTimeAtZero as Double

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Support for integration with Core Animation.
Notes: Use this constant to set the CoreAnimation's animation beginTime property to be time 0.
The constant is a small, non-zero, positive value which prevents CoreAnimation from replacing 0.0 with CACurrentMediaTime.

18.53.32 AVEncoderAudioQualityForVBRKey as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the Sample rate converter audio quality settings.

18.53.33 AVEncoderAudioQualityKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the audio encoder setting keys for the AVAudioRecorder class.
Notes: Value is a AVAudioQuality* constant.

18.53.34 AVEncoderBitDepthHintKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the audio encoder setting keys for the AVAudioRecorder class.
Notes: An integer ranging from 8 through 32.

18.53.35 AVEncoderBitRateKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the audio encoder setting keys for the AVAudioRecorder class.
Notes: An integer that identifies the audio bit rate.

18.53.36 AVEncoderBitRatePerChannelKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the audio encoder setting keys for the AVAudioRecorder class.
Notes: An integer that identifies the audio bit rate per channel.

18.53.37 AVEncoderBitRateStrategyKey as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the Sample rate converter audio quality settings.

18.53.38 AVErrorDeviceKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: The corresponding value is a string with the name of the device.

18.53.39 AVErrorDiscontinuityFlagsKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the keys in the user info dictionary in errors AVFoundation creates.

18.53.40 AVErrorFileSizeKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: The corresponding value is a number containing the size of the file in bytes.

18.53.41 AVErrorMediaSubTypeKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: The corresponding value is an array of integers that specify media subtypes.
The types are represented by four character codes (4ccs), as defined in CoreAudioTypes.h for audio media and in CMFormatDescription.h for video media.

18.53.42 AVErrorMediaTypeKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: The corresponding value is a string that specified a media format.

18.53.43 AVErrorPIDKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: nThe corresponding value is a number containing a process ID number.one

18.53.44 AVErrorRecordingSuccessfullyFinishedKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: The corresponding value is a Boolean value indicating whether recording finished successfully.

18.53.45 AVErrorTimeKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the keys in the user info dictionary in errors AVFoundation creates.
Notes: The corresponding value is an NSValue object containing a CMTime.

18.53.46 AVFileType3GPP as string

MBS AVFoundation Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: The value of this UTI is "public.3gpp".
Files are identified with the .3gp, .3gpp, and .sdv extensions.
Available in macOS 10.11 or newer.

18.53.47 AVFileType3GPP2 as string

MBS AVFoundation Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: The value of this UTI is "public.3gpp2".
Files are identified with the .3g2, .3gp2 extensions.
Available in macOS 10.11 or newer.

18.53.48 AVFileTypeAC3 as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: UTI for the AC-3 audio file format.
The value of this UTI is public.ac3-audio. Files are identified with the .ac3 extension.
Available in OS X v10.9 and later.

18.53.49 AVFileTypeAIFC as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: UTI for the AIFC audio file format.
The value of this UTI is public.aifc-audio. Files are identified with the .aifc and .cdda extensions.

18.53.50 AVFileTypeAIFF as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: UTI for the AIFF audio file format.
The value of this UTI is public.aiff-audio. Files are identified with the .aif and .aiff extensions.

18.53.51 AVFileTypeAMR as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: UTI for the adaptive multi-rate audio file format.
The value of this UTI is org.3gpp.adaptive-multi-rate-audio. Files are identified with the .amr extension.

18.53.52 AVFileTypeAppleM4A as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: UTI for the Apple m4a audio file format.
The value of this UTI is com.apple.m4a-audio. Files are identified with the .m4a extension.

18.53.53 AVFileTypeAppleM4V as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: UTI for the iTunes video file format.
The value of this UTI is com.apple.mpeg-4-video. Files are identified with the .m4v extension.

18.53.54 AVFileTypeAVCI as string

MBS AVFoundation Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: The value of this UTI is "public.avci".
Files are identified with the .avci extension.
Available in macOS 10.13 or newer.

18.53.55 AVFileTypeCoreAudioFormat as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: UTI for the CoreAudio file format.
The value of this UTI is com.apple.coreaudio-format. Files are identified with the .caf extension.

18.53.56 AVFileTypeDNG as string

MBS AVFoundation Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: The value of this UTI is "com.adobe.raw-image".
Files are identified with the .dng extension.
Available in macOS 10.13 or newer.

18.53.57 AVFileTypeEnhancedAC3 as string

MBS AVFoundation Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: The value of this UTI is "public.ac3-audio".
Files are identified with the .ac3 extension.
Available in macOS 10.9 or newer.

18.53.58 AVFileTypeHEIC as string

MBS AVFoundation Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: The value of this UTI is "public.heic".
Files are identified with the .heic extension.

Available in macOS 10.13 or newer.

18.53.59 AVFileTypeHEIF as string

MBS AVFoundation Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: The value of this UTI is "public.heif".
Files are identified with the .heif extension.
Available in macOS 10.13 or newer.

18.53.60 AVFileTypeJPEG as string

MBS AVFoundation Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: The value of this UTI is "public.jpeg".
Files are identified with the .jpg or .jpeg extension.
Available in macOS 10.13 or newer.

18.53.61 AVFileTypeMPEG4 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: UTI for the MPEG-4 file format.
The value of this UTI is public.mpeg-4. Files are identified with the .mp4 extension.

18.53.62 AVFileTypeMPEGLayer3 as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: UTI for the MPEG layer 3 audio file format.
The value of this UTI is public.mp3. Files are identified with the .mp3 extension.
Available in OS X v10.9 and later.

18.53.63 AVFileTypeQuickTimeMovie as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: UTI for the QuickTime movie file format.
The value of this UTI is com.apple.quicktime-movie. Files are identified with the .mov and .qt extensions.

18.53.64 AVFileTypeSunAU as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: UTI for the Sun/NeXT audio file format.
The value of this UTI is public.au-audio. Files are identified with the .au and .snd extensions.
Available in OS X v10.9 and later.

18.53.65 AVFileTypeTIFF as string

MBS AVFoundation Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: The value of this UTI is "public.tiff".
Files are identified with the .tiff or .tif extension.
Available in macOS 10.13 or newer.

18.53.66 AVFileTypeWAVE as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the file format uniform type identifiers (UTIs).
Notes: A UTI for the WAVE audio file format.
The value of this UTI is com.microsoft.waveform-audio. Files are identified with the .wav, .wave, and .bwf extensions.

18.53.67 AVFormatIDKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the Audio setting keys that apply to all audio formats handled by the AVAudioPlayer and AVAudioRecorder classes.
Notes: A format identifier. See the "Audio Data Format Identifiers" enumeration in Core Audio Data

Types Reference.

18.53.68 AVFoundationErrorDomain as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Domain for AVFoundation errors.

18.53.69 AVLayerVideoGravityResize as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The constants define how the video is displayed within a layer's bounds rectangle.
Notes: Specifies that the video should be stretched to fill the layer's bounds.

18.53.70 AVLayerVideoGravityResizeAspect as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The constants define how the video is displayed within a layer's bounds rectangle.
Notes: Specifies that the player should preserve the video's aspect ratio and fit the video within the layer's bounds.

18.53.71 AVLayerVideoGravityResizeAspectFill as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The constants define how the video is displayed within a layer's bounds rectangle.
Notes: Specifies that the player should preserve the video's aspect ratio and fill the layer's bounds.

18.53.72 AVLinearPCMBitDepthKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the Audio setting keys that apply to linear PCM audio formats.
Notes: An integer that indicates the bit depth for a linear PCM audio format—one of 8, 16, 24, or 32.

18.53.73 AVLinearPCMIsBigEndianKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the Audio setting keys that apply to linear PCM audio formats.
Notes: A Boolean value that indicates whether the audio format is big endian (true) or little endian (false).

18.53.74 AVLinearPCMIsFloatKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the Audio setting keys that apply to linear PCM audio formats.
Notes: A Boolean value that indicates that the audio format is floating point (true) or fixed point (false).

18.53.75 AVLinearPCMIsNonInterleaved as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the Audio setting keys that apply to linear PCM audio formats.
Notes: A Boolean value that indicates that the audio format is non-interleaved (true) or interleaved (false).

18.53.76 AVMakeRectWithAspectRatioInsideRect(aspectRatio as CGSizeMBS, boundingRect as CGRectMBS) as CGRectMBS

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a scaled CGRect that maintains the aspect ratio specified by a CGSize within a bounding CGRect.
Notes: aspectRatio: The width and height ratio (aspect ratio) you want to maintain.
boundingRect: The bounding rectangle you want to fit into.

Returns a scaled CGRect that maintains the aspect ratio specified by aspectRatio that fits withinboundingRect.

This is useful when attempting to fit the naturalSize property of an AVPlayerItem object within the bounds of another CALayer. You would typically use the return value of this function as an AVPlayerLayer frame property value. For example:

myPlayerLayer.frame = AVMakeRectWithAspectRatioInsideRect(myPlayerItem.naturalSize, mySuperLayer.bounds)

18.53.77 AVMediaCharacteristicAudible as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the characteristics of media types.
Notes: Indicates that the media is audible.

18.53.78 AVMediaCharacteristicContainsAlphaChannel as string

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: To determine whether alpha is straight or pre-multiplied, look for the format description extension with key kCMFormatDescriptionExtension_AlphaChannelMode.

18.53.79 AVMediaCharacteristicContainsOnlyForcedSubtitles as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: Indicates that the options presents only forced subtitles.
Media options with forced-only subtitles are typically selected when 1) the user has not selected a legible option with an accessibility characteristic or an auxiliary purpose and 2) its locale matches the locale of the selected audible media selection option.
The value of this characteristic is "public.subtitles.forced-only".
The presence of this characteristic for a legible media option is inferred from the format description of the associated track that presents the subtitle media.
Available in OS X v10.8 and later.

18.53.80 AVMediaCharacteristicDescribesMusicAndSoundForAccessibility as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: Indicates that the option includes legible content in the language of its specified locale that describes music and sound effects occurring in program audio.
It is possible for a legible media option to include both transcriptions of spoken dialog and descriptions of music and sound effects.
The value of this characteristic is "public.accessibility.describes-music-and-sound".
For QuickTime movie and .m4v files, a media option is considered to have the characteristic AVMediaCharacteristicDescribesMusicAndSoundForAccessibility only if it's explicitly tagged with that characteristic.
Available in OS X v10.8 and later.

18.53.81 AVMediaCharacteristicDescribesVideoForAccessibility as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: Indicates that the option includes audible content that describes the visual portion of the presentation.
It is possible for a legible media option to include both transcriptions of spoken dialog and descriptions of music and sound effects.
The value of this characteristic is "public.accessibility.describes-video".
For QuickTime movie and .m4v files a media option is considered to have the characteristic AVMediaCharacteristicDescribesVideoForAccessibility only if it's explicitly tagged with that characteristic.
Available in OS X v10.8 and later.

18.53.82 AVMediaCharacteristicDubbedTranslation as string

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: The track or media selection option contains a language or dialect translation of originally or previously produced content.

18.53.83 AVMediaCharacteristicEasyToRead as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: Indicates that the option provides legible content in the language of its specified locale and that the content has been edited for ease of reading.
Closed caption tracks that carry "easy reader" captions (per the CEA-608 specification) should be tagged with this characteristic. Subtitle tracks can also be tagged with this characteristic, where appropriate.
The value of this characteristic is "public.easy-to-read".
For QuickTime movie and .m4v files a media option is considered to have the characteristic AVMediaCharacteristicEasyToRead only if it's explicitly tagged with that characteristic.

18.53.84 AVMediaCharacteristicFrameBased as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the characteristics of media types.
Notes: Indicates that the media is frame-based.

18.53.85 AVMediaCharacteristicIsAuxiliaryContent as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: Indicates that the option includes content that's marked by the content author as auxiliary to the presentation of the asset.
Example: an option that presents audio media containing commentary on the presentation would typically have this characteristic.
The value of this characteristic is "public.auxiliary-content".
For QuickTime movie and .m4v files, a media option is considered to have the characteristic AVMediaCharacteristicIsAuxiliaryContent if it's explicitly tagged with that characteristic or if, as a member of an alternate track group, its associated track is excluded from autoselection.
Available in OS X v10.8 and later.

18.53.86 AVMediaCharacteristicIsMainProgramContent as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: Indicates that the option includes content that's marked by the content author as intrinsic to the presentation of the asset.
Example: an option that presents the main program audio for the presentation, regardless of locale, would typically have this characteristic.
The value of this characteristic is "public.main-program-content".
The presence of this characteristic for a media option is inferred; any option that does not have the characteristic AVMediaCharacteristicIsAuxiliaryContent is considered to have the characteristic.
Available in OS X v10.8 and later.

18.53.87 AVMediaCharacteristicIsOriginalContent as string

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: A media characteristic that indicates that a track or media selection option includes content that's marked by the content author as original to the principal production of the media, as opposed to supplementary or derivative content created by means of language translation or by other means.

The value of this characteristic is @"public.original-content".

Example: an option that presents audio media with dialog in the principal language of the production may be tagged with this characteristic; audio media containing dialog dubbed in a language other than the principal language of the production typically would not be tagged with this characteristic.

Note for content authors: for QuickTime movie and .m4v files and for HTTP Live Streaming, a media option is considered to have the characteristic AVMediaCharacteristicIsOriginalContent only if it's explicitly tagged with the characteristic.

See the discussion of the tagging of tracks with media characteristics below.

18.53.88 AVMediaCharacteristicLanguageTranslation as string

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: A media characteristic that indicates that a track or media selection option contains a language or dialect translation of originally or previously produced content, intended to be used as a substitute for that content by users who prefer its designated language.

The value of this characteristic is "public.translation".

Note for content authors: for QuickTime movie and .m4v files a media option is considered to have the characteristic AVMediaCharacteristicLanguageTranslation only if it's explicitly tagged with that characteristic.

18.53.89 AVMediaCharacteristicLegible as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the characteristics of media types.
Notes: Indicates that the media is legible.

18.53.90 AVMediaCharacteristicTranscribesSpokenDialogForAccessibility as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: Indicates that the option includes legible content in the language of its specified locale that transcribes spoken dialog.
It is possible for a legible media option to include both transcriptions of spoken dialog and descriptions of music and sound effects.
The value of this characteristic is "public.accessibility.transcribes-spoken-dialog".
For QuickTime movie and .m4v files, a media option is considered to have the characteristic AVMediaCharacteristicTranscribesSpokenDialogForAccessibility only if it's explicitly tagged with that characteristic.
Available in OS X v10.8 and later.

18.53.91 AVMediaCharacteristicUsesWideGamutColorSpace as string

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: A media characteristic that indicates that a track uses a wide gamut color space and therefore may make use of colors that cannot be accurately represented otherwise.

A wide color space such as AVVideo*_P3_D65 contains additional dynamic range that may benefit from special treatment when compositing. Care should be taken to avoid clamping. Non-wide spaces include AVVideo*_ITU_R_709_2 and AVVideo*_SMPTE_C.

18.53.92 AVMediaCharacteristicVisual as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the characteristics of media types.
Notes: Indicates that the media is visual.

18.53.93 AVMediaCharacteristicVoiceOverTranslation as string

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the media characteristic that may be present in an AVMediaSelectionOption object.
Notes: A media characteristic that indicates that a track or media selection option contains a language translation of originally or previously produced content, created by adding, in its designated language, a verbal interpretation of dialog and translations of other important information to a new mix of the audio content.

Tracks to which this characteristic is assigned should typically also be assigned the characteristic AVMediaCharacteristicLanguageTranslation.

The value of this characteristic is "public.translation.voice-over".

Note for content authors: for QuickTime movie and .m4v files a media option is considered to have the characteristic AVMediaCharacteristicVoiceOverTranslation only if it's explicitly tagged with that characteristic.

18.53.94 AVMediaTypeAudio as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media types.

Notes: Specifies audio.

18.53.95 AVMediaTypeClosedCaption as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media types.
Notes: Specifies closed-caption content.

18.53.96 AVMediaTypeDepthData as string

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: The key for media type depth data.

18.53.97 AVMediaTypeMetadata as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media types.
Notes: Specifies metadata.

18.53.98 AVMediaTypeMetadataObject as string

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: mediaType of AVCaptureInputPorts that provide AVMetadataObjects.
Notes: Prior to iOS 9.0, camera AVCaptureDeviceInputs provide metadata (detected faces and barcodes) to an AVCaptureMetadataOutput through an AVCaptureInputPort whose mediaType is AVMediaTypeMetadata. The AVCaptureMetadataOutput presents metadata to the client as an array of AVMetadataObjects, which are defined by Apple and not externally subclassable. Starting in iOS 9.0, clients may record arbitrary metadata to a movie file using the AVCaptureMovieFileOutput. The movie file output consumes metadata in a different format than the AVCaptureMetadataOutput, namely it accepts CMSampleBuffers of type 'meta'.

18.53.99 AVMediaTypeMuxed as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media types.
Notes: Specifies muxed media.

18.53.100 AVMediaTypeSubtitle as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media types.
Notes: Specifies subtitles.

18.53.101 AVMediaTypeText as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media types.
Notes: Specifies text.

18.53.102 AVMediaTypeTimecode as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media types.
Notes: Specifies a time code.

18.53.103 AVMediaTypeVideo as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the media types.
Notes: Specifies video.

18.53.104 AVMetadata3GPUserDataKeyAlbumAndTrack as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.105 AVMetadata3GPUserDataKeyAuthor as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.106 AVMetadata3GPUserDataKeyCollection as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.107 AVMetadata3GPUserDataKeyCopyright as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.108 AVMetadata3GPUserDataKeyDescription as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.109 AVMetadata3GPUserDataKeyGenre as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.110 AVMetadata3GPUserDataKeyKeywordList as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.111 AVMetadata3GPUserDataKeyLocation as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.112 AVMetadata3GPUserDataKeyMediaClassification as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.113 AVMetadata3GPUserDataKeyMediaRating as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.114 AVMetadata3GPUserDataKeyPerformer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.115 AVMetadata3GPUserDataKeyRecordingYear as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.116 AVMetadata3GPUserDataKeyThumbnail as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.117 AVMetadata3GPUserDataKeyTitle as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.118 AVMetadata3GPUserDataKeyUserRating as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.119 AVMetadataCommonKeyAlbumName as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.120 AVMetadataCommonKeyArtist as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.121 AVMetadataCommonKeyArtwork as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.122 AVMetadataCommonKeyAuthor as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.123 AVMetadataCommonKeyContributor as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.124 AVMetadataCommonKeyCopyrights as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.125 AVMetadataCommonKeyCreationDate as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.126 AVMetadataCommonKeyCreator as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.127 AVMetadataCommonKeyDescription as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.128 AVMetadataCommonKeyFormat as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.129 AVMetadataCommonKeyIdentifier as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.130 AVMetadataCommonKeyLanguage as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.131 AVMetadataCommonKeyLastModifiedDate as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.132 AVMetadataCommonKeyLocation as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.133 AVMetadataCommonKeyMake as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.134 AVMetadataCommonKeyModel as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.135 AVMetadataCommonKeyPublisher as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.136 AVMetadataCommonKeyRelation as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.137 AVMetadataCommonKeySoftware as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.138 AVMetadataCommonKeySource as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.139 AVMetadataCommonKeySubject as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.140 AVMetadataCommonKeyTitle as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.141 AVMetadataCommonKeyType as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the common metadata keys.

18.53.142 AVMetadataFormatID3Metadata as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the metadata formats.
Notes: The asset has metadata in the ID3 format.

18.53.143 AVMetadataFormatISOUserData as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the metadata formats.

18.53.144 AVMetadataFormatiTunesMetadata as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the metadata formats.
Notes: The asset has metadata in the iTunes format.

18.53.145 AVMetadataFormatQuickTimeMetadata as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the metadata formats.
Notes: The asset has metadata in the QuickTime metadata format.

18.53.146 AVMetadataFormatQuickTimeUserData as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the metadata formats.
Notes: The asset has metadata in the QuickTime user data format.

18.53.147 AVMetadataID3MetadataKeyAlbumSortOrder as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TSOA album sort order.

18.53.148 AVMetadataID3MetadataKeyAlbumTitle as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TALB album/Movie/Show title.

18.53.149 AVMetadataID3MetadataKeyAttachedPicture as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: APIC attached picture.

18.53.150 AVMetadataID3MetadataKeyAudioEncryption as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: AENC audio encryption.

18.53.151 AVMetadataID3MetadataKeyAudioSeekPointIndex as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: ASPI audio seek point index.

18.53.152 AVMetadataID3MetadataKeyBand as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TPE2 band/orchestra/accompaniment.

18.53.153 AVMetadataID3MetadataKeyBeatsPerMinute as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TBPM BPM (beats per minute).

18.53.154 AVMetadataID3MetadataKeyComments as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: COMM comments.

18.53.155 AVMetadataID3MetadataKeyCommercial as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: COMR commercial frame.

18.53.156 AVMetadataID3MetadataKeyCommercialInformation as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: WCOM commercial information.

18.53.157 AVMetadataID3MetadataKeyComposer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TCOM composer.

18.53.158 AVMetadataID3MetadataKeyConductor as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TPE3 conductor/performer refinement.

18.53.159 AVMetadataID3MetadataKeyContentGroupDescription as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TIT1 content group description.

18.53.160 AVMetadataID3MetadataKeyContentType as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TCON content type.

18.53.161 AVMetadataID3MetadataKeyCopyright as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TCOP copyright message.

18.53.162 AVMetadataID3MetadataKeyCopyrightInformation as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: WCOP copyright/legal information.

18.53.163 AVMetadataID3MetadataKeyDate as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TDAT date.

18.53.164 AVMetadataID3MetadataKeyEncodedBy as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TENC encoded by.

18.53.165 AVMetadataID3MetadataKeyEncodedWith as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TSSE software/hardware and settings used for encoding.

18.53.166 AVMetadataID3MetadataKeyEncodingTime as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TDEN encoding time.

18.53.167 AVMetadataID3MetadataKeyEncryption as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: ENCR encryption method registration.

18.53.168 AVMetadataID3MetadataKeyEqualization as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: EQUA equalization.

18.53.169 AVMetadataID3MetadataKeyEqualization2 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: EQU2 equalization (2).

18.53.170 AVMetadataID3MetadataKeyEventTimingCodes as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: ETCO event timing codes.

18.53.171 AVMetadataID3MetadataKeyFileOwner as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TOWN file owner/licensee.

18.53.172 AVMetadataID3MetadataKeyFileType as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TFLT file type.

18.53.173 AVMetadataID3MetadataKeyGeneralEncapsulatedObject as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: GEOB general encapsulated object.

18.53.174 AVMetadataID3MetadataKeyGroupIdentifier as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: GRID group identification registration.

18.53.175 AVMetadataID3MetadataKeyInitialKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TKEY initial key.

18.53.176 AVMetadataID3MetadataKeyInternationalStandardRecordingCode as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TSRC ISRC (international standard recording code).

18.53.177 AVMetadataID3MetadataKeyInternetRadioStationName as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TRSN internet radio station name.

18.53.178 AVMetadataID3MetadataKeyInternetRadioStationOwner as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TRSO internet radio station owner.

18.53.179 AVMetadataID3MetadataKeyInvolvedPeopleList_v23 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: IPLS involved people list.

18.53.180 AVMetadataID3MetadataKeyInvolvedPeopleList_v24 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TIPL involved people list.

18.53.181 AVMetadataID3MetadataKeyLanguage as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TLAN language(s).

18.53.182 AVMetadataID3MetadataKeyLeadPerformer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TPE1 lead performer(s)/Soloist(s).

18.53.183 AVMetadataID3MetadataKeyLength as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TLEN length.

18.53.184 AVMetadataID3MetadataKeyLink as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: LINK linked information.

18.53.185 AVMetadataID3MetadataKeyLyricist as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TEXT lyricist/text writer.

18.53.186 AVMetadataID3MetadataKeyMediaType as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TMED media type.

18.53.187 AVMetadataID3MetadataKeyModifiedBy as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TPE4 interpreted, remixed, or otherwise modified by.

18.53.188 AVMetadataID3MetadataKeyMood as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TMOO mood.

18.53.189 AVMetadataID3MetadataKeyMPEGLocationLookupTable as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: MLLT MPEG location lookup table.

18.53.190 AVMetadataID3MetadataKeyMusicCDIdentifier as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: MCDI music CD identifier.

18.53.191 AVMetadataID3MetadataKeyMusicianCreditsList as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TMCL musician credits list.

18.53.192 AVMetadataID3MetadataKeyOfficialArtistWebpage as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: WOAR official artist/performer webpage.

18.53.193 AVMetadataID3MetadataKeyOfficialAudioFileWebpage as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: WOAF official audio file webpage.

18.53.194 AVMetadataID3MetadataKeyOfficialAudioSourceWebpage as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: WOAS official audio source webpage.

18.53.195 AVMetadataID3MetadataKeyOfficialInternetRadioStationHomepage as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: WORS official Internet radio station homepage.

18.53.196 AVMetadataID3MetadataKeyOfficialPublisherWebpage as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: WPUB publishers official webpage.

18.53.197 AVMetadataID3MetadataKeyOriginalAlbumTitle as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TOAL original album/movie/show title.

18.53.198 AVMetadataID3MetadataKeyOriginalArtist as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TOPE original artist(s)/performer(s).

18.53.199 AVMetadataID3MetadataKeyOriginalFilename as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TOFN original filename.

18.53.200 AVMetadataID3MetadataKeyOriginalLyricist as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TOLY original lyricist(s)/text writer(s).

18.53.201 AVMetadataID3MetadataKeyOriginalReleaseTime as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TDOR original release time.

18.53.202 AVMetadataID3MetadataKeyOriginalReleaseYear as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TORY original release year.

18.53.203 AVMetadataID3MetadataKeyOwnership as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: OWNE ownership frame.

18.53.204 AVMetadataID3MetadataKeyPartOfASet as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TPOS part of a set.

18.53.205 AVMetadataID3MetadataKeyPayment as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: WPAY payment.

18.53.206 AVMetadataID3MetadataKeyPerformerSortOrder as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TSOP performer sort order.

18.53.207 AVMetadataID3MetadataKeyPlayCounter as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: PCNT play counter.

18.53.208 AVMetadataID3MetadataKeyPlaylistDelay as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TDLY playlist delay.

18.53.209 AVMetadataID3MetadataKeyPopularimeter as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: POPM popularimeter.

18.53.210 AVMetadataID3MetadataKeyPositionSynchronization as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: POSS position synchronisation frame.

18.53.211 AVMetadataID3MetadataKeyPrivate as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: PRIV private frame.

18.53.212 AVMetadataID3MetadataKeyProducedNotice as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TPRO produced notice.

18.53.213 AVMetadataID3MetadataKeyPublisher as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TPUB publisher.

18.53.214 AVMetadataID3MetadataKeyRecommendedBufferSize as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: RBUF recommended buffer size.

18.53.215 AVMetadataID3MetadataKeyRecordingDates as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TRDA recording dates.

18.53.216 AVMetadataID3MetadataKeyRecordingTime as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TDRC recording time.

18.53.217 AVMetadataID3MetadataKeyRelativeVolumeAdjustment as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: RVAD relative volume adjustment.

18.53.218 AVMetadataID3MetadataKeyRelativeVolumeAdjustment2 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: RVA2 relative volume adjustment (2).

18.53.219 AVMetadataID3MetadataKeyReleaseTime as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TDRL release time.

18.53.220 AVMetadataID3MetadataKeyReverb as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: RVRB reverb.

18.53.221 AVMetadataID3MetadataKeySeek as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: SEEK seek frame.

18.53.222 AVMetadataID3MetadataKeySetSubtitle as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TSST set subtitle.

18.53.223 AVMetadataID3MetadataKeySignature as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: SIGN signature frame.

18.53.224 AVMetadataID3MetadataKeySize as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TSIZ size.

18.53.225 AVMetadataID3MetadataKeySubTitle as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TIT3 subtitle/description refinement.

18.53.226 AVMetadataID3MetadataKeySynchronizedLyric as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: SYLT synchronized lyric/text.

18.53.227 AVMetadataID3MetadataKeySynchronizedTempoCodes as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: SYTC synchronized tempo codes.

18.53.228 AVMetadataID3MetadataKeyTaggingTime as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TDTG tagging time.

18.53.229 AVMetadataID3MetadataKeyTermsOfUse as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: USER terms of use.

18.53.230 AVMetadataID3MetadataKeyTime as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TIME time.

18.53.231 AVMetadataID3MetadataKeyTitleDescription as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TIT2 title/songname/content description.

18.53.232 AVMetadataID3MetadataKeyTitleSortOrder as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TSOT title sort order.

18.53.233 AVMetadataID3MetadataKeyTrackNumber as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TRCK track number/position in set.

18.53.234 AVMetadataID3MetadataKeyUniqueFileIdentifier as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: UFID unique file identifier.

18.53.235 AVMetadataID3MetadataKeyUnsynchronizedLyric as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: USLT unsynchronized lyric/text transcription.

18.53.236 AVMetadataID3MetadataKeyUserText as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TXXX user defined text information frame.

18.53.237 AVMetadataID3MetadataKeyUserURL as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: WXXX user defined URL link frame.

18.53.238 AVMetadataID3MetadataKeyYear as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for ID3 Metadata.
Notes: TYER year.

18.53.239 AVMetadataISOUserDataKeyCopyright as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.240 AVMetadataiTunesMetadataKeyAccountKind as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.241 AVMetadataiTunesMetadataKeyAcknowledgement as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.242 AVMetadataiTunesMetadataKeyAlbum as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.243 AVMetadataiTunesMetadataKeyAlbumArtist as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.244 AVMetadataiTunesMetadataKeyAppleID as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.245 AVMetadataiTunesMetadataKeyArranger as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.246 AVMetadataiTunesMetadataKeyArtDirector as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.247 AVMetadataiTunesMetadataKeyArtist as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.248 AVMetadataiTunesMetadataKeyArtistID as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.249 AVMetadataiTunesMetadataKeyAuthor as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.250 AVMetadataiTunesMetadataKeyBeatsPerMin as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.251 AVMetadataiTunesMetadataKeyComposer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.252 AVMetadataiTunesMetadataKeyConductor as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.253 AVMetadataiTunesMetadataKeyContentRating as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.254 AVMetadataiTunesMetadataKeyCopyright as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.255 AVMetadataiTunesMetadataKeyCoverArt as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.
Example:

```
// load file and look for cover art

Var file As FolderItem = SpecialFolder.Desktop.Child("test.m4a")
Var a As AVURLAssetMBS = AVURLAssetMBS.URLAssetWithFile(file)

Var iTunesMetadataKeyCoverArtString As String = AVFoundationMBS.AVMetadataiTunesMetadataKey-
CoverArt
Var iTunesMetadataKeyCoverArtNumber As Integer = OSTypeFromStringMBS(iTunesMetadataKeyCov-
erArtString)

Var items() As AVMetadataItemMBS = a.metadata

For Each item As AVMetadataItemMBS In items

Var key As Variant = item.key
Var Val As Variant = item.value

If key.IntegerValue = iTunesMetadataKeyCoverArtNumber Or key.StringValue = iTunesMetadataKeyCov-
erArtString Then

Var v As MemoryBlock = Val
Window1.Backdrop = picture.FromData(v)
End If

Next
```

18.53.256 AVMetadataiTunesMetadataKeyCredits as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.257 AVMetadataiTunesMetadataKeyDescription as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.258 AVMetadataiTunesMetadataKeyDirector as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.259 AVMetadataiTunesMetadataKeyDiscCompilation as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.260 AVMetadataiTunesMetadataKeyDiscNumber as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.261 AVMetadataiTunesMetadataKeyEncodedBy as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.262 AVMetadataiTunesMetadataKeyEncodingTool as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.263 AVMetadataiTunesMetadataKeyEQ as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.264 AVMetadataiTunesMetadataKeyExecProducer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.265 AVMetadataiTunesMetadataKeyGenreID as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.266 AVMetadataiTunesMetadataKeyGrouping as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.267 AVMetadataiTunesMetadataKeyLinerNotes as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.268 AVMetadataiTunesMetadataKeyLyrics as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.269 AVMetadataiTunesMetadataKeyOnlineExtras as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.270 AVMetadataiTunesMetadataKeyOriginalArtist as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.271 AVMetadataiTunesMetadataKeyPerformer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.272 AVMetadataiTunesMetadataKeyPhonogramRights as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.273 AVMetadataiTunesMetadataKeyPlaylistID as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.274 AVMetadataiTunesMetadataKeyPredefinedGenre as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.275 AVMetadataiTunesMetadataKeyProducer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.276 AVMetadataiTunesMetadataKeyPublisher as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.277 AVMetadataiTunesMetadataKeyRecordCompany as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.278 AVMetadataiTunesMetadataKeyReleaseDate as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.279 AVMetadataiTunesMetadataKeySoloist as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.280 AVMetadataiTunesMetadataKeySongID as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.281 AVMetadataiTunesMetadataKeySongName as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.282 AVMetadataiTunesMetadataKeySoundEngineer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.283 AVMetadataiTunesMetadataKeyThanks as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.284 AVMetadataiTunesMetadataKeyTrackNumber as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.285 AVMetadataiTunesMetadataKeyTrackSubTitle as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.286 AVMetadataiTunesMetadataKeyUserComment as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.287 AVMetadataiTunesMetadataKeyUserGenre as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for iTunes Metadata.

18.53.288 AVMetadataKeySpaceCommon as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the key spaces.
Notes: The common key space. Keys in this space represent standard versions of keys that are found in most or all other key spaces.

18.53.289 AVMetadataKeySpaceID3 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the key spaces.
Notes: The ID3 key space.

18.53.290 AVMetadataKeySpaceISOUserData as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the metadata formats.

18.53.291 AVMetadataKeySpaceiTunes as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the key spaces.
Notes: The iTunes key space.

18.53.292 AVMetadataKeySpaceQuickTimeMetadata as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the key spaces.
Notes: The QuickTime metadata key space.

18.53.293 AVMetadataKeySpaceQuickTimeUserData as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the key spaces.
Notes: The QuickTime user data key space.

18.53.294 AVMetadataQuickTimeMetadataKeyAlbum as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.295 AVMetadataQuickTimeMetadataKeyArranger as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.296 AVMetadataQuickTimeMetadataKeyArtist as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.297 AVMetadataQuickTimeMetadataKeyArtwork as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.298 AVMetadataQuickTimeMetadataKeyAuthor as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.299 AVMetadataQuickTimeMetadataKeyCameraFrameReadoutTime as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.300 AVMetadataQuickTimeMetadataKeyCameraIdentifier as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.301 AVMetadataQuickTimeMetadataKeyCollectionUser as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.302 AVMetadataQuickTimeMetadataKeyComment as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.303 AVMetadataQuickTimeMetadataKeyComposer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.304 AVMetadataQuickTimeMetadataKeyCopyright as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.305 AVMetadataQuickTimeMetadataKeyCreationDate as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.306 AVMetadataQuickTimeMetadataKeyCredits as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.307 AVMetadataQuickTimeMetadataKeyDescription as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.308 AVMetadataQuickTimeMetadataKeyDirectionFacing as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.309 AVMetadataQuickTimeMetadataKeyDirectionMotion as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.310 AVMetadataQuickTimeMetadataKeyDirector as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.311 AVMetadataQuickTimeMetadataKeyDisplayName as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.312 AVMetadataQuickTimeMetadataKeyEncodedBy as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.313 AVMetadataQuickTimeMetadataKeyGenre as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.314 AVMetadataQuickTimeMetadataKeyInformation as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.315 AVMetadataQuickTimeMetadataKeyiXML as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.316 AVMetadataQuickTimeMetadataKeyKeywords as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.317 AVMetadataQuickTimeMetadataKeyLocationBody as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.318 AVMetadataQuickTimeMetadataKeyLocationDate as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.319 AVMetadataQuickTimeMetadataKeyLocationISO6709 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.320 AVMetadataQuickTimeMetadataKeyLocationName as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.321 AVMetadataQuickTimeMetadataKeyLocationNote as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.322 AVMetadataQuickTimeMetadataKeyLocationRole as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.323 AVMetadataQuickTimeMetadataKeyMake as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.324 AVMetadataQuickTimeMetadataKeyModel as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.325 AVMetadataQuickTimeMetadataKeyOriginalArtist as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.326 AVMetadataQuickTimeMetadataKeyPerformer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.327 AVMetadataQuickTimeMetadataKeyPhonogramRights as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.328 AVMetadataQuickTimeMetadataKeyProducer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.329 AVMetadataQuickTimeMetadataKeyPublisher as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.330 AVMetadataQuickTimeMetadataKeyRatingUser as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.331 AVMetadataQuickTimeMetadataKeySoftware as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.332 AVMetadataQuickTimeMetadataKeyTitle as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.333 AVMetadataQuickTimeMetadataKeyYear as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible keys for QuickTime Metadata.

18.53.334 AVMetadataQuickTimeUserDataKeyAlbum as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.335 AVMetadataQuickTimeUserDataKeyArranger as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.336 AVMetadataQuickTimeUserDataKeyArtist as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.337 AVMetadataQuickTimeUserDataKeyAuthor as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.338 AVMetadataQuickTimeUserDataKeyChapter as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.339 AVMetadataQuickTimeUserDataKeyComment as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.340 AVMetadataQuickTimeUserDataKeyComposer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.341 AVMetadataQuickTimeUserDataKeyCopyright as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.342 AVMetadataQuickTimeUserDataKeyCreationDate as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.343 AVMetadataQuickTimeUserDataKeyCredits as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.344 AVMetadataQuickTimeUserDataKeyDescription as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.345 AVMetadataQuickTimeUserDataKeyDirector as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.346 AVMetadataQuickTimeUserDataKeyDisclaimer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.347 AVMetadataQuickTimeUserDataKeyEncodedBy as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.348 AVMetadataQuickTimeUserDataKeyFullName as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.349 AVMetadataQuickTimeUserDataKeyGenre as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.350 AVMetadataQuickTimeUserDataKeyHostComputer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.351 AVMetadataQuickTimeUserDataKeyInformation as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.352 AVMetadataQuickTimeUserDataKeyKeywords as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.353 AVMetadataQuickTimeUserDataKeyLocationISO6709 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.354 AVMetadataQuickTimeUserDataKeyMake as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.355 AVMetadataQuickTimeUserDataKeyModel as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.356 AVMetadataQuickTimeUserDataKeyOriginalArtist as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.357 AVMetadataQuickTimeUserDataKeyOriginalFormat as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.358 AVMetadataQuickTimeUserDataKeyOriginalSource as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.359 AVMetadataQuickTimeUserDataKeyPerformers as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.360 AVMetadataQuickTimeUserDataKeyPhonogramRights as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.361 AVMetadataQuickTimeUserDataKeyProducer as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.362 AVMetadataQuickTimeUserDataKeyProduct as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.363 AVMetadataQuickTimeUserDataKeyPublisher as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.364 AVMetadataQuickTimeUserDataKeySoftware as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.365 AVMetadataQuickTimeUserDataKeySpecialPlaybackRequirements as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.366 AVMetadataQuickTimeUserDataKeyTaggedCharacteristic as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.367 AVMetadataQuickTimeUserDataKeyTrack as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.368 AVMetadataQuickTimeUserDataKeyTrackName as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.369 AVMetadataQuickTimeUserDataKeyURLLink as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.370 AVMetadataQuickTimeUserDataKeyWarning as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.371 AVMetadataQuickTimeUserDataKeyWriter as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the possible metadata keys for QuickTime UserData.

18.53.372 AVNumberOfChannelsKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the Audio setting keys that apply to all audio formats handled by the AVAudioPlayer and AVAudioRecorder classes.
Notes: The number of channels expressed as an integer value.

18.53.373 AVPlayerItemDidPlayToEndTimeNotification as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Posted when the item has played to its end time.
Notes: The notification's object is the item that finished playing.

18.53.374 AVPlayerItemFailedToPlayToEndTimeErrorKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Key to retrieve information from a notification's user info dictionary.
Notes: The key to retrieve an error object (NSError) from the user info dictionary of an AVPlayerItem-

TimeJumpedNotification notification.

18.53.375 AVPlayerItemFailedToPlayToEndTimeNotification as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Posted when the item failed to play to its end time.
Notes: The notification's object is the item that finished playing.
The user info dictionary contains an error object that describes the problem—seeAVPlayerItemFailedToPlayToEndTimeErrorKey.

18.53.376 AVPlayerItemNewAccessLogEntryNotification as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The notification name to use with NSNotificationObserverMBS class.
Notes: Posted when a new access log entry has been added.
The notification's object is the player item. The new log entry is accessible via accessLog.
Available on Mac OS X 10.9 or later.

18.53.377 AVPlayerItemNewErrorLogEntryNotification as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The notification name to use with NSNotificationObserverMBS class.
Notes: Posted when a new error log entry has been added.
The notification's object is the player item. The new log entry is accessible via errorLog, respectively.
Available on Mac OS X 10.9 or later.

18.53.378 AVPlayerItemPlaybackStalledNotification as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The notification name to use with NSNotificationObserverMBS class.
Notes: Posted when some media did not arrive in time to continue playback.
The notification's object is the AVPlayerItem instance whose playback was unable to continue because the necessary media isn't available yet, usually because it didn't arrive in a timely fashion from its source over a network. Playback will continue once a sufficient amount of media has subsequently been delivered.
Available on Mac OS X 10.9 or later.

18.53.379 AVPlayerItemTimeJumpedNotification as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Posted when the item's current time has changed discontinuously.
Notes: The notification's object is the item.

18.53.380 AVSampleRateConverterAlgorithmKey as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: The algorithm for the rate conversion.
Notes: Can be AVSampleRateConverterAlgorithm_Mastering or AVSampleRateConverterAlgorithm_Normal.
Available in OS X v10.9 and later.

18.53.381 AVSampleRateConverterAlgorithm_Mastering as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the supported values for the AVEncoderBitRateStrategyKey encoder setting.
Notes: Available in OS X v10.9 and later.

18.53.382 AVSampleRateConverterAlgorithm_Normal as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the supported values for the AVEncoderBitRateStrategyKey encoder setting.
Notes: Available in OS X v10.9 and later.

18.53.383 AVSampleRateConverterAudioQualityKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sample rate converter audio quality settings.
Notes: Value is an integer value. See AVAudioQuality* constants.

18.53.384 AVSampleRateKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the Audio setting keys that apply to all audio formats handled by the AVAudioPlayer and AVAudioRecorder classes.
Notes: A sample rate, in hertz, expressed as an floating point value.

18.53.385 AVStreamingKeyDeliveryContentKeyType as string

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: A UTI for streaming key delivery content keys.
Notes: The value of this UTI is "com.apple.streamingkeydelivery.contentkey".

18.53.386 AVStreamingKeyDeliveryPersistentContentKeyType as string

MBS AVFoundation Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: A UTI for persistent streaming key delivery content keys
Notes: The value of this UTI is "com.apple.streamingkeydelivery.persistentcontentkey".

18.53.387 AVTrackAssociationTypeAudioFallback as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Constants for identifying how other tracks are associated with a track.
Notes: An association from one audio track to another audio track. This constant indicates when one track contains the same content as another but in a more widely supported format. A player that does not support the format of the original track can use the "fallback" track instead.
For example, an asset may contain both stereo and a 5.1-channel audio tracks. In this case, marking the stereo track as the fallback for the 5.1-channel track would ensure that devices not capable of playing 5.1-channel audio can still play an equivalent track.
Available in OS X v10.9 and later.

18.53.388 AVTrackAssociationTypeChapterList as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Constants for identifying how other tracks are associated with a track.
Notes: An association from a track to another track containing chapter information, which may be a text track, a video track, or a timed metadata track.
Available in OS X v10.9 and later.

18.53.389 AVTrackAssociationTypeForcedSubtitlesOnly as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Constants for identifying how other tracks are associated with a track.
Notes: An association from one subtitle track, containing both forced and nonforced subtitles, to another subtitle track containing only forced subtitles for the same content.
Nonforced subtitles usually transcribe all "normal" dialogue in a media asset and are typically not presented by default. Forced subtitles are those that are essential for presentation even when normal subtitles are disabled (for example, when a character speaks in a language foreign to that of the audio track).
Available in OS X v10.9 and later.

18.53.390 AVTrackAssociationTypeSelectionFollower as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Constants for identifying how other tracks are associated with a track.
Notes: An association from one track to another specifying that when the user selects the first track, the second should be considered an appropriate default selection.
For example, a follower for an audio track could be a subtitle track in the same language. When the user chooses a language for audio, the subtitle language "follows" the audio language selection.
Available in OS X v10.9 and later.

18.53.391 AVTrackAssociationTypeTimecode as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Constants for identifying how other tracks are associated with a track.
Notes: An association from one track (of any type) to a timecode track containing timing information for the original track.
Available in OS X v10.9 and later.

18.53.392 AVURLAssetHTTPCookiesKey as string

MBS AVFoundation Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: HTTP cookies that the AVURLAsset may send with HTTP requests.
Notes: Standard cross-site policy still applies: cookies will only be sent to domains to which they apply.

By default, an AVURLAsset will only have access to cookies in the client's default cookie storage that apply to the AVURLAsset's URL. You can supplement the cookies available to the asset via use of this initialization option

HTTP cookies do not apply to non-HTTP(S) URLS.
In HLS, many HTTP requests (e.g., media, crypt key, variant index) might be issued to different paths or hosts.
In both of these cases, HTTP requests will be missing any cookies that do not apply to the AVURLAsset's URL.
This init option allows the AVURLAsset to use additional HTTP cookies for those HTTP(S) requests.

18.53.393 AVURLAssetPreferPreciseDurationAndTimingKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the keys for AVAsset creations.
Example:

```
Var options as new Dictionary
options.value(AVFoundationMBS.AVURLAssetPreferPreciseDurationAndTimingKey) = true
Var f as FolderItem = SpecialFolder.Desktop.Child("test.mov")
Var a as AVAssetMBS = AVURLAssetMBS.URLAssetWithFile(f, options)

MessageBox str(a.duration.Seconds)+" seconds with precision: "+str(a.providesPreciseDurationAndTiming)
```

Notes: The corresponding value is a boolean, contained in an NSValue object, that indicates whether the asset should be prepared to indicate a precise duration and provide precise random access by time.
True indicates that longer loading times are acceptable in cases in which precise timing is required. Such precision, however, may require additional parsing of the resource in advance of operations that make use of any portion of it, depending on the specifics of its container format.
Many container formats provide sufficient summary information for precise timing and do not require additional parsing to prepare for it; QuickTime movie files and MPEG-4 files are examples of such formats. Other formats do not provide sufficient summary information, and precise random access for them is possible only after a preliminary examination of a file's contents.
If you only intend that the asset be played, the default value of false will suffice (because AVPlayer supports approximate random access by time when full precision isn't available). If you intend to insert the asset into an AVMutableComposition object, precise random access is typically desirable, and the value of true is recommended.

18.53.394 AVURLAssetReferenceRestrictionsKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the keys for AVAsset creations.
Notes: The corresponding value is a number wrapping an "AVAssetReferenceRestrictions" enum value—or the logical combination of multiple such values—that indicates the restrictions used by the asset when resolving references to external media data.

Some assets can contain references to media data stored outside the asset's container file, for example in another file. This key can be used to specify a policy to use when these references are encountered. If an asset contains one or more references of a type that is forbidden by the reference restrictions, loading of asset properties will fail. In addition, such an asset cannot be used with other AVFoundation modules, such as AVPlayerItem or AVAssetExportSession.

18.53.395 AVVideoAverageBitRateKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the average bit rate (as bits per second) used in encoding.
The corresponding value is a number.
Apple documentation says H.264 only.

18.53.396 AVVideoCleanApertureHeightKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the clean aperture height.
The corresponding value is a number.

18.53.397 AVVideoCleanApertureHorizontalOffsetKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the clean aperture horizontal offset.
The corresponding value is a number.

18.53.398 AVVideoCleanApertureKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the clean aperture.
The corresponding value is a dictionary.

18.53.399 AVVideoCleanApertureVerticalOffsetKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the clean aperture vertical offset.
The corresponding value is a number.

18.53.400 AVVideoCleanApertureWidthKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the clean aperture width.
The corresponding value is a number.

18.53.401 AVVideoCodecAppleProRes422 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies that the video was encoded using the ProRes 422 Standard Definition encoder.
Files are identified with the .apcn extension.

18.53.402 AVVideoCodecAppleProRes4444 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies that the video was encoded using the Apple ProRes 4444 encoder.
Files are identified with the .ap4h extension.

18.53.403 AVVideoCodecH264 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies that the video was encoded using H264.

18.53.404 AVVideoCodecJPEG as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies that the video was encoded using the JPEG encoder.

18.53.405 AVVideoCodecKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the name of the codec used to encode the video. The corresponding value is a string; equivalent to CMVideoCodecType.

18.53.406 AVVideoCodecTypeAppleProRes422 as string

MBS AVFoundation Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: One of the values used to describe codecs for video capture.
Notes: The Apple ProRes422 video codec.

18.53.407 AVVideoCodecTypeAppleProRes4444 as string

MBS AVFoundation Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: One of the values used to describe codecs for video capture.
Notes: The Apple ProRes4444 video codec.

18.53.408 AVVideoCodecTypeH264 as string

MBS AVFoundation Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: One of the values used to describe codecs for video capture.
Notes: The H.264 video codec.

18.53.409 AVVideoCodecTypeHEVC as string

MBS AVFoundation Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: One of the values used to describe codecs for video capture.
Notes: The HEVC video codec.

18.53.410 AVVideoCodecTypeJPEG as string

MBS AVFoundation Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: One of the values used to describe codecs for video capture.
Notes: The JPEG video codec.

18.53.411 AVVideoCodecTypeJPEGXL as string

MBS AVFoundation Plugin, Plugin Version: 24.5, Platform: macOS, Targets: All.

Function: One of the values used to describe codecs for video capture.
Notes: The JPEG XL video codec. Available on macOS 15.0 or newer.

18.53.412 AVVideoColorPrimariesKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The key to identify color primaries in a color properties dictionary.

18.53.413 AVVideoColorPrimaries_EBU_3213 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the values to use with AVVideoColorPrimariesKey.

18.53.414 AVVideoColorPrimaries_ITU_R_709_2 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the values to use with AVVideoColorPrimariesKey.

18.53.415 AVVideoColorPrimaries_SMPTE_C as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the values to use with AVVideoColorPrimariesKey.

18.53.416 AVVideoColorPropertiesKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The key for a dictionary that contains properties specifying video color.
Notes: The dictionary must contain the keys AVVideoColorPrimariesKey, AVVideoTransferFunctionKey, and AVVideoYCbCrMatrixKey.

18.53.417 AVVideoCompressionPropertiesKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the compression properties.
The corresponding value is a Dictionary.

18.53.418 AVVideoHeightKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the height of the video in pixels.
The corresponding value is a number.

18.53.419 AVVideoMaxKeyFrameIntervalDurationKey as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Number (1 means key frames only, H.264 only)

18.53.420 AVVideoMaxKeyFrameIntervalKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the maximum interval between key frames.
The corresponding value is a number. 1 means key frames only.

18.53.421 AVVideoPixelAspectRatioHorizontalSpacingKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the pixel aspect ratio horizontal spacing.
The corresponding value is a number.

18.53.422 AVVideoPixelAspectRatioKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the pixel aspect ratio.
The corresponding value is a dictionary.

18.53.423 AVVideoPixelAspectRatioVerticalSpacingKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the pixel aspect ratio vertical spacing.
The corresponding value is a number.

18.53.424 AVVideoProfileLevelH264Baseline30 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a baseline level 3.0 profile.
Available in OS X v10.8 and later.

18.53.425 AVVideoProfileLevelH264Baseline31 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a baseline level 3.1 profile.
Available in OS X v10.8 and later.

18.53.426 AVVideoProfileLevelH264Baseline41 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a baseline level 4.1 profile.
Available in OS X v10.8 and later.

18.53.427 AVVideoProfileLevelH264BaselineAutoLevel as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Baseline Profile Auto Level.
Available on Mac OS X 10.9.

18.53.428 AVVideoProfileLevelH264High40 as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: High Profile Level 4.0
Available on Mac OS X 10.9.

18.53.429 AVVideoProfileLevelH264High41 as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: High Profile Level 4.1
Available on Mac OS X 10.9.

18.53.430 AVVideoProfileLevelH264HighAutoLevel as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: High Profile Auto Level
Available on Mac OS X 10.9.

18.53.431 AVVideoProfileLevelH264Main30 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a main level 3.0 profile.
Available in OS X v10.8 and later.

18.53.432 AVVideoProfileLevelH264Main31 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a main level 3.1 profile.
Available in OS X v10.8 and later.

18.53.433 AVVideoProfileLevelH264Main32 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a main level 3.2 profile.
Available in OS X v10.8 and later.

18.53.434 AVVideoProfileLevelH264Main41 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a main level 4.2 profile.
Available in OS X v10.8 and later.

18.53.435 AVVideoProfileLevelH264MainAutoLevel as string

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Main Profile Auto Level
Available on Mac OS X 10.9.

18.53.436 AVVideoProfileLevelKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the video profile.
Available in OS X v10.8 and later.

18.53.437 AVVideoQualityKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the JPEG coded quality.
The corresponding value is a number 0.0-1.0.

JPEG and HEIC only. With HEIC, 1.0 indicates lossless compression

18.53.438 AVVideoScalingModeFit as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to specify how video should be scaled to fit a given area.
Notes: Crop to remove edge processing region; preserve aspect ratio of cropped source by reducing specified width or height if necessary.
This mode does not scale a small source up to larger dimensions.

18.53.439 AVVideoScalingModeKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to specify how video should be scaled to fit a given area.
Notes: A key to retrieve the video scaling mode from a dictionary.

18.53.440 AVVideoScalingModeResize as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to specify how video should be scaled to fit a given area.
Notes: Crop to remove edge processing region; scale remainder to destination area.
This mode does not preserve the aspect ratio.

18.53.441 AVVideoScalingModeResizeAspect as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to specify how video should be scaled to fit a given area.
Notes: Preserve aspect ratio of the source, and fill remaining areas with black to fit destination dimensions.

18.53.442 AVVideoScalingModeResizeAspectFill as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants to specify how video should be scaled to fit a given area.
Notes: Preserve aspect ratio of the source, and crop picture to fit destination dimensions.

18.53.443 AVVideoTransferFunctionKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The key to identify the transfer function in a color properties dictionary.

18.53.444 AVVideoTransferFunction_ITU_R_709_2 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the values to use with AVVideoTransferFunctionKey.

18.53.445 AVVideoTransferFunction_SMPTE_240M_1995 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the values to use with AVVideoTransferFunctionKey.

18.53.446 AVVideoWidthKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the constants for the dictionary with video settings.
Notes: Specifies a key to access the width of the video in pixels.
The corresponding value is a number.

18.53.447 AVVideoYCbCrMatrixKey as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The key to identify the Y'CbCr matrix in a color properties dictionary.

18.53.448 AVVideoYCbCrMatrix_ITU_R_601_4 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the values to use with AVVideoYCbCrMatrixKey.

18.53.449 AVVideoYCbCrMatrix_ITU_R_709_2 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the values to use with AVVideoYCbCrMatrixKey.

18.53.450 AVVideoYCbCrMatrix_SMPTE_240M_1995 as string

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: One of the values to use with AVVideoYCbCrMatrixKey.

18.53.451 WriteCGImageToFile(File as FolderItem, Type as String, Image as Variant, options as Dictionary = nil, tag as Variant = nil) as boolean

MBS AVFoundation Plugin, Plugin Version: 14.0, Platform: macOS, Targets: All.

Function: Writes a CGImage to a file on disk on another thread.
Notes: Image must be a CGImageMBS.

If this method returns true (parameters are correct), it starts the compression and writing of the image on a helper thread and later calls WriteCGImageToFileCompleted event to inform you about success or failure. Returns false in case of bad parameters.

Tag is the value you passed when calling the original method.

18.53.452 Events

18.53.453 AssetLoadValuesAsynchronouslyForKeysFinished(MetadataItem as AVMetadataItemMBS, keys() as string, tag as Variant)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Called by AVAssetMBS.loadValuesAsynchronouslyForKeys method on completion.
Notes: Tag is the value you passed when calling the original method.

18.53.454 AssetTrackLoadValuesAsynchronouslyForKeysFinished(MetadataItem as AVMetadataItemMBS, keys() as string, tag as Variant)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Called by AVAssetTrackMBS.loadValuesAsynchronouslyForKeys method on completion.
Notes: Tag is the value you passed when calling the original method.

18.53.455 audioPlayerDecodeErrorDidOccur(player as AVAudioPlayerMBS, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Called when an audio player encounters a decoding error during playback.
Notes: player: The audio player that encountered the decoding error.
error: The decoding error.

18.53.456 audioPlayerDidFinishPlaying(player as AVAudioPlayerMBS, successful as boolean)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Called when a sound has finished playing.
Notes: player: The audio player that finished playing.
flag: True on successful completion of playback; false if playback stopped because the system could not decode the audio data.

This method is not called upon an audio interruption. Rather, an audio player is paused upon interruption—the sound has not finished playing.

18.53.457 audioRecorderDidFinishRecording(recorder as AVAudioRecorderMBS, successful as boolean)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Called by the system when a recording is stopped or has finished due to reaching its time limit.
Notes: recorder: The audio recorder that has finished recording.
flag: True on successful completion of recording; False if recording stopped because of an audio encoding error.

This method is not called by the system if the audio recorder stopped due to an interruption.

18.53.458 audioRecorderEncodeErrorDidOccur(recorder as AVAudioRecorderMBS, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Called when an audio recorder encounters an encoding error during recording.
Notes: recorder: The audio recorder that encountered the encoding error.
error: The encoding error.

18.53.459 BoundaryTimeObserver(Player as AVPlayerMBS, tag as Variant)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Called by addBoundaryTimeObserverForTimes.
Notes: Tag is the value you passed when calling the original method.

18.53.460 CaptureDeviceSubjectAreaDidChange(device as AVCaptureDeviceMBS, notification as Variant)

MBS AVFoundation Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.
