y	(Mandatory)	The y offset in pixels.

30.5.54 setReverse(value as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reverse the axis.
Notes: For a normal vertical axis, the axis starts from the bottom and increase its value towards the top. For a normal horizontal axis, the axis starts from the left and increase its value towards the right. The setReverse method can be used to reverse the direction of the axis.

Parameter	Default	Description
b	true	A true value means the axis is reversed. A false value means the axis is not reversed.

30.5.55 setRounding(roundMin as boolean, roundMax as boolean)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Controls whether to round the ends of the axis to align with tick positions.
Notes: For example, if the axis is from 0.33 - 9.7, ChartDirector may round it to 0 - 10 so that the ends 0 and 10 are properly aligned with the ticks.

By default, ChartDirector will round the axis ends for the y-axis, but not for the x-axis. An exception is a chart containing a scatter layer, where both x and y axes will be rounded.

Parameter	Default	Description
roundMin	(Mandatory)	A true value means the lesser end of the axis should be rounded to align with tick positions. A false value means no rounding.
roundMax	(Mandatory)	A true value means the greater end of the axis should be rounded to align with tick positions. A false value means no rounding.

30.5.56 setTickColor(majorTickColor as color, minorTickColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setTickColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.5.57 setTickColor(majorTickColor as Integer, minorTickColor as Integer = -1) 5098

30.5.57 setTickColor(majorTickColor as Integer, minorTickColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colors of the axis ticks.
Notes:

Parameter	Default	Description
majorTickColor	(Mandatory)	The color of the major ticks.
minorTickColor	-1	The color of the major ticks. -1 means the color is the same as majorTickColor

See also:

- 30.5.56 setTickColor(majorTickColor as color, minorTickColor as color) 5098

30.5.58 setTickDensity(majorTickSpacing as Integer, minorTickSpacing as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the density of the axis ticks.
Notes: Tick density is the desired distance between two ticks in pixels. When ChartDirector performs auto-scaling, it will decide how many ticks to put on the axis based on tick density.

Note that the actual tick density chosen in auto-scaling may not be exactly the same as the desired tick density. It is because ChartDirector may have other constraints in choosing the ticks, such as the ticks and axis range should be neat numbers, and the axis must contain an integral number of ticks, etc. ChartDirector may use a tick distance that is larger than suggested, but never smaller.

Parameter	Default	Description
majorTickSpacing	(Mandatory)	Specify the desired distance between two major ticks in pixels.
minorTickSpacing	-1	Specify the desired distance between two minor ticks in pixels. -1 means minor ticks are not used.

30.5.59 setTickLength(majorTickLen as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the length of the axis ticks.
Notes: A positive tick length means the ticks are drawn outside the plot area. A negative tick length means the ticks are drawn inside the plot area.

Parameter	Default	Description
majorTickLen	(Mandatory)	The length of the major ticks in pixels. The length of the minor ticks will automatically be set to half the length of the major ticks.

See also:

- 30.5.60 setTickLength(majorTickLen as Integer, minorTickLen as Integer) 5099

30.5.60 setTickLength(majorTickLen as Integer, minorTickLen as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the length of the major and minor axis ticks.
Notes: A positive tick length means the ticks are drawn outside the plot area. A negative tick length means the ticks are drawn inside the plot area.

Parameter	Default	Description
majorTickLen	(Mandatory)	The length of the major ticks in pixels.
minorTickLen	(Mandatory)	The length of the minor ticks in pixels.

See also:

- 30.5.59 setTickLength(majorTickLen as Integer) 5099

30.5.61 setTickOffset(offset as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shifts the position of the ticks along the axis.
Notes: By default, ChartDirector draws the ticks at the label position. This method is typically used to shift the ticks so that the ticks are between two labels, rather than aligned with the label.

The offset is specified as a value on the axis scale. For a label based axis (configured using Axis.setLabels), shifting with an offset of 0.5 means shifting half the label interval. This will achieve the effect of putting the ticks in between the labels.

Parameter	Default	Description
offset	(Mandatory)	The distance to shift the ticks along the axis as a value on the axis scale.

30.5.62 setTickWidth(majorTickWidth as Integer, minorTickWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the width of the axis ticks.
Notes:

Parameter	Default	Description
majorTickWidth	(Mandatory)	The width of the major ticks in pixels.
minorTickWidth	-1	The width of the minor ticks in pixels. -1 means the width is the same as majorTickWidth.

30.5.63 setTitle(text as string, font as string = """, fontsize as Double = 8, fontcolor as Integer = &hffff0002) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a title to the axis.
Notes: See Font Specification for details on various font attributes.

Parameter	Default	Description
text	(Mandatory)	The title text.
font	""	The font used to draw the title. If no font is specified, the default is "bold".
fontSize	8	The size of the font in points.
fontColor	TextColor	The color used to draw the title text.

Return Value
A TextBox object representing the axis title. This may be used to fine-tune the appearance of the axis title.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.5.64 setTitle(text as string, font as string, fontsize as Double, fontcolor as color) as CDTextBoxMBS 5101

30.5.64 setTitle(text as string, font as string, fontsize as Double, fontcolor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setTitle method, but uses color instead of integer data type for passing color values.
See also:

- 30.5.63 setTitle(text as string, font as string = "", fontsize as Double = 8, fontcolor as Integer = &hffff0002) as CDTextBoxMBS 5100

30.5.65 setTitlePos(alignment as Integer, titleGap as Integer = 3)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position of the axis title relative to the axis.
Notes: By default, the axis title will be drawn at the middle of the axis outside the plot area. You may change the location of the title. For example, instead of drawing the y-axis title at the middle of the axis, you may want draw it at the top of the axis.

Parameter	Default	Description
alignment	(Mandatory)	The position of the title relative to the axis.
titleGap	3	The distance between the axis title and the axis in pixels.

30.5.66 setWidth(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the line width of the axis.
Notes:

Parameter	Default	Description
width	(Mandatory)	The line width of the axis in pixels.

30.5.67 syncAxis(axis as CDAxisMBS, slope as Double = 1.0, intercept as Double = 0.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Synchronizes this axis with another axis using a linear formula.
Notes: This method is typically used if the two axes represent the same quantity but in different units. For example, one axis may represent temperature in Celsius, and the other in Fahrenheit, or they may represent lengths in meters and feet.

The scale of this axis (value) will be related to the scale of the another axis (value2) using the following formula:

value = value2 * slope + intercept

Typically, one of the axis will be for actual charting, and its scale will be determined in the standard way using auto or manual scaling. Then the second axis is set to synchronize with the first axis.

Parameter	Default	Description
axis	(Mandatory)	The axis to synchronize to.
slope	1	The slope for synchronizing this axis to the other axis.
intercept	0	The intercept parameter for synchronizing this axis to the other axis.

30.5.68 syncScale(axis as CDAxisMBS = nil, slope as double = 1.0, intercept as double = 0.0)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Synchronizes the scale of this axis with another axis using a linear formula.
Notes: The scale of this axis (value) will be related to the scale of the source axis (value2) using the following formula:

value = value2 * slope + intercept

The differences between syncScale and Axis.syncAxis are:

- Axis.syncAxis assumes the two axes are of the same length. In addition to the scale, it will also synchronize the ticks and labels, and configurations that may affect the positions of ticks and labels, such as axis margins and axis indentation. This ensures the two axes scale align properly.
- syncScale does not assume the two axes are of the same length. For example, the y-axis of one chart can be synchronized with the CDColorAxisMBS of a different chart. The two axes can have different labels to fit their different lengths.

Argument	Default	Description
axis	(Mandatory)	The axis to synchronize to. A value of null means not to synchronize to any axis.
slope	1	The slope for synchronizing this axis to the other axis.
intercept	0	The intercept parameter for synchronizing this axis to the other axis.

30.6 class CDBarLayerMBS

30.6.1 class CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The BarLayer class represents bar layers. BarLayer is a subclass of Layer.
Example:

```
// a bar chart with round bars, no gaps between groups and value labels
Var data() As Double = Array(35.0, 52.0, 41.0, 68.0)
Var labels() As String = Array("Q1", "Q2", "Q3", "Q4")
Var c As New CDXYChartMBS(400, 300)
Call c.setPlotArea(50, 30, 320, 230)
Call c.xAxis.setLabels(labels)

Var bars As CDBarLayerMBS = c.addBarLayer(data, &h3399CC)
bars.setBarGap(0.4) // 40% gap between bars
bars.setBarShape(CDBaseChartMBS.kCircleShape)
Call bars.setAggregateLabelStyle("arialbd.ttf", 9)

Var pic As Picture = c.makeChartPicture
```

Notes: Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.6.2 Methods

30.6.3 setBarGap(barGap as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the gap between the bars in a bar chart layer.
Notes: In the setBarGap method, the gap between the bars is expressed as the portion of the space between the bars. For example, a bar gap of 0.2 means 20% of the distance between two adjacent bars is the gap between the bars.

A bar gap of 0 means there is no gap in between the bars. The bar gap can be negative. In this case, the bars will overlap. The predefined constant TouchBar (= -1.7E-100) means the bars will "touch", that is, the bar borders overlap, so two adjacent bars will share the same border.

For multi-bar layers (bar layers using the Side data combine method, or for stacked bar layers with multiple data groups), barGap refers to the portion of the space between bar groups, while subBarGap refers to the portion of the space between bars within the bar group.

Parameter	Default	Description
barGap	(Mandatory)	The portion of the space between the bars (or between bar groups for multi-bar layers).
subBarGap	0.2	This argument only applies to multi-bar charts. It is the portion of the space between the bars in a bar group.

See also:

- 30.6.4 setBarGap(barGap as Double, subBarGap as Double) 5105

30.6.4 setBarGap(barGap as Double, subBarGap as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the gap between the bars in a bar chart layer.
Notes: In the setBarGap method, the gap between the bars is expressed as the portion of the space between the bars. For example, a bar gap of 0.2 means 20% of the distance between two adjacent bars is the gap between the bars.

A bar gap of 0 means there is no gap in between the bars. The bar gap can be negative. In this case, the bars will overlap. The predefined constant TouchBar (= -1.7E-100) means the bars will "touch", that is, the bar borders overlap, so two adjacent bars will share the same border.

For multi-bar layers (bar layers using the Side data combine method, or for stacked bar layers with multiple

data groups), barGap refers to the portion of the space between bar groups, while subBarGap refers to the portion of the space between bars within the bar group.

Parameter	Default	Description
barGap	(Mandatory)	The portion of the space between the bars (or between bar groups for multi-bar layers).
subBarGap	0.2	This argument only applies to multi-bar charts. It is the portion of the space between the bars in a bar group.

See also:

- 30.6.3 setBarGap(barGap as Double) 5105

30.6.5 setBarShape(shape as Integer, dataGroup as Integer = -1, dataItem as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the shape of the bar(s) using built-in shapes.
Notes:

Parameter	Default	Description
shape	(Mandatory)	The bar shape to use. Please refer to Shape Specification on how shapes are specified.
dataGroup	-1	The index of the data group that the shape applies to. In a multi-stacked bar, the data sets that are stacked up into a single bar forms a data group. In a multi-bar chart, each data set is a data group by itself. The default value of -1 means the shape applies to all data groups.
dataItem	-1	The index of the data points that the shape applies to. For example, if set to 3, the shape will only apply to the 4th bar (index starts from 0) in each data series. The default value of -1 means the shape applies to all data points.

See also:

- 30.6.6 setBarShape(shape() as Integer, dataGroup as Integer = -1, dataItem as Integer = -1) 5106

30.6.6 setBarShape(shape() as Integer, dataGroup as Integer = -1, dataItem as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the shape of the bar(s) to a custom shape defined using an array of (x, y) coordinates.
Notes:

See also:

Parameter	Default	Description
shape	(Mandatory)	The bar shape to use. Please refer to Shape Specification on how shapes are specified.
dataGroup	-1	The index of the data group that the shape applies to. In a multi-stacked bar, the data sets that are stacked up into a single bar forms a data group. In a multi-bar chart, each data set is a data group by itself. The default value of -1 means the shape applies to all data groups.
dataItem	-1	The index of the data points that the shape applies to. For example, if set to 3, the shape will only apply to the 4th bar (index starts from 0) in each data series. The default value of -1 means the shape applies to all data points.

- 30.6.5 setBarShape(shape as Integer, dataGroup as Integer = -1, dataItem as Integer = -1) 5106

30.6.7 setBarWidth(barWidth as Integer, subBarWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the width of the bars.
Notes:

Parameter	Default	Description
barWidth	(Mandatory)	The width of the bars (or bar groups for multi-bar layers) in pixels.
subBarWidth	-1	This argument only applies to multi-bar charts. It is the width of the bars in a bar group in pixels.

30.6.8 setIconSize(height as Integer, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the size of the icon(s) to be used in legend box.
Notes: By default, if a legend box is available on the chart, ChartDirector will insert an legend entry for any named data sets in the legend box. The icons for the data sets will be the shape of the bars. The size of the icons will be determined using the key size settings of the legend box (see LegendBox.setKeySize).

This method can be used to override the legend box settings to specify a custom width/height for the icons of the current BarLayer.

If the icon size is set to 0, a square color box will be used as the icon without regarding the shape of the bar.

Parameter	Default	Description
height	(Mandatory)	The height of the icon in pixels.
width	-1	The width of the icon in pixels. The default value of -1 means the width is the same as the height.

30.6.9 setMinImageMapSize(s as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the minimum height (or width if the x-axis and y-axis are swapped with CDXYChartMBS.swapXY) of the hot spots defined by the image map.
Notes: By default, the hot spots defined by image map exactly cover the bars. For very short bars, the hot spots may be very small, and it may become difficult to move the mouse over the hot spots.
This method ensures the hot spots are at least of certain size, even if the bars are shorter. The default is 5 pixels.

Arguments:

Argument	Default	Description
size	(Mandatory)	The minimum height (or width if the x-axis and y-axis are swapped with CDXYChartMBS.swapXY) of the hot spots defined by the image map.

30.6.10 setMinLabelSize(s as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the minimum height (or width for horizontal bars) of the bar segments below which data labels will be hidden.
Notes: In ChartDirector, for a bar layer, data labels (Layer.setDataLabelStyle) are drawn internal to the bar segment, while the aggregate labels (Layer.setAggregateLabelStyle) are drawn external to the bar.

ChartDirector will disable data labels for a bar segment if the bar segment is too short to contain the data label.

By default, ChartDirector will automatically determine what is meant by "too short". The setMinLabelSize method can be used to manually defined the threshold for "too short".

Sometimes it may be desirable to display the data label even though it cannot be contained within the bar segment. In this case, the setMinLabelSize can be used to set the threshold to 0.

Parameter	Default	Description
s	(Mandatory)	The minimum length of the bar segments in pixels, below which data labels will be hidden.

30.6.11 setOverlapRatio(overlapRatio as Double, firstOnTop as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets overlapping among bars in within a bar group in a multi-bar chart.
Notes: By default, in a multi-bar chart, the bars are not overlapped, but are separated with a gap in between. This method can be used to set an alternative style, where the bars partially overlap.

Parameter	Default	Description
overlapRatio	(Mandatory)	The overlapping ratio between adjacent bars in a bar group. Should be between 0 to 1.
firstOnTop	true	If this value is true, the first data set will be on top of the second data during overlapping, and the second data set will be on top of the third data set, and so on. If this value is false, then the overlapping order will be reversed.

30.6.12 setRoundedCorners

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures rounded corners for rectangular bars.
Notes: A rectangular bar has 4 corners. Two of them are at the base of the bar, while the other two are at the "data end" of the bar. Note that the base of the bar can be any side of the bar, depending on whether the bar is positive or negative, vertical or horizontal.

For the 2 base corners, one of them is at the negative x direction while the other is at the positive x direction. The same applies to the two data end corners.

This method accepts 0, 1, 2 or 4 radius values. The usage of these values depend how many values are provided as follows.

See also:

- 30.6.13 setRoundedCorners(r1 as Integer, r2 as Integer = -2147483647, r3 as Integer = -2147483647, r4 as Integer = -2147483647)

Values Provided	Description
0	The radii of the data end corners are automatically determined. The radii of the base corners are set to 0.
1	The radii of the data end corners are set to the specified value. The radii of the base corners are set to 0.
2	The radii of the data end corners are set to the first value. The radii of the base corners are set to the second value.
4	The radius of the data end corner at the negative x direction is set to the first value. The radius of the data end corner at the positive x direction is set to the second value. The radius of the base corner at the negative x direction is set to the third value. The radius of the base corner at the positive x direction is set to the fourth value.

Argument	Default	Description
r1	-&h7fffffff	The first radius. See description above on how this radius value is used.
r2	-&h7fffffff	The second radius. See description above on how this radius value is used.
r3	-&h7fffffff	The third radius. See description above on how this radius value is used.
r4	-&h7fffffff	The fourth radius. See description above on how this radius value is used.

30.6.13 setRoundedCorners(r1 as Integer, r2 as Integer = -2147483647, r3 as Integer = -2147483647, r4 as Integer = -2147483647)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures rounded corners for rectangular bars.
Notes: A rectangular bar has 4 corners. Two of them are at the base of the bar, while the other two are at the "data end" of the bar. Note that the base of the bar can be any side of the bar, depending on whether the bar is positive or negative, vertical or horizontal.

For the 2 base corners, one of them is at the negative x direction while the other is at the positive x direction. The same applies to the two data end corners.

This method accepts 0, 1, 2 or 4 radius values. The usage of these values depend how many values are provided as follows.

See also:

- 30.6.12 setRoundedCorners 5109

Values Provided	Description
0	The radii of the data end corners are automatically determined. The radii of the base corners are set to 0.
1	The radii of the data end corners are set to the specified value. The radii of the base corners are set to 0.
2	The radii of the data end corners are set to the first value. The radii of the base corners are set to the second value.
4	The radius of the data end corner at the negative x direction is set to the first value. The radius of the data end corner at the positive x direction is set to the second value. The radius of the base corner at the negative x direction is set to the third value. The radius of the base corner at the positive x direction is set to the fourth value.

Argument	Default	Description
r1	-&h7fffffff	The first radius. See description above on how this radius value is used.
r2	-&h7fffffff	The second radius. See description above on how this radius value is used.
r3	-&h7fffffff	The third radius. See description above on how this radius value is used.
r4	-&h7fffffff	The fourth radius. See description above on how this radius value is used.

30.7 class CDBaseBoxLayerMBS

30.7.1 class CDBaseBoxLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function:

The BaseBoxLayer class is the base class for layers that uses isolated symbols to represent multiple data sets. These include BoxWhiskerLayer, HLOCLayer and
CandleStickLayer.
Notes:

Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.7.2 Methods

30.7.3 setDataGap(gap as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the symbol width by specifying the gap ratio between adjacent symbols.
Notes:

Parameter	Default	Description
gap	(Mandatory)	The gap between two adjacent symbols as the portion of the space between the midpoints of the elements. The gap must be in the range 0 - 1. A value of 0 (the default) means there is no gap between two adjacent symbols.

30.7.4 setDataWidth(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the symbol width by specifying the pixel width of the symbols.
Notes:

Parameter	Default	Description
width	(Mandatory)	The width of the symbols in pixels.

30.7.5 setMinImageMapSize(size as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the minimum height (or width if the x-axis and y-axis are swapped with CDXYChartMBS.swapXY) of the hot spots defined by the image map.
Notes: By default, the hot spots defined by image map exactly cover the bars. For very short bars, the hot spots may be very small, and it may become difficult to move the mouse over the hot spots.
This method ensures the hot spots are at least of certain size, even if the bars are shorter. The default is 5 pixels.

Arguments:

Argument	Default	Description
size	(Mandatory)	The minimum height (or width if the x-axis and y-axis are swapped with CDXYChartMBS.swapXY) of the hot spots defined by the image map.

30.7.6 setRoundedCorners(r1 as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures rounded corners for the boxes.
Notes: This method currently is only supported by the BoxWhiskerLayer.

A box has 4 corners, two of them are at "box-top", and two of them are at "box-bottom". Note that "box-top" and "bottom-bottom" refer to the sides of the box representing the boxTop and boxBottom parameters in CDXYChartMBS.addBoxWhiskerLayer or CDXYChartMBS.addBoxLayer. Note that they are not necessarily the geometric top or bottom of the box. For example, if the y-axis is reversed (such as configured using CDAxisMBS.setReverse), the top and bottom side may be reversed. For horizontal boxes (with CDXYChartMBS.swapXY in effect), the box-top and box-bottom sides may actually be the right and left sides.

Of the 2 box-top corners, one of them is at the negative x direction while the other is at the positive x direction. The same applies to the box-bottom corners.

This method accepts 0, 1, 2 or 4 radius values. The usage of these values depend how many values are provided as follows.

See also:

- 30.7.7 setRoundedCorners(r1 as Integer, r2 as Integer, r3 as Integer = -2147483647, r4 as Integer = -2147483647) 5114

Values Provided	Description
0	The radii of all the box corners are automatically determined.
1	The radii of all the box corners are set to the specified value.
2	The radii of the box-top corners are set to the first value. The radii of the box-bottom corners are set to the second value.
4	The radius of the box-top corner at the negative x direction is set to the first value. The radius of the box-top corner at the positive x direction is set to the second value. The radius of the box-bottom corner at the negative x direction is set to the third value. The radius of the box-bottom corner at the positive x direction is set to the fourth value.

Argument	Default	Description
r1	-0x7fffffff	The first radius. See description above on how this radius value is used.
r2	-0x7fffffff	The second radius. See description above on how this radius value is used.
r3	-0x7fffffff	The third radius. See description above on how this radius value is used.
r4	-0x7fffffff	The fourth radius. See description above on how this radius value is used.

30.7.7 setRoundedCorners(r1 as Integer, r2 as Integer, r3 as Integer = -2147483647, r4 as Integer = -2147483647)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures rounded corners for the boxes.
Notes: This method currently is only supported by the BoxWhiskerLayer.

A box has 4 corners, two of them are at "box-top", and two of them are at "box-bottom". Note that "box-top" and "bottom-bottom" refer to the sides of the box representing the boxTop and boxBottom parameters in CDXYChartMBS.addBoxWhiskerLayer or CDXYChartMBS.addBoxLayer. Note that they are not necessarily the geometric top or bottom of the box. For example, if the y-axis is reversed (such as configured using CDAxisMBS.setReverse), the top and bottom side may be reversed. For horizontal boxes (with CDXYChartMBS.swapXY in effect), the box-top and box-bottom sides may actually be the right and left sides.

Of the 2 box-top corners, one of them is at the negative x direction while the other is at the positive x direction. The same applies to the box-bottom corners.

This method accepts 0, 1, 2 or 4 radius values. The usage of these values depend how many values are provided as follows.

See also:

- 30.7.6 setRoundedCorners(r1 as Integer) 5113

Values Provided	Description
0	The radii of all the box corners are automatically determined.
1	The radii of all the box corners are set to the specified value.
2	The radii of the box-top corners are set to the first value. The radii of the box-bottom corners are set to the second value.
4	The radius of the box-top corner at the negative x direction is set to the first value. The radius of the box-top corner at the positive x direction is set to the second value. The radius of the box-bottom corner at the negative x direction is set to the third value. The radius of the box-bottom corner at the positive x direction is set to the fourth value.

Argument	Default	Description
r1	-0x7fffffff	The first radius. See description above on how this radius value is used.
r2	-0x7fffffff	The second radius. See description above on how this radius value is used.
r3	-0x7fffffff	The third radius. See description above on how this radius value is used.
r4	-0x7fffffff	The fourth radius. See description above on how this radius value is used.

30.8 class CDBaseChartMBS

30.8.1 class CDBaseChartMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The BaseChart class is an abstract class containing methods that are common to all chart types.
Example:

```
// settings every ChartDirector chart has: size, background, title, legend and picture output
Var c As New CDPieChartMBS(400, 300)
c.setBackground(&hF8F8FF, &h888888, 1) // color, border, raised effect
Call c.addTitle("Market share", "arialbd.ttf", 14)
Call c.addLegend(300, 60)

Var data() As Double = Array(45.0, 30.0, 25.0)
Var labels() As String = Array("Product A", "Product B", "Other")
c.setPieSize(150, 160, 100)
c.setData(data, labels)

Var pic As Picture = c.makeChartPicture
// show pic in a Canvas, or save it with makeChart(file)
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.8.2 Methods

30.8.3 addExtraField(numbers() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an array of numbers/dates to be used as an extra field in various places.
Notes: This method merely stores the data inside the chart object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

Argument	Default	Description
numbers	(Mandatory)	An array of numbers/dates to be stored inside the chart object.

See also:

- 30.8.4 addExtraField(paths() as folderitem) 5118
- 30.8.5 addExtraField(texts() as string) 5118

30.8.4 addExtraField(paths() as folderitem)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an array of file paths to be used as an extra field in various places.
Notes: This method merely stores the data inside the chart object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

Argument	Default	Description
texts	(Mandatory)	An array of text to be stored inside the chart object.

See also:

- 30.8.3 addExtraField(numbers() as Double) 5117
- 30.8.5 addExtraField(texts() as string) 5118

30.8.5 addExtraField(texts() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an array of text to be used as an extra field in various places.
Notes: This method merely stores the data inside the chart object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

Argument	Default	Description
texts	(Mandatory)	An array of text to be stored inside the chart object.

Great to add point labels to the chart.
See also:

- 30.8.3 addExtraField(numbers() as Double) 5117
- 30.8.4 addExtraField(paths() as folderitem) 5118

30.8.6 addLegend(x as Integer, y as Integer, noOfCols as Integer, font as string = """, fontsize as Double = 10) as CDLegendBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a legend box to the chart with grid layout.
Notes: In grid layout, the legend box will be divided into a table in which all cells are of same width. The legend entries will fill the cells from left to right, top to bottom.

The number of columns can be specified using the noOfCols argument. If this argument is set to the special constant AutoGrid (= -2), the number of columns will be automatically determined based on the longest legend entry. If this argument is 0, the legend box will use a flow layout (from left to right and then top to bottom, in which the entries may not be vertically aligned).

In any case, the number of rows in the table is automatically determined so as to have enough cells for all legend entries.

Argument	Default	Description
x	(Mandatory)	The x coordinate of the reference point of the legend box. By default, the reference point is the top-left corner of the box, but can be configured by using TextBox.setAlignment.
y	(Mandatory)	The y coordinate of the reference point of the legend box. By default, the reference point is the top-left corner of the box, but can be configured by using TextBox.setAlignment.
noOfCols	(Mandatory)	The number of columns in the legend box. The special value AutoGrid (= -2) means the number of columns is automatically determined. If this argument is 0, the legend box will use a flow layout (from left to right and then top to bottom, in which the entries may not be vertically aligned).
font	""	The font name of the font for drawing the legend text. The default is "normal". See Font Specification for details on various font attributes.
fontSize	10	The font size of the legend text.

Return Value
A LegendBox object representing the legend box. You may use this object to fine-tune the appearance of the legend box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.8.7 addLegend(x as Integer, y as Integer, vertical as boolean=true, font as string = "", fontsize as Double = 10) as CDLegendBoxMBS 5120

30.8.7 addLegend(x as Integer, y as Integer, vertical as boolean=true, font as string = ””, fontsize as Double = 10) as CDLegendBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a legend box to the chart.
Notes: The entries in the legend box will flow from top to bottom (one line per entry), or from left to right and then top to bottom (like flowing text), depending on the vertical argument. For grid layout, use BaseChart.addLegend2.

Argument	Default	Description
x	(Mandatory)	The x coordinate of the reference point of the legend box. By default, the reference point is the top-left corner of the box, but can be configured by using TextBox.setAlignment.
y	(Mandatory)	The y coordinate of the reference point of the legend box. By default, the reference point is the top-left corner of the box, but can be configured by using TextBox.setAlignment.
vertical	true	A true value means the legend keys are laid out vertically (one line per entry). A false value means the legend keys are laid out horizontal and flow like text (from left to right, top to bottom).
font	””	The font name of the font for drawing the legend text. The default is ”normal”. See Font Specification for details on various font attributes.
fontSize	10	The font size of the legend text.

Return Value
A LegendBox object representing the legend box. You may use this object to fine-tune the appearance of the legend box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.8.6 addLegend(x as Integer, y as Integer, noOfCols as Integer, font as string = ””, fontsize as Double = 10) as CDLegendBoxMBS 5119

30.8.8 addLine(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, colorvalue as color, lineWidth as Integer = 1) as CDLineMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addLine method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.9 addLine(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, colorvalue as Integer =

&hffff0001, lineWidth as Integer = 1) as CDLineMBS 5121

30.8.9 addLine(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, colorvalue as Integer = &hffff0001, lineWidth as Integer = 1) as CDLineMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a line to the chart.
Notes:

Argument	Default	Description
x1	(Mandatory)	The x coordinate of the first endpoint of the line.
y1	(Mandatory)	The y coordinate of the first endpoint of the line.
x2	(Mandatory)	The x coordinate of the second endpoint of the line.
y2	(Mandatory)	The y coordinate of the second endpoint of the line.
color	LineColor	The color of the line.
lineWidth	1	The width of the line.

Return Value
A Line object representing the line added. You may use this object to fine- tune the appearance of the line.
See also:

- 30.8.8 addLine(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, colorvalue as color, lineWidth as Integer = 1) as CDLineMBS 5120

30.8.10 addTable(x as Integer, y as Integer, alignment as Integer, col as Integer, row as Integer) as CDMLTableMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a CDML table to the chart.
Notes: Arguments:

Argument	Default	Description
x	(Mandatory)	The x-coordinate of the reference point used to position the table.
y	(Mandatory)	The y-coordinate of the reference point used to position the table.
alignment	(Mandatory)	The alignment of the table with respect to the reference point. For example, a value of kTopLeft means the reference point is the top- left corner of the table. See Alignment Specification for supported alignment types..
col	(Mandatory)	The number of columns in the table.
row	(Mandatory)	The number of rows in the table.

Returns a CDMLTableMBS object representing the CDML table added.

30.8.11 addText(x as Integer, y as Integer, text as string, font as string = ””, fontsize as Double = 8, fontcolor as Integer = &hffff0002, alignment as Integer = 7, angle as Double = 0, vertical as boolean=false) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a text box to the chart.
Notes: By default, only the text is visible, the box is transparent. This method returns a TextBox object that can be used to change the appearance of the text box.

Argument	Default	Description
x	(Mandatory)	The x coordinate of the left of the text box.
y	(Mandatory)	The y coordinate of the top of the text box.
text	(Mandatory)	The text to shown in the text box. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.
font	””	The font used to draw the text. See Font Specification for details on various font attributes.
fontSize	8	The font size used to draw the text.
fontColor	TextColor	The color used to draw the text.
alignment	TopLeft	The alignment of the text within the text box. See Alignment Specification for supported alignment types.
angle	0	The rotation angle of the text within the text box.
vertical	false	Indicate whether the text should be laid out vertically (from top to bottom) or horizontally (from left to right).

Return Value
A TextBox object representing the text box. This may be used to fine-tune the appearance of the text box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.8.12 addText(x as Integer, y as Integer, text as string, font as string, fontsize as Double, fontcolor as color, alignment as Integer = 7, angle as Double = 0, vertical as boolean=false) as CDTextBoxMBS 5122

30.8.12 addText(x as Integer, y as Integer, text as string, font as string, fontsize as Double, fontcolor as color, alignment as Integer = 7, angle as Double = 0, vertical as boolean=false) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addText method, but uses color instead of integer data type for passing color

values.
See also:

- 30.8.11 addText(x as Integer, y as Integer, text as string, font as string = """, fontsize as Double = 8, fontcolor as Integer = &hffff0002, alignment as Integer = 7, angle as Double = 0, vertical as boolean=false) as CDTextBoxMBS 5122

30.8.13 addTitle(alignment as Integer, text as string, font as string = """, fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a title to the chart.
Notes:

Argument	Default	Description
alignment	(Mandatory)	The position on the title on the chart. See Alignment Specification for supported alignment types.
text	(Mandatory)	The text for the title. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.
font	"""	The font used to draw the title text. The default is "bold". See Font Specification for details on various font attributes.
fontSize	12	The font size in points for the title text.
fontColor	TextColor	The color of the title text.
bgColor	Transparent	The background color of the title box.
edgeColor	Transparent	The border color of the title box.

Return Value
A TextBox object representing the title box. This may be used to fine-tune the appearance of the title box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.8.14 addTitle(alignment as Integer, text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS 5124
- 30.8.15 addTitle(text as string, font as string = """, fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS 5124
- 30.8.16 addTitle(text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS 5125

30.8.14 addTitle(alignment as Integer, text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addTitle method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.13 addTitle(alignment as Integer, text as string, font as string = """, fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS 5123
- 30.8.15 addTitle(text as string, font as string = """, fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS 5124
- 30.8.16 addTitle(text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS 5125

30.8.15 addTitle(text as string, font as string = """, fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a title at the top center of the chart.
Notes: The title is contained within a box, of which the width is the same as the width of the chart, and the height is automatically adjusted to fit the text. The box is initially invisible, but can be made visible by setting the bgColor and edgeColor.

Argument	Default	Description
text	(Mandatory)	The text for the title. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.
font	"""	The font used to draw the title text. The default is "bold". See Font Specification for details on various font attributes.
fontSize	12	The font size in points for the title text.
fontColor	TextColor	The color of the title text.
bgColor	Transparent	The background color of the title box.
edgeColor	Transparent	The border color of the title box.

Return Value
A TextBox object representing the title box. This may be used to fine-tune the appearance of the title box.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.8.13 addTitle(alignment as Integer, text as string, font as string = """, fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS 5123
- 30.8.14 addTitle(alignment as Integer, text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS 5124
- 30.8.16 addTitle(text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS 5125

30.8.16 addTitle(text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addTitle method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.13 addTitle(alignment as Integer, text as string, font as string = """, fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS 5123
- 30.8.14 addTitle(alignment as Integer, text as string, font as string, fontsize as Double, fontColor as color, bgColor as color, edgeColor as color) as CDTextBoxMBS 5124
- 30.8.15 addTitle(text as string, font as string = """, fontsize as Double = 12, fontColor as Integer = &hffff0002, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000) as CDTextBoxMBS 5124

30.8.17 adjustBrightness(ColorValue as color, brightness as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other adjustBrightness method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.18 adjustBrightness(ColorValue as Integer, brightness as Double) as Integer 5126

30.8.18 adjustBrightness(ColorValue as Integer, brightness as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a color that is a darkened or brightened version of the given color.
Notes: A brightness less than 1 means the color is darkened, while a brightness greater than 1 means the color is brightened. For example, a brightness of 0.5 means the color is half as bright as the original color. If the original color is red, the color will become dark red. Conversely, a brightness of 2 means the color is twice as bright as the original color. If the original color is red, the color will become light red.

Arguments:

Argument	Default	Description
c	(Mandatory)	The given color.
brightness	(Mandatory)	A non-negative number represent the factor to darken or brighten the color.

Return Value
A 32-bit integer representing the darkened or brightened color.
See also:

- 30.8.17 adjustBrightness(ColorValue as color, brightness as Double) as Integer 5125

30.8.19 AllPassFilter as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches every element.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 as a "catch all" filter.
Return Value
An integer filter id representing the filter.

30.8.20 ArrowShape(angle as Double = 0.0, widthRatio as Double = 1, stemWidthRatio as Double = 0.5, stemLengthRatio as Double = 0.5) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the shape id that represents an arrow shape.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Argument	Default	Description
angle	0	The clockwise angle of the arrow relative to the upward pointing position.
widthRatio	1	The width of the base of the arrow head as a ratio to the height of the entire arrow. Must be between 0 and 1.
stemWidthRatio	0.5	The width of the arrow stem as a ratio to the width of the base of the arrow head. Must be between 0 and 1.
stemLengthRatio	0.5	The length of the arrow stem as a ratio to the height of the entire arrow. Must be between 0 and 1.

Returns an integer shape id representing the arrow shape.

30.8.21 barLighting(startBrightness as Double = 0.75, endBrightness as Double = 1.5) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A special shading effect for rectangular and polygonal bars on a CDBarLayerMBS.
Notes: It shades all surfaces of a 2D or 3D bar with gradient colors.

For the front surface of a bar, the gradient is from base line of the bar to the end of the bar. For example, for a vertical bar pointing upwards, the gradient is from bottom to the top. Similarly, for a horizontal bar pointing rightwards, the gradient is from left to right.

For a 3D bar, the gradient for the top surface of a vertical bar or the right surface of a horizontal bar is from front to back. The gradients for the side surfaces are the same as for the front surface.

The gradient is specified with two brightness values at the gradient end points. A brightness less than 1 means the color is darkened, while a brightness greater than 1 means the color is brightened. For example, a brightness of 0.5 means the color is half as bright as the original color. If the original color is red, the color will become dark red. Conversely, a brightness of 2 means the color is twice as bright as the original color. If the original color is red, the color will become light red.

The followings are some examples demonstrating this effect.

The barLighting method returns an integer representing this effect. The integer can be used as the second argument to CDLayerMBS.setBorderColor for CDBarLayerMBS objects to apply the effect to bars.

Arguments:

Return Value
An integer representing the bar lighting effect.

Argument	Default	Description
startBrightness	0.75	The brightness at the starting point.
endBrightness	1.5	The brightness at the ending point.

30.8.22 blueMetalGradient as Integer()

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constant array of integers to represent a gradient that looks like a blue metallic color.
Notes: The array is in a format that can be directly used in BaseChart.gradientColor2 and DrawArea.gradientColor2. Its contents (in hex) is:

00 9898E0 60 F0F0FF B0 D8D8F0 100 9898E0
See Color Specification on how colors are represented in ChartDirector.

30.8.23 brushedGoldColor(texture as Integer = 2, angle as Integer = 90) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a brushed golden color, most commonly used as a background color.
Notes: This method is a short cut to the CDBaseChartMBS.brushedMetalColor method, using yellow (FFEE44 in hex) as the base color.

Arguments:

Argument	Default	Description
texture	2	The strength of the brushed texture. Must be 0, 1, 2 or 3 for no texture, light texture, medium texture and strong texture.
angle	90	The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.

Return Value:
A 32-bit integer representing the brushed golden color.

30.8.24 brushedMetalColor(c as Integer, texture as Integer = 2, angle as Integer = 90) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a color by modulates the brightness of another color to create brushed metallic shiny effects.
Notes: The brightness of the color will vary smoothly across the image in a given a direction, so as to produce a shiny effect. The color will then be modulated with a horizontal texture to create the brushed effect. The modulation period will be the same as the size of the image, so this method is best use to create background colors.

Arguments:

Argument	Default	Description
c	(Mandatory)	The color to be modulated.
texture	2	The strength of the brushed texture. Must be 0, 1, 2 or 3 for no texture, light texture, medium texture and strong texture.
angle	90	The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.

Return Value:
A 32-bit integer representing the brushed metallic color.

30.8.25 brushedSilverColor(texture as Integer = 2, angle as Integer = 90) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a brushed silver color, most commonly used as a background color.
Notes: This method is a short cut to the CDBaseChartMBS.brushedMetalColor method, using grey (DDDDDD in hex) as the base color.

Arguments:

Argument	Default	Description
texture	2	The strength of the brushed texture. Must be 0, 1, 2 or 3 for no texture, light texture, medium texture and strong texture.
angle	90	The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.

Return Value
A 32-bit integer representing the brushed silver color.

30.8.26 bSearch(values() as Double, value as Double) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses binary search to search for a value in an array.
Notes: This method returns the array index of the value in the array, which must be sorted in ascending order.

If the value is in between two elements of the array, this method returns a non-integer that interpolates the indexes of the two elements. For example, suppose the array consists of 3 elements [4, 6, 10] . If this method is used to search for the value 7, it will return 1.25.

If the value is smaller or larger than all the elements in the array, this method returns the nearest index, which must be either 0 or the index of the last element of the array.

Argument	Default	Description
a	(Mandatory)	The array to be searched.
v	(Mandatory)	The value to search for.

Returns the index of the value within the array. If the value is in between two elements of the array, this method returns a non-integer that interpolates the indexes of the two elements. If the value is smaller or larger than all the elements in the array, thie method returns the nearest index.

30.8.27 chartTime(t as Integer) as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a UNIX time (seconds elapsed since 01-01-1970 00:00:00 GMT) to the date/time format used by ChartDirector.
Notes: The UNIX time will be converted assuming based on local time zone (the time zone settings of the operating system).

Argument	Default	Description
t	(Mandatory)	A time represented as seconds elapsed since 01-01-1970 00:00:00 GMT.

Return Value
The second elapsed since 01-01-0001 00:00:00 to the given time.

See also:

- 30.8.28 chartTime(year as Integer, month as Integer, day as Integer, hour as Integer = 0, minute as Integer = 0, second as Integer = 0) as Double 5131

30.8.28 chartTime(year as Integer, month as Integer, day as Integer, hour as Integer = 0, minute as Integer = 0, second as Integer = 0) as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain the second elapsed since 01-01-0001 00:00:00 to the given time, which is the date/time format used by ChartDirector.
Notes:

Argument	Default	Description
y	(Mandatory)	The year component of the given time.
m	(Mandatory)	The month component of the given time
d	(Mandatory)	The day of month component of the given time.
h	0	The hour component of the given time.
n	0	The minute component of the given time.
s	0	The second component of the given time.

Return Value
The second elapsed since 01-01-0001 00:00:00 to the given time.
See also:

- 30.8.27 chartTime(t as Integer) as Double 5130

30.8.29 ClearTypeColor(gamma as Double = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a value to represent that standard ClearType or a similar technology be used for font rendering.
Notes: This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.

ClearType is a Microsoft font rendering technology that renders text more accurately with subpixel rendering. Similar technologies include Quartz in Mac OS X, Adobe CoolType and other unnamed algorithms. Although this API uses ClearType in its name, ChartDirector may use ClearType or a similar technology depending on the operating system and programming language.

In most modern flat panel displays, a pixel is consisted of 3 sub-pixels R, G and B for the red, green and blue colors, typically arranged horizontally. So a row of pixels is actually a sequence of subpixels like RGBRGBRGBRGB... To display a white pixel, the display hardware turns on the RGB subpixels.

It happens a white dot can also be made by turning on the GB subpixels of one pixel, and the R subpixel of the next pixel to the right. This will result in 3 consecutive subpixels GBR, which is also white. This white dot will be in between the two pixels, with 2/3 on the left pixel, and 1/3 on the right pixel. In other words, it is possible to position a white dot in between two pixels without blurring it. ClearType uses this effect to render text with subpixel accuracy.

Apart from subpixel rendering, ClearType may adjust the glyph shapes to fit the pixel grid (technically called hinting) differently from classical rendering. As a result, the glyph shapes and sizes in ClearType may be different from classical rendering.

One issue with ClearType is that it is hardware dependent. To work perfectly, it needs to know the subpixels ordering of the display. In many applications, the charts are rendered on one computer, but viewed using another computer. For example, in a web application, the charts can be rendered on the server but displayed on the browser computer. The chart generating computer may not know the subpixel configuration of the viewing computer. If ClearType is used, there is a risk that the text may look suboptimal on the viewing computer.

To address the above issues, ChartDirector supports a hardware independent ClearType method, represented by ClearTypeMono. This is basically ClearType with subpixel rendering disabled. The resulting text has no color distortion. Black and white text will not be as sharp as standard ClearType, but is still better than classical anti-alias. The charts rendered can be viewed equally well with different types of displays. This is especially useful for applications in which the charts are rendered and viewed by different computers.

Argument	Default	Description
gamma	0	Specifies the level of gamma correction used for ClearType font rendering. This is usually a number between 1 to 2.5. A value of 0 means the default gamma level.

30.8.30 ClearTypeMono(gamma as Double = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a value to represent that hardware independent ClearType or a similar technology be used for font rendering.
Notes: This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.

Please refer to ClearTypeColor on the detail explanation of what is standard ClearType and hardware independent ClearType.

Argument	Default	Description
gamma	0	Specifies the level of gamma correction used for ClearType font rendering. This is usually a number between 1 to 2.5. A value of 0 means the default gamma level.

30.8.31 ColorToInteger(c as color, alpha as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a Xojo color object to an integer for ChartDirector.

30.8.32 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.8.33 Cross2Shape(width as Double = 0.5) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the shape id that represents a 'X' shape.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Argument	Default	Description
width	(Mandatory)	The percentage width of the arms of the a 'X' relative to the entire shape. Must be between 0 and 1.

Return Value
An integer shape id representing the a 'X' shape.

30.8.34 CrossShape(width as Double = 0.5) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the shape id that represents a '+' shape.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Argument	Default	Description
width	(Mandatory)	The percentage width of the arms of the a '+' relative to the entire shape. Must be between 0 and 1.

Return Value
An integer shape id representing the a '+' shape.

30.8.35 cylinderEffect(orientation as Integer = 5, ambientIntensity as Double = 0.5, diffuseIntensity as Double = 0.5, specularIntensity as Double = 0.75, shininess as Integer = 8) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A special shading effect that emulates the lighting of a cylinder surface.
Notes: This effect adjusts the brightness of the color of a rectangular box to make it look like cylindrical. The brightness is adjusted as according to the Phong lighting model, in which the light source is from the viewer direction and is far away.

The cylinderEffect method returns an integer representing this effect. The integer can be used as the third argument to CDBoxMBS.setBackground to apply the effect to Box objects (including derived objects such as CDTextBoxMBS objects).

This effect is automatically used for cylindrical bars in a CDBarLayerMBS. You may use this method to adjust the lighting parameters by using its return value as the second argument to CDLayerMBS.setBorderColor.

Arguments:

Argument	Default	Description
orientation	kCenter	The orientation of the cylinder. A value of kTop or kBottom means the cylinder is vertical. A value of kLeft or kRight means the cylinder is horizontal. A value of kCenter means the orientation is automatically determined. For a CDBarLayerMBS, the orientation will be the same as the orientation of the bars. For other objects (eg. CDTextBoxMBS objects), if the object height is bigger than its width, the cylinder will be treated as vertical, otherwise it will be treated as horizontal.
ambientIntensity	0.5	The ambient reflection coefficient of the Phong lighting model.
diffuseIntensity	0.5	The diffuse reflection coefficient of the Phong lighting model.
specularIntensity	0.75	The specular reflection coefficient of the Phong lighting model.
shininess	8	The shininess coefficient of the Phong lighting model.

Return Value
An integer representing the cylinder effect.

30.8.36 dashLineColor(colorvalue as color, patternCode as Integer = &h0505) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other dashLineColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.37 dashLineColor(colorvalue as Integer, patternCode as Integer = &h0505) as Integer 5135

30.8.37 dashLineColor(colorvalue as Integer, patternCode as Integer = &h0505) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constant equals to 0505 (in hex) to represent a dash line pattern for use in dash colors.
Notes: See Color Specification on how colors are represented in ChartDirector.
See also:

- 30.8.36 dashLineColor(colorvalue as color, patternCode as Integer = &h0505) as Integer 5135

30.8.38 defaultPalette as Integer()

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the default palette.

30.8.39 Destructor

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor for the base chart.

30.8.40 enableVectorOutput

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Enables true vector graphics output.
Notes: By default, when creating the output image, ChartDirector draws directly onto an output buffer representing the bitmap of the image. For example, for a chart 800 x 600 pixels in size, the output buffer may represent a 800 x 600 bitmap. The output buffer size is unchanged no matter how many items are drawn onto it. Even if the output contains 1 million elements (eg. 1 million symbols), the size of the output buffer is still the same.

On the other hand, a true vector output is indefinitely scalable and can be considered as having infinite resolution. To produce a true vector output, it is necessary to remember the graphics operations for every element in the output buffer. The output buffer size is therefore proportional to the number of elements to draw.

This method tells ChartDirector that it needs to remember the graphics operations to prepare for true vector output. If true vector output is needed, this method should be called immediately after creating the BaseChart object.

If this method is not called, and a vector graphics output format is used (such as SVG), instead of a true vector output, ChartDirector will output a raster image using the vector graphics format. (Most vector graphics formats support embedded raster images.)

30.8.41 flatBorder(thickness as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies a flat border of a given width.
Example:

```
// set edge to be 2 pixel wide line
Var table As CDMLTableMBS
Var t As CDTextBoxMBS = table.getStyle
Var x As Integer = c.flatBorder(2)
t.setBackground(&heeeeee, CDXYChartMBS.kLineColor, x)
```

Notes: The flatBorder method returns an integer representing this effect. The integer can be used as the third argument to Box.setBackground to apply the effect to Box objects (including derived objects such as TextBox objects). It may also be used as the second argument to Layer.setBorderColor for BarLayer or BoxWhiskerLayer objects to apply the effect to bars or boxes.

Argument	Default	Description
width	(Mandatory)	The border width. A positive value means the border is drawn inside the box or bar. A negative value means the border is outside the box or bar.

Returns an integer representing using flat border of the specified width.

30.8.42 formatValue(value as Double, formatstring as string) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Formats a number/date using the ChartDirector formatting syntax as is in Parameter Substitution and Formatting.
Notes:

Argument	Default	Description
value	(Mandatory)	The value to be formatted.
formatString	(Mandatory)	The format string, using { value } to denote the value. For example, $ { value | 2, } can be used to format the value to 2 decimal points, using "," as the thousand separator, and with a '$ ' sign in front.

30.8.43 getAbsOffsetX as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the x offset of the chart relative to the outermost MultiChart container.
Notes: Returns an integer representing the x offset in pixels relative to the outermost MultiChart container, or 0 if the chart is not within a MultiChart container.

30.8.44 getAbsOffsetY as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the y offset of the chart relative to the outermost MultiChart container.
Notes: Returns an integer representing the y offset in pixels relative to the outermost MultiChart container, or 0 if the chart is not within a MultiChart container.

30.8.45 getChartMetrics as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the chart metrics for passing to CChartViewer to support view ports.
Notes: The format of the chart metrics is not published.
Return Value
A text string representing the chart metrics.

30.8.46 getChartWeekDay(t as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the weekday represented by a ChartDirector date/time.
Notes:

Argument	Default	Description
t	(Mandatory)	A ChartDirector date/time, that is, a number representing seconds elapsed since 01-01-0001 00:00:00.

Return Value
An integer from 0 - 6 representing Sun - Sat.

30.8.47 getChartYMD(t as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the year, month and day represented by a ChartDirector date/time.
Notes:

Argument	Default	Description
t	(Mandatory)	A ChartDirector date/time, that is, a number representing seconds elapsed since 01-01-0001 00:00:00.

Return Value
An integer which when represented in decimal notation is yyyymmdd, where yyyy is the year, mm is the month (1 - 12), and dd is the day (1 - 31).

30.8.48 getColor(index as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the color at the specified position of the palette.
Notes: See Color Specification on how colors are represented in ChartDirector.

Argument	Default	Description
paletteEntry	(Mandatory)	An index to the palette.

Return Value
The requested color.

30.8.49 getCopyright as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the copyright string of the ChartDirector library.
Example:

MessageBox CDBaseChartMBS.getCopyright
// displays "Copyright (c) 2006 Advanced Software Engineering Limited"

30.8.50 getDescription as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the library description.
Example:

MessageBox CDBaseChartMBS.getDescription // displays "ChartDirector"

30.8.51 getDrawArea as CDDrawAreaMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the internal DrawArea object that is used to draw the chart.
Notes: The most common reason of accessing the internal DrawArea object is to add custom drawings (lines, texts, shapes, etc) to the chart.

If the custom drawings are drawn before drawing the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart or BaseChart.makeChart3), the custom drawings will be at the background of the chart.
Return Value
A DrawArea object that can be used to add custom text and shapes to the chart.

30.8.52 getHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the height of the chart.

30.8.53 getHTMLImageMap(url as string, queryFormat as string = """, extraAttr as string = """, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates an HTML image map for the chart.
Notes: This method generates an image map to represent all data points on the chart. It does not include legend box, title box or custom text box. Please use LegendBox.getHTMLImageMap or Box.getImageCoor to produce image maps for these objects.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

This method accepts a URL as its argument. When generating an image map, it appends query parameters to the URL to indicate which data point the user has clicked.

The following is an example image map generated for a bar chart with 3 bars.

<area shape="rect" coords="34,219,63,139" href="myurl.cpp?x=0&xLabel=Mon&dataSet=0&dataSetName=Revenue&value=100">
<area shape="rect" coords="74,219,103,119" href="myurl.cpp?x=1&xLabel=Tue&dataSet=0&dataSetName=Revenue&value=125">
<area shape="rect" coords="114,219,143,22" href="myurl.cpp?x=2&xLabel=Wed&dataSet=0&dataSetName=Revenue&value=245.78">

The image map consists of multiple <area>tags, one for each bar in the chart. In the "href" attributes, query parameters are appended to the URL to provide information on the bar clicked.

The image map produces by ChartDirector does not include the <map>and </map>tag. This is intentional so that you can add additional custom <area>tags to the image map, or append multiple image maps together.

The type of query parameters to append to the URL depends on the chart type and layer type. The default query parameters are as follows.

Chart/Layer TypeDefault Query Format

The texts in curly brackets (e.g. { sector } , { dataSet } , etc.) will be replaced by the actual values when generating the image map. For example, { sector } will be replaced by the sector number of the sector.

ChartDirector allows developers to modify the query parameters by using the queryFormat argument. For

Pie chart	sector= { sector } &label= { label } &value= { value } &percent= { percent }
Bar, Line, Spline, Step Line, Area and Scatter layers	x= { x } &xLabel= { xLabel } &dataSet= { dataSet } &dataSetName= { dataSetName } &value= { value }
Percentage Bar and Percentage Area layers	x= { x } &xLabel= { xLabel } &dataSet= { dataSet } &dataSetName= { dataSetName } &value= { value } &percent= { percent }
HLOC and CandleStick layers	x= { x } &xLabel= { xLabel } &high= { high } &low= { low } &open= { open } &close= { close }
Box-Whisker layer	x= { x } &xLabel= { xLabel } &top= { top } &bottom= { bottom } &max= { max } &min= { min } &med= { med }
Trend layer	dataSetName= { dataSetName }
Vector layer and Polar Vector layer	x= { x } &xLabel= { xLabel } &dataSetName= { dataSetName } &value= { value } &dir= { dir } &len= { len }
Polar Line, Area, Spline Line and Spline Area layers	"x= { x } &label= { label } &name= { name } &value= { value } "

example, if "x= { x } &v= { value } " is used as the queryFormat for a XYChart, only the x position and the value of the data point will be included in query parameters.

Please refer to Parameter Substitution and Formatting on all available parameters and their meanings.

In addition to customizing the query parameters, ChartDirector supports additional HTML attributes in the <area>tags by using the extraAttr argument.

For example, the following extraAttr will add an "title" HTML attribute to every <area>tag. The attribute which will contain the x-axis label and the value of the data point. The "title" attribute will be displayed as "tool tip" when the mouse moves over the image map.

title=' { xlabel } : { value } '
Another common usage of the extraAttr argument is to add "onmouseover" and "onmouseout" HTML attributes to handle user interaction using Javascript on the browser.

Argument	Default	Description
url	(Mandatory)	The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.
queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default.

Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.

Return Value

extraAttr	""	A text string to specify additional attributes to add to the <area>tag. Parameter Substitution and Formatting is supported.
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

A text string containing the image map generated.

30.8.54 getLegend as CDLegendBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the LegendBox object representing the legend box in the chart.
Notes: The LegendBox obtains using this method is not fixed. This allows you to add more keys to the legend box, and change the legend box fonts, etc. However, this also means that the legend box size (Box.getWidth and Box.getHeight) is undefined.

To obtain the width and height of the legend box, use BaseChart.layoutLegend.
Return Value
The LegendBox object representing the legend box in the chart.

30.8.55 GetPath(path as folderitem) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a path string for a folderitem.
Notes: Returns the path in the UTF8 format as ChartDirector needs them.

30.8.56 getVersion as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets ChartDirector version information.
Example:

```
Var v as Integer = CDBaseChartMBS.getVersion

Var v1 as Integer = Bitwise.BitAnd( Bitwise.ShiftRight(v, 24), 255)
```

```
Var v2 as Integer = Bitwise.BitAnd( Bitwise.ShiftRight(v, 16), 255)
Var v3 as Integer = Bitwise.BitAnd( v, 65535)

MessageBox str(v1)+"."+str(V2)+"."+str(V3)
```

Notes: The version number is encoded as a 32-bit integer. The most significant 8 bits is the major version number. The next 8 bits are the minor version number. The least significant 16 bits are the build number.
Return Value
The version information encoded in a 32-bit integer.

30.8.57 getWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the width of the chart.

30.8.58 glassEffect(glareSize as Integer = 3, glareDirection as Integer = 8, raisedEffect as Integer = 5) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A complex shading effect that emulates tinted glass or semi-transparent plastic material.
Notes: This effect involves glare and variation of lighting caused by reflection and refraction inside the material. It is best explained by viewing the examples.

ExampleLocation of lighting effect

Error Line Chart	The title is shaded using glass effect, with NormalGlare, lighting from Top, and raised effect of 5 pixels.
Donut Chart	Both the title and the sector labels are shaded using glass effect with ReducedGlare, lighting from Top, and raised effect of 5 pixels.
Glass Multi-Bar Chart	The bars are shaded using glass effect, with NormalGlare, lighting from Left, and raised effect of 5 pixels.

Currently, this effect only works well for long, thin objects, such as title bars, text boxes and bars in bar charts.

The glassEffect method returns an integer representing this effect. The integer can be used as the third argument to Box.setBackground to apply the effect it objects derived from Box (such as labels and titles represented by TextBox). It may also be used as the second argument to Layer.setBorderColor for BarLayer objects to apply the effect to bars.

Argument	Default	Description
glareSize	NormalGlare	The amount of glare. Must be one of the predefined constants NormalGlare, ReducedGlare or NoGlare. With NormalGlare and ReducedGlare, the glare will cover around 50% and 35% of the object. If NoGlare is used, there will be no glare and the effect will not look like glass at all, but is equivalent to the CDBaseChartMBS.softLighting effect.

Usually, NormalGlare is best for thin objects with lightly colored background, while ReducedGlare is best for dark background objects or not-so-thin objects (eg. text boxes using white text on a dark background, or with more than 1 line of text).

glareDirection	Top	The direction of the glare, which must be one of the predefined constants Top, Right, Bottom, Left.
raisedEffect	5	With glass shading effect, the object will appear to have some 3D depth. The raisedEffect argument controls the amount of 3D depth in pixels.

Return Value
An integer representing the glass effect.

30.8.59 goldColor(angle as Integer = 90) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a golden color, most commonly used as a background color.
Notes: This method is a short cut to the CDBaseChartMBS.metalColor method, using yellow (FFEE44 in hex) as the base color.

Argument	Default	Description
angle	90	The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.

Return Value
A 32-bit integer representing the golden color.

30.8.60 goldGradient as Integer()

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constant array of integers to represent a gradient that looks like a golden color.
Notes: The array is in a format that can be directly used in BaseChart.gradientColor and DrawArea.gradientColor. Its contents (in hex) is:

00 FFE743 60 FFFFE0 B0 FFF0B0 100 FFE743
See Color Specification on how colors are represented in ChartDirector.

30.8.61 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other gradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.62 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5145
- 30.8.63 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer 5146
- 30.8.64 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer 5146

30.8.62 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a multi-point linear gradient color.
Notes: This method is for backward compatibility. Use BaseChart.linearGradientColor2 instead.

Return Value
A 32-bit integer representing the linear gradient color.
See also:

- 30.8.61 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5145
- 30.8.63 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer 5146
- 30.8.64 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer 5146

Argument	Default	Description
colorArray	(Mandatory)	An array defining the positions and colors of the pixels along the reference gradient line segment.
angle	90	The direction of the reference gradient line segment in degrees, measured clockwise, with 0 degree as the upward pointing direction. The default direction is horizontal from left to right (90 degrees).
scale	1.0	The scaling factor for the reference gradient line segment. By default, the reference gradient line segment is 256 pixels in length. The scaling factor can be use to stretch or compress the gradient line segment.
startX	0	The x coordinate of the starting point of the reference gradient line segment.
startY	0	The y coordinate of the starting point of the reference gradient line segment.

30.8.63 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other gradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.61 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5145
- 30.8.62 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5145
- 30.8.64 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer 5146

30.8.64 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a two-point linear gradient color.
Notes: This method is for backward compatibility. Use BaseChart.linearGradientColor instead.

Return Value
A 32-bit integer representing the linear gradient color.
See also:

- 30.8.61 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5145
- 30.8.62 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5145

Argument	Default	Description
startX	(Mandatory)	The x coordinate of the starting point of the reference gradient line segment.
startY	(Mandatory)	The y coordinate of the starting point of the reference gradient line segment.
endX	(Mandatory)	The x coordinate of the ending point of the reference gradient line segment.
endY	(Mandatory)	The y coordinate of the ending point of the reference gradient line segment.
startColor	(Mandatory)	The color at the starting point of the reference gradient line segment.
endColor	(Mandatory)	The color at the ending point of the reference gradient line segment.

- 30.8.63 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer 5146

30.8.65 greenMetalGradient as Integer()

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constant array of integers to represent a gradient that looks like a green metallic color.
Notes: The array is in a format that can be directly used in BaseChart.gradientColor2 and DrawArea.gradientColor2. Its contents (in hex) is:

00 98E098 60 F0FFF0 B0 D8F0D8 100 98E098
See Color Specification on how colors are represented in ChartDirector.

30.8.66 halfColor(c as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a color that is half the intensity of the given color.
Notes:

Argument	Default	Description
c	(Mandatory)	The given color.

Return Value
A 32-bit integer representing the half intensity color.

30.8.67 initDynamicLayer as CDDrawAreaMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes a dynamic layer for drawing text and shapes.
Notes: This method clears the existing dynamic layer, or creates a new one if there is no existing dynamic

layer. This method returned a DrawArea object that can be used to draw on the dynamic layer. The dynamic layer can later be removed using BaseChart.removeDynamicLayer.

The design of the dynamic layer is for drawing small, rapidly updatable contents for desktop applications. For example, the dynamic layer can be used to implement a cross-hair mouse cursor, with text showing the location of the mouse cursor. To do this, in the mouse move event handler, BaseChart.initDynamicLayer can be used to create or clear the dynamic layer. The returned DrawArea object can then be used to draw the cross hair cursor (as two straight lines) and the text. When the mouse cursor leaves the chart, BaseChart.removeDynamicLayer can be used in the mouse out event handler to remove the cross-hair cursor and the text.

Note that as long as the dynamic layer is not removed with BaseChart.removeDynamicLayer, only the returned DrawArea object should be used to draw things on the dynamic layer. No other objects should be used to draw on the chart.

Returns a DrawArea object that can be used to add text and shapes to the dynamic layer.

30.8.68 kDataBound as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to -1.7E-100 to represent that the interpolated z values should not exceed the minimum or maximum values of the original data.
This constant is used in ContourLayer.setZBounds.

30.8.69 kLinearTick as Double

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to +1.5E+308 to represent that the ticks in a log scale axis should be 1 - 2 - 3 - 4 - 5 - 6 - 7 - 8 - 9 - 10 style increments.

30.8.70 kLogTick as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to +1.6e308 to represent that the ticks in a log scale axis should be 1 - 2 - 5 - 10 style increments.

This constant is used in Axis.setLogScale.

30.8.71 kMicroTickOnly as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to -1.6e308 to represent that the label position should contain a micro tick only.
This constant is used in Axis.setLabels and BaseMeter.setScale.

30.8.72 kMinorTickOnly as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to -1.7e308 to represent that the label position should contain a minor tick only.
This constant is used in Axis.setLabels.

30.8.73 kNoValue as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to 1.7E+308 to represent missing values in ChartDirector.
Please refer to No Value Specification for more details.

30.8.74 kTickInc as Double

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to +1E+200 to represent the distance between major ticks.
This constant is used in CDAxisMBS.setLogScale.

30.8.75 kTouchBar as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: One of the special constants.
Notes: A constant equals to -1.7e-100 to represent that the bars in a bar layer should touch each others

with no gap in between.
This constant is used in BarLayer.setBarGap.

30.8.76 layout

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform auto-scaling of the axis and compute the positions of the various objects in the chart.
Notes: BaseChart.layout is automatically called when drawing the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart or BaseChart.makeChart3). There is usually no need to call BaseChart.layout explicitly.

However, if you would like to add custom objects to the chart whose positions depend on the axis scales or position of other objects, you may need to call BaseChart.layout explicit to auto-scaling the axis. An example is to draw a custom label at the maximum value point of a data line.

30.8.77 layoutLegend as CDLegendBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Lays out and gets the LegendBox object representing the legend box in the chart.
Notes: Once the legend box has been laid out, the width and height is known and can be obtained using Box.getWidth and Box.getHeight. However, you may not perform actions that may affect the legend box sizes, such as changing the fonts or adding more data. You may still move the legend box around by using Box.setPos.

The most common use of this method is to position the legend box based on its actual size.
Return Value
The LegendBox object representing the legend box in the chart.

30.8.78 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other linearGradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.79 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer

- 30.8.80 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5152
- 30.8.81 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5152

30.8.79 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a multi-point linear gradient color.
Notes: In this method, the color points are defined as an array of positions and colors along a reference line segment, in the following format:

position0, color0, position1, color1, ... positionN, colorN
The positions are specified as a number from 0 - 256 (0 - 100 in hex), in which 0 represents the starting point of the reference line segment, and 256 (100 in hex) represents the ending point of the reference line segment.

For example, the array (in hex):

000000, FF0000, 000080, FFFF00, 000100, 00FF00
means the starting point (000000) is red (FF0000), the mid-point (000080 in hex) is yellow (FFFF00), and the ending point (000100 in hex) is green (00FF00).

One common usage of multi-point gradient colors is to define colors that have metallic look and feel. ChartDirector comes from several predefined gradient color arrays as follows.

NameValue (in Hex)

goldGradient	000000, FFE743, 000060, FFFFE0, 0000B0, FFF0B0, 000100, FFE743
silverGradient	000000, C8C8C8, 000060, F8F8F8, 0000B0, E0E0E0, 000100, C8C8C8
redMetalGradient	000000, E09898, 000060, FFF0F0, 0000B0, F0D8D8, 000100, E09898
greenMetalGradient	000000, 98E098, 000060, F0FFF0, 0000B0, D8F0D8, 000100, 98E098
blueMetalGradient	000000, 9898E0, 000060, F0F0FF, 0000B0, D8D8F0, 000100, 9898E0

Return Value
A 32-bit integer representing the linear gradient color.
See also:

- 30.8.78 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer 5150

Argument	Default	Description
startX	(Mandatory)	The x coordinate of the starting point of the reference gradient line segment.
startY	(Mandatory)	The y coordinate of the starting point of the reference gradient line segment.
endX	(Mandatory)	The x coordinate of the ending point of the reference gradient line segment.
endY	(Mandatory)	The y coordinate of the ending point of the reference gradient line segment.
colorArray	(Mandatory)	An array defining the positions and colors of the pixels along the reference gradient line segment.
periodic	false	Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie beyond the end points of the gradient line segment will assume the colors of the end points.

- 30.8.80 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5152
- 30.8.81 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5152

30.8.80 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other linearGradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.78 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer 5150
- 30.8.79 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer 5151
- 30.8.81 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5152

30.8.81 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a two-point linear gradient color.
Notes:

Argument	Default	Description
startX	(Mandatory)	The x coordinate of the starting point of the reference gradient line segment.
startY	(Mandatory)	The y coordinate of the starting point of the reference gradient line segment.
endX	(Mandatory)	The x coordinate of the ending point of the reference gradient line segment.
endY	(Mandatory)	The y coordinate of the ending point of the reference gradient line segment.
startColor	(Mandatory)	The color at the starting point of the reference gradient line segment.
endColor	(Mandatory)	The color at the ending point of the reference gradient line segment.
periodic	false	Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie beyond the end points of the gradient line segment will assume the colors of the end points.

Return Value
A 32-bit integer representing the linear gradient color.
See also:

- 30.8.78 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer 5150
- 30.8.79 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer 5151
- 30.8.80 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5152

30.8.82 makeChart as CDDrawAreaMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates the chart in internal format and return a DrawArea object to allow adding custom drawings on top of the chart.
Notes: If you want to add custom drawings at the background of the chart, use the BaseChart.getDrawArea method to obtain the DrawArea instead.

After finish adding custom drawings, the resulting chart can then be output using other chart output methods.
Return Value
A DrawArea object that can be used to add custom text and shapes to the chart.
See also:

- 30.8.83 makeChart(format as Integer) as string 5153
- 30.8.84 makeChart(path as folderitem) as boolean 5154

30.8.83 makeChart(format as Integer) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates the chart as an image in memory.
Notes: This method is most often used to output the chart directly to an HTTP stream.

ChartDirector supports PNG, JPG, GIF, WBMP and BMP formats, denoted by the following predefined constants:

Constant	Value	Description
kPNG	0	The PNG format.
kGIF	1	The GIF format.
kJPG	2	The JPEG format.
kWMP	3	The WAP bitmap format.
kBMP	4	The BMP format.
kSVG	5	Normal SVG.
kSVGZ	6	Compressed SVG
kPDF	7	PDF format

For vector output (SVG), please call enableVectorOutput early.

Argument	Default	Description
format	(Mandatory)	A constant representing the format of the image.

Return Value
A memory block containing the binary image of the chart in the requested format.
See also:

- 30.8.82 makeChart as CDDrawAreaMBS 5153
- 30.8.84 makeChart(path as folderitem) as boolean 5154

30.8.84 makeChart(path as folderitem) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates the chart image and save it into a file.
Notes: ChartDirector supports PNG, JPG, GIF, WBMP, SVG, PDF and BMP. The format used are selected based on file extension, which should be png, jpg, jpeg, gif, wbmp, wmp, pdf, svg or bmp.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.
See also:

Argument	Default	Description
filename	(Mandatory)	The name of the file to save the image.

- 30.8.82 makeChart as CDDrawAreaMBS 5153
- 30.8.83 makeChart(format as Integer) as string 5153

30.8.85 makeChartPicture as picture

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates the chart as a picture.
Notes: Returns nil on any error.

30.8.86 metalColor(c as Integer, angle as Integer = 90) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a color by modulates the brightness of another color to create metallic shiny effects.
Notes: The brightness of the color will vary smoothly across the image in a given a direction, so as to produce a shiny effect. The modulation period will be the same as the size of the image, so this method is best use to create background colors.

Argument	Default	Description
c	(Mandatory)	The color to be modulated.
angle	90	The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.

Return Value
A 32-bit integer representing the metallic color.

30.8.87 NonePassFilter as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches no element.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 as a "deny all" filter.
Return Value
An integer filter id representing the filter.

30.8.88 patternColor(colorvalues() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other patternColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.89 patternColor(colorvalues() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5156
- 30.8.90 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer 5157
- 30.8.91 patternColor(path as string, startX as integer = 0, startY as integer = 0) as integer 5157
- 30.8.92 patternColor(pic as picture, startX as Integer = 0, startY as Integer = 0) as Integer 5158

30.8.89 patternColor(colorvalues() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a pattern color using an array of colors as the bitmap pattern.
Notes: A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

Argument	Default	Description
colorArray	(Mandatory)	An array of colors representing the colors of the bitmap pixels. The color of the pixel at (x, y) should correspond to index (x + y * width - 1) of the array.
height	(Mandatory)	The height of the bitmap in pixels. (The width is automatically computed as the size of the color array divided by the height.)
startX	0	The x coordinate of a reference point to align with the top-left corner the pattern.
startY	0	The y coordinate of a reference point to align with the top-left corner the pattern.

Return Value
A 32-bit integer representing the pattern color.
See also:

- 30.8.88 patternColor(colorvalues() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5156
- 30.8.90 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer 5157
- 30.8.91 patternColor(path as string, startX as integer = 0, startY as integer = 0) as integer 5157
- 30.8.92 patternColor(pic as picture, startX as Integer = 0, startY as Integer = 0) as Integer 5158

30.8.90 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a pattern color by loading the pattern from an image file.
Notes: A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
filename	(Mandatory)	An image file providing the pattern.
startX	0	The x coordinate of a reference point to align with the top-left corner the pattern.
startY	0	The y coordinate of a reference point to align with the top-left corner the pattern.

Return Value
A 32-bit integer representing the pattern color.
See also:

- 30.8.88 patternColor(colorvalues() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5156
- 30.8.89 patternColor(colorvalues() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5156
- 30.8.91 patternColor(path as string, startX as integer = 0, startY as integer = 0) as integer 5157
- 30.8.92 patternColor(pic as picture, startX as Integer = 0, startY as Integer = 0) as Integer 5158

30.8.91 patternColor(path as string, startX as integer = 0, startY as integer = 0) as integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates pattern color with named item.
See also:

- 30.8.88 patternColor(colorvalues() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5156

- 30.8.89 patternColor(colorvalues() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5156
- 30.8.90 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer 5157
- 30.8.92 patternColor(pic as picture, startX as Integer = 0, startY as Integer = 0) as Integer 5158

30.8.92 patternColor(pic as picture, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a pattern color using a picture.
Notes: A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

Argument	Default	Description
pic	(Mandatory)	A picture. The color of the pixel at (x, y) should correspond to index (x + y * width - 1) of the array.
startX	0	The x coordinate of a reference point to align with the top-left corner the pattern.
startY	0	The y coordinate of a reference point to align with the top-left corner the pattern.

Return Value
A 32-bit integer representing the pattern color.
See also:

- 30.8.88 patternColor(colorvalues() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5156
- 30.8.89 patternColor(colorvalues() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5156
- 30.8.90 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer 5157
- 30.8.91 patternColor(path as string, startX as integer = 0, startY as integer = 0) as integer 5157

30.8.93 phongLighting(ambientIntensity as Double = 0.5, diffuseIntensity as Double = 0.5, specularIntensity as Double = 0.75, shininess as Integer = 8) as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the parameters for the phong lighting effect.
Notes: The return value of this method can be used as the second argument to Layer.setBorderColor to

configure phong lighting effect for the layer.

Argument	Default	Description
ambientIntensity	0.5	The ambient reflection coefficient of the Phong lighting model.
diffuseIntensity	0.5	The diffuse reflection coefficient of the Phong lighting model.
specularIntensity	0.75	The specular reflection coefficient of the Phong lighting model.
shininess	8	The shininess coefficient of the Phong lighting model.

30.8.94 Polygon2Shape(slide as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the shape id that represents a polygon in an alternative orientation.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Argument	Default	Description
side	(Mandatory)	The number of sides the polygon has.

Return Value
An integer shape id representing the polygon in an alternative orientation.

30.8.95 PolygonShape(slide as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the shape id that represents a polygon.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Argument	Default	Description
side	(Mandatory)	The number of sides the polygon has.

Return Value
An integer shape id representing the polygon.

30.8.96 PolynomialRegression(n as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the degree of the polynomial regression to be used in a trend layer.
Notes: This method is used to specify the polynomial regression type in CDTrendLayerMBS.setRegressionType.

Arguments:

Argument	Default	Description
n	(Mandatory)	The degree of the polynomial.

Return Value
An integer representing a polynomial regression of degree n to be used as an argument to CDTrendLayerMBS.setRegressionType.

30.8.97 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, data() as Integer, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a multi-point radial gradient color.
Notes: In this method, the color points are defined as an array of radial distances and colors, in the following format:

distance0, color0, distance1, color1, ... distanceN, colorN
The distances are specified as a number from 0 - 256 (0 - 100 in hex), in which 0 represents the center of the gradient defining ellipse, and 256 (100 in hex) represents the perimeter of the gradient defining ellipse.

For example, the array (in hex):

000000, FF0000, 000080, FFFF00, 000100, 00FF00
means the center (000000) is red (FF0000), the mid-point (000080 in hex) is yellow (FFFF00), and the perimeter (000100 in hex) is green (00FF00).

Return Value
A 32-bit integer representing the radial gradient color.
See also:

- 30.8.98 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5161
- 30.8.99 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5161

Argument	Default	Description
cx	(Mandatory)	The x coordinate of the center of the radial gradient.
cy	(Mandatory)	The y coordinate of the center of the radial gradient.
rx	(Mandatory)	The horizontal radius of the radial gradient defining ellipse.
ry	(Mandatory)	The vertical radius of the radial gradient defining ellipse.
colorArray	(Mandatory)	An array defining the radial distances and colors.
periodic	false	Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie outside the gradient defining ellipse will assume the color at the perimeter of the gradient defining ellipse.

30.8.98 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other radialGradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.97 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, data() as Integer, periodic as boolean=false) as Integer 5160
- 30.8.99 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5161

30.8.99 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a two-point radial gradient color.
Notes:

Argument	Default	Description
cx	(Mandatory)	The x coordinate of the center of the radial gradient.
cy	(Mandatory)	The y coordinate of the center of the radial gradient.
rx	(Mandatory)	The horizontal radius of the radial gradient defining ellipse.
ry	(Mandatory)	The vertical radius of the radial gradient defining ellipse.
startColor	(Mandatory)	The color at the center of the gradient defining ellipse.
endColor	(Mandatory)	The color at the perimeter of the gradient defining ellipse.
periodic	false	Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie outside the gradient defining ellipse will assume the color at the perimeter of the gradient defining ellipse.

Return Value
A 32-bit integer representing the radial gradient color.
See also:

- 30.8.97 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, data() as Integer, periodic as boolean=false) as Integer 5160
- 30.8.98 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5161

30.8.100 redMetalGradient as Integer()

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constant array of integers to represent a gradient that looks like a red metallic color.
Notes: The array is in a format that can be directly used in BaseChart.gradientColor and DrawArea.gradientColor. Its contents (in hex) is:

00 E09898 60 FFF0F0 B0 F0D8D8 100 E09898
See Color Specification on how colors are represented in ChartDirector.

30.8.101 RegularSpacingFilter(labelStep as Integer = 1, initialMargin as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches 1 out of every N elements.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific elements for formatting as axis labels.

Argument	Default	Description
labelStep	1	Picks 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements will be selected.
initialMargin	0	Adds an offset when determining the elements to be selected. For example, if the labelStep is 3, the selected indexes should be 0, 3, 6, 9, ... If initialMargin is set to 1, the indexes becomes 1, 4, 7, 10, ...

Return Value
An integer filter id representing the filter.

30.8.102 removeDynamicLayer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the dynamic layer if any.

30.8.103 RGB(r as Integer, g as Integer, b as Integer, a as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a RGB color.

30.8.104 SelectItemFilter(item as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches the specified item.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select a specific element for special formatting.

Argument	Default	Description
item	(Mandatory)	The index of the specified item.

Return Value
An integer filter id representing the filter.

30.8.105 setAMPM(am as string, pm as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the names to be used to denote morning and afternoon.
Notes: The default is to use "am" and "pm".

Argument	Default	Description
am	(Mandatory)	The name used to denote morning.
pm	(Mandatory)	The name used to denote afternoon.

30.8.106 setAntiAlias(shapeAntiAlias as Boolean, textAntiAlias as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Controls whether anti-alias is used when drawing lines, shapes and text.
Notes: For anti-aliasing text, ChartDirector supports the following modes.

ConstantValueDescription

NoAntiAlias	0	Disable anti-alias when drawing text
AntiAlias	1	Always use anti-alias when drawing text
AutoAntiAlias	2	Automatically determine if anti-alias should be used for the text. This is the default.

Currently, ChartDirector will anti-alias only large or bold fonts. For small fonts, assuming it is of high quality, anti-alias is unnecessary. It is because high quality fonts are normally designed to be sharp and clear at low resolution. Anti-aliasing will blur the fonts and make them look worse.

However, for complicated fonts (e.g. some fonts with oriental characters), or for lower quality fonts (e.g. some freeware fonts), anti-alias may be necessary. In this case, it may be needed to force anti-aliasing of all fonts using AntiAlias mode.

Argument	Default	Description
shapeAntiAlias	true	A true value enables anti-alias when drawing lines and shapes. A false value disables anti-alias when drawing lines and shapes
textAntiAlias	AutoAntiAlias	The text anti-alias mode, which must be one of AutoAntiAlias, AntiAlias or NoAntiAlias.

30.8.107 setBackground(colorvalue as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setBackground method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.108 setBackground(colorvalue as Integer, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0) 5165

30.8.108 setBackground(colorvalue as Integer, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the background color, border color and 3D border effect of the chart.
Notes:

See also:

Argument	Default	Description
color	(Mandatory)	The background color of the chart.
edgeColor	Transparent	The border color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

- 30.8.107 setBackground(colorvalue as color, edgeColor as color, raisedEffect as Integer = 0) 5165

30.8.109 setBgImage(img as string, align as Integer = 5)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses the image from the specified file as the background image of the chart.
Notes: ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
img	(Mandatory)	The image file that is used as the background image of the chart.
align	Center	The alignment of the background image relative to the chart. See Alignment Specification for supported alignment types.

30.8.110 setBorder(colorvalue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setBorder method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.111 setBorder(colorvalue as Integer) 5166

30.8.111 setBorder(colorvalue as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deprecated. Use SetBackground instead.
See also:

- 30.8.110 setBorder(colorvalue as color) 5166

30.8.112 setColor(paletteEntry as Integer, colorvalue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.113 setColor(paletteEntry as Integer, colorvalue as Integer) 5167

30.8.113 setColor(paletteEntry as Integer, colorvalue as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Change the color at the specified position in the palette.
Notes: See Color Specification on how colors are represented in ChartDirector.

Argument	Default	Description
paletteEntry	(Mandatory)	An index to the palette.
color	(Mandatory)	The color to change to.

See also:

- 30.8.112 setColor(paletteEntry as Integer, colorvalue as color) 5167

30.8.114 setColors(numbers() as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setColors method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.115 setColors(numbers() as Integer) 5167
- 30.8.116 setColors(paletteEntry as Integer, numbers() as color) 5168
- 30.8.117 setColors(paletteEntry as Integer, numbers() as Integer) 5168

30.8.115 setColors(numbers() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Change the colors in the palette.
Notes: See Color Specification on how colors are represented in ChartDirector.

Argument	Default	Description
colors	(Mandatory)	An array of colors to change to.

See also:

- 30.8.114 setColors(numbers() as color) 5167
- 30.8.116 setColors(paletteEntry as Integer, numbers() as color) 5168
- 30.8.117 setColors(paletteEntry as Integer, numbers() as Integer) 5168

30.8.116 setColors(paletteEntry as Integer, numbers() as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setColors method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.114 setColors(numbers() as color) 5167
- 30.8.115 setColors(numbers() as Integer) 5167
- 30.8.117 setColors(paletteEntry as Integer, numbers() as Integer) 5168

30.8.117 setColors(paletteEntry as Integer, numbers() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Change the colors in the palette, starting from the specified position in the palette.
Notes: See Color Specification on how colors are represented in ChartDirector.

Argument	Default	Description
paletteEntry	(Mandatory)	An index to the palette to start changing the colors.
colors	(Mandatory)	An array of colors to change to.

See also:

- 30.8.114 setColors(numbers() as color) 5167
- 30.8.115 setColors(numbers() as Integer) 5167
- 30.8.116 setColors(paletteEntry as Integer, numbers() as color) 5168

30.8.118 setDefaultColors(paletteEntry as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the default colors.

30.8.119 setDefaultFonts(normal as string, bold as string, italic as string, boldItalic as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the defaults for normal, bold, italic and bold-italic fonts.
Example:

```
Var Chart as CDBaseChartMBS // your chart

#If TargetARM And TargetLinux Then
// use specific fonts on Linux on Raspberry Pi
Call Chart.setDefaultFonts("/usr/share/fonts/truetype/piboto/PibotoLt-Regular.ttf","/usr/share/fonts/truetype/piboto/Pi
#EndIf
```

Notes: See Font Specification for details on various font attributes.

Argument	Default	Description
normal	(Mandatory)	The default normal font. This is the same as the first font in the font table.
bold	""	The default bold font. This is the same as the second font in the font table. An empty string means the default is unchanged.
italic	""	The default italic font. This is the same as the third font in the font table. An empty string means the default is unchanged.
boldItalic	""	The default bold-italic font. This is the same as the fourth font in the font table. An empty string means the default is unchanged.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

30.8.120 setDropShadow(ColorValue as color, OffsetX as Integer = 5, OffsetY as Integer = &h7ffffff, blurRadius as Integer = 5)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setDropShadow method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.121 setDropShadow(ColorValue as Integer = &hAAAAAA, OffsetX as Integer = 5, OffsetY as Integer = &h7fffffff, blurRadius as Integer = 5) 5170

30.8.121 setDropShadow(ColorValue as Integer = &hAAAAAA, OffsetX as Integer = 5, OffsetY as Integer = &h7fffffff, blurRadius as Integer = 5)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a drop shadow to the chart.
Notes: The drop shadow effect is created using a single color representation of the non-transparent part of the chart, offsetted by an amount, and put under the chart. The drop shadow can be blurred to create a soft drop shadow effect.

Note that adding a drop shadow will increase the width and height of the chart image so as to accommodate the drop shadow.

Because the drop shadow is located exterior to the original chart, it uses an exterior background color different from the background color of the original chart. The exterior background color is by default white, and can be configured with CDBaseChartMBS.setRoundedFrame.

Arguments:

Argument	Default	Description
color	AAAAAA	The color of the drop shadow.
offsetX	5	The x offset of the drop shadow.
offsetY	7fffffff	The y offset of the drop shadow. 7fffffff means it is the same as the x offset.
blurRadius	5	The blur radius of the drop shadow.

See also:

- 30.8.120 setDropShadow(ColorValue as color, OffsetX as Integer = 5, OffsetY as Integer = &h7fffffff, blurRadius as Integer = 5) 5169

30.8.122 SetFontSearchPath(path as folderitem)

MBS ChartDirector Plugin, Plugin Version: 14.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font search path.
Example:

```
Var FontFolder as folderitem = SpecialFolder.Desktop.Child("fonts")
CDBaseChartMBS.SetFontSearchPath FontFolder
```

Notes: This method can be used to configure the font search path. You may set your own font search path, or add additional search path before or after the default search path. The usage us like:

CDBaseChartMBS.setFontSearchPath("myPath1;myPath2;%PATH%;myPath3;myPath4");

In the above %PATH% (case sensitive) represents the default search path. This method must be called before the ChartDirector font system is used. It is suggested it be called before any ChartDirector methods. Once ChartDirector tries to look for the fonts (eg. to get font metrics so as to layout a chart), the search path cannot be changed without restarting the process.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.
See also:

- 30.8.123 SetFontSearchPath(path as string) 5171

30.8.123 SetFontSearchPath(path as string)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font search path.
Example:

```
if TargetLinux then
CDBaseChartMBS.SetFontSearchPath "/usr/share/fonts/truetype;/usr/share/fonts/truetype/msttcorefonts"
else
// on Mac and Windows we use system fonts.
end if
```

Notes: This method can be used to configure the font search path. You may set your own font search path, or add additional search path before or after the default search path. The usage us like:

CDBaseChartMBS.setFontSearchPath("myPath1;myPath2;%PATH%;myPath3;myPath4");

In the above %PATH% (case sensitive) represents the default search path. This method must be called before the ChartDirector font system is used. It is suggested it be called before any ChartDirector methods. Once ChartDirector tries to look for the fonts (eg. to get font metrics so as to layout a chart), the search path cannot be changed without restarting the process.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.
See also:

- 30.8.122 SetFontSearchPath(path as folderitem) 5170

30.8.124 setFontTable(index as Integer, font as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an entry in the font table to the specified font name.
Notes: The first 4 fonts in the font table have special significance. They are the defaults for normal, bold, italic and bold-italic fonts.

See Font Specification for details on various font attributes.

Argument	Default	Description
index	(Mandatory)	An index to the font table, starting from 0.
font	(Mandatory)	The font name to be put into the font table.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

30.8.125 setLicenseCode(n as string, enddate as Integer, v1 as Integer, v2 as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Registeres the chartdirector plugin and library.

30.8.126 setMonthNames(names() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the names of the months for date/time formatting purposes.
Notes: The default is to use the first 3 characters of the English month names (Jan, Feb, Mar ...).

Argument	Default	Description
names	(Mandatory)	An array of 12 text strings to be used as the month names.

30.8.127 setNumberFormat(thousandSeparator as string = " textasciitilde ", decimalPointChar as string = ".", signChar as string = "-")

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the characters used for thousand separator, decimal point, and negative sign.
Notes:

Argument	Default	Description
thousandSeparator	'	
textasciitilde '	The thousand separator. Use '	
textasciitilde ' to mean no thousand separator.		
decimalPointChar	'.'	The decimal point character.
signChar	'-'	The negative sign character.

30.8.128 setOutputOptions(options as string)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets output format options for the next chart output. Currently, only SVG, SVGZ and PDF output formats support output options.
Example:

```
Var c as CDBaseChartMBS // your chart object

// 2x for higher DPI displays
c.setOutputOptions("bmpscale=2")
```

Notes: An output option can be a flag (such as "compress") or an attribute-value pair (such as "width=800"). Multiple output options can be joined using semicolons as delimiters.

Raster Image Options (PNG, JPG, GIF, BMP or desktop display output)

Raster Image Option	Type	Description
bmpScale	Attribute	Render the chart with a scale factor. For example, "bmpScale=1.5" means the chart size will be 1.5 times of the original. The supported bmpScale is 0.1 to 4.
dpi	Attribute	Specify the factor for conversion from pixel to physical unit. e.g. 196 for double size.

SVG Options

PDF Options

30.8.129 setResource(id as string, data as MemoryBlock)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a memory block to allow it to be referenced using a resource path.

SVG Option	Type	Description
compress	Flag	Compressed the SVG, that is, output SVGZ.
bitmap	Flag	Render the chart as a bitmap and output the bitmap as SVG.
noxmldecl	Flag	Do not include the xml declaration line "<?xml version="1.0" .... >" in the SVG.
nodoctype	Flag	Do not include the document type declaration line "<!DOCTYPE svg PUBLIC .... >" in the SVG.
width	Flag / Attribute	Specifies the width attribute of the SVG. By default, ChartDirector will not include the width or height attribute in the SVG output. In this case, the SVG is variable in size and would assume the size of its container. For example, if the SVG is inside a <DIV>block in a web page, it will assume the size of the DIV block. If the "width" option is used as a flag, ChartDirector will include the width attribute in the SVG and set it to the chart width. If the "width" option is used as an attribute (such as "width=800"), ChartDirector will include the width attribute in the SVG and set it to the specified value. The specified value should be some text that is valid as SVG width. Examples are "100" and "75%".
height	Flag / Attribute	Specifies the height attribute of the SVG. See the description on "width" above on how to use it.

Notes: Many ChartDirector features, such as BaseChart.setBgImage and the <*img*>tag in CDML, expect a file or resource path for loading an image. If the image happens to be in memory, such as if the image is retrieved from a database, setResource can be used to assign a resource ID to the memory. It can then be referenced using "@/res_id", in which res_id is the resource ID.

The assigned resource ID is only valid for the DrawArea object of which this method is called. Use setResourceGlobal to assign a resource ID that is valid for all ChartDirector objects.

This method stores only a pointer to the memory. It does not copy the memory. You must ensure the memory contains valid content for as long as the resource is being used.

While ChartDirector does not copy the data, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.
See also:

- 30.8.130 setResource(id as string, data as string) 5174
- 30.8.131 setResource(id as string, DataArea as CDDrawAreaMBS) 5176

30.8.130 setResource(id as string, data as string)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a memory block to allow it to be referenced using a resource path.
Notes: Many ChartDirector features, such as BaseChart.setBgImage and the <*img*>tag in CDML, expect a file or resource path for loading an image. If the image happens to be in memory, such as if the image

PDF Option	Type	Description
bitmap	Flag	Render the chart as a bitmap and output the bitmap as PDF.
width	Attribute	The width of the chart in the PDF in pixel unit. By default, ChartDirector will use the pixel width of the chart as the width of the chart in PDF. The "width" attribute can be used to specify an alternative value. The value must be a number.
height	Attribute	The width of the chart in the PDF in pixel unit. See the description on "width" above for how to use it.
pagewidth	Attribute	The page width in pixel unit. By default, ChartDirector will set the page width to the same width as the chart. The "pagewidth" attribute can be used to specify an alternative value. The value must be a number.
pageheight	Attribute	The page height in pixel unit. By default, ChartDirector will set the page height to the same height as the chart. The "pageheight" attribute can be used to specify an alternative value. The value must be a number.
leftx	Attribute	The x coordinate of the left side of the chart within the page in pixel unit. By default, ChartDirector will center the chart in the page. The "leftx" attribute can be used to specify an alternative horizontal position. The coordinate must be a number.
topy	Attribute	The y coordinate of the top side of the chart within the page in pixel unit. By default, ChartDirector will center the chart in the page. The "topy" attribute can be used to specify an alternative vertical position. The coordinate must be a number.
dpi	Attribute	Specify the factor for conversion from pixel to physical unit. The PDF viewer will convert the pixel unit into physical unit (eg. inches) so that it can be layout on paper or other physical media. The default conversion factor for the chart is 96 pixels per inch. The "dpi" attribute can be used to specify an alternative value. The value must be a number.

Argument	Default	Description
options	(Mandatory)	A list of options delimited by semicolons.

is retrieved from a database, setResource can be used to assign a resource ID to the memory. It can then be referenced using "@/res_id", in which res_id is the resource ID.

The assigned resource ID is only valid for the DrawArea object of which this method is called. Use setResourceGlobal to assign a resource ID that is valid for all ChartDirector objects.

This method stores only a pointer to the memory. It does not copy the memory. You must ensure the memory contains valid content for as long as the resource is being used.

While ChartDirector does not copy the data, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.
See also:

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the memory image.
data	(Mandatory)	The memory that the image occupies.

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the memory image.
data	(Mandatory)	The memory that the image occupies.

- 30.8.129 setResource(id as string, data as MemoryBlock) 5173
- 30.8.131 setResource(id as string, DataArea as CDDrawAreaMBS) 5176

30.8.131 setResource(id as string, DataArea as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a DrawArea object to allow it to be referenced using a resource path.
Notes: This method is the same DrawArea.setResource, except that it assigns the resource ID to a CDBaseChartMBS object instead of a memory image. This allows the CDBaseChartMBS object to be reference as an image resource using "@/res_id".

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the DrawArea object.
drawArea	(Mandatory)	The CDDrawAreaMBS object to be used as a resource.

While ChartDirector does not copy the draw area, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.
See also:

- 30.8.129 setResource(id as string, data as MemoryBlock) 5173
- 30.8.130 setResource(id as string, data as string) 5174

30.8.132 setResourceGlobal(id as string, data as MemoryBlock)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a memory block to allow it to be referenced using a resource path.
Notes: Many ChartDirector features, such as BaseChart.setBgImage and the <*img*>tag in CDML, expect a file or resource path for loading an image. If the image happens to be in memory, such as if the image is retrieved from a database, setResource can be used to assign a resource ID to the memory. It can then be referenced using "@/res_id", in which res_id is the resource ID.

This method stores only a pointer to the memory. It does not copy the memory. You must ensure the memory contains valid content for as long as the resource is being used.

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the memory image.
data	(Mandatory)	The memory that the image occupies.

While ChartDirector does not copy the data, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.

- 30.8.133 setResourceGlobal(id as string, data as string) 5177
- 30.8.134 setResourceGlobal(id as string, DrawArea as CDDrawAreaMBS) 5177

30.8.133 setResourceGlobal(id as string, data as string)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a memory block to allow it to be referenced using a resource path.
Notes: Many ChartDirector features, such as BaseChart.setBgImage and the <*img*>tag in CDML, expect a file or resource path for loading an image. If the image happens to be in memory, such as if the image is retrieved from a database, setResource can be used to assign a resource ID to the memory. It can then be referenced using "@/res_id", in which res_id is the resource ID.

This method stores only a pointer to the memory. It does not copy the memory. You must ensure the memory contains valid content for as long as the resource is being used.

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the memory image.
data	(Mandatory)	The memory that the image occupies.

While ChartDirector does not copy the data, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.
See also:

- 30.8.132 setResourceGlobal(id as string, data as MemoryBlock) 5176
- 30.8.134 setResourceGlobal(id as string, DrawArea as CDDrawAreaMBS) 5177

30.8.134 setResourceGlobal(id as string, DrawArea as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a DrawArea object to allow it to be referenced using a resource path.
Notes: This method is the same DrawArea.setResource, except that it assigns the resource ID to a CDBaseChartMBS object instead of a memory image. This allows the CDBaseChartMBS object to be reference as an image resource using "@/res_id".

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the DrawArea object.
drawArea	(Mandatory)	The CDDrawAreaMBS object to be used as a resource.

While ChartDirector does not copy the draw area, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.

30.8.135 setRoundedFrame(extColor as color, r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setRoundedFrame method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.136 setRoundedFrame(extColor as Integer = &hFFFFFF, r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1) 5178

30.8.136 setRoundedFrame(extColor as Integer = &hFFFFFF, r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border style of the chart to rounded corners.
Notes: The underlying drawing surface for a chart is always rectangular. When rounded corners are used, part of the drawing surface (the regions external to the rounded corners) will be outside the chart border. The extColor argument specifies the color to be used for the external regions. Typically, it is set to the same color as the background the container that will be hosting the chart.

For example, in a web page, the extColor may be set to the same color as the web page background.

See also:

Argument	Default	Description
extColor	FFFFFF	The exterior background color.
r1	10	The radius of the top-left rounded corner in pixels.
r2	-1	The radius of the top-right rounded corner in pixels. The default value of -1 means it is the same as the radius of the top-left corner.
r3	-1	The radius of the bottom-right rounded corner in pixels. The default value of -1 means it is the same as the radius of the top-left corner.
r4	-1	The radius of the bottom-left rounded corner in pixels. The default value of -1 means it is the same as the radius of the top-left corner.

- 30.8.135 setRoundedFrame(extColor as color, r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1) 5178

30.8.137 setSearchPath(path as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the file system search path for loading image files.
Notes: The plugin uses folderitems for most file operations, so this method is not needed for most operations.

Several ChartDirector operations involve loading image files. Examples are wallpapers (BaseChart.setWallpaper), background images (BaseChart.setBgImage and PlotArea.setBackground2), user-defined symbols (DataSet.setDataSymbol2) or for embedding images in text using ChartDirector Mark Up Language.

Argument	Default	Description
path	(Mandatory)	A list of directories, separated with the path separator of your operating system (";" for Windows, ":" for Linux/UNIX).

30.8.138 setSize(width as Integer, height as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the size of the chart.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.

30.8.139 setThickFrame(thickness as Integer, frameColor as Integer = -1, outerEdgeColor as Integer = -1, innerEdgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a thick frame around the chart.
Notes: The thick frame can have 3 colors for the frame itself, the outer edge and the inner edge.

In some applications, the frame color may be similar to the external background color. An common example is a "silver" frame (which is actually a light grey gradient) against a white background. In this case, the frame effect may look less than optimal. An outer edge of different color (such as darker grey) can often help to highlight the frame. Similarly, if the frame color is similar to the chart background, an inner edge of different color may help to improve the frame effect.

Argument	Default	Description
thickness	(Mandatory)	The frame thickness.
frameColor	-1	The frame color. The default value of -1 means the frame color is the same as the outer edge color.
outerEdgeColor	-1	The outer edge color. The default value of -1 means the outer edge color is the same as the current edge color, which can be set in the chart constructor or in BaseChart.setBackground.
innerEdgeColor	-1	The inner edge color. The default value of -1 means the inner edge color is the same as the frame color.

30.8.140 setTransparentColor(c as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setTransparentColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.8.141 setTransparentColor(c as Integer) 5180

30.8.141 setTransparentColor(c as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies a certain color to mean transparent when creating the image output, or to include alpha transparency channel in the output.
Notes: Alpha transparency: In addition to red, green and blue levels, there is a transparency level associated with each pixel, which can range from completely transparent to completely opaque. The data associated with the transparency information is called the alpha channel.

Single color transparency: The image itself has no alpha channel, but a certain color is used to mean completely transparent. For internal drawing, ChartDirector always use alpha transparency. However, when outputting the image as an image file, ChartDirector by default will remove the alpha channel to reduce image size. It is because many image displaying software do not support alpha transparency. For example, the IE browser only supports single color transparency but not alpha transparency.

If you want to use single color transparency in the output, you may specify the transparent color as the argument to the setTransparentColor method. Note that only GIF and PNG can support single color transparency. JPEG, BMP and WBMP cannot support transparency at all.

If you do want to keep the alpha channel in final output, you may pass -1 as the argument to setTransparentColor. Note that the only image format that can support alpha transparency is PNG.

One important thing to note is that the IE browser (and possibly many image displaying software) only supports single color transparency for palette based images with up to 256 colors, but not for true color images. For this reason, if single color transparency is used, ChartDirector will automatically reduce the image to 256 colors if it has more than 256 colors. This may result in lost of image quality, especially if the image contains gradient colors.

Therefore, due to the limitations of the current generations of image displaying software, for highest image quality, sometimes it may be beneficial to not using transparency in image output, but to set the image background color to the same color as the container background.

Argument	Default	Description
c	(Mandatory)	The color that is designated as the transparent color. If -1 is used, the full alpha transparency channel will be included in the final output.

See also:

- 30.8.140 setTransparentColor(c as color) 5180

30.8.142 setTransparentColors(paletteEntry as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color palette to transparent colors.

30.8.143 setWallpaper(img as folderitem)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses the image from the specified file as the wallpaper to repetitively fill the background of the chart.
Notes: ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
img	(Mandatory)	The image file that is used as the background wallpaper of the chart.

30.8.144 setWeekDayNames(names() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the names of the week days for date/time formatting purposes.
Notes: The default is to use the first 3 characters of the English week day names (Sun, Mon, Tue, ...).

Argument	Default	Description
names	(Mandatory)	An array of 7 text strings to be used as the week day names.

30.8.145 setWhiteOnBlackColors(paletteEntry as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color palette to white on black colors.

30.8.146 silverColor(angle as Integer = 90) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a silver color, most commonly used as a background color.
Notes: This method is a short cut to the CDBaseChartMBS.metalColor method, using grey (CCCCCC in hex) as the base color.

Argument	Default	Description
angle	90	The direction for brightness modulation, specified as a clockwise angle in degrees, with 0 being the upward pointing direction.

Return Value
A 32-bit integer representing the silver color.

30.8.147 silverGradient as Integer()

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A constant array of integers to represent a gradient that looks like a silver color.
Notes: The array is in a format that can be directly used in BaseChart.gradientColor2 and DrawArea.gradientColor2. Its contents (in hex) is:

00 C8C8C8 60 F8F8F8 B0 E0E0E0 100 C8C8C8
See Color Specification on how colors are represented in ChartDirector.

30.8.148 softLighting(direction as Integer = 8, raisedEffect as Integer = 4) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A special shading effect that looks like gradient coloring.
Notes: This effect is best explained by viewing the examples.

ExampleLocation of lighting effect

Soft Multi-Bar Chart	The bars are shaded using soft lighting effect, with light direction from Top, and raised effect of 4 pixels.
Soft Bar Shading	The bars are shaded using soft lighting effect, with light direction from Left, and raised effect of 4 pixels.
Spline Line Chart	The title is shaded using soft lighting effect, with light direction from Right, and raised effect of 4 pixels.

The softLighting method returns an integer representing this effect. The integer can be used as the third argument to Box.setBackground to apply the effect it objects derived from Box (such as labels and titles represented by TextBox). It may also be used as the second argument to Layer.setBorderColor for BarLayer objects to apply the effect to bars.

Return Value
An integer representing the soft lighting effect.

Argument	Default	Description
direction	Top	The direction of the lighting, which must be one of the predefined constants Top, Bottom, Right or Left.
raisedEffect	4	With soft lighting effect, the object will appear to have some 3D depth. The raisedEffect argument controls the amount of 3D depth in pixels.

30.8.149 StarShape(slide as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the shape id that represents a star shape.
Notes: Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Argument	Default	Description
side	(Mandatory)	The number of points the polygon has.

Return Value
An integer shape id representing the star shape.

30.8.150 StartOfDayFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches date/times that represent the start of a new day in a date/time series.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new day if it is of a different day than the previous element. It does not need to be at exactly the starting instance of the day.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new day if it is "near" the exact starting instance of the current day, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the day duration.

Return Value
An integer filter id representing the filter.

Argument	Default	Description
labelStep	1	For dates/times that matches the start of day criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of day will be selected.
initialMargin	0.05	If the first label is "near" the exact starting instance of the current day to within the ratio specified in the initial margin, it will be considered to have matched the start of day criteria.

30.8.151 StartOfHourFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches date/times that represent the start of a new hour in a date/time series.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new hour if it is of a different hour than the previous element. It does not need to be at exactly the starting instance of the hour.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new hour if it is "near" the exact starting instance of the current hour, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the hour duration.

Argument	Default	Description
labelStep	1	For dates/times that matches the start of hour criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of hour will be selected.
initialMargin	0.05	If the first label is "near" the exact starting instance of the current hour to within the ratio specified in the initial margin, it will be considered to have matched the start of hour criteria.

Return Value
An integer filter id representing the filter.

30.8.152 StartOfMinuteFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches date/times that represent the start of a new minute in a

date/time series.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new minute if it is of a different minute than the previous element. It does not need to be at exactly the starting instance of the minute.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new minute if it is "near" the exact starting instance of the current minute, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the minute duration.

Argument	Default	Description
labelStep	1	For dates/times that matches the start of minute criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of minute will be selected.
initialMargin	0.05	If the first label is "near" the exact starting instance of the current minute to within the ratio specified in the initial margin, it will be considered to have matched the start of minute criteria.

Returns an integer filter id representing the filter.

30.8.153 StartOfMonthFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches date/times that represent the start of a new month in a date/time series.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new month if it is of a different month than the previous element. It does not need to be at exactly the starting instance of the month.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new month if it is "near" the exact starting instance of the current month, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the month duration.

Return Value
An integer filter id representing the filter.

Argument	Default	Description
labelStep	1	For dates/times that matches the start of month criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of month will be selected.
initialMargin	0.05	If the first label is "near" the exact starting instance of the current month to within the ratio specified in the initial margin, it will be considered to have matched the start of month criteria.

30.8.154 StartOfSecondFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches date/times that represent the start of a new second in a date/time series.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new second if it is of a different second than the previous element. It does not need to be at exactly the starting instance of the second.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new second if it is "near" the exact starting instance of the current second, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the second duration.

Argument	Default	Description
labelStep	1	For dates/times that matches the start of second criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of second will be selected.
initialMargin	0.05	If the first label is "near" the exact starting instance of the current second to within the ratio specified in the initial margin, it will be considered to have matched the start of second criteria.

Returns an integer filter id representing the filter.

30.8.155 StartOfWeekFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches date/times that represent the start of a new week in a date/time series.

Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new week if it is of a different week than the previous element. It does not need to be at exactly the starting instance of the week.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new week if it is "near" the exact starting instance of the current week, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the week duration.

Argument	Default	Description
labelStep	1	For dates/times that matches the start of week criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of week will be selected.
initialMargin	0.05	If the first label is "near" the exact starting instance of the current week to within the ratio specified in the initial margin, it will be considered to have matched the start of week criteria.

Return Value
An integer filter id representing the filter.

30.8.156 StartOfYearFilter(labelStep as Integer = 1, initialMargin as Double = 0.05) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a data filter that matches date/times that represent the start of a new year in a date/time series.
Notes: This method is typically used in Axis.setMultiFormat and Axis.setMultiFormat2 to select specific dates/times for formatting as axis labels.

In a date/time series, an element is considered that start of a new year if it is of a different year than the previous element. It does not need to be at exactly the starting instance of the year.

For the first element of the date/time series, because there is no previous element to compare with, it will be considered as the start of a new year if it is "near" the exact starting instance of the current year, in which "near" is defined using the initialMargin argument, expressed as a ratio (0 to 1) of the year duration.

Return Value
An integer filter id representing the filter.

Argument	Default	Description
labelStep	1	For dates/times that matches the start of year criteria, picks only 1 out of every "labelStep" number of elements. For example, if this argument is 3, only 1 of every 3 elements that at at the start of year will be selected.
initialMargin	0.05	If the first label is "near" the exact starting instance of the current year to within the ratio specified in the initial margin, it will be considered to have matched the start of year criteria.

30.8.157 testFont(font as string, fontIndex as Integer, fontHeight as Double, fontWidth as Double, angle as Double, byref buffer as string) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A diagnostic function to perform a font loading test.
Example:

```
Var buffer as string
call CDBaseChartMBS.testFont("arial.ttf", 0, 12, 12, 0, buffer)
MessageBox buffer
```

Notes: From experience, the most common issue for font loading is unable to access server side fonts using anonymous user account for a web application, probably due to security restrictions. This diagnostic function can return the cause of problem to aid trouble-shooting.

Other uses of this function is to trace out where does ChartDirector search for the fonts, and the substitution font in case the request font is not available.

Argument	Default	Description
font	(Mandatory)	The font name. See Font Specification for details on various font attributes.
fontIndex	(Mandatory)	The font index if the font name refers to a font collection. An index of 0 means the first font.
fontHeight	(Mandatory)	The font height in points. This parameter will not affect font loading if the exact font exists, but will affect which substitution font to use if the font does not exist.
fontWidth	(Mandatory)	The font width in points. This parameter will not affect font loading if the exact font exists, but will affect which substitution font to use if the font does not exist.
angle	(Mandatory)	The rotation angle of the text. The angle is measured in degrees in clockwise direction. This parameter will not affect font loading if the exact font exists, but will affect which substitution font to use if the font does not exist.
buffer	(Mandatory)	A string to hold the result of the font loading test.

See font specification here:

http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

30.8.158 transparentPalette as Integer()

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the default transparent palette.

30.8.159 whiteOnBlackPalette as Integer()

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the default white on black palette.

30.8.160 xySize(x as Integer, y as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Encode width and height into a single number to be used as size.
Notes: This is intended to be used in certain ChartDirector API that that supports the encoded value.

Argument	Default	Description
width	(Mandatory)	An integer between 0 and 30000.
height	(Mandatory)	An integer between 0 and 30000.

Returns a number that encodes the width and height.

30.8.161 Properties

30.8.162 Handle as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

30.8.163 Resources as Dictionary

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal resource dictionary.
Notes: Stores references for registered resources.
Just for debugging.
(Read only property)

30.8.164 ScaleFactor as Double

MBS ChartDirector Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scale factor for charts.
Example:

```
Var c as CDBaseChartMBS // your chart object

// 2x for higher DPI displays
c.setOutputOptions("bmpscale=2")
' better than c.ScaleFactor = 2
```

Notes: When the plugin internally passes a pixel number to ChartDirector library, we multiply by this factor.
When numbers come back we divide by factor.
Default is 1.

You may better do use setOutputOptions function to set scale factor.
(Read and Write property)

30.8.165 Constants

Constants

Constant	Value	Description
kCircleLayout	1	A constant equals to 1 to represent the circular label layout method for pie/donut charts. Circle Layout This constant is used in PieChart.setLabelLayout.
kKeepAspectRatio	3	A constant equals to 3 to represent can be both horizontal and vertical and the zoom level will be kept the same in both directions. This constant is used in CChartViewer.setZoomDirection and QChartViewer.setZoomDirection .
kNewShape	-1342177279	A constant equals to &h4fffffff in hexadecimal to represent a shape separator in custom shape definition. This constant is used in custom shape definition in DrawArea.polyShape, DataSet.setDataSymbol4 and PolarLayer.setDataSymbol4.
kSideLayout	0	A constant equals to 0 to represent the side label layout method for pie/donut charts. Side Layout This constant is used in PieChart.setLabelLayout.

Aggregate Modes

Constant	Value	Description
kAggregateAvg	1	A constant equals to 1 to represent using the average as the aggregated value in CDArrayMBS.aggregate.
kAggregateCount	9	A constant equals to 9 to represent using the item count as the aggregated value in CDArrayMBS.aggregate.
kAggregateFirst	7	A constant equals to 7 to represent using the first value as the aggregated value in CDArrayMBS.aggregate.
kAggregateLast	8	A constant equals to 8 to represent using the last value as the aggregated value in CDArrayMBS.aggregate.
kAggregateMax	5	A constant equals to 5 to represent using the maximum value as the aggregated value in CDArrayMBS.aggregate.
kAggregateMed	4	A constant equals to 4 to represent using the median value as the aggregated value in CDArrayMBS.aggregate.
kAggregateMin	3	A constant equals to 3 to represent using the minimum value as the aggregated value in CDArrayMBS.aggregate.
kAggregatePercentile	6	A constant equals to 6 to represent using the percentile value as the aggregated value in CDArrayMBS.aggregate.
kAggregateStdDev	2	A constant equals to 2 to represent using the standard deviation as the aggregated value in CDArrayMBS.aggregate.
kAggregateSum	0	A constant equals to 0 to represent using the sum as the aggregated value in CDArrayMBS.aggregate.

Line Modes

Constant	Value	Description
kAltDashLine	&h0A050505	A constant equals to 0A050505 (in hex) to represent a alternating long/short dash line pattern for use in dash colors. See Color Specification on how colors are represented in ChartDirector.
kDashLine	&h0505	A constant equals to 00000505 (in hex) to represent a dash line pattern for use in dash colors. See Color Specification on how colors are represented in ChartDirector.
kDotDashLine	&h05050205	A constant equals to 05050205 (in hex) to represent a dot-dash line pattern for use in dash colors. See Color Specification on how colors are represented in ChartDirector.
kDotLine	&h0202	A constant equals to 00000202 (in hex) to represent a dot-line pattern for use in dash colors. See Color Specification on how colors are represented in ChartDirector.

Scale Modes

Constant	Value	Description
kAngularAxisScale	1	A constant equals to 1 to represent that the size is measured using the angular-axis scale. This constant is used in PolarLayer.setSymbolScale.
kEndPoints	3	A constant equals to 3 to represent that the vector lengths and directions are measured by specifying the end points.
kPixelScale	0	A constant equals to 0 to represent that the size is measured in pixels. This constant is used in LineLayer.setSymbolScale, PolarLayer.setSymbolScale, XYChart.addVectorLayer, PolarChart.addVectorLayer, VectorLayer.setVector and PolarVectorLayer.setVector.
kRadialAxisScale	2	A constant equals to 2 to represent that the size is measured using the radial-axis scale. This constant is used in PolarLayer.setSymbolScale, PolarChart.addVector-Layer and PolarVectorLayer.setVector.
kXAxisScale	1	A constant equals to 1 to represent that the size is measured using the x-axis scale. This constant is used in LineLayer.setSymbolScale, XYChart.addVectorLayer and VectorLayer.setVector.
kYAxisScale	2	A constant equals to 2 to represent that the size is measured using y-axis scale. This constant is used in LineLayer.setSymbolScale, XYChart.addVectorLayer and VectorLayer.setVector.

Anti Alias Modes

Constant	Value	Description
kAntiAlias	1	Anti-Aliasing This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.
kAutoAntiAlias	2	Auto Anti-Aliasing This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.
kClearType	3	Clear Type
kCompatAntiAlias	6	Compat Anti-Aliasing This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.
kNoAntiAlias	0	No Anti-Aliasing This constant is used in BaseChart.setAntiAlias and DrawArea.setAntiAlias.

Pointers

Constant	Value	Description
kArrowPointer	2	A constant equals to 2 to represent the arrow style meter pointer. This constant is used in MeterPointer.setShape.
kArrowPointer2	3	A constant equals to 3 to represent the alternative arrow style meter pointer. This constant is used in MeterPointer.setShape.
kDiamondPointer	0	A constant equals to 0 to represent the diamond style meter pointer. This constant is used in MeterPointer.setShape.
kLinePointer	4	A constant equals to 4 to represent the line style meter pointer. This constant is used in MeterPointer.setShape.
kLinePointer2	7	A constant equals to 7 to represent the line style meter pointer. This constant is used in MeterPointer.setShape.
kPencilPointer	5	A constant equals to 5 to represent the pencil style meter pointer. This constant is used in MeterPointer.setShape.
kTriangularPointer	1	A constant equals to 1 to represent the triangular style meter pointer. This constant is used in MeterPointer.setShape.
kTriangularPointer2	6	A constant equals to 6 to represent the new triangular style meter pointer.

Special Values

Constant	Value	Description
kAutoGrid	-2	A constant equals to -2 to represent that the number of columns in the legend box with grid layout is automatically determine. This constant is used in BaseChart.addLegend and LegendBox.setCols.

Special Colors

Constant	Value	Description
kBackgroundColor	&hFFFF0000	A constant equals to FFFF0000 (in hex) to represent the background color. See Color Specification on how colors are represented in ChartDirector.
kDataColor	&hFFFF0008	A constant equals to FFFF0008 (in hex) to represent the starting index of automatic data color. The array is in a format that can be directly used in BaseChart.setColors and DrawArea.setColorTable. See Color Specification on how colors are represented in ChartDirector.
kLineColor	&hFFFF0001	A constant equals to FFFF0001 (in hex) to represent the default line color. See Color Specification on how colors are represented in ChartDirector.
kPalette	&hFFFF0000	A constant equals to FFFF0000 (in hex) to represent the starting index of the color palette. See Color Specification on how colors are represented in ChartDirector.
kSameAsMainColor	&hFFFF0007	A constant equals to FFFF0007 (in hex) to represent the current main color. See Color Specification on how colors are represented in ChartDirector.
kTextColor	&hFFFF0002	A constant equals to FFFF0002 (in hex) to represent the default text color. See Color Specification on how colors are represented in ChartDirector.
kTransparent	&hFF000000	A constant equals to FF000000 (in hex) to represent the transparent color. See Color Specification on how colors are represented in ChartDirector.

Filter Modes

Constant	Value	Description
kBesselFilter	13	A constant equals to 13 to represent a Bessel graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.
kBlackmanFilter	12	A constant equals to 12 to represent a Blackman graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.
kBoxFilter	0	A constant equals to 0 to represent a Box graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.
kBSplineFilter	3	A constant equals to 3 to represent a B-spline graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.
kCatromFilter	5	A constant equals to 5 to represent a Catrom graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.
kGaussianFilter	9	A constant equals to 9 to represent a Gaussian graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.
kHammingFilter	11	A constant equals to 11 to represent a Hamming graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.
kHanningFilter	10	A constant equals to 10 to represent a Hanning graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.
kHermiteFilter	4	A constant equals to 4 to represent a Hermite graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.
kLanczosFilter	8	A constant equals to 8 to represent a Lanczos graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.
kLinearFilter	1	A constant equals to 1 to represent a Linear graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.
kMitchellFilter	6	A constant equals to 6 to represent a Mitchell graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.
kQuadraticFilter	2	A constant equals to 2 to represent a Quadratic graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.
kSincFilter	7	A constant equals to 7 to represent a Sinc graphical re-sampling filter. Please refer to Re-Sampling Filters for more information graphical filters in ChartDirector.

Image Formats

Constant	Value	Description
kBMP	4	The BMP format. This constant is used in BaseChart.makeChart.
kGIF	1	The GIF format. This constant is used in BaseChart.makeChart.
kJPG	2	The JPEG format. This constant is used in BaseChart.makeChart.
kPDF	7	The PDF format.
kPNG	0	The PNG format. This constant is used in BaseChart.makeChart.
kQTIMG	9	The QT Image format.
kSVG	5	The SVG format.
kSVGZ	6	The compressed SVG format.
kWMP	3	The WAP bitmap format. This constant is used in BaseChart.makeChart.

Alignment

Constant	Value	Description
kBottom	2	A constant equals to 2 to represent the bottom position. See Alignment Specification for supported alignment types.
kBottomCenter	2	A constant equals to 2 to represent the bottom center position. See Alignment Specification for supported alignment types.
kBottomLeft	1	A constant equals to 1 to represent the bottom left position. See Alignment Specification for supported alignment types.
kBottomLeft2	12	A constant equals to 12 to represent the alternative exterior bottom left position. See Alignment Specification for supported alignment types.
kBottomRight	3	A constant equals to 3 to represent the bottom right position. See Alignment Specification for supported alignment types.
kBottomRight2	13	A constant equals to 13 to represent the alternative exterior bottom right position. See Alignment Specification for supported alignment types.
kCenter	5	A constant equals to 5 to represent the center position. See Alignment Specification for supported alignment types.
kLeft	4	A constant equals to 4 to represent the left position. See Alignment Specification for supported alignment types.
kRight	6	A constant equals to 6 to represent the right position. See Alignment Specification for supported alignment types.
kTop	8	A constant equals to 8 to represent the top position. See Alignment Specification for supported alignment types.
kTopCenter	8	A constant equals to 8 to represent the top center position. See Alignment Specification for supported alignment types.
kTopLeft	7	A constant equals to 7 to represent the top left position. See Alignment Specification for supported alignment types.
kTopLeft2	10	A constant equals to 10 to represent the alternative exterior top left position. See Alignment Specification for supported alignment types.
kTopRight	9	A constant equals to 9 to represent the top right position. See Alignment Specification for supported alignment types.
kTopRight2	11	A constant equals to 11 to represent the alternative exterior top right position. See Alignment Specification for supported alignment types.

Z-Level

Constant	Value	Description
kChartBackZ	&h100	A constant equals to 100 (in hex) to represent the z-order of the back surface of the chart. This constant is used in Box.setZOrder, Line.setZOrder and MeterPointer.setZOrder.
kChartFrontZ	&hffff	A constant equals to ffff (in hex) to represent the z-order of the front surface of the chart. This constant is used in Box.setZOrder, Line.setZOrder and MeterPointer.setZOrder.
kGridLinesZ	&h2000	A constant equals to 2000 (in hex) to represent the z-order of the grid lines of the chart. This constant is used in Box.setZOrder, Line.setZOrder and MeterPointer.setZOrder.
kPlotAreaZ	&h1000	A constant equals to 1000 (in hex) to represent the z-order of the plot area back surface of the chart. This constant is used in Box.setZOrder, Line.setZOrder and MeterPointer.setZOrder.

Filter Tags

Constant	Value	Description
kChartDir_AllPassFilterTag	7	All pass filter
kChartDir_NonePassFilterTag	8	None pass
kChartDir_RegularSpacingFilterTag	6	Regular Spacing
kChartDir_SelectItemFilterTag	9	Select Item
kChartDir_StartOfDayFilterTag	2	Start of Day
kChartDir_StartOfHourFilterTag	1	Start of Hour
kChartDir_StartOfMinuteFilterTag	10	Start of minute
kChartDir_StartOfMonthFilterTag	4	Start of month
kChartDir_StartOfSecondFilterTag	11	Start of second
kChartDir_StartOfWeekFilterTag	3	Start of week
kChartDir_StartOfYearFilterTag	5	Start of year

Symbols

Constant	Value	Description
kChartDir_ArrowSymbol	18	Arrow
kChartDir_CustomSymbol	14	Custom
kChartDir_Polygon2Symbol	12	Polygon 2
kChartDir_PolygonSymbol	11	Polygon
kChartDir_StarSymbol	13	Star
kCircleSymbol	7	Circle
kCross2Symbol	9	Cross 2
kCrossSymbol	8	Cross
kDiamondSymbol	2	Diamond
kInvertedTriangleSymbol	6	Inverted Triangle
kLeftTriangleSymbol	5	Left Triangle
kNoSymbol	0	No symbol
kRightTriangleSymbol	4	Right Triangle
kSquareSymbol	1	Square
kTriangleSymbol	3	Triangle

Shapes

Constant	Value	Description
kCircleShape	7	Circle Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.
kCircleShapeNoShading	10	Circle without shading. Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.
kDiamondShape	2	Diamond Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.
kGlassSphere2Shape	16	Glas Sphere 2
kGlassSphereShape	15	Glas Sphere
kInvertedTriangleShape	6	Inverted Triangle Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.
kLeftTriangleShape	5	Left Triangle Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.
kNoShape	0	No shape
kRightTriangleShape	4	Triangle Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.
kSolidSphereShape	17	Solid shape
kSquareShape	1	Square shape Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.
kTriangleShape	3	Triangle Please refer to Shape Specification for samples and more information on using shapes in ChartDirector.

Shadings

Constant	Value	Description
kConcaveShading	4	Concave shading
kDefaultShading	0	Default shading
kFlatShading	1	Flat shading
kGlobalGradientShading	3	Global gradient shading
kLocalGradientShading	2	Local gradient shading
kRadialShading	7	Radial shading
kRingShading	8	Ring shading
kRoundedEdgeNoGlareShading	5	Rounded edge and no glare
kRoundedEdgeShading	6	Rounded Edge

Regression Modes

Constant	Value	Description
kConstrainedLinearRegression	0	A constant equals to 0 to represent that constrained linear regression be used to draw a trend line.
kExponentialRegression	-1	A constant equals to -1 to represent that exponential regression be used to draw a trend line.
kLinearRegression	1	A constant equals to 1 to represent that linear regression be used to draw a trend line.
kLogarithmicRegression	-2	A constant equals to -2 to represent that logarithmic regression be used to draw a trend line. This constant is used in CDTrendLayerMBS.setRegressionType.

Data Combine Methods

Constant	Value	Description
kDepth	2	A constant equals to 2 to represent the ”Depth” data representation method for multiple data sets. This constant is used in XYChart.addBarLayer, XYChart.addAreaLayer, and Layer.setDataCombineMethod.
kOverlay	0	A constant equals to 0 to represent the ”Overlay” data representation method for multiple data sets. This constant is used in XYChart.addBarLayer, XYChart.addAreaLayer, and Layer.setDataCombineMethod.
kPercentage	4	A constant equals to 4 to represent the ”Percentage” data representation method for multiple data sets. This constant is used in XYChart.addBarLayer, XYChart.addAreaLayer and Layer.setDataCombineMethod.
kSide	3	A constant equals to 3 to represent the ”Side” data representation method for multiple data sets. This constant is used in XYChart.addBarLayer, XYChart.addAreaLayer and Layer.setDataCombineMethod.
kStack	1	A constant equals to 1 to represent the ”Stack” data representation method for multiple data sets. This constant is used in XYChart.addBarLayer, XYChart.addAreaLayer and Layer.setDataCombineMethod.

Directions

Constant	Value	Description
kDirectionHorizontal	0	A constant equals to 0 to represent that the zoom and/or scroll orientation is horizontal. This constant is used in CChartViewer.setZoomDirection and CChartViewer.setScrollDirection.
kDirectionHorizontalVertical	2	A constant equals to 2 to represent that the zoom and/or scroll orientation can be both horizontal and vertical. This constant is used in CChartViewer.setZoomDirection and CChartViewer.setScrollDirection.
kDirectionVertical	1	A constant equals to 1 to represent that the zoom and/or scroll orientation is vertical. This constant is used in CChartViewer.setZoomDirection and CChartViewer.setScrollDirection.

Dithering Modes

Constant	Value	Description
kErrorDiffusion	2	Error Diffusion This constant is used in DrawArea.setDitherMethod.
kOrderedDither	1	Ordered Dither This constant is used in DrawArea.setDitherMethod.
kQuantize	0	Quantize This constant is used in DrawArea.setDitherMethod.

Palette Modes

Constant	Value	Description
kForcePalette	1	Force palette. This constant is used in DrawArea.setPaletteMode.
kNoPalette	2	No palette. This constant is used in DrawArea.setPaletteMode.
kTryPalette	0	Try palette. This constant is used in DrawArea.setPaletteMode.

HLOC

Constant	Value	Description
kHLOCDefault	0	A constant equals to 0 to represent that the HLOC symbols should be drawn using the same color. This constant is used in XYChart.addHLOCLayer and HLOCLayer.setColorMethod.
kHLOCOpenClose	1	A constant equals to 1 to represent that the HLOC symbols should be drawn using two alternative colors based on whether the closing price is higher than the opening price. This constant is used in XYChart.addHLOCLayer and HLOCLayer.setColorMethod.
kHLOCUpDown	2	A constant equals to 2 to represent that the HLOC symbols should be drawn using two alternative colors based on whether the closing price is higher than the previous closing price. This constant is used in XYChart.addHLOCLayer and HLOCLayer.setColorMethod.

Monotonic Modes

Constant	Value	Description
kMonotonicAuto	4	A constant equals to 4 to represent that the system will automatically determine whether to constrained a spline curve to not overshooting or undershooting in the x-axis direction and/or the y-axis direction.
kMonotonicNone	0	A constant equals to 0 to represent that a spline curve is not constraint to flow in any direction.
kMonotonicX	1	A constant equals to 1 to represent that a spline curve is constrained to not overshooting or undershooting in the x-axis direction.
kMonotonicXY	3	A constant equals to 3 to represent that a spline curve is constrained to not overshooting or undershooting in both the x-axis direction and the y-axis direction.
kMonotonicY	2	A constant equals to 2 to represent that a spline curve is constrained to not overshooting or undershooting in the y-axis direction.

Glare Modes

Constant	Value	Description
kNoGlare	1	A constant equals to 1 to represent disabling the glare in CDBaseChartMBS.glassEffect shading style.
kNormalGlare	3	A constant equals to 3 to represent using normal glare strength in CDBaseChartMBS.glassEffect shading style.
kReducedGlare	2	A constant equals to 2 to represent using reduced glare strength in CDBaseChartMBS.glassEffect shading style.

Legend Modes

Constant	Value	Description
kNoLegend	2	A constant equals to 2 to represent that no legend keys should be added to the legend box. This constant is used in Layer.setLegendOrder.
kNormalLegend	0	A constant equals to 0 to represent that the legend keys order should follow the creation order of the data sets. This constant is used in Layer.setLegendOrder.
kReverseLegend	1	A constant equals to 1 to represent that the legend keys order is the reverse of the creation order of the data sets. This constant is used in Layer.setLegendOrder.

Surface Shading Style

Constant	Value	Description
kRectangularFrame	4	
kRectangularShading	2	Rectangular sharing
kSmoothShading	0	Smooth
kTriangularFrame	3	
kTriangularShading	1	Triangular

Layout Methods

Constant	Value	Description
kTreeMapBinaryByMid	5	Same as TreeMapBinaryBySize except that the nodes will be partitioned so that the count of nodes are as equal as possible.
kTreeMapBinaryBySize	4	Without changing the ordering of the nodes, the nodes will be partitioned into two groups so that their sizes are as equal as possible. The two groups will then become two rectangular region. If the width of the plot area is not smaller than its height, the two groups will be placed at the left and right sides of plot area, otherwise they will be placed at the top and bottom sides of the plot area. The splitting then recursively apply to each group to partition them, until each subgroup contains only one node and can no longer be partitioned.
kTreeMapNoLayout	6	No layout.
kTreeMapSliceAndDice	1	This method is intended for multi-level tree maps. Assume the layout direction is TopLeft, the first level nodes will flow from left to right. The second level nodes will flow from top to bottom. If there are more levels, they will alternate between left/right and top/bottom flow directions. The layoutDirection argument can be used to specify other layout directions.
kTreeMapSquarify	2	The nodes will be layout so that they are as close to a square as possible. This method may sort the nodes, so the ordering of the nodes on the chart may be different from the ordering in the data array.
kTreeMapStrip	3	The nodes will flow according to the layoutDirection argument. The default is TopLeft, which means the nodes will flow from left to right and top to bottom like text. The number of nodes in each row will be such that on average, they are as close to squares as possible.

At Origin

Constant	Value	Description
kXAxisAtOrigin	1	A constant equals to 1 to represent that the x-axis should intersect with the zero point of the y-axis if it exists on the chart. This constant is used in XYChart.setAxisAtOrigin.
kXYAxisAtOrigin	3	A constant equals to 3 to represent that the x-axis and y-axis should intersect at the origin if it exists on the chart. This constant is used in XYChart.setAxisAtOrigin.
kYAxisAtOrigin	2	A constant equals to 2 to represent that the y-axis should intersect with the zero point of the x-axis if it exists on the chart. This constant is used in XYChart.setAxisAtOrigin.

Symmetric Modes

Constant	Value	Description
kXAxisSymmetric	1	A constant equals to 1 to represent that the x-axis should be symmetrical about the origin. This constant is used in XYChart.setAxisAtOrigin.
kXAxisSymmetricIfNeeded	2	A constant equals to 2 to represent that the x-axis should be symmetrical about the origin if the data contain both positive and negative values. This constant is used in XYChart.setAxisAtOrigin.
kXYAxisSymmetric	16	A constant equals to 16 to represent that the x-axis and y-axis should be symmetrical about the origin. This constant is used in XYChart.setAxisAtOrigin.
kXYAxisSymmetricIfNeeded	32	A constant equals to 32 to represent that the x-axis and y-axis should be symmetrical about the origin if the data contain both positive and negative values. This constant is used in XYChart.setAxisAtOrigin.
kYAxisSymmetric	4	A constant equals to 4 to represent that the y-axis should be symmetrical about the origin. This constant is used in XYChart.setAxisAtOrigin.
kYAxisSymmetricIfNeeded	8	A constant equals to 8 to represent that the y-axis should be symmetrical about the origin if the data contain both positive and negative values. This constant is used in XYChart.setAxisAtOrigin.

30.9 class CDBaseMeterMBS

30.9.1 class CDBaseMeterMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The BaseMeter class represents a generic meter.
Example:

```
// a speedometer style gauge with colored zones and a pointer
Var m As New CDAngularMeterMBS(300, 200)
m.setMeter(150, 160, 120, -90, 90) // center, radius, from left to right
m.setScale(0, 100, 10, 5, 1) // 0 to 100, labels every 10, ticks every 5 and 1
m.setLabelFormat(" { value } %")
m.addZone(0, 60, &h99FF99)
m.addZone(60, 85, &hFFFF66)
m.addZone(85, 100, &hFF6666)
Call m.addPointer(72, &h0000CC)

Var pic As Picture = m.makeChartPicture
```

Notes: Subclass of the CDBaseChartMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.9.2 Methods

30.9.3 addColorScale(colorStops() as Double, startPos as Integer = -2147483647, startWidth as Integer = -2147483647, endPos as Integer = -2147483647, endWidth as Integer = -2147483647, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a color scale to the meter.
Notes: A color scale is similar to a meter scale. Instead of using labels to denote the values, a color scale uses different colors for different values. The colors can vary continuously or in discrete steps. The width of the color scale can also vary based on the value. There can be multiple more than one color scale in a meter.

A color scale is defined with an array of numbers. For a continuous color scale, each pair of numbers represents a value and its associated color. For example, to define a continuous color scale in which 0 is blue (0000FF), 50 is yellow (FFFF00) and 100 is red (FF0000), the numbers should be:

0.0, &h0000ff, 50.0, &hffff00, 100.0, &hff0000

For a step color scale, the number of colors would be one less than the number of values. For example, to define a step color scale in which 0 to 50 is red (FF0000), and 50 to 100 is green (00FF00), the numbers will be:

0.0, &hff000, 50.0, &h00ff00, 100.0

Argument	Default	Description
colorStops	(Mandatory)	An array of numbers alternating between values and colors. If the number count is even, the array will define a continuous color scale, otherwise it will define a step color scale.
startPos	-&h7fffffff	The position of the starting point of the color scale. For an angular meter, the position refers to the radius, and the default is the meter scale radius (see AngularMeter.setMeter). For a linear meter, the position refers to the x or y coordinate depending on whether the meter is vertical or horizontal, and the default is the leftX or topY coordinate of the meter scale (see LinearMeter.setMeter).
startWidth	-&h7fffffff	The width at the starting point of the color scale. A positive value means the width is in the direction of increasing "position", while a negative value means decreasing "position". Please refer to the description of startPos on the meaning of "position" for various types of meters. The default is the length of the major tick (see BaseMeter.setTickLength).
endPos	-&h7fffffff	The position of the ending point of the color scale. Please refer to the description of startPos above on how the position parameter is interpreted. The default is for the ending position to be equal to the starting position.
endWidth	-&h7fffffff	The width at the ending point of the color scale. Please refer to the description of startWidth above on how the width parameter is interpreted. The default is for the ending width to be equal to the starting width.
edgeColor	-1	The edge color of the color scale. The default is to have no edge.

30.9.4 addColorScale(colorStops() as Double, startPos as Integer, startWidth as Integer, endPos as Integer, endWidth as Integer, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a color scale to the meter.
Notes: A color scale is similar to a meter scale. Instead of using labels to denote the values, a color scale uses different colors for different values. The colors can vary continuously or in discrete steps. The width of the color scale can also vary based on the value. There can be multiple more than one color scale in a meter.

A color scale is defined with an array of numbers. For a continuous color scale, each pair of numbers represents a value and its associated color. For example, to define a continuous color scale in which 0 is blue (0000FF), 50 is yellow (FFFF00) and 100 is red (FF0000), the numbers should be:

0.0, &h0000ff, 50.0, &hffff00, 100.0, &hff0000

For a step color scale, the number of colors would be one less than the number of values. For example, to define a step color scale in which 0 to 50 is red (FF0000), and 50 to 100 is green (00FF00), the numbers will be:

0.0, &hff000, 50.0, &h00ff00, 100.0

Argument	Default	Description
colorStops	(Mandatory)	An array of numbers alternating between values and colors. If the number count is even, the array will define a continuous color scale, otherwise it will define a step color scale.
startPos	-&h7fffffff	The position of the starting point of the color scale. For an angular meter, the position refers to the radius, and the default is the meter scale radius (see AngularMeter.setMeter). For a linear meter, the position refers to the x or y coordinate depending on whether the meter is vertical or horizontal, and the default is the leftX or topY coordinate of the meter scale (see LinearMeter.setMeter).
startWidth	-&h7fffffff	The width at the starting point of the color scale. A positive value means the width is in the direction of increasing "position", while a negative value means decreasing "position". Please refer to the description of startPos on the meaning of "position" for various types of meters. The default is the length of the major tick (see BaseMeter.setTickLength).
endPos	-&h7fffffff	The position of the ending point of the color scale. Please refer to the description of startPos above on how the position parameter is interpreted. The default is for the ending position to be equal to the starting position.
endWidth	-&h7fffffff	The width at the ending point of the color scale. Please refer to the description of startWidth above on how the width parameter is interpreted. The default is for the ending width to be equal to the starting width.
edgeColor	-1	The edge color of the color scale. The default is to have no edge.

See also:

- 30.9.3 addColorScale(colorStops() as Double, startPos as Integer = -2147483647, startWidth as Integer = -2147483647, endPos as Integer = -2147483647, endWidth as Integer = -2147483647, edgeColor as Integer = -1) 5207

30.9.5 addLabel(v as Double, label as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a label to a specific position on the meter scale.
Notes: By default, all labels will be associated major ticks on the scale. To associate a label with a minor tick instead , use '-' as the first character of the label. To associate a label with a micro tick instead, use ':' as the first character of the label. To draw the label without any tick at all, use '
textasciitilde ' as the first character of the label.

Leading '-', '
textasciitilde ' or ':' characters are tick specification characters and will not appear on the labels. They just specify the tick style to be associated with the labels. If you want have a label that actually begins these characters, add '\' as the first character as the escape character.

In some cases, it may be desirable to skip some labels. If you want to draw a major, minor or micro tick without any label, use ' ' (a space character), '-' or ':' as the only character in the label text. If you want leave a label position empty without a tick or a label, use an empty string.

Argument	Default	Description
pos	(Mandatory)	The position to add the label to in meter scale unit.
label	(Mandatory)	The label to add to the meter scale.

30.9.6 addPointer(value as Double, fillColor as color, edgeColor as color) as CDMeterPointerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addPointer method, but uses color instead of integer data type for passing color values.
See also:

- 30.9.7 addPointer(value as Double, fillColor as Integer = &hffff0001, edgeColor as Integer = -1) as CDMeterPointerMBS 5210

30.9.7 addPointer(value as Double, fillColor as Integer = &hffff0001, edgeColor as Integer = -1) as CDMeterPointerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a pointer to the meter.
Notes:

See also:

- 30.9.6 addPointer(value as Double, fillColor as color, edgeColor as color) as CDMeterPointerMBS 5210

Argument	Default	Description
value	(Mandatory)	The value that the pointer will point to.
fillColor	LineColor	The fill color of the pointer.
edgeColor	-1	The edge color of the pointer. The default value of -1 means the edge color is the same as the fill color.

30.9.8 getCoor(v as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the geometric coordinates given the data value.
Notes: For an angular meter, this method returns the angular position of the pointer for the given data value in degrees. The angle is measure in the clockwise direction, with 0 being the upward pointing direction.

For a linear meter, this method returns the linear pixel offset of the pointer for the given data value.

Argument	Default	Description
v	(Mandatory)	The input data value.

Return Value
The geometric representation of the data value, which is an angle in degrees for an angular meter, and a linear pixel offset for a linear meter.

30.9.9 getLabel(v as Double) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the label at the specified position on the meter scale.
Notes:

Argument	Default	Description
i	(Mandatory)	The position specified as a value on the meter scale.

Return Value
Returns the label at the specified position, or a null string if there is no label at that position.

30.9.10 getTicks as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the positions of all ticks as values on the meter scale.
Notes: Return Value
All array of numbers representing the positions of the ticks as values on the meter scale.

30.9.11 setLabelFormat(mainLabelFormat as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the format of the labels computed by ChartDirector.
Example:

```
Var c as CDBaseMeterMBS

// you can use label formats like this:

c.setLabelFormat("<*block,halign=left*><*font=timesbi.ttf,size=12,underline=1*>{ label } <*/font*><*br*>US$
{ value } K ( { percent } %)")

// we can reduce that to this:

c.setLabelFormat(" { label } { value } { percent } %")

// and it shows 3 numbers. With | 1 after the variable name, we define the decimals after dot:

c.setLabelFormat(" { label } { value | 1 } { percent | 1 } %")

// and

c.setLabelFormat(" { label } { value | 1., } { percent | 1., } %")

// uses dot for thousands and comma for decimal separator.
```

Notes: The method is mainly used when BaseMeter.setScale is used, in which case the label values are not directly specified but are computed by ChartDirector. For example, a format string of " { value | 2 } " will format the values with 2 decimal places.

Please refer to Parameter Substitution and Formatting on all available format parameters.

Argument	Default	Description
formatString	(Mandatory)	The format string.

30.9.12 setLabelPos(labelInside as boolean, labelOffset as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the positions of the meter scale labels.
Notes:

Argument	Default	Description
labelInside	(Mandatory)	A true value means that the labels are on the 'inward' side of the meter scale. A false value means the labels are on the 'outward' side of the meter scale. For an angular meter, the default is for the labels on the 'inward' side. For a linear meter, the default is for the labels on the 'outward' side.
labelOffset	0	The offset, in pixels, of the labels position relative to the standard position. If the major tick is at the same side as the label, the standard starting position of the label is at the end point of the major tick. Otherwise, the standard starting position is on the meter scale.

A positive labelOffset means the labels should move more towards the 'inward' or 'outward' side, depending on the first parameter. A negative labelOffset means moving the labels towards the opposite direction.

30.9.13 setLabelStyle(font as string = "", fontsize as Double = -1, fontcolor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font style used to for the meter labels.
Notes: See Font Specification for details on various font attributes.

Argument	Default	Description
font	"bold"	The font used to draw the labels.
fontSize	-1	The font size used to draw the labels in points. A value of -1 means the font size is not changed. The default font size is 10 points for angular meters, and 8 points for linear meters.
fontColor	TextColor	The color used to draw the labels.
fontAngle	0	The rotation angle of the labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.9.14 setLabelStyle(font as string, fontsize as Double, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS 5214

30.9.14 setLabelStyle(font as string, fontsize as Double, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setLabelStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.9.13 setLabelStyle(font as string = """, fontsize as Double = -1, fontcolor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 5213

30.9.15 setLineWidth(axisWidth as Integer, majorTickWidth as Integer = 1, minorTickWidth as Integer = 1, microTickWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the line widths of the scale line and the ticks on the meter.
Notes:

Argument	Default	Description
axisWidth	(Mandatory)	The line width for drawing the meter scale line in pixels. For an angular meter, the default is 1 pixel. For a linear meter, the default is 2 pixels.
majorTickWidth	1	The line width of the major ticks in pixels. For a linear meter, if this method is not called, the initial major tick width is set to 2 pixels.
minorTickWidth	1	The line width of the minor ticks in pixels.
microTickWidth	1	The line width of the micro ticks in pixels.

30.9.16 setMeterColors(axisColor as color, labelColor as color, tickColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setMeterColors method, but uses color instead of integer data type for passing color values.
See also:

- 30.9.17 setMeterColors(axisColor as Integer, labelColor as Integer = -1, tickColor as Integer = -1) 5215

30.9.17 setMeterColors(axisColor as Integer, labelColor as Integer = -1, tickColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colors of the meter scale line, scale label and tick.
Notes:

Argument	Default	Description
axisColor	(Mandatory)	The color for drawing the meter scale line. The default is LineColor.
labelColor	-1	The color for drawing the scale labels. Passing -1 in this argument means the label color is not changed. The default label color is TextColor.
tickColor	-1	The color for drawing the ticks. Passing -1 in this argument means the tick color is not changed. The default tick color is LineColor.

See also:

- 30.9.16 setMeterColors(axisColor as color, labelColor as color, tickColor as color) 5214

30.9.18 setScale(lowerLimit as Double, upperLimit as Double, labels() as Double, formatstring as string = "")

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the meter to use the given scale with the given numeric labels and tick positions.
Notes: ChartDirector will distribute the labels evenly on the scale. By default, all labels are associated with major ticks. If you want certain positions to show a minor or micro ticks only, use MinorTickOnly or MicroTickOnly as the label values for those positions.

Argument	Default	Description
lowerLimit	(Mandatory)	The lower limit of the meter scale.
upperLimit	(Mandatory)	The upper limit of the meter scale.
labels	(Mandatory)	An array of numbers to be used as the labels on the meter scale.
formatString	""	The format string for formatting the numbers. An empty string means the format will be automatically determined.

See also:

- 30.9.19 setScale(lowerLimit as Double, upperLimit as Double, labels() as string) 5216
- 30.9.20 setScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0, microTickInc as Double = 0) 5216

30.9.19 setScale(lowerLimit as Double, upperLimit as Double, labels() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the meter to use the given scale with the given text labels and tick positions.
Notes: ChartDirector will distribute the labels evenly on the scale. By default, all labels are associated with major ticks. These can be modified by using '-', '
textasciitilde ' or ':' as the first character. Please refer to BaseMeter.addLabel for details.

Argument	Default	Description
lowerLimit	(Mandatory)	The lower limit of the meter scale.
upperLimit	(Mandatory)	The upper limit of the meter scale.
labels	(Mandatory)	An array of text strings to be used as the labels on the meter scale.

See also:

- 30.9.18 setScale(lowerLimit as Double, upperLimit as Double, labels() as Double, formatstring as string = "") 5215
- 30.9.20 setScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0, microTickInc as Double = 0) 5216

30.9.20 setScale(lowerLimit as Double, upperLimit as Double, majorTickInc as Double = 0, minorTickInc as Double = 0, microTickInc as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the meter to use the given scale.
Notes:

Argument	Default	Description
lowerLimit	(Mandatory)	The lower limit of the meter scale.
upperLimit	(Mandatory)	The upper limit of the meter scale.
majorTickInc	0	The interval between major ticks. For example, a value of 10 means a major tick every 10 units in the meter scale. Each major tick will have an associated label for the value at the tick. A value of 0 disables major ticks.
minorTickInc	0	The interval between minor ticks. For example, a value of 5 means a minor tick every 5 units in the meter scale. A value of 0 disables minor ticks.
microTickInc	0	The interval between minor ticks. For example, a value of 1 means a minor tick every 1 units in the meter scale. A value of 0 disables micro ticks.

See also:

- 30.9.18 setScale(lowerLimit as Double, upperLimit as Double, labels() as Double, formatstring as string = "") 5215

• 30.9.19 setScale(lowerLimit as Double, upperLimit as Double, labels() as string) 5216

30.9.21 setTickLength(majorLen as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the lengths of the ticks.
Notes:

Argument	Default	Description
majorLen	(Mandatory)	The length of the major ticks in pixels. A positive value means the tick is at the 'outward' direction of the meter. A negative value means the tick is at the 'inward' direction.

For an angular meter, the default is -10 (10 pixels at the inward direction). For a horizontal linear meter, the default is the same height as the meter scale region in the inward direction. For a vertical linear meter, the default is the same width as the meter scale region in the inward direction.

minorLen	-7fffffff	The length of the minor ticks in pixels. The default is 60% of the length of the major ticks.
microLen	-7fffffff	The length of the micro ticks in pixels. The default is 50% of the length of the minor ticks.

See also:

• 30.9.22 setTickLength(majorLen as Integer, minorLen as Integer) 5217

• 30.9.23 setTickLength(majorLen as Integer, minorLen as Integer, microLen as Integer) 5218

30.9.22 setTickLength(majorLen as Integer, minorLen as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the lengths of the ticks.
Notes:

Argument	Default	Description
majorLen	(Mandatory)	The length of the major ticks in pixels. A positive value means the tick is at the 'outward' direction of the meter. A negative value means the tick is at the 'inward' direction.

For an angular meter, the default is -10 (10 pixels at the inward direction). For a horizontal linear meter, the default is the same height as the meter scale region in the inward direction. For a vertical linear meter,

the default is the same width as the meter scale region in the inward direction.

minorLen	-7fffffff	The length of the minor ticks in pixels. The default is 60% of the length of the major ticks.
microLen	-7fffffff	The length of the micro ticks in pixels. The default is 50% of the length of the minor ticks.

See also:

- 30.9.21 setTickLength(majorLen as Integer) 5217
- 30.9.23 setTickLength(majorLen as Integer, minorLen as Integer, microLen as Integer) 5218

30.9.23 setTickLength(majorLen as Integer, minorLen as Integer, microLen as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the lengths of the ticks.
Notes:

Argument	Default	Description
majorLen	(Mandatory)	The length of the major ticks in pixels. A positive value means the tick is at the 'outward' direction of the meter. A negative value means the tick is at the 'inward' direction.

For an angular meter, the default is -10 (10 pixels at the inward direction). For a horizontal linear meter, the default is the same height as the meter scale region in the inward direction. For a vertical linear meter, the default is the same width as the meter scale region in the inward direction.

minorLen	-7fffffff	The length of the minor ticks in pixels. The default is 60% of the length of the major ticks.
microLen	-7fffffff	The length of the micro ticks in pixels. The default is 50% of the length of the minor ticks.

See also:

- 30.9.21 setTickLength(majorLen as Integer) 5217
- 30.9.22 setTickLength(majorLen as Integer, minorLen as Integer) 5217

30.10 class CDBoxMBS

30.10.1 class CDBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Box class represents boxes.
Example:

```
// add a colored box with rounded corners behind the legend of a chart
Var data() As Double = Array(10.0, 14.0, 9.0)
Var c As New CDXYChartMBS(400, 300)
Call c.setPlotArea(50, 60, 320, 200)
Call c.addBarLayer(data, &h66AAEE, "Sales")

Var legend As CDLegendBoxMBS = c.addLegend(50, 10, False)
legend.setBackground(&hF0F0F0, &h999999) // CDLegendBoxMBS is a CDBoxMBS
legend.setRoundedCorners(8)
legend.setMargin(6)

Var pic As Picture = c.makeChartPicture
```

Notes: It is used as the base class for more complex classes (such as the TextBox class).
Subclass of the CDDrawObjMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.10.2 Methods

30.10.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.10.4 getHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the height of the box.
Notes: In some usages, the height of a box may be dynamically determined. An example is the height of an LegendBox, which cannot be known until all data are available. In these cases, the height is undefined until the chart or at least the legend box has been laid out (using BaseChart.layout or BaseChart.layoutLegend), or the chart image has been drawn (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3).

Return Value
The height of the box in pixels.

30.10.5 getImageCoor(OffsetX as Integer = 0, OffsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the image map coordinates of the box as HTML image map attributes.
Notes: The image map coordinates will be in the following format:

shape="rect" cords=" [x1] , [y1] , [x2] , [y2] "
where (x1, y1) and (x2, y2) are opposite corners of the box. The format is designed so that it can easily be incorporated into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string representing the coordinates of the box in HTML image map attribute format.

30.10.6 getLeftX as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the left x pixel coordinate of the box.
Notes: In some cases, the left x coordinate of a box may be dynamically determined. An example is the left x coordinate of an CDLegendBoxMBS with alignment set to Center. To determine the left x coordinate, the size of the box must be known first. For these cases, the left x coordinate is undefined until the legend box or the entire chart has been laid out (using CDBaseChartMBS.layout or CDBaseChartMBS.layoutLegend), or the chart image has been drawn (eg. using CDBaseChartMBS.makeChart).

Arguments:
None

Return Value
the left x pixel coordinate of the box.

30.10.7 getTopY as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the top y pixel coordinate of the box.
Notes: In some cases, the top y coordinate of a box may be dynamically determined. An example is the top y coordinate of an CDLegendBoxMBS with alignment set to Center. To determine the top y coordinate, the size of the box must be known first. For these cases, the top y coordinate is undefined until the legend box or the entire chart has been laid out (using CDBaseChartMBS.layout or CDBaseChartMBS.layoutLegend), or the chart image has been drawn (eg. using CDBaseChartMBS.makeChart).

Arguments:
None

Return Value
The top y pixel coordinate of the box.

30.10.8 getWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the width of the box.
Notes: In some usages, the width of a box may be dynamically determined. An example is the width of an LegendBox, which cannot be known until all data are available. In these cases, the width is undefined until the chart or at least the legend box has been laid out (using BaseChart.layout or BaseChart.layoutLegend), or the chart image has been drawn (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3).
Return Value
The width of the box in pixels.

30.10.9 setBackground(colorvalue as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setBackground method, but uses color instead of integer data type for passing color values.
Example:

```
// set edge to be 2 pixel wide line
Var table As CDMLTableMBS
Var t As CDTextBoxMBS = table.getStyle
Var x As Integer = c.flatBorder(2)
t.setBackground(&heeeeee, CDXYChartMBS.kLineColor, x)
```

See also:

- 30.10.10 setBackground(colorvalue as Integer, edgeColor as Integer = -1, raisedEffect as Integer = 0) 5222

30.10.10 setBackground(colorvalue as Integer, edgeColor as Integer = -1, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the background color, border color and 3D border effect of the box.
Notes:

Argument	Default	Description
color	(Mandatory)	The background color of the box.
edgeColor	-1	The border color of the box.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support Chart::glassEffect and Chart::softLighting effects.

See also:

- 30.10.9 setBackground(colorvalue as color, edgeColor as color, raisedEffect as Integer = 0) 5221

30.10.11 setPos(x as Integer, y as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the coordinates of the top-left corner of the box.
Example:

```
// Create a XYChart object of size 250 x 250 pixels
Var c as new CDXYChartMBS(250, 250)

// Add a bar chart layer using the given data
Var t as CDTextBoxMBS = c.addBarLayer(data)
t.setPos(0, -10) // move 10 up
```

Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of the left of the box.
y	(Mandatory)	The y coordinate of the top of the box.

30.10.12 setRoundedCorners(r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border style to use rounded corners.
Notes:

Argument	Default	Description
r1	10	The radius of the top-left rounded corner in pixels.
r2	-1	The radius of the top-right rounded corner in pixels. The default value of -1 means it is the same as the radius of the top-left corner.
r3	-1	The radius of the bottom-right rounded corner in pixels. The default value of -1 means it is the same as the radius of the top-left corner.
r4	-1	The radius of the bottom-left rounded corner in pixels. The default value of -1 means it is the same as the radius of the top-left corner.

30.10.13 setSize(w as Integer, h as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the width and height of the box.
Notes:

Argument	Default	Description
w	(Mandatory)	The width of the box in pixels.
h	(Mandatory)	The height of the box in pixels.

30.11 class CDBoxWhiskerLayerMBS

30.11.1 class CDBoxWhiskerLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The BoxWhiskerLayer class represents box-whisker layers.
Notes: Subclass of the CDBaseBoxLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.11.2 Methods

30.11.3 setBoxColor(item as Integer, boxColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setBoxColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.11.4 setBoxColor(item as Integer, boxColor as Integer) 5224

30.11.4 setBoxColor(item as Integer, boxColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color for a single box.
Notes:

Argument	Default	Description
item	(Mandatory)	The index of the box to change color. The first box is 0, while the Nth box is N - 1.
boxColor	(Mandatory)	The color to use to fill the box.

See also:

- 30.11.3 setBoxColor(item as Integer, boxColor as color) 5224

30.11.5 setBoxColors(colors() as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setBoxColors method, but uses color instead of integer data type for passing color values.
See also:

- 30.11.6 setBoxColors(colors() as color, names() as string) 5225
- 30.11.7 setBoxColors(colors() as Integer) 5225
- 30.11.8 setBoxColors(colors() as Integer, names() as string) 5226

30.11.6 setBoxColors(colors() as color, names() as string)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setBoxColors method, but uses color instead of integer data type for passing color values.
See also:

- 30.11.5 setBoxColors(colors() as color) 5224
- 30.11.7 setBoxColors(colors() as Integer) 5225
- 30.11.8 setBoxColors(colors() as Integer, names() as string) 5226

30.11.7 setBoxColors(colors() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colors for all boxes.
Notes: The method will set the BoxWhiskerLayer into multi-color mode. The colors of each box will be obtained from the given colors array. If there are insufficient colors in the array, the remaining boxes will be auto-colored.

If the names argument is given, the names will appear in the legend box if one is configured for the chart.

Argument	Default	Description
colors	(Mandatory)	An array of colors to be used as the color of the boxes.
names	[Empty_Array]	An array of names to be used in the legend box, if one is configured for the chart.

See also:

- 30.11.5 setBoxColors(colors() as color) 5224
- 30.11.6 setBoxColors(colors() as color, names() as string) 5225
- 30.11.8 setBoxColors(colors() as Integer, names() as string) 5226

30.11.8 setBoxColors(colors() as Integer, names() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colors for all boxes.
Notes: The method will set the BoxWhiskerLayer into multi-color mode. The colors of each box will be obtained from the given colors array. If there are insufficient colors in the array, the remaining boxes will be auto-colored.

If the names argument is given, the names will appear in the legend box if one is configured for the chart.

Argument	Default	Description
colors	(Mandatory)	An array of colors to be used as the color of the boxes.
names	[Empty_Array]	An array of names to be used in the legend box, if one is configured for the chart.

See also:

- 30.11.5 setBoxColors(colors() as color) 5224
- 30.11.6 setBoxColors(colors() as color, names() as string) 5225
- 30.11.7 setBoxColors(colors() as Integer) 5225

30.11.9 setWhiskerBrightness(whiskerBrightness as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the whisker colors as darken or brightened fill colors of the boxes for BoxWhiskerLayer in multi-color mode.
Notes: In multi-color mode, the boxes of a BoxWhiskerLayer can have different fill colors. Instead of specifying a single whisker color for all boxes, ChartDirector supports deriving the whisker colors by darkening or brightening the corresponding fill colors.

Argument	Default	Description
whiskerBrightness	(Mandatory)	The brightness factor. A value less than 1 means darkening. A value larger than 1 means brightening. A zero value means black.

30.12 class CDCandleStickLayerMBS

30.12.1 class CDCandleStickLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The CandleStickLayer class represents candlestick layers.
Notes: Subclass of the CDBaseBoxLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.12.2 Methods

30.12.3 setColors(upFillColor as color, upLineColor as color, downFillColor as color, downLineColor as color)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures the colors for candlesticks.
Notes: The standard way to color a candlestick is to color it based on whether it is on an "up" or "down" trading session, in which "up" is defined as the closing price higher than or equal to the opening price, otherwise it is "down".

Argument	Default	Description
upFillColor	(Mandatory)	The fill color for "up" trading sessions.
upLineColor	(Mandatory)	The line color for "up" trading sessions.
downFillColor	(Mandatory)	The fill color for "down" trading sessions.
downLineColor	(Mandatory)	The line color for "down" trading sessions.

See also:

- 30.12.4 setColors(upFillColor as Integer, upLineColor as Integer, downFillColor as Integer, downLineColor as Integer) 5227

30.12.4 setColors(upFillColor as Integer, upLineColor as Integer, downFillColor as Integer, downLineColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures the colors for candlesticks.
Notes: The standard way to color a candlestick is to color it based on whether it is on an "up" or "down" trading session, in which "up" is defined as the closing price higher than or equal to the opening price, otherwise it is "down".

Argument	Default	Description
upFillColor	(Mandatory)	The fill color for "up" trading sessions.
upLineColor	(Mandatory)	The line color for "up" trading sessions.
downFillColor	(Mandatory)	The fill color for "down" trading sessions.
downLineColor	(Mandatory)	The line color for "down" trading sessions.

See also:

- 30.12.3 setColors(upFillColor as color, upLineColor as color, downFillColor as color, downLineColor as color) 5227

30.12.5 setExtraColors(upDownFillColor as color, upDownLineColor as color, downDownFillColor as color, downDownLineColor as color, leadValue as Double = -1.7E308)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures additional colors for candlesticks.
Notes: The standard way to color a candlestick is to color it using the method as mentioned in CandleStickLayer.setColors, in which "up" is defined as the closing price higher than or equal to the opening price.

In some applications, it may be desirable to vary the candlestick colors based on an alternative definition of "up" and "down", in which "up" is defined as the closing price higher than or equal to that of the previous trading session.

With these two definitions of "up" and "down", a candlestick can have 4 states. It can be "up/up" ("up" as according to both the standard and alternative definitions), "up/down" ("up" according to the standard definition, "down" according to the alternative definition), "down/up" or "down/down".

The setExtraColors method can be used to configure the "up/down" and "down/down" colors. If this method is used, the colors configured with CandleStickLayer.setColors will be considered as the "up/up" and "down/up" colors.

See also:

- 30.12.6 setExtraColors(upDownFillColor as Integer, upDownLineColor as Integer, downDownFillColor as Integer, downDownLineColor as Integer, leadValue as Double = -1.7E308) 5229

Argument	Default	Description
upDownFillColor	(Mandatory)	The fill color for "up/down" days.
upDownLineColor	(Mandatory)	The line color for "up/down" days.
downDownFillColor	(Mandatory)	The fill color for "down/down" days.
downDownLineColor	(Mandatory)	The line color for "down/down" days.
leadValue	[-Infinity]	The closing price before the first trading session, which is used to determine if the first trading session is "up" or "down" according to the alternative definition.

30.12.6 setExtraColors(upDownFillColor as Integer, upDownLineColor as Integer, downDownFillColor as Integer, downDownLineColor as Integer, leadValue as Double = -1.7E308)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures additional colors for candlesticks.
Notes: The standard way to color a candlestick is to color it using the method as mentioned in CandleStickLayer.setColors, in which "up" is defined as the closing price higher than or equal to the opening price.

In some applications, it may be desirable to vary the candlestick colors based on an alternative definition of "up" and "down", in which "up" is defined as the closing price higher than or equal to that of the previous trading session.

With these two definitions of "up" and "down", a candlestick can have 4 states. It can be "up/up" ("up" as according to both the standard and alternative definitions), "up/down" ("up" according to the standard definition, "down" according to the alternative definition), "down/up" or "down/down".

The setExtraColors method can be used to configure the "up/down" and "down/down" colors. If this method is used, the colors configured with CandleStickLayer.setColors will be considered as the "up/up" and "down/up" colors.

Argument	Default	Description
upDownFillColor	(Mandatory)	The fill color for "up/down" days.
upDownLineColor	(Mandatory)	The line color for "up/down" days.
downDownFillColor	(Mandatory)	The fill color for "down/down" days.
downDownLineColor	(Mandatory)	The line color for "down/down" days.
leadValue	[-Infinity]	The closing price before the first trading session, which is used to determine if the first trading session is "up" or "down" according to the alternative definition.

See also:

- 30.12.5 setExtraColors(upDownFillColor as color, upDownLineColor as color, downDownFillColor as color, downDownLineColor as color, leadValue as Double = -1.7E308) 5228

30.13 class CDColorAxisMBS

30.13.1 class CDColorAxisMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The ColorAxis class represents color axes.
Example:

```
// set title and gradient of the color legend of a contour chart
Var xData() As Double = Array(0.0, 1.0, 2.0, 0.0, 1.0, 2.0, 0.0, 1.0, 2.0)
Var yData() As Double = Array(0.0, 0.0, 0.0, 1.0, 1.0, 1.0, 2.0, 2.0, 2.0)
Var zData() As Double = Array(1.0, 3.0, 2.0, 4.0, 9.0, 5.0, 2.0, 4.0, 3.0)

Var c As New CDXYChartMBS(500, 400)
Call c.setPlotArea(50, 30, 320, 320)
Var layer As CDContourLayerMBS = c.addContourLayer(xData, yData, zData)

Var axis As CDColorAxisMBS = layer.setColorAxis(400, 30, CDBaseChartMBS.kTopLeft, 320, 1)
Call axis.setTitle("Temperature")
axis.setColorGradient(True) // smooth instead of steps
axis.setBoxMargin(5)

Var pic As Picture = c.makeChartPicture
```

Notes: It is a subclass of Axis.

A color axis is similar to an x or y axis. However, instead of mapping data values to positions, a color axis maps data values to colors. Color axes are used in CDContourLayerMBS and in CDSurfaceChartMBS objects.

Similar to an x or y axis, a color axis is visually represented as a thin bar that can be horizontal or vertical, and has a scale along its length. The scale can be set explicitly or can be determined by auto-scaling.

If you are using the color axis on a surface chart, please note that by default, the color axis scale is synchronized to the z axis. You need to use CDAxisMBS.syncAxis to cancel the synchronization before you can independently set the color axis scale.

In addition to the scale, a color axis is colored with a continuous color gradient or discrete color steps along its length. This maps the values on the axis with colors.

For an x or y axis, the major and minor ticks correspond to major and minor grid lines on the chart. For a color axis, these ticks correspond to major and minor contour lines on the chart.

Like an x or y axis, you can add marks to the color axis using Axis.addMark. They will become mark contour lines on the chart.

The color axis, if visible, acts as a color legend. The axis stem is a thin rectangle 15 pixels in width, configurable with CDAxisMBS.setWidth. A bounding box can be added to surround the color axis using CDColorAxisMBS.setBoundingBox.

A color axis works normally (determines color mapping and contour levels) even if it is not displayed.
Subclass of the CDAxisMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.13.2 Methods

30.13.3 getBoxHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the height of the color axis inclusive of the bounding box.
Notes: This method should be called only after axis layout (after calling CDXYChartMBS.layoutAxes, CDBaseChartMBS.layout or CDXYChartMBS.packPlotArea).

30.13.4 getBoxWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the width of the color axis inclusive of the bounding box.
Notes: This method should be called only after axis layout (after calling CDXYChartMBS.layoutAxes, CDBaseChartMBS.layout or CDXYChartMBS.packPlotArea).

30.13.5 getColor(z as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the color given the data value.
Notes: You must call CDXYChartMBS.layoutAxes, CDBaseChartMBS.layout or CDXYChartMBS.packPlotArea first before calling this method. ChartDirector needs to perform auto-scaling and layout the axis before it can compute the color.

Arguments:

Argument	Default	Description
z	(Mandatory)	The data value.

Return Value
The color that corresponds to the data value.

30.13.6 getColorScale as Double()

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the color stops defining the axis scale and the associated colors.
Notes: Returns an array of numbers representing the color stops.
Please refer to ColorAxis.setColorScale on how to interpret this array.

30.13.7 setAxisBorder(edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setAxisBorder method, but uses color instead of integer data type for passing color values.
Notes:

Argument	Default	Description
edgeColor	(Mandatory)	The edge color of the axis stem.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument can also be used to specify glassEffect, softLighting, :cylinderEffect or flatBorder effects.

See also:

- 30.13.8 setAxisBorder(edgeColor as Integer, raisedEffect as Integer = 0) 5233

30.13.8 setAxisBorder(edgeColor as Integer, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border color and 3D border effect of the axis stem.
Notes:

Argument	Default	Description
edgeColor	(Mandatory)	The edge color of the axis stem.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument can also be used to specify glassEffect, softLighting, :cylinderEffect or flatBorder effects.

See also:

- 30.13.7 setAxisBorder(edgeColor as color, raisedEffect as Integer = 0) 5232

30.13.9 setAxisPos(x as Integer, y as Integer, alignment as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position and alignment of the color axis.

30.13.10 setBoundingBox(fillColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setBoundingBox method, but uses color instead of integer data type for passing color values.
See also:

- 30.13.11 setBoundingBox(fillColor as Integer, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0) 5233

30.13.11 setBoundingBox(fillColor as Integer, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the background color, border color and 3D border effect of the bounding box.
Notes: Arguments:

Argument	Default	Description
fillColor	(Mandatory)	The background color of the bounding box.
edgeColor	kTransparent	The border color of the bounding box.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support CDBaseChartMBS.glassEffect, CDBaseChartMBS.softLighting and CDBaseChartMBS.cylinderEffect effects.

See also:

- 30.13.10 setBoundingBox(fillColor as color, edgeColor as color, raisedEffect as Integer = 0) 5233

30.13.12 setBoxMargin(leftMargin as Integer, rightMargin as Integer, topMargin as Integer, bottomMargin as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the margins of the bounding box in pixels.
Notes: The margins of a bounding box refer to the distances between the borders of the bounding box to the color axis inside.

Arguments:

Argument	Default	Description
leftMargin	(Mandatory)	The left margin in pixels.
rightMargin	(Mandatory)	The right margin in pixels.
topMargin	(Mandatory)	The top margin in pixels.
bottomMargin	(Mandatory)	The bottom margin in pixels.

See also:

- 30.13.13 setBoxMargin(m as Integer) 5234

30.13.13 setBoxMargin(m as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets all margins (left, right, top, and bottom) of the bounding box to the same value.
Notes: The margins of a bounding box refer to the distances between the borders of the bounding box to the color axis inside.

Arguments:

Argument	Default	Description
m	(Mandatory)	The left, right, top and bottom margins in pixels.

See also:

- 30.13.12 setBoxMargin(leftMargin as Integer, rightMargin as Integer, topMargin as Integer, bottomMargin as Integer) 5234

30.13.14 setColorGradient(isContinuous as boolean, Colors() as color, underflowColor as color, overflowColor as color)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the continuous color gradient or discrete color steps for the color axis.
Notes: Arguments:

Argument	Default	Description
isContinuous	true	True ti set to continuous color gradient. False to set to discrete color steps.
colors	[Empty_Array]	An array of colors used to define the continuous color gradient. If an empty array is used, the colors are automatically determined.

ChartDirector will interpolate between the colors to create the continuous gradient. If discrete color steps are used, ChartDirector will take samples along the continuous color gradient. The number of samples is determined by the number of ticks on the axis, and may not equal the number of colors in the colors array.

overflowColor	-1	The color to use if a value exceeds the maximum value of the axis scale. -1 means the overflowColor is the same color at the maximum value.
underflowColor	-1	The color to use if a value falls below the minimum value of the axis scale. -1 means the underflowColor is the same color at the minimum value.

See also:

- 30.13.15 setColorGradient(isContinuous as boolean, Colors() as color, underflowColor as Integer, overflowColor as Integer = -1) 5236
- 30.13.16 setColorGradient(isContinuous as boolean, Colors() as Integer, underflowColor as Integer = -1, overflowColor as Integer = -1) 5236
- 30.13.17 setColorGradient(isContinuous as boolean=true) 5237

30.13.15 setColorGradient(isContinuous as boolean, Colors() as color, underflowColor as Integer, overflowColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the continuous color gradient or discrete color steps for the color axis.
Notes: Arguments:

Argument	Default	Description
isContinuous	true	True ti set to continuous color gradient. False to set to discrete color steps.
colors	[Empty_Array]	An array of colors used to define the continuous color gradient. If an empty array is used, the colors are automatically determined.

ChartDirector will interpolate between the colors to create the continuous gradient. If discrete color steps are used, ChartDirector will take samples along the continuous color gradient. The number of samples is determined by the number of ticks on the axis, and may not equal the number of colors in the colors array.

overflowColor	-1	The color to use if a value exceeds the maximum value of the axis scale. -1 means the overflowColor is the same color at the maximum value.
underflowColor	-1	The color to use if a value falls below the minimum value of the axis scale. -1 means the underflowColor is the same color at the minimum value.

- 30.13.17 setColorGradient(isContinuous as boolean=true) 5237

30.13.16 setColorGradient(isContinuous as boolean, Colors() as Integer, underflowColor as Integer = -1, overflowColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the continuous color gradient or discrete color steps for the color axis.
Notes: Arguments:

ChartDirector will interpolate between the colors to create the continuous gradient. If discrete color steps are used, ChartDirector will take samples along the continuous color gradient. The number of samples is determined by the number of ticks on the axis, and may not equal the number of colors in the colors array.

Argument	Default	Description
isContinuous	true	True ti set to continuous color gradient. False to set to discrete color steps.
colors	[Empty_Array]	An array of colors used to define the continuous color gradient. If an empty array is used, the colors are automatically determined.
overflowColor	-1	The color to use if a value exceeds the maximum value of the axis scale. -1 means the overflowColor is the same color at the maximum value.
underflowColor	-1	The color to use if a value falls below the minimum value of the axis scale. -1 means the underflowColor is the same color at the minimum value.

See also:

- 30.13.15 setColorGradient(isContinuous as boolean, Colors() as color, underflowColor as Integer, overflowColor as Integer = -1) 5236
- 30.13.17 setColorGradient(isContinuous as boolean=true) 5237

30.13.17 setColorGradient(isContinuous as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the continuous color gradient or discrete color steps for the color axis.
Notes: Arguments:

Argument	Default	Description
isContinuous	true	True ti set to continuous color gradient. False to set to discrete color steps.
colors	[Empty_Array]	An array of colors used to define the continuous color gradient. If an empty array is used, the colors are automatically determined.

ChartDirector will interpolate between the colors to create the continuous gradient. If discrete color steps are used, ChartDirector will take samples along the continuous color gradient. The number of samples is determined by the number of ticks on the axis, and may not equal the number of colors in the colors array.

See also:

- 30.13.14 setColorGradient(isContinuous as boolean, Colors() as color, underflowColor as color, overflowColor as color) 5235
- 30.13.15 setColorGradient(isContinuous as boolean, Colors() as color, underflowColor as Integer, overflowColor as Integer = -1) 5236

overflowColor	-1	The color to use if a value exceeds the maximum value of the axis scale. -1 means the overflowColor is the same color at the maximum value.
underflowColor	-1	The color to use if a value falls below the minimum value of the axis scale. -1 means the underflowColor is the same color at the minimum value.

- 30.13.16 setColorGradient(isContinuous as boolean, Colors() as Integer, underflowColor as Integer = -1, overflowColor as Integer = -1) 5236

30.13.18 setColorScale(colorStops() as Double, underflowColor as Integer = -1, overflowColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the axis scale and the associated colors.
Notes: The axis scale and the associated colors are defined with an array of numbers. For a color scale with continuous color gradient, each pair of numbers represents a value and its associated color. For example, for a continuous color scale in which 0 is blue (0000FF), 50 is yellow (FFFF00) and 100 is red (FF0000), the numbers should be:

0.0, &h0000ff, 50.0, &hffff00, 100.0, &hff0000

For a color scale with discrete color steps, the number of colors would be one less than the number of values. For example, to define a step color scale in which 0 to 50 is red (FF0000), and 50 to 100 is green (00FF00), the numbers will be:

0.0, &hff000, 50.0, &h00ff00, 100.0

Argument	Default	Description
colorStops	(Mandatory)	An array of numbers alternating between values and colors. If the number count is even, the array will define a continuous color scale, otherwise it will define a step color scale.
underflowColor	-1	The color to use if a value falls below the minimum value of the axis scale. -1 means the underflowColor is the same color at the minimum value.
overflowColor	-1	The color to use if a value exceeds the maximum value of the axis scale. -1 means the overflowColor is the same color at the maximum value.

30.13.19 setCompactAxis(b as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets whether to compact the axis or not.

Notes: For a color axis, the axis can assume any length. Typically, an initial length is specified so that ChartDirector can determine how many labels can be fitted on the axis, and auto-scale the axis accordingly.

After the labels are determined, ChartDirector can compact the axis by setting its length to the minimum length compatible with the major tick density (see CDAxisMBS.setTickDensity).

For example, suppose ChartDirector auto-scaling has set the axis labels to be [0, 1, 2, 3, 4, 5] , and the major tick density is 20 pixels, ChartDirector will set the axis length to 100 pixels, irrespective of its original length.

If this method is never called, the default is not to compact the axis.

Arguments:

Argument	Default	Description
b	true	A true value means to compact the axis. A false value means not to compact the axis.

30.13.20 setLevels(maxLevels as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the maximum number of contour intervals on the axis.
Notes: If discrete color steps are used, the number of contour intervals is the number of color steps on the axis.

For a general color axis, the number of contour intervals is equal to the number of ticks minus 1. For example, an axis with 6 ticks at [0, 2, 4, 6, 8, 10] has 6 contour lines and 5 contour intervals.

The main usage of this method is to limit the number of contour lines and/or color steps on the contour layer.

If this method is never called, the default maximum number of contour intervals is 16.

Arguments:

Argument	Default	Description
maxLevels	(Mandatory)	An integer representing the maximum number of contour intervals.

30.13.21 setRoundedCorners(r1 as Integer = 10, r2 as Integer = -1, r3 as Integer = -1, r4 as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border style of the bounding box to rounded corners.
Notes: Arguments:

Argument	Default	Description
r1	10	The radius of the top-left rounded corner in pixels.
r2	-1	The radius of the top-right rounded corner in pixels. -1 means it is the same as the radius of the top-left corner.
r3	-1	The radius of the bottom-right rounded corner in pixels. -1 means it is the same as the radius of the top-left corner.
r4	-1	The radius of the bottom-left rounded corner in pixels. -1 means it is the same as the radius of the top-left corner.

30.14 class CDContourLayerMBS

30.14.1 class CDContourLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The ContourLayer class represents contour layers
Example:

```
// a contour chart of z = x * y with a color legend
Var xData(), yData(), zData() As Double
For yi As Integer = 0 To 10
For xi As Integer = 0 To 10
xData.Add xi
yData.Add yi
zData.Add xi * yi
Next
Next

Var c As New CDXYChartMBS(500, 420)
Call c.setPlotArea(60, 40, 340, 340)
Var layer As CDContourLayerMBS = c.addContourLayer(xData, yData, zData)
layer.setContourColor(&h80000000) // semi transparent black contour lines
Call layer.setColorAxis(420, 40, CDBaseChartMBS.kTopLeft, 340, 1) // 1 = vertical

Var pic As Picture = c.makeChartPicture
```

Notes: CDContourLayerMBS is a subclass of CDLayerMBS.

CDContourLayerMBS objects are created by using CDXYChartMBS.addContourLayer.

The data for the CDContourLayerMBS are the z values at some points in the xy plane. Both gridded and scattered data points are supported.

Using the data, the ContourLayer computes the z values of all pixels in the xy plane. The computation can be based on spline or bilinear/line surface fitting, configurable using CDContourLayerMBS.setSmoothInterpolation.

The ContourLayer then colors the pixels based on the z values, and draws contour lines to join positions with the same z values. The color mapping and contour levels are controlled by the ColorAxis object of the ContourLayer, obtainable using CDContourLayerMBS.colorAxis.

If you need to change colors for the contour layer, please use ColorAxis.setColorGradient:

Call myContourLayer.colorAxis().setColorGradient(True, anArrayOfColors)

ChartDirector will then use the array of colors, and interpolate among them, to fill the contour layer. For example, if the array of colors contain 3 colors red, green and blue, ChartDirector will interpolate from red to green for half of the z-levels, and green to blue for the other half.
Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.
Xojo Developer Magazine

- 7.4, page 33: Easy Charts and Graphs, Using the ChartDirector Plugin

30.14.2 Methods

30.14.3 addCustomContour(z as double, contourColor as Integer, contourWidth as Integer, contourLabel as string, font as string = "normal", fontsize as double = 12, fontColor as integer = &hffff0002) as CDMarkMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a custom contour to the layer.
Notes: You can also add a custom contour by using Axis.addMark on the ColorAxis, in which case a label will also be added to the color axis. The addCustomContour method adds the label to the contour without affecting the color axis.

Argument	Default	Description
z	(Mandatory)	The z value of the contour.
contourColor	(Mandatory)	The contour line color.
contourWidth	(Mandatory)	The contour line width in pixels.
contourLabel	(Mandatory)	The text of the contour label.
font	"normal"	The font used to draw the label.
fontSize	8	The font size used to draw the label.
fontColor	TextColor	The color used to draw the labels.

30.14.4 colorAxis as CDColorAxisMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the ColorAxis object representing the color axis (color legend).

30.14.5 getCrossSection(x0 as Integer, y0 as Integer, x1 as Integer, y1 as Integer) as Double()

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the cross section between two points on a contour layer.
Notes: Note: This method should be used only after ChartDirector has output the chart image, or after BaseChart.layout has been called.

This method will return an array of numbers representing the z values of evenly spaced samples along a straight line joining the two end-points. The end-points are specified in pixel coordinates. If the input are data values, they can be converted to pixel coordinates using XYChart.getXCoor and XYChart.getYCoor.

Argument	Default	Description
x0	(Mandatory)	The x pixel coordinate of the first end-point.
y0	(Mandatory)	The y pixel coordinate of the first end-point.
x1	(Mandatory)	The x pixel coordinate of the second end-point.
y1	(Mandatory)	The y pixel coordinate of the second end-point.

Return Value
An array of numbers epresenting the z values of evenly spaced samples along a straight line joining the two end-points. The array can contain NoValue if.

30.14.6 getZAtPixel(x as Integer, y as Integer) as Double

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the z value at the specify (x, y) pixel coordinate.
Notes: This method should be used only after ChartDirector has output the chart image, or after BaseChart.layout has been called.

Argument	Default	Description
x	(Mandatory)	The x pixel coordinate.
y	(Mandatory)	The y pixel coordinate.

Return Value
The z value at the sepcified (x, y) pixel coordinate, or NoValue if the point lie outside the contour region.

30.14.7 getZAtValue(x as double, y as double) as Double

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the z value at the specify (x, y) data values.
Notes: This method should be used only after ChartDirector has output the chart image, or after BaseChart.layout has been called.

Argument	Default	Description
x	(Mandatory)	The x data value.
y	(Mandatory)	The y data value.

Return Value
The z value at the sepcified (x, y) data coordinate, or NoValue if the point lie outside the contour region.

30.14.8 setColorAxis(x as Integer, y as Integer, alignment as Integer, length as Integer, orientation as Integer) as CDColorAxisMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position, length and orientation of the color axis (color legend).
Notes: Arguments:

Argument	Default	Description
x	(Mandatory)	The x-coordinate of the reference point used to position the color axis.
y	(Mandatory)	The y-coordinate of the reference point used to position the color axis.
alignment	(Mandatory)	The alignment of the color axis with respect to the reference point. For example, a value of kTopLeft means the reference point is the top- left corner of the color axis. See Alignment Specification for supported alignment types.
length	(Mandatory)	The length of the color axis in pixels.
orientation	(Mandatory)	The orientation of the color axis. A value of kTop/kBottom means the axis is horizontal, and the axis labels are at top/bottom side of the axis. A value of kLeft/kRight means the axis is vertical, and the axis labels are at the left/right side of the axis.

30.14.9 setContourColor(contourColor as color, minorContourColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setContourColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.14.10 setContourColor(contourColor as Integer, minorContourColor as Integer = -1)

30.14.10 setContourColor(contourColor as Integer, minorContourColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets contour line colors.
Notes:

Argument	Default	Description
contourColor	(Mandatory)	The major contour line color. If this method is never called, the default contour line color is semi-transparent black (&h80000000).
minorContourColor	-1	The minor contour line color. -1 means the minor contour line color is the same as the major contour line color.

See also:

- 30.14.9 setContourColor(contourColor as color, minorContourColor as color) 5244

30.14.11 setContourLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the data label format.
Notes: By default, the data label format is " { label } ". Please refer to Parameter Substitution and Formatting on available parameters and how to format them.

Argument	Default	Description
formatString	(Mandatory)	The format string.

30.14.12 setContourLabelSpacing(labelSpacing as Integer, minContourLen as Integer)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the spacing between contour labels.
Notes: ChartDirector will try to place labels at relative straight segments along the contour while ensuring the labels are not too close together. The default target label spacing is 300 pixels.

If the contour is short relative to the label length, all or a large part of the contour may become the label, and the contour line may become hard to see. By default, ChartDirector will not put a label on a contour if the contour length is less than 3 times that of the label length. This allows the contour on either side of the label to be as least as long as the label.

This method can be used to adjust what is the target label spacing and contour length for positioning labels.

Argument	Default	Description
labelSpacing	(Mandatory)	The target label spacing in pixels. The actual spacing may be different as the labels can only be placed on relatively straight segments along the contour.
minContourLen	(Mandatory)	The minimum contour length in pixels below which there will be no contour label.

30.14.13 setContourLabelStyle(font as string = "normal", fontsize as double = 12, fontColor as integer = &hffff0002) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables contour labels and sets their styles.
Notes:

Argument	Default	Description
font	"normal"	The font used to draw the labels.
fontSize	8	The font size used to draw the labels.
fontColor	TextColor	The color used to draw the labels.

Returns a TextBox object representing the prototype of the contour labels. This may be used to fine-tune the appearance of the contour labels.

30.14.14 setContourWidth(contourWidth as Integer, minorContourWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets contour line widths.
Notes: Arguments:

Argument	Default	Description
contourWidth	(Mandatory)	The major contour line width in pixels. If this method is never called, the default contour line width is 1 pixel.
minorContourWidth	-1	The minor contour line width. -1 means the minor contour line width is the same as the major contour line width.

30.14.15 setExactContour(contour as boolean = true)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets whether to use exact contours or boundary contours.
Notes: In exact contour mode, the contour at z = N refers to all points at z = N. For example, the contour at z = 10 refers to all points at z = 10. These points normally constitute lines. However, in case there is an exactly flat region at z = 10, the entire region will be the contour and will be colored using the contour color. In other words, instead of lines, a contour can become a region.

In boundary contour mode, the contour at z = N refers to the boundary between z <N and z >= N, except for the highest contour in which case the contour is the boundary between z <= N and z >N. With this method, if there is a flat region, the contour will occur at the boundary of the region.

If this method is never called, the default is to use boundary contour mode.

Argument	Default	Description
contour	true	A true value specifies exact contour mode for standard contours, otherwise boundary contour mode will be used.
markContour	[Same_As_Contour]	A true value specifies exact contour mode for mark contours. A false value specifies boundary contour mode for mark contours. A mark contour is an extra contour added using Axis.addMark on the color axis (obtained using ContourLayer.colorAxis). If this parameter is not specified, the default is to use the same contour mode as standard contours.

See also:

- 30.14.16 setExactContour(contour as boolean, markContour as boolean) 5247

30.14.16 setExactContour(contour as boolean, markContour as boolean)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets whether to use exact contours or boundary contours.
Notes: In exact contour mode, the contour at z = N refers to all points at z = N. For example, the contour at z = 10 refers to all points at z = 10. These points normally constitute lines. However, in case there is an exactly flat region at z = 10, the entire region will be the contour and will be colored using the contour color. In other words, instead of lines, a contour can become a region.

In boundary contour mode, the contour at z = N refers to the boundary between z <N and z >= N, except for the highest contour in which case the contour is the boundary between z <= N and z >N. With this method, if there is a flat region, the contour will occur at the boundary of the region.

If this method is never called, the default is to use boundary contour mode.

See also:

- 30.14.15 setExactContour(contour as boolean = true) 5246

Argument	Default	Description
contour	true	A true value specifies exact contour mode for standard contours, otherwise boundary contour mode will be used.
markContour	[Same_As_Contour]	A true value specifies exact contour mode for mark contours. A false value specifies boundary contour mode for mark contours. A mark contour is an extra contour added using Axis.addMark on the color axis (obtained using ContourLayer.colorAxis). If this parameter is not specified, the default is to use the same contour mode as standard contours.

30.14.17 setSmoothInterpolation(b as boolean)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets whether to use spline or bilinear/linear surface interpolation.
Notes: The data points for the contour layer are samples of the z values at certain gridded or scattered (x, y) points. However, to draw the contour and to color the layer, it is necessarily to know the z values at all pixels in the xy plane. ChartDirector uses surface interpolation to compute the z values at all pixels from the given data points.

In spline surface interpolation, ChartDirector will compute a smooth surface that passes through all data points. In bilinear/linear surface interpolation, ChartDirector will use the data points to partition the (x, y) plane into rectangular or triangular regions, and will fit bilinear or linear surfaces to the regions.

Spline surface interpolation generally produces smoother contours and is the default.

Arguments:

Argument	Default	Description
b	(Mandatory)	A true value means to use spline surface interpolation. A false value means to use bilinear/linear surface interpolation.

30.14.18 setZBounds(minZ as Double, maxZ as Double)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clips the z values to the given bounds.
Notes: In spline surface interpolation (see ContourLayer.setSmoothInterpolation), it is possible that the interpolated surface contains regions that are higher than the highest data point, or lower than the lowest data point.

As an example, consider a linear sequence of points with z values [10, 20, 30, 40, 40, 30, 20, 10] . The first 4 points represent an upward slope, while the last 4 points represent a download slope. If these points are to

be joined with a smooth spline, the peak will naturally fall somewhere between the middle two points and exceed 40. So there will be a region in the spline higher than the highest data point.

In some applications, it may be desirable to limit the z values to certain bounds. For example, if the data are about rainfall, it is not desirable if the interpolated surface falls below 0, as there cannot be negative rainfall. The setZBounds method can be used to clip the interpolated surface to the desired bounds.

Argument	Default	Description
minZ	DataBound	The minimum z value to clip to. Use NoValue if there is no minimum z bound. The special constant DataBound means that the minimum z value is the minimum data value.
maxZ	DataBound	The maximum z value to clip to. Use NoValue if there is no maximum z bound. The special constant DataBound means that the maximum z value is the maximum data value.

30.14.19 setZData(zData() as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the z data used for the contour chart.
Notes: Arguments:

Argument	Default	Description
zData	(Mandatory)	An array of numbers as the z data for the contour chart.

30.14.20 Screenshots

30.14.21 contour.jpg

Function: A XY chart showing a contour layer created using ChartDirector with the CDXYChartMBS class.

30.15 class CDDataAcceleratorMBS

30.15.1 class CDDataAcceleratorMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The DataAccelerator class is for speeding up processing of huge data series.
Example:

```
// prepare a huge data series for fast zooming in a chart
Var r As New CDRanSeriesMBS(1)
Var xData() As Double = r.getSeries(1000000, 0, 1000000) // one million x values
xData.Sort
Var yData() As Double = r.getSeries(1000000, 100, -1, 1, 0)

Var fast As New CDDataAcceleratorMBS(xData)
fast.addDataSeries("price", yData)
fast.setSubsetRange(0, 100000) // only the visible range

// pass fast to CDXYChartMBS.setDataAccelerator and add layers with the series id "price"
```

Notes: With the DataAccelerator, it is possible to plot a chart with 1 billion data points with programmable track cursor support. The chart can smoothly zoom out to display all data points and zoom in 100,000,000X to see individual data points. At the same time, the chart can update in real time with thousands of data points per second.

Even if DataAccelerator is not used, ChartDirector can often achieve adequate performance for up to a few million data points depending on chart complexity. That means you do not need to use DataAccelerator if you have less than 100000 data points.

Each DataAccelerator can support one x data series shared by multiple y data series. Multi-threading can be used to process the series in parallel. You can use multiple DataAccelerator objects if you have multiple x data series.

The DataAccelerator needs around 12 bytes of RAM per data value. Since the application must store the data in RAM before passing it to DataAccelerator, it needs at least 8 bytes per double precision number. That means the application would consume around 20 bytes per value, or 20G of RAM for 1 billion values.

In the current version of ChartDirector, only XY chart line layers can support DataAccelerator with the CDXYChartMBS.addLineLayer3 method. Area charts can be created from line layers with CDXY-ChartMBS.addInterLineLayer.

30.15.2 Methods

30.15.3 addDataSeries(id as string, yData as CDArrayMBS)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a data series.
Notes: The yData is an array for storing the y data values, and yDataLen is the number of valid values in the array.

To conserve memory, DataAccelerator will only keep a reference to the array and not copy it. The caller must ensure the array remains valid for as long as the DataAccelerator is in use.

For real time chart usage, the array acts as a buffer to store real time data. Initially the number of valid values can be 0. As new data come in, the values can be stored in the array and CDDataAcceleratorMBS.extendLength can be called to update the number of valid values.

This method is specially designed to allow multiple data series to be updated concurrently with multiple threads.

Argument	Default	Description
id	(Mandatory)	Name of the data series. Each data series in a CDDataAcceleratorMBS object must have a unique name.
yData	(Mandatory)	The array to store the data values.

See also:

- 30.15.4 addDataSeries(id as string, yData() as double) 5252

30.15.4 addDataSeries(id as string, yData() as double)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a data series.
Notes: The yData is an array for storing the y data values, and yDataLen is the number of valid values in the array.

To conserve memory, DataAccelerator will only keep a reference to the array and not copy it. The caller must ensure the array remains valid for as long as the DataAccelerator is in use.

For real time chart usage, the array acts as a buffer to store real time data. Initially the number of valid values can be 0. As new data come in, the values can be stored in the array and CDDataAcceleratorMBS.extendLength can be called to update the number of valid values.

This method is specially designed to allow multiple data series to be updated concurrently with multiple threads.

Argument	Default	Description
id	(Mandatory)	Name of the data series. Each data series in a CDDataAcceleratorMBS object must have a unique name.
yData	(Mandatory)	The array to store the data values.

See also:

- 30.15.3 addDataSeries(id as string, yData as CDArrayMBS) 5252

30.15.5 Constructor

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a DataAccelerator object.
Notes: The xData is an array for storing the x data values, and xDataLen is number of valid values in the array.

To conserve memory, DataAccelerator will only keep a reference to the array and not copy it. The caller must ensure the array remains valid for as long as the DataAccelerator is in use.

For real time chart usage, the array acts as a buffer to store real time data. Initially the number of valid values can be 0. As new data come in, the values can be stored in the array and DataAccelerator.extendLength can be called to update the number of valid values.

Argument	Default	Description
xData	(Mandatory)	The array to store the x values.
xDataLen	(Mandatory)	The number of valid values.

See also:

- 30.15.6 Constructor(xData as CDArrayMBS) 5254

• 30.15.7 Constructor(xData() as double) 5254

30.15.6 Constructor(xData as CDArrayMBS)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a DataAccelerator object.
Notes: The xData is an array for storing the x data values, and xDataLen is number of valid values in the array.

To conserve memory, DataAccelerator will only keep a reference to the array and not copy it. The caller must ensure the array remains valid for as long as the DataAccelerator is in use.

For real time chart usage, the array acts as a buffer to store real time data. Initially the number of valid values can be 0. As new data come in, the values can be stored in the array and DataAccelerator.extendLength can be called to update the number of valid values.

Argument	Default	Description
xData	(Mandatory)	The array to store the x values.
xDataLen	(Mandatory)	The number of valid values.

See also:

• 30.15.5 Constructor 5253

• 30.15.7 Constructor(xData() as double) 5254

30.15.7 Constructor(xData() as double)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a DataAccelerator object.
Notes: The xData is an array for storing the x data values, and xDataLen is number of valid values in the array.

To conserve memory, DataAccelerator will only keep a reference to the array and not copy it. The caller must ensure the array remains valid for as long as the DataAccelerator is in use.

For real time chart usage, the array acts as a buffer to store real time data. Initially the number of valid values can be 0. As new data come in, the values can be stored in the array and DataAccelerator.extendLength can be called to update the number of valid values.

Argument	Default	Description
xData	(Mandatory)	The array to store the x values.
xDataLen	(Mandatory)	The number of valid values.

See also:

- 30.15.5 Constructor 5253
- 30.15.6 Constructor(xData as CDArrayMBS) 5254

30.15.8 extendLength(len as Integer)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Extends the number of valid values in the arrays.
Notes: This method is usually used by real time charts. After storing the real time data into the data arrays, the extendLength method should be used to notify the DataAccelerator of the new data. You must ensure all data arrays in the DataAccelerator are updated to contain valid data before calling this method.

You can only increase the number of valid values, but not decrease it.

Argument	Default	Description
length	(Mandatory)	The number of valid values in the arrays.

30.15.9 setSubsetRange(xStart as double, xEnd as double, resolution as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the data range used for chart plotting.
Notes: For zoomable and scrollable chart, depending on the zoom level, only part of the data may be visible. The setSubsetRange method should be used to set the visible x range so that the DataAccelerator can supply the chart with the necessary data only.

The resolution argument is a hint of the number of pixels available in the x direction for plotting the data. This argument avoids the DataAccelerator from providing too much data to the chart. For example, if only 600 pixels are available in the x direction, it is not necessary to provide 10 million points to the chart, as they will overlap and block each others and the vast majority would not be visible. The DataAccelerator employs a special algorithm that can reduce the data to match the resolution without noticeably affecting the shape of the plotted chart.

Argument	Default	Description
xStart	(Mandatory)	The x value at the start of the visible range.
xEnd	(Mandatory)	The x value at the end of the visible range.
resolution	0	The approximate number of pixels available in the x direction for plotting the chart. In the most common case that the x-axis is horizontal, this is the plot area width. If this argument is not provided, ChartDirector will automatically choose the resolution to use.

30.16 class CDDataSetMBS

30.16.1 class CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The DataSet class represents data sets.
Example:

```
// two lines in one layer, each with its own name, width and symbol
Var sales() As Double = Array(10.0, 14.0, 12.0, 18.0)
Var costs() As Double = Array(8.0, 9.0, 11.0, 10.0)

Var c As New CDXYChartMBS(500, 300)
Call c.setPlotArea(50, 30, 420, 220)
Call c.addLegend(60, 10, False)

Var layer As CDLineLayerMBS = c.addLineLayer
Var s1 As CDDataSetMBS = layer.addDataSet(sales, &h0066CC, "Sales")
s1.setLineWidth(3)
s1.setDataSymbol(CDBaseChartMBS.kCircleSymbol, 9)
Var s2 As CDDataSetMBS = layer.addDataSet(costs, &hCC3300, "Costs")
s2.setDataSymbol(CDBaseChartMBS.kSquareSymbol, 7)

Var pic As Picture = c.makeChartPicture
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.16.2 Methods

30.16.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.16.4 getDataColor as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the main color used to draw the data set.
Notes: Returns the main color used to draw the data set.

30.16.5 getDataName as string

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the name of the data set.
Notes: Return the name of the data set.

30.16.6 getLegendIcon as string

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the CDML representation of the legend icon for the data set.
Notes: The CDML representation can be used in any ChartDirector API that supports CDML. Note that the CDML representation is only valid in the BaseChart object that contains the data set. It is not allowed to use the CDML representation obtained from one chart in a different chart.

The legend icon is the same icon that would appear in the LegendBox. If you modify the icon using methods of the LegendBox object (such as using LegendBox.setKeyBorder to set the legend icon border), the modification will also apply to the icon returned by this method.

Returns the CDML representation of the legend icon for the data set.

30.16.7 getPosition(i as Integer) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the positional value of a data point.
Notes: The positional value is the value used to position the data point. Usually, the positional value is equal to the data value. However, for chart types in which the data sets are combined using the Stack or Percentage method, the positional value can be different from the data value. For example, for stacked charts, the positional value of a data point is equal to the accumulative value of the corresponding data

points from data sets added before the target data set.

Argument	Default	Description
i	(Mandatory)	The data point index of the data point. The first data point is 0; the nth data point is (n - 1).

Returns the positional value of the data point.

30.16.8 getUseYAxis as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the y-axis to use when drawing the data set.
Notes: Returns an Axis object representing the y-axis to use when drawing the data set.

30.16.9 getValue(i as Integer) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the value of a data point.
Notes:

Argument	Default	Description
i	(Mandatory)	The data point index of the data point. The first data point is 0; the nth data point is (n - 1).

Returns the value of the data point.

30.16.10 setData(data() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the data for this dataset.

30.16.11 setDataColor(dataColor as color, edgeColor as color, shadowColor as color, shadowEdgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setDataColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.16.12 setDataColor(dataColor as Integer, edgeColor as Integer = -1, shadowColor as Integer = -1, shadowEdgeColor as Integer = -1) 5260

30.16.12 setDataColor(dataColor as Integer, edgeColor as Integer = -1, shadowColor as Integer = -1, shadowEdgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colors used to draw the data set.
Notes: The usage of the colors depend on the layer type. For example, in a bar layer, the dataColor and edgeColor are used as the fill and border color of the bar. In a line layer, the dataColor is used as the color of the line, while the edgeColor is used as the border of the line for 3D lines, and is ignored for 2D lines..

Argument	Default	Description
dataColor	(Mandatory)	The main color used to draw the data set.
edgeColor	-1	The color used to draw the edges or borders of the data set, if any. -1 means that the edges are drawn using the default border color of the layer (defined using Layer.setBorderColor).
shadowColor	-1	The color to use to draw 3D shadows of the data set, if any. -1 means the shadow color will be a "darker" version of the dataColor, created by reducing the RGB intensities of the dataColor in half.
shadowEdgeColor	-1	The color to use to draw edges of the 3D shadows of the data set, if any. -1 means the shadow color will be a "darker" version of the edgeColor, created by by reducing the RGB intensities of the edgeColor in half.

See also:

- 30.16.11 setDataColor(dataColor as color, edgeColor as color, shadowColor as color, shadowEdgeColor as color) 5259

30.16.13 setDataLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the data label format for the data set.
Notes: To set the label format for all data sets in a layer, use Layer.setDataLabelFormat.

For details description of data label format, please refer to Layer.setDataLabelFormat.

Argument	Default	Description
formatString	(Mandatory)	The format string.

30.16.14 setDataLabelStyle(font as string = """, fontsize as Double = 8, fontcolor as Integer = 0, fontangle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables data labels and sets their styles.
Notes: To set the data label styles for all data sets in a layer, use Layer.setDataLabelStyle.

For details description of data labels, please refer to :Layer.setDataLabelStyle.

Argument	Default	Description
font	""	The font used to draw the labels.
fontSize	8	The font size used to draw the labels.
fontColor	TextColor	The color used to draw the labels.
fontAngle	0	The rotation angle of the labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.
See also:

- 30.16.15 setDataLabelStyle(font as string, fontsize as Double, fontcolor as color, fontangle as Double = 0) as CDTextBoxMBS 5261

30.16.15 setDataLabelStyle(font as string, fontsize as Double, fontcolor as color, fontangle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setDataLabelStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.16.14 setDataLabelStyle(font as string = "", fontsize as Double = 8, fontcolor as Integer = 0, fontangle as Double = 0) as CDTextBoxMBS 5261

30.16.16 setDataName(name as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the name of the data set.
Notes: The name will be used in the legend box, if one is available for the chart.

Argument	Default	Description
name	(Mandatory)	The name of the data set.

30.16.17 setDataSymbol(drawobj as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses a DrawArea object as the graphics symbol to plot the data points.
Notes: In the current version of ChartDirector, data symbols are supported only in LineLayer, SplineLayer, StepLineLayer and ScatterLayer. To use data symbols in other layer types, add a ScatterLayer on top of that layer.

Argument	Default	Description
obj	(Mandatory)	A DrawArea object to be used as the symbol.

See also:

- 30.16.18 setDataSymbol(file as folderitem) 5262
- 30.16.19 setDataSymbol(ImageFilePath as string) 5263
- 30.16.20 setDataSymbol(pic as Picture) 5264
- 30.16.21 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgeColor as Integer = -1) 5265
- 30.16.22 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgeColor as color) 5265
- 30.16.23 setDataSymbol(symbol as Integer, size as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5266
- 30.16.24 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5267

30.16.18 setDataSymbol(file as folderitem)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Load an image from a file and use it as the graphics symbol to plot the data points.
Notes: ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

In the current version of ChartDirector, data symbols are supported only in LineLayer, SplineLayer, StepLineLayer and ScatterLayer. To use data symbols in other layer types, add a ScatterLayer on top of that layer.

Argument	Default	Description
image	(Mandatory)	The filename of the image file. The image type is determined based on file extension, which must be png, jpg/jpeg, gif or wbmp/wmp.

See also:

- 30.16.17 setDataSymbol(drawobj as CDDrawAreaMBS) 5262
- 30.16.19 setDataSymbol(ImageFilePath as string) 5263
- 30.16.20 setDataSymbol(pic as Picture) 5264
- 30.16.21 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgeColor as Integer = -1) 5265
- 30.16.22 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgeColor as color) 5265
- 30.16.23 setDataSymbol(symbol as Integer, size as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5266
- 30.16.24 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5267

30.16.19 setDataSymbol(ImageFilePath as string)

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Load an image from a file and use it as the graphics symbol to plot the data points.
Notes: ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

In the current version of ChartDirector, data symbols are supported only in LineLayer, SplineLayer, StepLineLayer and ScatterLayer. To use data symbols in other layer types, add a ScatterLayer on top of that layer.

See also:

- 30.16.17 setDataSymbol(drawobj as CDDrawAreaMBS) 5262

Argument	Default	Description
image	(Mandatory)	The filename of the image file. The image type is determined based on file extension, which must be png, jpg/jpeg, gif or wbmp/wmp.

- 30.16.18 setDataSymbol(file as folderitem) 5262
- 30.16.20 setDataSymbol(pic as Picture) 5264
- 30.16.21 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgeColor as Integer = -1) 5265
- 30.16.22 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgeColor as color) 5265
- 30.16.23 setDataSymbol(symbol as Integer, size as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5266
- 30.16.24 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5267

30.16.20 setDataSymbol(pic as Picture)

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses a picture object as the graphics symbol to plot the data points.
Notes: In the current version of ChartDirector, data symbols are supported only in LineLayer, SplineLayer, StepLineLayer and ScatterLayer. To use data symbols in other layer types, add a ScatterLayer on top of that layer.

Argument	Default	Description
obj	(Mandatory)	A picture object to be used as the symbol.

See also:

- 30.16.17 setDataSymbol(drawobj as CDDrawAreaMBS) 5262
- 30.16.18 setDataSymbol(file as folderitem) 5262
- 30.16.19 setDataSymbol(ImageFilePath as string) 5263
- 30.16.21 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgeColor as Integer = -1) 5265
- 30.16.22 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgeColor as color) 5265
- 30.16.23 setDataSymbol(symbol as Integer, size as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5266
- 30.16.24 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5267

30.16.21 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses a custom polygon as the graphics symbol to plot the data points.
Notes: In the current version of ChartDirector, data symbols are supported only in LineLayer, SplineLayer, StepLineLayer and ScatterLayer. To use data symbols in other layer types, add a ScatterLayer on top of that layer.

Argument	Default	Description
polygon	(Mandatory)	An array of integers representing the coordinates the polygon vertices. See Shape Specification on how the custom shape is defined.
size	11	The nominal width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means the color of the data set will be used.
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means the edge color of the data set will be used.

See also:

- 30.16.17 setDataSymbol(drawobj as CDDrawAreaMBS) 5262

- 30.16.19 setDataSymbol(ImageFilePath as string) 5263
- 30.16.20 setDataSymbol(pic as Picture) 5264
- 30.16.22 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgeColor as color) 5265
- 30.16.23 setDataSymbol(symbol as Integer, size as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5266
- 30.16.24 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5267

30.16.22 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setDataSymbol method, but uses color instead of integer data type for passing color values.
See also:

- 30.16.17 setDataSymbol(drawobj as CDDrawAreaMBS) 5262

- 30.16.18 setDataSymbol(file as folderitem) 5262
- 30.16.19 setDataSymbol(ImageFilePath as string) 5263
- 30.16.20 setDataSymbol(pic as Picture) 5264
- 30.16.21 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgeColor as Integer = -1) 5265
- 30.16.23 setDataSymbol(symbol as Integer, size as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5266
- 30.16.24 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5267

30.16.23 setDataSymbol(symbol as Integer, size as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses one of the built-in symbols as the graphics symbol to plot the data points.
Notes: In the current version of ChartDirector, data symbols are supported only in LineLayer, SplineLayer, StepLineLayer and ScatterLayer. To use data symbols in other layer types, add a ScatterLayer on top of that layer.

Argument	Default	Description
symbol	(Mandatory)	One of the predefined shape constants representing the symbol shape. See Shape Specification for the available built-in shapes.
size	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means the color of the data set will be used.
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means the edge color of the data set will be used.
lineWidth	1	The line width used for drawing the symbols.

- 30.16.19 setDataSymbol(ImageFilePath as string) 5263
- 30.16.20 setDataSymbol(pic as Picture) 5264
- 30.16.21 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgeColor as Integer = -1) 5265
- 30.16.22 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgeColor as color) 5265

- 30.16.24 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5267

30.16.24 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setDataSymbol method, but uses color instead of integer data type for passing color values.
See also:

- 30.16.17 setDataSymbol(drawobj as CDDrawAreaMBS) 5262
- 30.16.18 setDataSymbol(file as folderitem) 5262
- 30.16.19 setDataSymbol(ImageFilePath as string) 5263
- 30.16.20 setDataSymbol(pic as Picture) 5264
- 30.16.21 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgeColor as Integer = -1) 5265
- 30.16.22 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgeColor as color) 5265
- 30.16.23 setDataSymbol(symbol as Integer, size as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5266

30.16.25 setLineWidth(w as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the line width of lines when drawing the data set.
Notes: This method only applies to layers that employ lines to represent data (e.g. line layer).

If this method is not called, the default line width for the layer will be used (set using Layer.setLineWidth).

Argument	Default	Description
w	(Mandatory)	The width of the line in pixels.

30.16.26 setSymbolOffset(offsetX as Integer, offsetY as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Offset the symbols in the x and y directions in pixel unit.
Notes:

Argument	Default	Description
xOffset	(Mandatory)	The x offset in pixels. A positive value mean shifting to the right.
yOffset	(Mandatory)	The y offset in pixels. A positive value mean shifting to the bottom.

30.16.27 setUseYAxis(axis as CDAxisMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine if the primary or secondary y-axis should be used when drawing the data set.
Notes: To set the y-axis to use for all data sets within a layer, use Layer.setUseYAxis2.

Note: DataSet.setUseYAxis is a more general method that can support more than 2 y-axes.

Argument	Default	Description
b	true	A true value means the secondary y-axis will be used. A false value means the primary y-axis will be used.

See also:

- 30.16.28 setUseYAxis(b as boolean=true) 5268

30.16.28 setUseYAxis(b as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine the y-axis to use when drawing the data set.
Notes: To set the y-axis to use for all data sets within a layer, use Layer.setUseYAxis.

Argument	Default	Description
a	(Mandatory)	The y-axis to use when drawing the data set.

See also:

- 30.16.27 setUseYAxis(axis as CDAxisMBS) 5268

30.17 class CDDiscreteHeatMapLayerMBS

30.17.1 class CDDiscreteHeatMapLayerMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The DiscreteHeatMapLayer class represents discrete heat map layers. DiscreteHeatMapLayer is a subclass of Layer.
Notes: DiscreteHeatMapLayer objects are created by using XYChart.addDiscreteHeatMapLayer.

A discrete heat map consists of rectangular cells on a rectangular grid. The data values of the cells determine their colors. The data value to color mapping is controlled by the ColorAxis object of the DiscreteHeatMapLayer, obtainable using DiscreteHeatMapLayer.colorAxis.
Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.17.2 Methods

30.17.3 colorAxis as CDColorAxisMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the ColorAxis object representing the color axis (color legend).

30.17.4 setCellGap(gap as integer)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the gap between cells.
Notes: By default, the cells will touch each others with no gap in between.

Argument	Default	Description
gap	(Mandatory)	The gap between cells in pixels.

30.17.5 setColorAxis(x as integer, y as integer, alignment as integer, length as integer, orientation as integer) as CDColorAxisMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the position, length and orientation of the color axis (color legend).
Notes:

Argument	Default	Description
x	(Mandatory)	The x-coordinate of the reference point used to position the color axis.
y	(Mandatory)	The y-coordinate of the reference point used to position the color axis.
alignment	(Mandatory)	The alignment of the color axis with respect to the reference point. For example, a value of TopLeft means the reference point is the top- left corner of the color axis. See Alignment Specification for supported alignment types.
length	(Mandatory)	The length of the color axis in pixels.
orientation	(Mandatory)	The orientation of the color axis. A value of Top/Bottom means the axis is horizontal, and the axis labels are at top/bottom side of the axis. A value of Left/Right means the axis is vertical, and the axis labels are at the left/right side of the axis.

30.17.6 setDirectColoring(b as boolean = true)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets whether the data values are the colors themselves or if a CDColorAxisMBS will be used to map the data values to colors.
Notes: By default, a ColorAxis will be used to map the data values to colors. The setDirectColoring method allows directly specifying the colors of the cells without going through the CDColorAxisMBS.

Argument	Default	Description
b	true	A true value means the data values of the cells are their colors. A false value means a CDColorAxisMBS will be used to map the data values to colors.

30.18 class CDDrawAreaMBS

30.18.1 class CDDrawAreaMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The DrawArea class represents drawing surfaces, with methods for performing graphics primitives (such as drawing lines, shapes and texts) and the surfaces.
Example:

```
// draw shapes and text with ChartDirector's drawing surface
Var d As New CDDrawAreaMBS
d.setSize(300, 200, &cFFFFFF)
d.rect(10, 10, 290, 190, &c000000, &cEEEEFF)
d.circle(150, 100, 60, 60, &c0000FF, &c99CCFF)
d.line(10, 190, 290, 10, &cFF0000, 3)
d.text("Hello", "arialbd.ttf", 0, 20, 0, 0, False, 150, 100, &c000000, 5) // 5 = centered

Var pic As Picture = d.outPicture
// show pic in a Canvas, or save it: Call d.outPNG(SpecialFolder.Desktop.Child("drawing.png"))
```

Notes: All ChartDirector chart objects contains an internal DrawArea object for drawing the charts. This DrawArea object is accessible via BaseChart.getDrawArea or BaseChart.makeChart. This allows developers to apply custom graphics operations on the charts.

ChartDirector also supports creating standalone DrawArea objects by calling the DrawArea.DrawArea constructor. One common application is to use ChartDirector as a general purpose graphics library (e.g. adding text annotations to existing images, creating GIF buttons on the fly, etc).

30.18.2 Methods

30.18.3 adjustBrightness(c as Integer, brightness as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a color that is a darkened or brightened version of the given color.
Notes: A brightness less than 1 means the color is darkened, while a brightness greater than 1 means the color is brightened. For example, a brightness of 0.5 means the color is half as bright as the original color. If the original color is red, the color will become dark red. Conversely, a brightness of 2 means the color is twice as bright as the original color. If the original color is red, the color will become light red.

Arguments:

Argument	Default	Description
c	(Mandatory)	The given color.
brightness	(Mandatory)	A non-negative number represent the factor to darken or brighten the color.

Return Value
A 32-bit integer representing the darkened or brightened color.

30.18.4 affineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other affineTransform method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.5 affineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5272

30.18.5 affineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform affine transformation on the drawing surface.
Notes: An affine transformation is an operation where every pixel is copied to another pixel according to

the formula.

xDest = a * xSrc + b * ySrc + cyDest = d * xSrc + e * ySrc + f
where (xSrc, ySrc) is a source pixel, and (xDest, yDest) is where it should go to.

Many graphics operation, such as translation, rotation, and resizing, can be considered as a special case of affine transformation.

Argument	Default	Description
a	(Mandatory)	The parameter 'a' in the coordinate transformation formula "xDest = a * xSrc + b * ySrc + c".
b	(Mandatory)	The parameter 'b' in the coordinate transformation formula "xDest = a * xSrc + b * ySrc + c".
c	(Mandatory)	The parameter 'c' in the coordinate transformation formula "xDest = a * xSrc + b * ySrc + c".
d	(Mandatory)	The parameter 'd' in the coordinate transformation formula "yDest = d * xSrc + e * ySrc + f".
e	(Mandatory)	The parameter 'e' in the coordinate transformation formula "yDest = d * xSrc + e * ySrc + f".
f	(Mandatory)	The parameter 'f' in the coordinate transformation formula "yDest = d * xSrc + e * ySrc + f".
bgColor	FFFFFF	The background color used to fill destination pixels that are not mapped to any source pixels.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

- 30.18.4 affineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5272

30.18.6 angleGradientColor(cx as double, cy as double, a1 as double, a2 as double, r1 as double, r2 as double, c() as integer) as integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an angle gradient color.
Notes: An angle gradient color is a color that depends on the compass bearing of the pixel relative to the center point. The north (upward) direction is zero degree, and the angle is the clockwise angle from the north direction.

ChartDirector supports "smooth angle gradient" and "step angle gradient". For a smooth angle gradient, the color changes smoothly from one color stop to the next color stop. For a step angle gradient, the color

remains unchanged between the color stops, but change abruptly once it reaches the next color stop.

The color stops are defined as an array of offsets and colors. For a smooth angle gradient, the offsets and colors should be in the following format:

offset0, color0, offset1, color1, ... offsetN, colorN

The first offset (offset0) should be 0, which represents the start angle of the gradient, and color0 is the color at that offset. The last offset (offsetN) can be any number not greater than 100000. It represents the end angle of the gradient, and colorN represents the color at the that offset. The other offsets and colors represent the angles and colors of the color stops in between.

For a step angle gradient, the offsets and colors should be in the following format:

offset0, color0, offset1, color1, ..., offsetP, colorP, offsetN

Note that for a step color gradient, there is one more offset than colors. If there are 10 color steps, it will have 10 colors and 11 offsets. The offsets represent angles and are interpreted the same as in smooth angle gradient. The colors are applied between the offsets. For example, color0 is the color between offset0 and offset1, and color1 is the color between offset1 and offset2.

Argument	Default	Description
cx	(Mandatory)	The x coordinate of the center point.
cy	(Mandatory)	The y coordinate of the center point.
a1	(Mandatory)	The start angle of the gradient.
a2	(Mandatory)	The end angle of the gradient.
r1	(Mandatory)	The minimum radius for which the gradient is applicable.
r2	(Mandatory)	The maximum radius for which the gradient is applicable.
colorArray	(Mandatory)	An array defining the offsets and colors of the color stops along the gradient.

Returns a 32-bit integer representing the angle gradient color.

30.18.7 arc(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, c as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a circular or elliptical arc.
Notes:

Argument	Default	Description
cx	(Mandatory)	The x coordinate of the center of the circle or ellipse.
cy	(Mandatory)	The y coordinate of the center of the circle or ellipse.
rx	(Mandatory)	The horizontal radius of the circle or ellipse.
ry	(Mandatory)	The vertical radius of the circle or ellipse.
a1	(Mandatory)	The start angle of the arc in degrees. The angle is measured clockwise, with 0 degree being the upward pointing direction.
a2	(Mandatory)	The end angle of the arc in degrees. The angle is measured clockwise, with 0 degree being the upward pointing direction.
c	(Mandatory)	The color of the arc.

30.18.8 circle(cx as Integer, cy as Integer, rx as Integer, ry as Integer, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other circle method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.9 circle(cx as Integer, cy as Integer, rx as Integer, ry as Integer, edgeColor as Integer, fillColor as Integer) 5275

30.18.9 circle(cx as Integer, cy as Integer, rx as Integer, ry as Integer, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a circle or an ellipse.
Notes:

Argument	Default	Description
cx	(Mandatory)	The x coordinate of the center of the circle or ellipse.
cy	(Mandatory)	The y coordinate of the center of the circle or ellipse.
rx	(Mandatory)	The horizontal radius of the circle or ellipse.
ry	(Mandatory)	The vertical radius of the circle or ellipse.
edgeColor	(Mandatory)	The border color. To disable border, set the edgeColor the same as the fillColor.
fillColor	(Mandatory)	The fill color. To disable filling, set the fillColor to Transparent.

See also:

- 30.18.8 circle(cx as Integer, cy as Integer, rx as Integer, ry as Integer, edgeColor as color, fillColor as color) 5275

30.18.10 clone(d as CDDrawAreaMBS, x as Integer, y as Integer, align as Integer, newWidth as Integer = -1, newHeight as Integer = -1, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copy the current DrawArea object to another DrawArea object, with optional resizing.
Notes:

Argument	Default	Description
d	(Mandatory)	The destination DrawArea object where the current DrawArea is copied to.
x	(Mandatory)	The x coordinate of a reference point in the destination DrawArea object.
y	(Mandatory)	The y coordinate of a reference point in the destination DrawArea object.
align	(Mandatory)	The alignment of the current DrawArea relative to the reference point. See Alignment Specification for supported alignment types.
newWidth	-1	The new width to which the current DrawArea will be resized to before copying. The default value -1 means no resizing.
newHeight	-1	The new height to which the current DrawArea will be resized to before copying. The default value -1 means no resizing.
filter	LinearFilter	The filter to use for re-sampling. (Only applies if there is resizing.)
blur	1	The blur factor to use for re-sampling. (Only applies if there is resizing.)

30.18.11 Constructor

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a DrawArea object.

30.18.12 cylinder(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, depthX as Integer, depthY as Integer, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other cylinder method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.13 cylinder(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, depthX as Integer, depthY as Integer, edgeColor as Integer, fillColor as Integer)

30.18.13 cylinder(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, depthX as Integer, depthY as Integer, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a cylinder surface as the area spanned by moving an arc.
Notes:

Argument	Default	Description
cx	(Mandatory)	The x coordinate of the center of the circle or ellipse for the arc.
cy	(Mandatory)	The y coordinate of the center of the circle or ellipse for the arc.
rx	(Mandatory)	The horizontal radius of the circle or ellipse.
ry	(Mandatory)	The vertical radius of the circle or ellipse.
a1	(Mandatory)	The start angle of the arc. The angle is measured clockwise, with 0 degree being the upward pointing direction.
a2	(Mandatory)	The end angle of the arc. The angle is measured clockwise, with 0 degree being the upward pointing direction.
depthX	(Mandatory)	The x displacement representing the motion of the arc to span the cylinder.
depthY	(Mandatory)	The y displacement representing the motion of the arc to span the cylinder.
edgeColor	(Mandatory)	The border color. To disable border, set the edgeColor the same as the fillColor.
fillColor	(Mandatory)	The fill color. To disable filling, set the fillColor to Transparent.

See also:

- 30.18.12 cylinder(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, depthX as Integer, depthY as Integer, edgeColor as color, fillColor as color) 5276

30.18.14 dashLineColor(colorvalue as color, patternCode as Integer = &h0505) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other dashLineColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.15 dashLineColor(colorvalue as Integer, patternCode as Integer = &h0505) as Integer 5277

30.18.15 dashLineColor(colorvalue as Integer, patternCode as Integer = &h0505) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a dash line color.
Notes: A dash line color is a dynamic color that switches on and off periodically. When it is used to draw

a line, the line will appear as a dash line.

The style of the dash line is defined by a pattern code, which is a 4-byte integer. A value of PPQQRRSS (in hex) means the first PP pixels are turned on, followed by QQ pixels turned off, followed by RR pixels turned on, followed by SS pixels turned off, and then restart from PP again.

ChartDirector comes from several predefined constants for common dash line patterns.

ConstantValue (in Hex)Dash Line Style

DashLine	00000505
DotLine	00000202
DotDashLine	05050205
AltDashLine	0A050505

Argument	Default	Description
color	(Mandatory)	The color to draw the dash line.
patternCode	DashLine	A 4-byte integer representing the style of the dash line.

Return Value
A 32-bit integer representing the dash line color.
See also:

- 30.18.14 dashLineColor(colorvalue as color, patternCode as Integer = &h0505) as Integer 5277

30.18.16 enableVectorOutput

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Enables true vector graphics output.
Notes: By default, when creating the output image, ChartDirector draws directly onto an output buffer representing the bitmap of the image. For example, for a chart 800 x 600 pixels in size, the output buffer may represent a 800 x 600 bitmap. The output buffer size is unchanged no matter how many items are drawn onto it. Even if the output contains 1 million elements (eg. 1 million symbols), the size of the output buffer is still the same.

On the other hand, a true vector output is indefinitely scalable and can be considered as having infinite resolution. To produce a true vector output, it is necessary to remember the graphics operations for every element in the output buffer. The output buffer size is therefore proportional to the number of elements to draw.

This method tells ChartDirector that it needs to remember the graphics operations to prepare for true vector output. If true vector output is needed, this method should be called immediately after creating the DrawArea object.

If this method is not called, and a vector graphics output format is used (such as SVG), instead of a true vector output, ChartDirector will output a raster image using the vector graphics format. (Most vector graphics formats support embedded raster images.)

30.18.17 fill(x as Integer, y as Integer, colorvalue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other fill method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.18 fill(x as Integer, y as Integer, colorvalue as color, borderColor as color) 5279
- 30.18.19 fill(x as Integer, y as Integer, colorvalue as Integer) 5279
- 30.18.20 fill(x as Integer, y as Integer, colorvalue as Integer, borderColor as Integer) 5280

30.18.18 fill(x as Integer, y as Integer, colorvalue as color, borderColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other fill method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.17 fill(x as Integer, y as Integer, colorvalue as color) 5279
- 30.18.19 fill(x as Integer, y as Integer, colorvalue as Integer) 5279
- 30.18.20 fill(x as Integer, y as Integer, colorvalue as Integer, borderColor as Integer) 5280

30.18.19 fill(x as Integer, y as Integer, colorvalue as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flood fill a region using the specified color.
Notes:

See also:

- 30.18.17 fill(x as Integer, y as Integer, colorvalue as color) 5279
- 30.18.18 fill(x as Integer, y as Integer, colorvalue as color, borderColor as color) 5279
- 30.18.20 fill(x as Integer, y as Integer, colorvalue as Integer, borderColor as Integer) 5280

Argument	Default	Description
x	(Mandatory)	The x coordinate one pixel inside the region to be filled.
y	(Mandatory)	The y coordinate one pixel inside the region to be filled.
color	(Mandatory)	The color used to fill the region.

30.18.20 fill(x as Integer, y as Integer, colorvalue as Integer, borderColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fill a region using the specified color, where the region is bounded by a given border color.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate one pixel inside the region to be filled.
y	(Mandatory)	The y coordinate one pixel inside the region to be filled.
color	(Mandatory)	The color used to fill the region.
borderColor	(Mandatory)	The color of the border that bounds the region.

See also:

- 30.18.17 fill(x as Integer, y as Integer, colorvalue as color) 5279
- 30.18.18 fill(x as Integer, y as Integer, colorvalue as color, borderColor as color) 5279
- 30.18.19 fill(x as Integer, y as Integer, colorvalue as Integer) 5279

30.18.21 getARGBColor(c as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain the ARGB color given a palette color.
Notes: If the given color is already in ARGB format, the same value is returned.

Argument	Default	Description
c	(Mandatory)	The color to be changed to ARGB format.

Return Value
The ARGB color converted from the given color.

30.18.22 getHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the height of the drawing surface.

30.18.23 getPixel(x as Integer, y as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the color of a pixel.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of the pixel.
y	(Mandatory)	The y coordinate of the pixel.

Return Value
The color of the pixel.

30.18.24 getWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the width of the drawing surface.

30.18.25 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other gradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.26 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5282
- 30.18.27 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer 5282
- 30.18.28 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer 5283

30.18.26 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a multi-point linear gradient color.
Notes: This method is for backward compatibility. Use DrawArea.linearGradientColor2 instead.

Argument	Default	Description
colorArray	(Mandatory)	An array defining the positions and colors of the pixels along the reference gradient line segment.
angle	90	The direction of the reference gradient line segment in degrees, measured clockwise, with 0 degree as the upward pointing direction. The default direction is horizontal from left to right (90 degrees).
scale	1.0	The scaling factor for the reference gradient line segment. By default, the reference gradient line segment is 256 pixels in length. The scaling factor can be use to stretch or compress the gradient line segment.
startX	0	The x coordinate of the starting point of the reference gradient line segment.
startY	0	The y coordinate of the starting point of the reference gradient line segment.

Return Value
A 32-bit integer representing the linear gradient color.
See also:

- 30.18.25 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5281
- 30.18.27 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer 5282
- 30.18.28 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer 5283

30.18.27 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other gradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.25 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5281
- 30.18.26 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5282

- 30.18.28 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer 5283

30.18.28 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a two-point linear gradient color.
Notes: This method is for backward compatibility. Use DrawArea.linearGradientColor instead.

Argument	Default	Description
startX	(Mandatory)	The x coordinate of the starting point of the reference gradient line segment.
startY	(Mandatory)	The y coordinate of the starting point of the reference gradient line segment.
endX	(Mandatory)	The x coordinate of the ending point of the reference gradient line segment.
endY	(Mandatory)	The y coordinate of the ending point of the reference gradient line segment.
startColor	(Mandatory)	The color at the starting point of the reference gradient line segment.
endColor	(Mandatory)	The color at the ending point of the reference gradient line segment.

Return Value
A 32-bit integer representing the linear gradient color.
See also:

- 30.18.25 gradientColor(colors() as color, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5281
- 30.18.26 gradientColor(colors() as Integer, angle as Double = 90, scale as Double = 1.0, startX as Integer = 0, startY as Integer = 0) as Integer 5282
- 30.18.27 gradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color) as Integer 5282

30.18.29 halfColor(c as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a color that is half the intensity of the given color.
Notes:

Argument	Default	Description
c	(Mandatory)	The given color.

Return Value
A 32-bit integer representing the half intensity color.

30.18.30 hCylinderTransform(yDiameter as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other hCylinderTransform method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.31 hCylinderTransform(yDiameter as Integer, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5284

30.18.31 hCylinderTransform(yDiameter as Integer, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Wraps the drawing surface onto a horizontal cylinder.
Notes:

Argument	Default	Description
yDiameter	(Mandatory)	The diameter of the cylinder in pixels.
bgColor	FFFFFF	The background color used to fill the space left after transformation.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

See also:

- 30.18.30 hCylinderTransform(yDiameter as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5284

30.18.32 hFlip

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flip the drawing surface along the central horizontal line.

30.18.33 hline(x1 as Integer, x2 as Integer, y as Integer, c as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a horizontal line.
Notes:

Argument	Default	Description
x1	(Mandatory)	The x coordinate of the first end-point of the line.
x2	(Mandatory)	The x coordinate of the second end-point of the line.
y	(Mandatory)	The y coordinate of the line.
c	(Mandatory)	The color of the line.

30.18.34 hTriangleTransform(tWidth as Integer = -1, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Wraps the drawing surface onto a horizontal triangle pointing leftwards.
Notes:

Argument	Default	Description
tWidth	-1	The width of the triangle in pixels.
bgColor	FFFFFF	The background color used to fill the space left after transformation.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

See also:

- 30.18.35 hTriangleTransform(tWidth as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5285

30.18.35 hTriangleTransform(tWidth as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other hTriangleTransform method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.34 hTriangleTransform(tWidth as Integer = -1, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5285

30.18.36 initDynamicLayer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes a dynamic layer for drawing text and shapes.
Notes: This method clears the existing dynamic layer, or creates a new one if there is no existing dynamic layer. This method returned a DrawArea object that can be used to draw on the dynamic layer. The

dynamic layer can later be removed using BaseChart.removeDynamicLayer.

The design of the dynamic layer is for drawing small, rapidly updatable contents for desktop applications. For example, the dynamic layer can be used to implement a cross-hair mouse cursor, with text showing the location of the mouse cursor. To do this, in the mouse move event handler, BaseChart.initDynamicLayer can be used to create or clear the dynamic layer. The returned DrawArea object can then be used to draw the cross hair cursor (as two straight lines) and the text. When the mouse cursor leaves the chart, BaseChart.removeDynamicLayer can be used in the mouse out event handler to remove the cross-hair cursor and the text.

Note that as long as the dynamic layer is not removed with BaseChart.removeDynamicLayer, only the returned DrawArea object should be used to draw things on the dynamic layer. No other objects should be used to draw on the chart.

Returns a DrawArea object that can be used to add text and shapes to the dynamic layer.

30.18.37 line(x1 as Double, y1 as Double, x2 as Double, y2 as Double, colorValue as color, lineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a straight line.
Notes:

Argument	Default	Description
x1	(Mandatory)	The x coordinate of the first end-point of the line.
y1	(Mandatory)	The y coordinate of the first end-point of the line.
x2	(Mandatory)	The x coordinate of the second end-point of the line.
y2	(Mandatory)	The y coordinate of the second end-point of the line.
c	(Mandatory)	The color of the line.
lineWidth	1	The line width (thickness).

See also:

- 30.18.38 line(x1 as Double, y1 as Double, x2 as Double, y2 as Double, colorValue as Integer, lineWidth as Integer = 1) 5286

30.18.38 line(x1 as Double, y1 as Double, x2 as Double, y2 as Double, colorValue as Integer, lineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a straight line.
Notes:

Argument	Default	Description
x1	(Mandatory)	The x coordinate of the first end-point of the line.
y1	(Mandatory)	The y coordinate of the first end-point of the line.
x2	(Mandatory)	The x coordinate of the second end-point of the line.
y2	(Mandatory)	The y coordinate of the second end-point of the line.
c	(Mandatory)	The color of the line.
lineWidth	1	The line width (thickness).

See also:

- 30.18.37 line(x1 as Double, y1 as Double, x2 as Double, y2 as Double, colorValue as color, lineWidth as Integer = 1) 5286

30.18.39 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other linearGradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.40 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer 5287
- 30.18.41 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5289
- 30.18.42 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5289

30.18.40 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a multi-point linear gradient color.
Notes: In this method, the color points are defined as an array of positions and colors along a reference line segment, in the following format:

position0, color0, position1, color1, ... positionN, colorN
The positions are specified as a number from 0 - 256 (0 - 100 in hex), in which 0 represents the starting point

of the reference line segment, and 256 (100 in hex) represents the ending point of the reference line segment.

For example, the array (in hex):

000000, FF0000, 000080, FFFF00, 000100, 00FF00
means the starting point (000000) is red (FF0000), the mid-point (000080 in hex) is yellow (FFFF00), and the ending point (000100 in hex) is green (00FF00).

One common usage of multi-point gradient colors is to define colors that have metallic look and feel. ChartDirector comes from several predefined gradient color arrays as follows.

NameValue (in Hex)

goldGradient	000000, FFE743, 000060, FFFFE0, 0000B0, FFF0B0, 000100, FFE743
silverGradient	000000, C8C8C8, 000060, F8F8F8, 0000B0, E0E0E0, 000100, C8C8C8
redMetalGradient	000000, E09898, 000060, FFF0F0, 0000B0, F0D8D8, 000100, E09898
greenMetalGradient	000000, 98E098, 000060, F0FFF0, 0000B0, D8F0D8, 000100, 98E098
blueMetalGradient	000000, 9898E0, 000060, F0F0FF, 0000B0, D8D8F0, 000100, 9898E0

Argument	Default	Description
startX	(Mandatory)	The x coordinate of the starting point of the reference gradient line segment.
startY	(Mandatory)	The y coordinate of the starting point of the reference gradient line segment.
endX	(Mandatory)	The x coordinate of the ending point of the reference gradient line segment.
endY	(Mandatory)	The y coordinate of the ending point of the reference gradient line segment.
colorArray	(Mandatory)	An array defining the positions and colors of the pixels along the reference gradient line segment.
periodic	false	Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie beyond the end points of the gradient line segment will assume the colors of the end points.

Return Value
A 32-bit integer representing the linear gradient color.
See also:

- 30.18.39 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer 5287
- 30.18.41 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5289
- 30.18.42 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5289

30.18.41 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other linearGradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.39 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer 5287
- 30.18.40 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer 5287
- 30.18.42 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5289

30.18.42 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a two-point linear gradient color.
Notes:

Argument	Default	Description
startX	(Mandatory)	The x coordinate of the starting point of the reference gradient line segment.
startY	(Mandatory)	The y coordinate of the starting point of the reference gradient line segment.
endX	(Mandatory)	The x coordinate of the ending point of the reference gradient line segment.
endY	(Mandatory)	The y coordinate of the ending point of the reference gradient line segment.
startColor	(Mandatory)	The color at the starting point of the reference gradient line segment.
endColor	(Mandatory)	The color at the ending point of the reference gradient line segment.
periodic	false	Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie beyond the end points of the gradient line segment will assume the colors of the end points.

Return Value
A 32-bit integer representing the linear gradient color.
See also:

- 30.18.39 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as color, periodic as boolean=false) as Integer 5287
- 30.18.40 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, colors() as Integer, periodic as boolean=false) as Integer 5287

- 30.18.41 linearGradientColor(startX as Integer, startY as Integer, endX as Integer, endY as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5289

30.18.43 load(path as string) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Load an image file into the current DrawArea.
Notes: This method will overwrite the current DrawArea. The image type is determined based on file extension, which must be png, jpg/jpeg, gif or wbmp/wmp.

Argument	Default	Description
filename	(Mandatory)	The filename of the image to be loaded.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.

30.18.44 loadData(data as MemoryBlock, ImgType as Integer = -1) as boolean

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads image from data in MemoryBlock.
Notes: Optionally provide image type.
Returns true on success or false on failure.
See also:

- 30.18.45 loadData(data as string, ImgType as Integer = -1) as boolean 5290

30.18.45 loadData(data as string, ImgType as Integer = -1) as boolean

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads image from data in String.
Notes: Optionally provide image type.
Returns true on success or false on failure.
See also:

- 30.18.44 loadData(data as MemoryBlock, ImgType as Integer = -1) as boolean 5290

30.18.46 loadGIF(path as string) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Load a GIF image into the current DrawArea.
Notes: This method will overwrite the current DrawArea.

Argument	Default	Description
filename	(Mandatory)	The filename of the image to be loaded.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.

30.18.47 loadJPG(path as string) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Load a JPG image into the current DrawArea.
Notes: This method will overwrite the current DrawArea.

Argument	Default	Description
filename	(Mandatory)	The filename of the image to be loaded.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.

30.18.48 loadPNG(path as string) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Load a PNG image into the current DrawArea.
Notes: This method will overwrite the current DrawArea.

Argument	Default	Description
filename	(Mandatory)	The filename of the image to be loaded.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.

30.18.49 loadWMP(path as string) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Load a WAP bitmap image into the current DrawArea.
Notes: This method will overwrite the current DrawArea.

Argument	Default	Description
filename	(Mandatory)	The filename of the image to be loaded.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.

30.18.50 merge(d as CDDrawAreaMBS, x as Integer, y as Integer, align as Integer, transparency as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copy another DrawArea to the current DrawArea.
Notes:

Argument	Default	Description
d	(Mandatory)	A DrawArea object representing the source.
x	(Mandatory)	The x coordinate of a reference point in the current DrawArea.
y	(Mandatory)	The y coordinate of a reference point in the current DrawArea.
align	(Mandatory)	The alignment of the source DrawArea relative to the reference point. See Alignment Specification for supported alignment types.
transparency	(Mandatory)	Specify the transparency level when copying the other DrawArea to the current DrawArea. A value of 0 means non-transparent. A value of 255 means totally transparent.

30.18.51 move(xOffset as Double, yOffset as Double, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other move method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.52 move(xOffset as Double, yOffset as Double, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

30.18.52 move(xOffset as Double, yOffset as Double, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the drawing surface.
Notes:

Argument	Default	Description
xOffset	(Mandatory)	The pixel offset to move towards the left.
yOffset	(Mandatory)	The pixel offset to move towards the bottom.
bgColor	FFFFFF	The background color used to fill the space left after moving.
filter	LinearFilter	The filter to use for re-sampling. (Only applies for fractional pixel offsets.)
blur	1	The blur factor to use for re-sampling. (Only applies for fractional pixel offsets.)

See also:

- 30.18.51 move(xOffset as Double, yOffset as Double, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5292

30.18.53 out(file as folderitem) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea to an image file.
Notes: The file format is determined based on file extension, which must be png, jpg/jpeg, gif, wbmp/wmp or bmp.

Argument	Default	Description
filename	(Mandatory)	The filename of the output image file.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.

30.18.54 outBMP as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea as a BMP image to memory.
See also:

- 30.18.55 outBMP(file as folderitem) as boolean 5294

30.18.55 outBMP(file as folderitem) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea to a BMP image file.
Notes:

Argument	Default	Description
filename	(Mandatory)	The filename of the output image file.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.
See also:

- 30.18.54 outBMP as string 5293

30.18.56 outGIF as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea as a GIF image to memory.
See also:

- 30.18.57 outGIF(file as folderitem) as boolean 5294

30.18.57 outGIF(file as folderitem) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea to a GIF image file.
Notes:

Argument	Default	Description
filename	(Mandatory)	The filename of the output image file.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.
See also:

- 30.18.56 outGIF as string 5294

30.18.58 outJPG(file as folderitem, quality as Integer = 80) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea to a JPEG image file.
Notes:

Argument	Default	Description
filename	(Mandatory)	The filename of the output image file.
quality	80	The quality of the image.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.
See also:

- 30.18.59 outJPG(quality as Integer = 80) as string 5295

30.18.59 outJPG(quality as Integer = 80) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea as a JPEG image to memory.
Notes:

Argument	Default	Description
quality	80	The quality of the image.

Return Value
A binary string containing the JPEG image.
See also:

- 30.18.58 outJPG(file as folderitem, quality as Integer = 80) as boolean 5294

30.18.60 outPDF as string

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea as a PDF image to memory.
See also:

- 30.18.61 outPDF(file as folderitem) as boolean 5295

30.18.61 outPDF(file as folderitem) as boolean

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea to a PDF image file.
Notes: A return value being true indicates no error. A false value indicates the operation is unsuccessful.
See also:

- 30.18.60 outPDF as string 5295

30.18.62 outPicture as picture

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea into a picture.
Notes: Returns nil on any error.

30.18.63 outPNG as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea as a PNG image to memory.
See also:

- 30.18.64 outPNG(file as folderitem) as boolean 5296

30.18.64 outPNG(file as folderitem) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea to a PNG image file.
Notes:

Argument	Default	Description
filename	(Mandatory)	The filename of the output image file.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.
See also:

- 30.18.63 outPNG as string 5296

30.18.65 outSVG(file as folderitem, options as string = "") as boolean

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea to a SVG or SVGZ image file.
Notes: To output true vector graphics in SVG or SVGZ format, please ensure DrawArea.enableVectorOutput is called immediately after creating the DrawArea object. Otherwise the output will be a bitmap image embedded in SVG or SVGZ.

Arguments:

Argument	Default	Description
file	(Mandatory)	The file of the output image file.
options	""	A text string specifying optional parameters for the SVG output. Currently, the only supported text string is "compress", which means to create a SVGZ (compressed SVG) instead of a regular SVG.

See also:

- 30.18.66 outSVG(options as string = "") as string 5297

30.18.66 outSVG(options as string = "") as string

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea as a SVG or SVGZ image to memory.
Notes: To output true vector graphics in SVG or SVGZ format, please ensure DrawArea.enableVectorOutput is called immediately after creating the DrawArea object. Otherwise the output will be a bitmap image embedded in SVG or SVGZ.

Arguments:

Argument	Default	Description
options	""	A text string specifying optional parameters for the SVG output. Currently, the only supported text string is "compress", which means to create a SVGZ (compressed SVG) instead of a regular SVG.

Return Value
A memory block containing the SVG or SVGZ image.
See also:

- 30.18.65 outSVG(file as folderitem, options as string = "") as boolean 5296

30.18.67 outWMP as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea as a WAP bitmap image to memory.
See also:

- 30.18.68 outWMP(file as folderitem) as boolean 5298

30.18.68 outWMP(file as folderitem) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes the DrawArea to a WAP bitmap image file.
Notes:

Argument	Default	Description
filename	(Mandatory)	The filename of the output image file.

Return Value
A true value indicates no error. A false value indicates the operation is unsuccessful.
See also:

- 30.18.67 outWMP as string 5297

30.18.69 patternColor(colors() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other patternColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.70 patternColor(colors() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5298
- 30.18.71 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer 5299

30.18.70 patternColor(colors() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a pattern color using an array of colors as the bitmap pattern.
Notes: A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

Return Value
A 32-bit integer representing the pattern color.
See also:

- 30.18.69 patternColor(colors() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5298
- 30.18.71 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer 5299

Argument	Default	Description
colorArray	(Mandatory)	An array of colors representing the colors of the bitmap pixels. The color of the pixel at (x, y) should correspond to index (x + y * width - 1) of the array.
height	(Mandatory)	The height of the bitmap in pixels. (The width is automatically computed as the size of the color array divided by the height.)
startX	0	The x coordinate of a reference point to align with the top-left corner the pattern.
startY	0	The y coordinate of a reference point to align with the top-left corner the pattern.

30.18.71 patternColor(file as folderitem, startX as Integer = 0, startY as Integer = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a pattern color by loading the pattern from an image file.
Notes: A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to DrawArea.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
filename	(Mandatory)	An image file providing the pattern.
startX	0	The x coordinate of a reference point to align with the top-left corner the pattern.
startY	0	The y coordinate of a reference point to align with the top-left corner the pattern.

Return Value
A 32-bit integer representing the pattern color.
See also:

- 30.18.69 patternColor(colors() as color, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5298

- 30.18.70 patternColor(colors() as Integer, height as Integer, startX as Integer = 0, startY as Integer = 0) as Integer 5298

30.18.72 Pixel(x as Integer, y as Integer, c as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draw a pixel.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of the pixel.
y	(Mandatory)	The y coordinate of the pixel.
c	(Mandatory)	The color of the pixel.

30.18.73 polygon(x() as Double, y() as Double, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other polygon method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.74 polygon(x() as Double, y() as Double, edgeColor as Integer, fillColor as Integer) 5300
- 30.18.75 polygon(x() as Integer, y() as Integer, edgeColor as color, fillColor as color) 5301
- 30.18.76 polygon(x() as Integer, y() as Integer, edgeColor as Integer, fillColor as Integer) 5301

30.18.74 polygon(x() as Double, y() as Double, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a polygon.
Notes:

Argument	Default	Description
x	(Mandatory)	An array of numbers representing the x coordinates of the vertices of a polygon.
y	(Mandatory)	An array of numbers representing the y coordinates of the vertices of a polygon.
edgeColor	(Mandatory)	The border color. To disable border, set the edgeColor the same as the fillColor.
fillColor	(Mandatory)	The fill color. To disable filling, set the fillColor to Transparent.

See also:

- 30.18.73 polygon(x() as Double, y() as Double, edgeColor as color, fillColor as color) 5300

- 30.18.75 polygon(x() as Integer, y() as Integer, edgeColor as color, fillColor as color) 5301
- 30.18.76 polygon(x() as Integer, y() as Integer, edgeColor as Integer, fillColor as Integer) 5301

30.18.75 polygon(x() as Integer, y() as Integer, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other polygon method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.73 polygon(x() as Double, y() as Double, edgeColor as color, fillColor as color) 5300
- 30.18.74 polygon(x() as Double, y() as Double, edgeColor as Integer, fillColor as Integer) 5300
- 30.18.76 polygon(x() as Integer, y() as Integer, edgeColor as Integer, fillColor as Integer) 5301

30.18.76 polygon(x() as Integer, y() as Integer, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a polygon.
Notes:

#Argument	Default	Description
x	(Mandatory)	An array of numbers representing the x coordinates of the vertices of a polygon.
y	(Mandatory)	An array of numbers representing the y coordinates of the vertices of a polygon.
edgeColor	(Mandatory)	The border color. To disable border, set the edgeColor the same as the fillColor.
fillColor	(Mandatory)	The fill color. To disable filling, set the fillColor to Transparent.

See also:

- 30.18.73 polygon(x() as Double, y() as Double, edgeColor as color, fillColor as color) 5300
- 30.18.74 polygon(x() as Double, y() as Double, edgeColor as Integer, fillColor as Integer) 5300
- 30.18.75 polygon(x() as Integer, y() as Integer, edgeColor as color, fillColor as color) 5301

30.18.77 polyShape(xy() as integer, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a shape.
Notes: A simple shape can be a polygon or an ellipse. A polygon an be specified as an array of numbers

(x0, y0, x1, y1, ...) representing the coordinates of the polygon vertices. As a polygon must have at least 3 vertices, the array must contain at least 6 numbers. If it contains only 4 numbers, it is will considered as an ellipse, with the numbers (x, y, rx, ry) interpreted as the coordinates of the center and the horizontal and vertical radii.

A complex shape is composed of multiple simple shapes. For example, a donut is a complex shape composed of two concentric circles. The shape is filled using the even-odd rule. (The web should have a lot of explanation on what is the even-odd rule in graphics.) A complex shape can be specified by including multiple simple shapes in the array, using the NewShape constant to separate them.

Argument	Default	Description
xy	(Mandatory)	An array of integers specifying the shape.
edgeColor	(Mandatory)	The border color. To disable border, set the edgeColor the same as the fillColor.
fillColor	(Mandatory)	The fill color. To disable filling, set the fillColor to Transparent.

See also:

- 30.18.78 polyShape(xy() as integer, edgeColor as Integer, fillColor as Integer) 5302

30.18.78 polyShape(xy() as integer, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a shape.
Notes: A simple shape can be a polygon or an ellipse. A polygon an be specified as an array of numbers (x0, y0, x1, y1, ...) representing the coordinates of the polygon vertices. As a polygon must have at least 3 vertices, the array must contain at least 6 numbers. If it contains only 4 numbers, it is will considered as an ellipse, with the numbers (x, y, rx, ry) interpreted as the coordinates of the center and the horizontal and vertical radii.

A complex shape is composed of multiple simple shapes. For example, a donut is a complex shape composed of two concentric circles. The shape is filled using the even-odd rule. (The web should have a lot of explanation on what is the even-odd rule in graphics.) A complex shape can be specified by including multiple simple shapes in the array, using the NewShape constant to separate them.

Argument	Default	Description
xy	(Mandatory)	An array of integers specifying the shape.
edgeColor	(Mandatory)	The border color. To disable border, set the edgeColor the same as the fillColor.
fillColor	(Mandatory)	The fill color. To disable filling, set the fillColor to Transparent.

See also:

- 30.18.77 polyShape(xy() as integer, edgeColor as color, fillColor as color) 5301

30.18.79 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, data() as Integer, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a multi-point radial gradient color.
Notes: In this method, the color points are defined as an array of radial distances and colors, in the following format:

distance0, color0, distance1, color1, ... distanceN, colorN
The distances are specified as a number from 0 - 256 (0 - 100 in hex), in which 0 represents the center of the gradient defining ellipse, and 256 (100 in hex) represents the perimeter of the gradient defining ellipse.

For example, the array (in hex):

000000, FF0000, 000080, FFFF00, 000100, 00FF00
means the center (000000) is red (FF0000), the mid-point (000080 in hex) is yellow (FFFF00), and the perimeter (000100 in hex) is green (00FF00).

Argument	Default	Description
cx	(Mandatory)	The x coordinate of the center of the radial gradient.
cy	(Mandatory)	The y coordinate of the center of the radial gradient.
rx	(Mandatory)	The horizontal radius of the radial gradient defining ellipse.
ry	(Mandatory)	The vertical radius of the radial gradient defining ellipse.
colorArray	(Mandatory)	An array defining the radial distances and colors.
periodic	false	Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie outside the gradient defining ellipse will assume the color at the perimeter of the gradient defining ellipse.

Return Value
A 32-bit integer representing the radial gradient color.
See also:

- 30.18.80 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5303
- 30.18.81 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5304

30.18.80 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other radialGradientColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.79 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, data() as Integer, periodic as boolean=false) as Integer 5303
- 30.18.81 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer 5304

30.18.81 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as Integer, endColor as Integer, periodic as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a two-point radial gradient color.
Notes:

Argument	Default	Description
cx	(Mandatory)	The x coordinate of the center of the radial gradient.
cy	(Mandatory)	The y coordinate of the center of the radial gradient.
rx	(Mandatory)	The horizontal radius of the radial gradient defining ellipse.
ry	(Mandatory)	The vertical radius of the radial gradient defining ellipse.
startColor	(Mandatory)	The color at the center of the gradient defining ellipse.
endColor	(Mandatory)	The color at the perimeter of the gradient defining ellipse.
periodic	false	Specifies whether the gradient will repeat itself periodically. If the gradient does not repeat itself, the points that lie outside the gradient defining ellipse will assume the color at the perimeter of the gradient defining ellipse.

Return Value
A 32-bit integer representing the radial gradient color.
See also:

- 30.18.79 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, data() as Integer, periodic as boolean=false) as Integer 5303
- 30.18.80 radialGradientColor(cx as Integer, cy as Integer, rx as Integer, ry as Integer, startColor as color, endColor as color, periodic as boolean=false) as Integer 5303

30.18.82 rAffineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other rAffineTransform method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.83 rAffineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5305

30.18.83 rAffineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform reverse affine transformation on the drawing surface.
Notes: A reverse affine transformation is an operation where every pixel is copied from another pixel according to the formula.

xSrc = a * xDest + b * yDest + cySrc = d * xDest + e * yDest + f
where (xDest, yDest) is a destination pixel, and (xSrc, ySrc) is where it should come from.

Many graphics operation, such as translation, rotation, and resizing, can be considered as a special case of reverse affine transformation.

Argument	Default	Description
a	(Mandatory)	The parameter 'a' in the coordinate transformation formula "xSrc = a * xDest + b * yDest + c".
b	(Mandatory)	The parameter 'b' in the coordinate transformation formula "xSrc = a * xDest + b * yDest + c".
c	(Mandatory)	The parameter 'c' in the coordinate transformation formula "xSrc = a * xDest + b * yDest + c".
d	(Mandatory)	The parameter 'd' in the coordinate transformation formula "ySrc = d * xDest + e * yDest + f".
e	(Mandatory)	The parameter 'e' in the coordinate transformation formula "ySrc = d * xDest + e * yDest + f".
f	(Mandatory)	The parameter 'f' in the coordinate transformation formula "ySrc = d * xDest + e * yDest + f".
bgColor	FFFFFF	The background color used to fill destination pixels that are not mapped to any source pixels.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

See also:

- 30.18.82 rAffineTransform(a as Double, b as Double, c as Double, d as Double, e as Double, f as Double,

bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5304

30.18.84 rect(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, edgeColor as color, fillColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other rect method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.85 rect(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, edgeColor as Integer, fillColor as Integer, raisedEffect as Integer = 0) 5306

30.18.85 rect(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, edgeColor as Integer, fillColor as Integer, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a rectangle.
Notes:

Argument	Default	Description
x1	(Mandatory)	The x coordinate of one corner of the rectangle.
y1	(Mandatory)	The y coordinate of one corner of the rectangle.
x2	(Mandatory)	The x coordinate of the opposite corner of the rectangle.
y2	(Mandatory)	The y coordinate of the opposite corner of the rectangle.
edgeColor	(Mandatory)	The border color. To disable border, set the edgeColor the same as the fillColor.
fillColor	(Mandatory)	The fill color. To disable filling, set the fillColor to Transparent.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support CDBaseChartMBS.glassEffect and CDBaseChartMBS.softLighting effects.

See also:

- 30.18.84 rect(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer, edgeColor as color, fillColor as color, raisedEffect as Integer = 0) 5306

30.18.86 reduceColors(colorCount as Integer, blackAndWhite as boolean=false) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reduces the number of colors in the image.
Notes: The colors in the image will be reduced to at most the number of colors specified, which should be 16 - 256. You may also set the image to black and white. In this case, the color count means number of grey levels.

The colors will be reduced by computing an optimal palette for the image. The image will then be converted using the palette based on the current dithering settings (see DrawArea.setDitherMethod).

Argument	Default	Description
colorCount	(Mandatory)	The maximum number of colors that image should have after after reduction. Must be between 16 - 256.
blackAndWhite	false	A true value means the image will be converted to black and white (with grey levels). A false value means the image will not be converted to black and white.

Return Value
The actual number of colors the converted image has.

30.18.87 removeDynamicLayer(keepOriginal as boolean = false)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the dynamic layer if any.

30.18.88 resize(newWidth as Integer, newHeight as Integer, filter as Integer = 1, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize the drawing surface.
Notes:

Argument	Default	Description
newWidth	(Mandatory)	The new width of the drawing surface in pixels.
newHeight	(Mandatory)	The new height of the drawing surface in pixels.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

30.18.89 ring(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other ring method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.90 ring(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, edgeColor as Integer, fillColor as Integer) 5308

30.18.90 ring(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a ring.
See also:

- 30.18.89 ring(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, edgeColor as color, fillColor as color) 5307

30.18.91 ringSector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, a1 as Double, a2 as Double, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other ringSector method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.92 ringSector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, a1 as Double, a2 as Double, edgeColor as Integer, fillColor as Integer) 5308

30.18.92 ringSector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, a1 as Double, a2 as Double, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a ring sector.
See also:

- 30.18.91 ringSector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, rx2 as Integer, ry2 as Integer, a1 as Double, a2 as Double, edgeColor as color, fillColor as color) 5308

30.18.93 rotate(angle as Double, bgColor as color, cx as Double = -1, cy as Double = -1, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other rotate method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.94 rotate(angle as Double, bgColor as Integer = &hFFFFFF, cx as Double = -1, cy as Double = -1, filter as Integer = 2, blur as Double = 1.0) 5309

30.18.94 rotate(angle as Double, bgColor as Integer = &hFFFFFF, cx as Double = -1, cy as Double = -1, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rotate the drawing surface.
Notes:

Argument	Default	Description
angle	(Mandatory)	The rotation angle measured clockwise in degrees.
bgColor	FFFFFF	The background color used to fill the space left after rotation.
cx	-1	The x coordinate of the center of rotation. -1 means rotating about the center of the drawing surface.
cy	-1	The y coordinate of the center of rotation. -1 means rotating about the center of the drawing surface.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

See also:

- 30.18.93 rotate(angle as Double, bgColor as color, cx as Double = -1, cy as Double = -1, filter as Integer = 2, blur as Double = 1.0) 5309

30.18.95 sector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other sector method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.96 sector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, edgeColor as Integer, fillColor as Integer) 5310

30.18.96 sector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a circular or elliptical sector.
Notes:

Argument	Default	Description
cx	(Mandatory)	The x coordinate of the center of the circle or ellipse.
cy	(Mandatory)	The y coordinate of the center of the circle or ellipse.
rx	(Mandatory)	The horizontal radius of the circle or ellipse.
ry	(Mandatory)	The vertical radius of the circle or ellipse.
a1	(Mandatory)	The start angle of the sector in degrees. The angle is measured clockwise, with 0 degree being the upward pointing direction.
a2	(Mandatory)	The end angle of the sector in degrees. The angle is measured clockwise, with 0 degree being the upward pointing direction.
edgeColor	(Mandatory)	The border color. To disable border, set the edgeColor the same as the fillColor.
fillColor	(Mandatory)	The fill color. To disable filling, set the fillColor to Transparent.

See also:

- 30.18.95 sector(cx as Integer, cy as Integer, rx as Integer, ry as Integer, a1 as Double, a2 as Double, edgeColor as color, fillColor as color) 5309

30.18.97 setAntiAlias(shapeAntiAlias as boolean=true, textAntiAlias as Integer = 2)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Controls whether anti-alias is used when drawing lines, shapes and text.
Notes: For anti-aliasing text, ChartDirector supports the following modes.

ConstantValueDescription

NoAntiAlias	0	Disable anti-alias when drawing text
AntiAlias	1	Always use anti-alias when drawing text
AutoAntiAlias	2	Automatically determine if anti-alias should be used for the text. This is the default.

Currently, ChartDirector will anti-alias only large or bold fonts. For small fonts, assuming it is of high quality, anti-alias is unnecessary. It is because high quality fonts are normally designed to be sharp and clear at low resolution. Anti-aliasing will blur the fonts and make them look worse.

However, for complicated fonts (e.g. some fonts with oriental characters), or for lower quality fonts (e.g. some freeware fonts), anti-alias may be necessary. In this case, it may be needed to force anti-aliasing of all fonts using AntiAlias mode.

Argument	Default	Description
shapeAntiAlias	true	A true value enables anti-alias when drawing lines and shapes. A false value disables anti-alias when drawing lines and shapes
textAntiAlias	AutoAntiAlias	The text anti-alias mode, which must be one of AutoAntiAlias, AntiAlias or NoAntiAlias.

30.18.98 setAntiAliasText(value as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set how text is antialiased.

30.18.99 setBgColor(c as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setBgColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.100 setBgColor(c as Integer) 5311

30.18.100 setBgColor(c as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the background color of the image.
Notes:

Argument	Default	Description
c	(Mandatory)	The background color of the image.

See also:

- 30.18.99 setBgColor(c as color) 5311

30.18.101 setClipRect(left as Integer, top as Integer, right as Integer, bottom as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the clip rectangle.
Notes: When performing graphics operation, only regions inside the clip rectangle will be affected. Regions outside will be unaffected.

Argument	Default	Description
left	(Mandatory)	The x coordinate of the left side of the clip rectangle.
top	(Mandatory)	The y coordinate of the top side of the clip rectangle.
right	(Mandatory)	The x coordinate of the right side of the clip rectangle.
bottom	(Mandatory)	The y coordinate of the bottom side of the clip rectangle.

30.18.102 setColorTable(colors() as color, offset as Integer)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setColorTable method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.103 setColorTable(colors() as Integer, offset as Integer) 5313

30.18.103 setColorTable(colors() as Integer, offset as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Change the colors in the palette starting with the specified offset position.
Notes: See Color Specification on how colors are represented in ChartDirector.

Argument	Default	Description
colors	(Mandatory)	An array of colors to replace the colors in the palette.
offset	(Mandatory)	The position in the palette to start the replacement.

See also:

- 30.18.102 setColorTable(colors() as color, offset as Integer) 5312

30.18.104 setDefaultFonts(normal as string, bold as string, italic as string, boldItalic as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the defaults for normal, bold, italic and bold-italic fonts.
Notes: See Font Specification for details on various font attributes.

Argument	Default	Description
normal	(Mandatory)	The default normal font. This is the same as the first font in the font table.
bold	""	The default bold font. This is the same as the second font in the font table. An empty string means the default is unchanged.
italic	""	The default italic font. This is the same as the third font in the font table. An empty string means the default is unchanged.
boldItalic	""	The default bold-italic font. This is the same as the fourth font in the font table. An empty string means the default is unchanged.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

30.18.105 setDitherMethod(value as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the dithering method in case dithering is necessary.
Notes: Dithering is a process of reducing the colors of an image. It is required if an image has more colors than can be supported by the image format. For example, a GIF image can only have 256 colors. If the

actual image contains more than 256 colors, dithering is needed to reduce the colors to less than 256.

The dithering method must be one of the following predefined constants.

ConstantValueDescription

Quantize	0	ChartDirector will first compute an optimal 256-color palette based on colors on the actual image. It then replaces the color of each pixel with the nearest color in the palette. This is the default method and produces the best result in most cases.
OrderedDither	1	Use the ordered dithering algorithm with a 4 x 4 matrix, and with the standard web-safe palette. The web-safe palette is a palette compatible with very old browsers (e.g. Netscape 1.x and 2.x browsers) on 256-color displays. Web-safe palette is not an optimal palette. In most cases, this method is not as good as the Quantize method. Use this method only if you have to use the web-safe palette.
ErrorDiffusion	2	Similar to OrderedDither but use the Floyd and Steinberg error diffusion algorithm.

Argument	Default	Description
m	(Mandatory)	The dithering method to use in case dithering is necessary.

30.18.106 setFontTable(index as Integer, font as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an entry in the font table to the specified font name.
Notes: The first 4 fonts in the font table have special significance. They are the defaults for normal, bold, italic and bold-italic fonts.

See Font Specification for details on various font attributes.

Argument	Default	Description
index	(Mandatory)	An index to the font table, starting from 0.
font	(Mandatory)	The font name to be put into the font table.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

30.18.107 setInterlace(value as boolean)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the interlace mode when creating the image.
Notes: Note that in many case an interlaced image is less compressible, and may have a large image size. The default is non-interlace.

Note that this method only applies to image formats that support interlacing (GIF and PNG). It is ignored for image formats that does not support interlacing.

Argument	Default	Description
i	(Mandatory)	A true value means the image is interlaced. A false value means the image is non-interlaced.

30.18.108 setOutputOptions(options as string)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets output format options for the next chart output. Currently, only SVG, SVGZ and PDF output formats support output options.
Notes: An output option can be a flag (such as "compress") or an attribute-value pair (such as "width=800"). Multiple output options can be joined using semicolons as delimiters.

SVG Options

PDF Options

The PDF viewer will convert the pixel unit into physical unit (eg. inches) so that it can be layout on paper or other physical media. The default conversion factor for the chart is 96 pixels per inch. The "dpi" attribute can be used to specify an alternative value. The value must be a number.

30.18.109 setPaletteMode(value as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the palette mode to use when writing the image in PNG format.
Notes: The PNG format supports both palette based images and true color images. Palette based images can only have 256 colors, but is smaller in size.

SVG Option	Type	Description
compress	Flag	Compressed the SVG, that is, output SVGZ.
bitmap	Flag	Render the chart as a bitmap and output the bitmap as SVG.
noxmldecl	Flag	Do not include the xml declaration line "<?xml version="1.0" .... >" in the SVG.
nodoctype	Flag	Do not include the document type declaration line "<!DOCTYPE svg PUBLIC .... >" in the SVG.
width	Flag / Attribute	Specifies the width attribute of the SVG. By default, ChartDirector will not include the width or height attribute in the SVG output. In this case, the SVG is variable in size and would assume the size of its container. For example, if the SVG is inside a <DIV>block in a web page, it will assume the size of the DIV block. If the "width" option is used as a flag, ChartDirector will include the width attribute in the SVG and set it to the chart width. If the "width" option is used as an attribute (such as "width=800"), ChartDirector will include the width attribute in the SVG and set it to the specified value. The specified value should be some text that is valid as SVG width. Examples are "100" and "75%".
height	Flag / Attribute	Specifies the height attribute of the SVG. See the description on "width" above on how to use it.

The palette mode must be one of the following predefined constants.

ConstantValueDescription

30.18.110 setResource(id as string, data as MemoryBlock)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a memory block to allow it to be referenced using a resource path.
Notes: Many ChartDirector features, such as BaseChart.setBgImage and the <*img*>tag in CDML, expect a file or resource path for loading an image. If the image happens to be in memory, such as if the image is retrieved from a database, setResource can be used to assign a resource ID to the memory. It can then be referenced using "@/res_id", in which res_id is the resource ID.

The assigned resource ID is only valid for the DrawArea object of which this method is called. Use CDBaseChartMBS.setResourceGlobal to assign a resource ID that is valid for all ChartDirector objects.

This method stores only a pointer to the memory. It does not copy the memory. You must ensure the memory contains valid content for as long as the resource is being used.

While ChartDirector does not copy the data, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.
See also:

PDF Option	Type	Description
bitmap	Flag	Render the chart as a bitmap and output the bitmap as PDF.
width	Attribute	The width of the chart in the PDF in pixel unit. By default, ChartDirector will use the pixel width of the chart as the width of the chart in PDF. The "width" attribute can be used to specify an alternative value. The value must be a number.
height	Attribute	The width of the chart in the PDF in pixel unit. See the description on "width" above for how to use it.
pagewidth	Attribute	The page width in pixel unit. By default, ChartDirector will set the page width to the same width as the chart. The "pagewidth" attribute can be used to specify an alternative value. The value must be a number.
pageheight	Attribute	The page height in pixel unit. By default, ChartDirector will set the page height to the same height as the chart. The "pageheight" attribute can be used to specify an alternative value. The value must be a number.
leftx	Attribute	The x coordinate of the left side of the chart within the page in pixel unit. By default, ChartDirector will center the chart in the page. The "leftx" attribute can be used to specify an alternative horizontal position. The coordinate must be a number.
topy	Attribute	The y coordinate of the top side of the chart within the page in pixel unit. By default, ChartDirector will center the chart in the page. The "topy" attribute can be used to specify an alternative vertical position. The coordinate must be a number.
dpi	Attribute	Specify the factor for conversion from pixel to physical unit.

Argument	Default	Description
options	(Mandatory)	A list of options delimited by semicolons.

- 30.18.111 setResource(id as string, data as string) 5317
- 30.18.112 setResource(id as string, drawArea as CDDrawAreaMBS) 5318

30.18.111 setResource(id as string, data as string)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a memory block to allow it to be referenced using a resource path.
Notes: Many ChartDirector features, such as BaseChart.setBgImage and the <*img*>tag in CDML, expect a file or resource path for loading an image. If the image happens to be in memory, such as if the image is retrieved from a database, setResource can be used to assign a resource ID to the memory. It can then be referenced using "@/res_id", in which res_id is the resource ID.

The assigned resource ID is only valid for the DrawArea object of which this method is called. Use CDBaseChartMBS.setResourceGlobal to assign a resource ID that is valid for all ChartDirector objects.

TryPalette	0	Use palette mode if the image contains less than 256 colors, otherwise use true color mode. This is the default.
ForcePalette	1	Use palette mode. If the image contains more than 256 colors, reduce it to 256 colors using dithering (see DrawArea.setDitherMethod).
NoPalette	2	Use true color mode.

Argument	Default	Description
p	(Mandatory)	The palette mode for PNG images.

This method stores only a pointer to the memory. It does not copy the memory. You must ensure the memory contains valid content for as long as the resource is being used.

While ChartDirector does not copy the data, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.

- 30.18.110 setResource(id as string, data as MemoryBlock) 5316
- 30.18.112 setResource(id as string, drawArea as CDDrawAreaMBS) 5318

30.18.112 setResource(id as string, drawArea as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Assigns a resource ID to a DrawArea object to allow it to be referenced using a resource path.
Notes: This method is the same DrawArea.setResource, except that it assigns the resource ID to a DrawArea object instead of a memory image. This allows the DrawArea object to be reference as an image resource using "@/res_id".

While ChartDirector does not copy the draw area, the MBS Plugin will put the resources in a dictionary to make sure they stay available till the chart is destroyed and avoid a crash.
See also:

- 30.18.110 setResource(id as string, data as MemoryBlock) 5316
- 30.18.111 setResource(id as string, data as string) 5317

30.18.113 setSearchPath(path as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the file system search path for loading image files.
Notes: Several ChartDirector operations involve loading image files. Examples are wallpapers (BaseChart.set-

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the memory image.
img	(Mandatory)	The memory that the image occupies.

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the memory image.
img	(Mandatory)	The memory that the image occupies.

Wallpaper), background images (BaseChart.setBgImage and PlotArea.setBackground2), user-defined symbols (DataSet.setDataSymbol2) or for embedding images in text using ChartDirector Mark Up Language.

30.18.114 setSize(width as Integer, height as Integer, bgColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setSize method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.115 setSize(width as Integer, height as Integer, bgColor as Integer = &hFFFFFF) 5319

30.18.115 setSize(width as Integer, height as Integer, bgColor as Integer = &hFFFFFF)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the size and background color of the drawing surface.
Notes:

See also:

- 30.18.114 setSize(width as Integer, height as Integer, bgColor as color) 5319

30.18.116 setTransparentColor(value as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setTransparentColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.117 setTransparentColor(value as Integer) 5320

Argument	Default	Description
id	(Mandatory)	The resource ID to be used to reference the DrawArea object.
drawArea	(Mandatory)	The DrawArea object to be used as a resource.

Argument	Default	Description
path	(Mandatory)	A list of directories, separated with the path separator of your operating system (";" for Windows, ":" for Linux/UNIX).

30.18.117 setTransparentColor(value as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies a certain color to mean transparent when creating the image output, or to include alpha transparency channel in the output.
Notes: There are two types of transparency:

Alpha transparency: In addition to red, green and blue levels, there is a transparency level associated with each pixel, which can range from completely transparent to completely opaque. The data associated with the transparency information is called the alpha channel.

Single color transparency: The image itself has no alpha channel, but a certain color is used to mean completely transparent. For internal drawing, ChartDirector always use alpha transparency. However, when outputting the image as an image file, ChartDirector by default will remove the alpha channel to reduce image size. It is because many image displaying software do not support alpha transparency. For example, the IE browser only supports single color transparency but not alpha transparency.

If you want to use single color transparency in the output, you may specify the transparent color as the argument to the setTransparentColor method. Note that only GIF and PNG can support single color transparency. JPEG, BMP and WBMP cannot support transparency at all.

If you do want to keep the alpha channel in final output, you may pass -1 as the argument to setTransparentColor. Note that the only image format that can support alpha transparency is PNG.

One important thing to note is that the IE browser (and possibly many image displaying software) only supports single color transparency for palette based images with up to 256 colors, but not for true color images. For this reason, if single color transparency is used, ChartDirector will automatically reduce the image to 256 colors if it has more than 256 colors. This may result in lost of image quality, especially if the image contains gradient colors.

Therefore, due to the limitations of the current generations of image displaying software, for highest image quality, sometimes it may be beneficial to not using transparency in image output, but to set the image background color to the same color as the container background.

Argument	Default	Description
width	(Mandatory)	The width of the drawing surface in pixels.
height	(Mandatory)	The height of the drawing surface in pixels.
bgColor	FFFFFF	The background color of the drawing surface.

Argument	Default	Description
c	(Mandatory)	The color that is designated as the transparent color. If -1 is used, the full alpha transparency channel will be included in the final output.

See also:

- 30.18.116 setTransparentColor(value as color) 5319

30.18.118 shearTransform(xShear as Double, yShear as Double = 0, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shear the drawing surface.
Notes: Shearing can be applied along the horizontal direction and/or vertical direction. A rectangle, after shearing, will become a parallelogram.

Argument	Default	Description
xShear	(Mandatory)	The number of pixels to shear leftwards.
yShear	0	The number of pixels to shear downwards.
bgColor	FFFFFF	The background color used to fill the space left after transformation.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

See also:

- 30.18.119 shearTransform(xShear as Double, yShear as Double, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5321

30.18.119 shearTransform(xShear as Double, yShear as Double, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other shearTransform method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.118 shearTransform(xShear as Double, yShear as Double = 0, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5321

30.18.120 sphereTransform(xDiameter as Integer, yDiameter as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other sphereTransform method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.121 sphereTransform(xDiameter as Integer, yDiameter as Integer, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5322

30.18.121 sphereTransform(xDiameter as Integer, yDiameter as Integer, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Wraps the drawing surface onto a sphere or ellipsoid.
Notes:

Argument	Default	Description
xDiameter	(Mandatory)	The horizontal diameter of the sphere or ellipsoid in pixels.
yDiameter	(Mandatory)	The vertical diameter of the sphere or ellipsoid in pixels.
bgColor	FFFFFF	The background color used to fill the space left after transformation.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

See also:

- 30.18.120 sphereTransform(xDiameter as Integer, yDiameter as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5322

30.18.122 surface(cx1 as Double, y1 as Double, x2 as Double, y2 as Double, depthX as Integer, depthY as Integer, edgeColor as color, fillColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other surface method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.123 surface(cx1 as Double, y1 as Double, x2 as Double, y2 as Double, depthX as Integer, depthY as Integer, edgeColor as Integer, fillColor as Integer) 5323

30.18.123 surface(cx1 as Double, y1 as Double, x2 as Double, y2 as Double, depthX as Integer, depthY as Integer, edgeColor as Integer, fillColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a parallelogram.
Notes:

Argument	Default	Description
x1	(Mandatory)	The x coordinate of the first end-point of one line of the parallelogram.
y1	(Mandatory)	The y coordinate of the first end-point of one line of the parallelogram.
x2	(Mandatory)	The x coordinate of the second end-point of one line of the parallelogram.
y2	(Mandatory)	The y coordinate of the second end-point of one line of the parallelogram.
depthX	(Mandatory)	The x displacement of the line segment that is parallel to the line segment above.
depthY	(Mandatory)	The y displacement of the line segment that is parallel to the line segment above.
edgeColor	(Mandatory)	The border color. To disable border, set the edgeColor the same as the fillColor.
fillColor	(Mandatory)	The fill color. To disable filling, set the fillColor to Transparent.

See also:

- 30.18.122 surface(cx1 as Double, y1 as Double, x2 as Double, y2 as Double, depthX as Integer, depthY as Integer, edgeColor as color, fillColor as color) 5322

30.18.124 text(str as string, font as string, fontIndex as Integer, fontHeight as Double, fontWidth as Double, angle as Double, vertical as boolean) as CDTTFTextMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a TTFText object representing a text block.
Notes: The TTFText object contains methods to measure and draw the text. This method is useful if the size of the text is needed before deciding where the draw it.

Return Value

Argument	Default	Description
text	(Mandatory)	A string representing the text to be drawn. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.
font	(Mandatory)	The font name. See Font Specification for details on various font attributes.
fontIndex	(Mandatory)	The font index in case the font name refers to a font collection. An index of 0 means the first font.
fontHeight	(Mandatory)	The font height in points.
fontWidth	(Mandatory)	The font width in points.
angle	(Mandatory)	The rotation angle of the text.
vertical	(Mandatory)	A true value means the text is layout vertically (from top to bottom). A false value means the is layout horizontally (from left to right).

The TTFText object created.

30.18.126 text(str as string, font as string, fontIndex as Integer, fontHeight as Double, fontWidth as Double, angle as Double, vertical as boolean, x as Integer, y as Integer, colorvalue as Integer, alignment as Integer = 7)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws text.
Notes:

Argument	Default	Description
str	(Mandatory)	A string representing the text to be drawn. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.
font	(Mandatory)	The font name. See Font Specification for details on various font attributes.
fontIndex	(Mandatory)	The font index in case the font name refers to a font collection. An index of 0 means the first font.
fontHeight	(Mandatory)	The font height in points.
fontWidth	(Mandatory)	The font width in points.
angle	(Mandatory)	The rotation angle of the text. The angle is measured in degrees in clockwise direction.
vertical	(Mandatory)	A true value means the text is layout vertically (from top to bottom). A false value means the is layout horizontally (from left to right).
x	(Mandatory)	The x coordinate of a reference point to align the text.
y	(Mandatory)	The y coordinate of a reference point to align the text.
color	(Mandatory)	The color of the text.
alignment	TopLeft	The position of the text relative to the reference point. See Alignment Specification for supported alignment types.

30.18.129 text(str as string, font as string, fontsize as Double, x as Integer, y as Integer, colorvalue as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws text.
Notes:

Argument	Default	Description
str	(Mandatory)	A string representing the text to be drawn. See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.
font	(Mandatory)	The font name. See Font Specification for details on various font attributes.
fontSize	(Mandatory)	The font size in points.
x	(Mandatory)	The x coordinate of the top-left corner of the text.
y	(Mandatory)	The y coordinate of the top-left corner of the text.
color	(Mandatory)	The color of the text.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

30.18.130 tile(d as CDDrawAreaMBS, transparency as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copy another DrawArea to the current DrawArea as a wallpaper.
Notes: The wallpaper image will be tiled repeatedly on the current DrawArea until the entire DrawArea is covered.

Argument	Default	Description
d	(Mandatory)	A DrawArea object representing the source.
transparency	(Mandatory)	Specify the transparency level when copying the other DrawArea to the current DrawArea. A value of 0 means non-transparent. A value of 255 means totally transparent.

30.18.131 vCylinderTransform(xDiameter as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other vCylinderTransform method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.132 vCylinderTransform(xDiameter as Integer, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5328

30.18.132 vCylinderTransform(xDiameter as Integer, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Wraps the drawing surface onto a vertical cylinder.
Notes:

Argument	Default	Description
xDiameter	(Mandatory)	The diameter of the cylinder in pixels.
bgColor	FFFFFF	The background color used to fill the space left after transformation.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

See also:

- 30.18.131 vCylinderTransform(xDiameter as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5328

30.18.133 vFlip

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flip the drawing surface along the central vertical line.

30.18.134 vline(y1 as Integer, y2 as Integer, x as Integer, c as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws a vertical line.
Notes:

Argument	Default	Description
y1	(Mandatory)	The y coordinate of the first end-point of the line.
y2	(Mandatory)	The y coordinate of the second end-point of the line.
x	(Mandatory)	The x coordinate of the line.
c	(Mandatory)	The color of the line.

30.18.135 vTriangleTransform(tHeight as Integer = -1, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Wraps the drawing surface onto a vertical triangle pointing upwards.
Notes:

See also:

Argument	Default	Description
tHeight	-1	The height of the triangle in pixels.
bgColor	FFFFFF	The background color used to fill the space left after transformation.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

- 30.18.136 vTriangleTransform(tHeight as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5330

30.18.136 vTriangleTransform(tHeight as Integer, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other vTriangleTransform method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.135 vTriangleTransform(tHeight as Integer = -1, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5329

30.18.137 waveTransform(period as Integer, amplitude as Double, direction as Double = 0, startAngle as Double = 0, longitudinal as boolean=false, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the pixels on the drawing surface according to a sinusoidal function to achieve a wave effect.
Notes:

Argument	Default	Description
period	(Mandatory)	The period of the wave in pixels.
amplitude	(Mandatory)	The amplitude of the wave in pixels.
direction	0	The propagation direction of the wave. The upward pointing direction is 0 degree, and the angle is measured clockwise.
startAngle	0	The initial phase angle of the wave in degrees.
longitudinal	false	Determine if the wave is transversal or longitudinal. true means transversal. false means longitudinal.
bgColor	FFFFFF	The background color used to fill the space left after transformation.
filter	LinearFilter	The filter to use for re-sampling.
blur	1	The blur factor to use for re-sampling.

- 30.18.138 waveTransform(period as Integer, amplitude as Double, direction as Double, startAngle as Double, longitudinal as boolean, bgColor as color, filter as Integer = 2, blur as Double = 1.0) 5331

30.18.138 waveTransform(period as Integer, amplitude as Double, direction as Double, startAngle as Double, longitudinal as boolean, bgColor as color, filter as Integer = 2, blur as Double = 1.0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other waveTransform method, but uses color instead of integer data type for passing color values.
See also:

- 30.18.137 waveTransform(period as Integer, amplitude as Double, direction as Double = 0, startAngle as Double = 0, longitudinal as boolean=false, bgColor as Integer = &hFFFFFF, filter as Integer = 2, blur as Double = 1.0) 5330

30.18.139 Properties

30.18.140 Handle as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

30.18.141 Resources as Dictionary

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal resource dictionary.
Notes: Stores references for registered resources.
Just for debugging.
(Read only property)

30.19 class CDDrawObjMBS

30.19.1 class CDDrawObjMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: This is the base class for several drawing related subclasses.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.19.2 Methods

30.19.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.19.4 paint(d as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws the content to this object into a drawarea.

30.19.5 setZOrder(z as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the z-order.

30.20 class CDFinanceChartMBS

30.20.1 class CDFinanceChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: FinanceChart is a financial charting library built on top of the main ChartDirector library.
Example:

```
// draw a stock chart with candlesticks, moving average and volume bars
// use simulated prices for 100 trading days
Var sim As New CDFinanceSimulatorMBS(1, CDBaseChartMBS.chartTime(2025, 1, 1), CDBaseChartMBS.chartTime(2025, 6, 1), 86400)

Var c As New CDFinanceChartMBS(640)
c.setData(sim.getTimeStamps.Values, sim.getHighData.Values, sim.getLowData.Values, sim.getOpenData.Values, sim.getCloseData.Values, sim.getVolData.Values, 0)

Call c.addMainChart(240)
Call c.addCandleStick(&c00CC00, &cFF0000) // up and down colors
Call c.addSimpleMovingAvg(20, &c663300) // 20 days average
Call c.addVolBars(75, &c99FF99, &cFF9999, &c808080)
Call c.addRSI(75, 14, &c800080, 20, &cFF6666, &c6666FF)

Var pic As Picture = c.makeChartPicture
// show pic in a Canvas or ImageViewer
```

Notes: It extends CDMultiChartMBS by implementing many financial indicators, and allowing complex financial charts to be composed easily.

Key Features:

- Arbitrary Financial Chart Composition: Allows a complex financial chart to be constructed by stacking a main financial chart with arbitrary number of indicator charts in any order.
- Main Chart Layers: The main chart can show information in Candlestick or OHLC, and/or various price lines, such as closing price line, weighted close line, typical price line or median price line.
- Moving Averages: Chart can include arbitrary number of moving average lines of configurable types and periods. Supports simple, exponential, triangular and weighted moving averages.
- Parabolic SAR: A parabolic SAR indicator can be added to the main price chart.
- Bands and Envelops: Built-in Bollinger Band layer, Donchian Channel layer, and moving average envelops. Also supports custom-defined bands.
- Volume Bars: Volume Bars can be displayed as part of the main chart, or as a separate indicator chart.

- Axis Styles: Axis can be log or linear scale, and can display on left or right side of the chart.
- Built-In Indicators: Accumulation/Distribution, Aroon Up/Down, Aroon Oscillator, Average Directional Index, Average True Range (including raw True Range), Bollinger Band Width, Commodity Channel Index, Chaikin Money Flow, Chaikin Oscillator, Chaikin Volatility, Close Location Value, Detrended Price Oscillator, Donchian Channel Width, Ease of Movement, Fast Stochastic, MACD, Mass Index, Money Flow Index, Momentum, Negative Volume Index, On Balance Volume, Performance, Percentage Price Oscillator, Positive Volume Index, Percentage Volume Oscillator, Price Volume Trend, Rate of Change, Relative Strength Index, Slow Stochastic, Standard Deviation, Stochastic RSI, TRIX, Ultimate Oscillator, Volume, William %R.
- Custom Lines and Indicators: Extensible design allows developers to implement additional lines and indicator types.
- Customizable Look and Feel: Preserves the flexibility and power of the ChartDirector API. Background images, custom text boxes, logos, fonts and colors, etc., are all customizable.

Using FinanceChart:
You create an instance of FinanceChart. Next, you may add data to it using setData. After that, you may add the main chart (addMainChart) and other indicator charts to display the data graphically. These charts may be added in any order.

For the main chart, you may:

- Display price information using Candlesticks (addCandleStick) or HLOC (addHLOC) symbols
- Add various price lines (addCloseLine, addWeightedClose, addTypicalPrice, addMedianPrice)
- Add moving average lines of different types and periods (addSimpleMovingAvg, addExpMovingAvg, addTriMovingAvg, addWeightedMovingAvg)
- Add Parabolic SAR (addParabolicSAR)
- Add price bands or envelops: (addBollingerBand, addDonchianChannel, addEnvelop)
- Add custom lines or bands (addLineIndicator2, addBand)
- Add volume bars (addVolBars)

For indicator charts, FinanceChart includes a wide variety of indicators. Please refer to the table below for details. You may also add your own custom indicator chart using addLineIndicator and addBarIndicator.

In addition to chart building methods, FinanceChart also has a number of chart formatting methods, such as addPlotAreaTitle to add chart title, setPlotAreaStyle to control background color and grid lines, setDateLabelFormat to control date/time formatting, etc.

Furthermore, as FinanceChart is a subclass of CDMultiChartMBS, and the main and indicator charts are implemented as XYChart objects, they can use the powerful ChartDirector API for formatting (eg. background images, custom logos, custom text boxes, metallic colors, etc).
Subclass of the CDMultiChartMBS class.

30.20.2 Methods

30.20.3 addAccDist(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addAccDist method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.4 addAccDist(height as Integer, ColorValue as Integer) as CDXYChartMBS 5335

30.20.4 addAccDist(height as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an Accumulation/Distribution indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.3 addAccDist(height as Integer, ColorValue as color) as CDXYChartMBS 5335

30.20.5 addADX(height as Integer, period as Integer, posColor as color, negColor as color, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addADX method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.6 addADX(height as Integer, period as Integer, posColor as Integer, negColor as Integer, ColorValue as Integer) as CDXYChartMBS 5336

30.20.6 addADX(height as Integer, period as Integer, posColor as Integer, negColor as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an Average Directional Index indicators chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
posColor	(Mandatory)	The color of the Positive Directional Index line.
negColor	(Mandatory)	The color of the Negative Directional Index line.
color	(Mandatory)	The color of the Average Directional Index line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.5 addADX(height as Integer, period as Integer, posColor as color, negColor as color, ColorValue as color) as CDXYChartMBS 5336

30.20.7 addAroon(height as Integer, period as Integer, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addAroon method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.8 addAroon(height as Integer, period as Integer, upColor as Integer, downColor as Integer) as CDXYChartMBS 5337

30.20.8 addAroon(height as Integer, period as Integer, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an Aroon Up/Down indicators chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicators.
upColor	(Mandatory)	The color of the Aroon Up indicator line.
downColor	(Mandatory)	The color of the Aroon Down indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.7 addAroon(height as Integer, period as Integer, upColor as color, downColor as color) as CDXYChartMBS 5336

30.20.9 addAroonOsc(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addAroonOsc method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.10 addAroonOsc(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS 5337

30.20.10 addAroonOsc(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an Aroon Oscillator indicator chart.
Notes: Arguments:

Return Value
A CDXYChartMBS object representing the chart created.
See also:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

- 30.20.9 addAroonOsc(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS 5337

30.20.11 addATR(height as Integer, period as Integer, color1 as color, color2 as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addATR method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.12 addATR(height as Integer, period as Integer, color1 as Integer, color2 as Integer) as CDXY-ChartMBS 5338

30.20.12 addATR(height as Integer, period as Integer, color1 as Integer, color2 as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an Average True Range indicators chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color1	(Mandatory)	The color of the True Range line.
color2	(Mandatory)	The color of the Average True Range line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.11 addATR(height as Integer, period as Integer, color1 as color, color2 as color) as CDXY-ChartMBS 5338

30.20.13 addBand(upperLine() as Double, lowerLine() as Double, LineColor as color, FillColor as color, Name as string) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addBand method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.14 addBand(upperLine() as Double, lowerLine() as Double, LineColor as Integer, FillColor as Integer, Name as string) as CDInterLineLayerMBS 5339

30.20.14 addBand(upperLine() as Double, lowerLine() as Double, LineColor as Integer, FillColor as Integer, Name as string) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a generic band to the main finance chart.
Notes: This method is used internally by other methods to add various bands (eg. Bollinger band, Donchian channels, etc).

Arguments:

Argument	Default	Description
upperLine	(Mandatory)	The data series for the upper band line.
lowerLine	(Mandatory)	The data series for the lower band line.
lineColor	(Mandatory)	The color of the upper and lower band line.
fillColor	(Mandatory)	The color to fill the region between the upper and lower band lines.
name	(Mandatory)	The name of the band.

Return Value
An CDInterLineLayerMBS object representing the filled region.
See also:

- 30.20.13 addBand(upperLine() as Double, lowerLine() as Double, LineColor as color, FillColor as color, Name as string) as CDInterLineLayerMBS 5339

30.20.15 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addBarIndicator method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.16 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDBarLayerMBS 5340
- 30.20.17 addBarIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS 5340
- 30.20.18 addBarIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS 5341

30.20.16 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a bar layer to an existing indicator chart.
Notes: Arguments:

Argument	Default	Description
c	(Mandatory)	The indicator chart to add the bar layer to.
data	(Mandatory)	The data series of the indicator bars.
color	(Mandatory)	The color of the indicator bars.
name	(Mandatory)	The name of the indicator.

Return Value
A CDBarLayerMBS object representing the bar layer created.
See also:

- 30.20.15 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDBarLayerMBS 5339
- 30.20.17 addBarIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS 5340
- 30.20.18 addBarIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS 5341

30.20.17 addBarIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addBarIndicator method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.15 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDBarLayerMBS 5339
- 30.20.16 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDBarLayerMBS 5340
- 30.20.18 addBarIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS 5341

30.20.18 addBarIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a generic bar indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
data	(Mandatory)	The data series of the indicator bars.
color	(Mandatory)	The color of the indicator bars.
name	(Mandatory)	The name of the indicator.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.15 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDBarLayerMBS 5339
- 30.20.16 addBarIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDBarLayerMBS 5340
- 30.20.17 addBarIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS 5340

30.20.19 addBollingerBand(period as Integer, bandWidth as Double, lineColor as color, FillColor as color) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addBollingerBand method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.20 addBollingerBand(period as Integer, bandWidth as Double, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS 5342

30.20.20 addBollingerBand(period as Integer, bandWidth as Double, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Bollinger band to the main chart.
Notes: Arguments:

Argument	Default	Description
period	(Mandatory)	The period to compute the band.
bandWidth	(Mandatory)	The half-width of the band in terms multiples of standard deviation. Typically 2 is used.
lineColor	(Mandatory)	The color of the lines defining the upper and lower limits.
fillColor	(Mandatory)	The color to fill the regional within the band.

Return Value
An CDInterLineLayerMBS object representing the band created.
See also:

- 30.20.19 addBollingerBand(period as Integer, bandWidth as Double, lineColor as color, FillColor as color) as CDInterLineLayerMBS 5341

30.20.21 addBollingerWidth(height as Integer, period as Integer, width as Double, colorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addBollingerWidth method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.22 addBollingerWidth(height as Integer, period as Integer, width as Double, colorValue as Integer) as CDXYChartMBS 5343

30.20.22 addBollingerWidth(height as Integer, period as Integer, width as Double, colorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Bollinger Band Width indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
width	(Mandatory)	The band width to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.21 addBollingerWidth(height as Integer, period as Integer, width as Double, colorValue as color) as CDXYChartMBS 5342

30.20.23 addCandleStick(upColor as color, downColor as color) as CDCandleStickLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addCandleStick method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.24 addCandleStick(upColor as Integer, downColor as Integer) as CDCandleStickLayerMBS 5343

30.20.24 addCandleStick(upColor as Integer, downColor as Integer) as CDCandleStickLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a candlestick layer to the main chart.
Notes: Arguments:

Return Value
A CDCandleStickLayerMBS object representing the candlestick layer created.
See also:

Argument	Default	Description
upColor	(Mandatory)	The candle color for a up day.
downColor	(Mandatory)	The candle color for a down day.

- 30.20.23 addCandleStick(upColor as color, downColor as color) as CDCandleStickLayerMBS 5343

30.20.25 addCCI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addCCI method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.26 addCCI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS 5344

30.20.26 addCCI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Community Channel Index indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.
range	(Mandatory)	The distance between the middle line and the upper and lower threshold lines.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.25 addCCI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS 5344

30.20.27 addChaikinMoneyFlow(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addChaikinMoneyFlow method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.28 addChaikinMoneyFlow(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS 5345

30.20.28 addChaikinMoneyFlow(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Chaikin Money Flow indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.27 addChaikinMoneyFlow(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS 5345

30.20.29 addChaikinOscillator(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addChaikinOscillator method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.30 addChaikinOscillator(height as Integer, ColorValue as Integer) as CDXYChartMBS 5346

30.20.30 addChaikinOscillator(height as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Chaikin Oscillator indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.29 addChaikinOscillator(height as Integer, ColorValue as color) as CDXYChartMBS 5345

30.20.31 addChaikinVolatility(height as Integer, period1 as Integer, period2 as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addChaikinVolatility method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.32 addChaikinVolatility(height as Integer, period1 as Integer, period2 as Integer, ColorValue as Integer) as CDXYChartMBS 5346

30.20.32 addChaikinVolatility(height as Integer, period1 as Integer, period2 as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Chaikin Volatility indicator chart.
Notes: Arguments:

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.31 addChaikinVolatility(height as Integer, period1 as Integer, period2 as Integer, ColorValue as color) as CDXYChartMBS 5346

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The period to smooth the range.
period2	(Mandatory)	The period to compute the rate of change of the smoothed range.
color	(Mandatory)	The color of the indicator line.

30.20.33 addCloseLine(ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addCloseLine method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.34 addCloseLine(ColorValue as Integer) as CDLineLayerMBS 5347

30.20.34 addCloseLine(ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a closing price line on the main chart.
Notes: Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 30.20.33 addCloseLine(ColorValue as color) as CDLineLayerMBS 5347

30.20.35 addCLV(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addCLV method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.36 addCLV(height as Integer, ColorValue as Integer) as CDXYChartMBS 5348

30.20.36 addCLV(height as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Close Location Value indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.35 addCLV(height as Integer, ColorValue as color) as CDXYChartMBS 5347

30.20.37 addComparison(data() as Double, ColorValue as color, Name as string) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addComparison method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.38 addComparison(data() as Double, ColorValue as Integer, Name as string) as CDLineLayerMBS 5348

30.20.38 addComparison(data() as Double, ColorValue as Integer, Name as string) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data series to the main chart for comparison with the closing price.
Notes: The data series added will be scaled so that the first visible point in the data series will coincide the first visible point of the main closing price. This facilitate comparing the performance of the closing price with the data series. The data series typically is the closing price of another stock, or the value of a market index.

Arguments:

Return Value:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data series.
color	(Mandatory)	The color of the line.
name	(Mandatory)	The name of the data series.

A LineLayer object representing the comparison line created.
See also:

- 30.20.37 addComparison(data() as Double, ColorValue as color, Name as string) as CDLineLayerMBS 5348

30.20.39 addDonchianChannel(period as Integer, lineColor as color, FillColor as color) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addDonchianChannel method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.40 addDonchianChannel(period as Integer, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS 5349

30.20.40 addDonchianChannel(period as Integer, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Donchian channel to the main chart.
Notes: Arguments:

Argument	Default	Description
period	(Mandatory)	The period to compute the band.
lineColor	(Mandatory)	The color of the lines defining the upper and lower limits.
fillColor	(Mandatory)	The color to fill the regional within the band.

Return Value
An CDInterLineLayerMBS object representing the band created.
See also:

- 30.20.39 addDonchianChannel(period as Integer, lineColor as color, FillColor as color) as CDInterLineLayerMBS 5349

30.20.41 addDonchianWidth(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addDonchianWidth method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.42 addDonchianWidth(height as Integer, period as Integer, ColorValue as Integer) as CDXY-ChartMBS 5350

30.20.42 addDonchianWidth(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Donchian Channel Width indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.41 addDonchianWidth(height as Integer, period as Integer, ColorValue as color) as CDXY-ChartMBS 5350

30.20.43 addDPO(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addDPO method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.44 addDPO(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS 5351

30.20.44 addDPO(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Detrended Price Oscillator indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.43 addDPO(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS 5350

30.20.45 addEaseOfMovement(height as Integer, period as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addEaseOfMovement method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.46 addEaseOfMovement(height as Integer, period as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS 5351

30.20.46 addEaseOfMovement(height as Integer, period as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Ease of Movement indicator chart.
Notes: Arguments:

Return Value
A CDXYChartMBS object representing the chart created.
See also:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to smooth the indicator.
color1	(Mandatory)	The color of the indicator line.
color2	(Mandatory)	The color of the smoothed indicator line.

- 30.20.45 addEaseOfMovement(height as Integer, period as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS 5351

30.20.47 addEnvelop(period as Integer, range as Double, lineColor as color, FillColor as color) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addEnvelop method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.48 addEnvelop(period as Integer, range as Double, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS 5352

30.20.48 addEnvelop(period as Integer, range as Double, lineColor as Integer, FillColor as Integer) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a price envelop to the main chart.
Notes: The price envelop is a defined as a ratio around a moving average. For example, a ratio of 0.2 means 20% above and below the moving average.

Arguments:

Argument	Default	Description
period	(Mandatory)	The period for the moving average.
range	(Mandatory)	The ratio above and below the moving average.
lineColor	(Mandatory)	The color of the lines defining the upper and lower limits.
fillColor	(Mandatory)	The color to fill the regional within the band.

Return Value
An CDInterLineLayerMBS object representing the band created.
See also:

- 30.20.47 addEnvelop(period as Integer, range as Double, lineColor as color, FillColor as color) as CDInterLineLayerMBS 5352

30.20.49 addExpMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addExpMovingAvg method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.50 addExpMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS 5353

30.20.50 addExpMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an exponential moving average line on the main chart.
Notes: Arguments:

Argument	Default	Description
period	(Mandatory)	The moving average period
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 30.20.49 addExpMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS 5353

30.20.51 addFastStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addFastStochastic method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.52 addFastStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS 5354

30.20.52 addFastStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Fast Stochastic indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The period to compute the %K line.
period2	(Mandatory)	The period to compute the %D line.
color1	(Mandatory)	The color of the %K line.
color2	(Mandatory)	The color of the %D line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.51 addFastStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS 5353

30.20.53 addHLOC(upColor as color, downColor as color) as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addHLOC method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.54 addHLOC(upColor as Integer, downColor as Integer) as CDHLOCLayerMBS 5354

30.20.54 addHLOC(upColor as Integer, downColor as Integer) as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a HLOC layer to the main chart.
Notes: Arguments:

Return Value

Argument	Default	Description
upColor	(Mandatory)	The candle color for a up day.
downColor	(Mandatory)	The candle color for a down day.

A CDHLOCLayerMBS object representing the HLOC layer created.
See also:

- 30.20.53 addHLOC(upColor as color, downColor as color) as CDHLOCLayerMBS 5354

30.20.55 addIndicator(height as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a blank indicator chart to the finance chart.
Notes: Used internally to add other indicators. Override to change the default formatting (eg. axis fonts, etc.) of the various indicators.

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the chart in pixels.

Return Value
A CDXYChartMBS object representing the chart created.

30.20.56 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addLineIndicator method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.57 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDLineLayerMBS 5356
- 30.20.58 addLineIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS 5356
- 30.20.59 addLineIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS 5357

30.20.57 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a line to an existing indicator chart.
Notes: Arguments:

Argument	Default	Description
c	(Mandatory)	The indicator chart to add the line to.
data	(Mandatory)	The data series of the indicator line.
color	(Mandatory)	The color of the indicator line.
name	(Mandatory)	The name of the indicator.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 30.20.56 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDLineLayerMBS 5355
- 30.20.58 addLineIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS 5356
- 30.20.59 addLineIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS 5357

30.20.58 addLineIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addLineIndicator method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.56 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDLineLayerMBS 5355
- 30.20.57 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDLineLayerMBS 5356
- 30.20.59 addLineIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS 5357

30.20.59 addLineIndicator(height as Integer, data() as Double, ColorValue as Integer, name as string) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a generic line indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
data	(Mandatory)	The data series of the indicator line.
color	(Mandatory)	The color of the indicator line.
name	(Mandatory)	The name of the indicator.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.56 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as color, name as string) as CDLineLayerMBS 5355
- 30.20.57 addLineIndicator(chart as CDXYChartMBS, data() as Double, ColorValue as Integer, name as string) as CDLineLayerMBS 5356
- 30.20.58 addLineIndicator(height as Integer, data() as Double, ColorValue as color, name as string) as CDXYChartMBS 5356

30.20.60 addMACD(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addMACD method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.61 addMACD(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS 5357

30.20.61 addMACD(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a MACD indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The first moving average period to compute the indicator.
period2	(Mandatory)	The second moving average period to compute the indicator.
period3	(Mandatory)	The moving average period of the signal line.
color	(Mandatory)	The color of the indicator line.
signalColor	(Mandatory)	The color of the signal line.
divColor	(Mandatory)	The color of the divergent bars.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.60 addMACD(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS 5357

30.20.62 addMainChart(height as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the main chart - the chart that shows the data for the prices.
Notes: The chart added is initially empty. Other methods, such as CDFinanceChartMBS.addCandleStick and CDFinanceChartMBS.addSimpleMovingAvg, may be used to add various layers to the chart.

Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the main chart in pixels.

Return Value
A CDXYChartMBS object representing the main chart created.

30.20.63 addMassIndex(height as Integer, ColorValue as color, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addMassIndex method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.64 addMassIndex(height as Integer, ColorValue as Integer, upColor as Integer, downColor as Integer) as CDXYChartMBS 5359

30.20.64 addMassIndex(height as Integer, ColorValue as Integer, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Mass Index indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.63 addMassIndex(height as Integer, ColorValue as color, upColor as color, downColor as color) as CDXYChartMBS 5358

30.20.65 addMedianPrice(ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addMedianPrice method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.66 addMedianPrice(ColorValue as Integer) as CDLineLayerMBS 5359

30.20.66 addMedianPrice(ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a median price line on the main chart.
Notes: Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 30.20.65 addMedianPrice(ColorValue as color) as CDLineLayerMBS 5359

30.20.67 addMFI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addMFI method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.68 addMFI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS 5360

30.20.68 addMFI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Money Flow Index indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.
range	(Mandatory)	The distance between the middle line and the upper and lower threshold lines.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.67 addMFI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS 5360

30.20.69 addMomentum(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addMomentum method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.70 addMomentum(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS 5361

30.20.70 addMomentum(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Momentum indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.69 addMomentum(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS 5361

30.20.71 addNVI(height as Integer, period as Integer, ColorValue as color, signalColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addNVI method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.72 addNVI(height as Integer, period as Integer, ColorValue as Integer, signalColor as Integer) as CDXYChartMBS 5362

30.20.72 addNVI(height as Integer, period as Integer, ColorValue as Integer, signalColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Negative Volume Index indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the signal line.
color	(Mandatory)	The color of the indicator line.
signalColor	(Mandatory)	The color of the signal line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.71 addNVI(height as Integer, period as Integer, ColorValue as color, signalColor as color) as CDXYChartMBS 5361

30.20.73 addOBV(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addOBV method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.74 addOBV(height as Integer, ColorValue as Integer) as CDXYChartMBS 5362

30.20.74 addOBV(height as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an On Balance Volume indicator chart.
Notes: Arguments:

Return Value
A CDXYChartMBS object representing the chart created.
See also:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.

- 30.20.73 addOBV(height as Integer, ColorValue as color) as CDXYChartMBS 5362

30.20.75 addParabolicSAR(accInitial as Double, accIncrement as Double, accMaximum as Double, symbolType as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addParabolicSAR method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.76 addParabolicSAR(accInitial as Double, accIncrement as Double, accMaximum as Double, symbolType as Integer, symbolSize as Integer, fillColor as Integer, edgeColor as Integer) as CDLineLayerMBS 5363

30.20.76 addParabolicSAR(accInitial as Double, accIncrement as Double, accMaximum as Double, symbolType as Integer, symbolSize as Integer, fillColor as Integer, edgeColor as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a parabolic SAR indicator to the main chart.
Notes: Arguments

Argument	Default	Description
accInitial	(Mandatory)	The initial acceleration. A common value to use is 0.02.
accIncrement	(Mandatory)	The incremental acceleration. A common value to use is 0.02.
accMaximum	(Mandatory)	The maximum acceleration. A common value to use is 0.2.
symbolType	(Mandatory)	The symbol used to plot the parabolic SAR. One of the predefined shape constants representing the symbol shape. See Shape Specification for the available built-in shapes.
symbolSize	(Mandatory)	The width and height of the symbol in pixels
fillColor	(Mandatory)	The color used to fill the symbol.
edgeColor	(Mandatory)	The edge color used to draw the edge of the symbol.

Return Value
A CDLineLayerMBS object representing the parabolic SAR created.
See also:

- 30.20.75 addParabolicSAR(accInitial as Double, accIncrement as Double, accMaximum as Double, symbolType as Integer, symbolSize as Integer, fillColor as color, edgeColor as color) as CDLineLayerMBS 5363

30.20.77 addPerformance(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addPerformance method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.78 addPerformance(height as Integer, ColorValue as Integer) as CDXYChartMBS 5364

30.20.78 addPerformance(height as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Performance indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.77 addPerformance(height as Integer, ColorValue as color) as CDXYChartMBS 5364

30.20.79 addPlotAreaTitle(alignment as Integer, text as string) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a text title above the plot area.
Notes: You may add multiple title above the plot area by calling this method multiple times.

Arguments:

Argument	Default	Description
alignment	(Mandatory)	The alignment with respect to the region that is on top of the plot area. See Alignment Specification for supported alignment types.
text	(Mandatory)	The text to add.

Return Value
The CDTextBoxMBS object representing the text box above the plot area, which may be used to fine-tune the appearance of the text.

30.20.80 addPPO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addPPO method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.81 addPPO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS 5365

30.20.81 addPPO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Percentage Price Oscillator indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The first moving average period to compute the indicator.
period2	(Mandatory)	The second moving average period to compute the indicator.
period3	(Mandatory)	The moving average period of the signal line.
color	(Mandatory)	The color of the indicator line.
signalColor	(Mandatory)	The color of the signal line.
divColor	(Mandatory)	The color of the divergent bars.

Return Value
A CDXYChartMBS object representing the chart created.

See also:

- 30.20.80 addPPO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS 5365

30.20.82 addPVI(height as Integer, period as Integer, ColorValue as color, signalColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addPVI method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.83 addPVI(height as Integer, period as Integer, ColorValue as Integer, signalColor as Integer) as CDXYChartMBS 5366

30.20.83 addPVI(height as Integer, period as Integer, ColorValue as Integer, signalColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Positive Volume Index indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the signal line.
color	(Mandatory)	The color of the indicator line.
signalColor	(Mandatory)	The color of the signal line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.82 addPVI(height as Integer, period as Integer, ColorValue as color, signalColor as color) as CDXYChartMBS 5366

30.20.84 addPVO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addPVO method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.85 addPVO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS 5367

30.20.85 addPVO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, signalColor as Integer, divColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Percentage Volume Oscillator indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The first moving average period to compute the indicator.
period2	(Mandatory)	The second moving average period to compute the indicator.
period3	(Mandatory)	The moving average period of the signal line.
color	(Mandatory)	The color of the indicator line.
signalColor	(Mandatory)	The color of the signal line.
divColor	(Mandatory)	The color of the divergent bars.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.84 addPVO(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, signalColor as color, divColor as color) as CDXYChartMBS 5366

30.20.86 addPVT(height as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addPVT method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.87 addPVT(height as Integer, ColorValue as Integer) as CDXYChartMBS 5368

30.20.87 addPVT(height as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Price Volume Trend indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.86 addPVT(height as Integer, ColorValue as color) as CDXYChartMBS 5367

30.20.88 addROC(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addROC method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.89 addROC(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS 5368

30.20.89 addROC(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Rate of Change indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.88 addROC(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS 5368

30.20.90 addRSI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addRSI method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.91 addRSI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS 5369

30.20.91 addRSI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Relative Strength Index indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.
range	(Mandatory)	The distance between the middle line and the upper and lower threshold lines.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.90 addRSI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS 5369

30.20.92 addSimpleMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addSimpleMovingAvg method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.93 addSimpleMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS 5370

30.20.93 addSimpleMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a simple moving average line on the main chart.
Notes: Arguments:

Argument	Default	Description
period	(Mandatory)	The moving average period
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 30.20.92 addSimpleMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS 5370

30.20.94 addSlowStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addSlowStochastic method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.95 addSlowStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS 5371

30.20.95 addSlowStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as Integer, ColorValue2 as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Slow Stochastic indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The period to compute the %K line.
period2	(Mandatory)	The period to compute the %D line.
color1	(Mandatory)	The color of the %K line.
color2	(Mandatory)	The color of the %D line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.94 addSlowStochastic(height as Integer, period1 as Integer, period2 as Integer, ColorValue1 as color, ColorValue2 as color) as CDXYChartMBS 5370

30.20.96 addStdDev(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addStdDev method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.97 addStdDev(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS 5371

30.20.97 addStdDev(height as Integer, period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Moving Standard Deviation indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.96 addStdDev(height as Integer, period as Integer, ColorValue as color) as CDXYChartMBS 5371

30.20.98 addStochRSI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addStochRSI method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.99 addStochRSI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS 5372

30.20.99 addStochRSI(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Stochastic RSI indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.
range	(Mandatory)	The distance between the middle line and the upper and lower threshold lines.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.98 addStochRSI(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS 5372

30.20.100 addThreshold(chart as CDXYChartMBS, layer as CDLineLayerMBS, topRange as Double, topColor as color, bottomRange as Double, bottomColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addThreshold method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.101 addThreshold(chart as CDXYChartMBS, layer as CDLineLayerMBS, topRange as Double, topColor as Integer, bottomRange as Double, bottomColor as Integer) 5373

30.20.101 addThreshold(chart as CDXYChartMBS, layer as CDLineLayerMBS, topRange as Double, topColor as Integer, bottomRange as Double, bottomColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an upper/lower threshold range to an existing indicator chart.
Notes: Arguments:

Argument	Default	Description
c	(Mandatory)	The indicator chart to add the threshold range to.
layer	(Mandatory)	The line layer that the threshold range applies to.
topRange	(Mandatory)	The upper threshold.
topColor	(Mandatory)	The color to fill the region of the line that is above the upper threshold.
bottomRange	(Mandatory)	The lower threshold.
bottomColor	(Mandatory)	The color to fill the region of the line that is below the lower threshold.

See also:

- 30.20.100 addThreshold(chart as CDXYChartMBS, layer as CDLineLayerMBS, topRange as Double, topColor as color, bottomRange as Double, bottomColor as color) 5373

30.20.102 addTriMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addTriMovingAvg method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.103 addTriMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS 5375

30.20.103 addTriMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a triangular moving average line on the main chart.
Notes: Arguments:

Argument	Default	Description
period	(Mandatory)	The moving average period
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 30.20.102 addTriMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS 5374

30.20.104 addTRIX(height as Integer, Period as Integer, ColorValue as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addTRIX method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.105 addTRIX(height as Integer, Period as Integer, ColorValue as Integer) as CDXYChartMBS 5375

30.20.105 addTRIX(height as Integer, Period as Integer, ColorValue as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a TRIX indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.104 addTRIX(height as Integer, Period as Integer, ColorValue as color) as CDXYChartMBS 5375

30.20.106 addTypicalPrice(ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addTypicalPrice method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.107 addTypicalPrice(ColorValue as Integer) as CDLineLayerMBS 5376

30.20.107 addTypicalPrice(ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a typical price line on the main chart.
Notes: Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 30.20.106 addTypicalPrice(ColorValue as color) as CDLineLayerMBS 5376

30.20.108 addUltimateOscillator(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addUltimateOscillator method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.109 addUltimateOscillator(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS 5377

30.20.109 addUltimateOscillator(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an Ultimate Oscillator indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period1	(Mandatory)	The first moving average period to compute the indicator.
period2	(Mandatory)	The second moving average period to compute the indicator.
period3	(Mandatory)	The third moving average period to compute the indicator.
color	(Mandatory)	The color of the indicator line.
range	(Mandatory)	The distance between the middle line and the upper and lower threshold lines.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.108 addUltimateOscillator(height as Integer, period1 as Integer, period2 as Integer, period3 as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS 5376

30.20.110 addVolBars(height as Integer, upColor as color, downColor as color, flatColor as color) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addVolBars method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.111 addVolBars(height as Integer, upColor as Integer, downColor as Integer, flatColor as Integer) as CDBarLayerMBS 5378

30.20.111 addVolBars(height as Integer, upColor as Integer, downColor as Integer, flatColor as Integer) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a volume bar chart layer on the main chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the bar chart layer in pixels.
upColor	(Mandatory)	The color to used on an 'up' day. An 'up' day is a day where the closing price is higher than that of the previous day.
downColor	(Mandatory)	The color to used on a 'down' day. A 'down' day is a day where the closing price is lower than that of the previous day.
flatColor	(Mandatory)	The color to used on a 'flat' day. A 'flat' day is a day where the closing price is the same as that of the previous day.

Return Value
A CDBarLayerMBS object representing the bar layer created.
See also:

- 30.20.110 addVolBars(height as Integer, upColor as color, downColor as color, flatColor as color) as CDBarLayerMBS 5377

30.20.112 addVolIndicator(height as Integer, upColor as color, downColor as color, flatColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addVolIndicator method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.113 addVolIndicator(height as Integer, upColor as Integer, downColor as Integer, flatColor as Integer) as CDXYChartMBS 5378

30.20.113 addVolIndicator(height as Integer, upColor as Integer, downColor as Integer, flatColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Volume indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
upColor	(Mandatory)	The color to used on an 'up' day. An 'up' day is a day where the closing price is higher than that of the previous day.
downColor	(Mandatory)	The color to used on a 'down' day. A 'down' day is a day where the closing price is lower than that of the previous day.
flatColor	(Mandatory)	The color to used on a 'flat' day. A 'flat' day is a day where the closing price is the same as that of the previous day.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.112 addVolIndicator(height as Integer, upColor as color, downColor as color, flatColor as color) as CDXYChartMBS 5378

30.20.114 addWeightedClose(ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addWeightedClose method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.115 addWeightedClose(ColorValue as Integer) as CDLineLayerMBS 5379

30.20.115 addWeightedClose(ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a weighted close line on the main chart.
Notes: Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 30.20.114 addWeightedClose(ColorValue as color) as CDLineLayerMBS 5379

30.20.116 addWeightedMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addWeightedMovingAvg method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.117 addWeightedMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS 5380

30.20.117 addWeightedMovingAvg(period as Integer, ColorValue as Integer) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a weighted moving average line on the main chart.
Notes: Arguments:

Argument	Default	Description
period	(Mandatory)	The moving average period
color	(Mandatory)	The color of the line.

Return Value
A CDLineLayerMBS object representing the line created.
See also:

- 30.20.116 addWeightedMovingAvg(period as Integer, ColorValue as color) as CDLineLayerMBS 5380

30.20.118 addWilliamR(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addWilliamR method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.119 addWilliamR(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS 5381

30.20.119 addWilliamR(height as Integer, period as Integer, ColorValue as Integer, range as Double, upColor as Integer, downColor as Integer) as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a William %R indicator chart.
Notes: Arguments:

Argument	Default	Description
height	(Mandatory)	The height of the indicator chart in pixels.
period	(Mandatory)	The period to compute the indicator.
color	(Mandatory)	The color of the indicator line.
range	(Mandatory)	The distance between the middle line and the upper and lower threshold lines.
upColor	(Mandatory)	The fill color when the indicator exceeds the upper threshold line.
downColor	(Mandatory)	The fill color when the indicator falls below the lower threshold line.

Return Value
A CDXYChartMBS object representing the chart created.
See also:

- 30.20.118 addWilliamR(height as Integer, period as Integer, ColorValue as color, range as Double, upColor as color, downColor as color) as CDXYChartMBS 5380

30.20.120 Constructor(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new FinanceChart object.
Notes: Arguments:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels. The height will be automatically determined as the chart is built.

30.20.121 currentChart as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 12.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current chart of this finance chart.
Notes: While you add parts to the finance chart, you can access the last one here.

30.20.122 enableAntiAlias(antiAlias as boolean)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables/Disables anti-alias.
Notes: Enabling anti-alias makes the line smoother. Disabling anti-alias make the chart file size smaller, and so can be downloaded faster through the Internet. The default is to enable anti-alias.

Arguments:

Argument	Default	Description
antiAlias	(Mandatory)	True to enable anti-alias. False to disable anti-alias.

30.20.123 getToolTipDateFormat as string

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the date/time format string to use for tool tips.
Notes: The format string returned will be one of the format strings specified when calling CDFinanceChartMBS.setToolTipDateFormat based on data point spacing, or the equivalent default value. The format string may then be used in other ChartDirector functions such as CDBaseChartMBS.getHTMLImageMap for producing image maps.

Returns the date/time format string to use for tool tips.

30.20.124 mainChart as CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 12.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the main chart of this finance chart.

30.20.125 setAxisOnRight(b as Boolean)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets whether the main y-axis is on right of left side of the plot area.
Notes: The default is on right.

Arguments:

Argument	Default	Description
b	(Mandatory)	A true value means the y-axis is on right. A false value means the y-axis is on left.

30.20.126 setData(timeStamps() as Double, highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, volData() as Double, extraPoints as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the data to be used in the chart.
Notes: If some of the data are not available, some artificial values should be used. For example, if the high and low values are not available, you may use closeData as highData and lowData.

Arguments:

Argument	Default	Description
timeStamps	(Mandatory)	An array of dates/times for the time intervals.
highData	(Mandatory)	The high values in the time intervals.
lowData	(Mandatory)	The low values in the time intervals.
openData	(Mandatory)	The open values in the time intervals.
closeData	(Mandatory)	The close values in the time intervals.
volData	(Mandatory)	The volume values in the time intervals.
extraPoints	(Mandatory)	The number of leading time intervals that are not displayed in the chart. These intervals are typically used for computing indicators that require extra leading data, such as moving averages.

30.20.127 setDateLabelFormat(yearFormat as string, firstMonthFormat as string, otherMonthFormat as string, firstDayFormat as string, otherDayFormat as string, firstHourFormat as string, otherHourFormat as string)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the date/time formats to use for the x-axis labels under various cases.
Notes: See Parameter Substitution and Formatting on the syntax of ChartDirector format strings.

Arguments:

Argument	Default	Description
yearFormat	(Mandatory)	The format for displaying labels on an axis with yearly ticks. The default is " { value | yyyy } ".
firstMonthFormat	(Mandatory)	The format for displaying labels on an axis with monthly ticks. This parameter applies to the first available month of a year (usually January) only, so it can be formatted differently from the other labels. The default is "<*font=bold*>{ value | mmm yy } ".
otherMonthFormat	(Mandatory)	The format for displaying labels on an axis with monthly ticks. This parameter applies to months other than the first available month of a year. The default is " { value | mmm } ".
firstDayFormat	(Mandatory)	The format for displaying labels on an axis with daily ticks. This parameter applies to the first available day of a month only, so it can be formatted differently from the other labels. The default is "<*font=bold*>{ value | d mmm } ".
otherDayFormat	(Mandatory)	The format for displaying labels on an axis with daily ticks. This parameter applies to days other than the first available day of a month. The default is " { value | d } ".
firstHourFormat	(Mandatory)	The format for displaying labels on an axis with hourly resolution. This parameter applies to the first tick of a day only, so it can be formatted differently from the other labels. The default is "<*font=bold*>{ value | d mmm<*br*>h:nna } ".
otherHourFormat	(Mandatory)	The format for displaying labels on an axis with hourly. resolution. This parameter applies to ticks at hourly boundaries, except the first tick of a day. The default is " { value | h:nna } ".

30.20.128 setDateLabelSpacing(labelSpacing as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the minimum label spacing between two labels on the time axis.
Notes: Arguments:

Argument	Default	Description
labelSpacing	(Mandatory)	The label spacing in pixels. The default is 50 pixels.

30.20.129 setLegendStyle(font as string, fontSize as Double, fontColor as color, bgColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setLegendStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.130 setLegendStyle(font as string, fontSize as Double, fontColor as Integer, bgColor as Integer) 5385

30.20.130 setLegendStyle(font as string, fontSize as Double, fontColor as Integer, bgColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets legend font style and background color.
Notes: The default is Arial 8 pt black font on a semi-transparent light grey (80CCCCCC) background.

Arguments:

Argument	Default	Description
font	(Mandatory)	The font of the legend text.
fontSize	(Mandatory)	The font size of the legend text in points.
fontColor	(Mandatory)	The color of the legend text.
bgColor	(Mandatory)	The background color of the legend box.

See also:

- 30.20.129 setLegendStyle(font as string, fontSize as Double, fontColor as color, bgColor as color) 5384

30.20.131 setLogScale(b as Boolean)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determines if log scale should be used for the main chart.
Notes: The default is to use linear scale.

Arguments:

Argument	Default	Description
b	(Mandatory)	A true value means using log scale. A false value means using linear scale.

30.20.132 setMargins(leftMargin as Integer, topMargin as Integer, rightMargin as Integer, bottomMargin as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the margins around the plot area.
Notes: The default is 40 pixels for the left and right margins, and 30 pixels for the top margin and 35 pixels for the bottom margin.

Arguments:

Argument	Default	Description
leftMargin	(Mandatory)	The distance from the left side of the plot area to the left side of the chart.
topMargin	(Mandatory)	The distance from the top of the plot area to the top of the chart.
rightMargin	(Mandatory)	The distance from the right side of the plot area to the right side of the chart.
bottomMargin	(Mandatory)	The distance from the bottom of the plot area to the bottom of the chart.

30.20.133 setNumberLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the number format to use.
Notes: The default number format in FinanceChart is "P3". See Parameter Substitution and Formatting on the syntax of ChartDirector format strings.

Arguments:

Argument	Default	Description
formatString	(Mandatory)	The format for displaying numbers.

30.20.134 setPercentageAxis as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Label the axis of the main chart in percentage unit.
Notes: By default, the axis of the main chart will be labelled in price unit. If a percentage axis is used, the axis will be labelled in percentage unit, with the first visible point of the closing price being 100%.

30.20.135 setPlotAreaBorder(borderColor as color, borderGap as Integer)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setPlotAreaBorder method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.136 setPlotAreaBorder(borderColor as Integer, borderGap as Integer) 5387

30.20.136 setPlotAreaBorder(borderColor as Integer, borderGap as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the plot area border color and the gap distance between charts.
Notes: The default is a grey (888888) border with two 2 pixels gap between charts.

Arguments:

Argument	Default	Description
borderColor	(Mandatory)	The plot area border color.
borderGap	(Mandatory)	The distance between charts.

See also:

- 30.20.135 setPlotAreaBorder(borderColor as color, borderGap as Integer) 5386

30.20.137 setPlotAreaStyle(bgColor as color, majorHGridColor as color, majorVGridColor as color, minorHGridColor as color, minorVGridColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setPlotAreaStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.138 setPlotAreaStyle(bgColor as Integer, majorHGridColor as Integer, majorVGridColor as Integer, minorHGridColor as Integer, minorVGridColor as Integer) 5387

30.20.138 setPlotAreaStyle(bgColor as Integer, majorHGridColor as Integer, majorVGridColor as Integer, minorHGridColor as Integer, minorVGridColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the plot area background and grid colors.
Notes: The default is a white background with light grey (DDDDDD) grid lines.

Arguments:

See also:

Argument	Default	Description
bgColor	(Mandatory)	The plot area background color.
majorHGridColor	(Mandatory)	Major horizontal grid color.
majorVGridColor	(Mandatory)	Major vertical grid color.
minorHGridColor	(Mandatory)	Minor horizontal grid color. In current version, minor horizontal grid is not used.
minorVGridColor	(Mandatory)	Minor vertical grid color.

- 30.20.137 setPlotAreaStyle(bgColor as color, majorHGridColor as color, majorVGridColor as color, minorHGridColor as color, minorVGridColor as color) 5387

30.20.139 setToolTipDateFormat(monthFormat as string, dayFormat as string, hourFormat as string)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the date/time formats to use for the tool tips under various cases.
Notes: See Parameter Substitution and Formatting on the syntax of ChartDirector format strings.

Arguments:

Argument	Default	Description
monthFormat	(Mandatory)	The tool tip format to use if the data point spacing is one or more months (more than 30 days). The default is " [{ xLabel | mmm yyyy }] ".
dayFormat	(Mandatory)	The tool tip format to use if the data point spacing is 1 day to less than 30 days. The default is " [{ xLabel | mmm d, yyyy }] ".
hourFormat	(Mandatory)	The tool tip format to use if the data point spacing is less than 1 day. The default is " [{ xLabel | mmm d, yyyy hh:nn:ss }] ".

30.20.140 setXAxisStyle(font as string, fontSize as Double, fontColor as color, fontAngle as Double)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setXAxisStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.141 setXAxisStyle(font as string, fontSize as Double, fontColor as Integer, fontAngle as Double) 5389

30.20.141 setXAxisStyle(font as string, fontSize as Double, fontColor as Integer, fontAngle as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets x-axis label style.
Notes: The default is Arial 8 pt black color as font with no text rotation.

Arguments:

Argument	Default	Description
font	(Mandatory)	The font of the axis labels.
fontSize	(Mandatory)	The font size of the axis labels in points.
fontColor	(Mandatory)	The color of the axis labels.
fontAngle	(Mandatory)	The rotation of the axis labels.

See also:

- 30.20.140 setXAxisStyle(font as string, fontSize as Double, fontColor as color, fontAngle as Double) 5388

30.20.142 setYAxisStyle(font as string, fontSize as Double, fontColor as color, bgColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setYAxisStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.20.143 setYAxisStyle(font as string, fontSize as Double, fontColor as Integer, bgColor as Integer) 5389

30.20.143 setYAxisStyle(font as string, fontSize as Double, fontColor as Integer, bgColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets y-axis label style.
Notes: The default is Arial 8 pt black color, with 14 pixels margin.

Arguments:

Argument	Default	Description
font	(Mandatory)	The font of the axis labels.
fontSize	(Mandatory)	The font size of the axis labels in points.
fontColor	(Mandatory)	The color of the axis labels.
axisMargin	(Mandatory)	The margin at the top of the y-axis in pixels (to leave space for the legend box).

See also:

- 30.20.142 setYAxisStyle(font as string, fontSize as Double, fontColor as color, bgColor as color) 5389

30.20.144 Screenshots

30.20.145 finance.jpg

Function: A finance chart created using ChartDirector with the CDFinanceChartMBS class.

30.20.146 finance2.jpg

Function: A finance chart created using ChartDirector with the CDFinanceChartMBS class.

30.21 class CDFinanceSimulatorMBS

30.21.1 class CDFinanceSimulatorMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: FinanceSimulator is a utility class to produce tables with random numbers that look like valid financial data series.
Example:

```
// create realistic looking random stock prices for testing finance charts
Var startTime As Double = CDBaseChartMBS.chartTime(2025, 1, 1)
Var endTime As Double = CDBaseChartMBS.chartTime(2025, 3, 1)
Var sim As New CDFinanceSimulatorMBS("ACME", startTime, endTime, 86400) // daily values, the seed text gives repeatable data

Var closing() As Double = sim.getCloseData.Values
MessageBox closing.Count.ToString + " days, first close " + Format(closing(0), "0.00") + ", last close " + Format(closing(closing.LastIndex), "0.00")
// pass the arrays to CDFinanceChartMBS.setData
```

Notes: It facilitates testing and demonstrating ChartDirector financial charts without needing a real database table.

30.21.2 Methods

30.21.3 Constructor(seed as Integer, startTime as Double, endTime as Double, resolution as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a FinanceSimulator object.
Notes:

Argument	Default	Description
seed	(Mandatory)	The seed to be used in the random number generator.
startTime	(Mandatory)	The start date/time of the financial date series.
endTime	(Mandatory)	The end date/time of the financial date series.
resolution	(Mandatory)	The resolution of the financial data series in seconds. For example, a value of 86400 means daily data (1 day = 86400 seconds). A value of 7 * 86400 means weekly data. A value of 30 * 86400 means monthly data.

See also:

- 30.21.4 Constructor(seed as string, startTime as Double, endTime as Double, resolution as Integer)

5394

30.21.4 Constructor(seed as string, startTime as Double, endTime as Double, resolution as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a FinanceSimulator object.
Notes:

Argument	Default	Description
seed	(Mandatory)	The seed to be used in the random number generator.
startTime	(Mandatory)	The start date/time of the financial date series.
endTime	(Mandatory)	The end date/time of the financial date series.
resolution	(Mandatory)	The resolution of the financial data series in seconds. For example, a value of 86400 means daily data (1 day = 86400 seconds). A value of 7 * 86400 means weekly data. A value of 30 * 86400 means monthly data.

See also:

- 30.21.3 Constructor(seed as Integer, startTime as Double, endTime as Double, resolution as Integer) 5393

30.21.5 getCloseData as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the close data series.

30.21.6 getHighData as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the high data series.

30.21.7 getLowData as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the low data series.

30.21.8 getOpenData as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the open data series.

30.21.9 getTimeStamps as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the timestamps of the data series.

30.21.10 getVolData as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the volume data series.

30.22 class CDHLOCLayerMBS

30.22.1 class CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The HLOCLayer class represents high-low-open-close layers.
Notes: Subclass of the CDBaseBoxLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.22.2 Methods

30.22.3 setColorMethod(colorMethod as Integer, riseColor as color, fallColor as color, leadValue as Double = -1.7E308)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setColorMethod method, but uses color instead of integer data type for passing color values.
See also:

- 30.22.4 setColorMethod(colorMethod as Integer, riseColor as Integer, fallColor as Integer = -1, leadValue as Double = -1.7E308) 5396

30.22.4 setColorMethod(colorMethod as Integer, riseColor as Integer, fallColor as Integer = -1, leadValue as Double = -1.7E308)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the coloring method for the HLOC symbols.
Notes: See XYChart.addHLOCLayer for the supported coloring methods for HLOC symbols.

Argument	Default	Description
colorMethod	(Mandatory)	The method to color the HLOC layer. Please refer to XYChart.addHLOCLayer3 for the supported coloring methods.
riseColor	(Mandatory)	The color to be used on an "up" day.
fallColor	-1	The color to be used on a "down" day. The default value of -1 means it is the same as the riseColor.
leadValue	[-Infinity]	The lead value to act as the closing pricing before the first day, so as to determine if the first day is an "up" or "down" day.

See also:

- 30.22.3 setColorMethod(colorMethod as Integer, riseColor as color, fallColor as color, leadValue as Double = -1.7E308) 5396

30.23 class CDImageMapHandlerMBS

30.23.1 class CDImageMapHandlerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: ImageMapHandler is a utility class to handle image maps in HTML format (that is, as <AREA>tags).
Notes: It determines if a given point is on a hot spot as defined by the image map, and retrieves the hot spot parameters.

The BaseChart.getHTMLImageMap method can be used to automatically generate image maps for charts automatically.

The advantages of using HTML image map format is that it is easy for developers to customize the hot spots. For example, one can create custom buttons in the chart image by drawing custom text boxes, and then create custom image maps to define the text boxes as hot spots. These custom image maps can be appended to the image maps generated by BaseChart.getHTMLImageMap using simple string concatenation.

ImageMapHandler will process the various attributes of the HTML <AREA> tags as follows:

AttributeDescription

coords	This attribute defines the position and shape of the hot spot.
href	The URL specified in this attribute will become the attributes of the hot spot. The path portion of the URL will become the path attribute, while the query parameters will become the attributes of the hot spot as is.
title	This attribute defines the tool tip text to display when the mouse moves over and stops on the hot spot.

30.23.2 Methods

30.23.3 Constructor(ImageMap as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Constructs an image map handler object for the given image map.
Notes:

Argument	Default	Description
imageMap	(Mandatory)	A text string representing the image map in HTML format.

30.23.4 getHotSpot(xCoordinate as double, yCoordinate as double) as integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the hot spot under the given point as the current hot spot.
Notes: This method will retrieve the hot spot under the given point as the "current hot spot". Its attributes can then be retrieved using ImageMapHandler.getKey, ImageMapHandler.getValue and ImageMapHandler.getValue2.

This method returns an integer representing the hot spot, or -1 if the point is not over any hot spot. Each hot spot region is represented by a unique integer, which can be any arbitrary number. The number is mainly used to determine if the cursor has changed from one hot spot to another hot spot.

Argument	Default	Description
x	(Mandatory)	The x coordinate of a point of which the hot spot is to be retrieved.
y	(Mandatory)	The y coordinate of a point of which the hot spot is to be retrieved.

Return Value
An integer representing the hot spot, or -1 if the given point is not over any hot spot.

30.23.5 getKey(i as Integer) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the key of an attribute of the current hot spot.
Notes: Each hot spot is associated with an arbitrary number of attributes, in which each attribute consists of a key and a value. This method returns the key of the (i + 1)th attribute. (The first attribute is 0, while the nth attribute is n - 1.)

If the argument i is equal or larger than the number of attributes, an null string will be returned. This behaviour can be used to enumerate the attributes and to determine how many attributes are associated for the hot spot.

Argument	Default	Description
i	(Mandatory)	The index of the attribute to retrieve (index of first attribute is 0).

Return Value

A string representing the key of the attribute, or null if there is no such attribute.

30.23.6 getValue(i as Integer) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the value of an attribute of the current hot spot by using its numeric index.
Notes: Each hot spot is associated with an arbitrary number of attributes, in which each attribute consists of a key and a value. This method returns the value of the (i + 1)th attribute. (The first attribute is 0, while the nth attribute is n - 1.)

Argument	Default	Description
i	(Mandatory)	The index of the attribute to retrieve (index of first attribute is 0).

Return Value
A string representing the value of the attribute, or null if there is no such attribute.
See also:

- 30.23.7 getValue(key as string) as string 5400

30.23.7 getValue(key as string) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the value of an attribute of the current hot spot by using its key.
Notes: Each hot spot is associated with an arbitrary number of attributes, in which each attribute consists of a key and a value. This method returns the value of the attribute given the key.

Argument	Default	Description
key	(Mandatory)	A text string representing the key of the attribute.

Return Value
A string representing the value of the attribute, or null if there is no such attribute.
See also:

- 30.23.6 getValue(i as Integer) as string 5400

30.24 class CDInterLineLayerMBS

30.24.1 class CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The InterLineLayer class represents interline layers.
Notes: Interline layers are used to color the region between two lines. The lines can come from a variety of layer types, such as line layers, spline layers, step line layers, trend layers or axis mark lines.
Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.24.2 Methods

30.24.3 setGapColor(gapColor12 as Color, gapColor21 as Color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setGapColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.24.4 setGapColor(gapColor12 as Integer, gapColor21 as Integer = -1) 5401

30.24.4 setGapColor(gapColor12 as Integer, gapColor21 as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color used to fill the area under NoValue data points.
Notes: By default, if there are NoValue data points on the lines, ChartDirector will interpolate across the points. The region will remain continuous.

This method can be used to set up an alternative colors to represent the regions at NoValue data point positions. In particular, if the colors are set to Transparent, the NoValue data points will result in gaps in the fill region.

See also:

- 30.24.3 setGapColor(gapColor12 as Color, gapColor21 as Color) 5401

Argument	Default	Description
gapColor12	(Mandatory)	The color used to fill the region under NoValue positions when value of the first line is greater of the value of the second line.
gapColor21	-1	The color used to fill the region under NoValue positions when value of the second line is greater of the value of the first line. The default value of -1 means it is the same as gapColor12.

30.25 class CDLayerMBS

30.25.1 class CDLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Layer class is the base class for all XYChart layer classes.
Example:

```
// a 3D bar layer with value labels on top of the bars
Var data() As Double = Array(30.0, 45.0, 28.0, 60.0)
Var c As New CDXYChartMBS(500, 300)
Call c.setPlotArea(50, 30, 420, 230)

Var layer As CDBarLayerMBS = c.addBarLayer(data, &h66AAEE)
layer.set3D(10) // 10 pixels depth
layer.setDataLabelFormat(" { value } ")
layer.setBorderColor(&h336699)

Var pic As Picture = c.makeChartPicture
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.25.2 Methods

30.25.3 addCustomAggregateLabel(dataItem as Integer, label as string, font as string = """, fontSize as Double = 8, fontColor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a custom aggregate label to an aggregated object.
Notes: Aggregate data labels applies to layer types that contains "aggregated data", such as stacked bar layer and stacked area layer. In these layer types, data labels (see Layer.setDataLabelStyle) represents a

single data item, while aggregate labels represents the stacked object.

See Font Specification for details on various font attributes.

Argument	Default	Description
dataItem	(Mandatory)	The index of the aggregated object. The first aggregated object is 0, while the nth aggregated object is (n - 1).
label	(Mandatory)	A text string representing the custom aggregate label. Parameter Substitution and Formatting is supported.
font	""	The font used to draw the labels.
fontSize	8	The font size used to draw the labels.
fontColor	TextColor	The color used to draw the labels.
fontAngle	0	The rotation angle of the labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.25.4 addCustomAggregateLabel(dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS 5404

30.25.4 addCustomAggregateLabel(dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addCustomAggregateLabel method, but uses color instead of integer data type for passing color values.
See also:

- 30.25.3 addCustomAggregateLabel(dataItem as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 5403

30.25.5 addCustomDataLabel(dataSet as Integer, dataItem as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a custom data label to a data point.
Notes: Data labels are text used label data points in the layer. Please refer to Layer.setDataLabelStyle for a more detail description.

See Font Specification for details on various font attributes.

Argument	Default	Description
dataSet	(Mandatory)	The data set number for the data point. The first data set is 0, while the nth data set is (n - 1).
dataItem	(Mandatory)	The data point number for the data point within the data set. The first data point is 0, while the nth data point is (n - 1).
label	(Mandatory)	A text string representing the data label. Parameter Substitution and Formatting is supported.
font	""	The font used to draw the label.
fontSize	8	The font size used to draw the label.
fontColor	TextColor	The color used to draw the label.
fontAngle	0	The rotation angle of the label.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.25.6 addCustomDataLabel(dataSet as Integer, dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS 5405

30.25.6 addCustomDataLabel(dataSet as Integer, dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addCustomDataLabel method, but uses color instead of integer data type for passing color values.
See also:

- 30.25.5 addCustomDataLabel(dataSet as Integer, dataItem as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 5404

30.25.7 addCustomGroupLabel(dataGroup as Integer, dataItem as Integer, label as string, font as string =””, fontSize as Double = 8, fontColor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a custom data group label to object representing the group.
Notes: Data group label applies to layer types that may represent data groups. See Layer.addDataGroup on how data groups are created and the layer types that support data groups.

See Font Specification for details on various font attributes.

Argument	Default	Description
dataGroup	(Mandatory)	The data group number for the data point. The first data group is 0, while the nth data group is (n - 1).
dataItem	(Mandatory)	The data point number for the data point within the data group. The first data point is 0, while the nth data point is (n - 1).
label	(Mandatory)	A text string representing the data label. Parameter Substitution and Formatting is supported.
font	””	The font used to draw the label.
fontSize	8	The font size used to draw the label.
fontColor	TextColor	The color used to draw the label.
fontAngle	0	The rotation angle of the label.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.25.8 addCustomGroupLabel(dataGroup as Integer, dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS 5406

30.25.8 addCustomGroupLabel(dataGroup as Integer, dataItem as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addCustomGroupLabel method, but uses color instead of integer data type for passing color values.
See also:

- 30.25.7 addCustomGroupLabel(dataGroup as Integer, dataItem as Integer, label as string, font as string =””, fontSize as Double = 8, fontColor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 5406

30.25.9 addDataGroup(name as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Open a new data group.
Notes: Currently, only stacked bar layers support data groups for creating ”multi-stacked” bars.

In a normal stacked bar layer, all data sets are stacked on top of one another, creating one stacked bar per x-axis position. If data grouping is used, data sets within the same data group with be stacked up. So there may be multiple stacked bars in each x-axis position. These stacked bars are drawn side by side.

When you add a data set using Layer.addDataSet, the data set will belong to the current data group. The addDataGroup method can be used to open a new data group, so that subsequent data sets will belong to that new group.

You may associate a name with a data group. The name can then be used in data labels or image maps to identify the data group.

Argument	Default	Description
name	””	Name of the data group.

30.25.10 addDataSet(data as CDArrayMBS, colorvalue as color, name as string = ””) as CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addDataSet method, but uses color instead of integer data type for passing color values.
See also:

- 30.25.11 addDataSet(data as CDArrayMBS, colorvalue as Integer = -1, name as string = ””) as CDDataSetMBS 5408
- 30.25.12 addDataSet(data() as Double, colorvalue as color, name as string = ””) as CDDataSetMBS 5408
- 30.25.13 addDataSet(data() as Double, colorvalue as Integer = -1, name as string = ””) as CDDataSetMBS 5409

30.25.11 addDataSet(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data set to the chart layer.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the data item. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

Return Value
A DataSet object representing the data set added. You may use the methods of this object to fine-tune how the data set is drawn on the chart.
See also:

- 30.25.10 addDataSet(data as CDArrayMBS, colorvalue as color, name as string = "") as CDDataSetMBS 5407
- 30.25.12 addDataSet(data() as Double, colorvalue as color, name as string = "") as CDDataSetMBS 5408
- 30.25.13 addDataSet(data() as Double, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS 5409

30.25.12 addDataSet(data() as Double, colorvalue as color, name as string = "") as CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addDataSet method, but uses color instead of integer data type for passing color values.
See also:

- 30.25.10 addDataSet(data as CDArrayMBS, colorvalue as color, name as string = "") as CDDataSetMBS 5407
- 30.25.11 addDataSet(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS 5408
- 30.25.13 addDataSet(data() as Double, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS 5409

30.25.13 addDataSet(data() as Double, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data set to the chart layer.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the data item. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

Return Value
A DataSet object representing the data set added. You may use the methods of this object to fine-tune how the data set is drawn on the chart.
See also:

- 30.25.10 addDataSet(data as CDArrayMBS, colorvalue as color, name as string = "") as CDDataSetMBS 5407
- 30.25.11 addDataSet(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "") as CDDataSetMBS 5408
- 30.25.12 addDataSet(data() as Double, colorvalue as color, name as string = "") as CDDataSetMBS 5408

30.25.14 addExtraField(numbers() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an array of numbers/dates to be used as an extra field in various places.
Notes: This method merely stores the data inside the layer object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

Argument	Default	Description
numbers	(Mandatory)	An array of numbers/dates to be stored inside the layer object.

See also:

- 30.25.15 addExtraField(texts() as string) 5410

30.25.15 addExtraField(texts() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an array of text to be used as an extra field in various places.
Notes: This method merely stores the data inside the layer object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

Argument	Default	Description
texts	(Mandatory)	An array of text to be stored inside the layer object.

See also:

- 30.25.14 addExtraField(numbers() as Double) 5409

30.25.16 alignLayer(layer as CDLayerMBS, dataSet as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Aligns the layer with a data set of another bar chart layer in Side layout.
Notes: The Side layout is a layout method specific to the bar chart layer. In this layout method, multiple bars belonging to the same x-position are laid out side by side. Thus the bars are not centered exactly on the x-position, but are shifted. The shift amount depends on the data set numbers of the bars.

In some cases, it may be necessary to overlay another layer (eg. a line chart layer, or a box-whisker chart layer) on top of the bars. The alignLayer method ensures the data points are shifted by the same amount as a given data set on a given BarLayer.

Argument	Default	Description
layer	(Mandatory)	The BarLayer which contains the bars to synchronize with.
dataSet	(Mandatory)	The data set of the bars to synchronize with.

30.25.17 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.25.18 getDataSet(dataSet as Integer) as CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the requested DataSet object.
Notes:

Argument	Default	Description
dataSet	(Mandatory)	A data set number, starting from 0. The first data set object is 0, and the nth data set is (n-1).

Return Value
The requested DataSet object.

30.25.19 getDataSetByZ(z as Integer) as CDDataSetMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a DataSet object based on the order in which it is being drawn.
Notes: In certain layer types, the data sets are drawn in a certain order. For example, in a line layer, the data sets represent lines and they are drawn one by one. In contrast, for a candlestick layer, the high, low, open and close data sets are combined into candlestick symbols, and there is no specific order on which data sets are drawn.

This method can be used to get the data set based on the order it is being drawn. If the data sets are not drawn in any specific order, this method will return the data sets in the reverse order to which it is added to the layer.

Argument	Default	Description
zIndex	(Mandatory)	The z-index of the required data set. The z-index of the first data set drawn is 0. The z-index for the Nth data set drawn is N - 1.

Returns the DataSet object at the specified z-order.

30.25.20 getDataSetCount as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the number of data sets in the layer.
Notes: Returns the number of data sets in the layer.

30.25.21 getHTMLImageMap(url as string, queryFormat as string = """, extraAttr as string = """, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates an HTML image map for all data points as represented on the layer.
Notes: Please refer to BaseChart.getHTMLImageMap for the detail description of this method.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
url	(Mandatory)	The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.
queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default.

Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.

extraAttr	""	A text string to specify additional attributes to add to the <area> tag. Parameter Substitution and Formatting is supported.
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value

A text string containing the image map generated.

30.25.22 getImageCoor(dataSet as Integer, dataItem as Integer = &h80000001, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the image map coordinates of a data point as represented in the layer as HTML image map attributes.
Notes: The image map coordinates will be in the following format:

shape=" [shape] " cords=" [x1] , [y1] , [x2] , [y2] ..."
This format is specially designed so that it can easily be incorporated into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
dataSet	(Mandatory)	The data set number for the data point. The first data set is 0, while the nth data set is (n-1).
dataItem	(Mandatory)	The index of the data point within the data set. The first data point is 0, while the nth data point is (n-1).
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string representing the coordinates of the data point as represented in the layer in HTML image map attribute format.

30.25.23 getImageCoor2(dataItem as Integer, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the image map coordinates of a region containing all data points at the given x-position as HTML image map attributes.
Notes: For example, in a stacked bar chart, this method will obtain the image map coordinates of the whole stacked bar, which contains multiple data points at the same x-position.

The image map coordinates will be in the following format:

shape="" cords=" [x1] , [y1] , [x2] , [y2] ..."
This format is specially designed so that it can easily be included into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
dataItem	(Mandatory)	The x-position of the data points.
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string representing the image map coordinates of a region containing all data points at the given x-position as HTML image map attributes.

30.25.24 getLegendIcon(dataSetNo as Integer) as string

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the textual representation of the legend icon for a data set.
Notes: The textual representation can be used in any ChartDirector API that supports the ChartDirector Mark Up Language. A common usage is to insert the icon to a cell in a CDMLTable to label the data series in the table, or to create a custom legend table.

The legend icon is the same legend icon that would be used in the CDLegendBoxMBS. If you modify the icon appearance using the methods of the CDLegendBoxMBS object (such as using CDLegendBoxMBS.setKeyBorder to configure the legend key border), the modification will also apply to the icon returned this method.

Arguments:

Argument	Default	Description
dataSetNo	(Mandatory)	The data set for which the legend icon represents.

Return Value
The textual representation of the legend icon for the data set.

30.25.25 getNearestXValue(target as Double) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the x data value that is nearest to the specified x pixel coordinate.
Notes: This method will search all x data values in the Layer to look for the x data value that is nearest to the given x coordinate. If there are two x data values equally near to the specified x pixel coordinate, this method will arbitrarily return one of the values.

Argument	Default	Description
xCoor	(Mandatory)	The x pixel coordinate to search for.

Returns the x data value that is nearest to the specified x coordinate.

30.25.26 getXCoor(value as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the x pixel coordinate of a point given the x data value.
Notes: Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

Argument	Default	Description
v	(Mandatory)	The x data value.

Return Value
The x coordinate of the x data value.

30.25.27 getXIndexOf(xValue as Double, tolerance as Double = 0) as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the data point index at the specified x data value.
Notes: The index can be used in DataSet.getValue and DataSet.getPosition to obtain the y values and positions of the data points for all data sets in the layer.

The tolerance argument is to allow this method to consider data points that are not exactly at xValue, but are within tolerance from it.

If multiple data points at within tolerance, this method will return the index of the data point nearest to xValue. If multiple data points are equally near to xValue, this method will choose one arbitrarily and return its data point index. If no data points are found, this method will return -1.

Argument	Default	Description
xValue	(Mandatory)	The x data value used to look for the data points in order to get the data point index of the nearest data point.
tolerance	0	The tolerance allowed for for data points that are not exactly at the specified xValue.

Returns the data point index of the data point nearest to the specified x data value up to the specified tolerance, or -1 if no data points are found.

30.25.28 getXPosition(i as Integer) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the x positional value of a data point, as measured on the primary x-axis.
Notes:

Argument	Default	Description
i	(Mandatory)	The data point index of the data point. The first data point is 0; the nth data point is (n - 1).

30.25.29 getYCoor(value as Double, axis as boolean=true) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the y pixel coordinate of a point given the y data value.
Notes: Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

Argument	Default	Description
v	(Mandatory)	The y data value.
yAxis	nil	The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

For backward compatibility, the axis argument can also be a boolean value. A true value means the primary y-axis. A false value means the secondary y-axis.
Return Value

The y coordinate of the y data value.
See also:

- 30.25.30 getYCoor(value as Double, axis as CDAxisMBS) as Integer 5417

30.25.30 getYCoor(value as Double, axis as CDAxisMBS) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the y pixel coordinate of a point given the y data value.
Notes: Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

Argument	Default	Description
v	(Mandatory)	The y data value.
yAxis	nil	The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

For backward compatibility, the axis argument can also be a boolean value. A true value means the primary y-axis. A false value means the secondary y-axis.
Return Value
The y coordinate of the y data value.
See also:

- 30.25.29 getYCoor(value as Double, axis as boolean=true) as Integer 5416

30.25.31 moveBack(layer as CDLayerMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the layer in front of another layer.
Notes: By default, the front to back ordering of the Layer objects are the same as the order in which they are added to the chart. For example, a layer added first will be in front of a layer added last.

This method can be used to move the layer behind another layer.

Arguments:

30.25.32 moveFront(layer as CDLayerMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Argument	Default	Description
layer	nil	The Layer for this layer to move behind. A nil object means the layer will be moved behind all current layers.

Function: Moves the layer in front of another layer.
Notes: By default, the front to back ordering of the CDLayerMBS objects are the same as the order in which they are added to the chart. For example, a layer added first will be in front of a layer added last.

This method can be used to move the layer in front of another layer.

Arguments:

Argument	Default	Description
layer	nil	The Layer for this layer to move in front of. The default value of null means the layer will be moved in front of all current layers.

30.25.33 set3D(d as Integer = -1, zGap as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the 3D depth of the layer, and the 3D gap between the current layer and the next layer.
Notes:

Argument	Default	Description
d	-1	The 3D depth of the layer in pixels. -1 means the 3D depth is automatically calculated.
zGap	0	The 3D gap between the current layer and the next layer in pixels.

30.25.34 setAggregateLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the aggregate label format.
Notes: By default, the aggregate label format is " { value } ". Please refer to Parameter Substitution and Formatting on available parameters and how to format them.

Argument	Default	Description
formatString	(Mandatory)	The format string.

30.25.35 setAggregateLabelStyle(font as string = """, fontSize as Double = 8, fontcolor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables aggregate labels and sets their styles.
Notes: Aggregate data labels applies to layer types that contains "aggregated data", such as stacked bar layer and stacked area layer. In these layer types, data labels (see Layer.setDataLabelStyle) represents a single data item, while aggregate labels represents the stacked object.

See Font Specification for details on various font attributes.

Argument	Default	Description
font	""	The font used to draw the labels.
fontSize	8	The font size used to draw the labels.
fontColor	TextColor	The color used to draw the labels.
fontAngle	0	The rotation angle of the labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.25.36 setAggregateLabelStyle(font as string, fontSize as Double, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS 5419

30.25.36 setAggregateLabelStyle(font as string, fontSize as Double, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setAggregateLabelStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.25.35 setAggregateLabelStyle(font as string = """, fontSize as Double = 8, fontcolor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 5419

30.25.37 setBaseLine(BaseLine as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the baseline for the data representation.
Notes: Certain data representation, such as bars in bar layers and area in area layers, are drawn from a base line. The base line by default is y = 0.

For example, for a vertical bar layer, the bars start from y = 0 and grow upwards for positive data (assuming the y-axis is not reversed), and downwards for negative data.

This method can be used to modify the base line to other values.

Arguments:

Argument	Default	Description
baseLine	(Mandatory)	The value of the base line.

30.25.38 setBorderColor(colorvalue as color, lightingEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the default border color and 3D raised effect when drawing data sets on the layer.
Notes: This method only applies to layers that represents data with elements that have borders (e.g. bar layer).

This method affect all data sets. To set the color of one particular data set, use DataSet.setDataColor.

Argument	Default	Description
color	(Mandatory)	The border color.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support glassEffect and softLighting effects.

See also:

- 30.25.39 setBorderColor(colorvalue as Integer, lightingEffect as Integer = 0) 5421

30.25.39 setBorderColor(colorvalue as Integer, lightingEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the default border color and 3D raised effect when drawing data sets on the layer.
Notes: This method only applies to layers that represents data with elements that have borders (e.g. bar layer).

This method affect all data sets. To set the color of one particular data set, use DataSet.setDataColor.

Argument	Default	Description
color	(Mandatory)	The border color.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support glassEffect and softLighting effects.

See also:

- 30.25.38 setBorderColor(colorvalue as color, lightingEffect as Integer = 0) 5420

30.25.40 setDataCombineMethod(m as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the method used to combine multiple data sets in a layer.
Notes: This method is used only for layers that can combine multiple data sets in different ways. Some layers can only support a subset of the data combine methods defined below.

ConstantValueDescription

Side	3	The data sets are combined by plotting the data representation side by side.
Stack	1	The data sets are combined by stacking up their data representations.
Overlay	0	The data sets are combined by drawing them independently, overlapping each others.
Percentage	4	The data sets are combined similar to the Stack method, except that the data is scaled so that each stack always summed up to 100. In other words, the region that a data item occupies in a stack represents the percentage of the data item relative to sum of all the data items in the stack.

Argument	Default	Description
m	(Mandatory)	one of the predefined constants representing the data combine method to use.

30.25.41 setDataLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the data label format.
Notes: This method affects all data labels in the layer. To set the label format for one particular data set only, use DataSet.setDataLabelFormat.

Data labels are text used label data points in the layer. Please refer to Layer.setDataLabelStyle for a more detail description.

By default, the data label format is " { value } ". Please refer to Parameter Substitution and Formatting on available parameters and how to format them.

Argument	Default	Description
formatString	(Mandatory)	The format string.

30.25.42 setDataLabelStyle(font as string = "", fontSize as Double = 8, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setDataLabelStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.25.43 setDataLabelStyle(font as string = "", fontSize as Double = 8, fontcolor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 5422

30.25.43 setDataLabelStyle(font as string = "", fontSize as Double = 8, fontcolor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables data labels and sets their styles.
Notes: This method affects all data labels in the layer. To set the style for one particular data set only, use DataSet.setDataLabelStyle.

Data labels are text used label data points in the layer. Different layer types put data labels in different positions. For example, in a bar chart, data labels are put at the internal end of the bar. For a line chart, data labels are put above the data points.

For some chart types, the position of the data labels can be manipulated by calling the TextBox.setAlignment method of the TextBox object returned by the setDataLabelStyle method.

See Font Specification for details on various font attributes.

Argument	Default	Description
font	""	The font used to draw the labels.
fontSize	8	The font size used to draw the labels.
fontColor	TextColor	The color used to draw the labels.
fontAngle	0	The rotation angle of the labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.25.42 setDataLabelStyle(font as string = "", fontSize as Double = 8, fontcolor as color, fontAngle as Double = 0) as CDTextBoxMBS 5422

30.25.44 setHTMLImageMap(url as string, queryFormat as string = "", extraAttr as string = "")

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Override the default arguments used when generating HTML image map for the layer.
Notes: BaseChart.getHTMLImageMap can be used to generate HTML image map for the whole chart. When BaseChart.getHTMLImageMap is used, the image map for all layers will be generated based on the arguments supplied to BaseChart.getHTMLImageMap.

The setHTMLImageMap method can be used to override those arguments for a chart layer, so the image map for that layer can be different.

For a detail description of image maps, please refer to BaseChart.getHTMLImageMap.

The special keyword " { default } " represents the global URL as specified in BaseChart.getHTMLImageMap.

Argument	Default	Description
url	(Mandatory)	The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported.
queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.
extraAttr	""	A text string to specify additional attributes to add to the <area> tag. Parameter Substitution and Formatting is supported.

This field is useful for specifying appending to the global URL.

Note that an empty string also means to use the global URL. To specify no URL, use the special keyword " { none } ".

To disable the entire image map, use the special keyword " { disable } ".

The special keyword " { default } " represents the global query parameters as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global query parameters.

Note that an empty string also means to use the global query parameters. To specify no query parameters, use the special keyword " { none } ".

The special keyword " { default } " represents the global additional attributes as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global additional attributes.

Note that an empty string also means to use the global additional attributes. To specify no additional attributes, use the special keyword " { none } ".

30.25.45 setLegend(m as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the order of the data set names as appeared in the legend box.
Notes: This method is for backward compatibility. It is equivalent to Layer.setLegendOrder(m).

Argument	Default	Description
m	(Mandatory)	One of the predefined constants representing the legend entry ordering method for data sets within the layer.

30.25.46 setLegendOrder(dataSetOrder as Integer, layerOrder as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the order of the data set names as appeared in the legend box.
Notes: By default, ChartDirector will add named data sets to the legend box. The ordering of the entries follows the order in which the layers are created. For data sets within the same layer, the ordering follows the order in which the data sets are added.

To support flexible ordering of the legend entries, ChartDirector employs a legend entry priority system. Please refer to LegendBox for details of the legend entry priority system.

The base priority of the layer can be specified using the layerOrder argument. The priority of the data sets within a layer can be modified by using the dataSetOrder argument, which must be one of the following predefined constant.

ConstantValueDescription

NormalLegend	0	The data set priority is 10 x (data_set_index + 1). Legend entries are ordered in the order with which the data sets are created.
ReverseLegend	1	The data sets priority is the reverse of the normal data set priority. Legend entries are ordered in the reverse order with which the data sets are created.
NoLegend	2	The data set names are not added to the legend box at all.

Argument	Default	Description
dataSetOrder	(Mandatory)	One of the predefined constants representing the legend entry ordering method for data sets within the layer.
layerOrder	-1	The base legend entry priority of the layer. The default value of -1 means the priority is 10000 x (layer_index + 1).

30.25.47 setLineWidth(w as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the default line width of lines when drawing data sets on the layer.
Notes: This method only applies to layers that employ lines to represent data (e.g. line layer).

This method affect all data sets. To set the line width of one particular data set, use DataSet.setLineWidth.

Argument	Default	Description
w	(Mandatory)	The width of the line in pixels.

30.25.48 setUseYAxis(axis as CDAxisMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine the y-axis to use when drawing the data sets.
Notes: This method affects all data sets in the layer. To set the y-axis to use for a particular data set, use DataSet.setUseYAxis.

Argument	Default	Description
a	(Mandatory)	The y-axis to use when drawing the data sets.

30.25.49 setUseYAxis2(b as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine if the primary or secondary y-axis should be used when drawing the data sets.
Notes: This method affects all data sets in the layer. To set the y-axis to use for a particular data set, use DataSet.setUseYAxis2.

Note: Layer.setUseYAxis is a more general method that can support more than 2 y-axes.

Argument	Default	Description
b	true	A true value means the secondary y-axis will be used. A false value means the primary y-axis will be used.

30.25.50 setXData(data as CDArrayMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the x values of the data points in the data sets.
Notes: In most ChartDirector XY chart layers, when a data set is added, only the y Values for the data points are needed. For example, in a bar layer, you just need to specify the values of the bars (y values). ChartDirector will automatically layout the bars evenly on the x-axis. You can then specify the labels on the x-axis using Axis.setLabels.

In ChartDirector, this type of x-axis scaling is called ”enumerated” scale. Please refer to Axis.setLabels for

a more detail explanation of "enumerated" scale.

However, in some cases, it may be necessary to specify the x values explicitly. For example, if a chart contains data points that are not evenly distributed on the x-axis, it is necessary to specify the x values explicitly. It is because enumerated scale always assume the data points are distributed evenly on the x- axis. In this case, the setXData method can be used to specify the x values for the data points.

In general, if the data points are evenly distributed on the x-axis, it is recommended enumerated x-scale be used and no x values are necessary. Even the data points are evenly distributed, except that some data points are missing, it is still possible to use enumerated x-scale by using the NoValue constant to represent missing data points.

On the other hand, if the data points are by its nature not evenly distributed, the x values should be provided explicitly using the setXData method.

Each layer only supports one x values series. All data sets in the layer will use the same x value series. If two data sets have different x values, they should be put in two separate layers.

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x value series.

See also:

- 30.25.51 setXData(data() as Double) 5427
- 30.25.52 setXData(dates() as date) 5428
- 30.25.53 setXData(dates() as dateTime) 5429
- 30.25.54 setXData(minValue as Double, maxValue as Double) 5430

30.25.51 setXData(data() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the x values of the data points in the data sets.
Notes: In most ChartDirector XY chart layers, when a data set is added, only the y Values for the data points are needed. For example, in a bar layer, you just need to specify the values of the bars (y values). ChartDirector will automatically layout the bars evenly on the x-axis. You can then specify the labels on the x-axis using Axis.setLabels.

In ChartDirector, this type of x-axis scaling is called "enumerated" scale. Please refer to Axis.setLabels for a more detail explanation of "enumerated" scale.

However, in some cases, it may be necessary to specify the x values explicitly. For example, if a chart contains data points that are not evenly distributed on the x-axis, it is necessary to specify the x values explicitly. It is because enumerated scale always assume the data points are distributed evenly on the x- axis. In this case, the setXData method can be used to specify the x values for the data points.

In general, if the data points are evenly distributed on the x-axis, it is recommended enumerated x-scale be used and no x values are necessary. Even the data points are evenly distributed, except that some data points are missing, it is still possible to use enumerated x-scale by using the NoValue constant to represent missing data points.

On the other hand, if the data points are by its nature not evenly distributed, the x values should be provided explicitly using the setXData method.

Each layer only supports one x values series. All data sets in the layer will use the same x value series. If two data sets have different x values, they should be put in two separate layers.

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x value series.

See also:

- 30.25.54 setXData(minValue as Double, maxValue as Double) 5430

30.25.52 setXData(dates() as date)

MBS ChartDirector Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the x values of the data points in the data sets.
Notes: In most ChartDirector XY chart layers, when a data set is added, only the y Values for the data points are needed. For example, in a bar layer, you just need to specify the values of the bars (y values). ChartDirector will automatically layout the bars evenly on the x-axis. You can then specify the labels on the x-axis using Axis.setLabels.

In ChartDirector, this type of x-axis scaling is called ”enumerated” scale. Please refer to Axis.setLabels for a more detail explanation of ”enumerated” scale.

However, in some cases, it may be necessary to specify the x values explicitly. For example, if a chart contains data points that are not evenly distributed on the x-axis, it is necessary to specify the x values explicitly. It is because enumerated scale always assume the data points are distributed evenly on the x- axis. In this case, the setXData method can be used to specify the x values for the data points.

In general, if the data points are evenly distributed on the x-axis, it is recommended enumerated x-scale be used and no x values are necessary. Even the data points are evenly distributed, except that some data points are missing, it is still possible to use enumerated x-scale by using the NoValue constant to represent missing data points.

On the other hand, if the data points are by its nature not evenly distributed, the x values should be provided explicitly using the setXData method.

Each layer only supports one x values series. All data sets in the layer will use the same x value series. If two data sets have different x values, they should be put in two separate layers.

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x value series.

- 30.25.50 setXData(data as CDArrayMBS) 5426
- 30.25.51 setXData(data() as Double) 5427
- 30.25.53 setXData(dates() as dateTime) 5429
- 30.25.54 setXData(minValue as Double, maxValue as Double) 5430

30.25.53 setXData(dates() as dateTime)

MBS ChartDirector Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the x values of the data points in the data sets.
See also:

- 30.25.50 setXData(data as CDArrayMBS) 5426
- 30.25.51 setXData(data() as Double) 5427
- 30.25.52 setXData(dates() as date) 5428
- 30.25.54 setXData(minValue as Double, maxValue as Double) 5430

30.25.54 setXData(minValue as Double, maxValue as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the x values of the data points in the data sets as evenly distributed in a range.
Notes: This method is most useful when two layers contain data at different x axis scale. An example is a line layer with one data point per minute, and another line layer with one data point per 5 minutes.

In the above example, in one hour, the first layer will have 60 data points, while the second layer will have 12 data points. If enumerated x-scale is used, the x-axis will contain 60 positions evenly distributed. The 60 data points in the first layer will corresponds to the 60 positions in the x-axis, which is correct. However, the 12 data points in the second layer will corresponds to the first 12 positions on the x-axis, which is not the desired result.

Instead, the 12 data points in the second layer should corresponds to positions 0, 5, 10, 15, ... A little thought will review that the 12 data points in the second layer should be distributed evenly among positions 0 - 55. The setXData2 method can be used to inform ChartDirector about the scaling used in the second layer.

Argument	Default	Description
minValue	(Mandatory)	The x value of the first point in a data set.
maxValue	(Mandatory)	The x value of the last point in the data set.

- 30.25.51 setXData(data() as Double) 5427
- 30.25.52 setXData(dates() as date) 5428
- 30.25.53 setXData(dates() as dateTime) 5429

30.25.55 xZoneColor(threshold as Double, belowColor as color, aboveColor as color) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other xZoneColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.25.56 xZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer) as Integer 5431

30.25.56 xZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a x-zone color. A x-zone will change from one color to another depending on a threshold value on the x-axis.
Notes: For example, if a x-zone color is used as the line color in a line layer, the line will switch from one color to another when its passes through a certain value on the x-axis. Similarly, if a x-zone color is used as the fill color in an area layer, the area will switch from one color to another when it passes through a certain value on the x-axis.

The two colors used in a x-zone color can be other dynamic colors. For example, one color could be a solid color, while the other color could be a dash line color (see !BaseChart.dashLineColor). When this x-zone color is as the line color, the line will change from a solid style to a dash line style when the line passes through a certain value on the x-axis

You may create x-zone colors with more than 2 zones by cascading multiple x-zone colors.

Argument	Default	Description
threshold	(Mandatory)	The x value serving as the threshold for switching between two colors.
belowColor	(Mandatory)	The color to use when the x-axis value of the pixel is smaller than the threshold.
aboveColor	(Mandatory)	The color to use when the x-axis value of the pixel is greater than the threshold.

Return Value
A 32-bit integer representing the x-zone color.
See also:

- 30.25.55 xZoneColor(threshold as Double, belowColor as color, aboveColor as color) as Integer 5430

30.25.57 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as boolean=true) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other yZoneColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.25.58 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS) as Integer 5432
- 30.25.59 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as boolean=true) as Integer 5432

- 30.25.60 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS) as Integer 5433

30.25.58 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other yZoneColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.25.57 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as boolean=true) as Integer 5431
- 30.25.59 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as boolean=true) as Integer 5432
- 30.25.60 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS) as Integer 5433

30.25.59 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as boolean=true) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a y-zone color. A y-zone will change from one color to another depending on a threshold value on the y-axis.
Notes: For example, if a y-zone color is used as the fill color in an area layer, the area will switch from one color to another when its value is higher than a certain value on the y-axis.

The two colors used in a y-zone color can be other dynamic colors. You may create y-zone colors with more than 2 zones by cascading multiple y-zone colors.

Argument	Default	Description
threshold	(Mandatory)	The y value serving as the threshold for switching between two colors.
belowColor	(Mandatory)	The color to use when the y-axis value of the pixel is smaller than the threshold.
aboveColor	(Mandatory)	The color to use when the y-axis value of the pixel is greater than the threshold.
yAxis	nil	The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

For backward compatibility, the axis argument can also be a boolean value. A true value means the primary y-axis. A false value means the secondary y-axis.
Return Value

A 32-bit integer representing the y-zone color.
See also:

- 30.25.57 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as boolean=true) as Integer 5431
- 30.25.58 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS) as Integer 5432
- 30.25.60 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS) as Integer 5433

30.25.60 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a y-zone color. A y-zone will change from one color to another depending on a threshold value on the y-axis.
Notes: For example, if a y-zone color is used as the fill color in an area layer, the area will switch from one color to another when its value is higher than a certain value on the y-axis.

The two colors used in a y-zone color can be other dynamic colors. You may create y-zone colors with more than 2 zones by cascading multiple y-zone colors.

Argument	Default	Description
threshold	(Mandatory)	The y value serving as the threshold for switching between two colors.
belowColor	(Mandatory)	The color to use when the y-axis value of the pixel is smaller than the threshold.
aboveColor	(Mandatory)	The color to use when the y-axis value of the pixel is greater than the threshold.
yAxis	nil	The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

For backward compatibility, the axis argument can also be a boolean value. A true value means the primary y-axis. A false value means the secondary y-axis.
Return Value
A 32-bit integer representing the y-zone color.
See also:

- 30.25.57 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as boolean=true) as Integer 5431
- 30.25.58 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS) as Integer 5432
- 30.25.59 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as boolean=true) as Integer 5432

30.26 class CDLegendBoxMBS

30.26.1 class CDLegendBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class LegendBox represents legend boxes.
Example:

```
// a horizontal legend above a chart with two lines
Var a() As Double = Array(3.0, 5.0, 4.0, 7.0)
Var b() As Double = Array(2.0, 4.0, 6.0, 5.0)
Var c As New CDXYChartMBS(450, 300)
Call c.setPlotArea(50, 50, 370, 210)

Var legend As CDLegendBoxMBS = c.addLegend(50, 10, False, "arial.ttf", 10) // False = horizontal
legend.setBackground(CDBaseChartMBS.kTransparent)
legend.setKeySize(20, 10)

Call c.addLineLayer(a, &h0066CC, "This year")
Call c.addLineLayer(b, &hCC6600, "Last year")

Var pic As Picture = c.makeChartPicture
```

Notes: Subclass of the CDTextBoxMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.26.2 Methods

30.26.3 addKey(pos as Integer, text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addKey method, but uses color instead of integer data type for passing color values.
See also:

- 30.26.4 addKey(pos as Integer, text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5435
- 30.26.5 addKey(text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5436
- 30.26.6 addKey(text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5436

30.26.4 addKey(pos as Integer, text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a custom entry to the legend box with a given legend entry priority.
Notes: See LegendBox for more information on legend entry priority system.

Argument	Default	Description
pos	(Mandatory)	The legend entry priority
text	(Mandatory)	The text of the legend entry.
color	(Mandatory)	The icon color of the legend entry.
lineWidth	0	The line width for legend entry that represents lines in line charts.
drawarea	nil	A DrawArea containing the data symbol represents the legend entry. This is primarily used for legend entries in line charts with data symbols, or in scatter charts.

See also:

- 30.26.3 addKey(pos as Integer, text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5435
- 30.26.5 addKey(text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5436
- 30.26.6 addKey(text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5436

30.26.5 addKey(text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addKey method, but uses color instead of integer data type for passing color values.
See also:

- 30.26.3 addKey(pos as Integer, text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5435
- 30.26.4 addKey(pos as Integer, text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5435
- 30.26.6 addKey(text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5436

30.26.6 addKey(text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a custom entry to the legend box.
Notes: This method adds an entry within a legend entry priority of 1 (followed by 2, 3, 4, ... for repeated calls). This has higher priority than entries added automatically by ChartDirector for representing data sets. As a result, by default, the custom entry will appear before the automatic entries.

To control the order of the custom entry relative to the automatic entries, use LegendBox.addKey2.

See LegendBox for more information on legend entry priority system.

Argument	Default	Description
text	(Mandatory)	The text of the legend entry.
color	(Mandatory)	The icon color of the legend entry.
lineWidth	0	The line width for legend entry that represents lines in line charts.
drawarea	nil	A DrawArea containing the data symbol represents the legend entry. This is primarily used for legend entries in line charts with data symbols, or in scatter charts.

See also:

- 30.26.3 addKey(pos as Integer, text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5435

- 30.26.4 addKey(pos as Integer, text as string, colorvalue as Integer, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5435
- 30.26.5 addKey(text as string, colorvalue as color, lineWidth as Integer = -1, drawarea as CDDrawAreaMBS=nil) 5436

30.26.7 addText(pos as Integer, text as string)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a custom text to the legend box.
See also:

- 30.26.8 addText(text as string) 5437

30.26.8 addText(text as string)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a custom text to the legend box.
See also:

- 30.26.7 addText(pos as Integer, text as string) 5437

30.26.9 getHTMLImageMap(url as string, queryFormat as string = """, extraAttr as string = """, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates an HTML image map for the legend.
Notes: By default, ChartDirector will add named data representation to the legend box. For pie charts, named sectors (sectors that have text labels) will be added. For xy charts, named data sets will be added. For polar charts, named layers will be added.

You may add custom entries to the legend box by using LegendBox.addKey.

To control the ordering of the legend entries, ChartDirector employs a legend entry priority system. Each entry is given a priority number, and the entries are ordered according to ascending priority (unless reversed by using LegendBox.setReverse).

For a PieChart, the legend entry priority of a sector is 10000 x (sector_index + 1). The Nth sector has sector_index (N - 1). That means the ordering of the sectors in the legend box is the same as the data array.

For an XYChart, the base legend entry priority for a layer is 10000 x (layer_index + 1). Within a layer, the data set priority is 10 x (data_set_index + 1). For example, the legend entry priority for the 5th dataset in the 3rd layer will be 30050. That means the ordering of the data sets in the legend box follows the order in which the layers are created. For data sets within the same layer, the ordering follows the order in which the data sets are added. The ordering can be modified by using Layer.setLegendOrder.

For an PolarChart, the legend entry priority of a layer is 10000 x (layer_index + 1). That means the ordering of the layers in the legend box follows the order in which the layers are created.

For custom entries added using LegendBox.addKey2, you may control the legend entry priority. That means you may insert custom entries anywhere relative to the automatic entries added by ChartDirector.

30.26.10 getImageCoor(dataItem as Integer, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the image map coordinates of an legend entry as HTML image map attributes.
Notes: The image map coordinates will be of the following format:

shape="rect" cords=" [x1] , [y1] , [x2] , [y2] "
where (x1, y1) and (x2, y2) are opposite corners of the box that enclosed the legend entry. The format is specially designed so that it can easily be included into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
dataItem	(Mandatory)	The legend entry number, starting from 0. The first legend entry is 0. The nth legend entry is (n-1).
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string representing the coordinates of the legend entry in HTML image map attribute format.

30.26.11 setCols(noOfCols as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the number of columns in the legend box.
Notes:

Argument	Default	Description
noOfCols	(Mandatory)	The number of columns in the legend box. The special value AutoGrid (= -2) means the number of columns is automatically determined. If this argument is 0, the legend box will use a flow layout (from left to right and then top to bottom, in which the entries may not be vertically aligned).

30.26.12 setKeyBorder(edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setKeyBorder method, but uses color instead of integer data type for passing color values.
See also:

- 30.26.13 setKeyBorder(edgeColor as Integer, raisedEffect as Integer = 0) 5439

30.26.13 setKeyBorder(edgeColor as Integer, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the default border color of the legend icon.
Notes: This method applies only to data sets of which the icons are rectangles showing the colors of the data sets. If the icon is a shape or symbol (such as for a line with data point symbols), the border color of the original shape or symbol is always used.

Argument	Default	Description
edgeColor	(Mandatory)	The border color.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument is also used to support Chart::glassEffect and Chart::softLighting effects.

See also:

- 30.26.12 setKeyBorder(edgeColor as color, raisedEffect as Integer = 0) 5439

30.26.14 setKeySize(width as Integer = -1, height as Integer = -1, gap as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the size of the legend icon and its distance from the legend text.
Notes: Each legend entry consists of an icon and a text description. By default, the size of the icon and its distance from the text is determined automatically based on font size. This method can be used to override the default.

Argument	Default	Description
width	(Mandatory)	The width of the legend icon in pixels.
height	-1	The height of the legend icon in pixels. -1 means the height is automatically determined.
gap	-1	The distance between the legend icon and the legend text in pixels. -1 means the distance is automatically determined.

30.26.15 setKeySpacing(keySpacing as Integer, lineSpacing as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the distance between two legend entries.
Notes: In horizontal legend layout, the legend entries will flow from left to right, top to bottom, with a horizontal gap between two legend entries. In vertical legend layout, the legend entries will flow from top to bottom, with one entry per line.

By default, the horizontal gap and the line spacing is automatically determined based on font size. This method can be used to set the horizontal gap and line spacing in pixels.

Argument	Default	Description
keySpacing	(Mandatory)	The horizontal gap between two legend entries for horizontal legend layout, expressed in pixels.
lineSpacing	-1	The line spacing between two lines in the legend box, expressed in pixels. -1 means the line spacing is automatically determined.

30.26.16 setLineStyleKey(b as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determines whether to always use ”line style legend keys” or not.
Notes: By default, ChartDirector will use a small colored square box as the legend key icon. This allows

people to determine the colors for the data representations.

In some cases, colors alone cannot distinguish the data representations. For example, in a line chart with multiple lines, it is possible all lines are of the same color, and are distinguished by line styles (solid, dash, dotted, etc), etc), or the lines may be distinguished by data symbols (small circles, squares, etc) on the lines.

For charts with non-solid lines (eg. dash, dotted, etc) or lines with data symbols, ChartDirector will use "line style legend keys" for the lines. A line style legend key consist a of line with an optional data symbol, which reflects the line style and data symbol representing the data series.

This method can be used to force ChartDirector to always use the "line style legend keys".

Arguments:

Argument	Default	Description
b	true	A true value means to always use "line style legend keys". A false value means to automatically determined if "line style legend keys" should be used.

30.26.17 setReverse(b as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reverses the ordering of the legend entries.
Notes: By default, the legend entries are ordered based on ascending legend entry priority number. This method can be used to change the ordering to following descending legend entry priority number instead.

See LegendBox for more information on legend entry priority system.

Argument	Default	Description
b	true	A true value means the legend entries are ordered based on descending legend entry priority number. false value means the legend entries are ordered based on ascending legend entry priority number.

30.27 class CDLinearMeterMBS

30.27.1 class CDLinearMeterMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The LinearMeter class represents linear meters.
Example:

```
// draw a horizontal meter showing the value 75 on a scale from 0 to 100
Var m As New CDLinearMeterMBS(250, 75)
m.setMeter(15, 25, 220, 20)
m.setScale(0, 100, 10)
Call m.addPointer(75)

Var pic As Picture = m.makeChartPicture
// show pic in a Canvas or ImageViewer, or save it to a file
```

Notes: Subclass of the CDBaseMeterMBS class.

30.27.2 Methods

30.27.3 addBar(startValue as Double, endValue as Double, colorvalue as color, effect as Integer = 0, roundedCorner as Integer = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a bar to the meter.
Notes: This method adds an empty TextBox to the meter. It configures the textbox position, size and color so that it looks like a bar on the meter scale.

Returns a CDTextBoxMBS object representing the bar. This may be used to fine-tune the appearance of the bar.
See also:

- 30.27.4 addBar(startValue as Double, endValue as Double, colorvalue as Integer, effect as Integer = 0, roundedCorner as Integer = 0) as CDTextBoxMBS

Argument	Default	Description
startValue	(Mandatory)	The start value of the bar.
endValue	(Mandatory)	The end value of the bar.
color	(Mandatory)	The color of the bar.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument can also be used to specify Chart::glassEffect, Chart::softLighting, Chart::cylinderEffect or Chart::flatBorder effects.
roundedCorners	0	The radius for the two corners at the end position of the bar.

30.27.4 addBar(startValue as Double, endValue as Double, colorvalue as Integer, effect as Integer = 0, roundedCorner as Integer = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a bar to the meter.
Notes: This method adds an empty TextBox to the meter. It configures the textbox position, size and color so that it looks like a bar on the meter scale.

Argument	Default	Description
startValue	(Mandatory)	The start value of the bar.
endValue	(Mandatory)	The end value of the bar.
color	(Mandatory)	The color of the bar.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument can also be used to specify Chart::glassEffect, Chart::softLighting, Chart::cylinderEffect or Chart::flatBorder effects.
roundedCorners	0	The radius for the two corners at the end position of the bar.

Returns a CDTextBoxMBS object representing the bar. This may be used to fine-tune the appearance of the bar.
See also:

- 30.27.3 addBar(startValue as Double, endValue as Double, colorvalue as color, effect as Integer = 0, roundedCorner as Integer = 0) as CDTextBoxMBS 5442

30.27.5 addZone(startValue as Double, endValue as Double, colorvalue as color, label as string = "") as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addZone method, but uses color instead of integer data type for passing color values.
See also:

- 30.27.6 addZone(startValue as Double, endValue as Double, colorvalue as Integer, label as string = "") as CDTextBoxMBS 5444

30.27.6 addZone(startValue as Double, endValue as Double, colorvalue as Integer, label as string = "") as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a zone to the meter.
Notes:

Argument	Default	Description
startValue	(Mandatory)	The start value (the lower bound) for the zone.
endValue	(Mandatory)	The end value (the upper bound) for the zone.
color	(Mandatory)	The color of the zone.
label	""	The text to be put at the center of the zone.

Return Value
A TextBox object representing the label. This may be used to fine-tune the appearance of the label.
See also:

- 30.27.5 addZone(startValue as Double, endValue as Double, colorvalue as color, label as string = "") as CDTextBoxMBS 5443

30.27.7 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 30.27.8 Constructor(width as Integer, height as Integer, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0) 5444

30.27.8 Constructor(width as Integer, height as Integer, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new LinearMeter object.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

See also:

- 30.27.7 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0) 5444

30.27.9 setMeter(leftX as Integer, topY as Integer, width as Integer, height as Integer, axisPos as Integer = 4, isReversed as boolean=false)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the orientation and position of the meter plot area.
Notes: The plot area is a rectangular region of the linear meter. The meter scale (the labels showing the values) will be on one external side of the plot area (say on the left side). The pointer start on the opposite side and points towards the meter scale.

This method defines the position and size of the rectangular region, as well as which side the meter scale is on. If the scale is on the left or right side, the meter is assumed to be a horizontal linear meter. If the scale is on the top or bottom side, the meter is assumed to be a vertical linear meter.

Argument	Default	Description
leftX	(Mandatory)	The x-coordinate of the top-left corner of the meter plot area.
topY	(Mandatory)	The y-coordinate of the top-left corner of the meter plot area.
width	(Mandatory)	The horizontal width of the meter plot area.
height	(Mandatory)	The vertical height of the meter plot area.
axisPos	Left	The position of the meter scale. The scale should be on one of the 4 sides of the plot area border, specified by Left, Top, Right and Bottom.
isReversed	false	By default, if the meter is horizontal, the meter scale will run from left to right. If the meter is vertical, the meter scale will run from bottom to top. If this argument is set to true, the meter scale will be reversed.

30.27.10 setRail(railColor as color, railWidth as Integer = 2, railOffset as Integer = 6)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setRail method, but uses color instead of integer data type for passing color values.
See also:

- 30.27.11 setRail(railColor as Integer, railWidth as Integer = 2, railOffset as Integer = 6) 5446

30.27.11 setRail(railColor as Integer, railWidth as Integer = 2, railOffset as Integer = 6)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position, width and color of the pointer rail.
Notes: The pointer rail is the locus traced out by the starting point of the meter pointer as the pointer slides on the meter. The pointer rail is on the opposite side of the meter scale.

Argument	Default	Description
railColor	(Mandatory)	The color of the pointer rail.
railWidth	2	The line width of the pointer rail in pixels.
railOffset	6	The gap between the pointer rail and the plot area in pixels. A negative value will mean the pointer rail may move within the plot area.

See also:

- 30.27.10 setRail(railColor as color, railWidth as Integer = 2, railOffset as Integer = 6) 5445

30.27.12 Screenshots

30.27.13 mutlivmeter.jpg

Function: A meter with three pointers created using ChartDirector with the CDLinearMeterMBS class.

30.28 class CDLineLayerMBS

30.28.1 class CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The LineLayer class represents line layers.
Notes: Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.28.2 Methods

30.28.3 getLine(dataSet as Integer = 0) as CDLineObjMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves an opaque LineObj representing a line in the line layer. The opaque LineObj is to be used in XYChart.addInterLineLayer for adding coloring between lines.
Notes:

Argument	Default	Description
dataSet	0	The data set number for the line. The first data set is 0. The nth data set is (n - 1).

Return Value
An opaque LineObj representing the requested line.

30.28.4 setFastLineMode(b as boolean = true)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables or disables fast line mode.
Notes: In a chart, the plot area width is usually a few hundred to around 2000 pixels. For a line chart that "flows" horizontally (eg. from left to right), if there are a lot more data points (eg. 100000 data points than the plot area pixel width, many of the points would be at the same x-pixel coordinates. The line segments joining the data points at the same x-pixel coordinates would just be oscillating up and down, overlapping themselves. What is visible at each x-pixel position is essentially a line joining the minimum point and the maximum point.

In fast line mode, ChartDirector will automatically detect that there are too many points in the same x-pixel coordinate, and draws only a line segment joining the extreme points at that coordinate. The resulting line is visually indistinguishable from a line in which the line segments join all data points. The fast line mode can significantly reduce the number of points drawn without affecting the chart appearance.

The fast line mode has no effect if there are not significantly more data points than the pixel width of the plot area. For charts with evenly spaced data points, the fast line mode would only act on x-pixel positions with too many data points. Thus the fast line mode can be enabled on line charts regardless of the number of data points.

The fast line mode should not be used if the data points are not flowing horizontally (or vertically if XYChart.swapXY is in effect), but are flowing in random directions.

Argument	Default	Description
b	true	A true value enables fast line mode. A false value disables fast line mode.

30.28.5 setGapColor(lineColor as color, lineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setGapColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.28.6 setGapColor(lineColor as Integer, lineWidth as Integer = -1) 5449

30.28.6 setGapColor(lineColor as Integer, lineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color and style of the line used for jumping across NoValue data points.
Notes: By default, the color of the line for jumping across NoValue data points is Transparent, which means the line will become discontinuous.

Argument	Default	Description
lineColor	(Mandatory)	The line color of the line used for jumping across NoValue data points
lineWidth	-1	The line width of the line used for jumping across NoValue data points. -1 means the width will be the same as the line width of the line for drawing normal data points.

See also:

- 30.28.5 setGapColor(lineColor as color, lineWidth as Integer = -1) 5449

30.28.7 setImageMapWidth(Width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the effective width of the line used for producing image maps.
Notes: For thin lines, it is hard to click on the lines. So for the purpose of producing image maps for a line chart, ChartDirector can assume the line is very thick. The default is 10 pixels.

Argument	Default	Description
width	(Mandatory)	The effective width of the line used for producing image maps.

30.28.8 setSymbolScale(zDataX() as Double, scaleTypeX as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the size of the symbol for each data point (for creating bubble charts).
Notes: One common usage for this method is to draw circle symbols of different sizes at each data points, creating a bubble chart.

This method supports any valid data symbols. You can create bubble charts with square bubbles, or even custom data symbols. Also, this method supports independent x and y direction sizing, so you can create bubbles elliptical in shape, and use the horizontal and vertical radius to represent different data.

ChartDirector supports specifying sizes as pixels or in axis scale. The unit is specified by using the following predefined constants.

ConstantValueDescription

See also:

PixelScale	0	The unit is measured in pixels.
XAxisScale	1	The unit is measured in x-axis scale.
YAxisScale	2	The unit is measured in y-axis scale.

Argument	Default	Description
zDataX	(Mandatory)	The sizes of the symbols at the x-axis direction, expressed using the unit defined by the scaleTypeX argument.
scaleTypeX	PixelScale	The unit for zDataX, which must be one of the predefined constants in the table above.
zDataY	[Empty_Array]	The sizes of the symbols at the y-axis direction, expressed using the unit defined by the scaleTypeY argument. An empty array means the sizes at the y-axis direction are the means as the sizes at the x-axis direction.
scaleTypeY	PixelScale	The unit for zDataY, which must be one of the predefined constants in the table above.

- 30.28.9 setSymbolScale(zDataX() as Double, scaleTypeX as Integer, zDataY() as Double, scaleTypeY as Integer = 0) 5451

30.28.9 setSymbolScale(zDataX() as Double, scaleTypeX as Integer, zDataY() as Double, scaleTypeY as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the size of the symbol for each data point (for creating bubble charts).
Notes: One common usage for this method is to draw circle symbols of different sizes at each data points, creating a bubble chart.

This method supports any valid data symbols. You can create bubble charts with square bubbles, or even custom data symbols. Also, this method supports independent x and y direction sizing, so you can create bubbles elliptical in shape, and use the horizontal and vertical radius to represent different data.

ChartDirector supports specifying sizes as pixels or in axis scale. The unit is specified by using the following predefined constants.

ConstantValueDescription

PixelScale	0	The unit is measured in pixels.
XAxisScale	1	The unit is measured in x-axis scale.
YAxisScale	2	The unit is measured in y-axis scale.

See also:

Argument	Default	Description
zDataX	(Mandatory)	The sizes of the symbols at the x-axis direction, expressed using the unit defined by the scaleTypeX argument.
scaleTypeX	PixelScale	The unit for zDataX, which must be one of the predefined constants in the table above.
zDataY	[Empty_Array]	The sizes of the symbols at the y-axis direction, expressed using the unit defined by the scaleTypeY argument. An empty array means the sizes at the y-axis direction are the means as the sizes at the x-axis direction.
scaleTypeY	PixelScale	The unit for zDataY, which must be one of the predefined constants in the table above.

- 30.28.8 setSymbolScale(zDataX() as Double, scaleTypeX as Integer = 0) 5450

30.29 class CDLineMBS

30.29.1 class CDLineMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Line class represents straight lines.
Notes: Subclass of the CDDrawObjMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.29.2 Methods

30.29.3 setColor(c as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.29.4 setColor(c as Integer) 5453

30.29.4 setColor(c as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color of the line.
Notes: By default, the color of the line is LineColor. To draw a dash line, you can use a dash line color (created using BaseChart.dashLineColor or DrawArea.dashLineColor).

Argument	Default	Description
c	(Mandatory)	The color of the line.

See also:

- 30.29.3 setColor(c as color) 5453

30.29.5 setPos(x1 as Integer, y1 as Integer, x2 as Integer, y2 as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the end-points of the line..
Notes:

Argument	Default	Description
x1	(Mandatory)	The x coordinate of the first end-point of the line.
y1	(Mandatory)	The y coordinate of the first end-point of the line.
x2	(Mandatory)	The x coordinate of the second end-point of the line.
y2	(Mandatory)	The y coordinate of the second end-point of the line.

30.29.6 setWidth(w as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the width of the line in pixels.
Notes:

Argument	Default	Description
w	(Mandatory)	The width (thickness) of the line in pixels.

30.30 class CDLineObjMBS

30.30.1 class CDLineObjMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The line object class.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.30.2 Methods

30.30.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.31 class CDMarkMBS

30.31.1 class CDMarkMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Mark class represents mark lines.
Notes: Subclass of the CDTextBoxMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.
Xojo Developer Magazine

- 7.4, page 34: Easy Charts and Graphs, Using the ChartDirector Plugin

30.31.2 Methods

30.31.3 getLine as CDLineObjMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves an opaque LineObj representing the mark line. The opaque LineObj is to be used in XYChart.addInterLineLayer for adding coloring between lines.
Notes: Return Value
An opaque LineObj representing the mark line.

30.31.4 setDrawOnTop(b as boolean)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determine whether the mark line is drawn at the front of the chart layers, or at the back of the plot area (that is, like grid lines).
Notes:

Argument	Default	Description
b	(Mandatory)	A true value means drawing the mark line at the front of the chart layers. A false value means drawing the mark line at the back of the plot area.

30.31.5 setLineWidth(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the line width of the mark line.
Notes:

Argument	Default	Description
w	(Mandatory)	The mark line width in pixels.

30.31.6 setMarkColor(lineColor as color, textColor as color, tickColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setMarkColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.31.7 setMarkColor(lineColor as Integer, textColor as Integer = -1, tickColor as Integer = -1) 5457

30.31.7 setMarkColor(lineColor as Integer, textColor as Integer = -1, tickColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the line, text and tick colors of the mark line.
Notes:

Argument	Default	Description
lineColor	(Mandatory)	The color of the mark line.
textColor	-1	The color of the text label that will be shown on the axis. -1 means the text label color is the same as the line color.
tickColor	-1	The color of the tick that will be shown on the axis. -1 means the tick color is the same as the line color.

See also:

- 30.31.6 setMarkColor(lineColor as color, textColor as color, tickColor as color) 5457

30.31.8 setValue(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the value of the mark line.
Notes:

Argument	Default	Description
value	(Mandatory)	The value of the mark.

30.32 class CDMeterPointerMBS

30.32.1 class CDMeterPointerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The MeterPointer class represents meter pointers.
Example:

```
// a meter with two pointers in different shapes and colors
Var m As New CDAngularMeterMBS(300, 300)
m.setMeter(150, 150, 120, -135, 135)
m.setScale(0, 100, 10, 5, 1)

Var current As CDMeterPointerMBS = m.addPointer(65, &hCC0000)
current.setShapeAndOffset(CDBaseChartMBS.kPencilPointer)

Var target As CDMeterPointerMBS = m.addPointer(80, &h80008000) // semi transparent green
target.setShapeAndOffset(CDBaseChartMBS.kLinePointer)
target.setPos(85) // move the pointer later

Var pic As Picture = m.makeChartPicture
```

Notes: Subclass of the CDDrawObjMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.32.2 Methods

30.32.3 setColor(fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.32.4 setColor(fillColor as Integer, edgeColor as Integer = -1)

30.32.4 setColor(fillColor as Integer, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the fill and border colors of the meter pointer.
Notes:

Argument	Default	Description
fillColor	(Mandatory)	The fill color of the meter pointer.
edgeColor	-1	The border color of the meter pointer. The default value of -1 means it is the same as the fill color.

See also:

- 30.32.3 setColor(fillColor as color, edgeColor as color) 5458

30.32.5 setPos(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the value the pointer points to on the meter scale.
Notes:

Argument	Default	Description
value	(Mandatory)	The value the pointer points to.

30.32.6 setShape(pointerCoor() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the shape of the meter pointer to a custom polygon.
Notes: The custom polygon is specified as a list of numbers representing the (x, y) coordinates of polygon vertices.

For an angular meter, the polygon should be defined with a nominal dimension of 1000 units. ChartDirector will scale the polygon so that 1000 units will become the radius of the meter.

For a linear meter, the length of the pointer should be defined with a nominal dimension of 1000 units. ChartDirector will scale the polygon so that 1000 units will be the length required for the pointer to reach the meter scale. The width of the pointer will be in 0.1 pixel units (that is, 10 units = 1 pixel).

The coordinate system for defining the polygon is that the x-axis points from left to right, and the y-axis points from bottom to top. The polygon will be defined as a pointer with the pivot at the origin, pointing

to the upward direction.

As an example, the coordinates of the standard diamond pointer for an angular meter are:

0, -100, -50, -50, 0, 1000, 50, -50
The coordinates for the standard pencil pointer for a linear meter are:

-30, 0, 30, 0, 30, 768, 0, 1000, -30, 768
After scaling the pointers based on the nominal units, ChartDirector will in addition applies the lengthRatio and widthRatio scaling factor to the pointer. These ratios allow you to change the pointer sizes without changing the polygon definition. For example, if you want the meter pointer to be only 80% of the radius in the angular meter, you can set the lengthRatio to 0.80.

Argument	Default	Description
pointerCoor	(Mandatory)	An array of numbers x0, y0, x1, y1, x2, y2, ..., representing the coordinates the polygon vertices.
lengthRatio	NoValue	The length ratio applies to the pointer. NoValue means the lengthRatio is not modified. The default is 1.0 for angular meters and 0.75 for linear meters.
widthRatio	NoValue	The width ratio applies to the pointer. NoValue means the widthRatio is not modified. The default is 1.0.

30.32.7 setShape(pointerCoor() as Integer, lengthRatio as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the shape of the meter pointer to a custom polygon.
Notes: The custom polygon is specified as a list of numbers representing the (x, y) coordinates of polygon vertices.

For an angular meter, the polygon should be defined with a nominal dimension of 1000 units. ChartDirector will scale the polygon so that 1000 units will become the radius of the meter.

For a linear meter, the length of the pointer should be defined with a nominal dimension of 1000 units. ChartDirector will scale the polygon so that 1000 units will be the length required for the pointer to reach the meter scale. The width of the pointer will be in 0.1 pixel units (that is, 10 units = 1 pixel).

The coordinate system for defining the polygon is that the x-axis points from left to right, and the y-axis points from bottom to top. The polygon will be defined as a pointer with the pivot at the origin, pointing to the upward direction.

As an example, the coordinates of the standard diamond pointer for an angular meter are:

0, -100, -50, -50, 0, 1000, 50, -50
The coordinates for the standard pencil pointer for a linear meter are:

-30, 0, 30, 0, 30, 768, 0, 1000, -30, 768
After scaling the pointers based on the nominal units, ChartDirector will in addition applies the lengthRatio and widthRatio scaling factor to the pointer. These ratios allow you to change the pointer sizes without changing the polygon definition. For example, if you want the meter pointer to be only 80% of the radius in the angular meter, you can set the lengthRatio to 0.80.

Argument	Default	Description
pointerCoor	(Mandatory)	An array of numbers x0, y0, x1, y1, x2, y2, ..., representing the coordinates the polygon vertices.
lengthRatio	NoValue	The length ratio applies to the pointer. NoValue means the lengthRatio is not modified. The default is 1.0 for angular meters and 0.75 for linear meters.
widthRatio	NoValue	The width ratio applies to the pointer. NoValue means the widthRatio is not modified. The default is 1.0.

- 30.32.11 setShape(pointerType as Integer, lengthRatio as Double, widthRatio as Double) 5464

30.32.9 setShape(pointerType as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the shape of the meter pointer to one of the built-in shapes.
Notes: The built-in symbols are specified by using the following predefined constants as the pointerType argument.

ConstantValueDescription

DiamondPointer	0	The blue pointers in the meters above.
TriangularPointer	1	The purple pointers in the meters above.
ArrowPointer	2	The red pointers in the meters above.
ArrowPointer2	3	The yellow pointers in the meters above.
LinePointer	4	The green pointers in the meters above.
PencilPointer	5	The grey pointers in the meters above.

The length and width of the pointer can be scaled by using the lengthRatio and widthRatio arguments. The meters above are using default length and width ratios, which are both 1 for angular meters, and 0.75 and 1 for linear meters.

Argument	Default	Description
pointerType	(Mandatory)	One of the predefined pointer shape constants to specify the pointer shape to use.
lengthRatio	NoValue	The length ratio applies to the pointer. NoValue means the lengthRatio is not modified. The default is 1.0 for angular meters and 0.75 for linear meters.
widthRatio	NoValue	The width ratio applies to the pointer. NoValue means the widthRatio is not modified. The default is 1.0.

- 30.32.10 setShape(pointerType as Integer, lengthRatio as Double) 5463
- 30.32.11 setShape(pointerType as Integer, lengthRatio as Double, widthRatio as Double) 5464

30.32.10 setShape(pointerType as Integer, lengthRatio as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the shape of the meter pointer to one of the built-in shapes.
Notes: The built-in symbols are specified by using the following predefined constants as the pointerType argument.

ConstantValueDescription

DiamondPointer	0	The blue pointers in the meters above.
TriangularPointer	1	The purple pointers in the meters above.
ArrowPointer	2	The red pointers in the meters above.
ArrowPointer2	3	The yellow pointers in the meters above.
LinePointer	4	The green pointers in the meters above.
PencilPointer	5	The grey pointers in the meters above.

The length and width of the pointer can be scaled by using the lengthRatio and widthRatio arguments. The meters above are using default length and width ratios, which are both 1 for angular meters, and 0.75 and 1 for linear meters.

Argument	Default	Description
pointerType	(Mandatory)	One of the predefined pointer shape constants to specify the pointer shape to use.
lengthRatio	NoValue	The length ratio applies to the pointer. NoValue means the lengthRatio is not modified. The default is 1.0 for angular meters and 0.75 for linear meters.
widthRatio	NoValue	The width ratio applies to the pointer. NoValue means the widthRatio is not modified. The default is 1.0.

- 30.32.11 setShape(pointerType as Integer, lengthRatio as Double, widthRatio as Double) 5464

30.32.11 setShape(pointerType as Integer, lengthRatio as Double, widthRatio as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the shape of the meter pointer to one of the built-in shapes.
Notes: The built-in symbols are specified by using the following predefined constants as the pointerType

argument.

ConstantValueDescription

DiamondPointer	0	The blue pointers in the meters above.
TriangularPointer	1	The purple pointers in the meters above.
ArrowPointer	2	The red pointers in the meters above.
ArrowPointer2	3	The yellow pointers in the meters above.
LinePointer	4	The green pointers in the meters above.
PencilPointer	5	The grey pointers in the meters above.

The length and width of the pointer can be scaled by using the lengthRatio and widthRatio arguments. The meters above are using default length and width ratios, which are both 1 for angular meters, and 0.75 and 1 for linear meters.

Argument	Default	Description
pointerType	(Mandatory)	One of the predefined pointer shape constants to specify the pointer shape to use.
lengthRatio	NoValue	The length ratio applies to the pointer. NoValue means the lengthRatio is not modified. The default is 1.0 for angular meters and 0.75 for linear meters.
widthRatio	NoValue	The width ratio applies to the pointer. NoValue means the widthRatio is not modified. The default is 1.0.

- 30.32.10 setShape(pointerType as Integer, lengthRatio as Double) 5463

30.32.12 setShapeAndOffset(pointerCoor() as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the shape of new style angular meter pointers to a custom polygon.
Notes: The custom polygon is specified as a list of numbers representing the (x, y) coordinates of the polygon vertices, with the x-axis pointing from left to right and the y-axis pointing from bottom to top. The direction of the pointer should be pointing upwards, with the starting point at y = 0, and the ending point at y = 1000.

As an example, the coordinates of the new style triangular pointer are:

-15, 0, 15, 0, 0, 1000, 1000

The coordinates for the new style line pointer are:

-5, 0, 5, 0, 5, 1000, -5, 1000

In actual usage, ChartDirector will rotate the polygon to point it to the desired value, and adjust the polygon size and position based on the startOffset, endOffset and widthRatio arguments. Please refer to MeterPointer.setShapeAndOffset2 for the meaning of these arguments.

Argument	Default	Description
pointerCoor	(Mandatory)	An array of numbers x0, y0, x1, y1, x2, y2, ..., representing the coordinates the polygon vertices.
startOffset	NoValue	The position of the starting point as a ratio to the scale radius. NoValue means the position is automatically determined.
endOffset	NoValue	The position of the ending point as a ratio to the scale radius. NoValue means the position is automatically determined.
widthRatio	NoValue	The width of the pointer relative to the default width. NoValue means the width is automatically determined.

- 30.32.18 setShapeAndOffset(pointerType as Integer, startOffset as Double, endOffset as Double) 5472
- 30.32.19 setShapeAndOffset(pointerType as Integer, startOffset as Double, endOffset as Double, widthRatio as Double) 5472

30.32.14 setShapeAndOffset(pointerCoor() as Integer, startOffset as Double, endOffset as Double)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the shape of new style angular meter pointers to a custom polygon.
Notes: The custom polygon is specified as a list of numbers representing the (x, y) coordinates of the polygon vertices, with the x-axis pointing from left to right and the y-axis pointing from bottom to top. The direction of the pointer should be pointing upwards, with the starting point at y = 0, and the ending point at y = 1000.

As an example, the coordinates of the new style triangular pointer are:

-15, 0, 15, 0, 0, 1000, 1000

The coordinates for the new style line pointer are:

-5, 0, 5, 0, 5, 1000, -5, 1000

In actual usage, ChartDirector will rotate the polygon to point it to the desired value, and adjust the polygon size and position based on the startOffset, endOffset and widthRatio arguments. Please refer to MeterPointer.setShapeAndOffset2 for the meaning of these arguments.

Argument	Default	Description
pointerCoor	(Mandatory)	An array of numbers x0, y0, x1, y1, x2, y2, ..., representing the coordinates the polygon vertices.
startOffset	NoValue	The position of the starting point as a ratio to the scale radius. NoValue means the position is automatically determined.
endOffset	NoValue	The position of the ending point as a ratio to the scale radius. NoValue means the position is automatically determined.
widthRatio	NoValue	The width of the pointer relative to the default width. NoValue means the width is automatically determined.

30.32.16 setShapeAndOffset(pointerType as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the shape of new style angular meter pointers.
Notes: New style pointers are designed to have configurable starting and ending points, as well as configurable width. In this documentation, the ending point refers to the "tip" of the pointer, while the starting point is the "base" of the pointer.

By default, the starting and ending points are at -0.15 and 0.95. It means the distance between the starting point and the center is 15% of the scale radius. The negative sign means that relative to the center, the starting point is at the opposite direction to the value the pointer is supposed to point to. Similarly, the distance between the ending point and the center is 95% of the scale radius, which means the ending point should be quite close to the outer rim of the meter scale.

Argument	Default	Description
pointerType	(Mandatory)	Should be TriangularPointer2 for new style triangular pointer, and LinePointer2 for new style line pointer.
startOffset	NoValue	The radius the pointer starts at, expressed as a ratio to the scale radius. NoValue means the radius is automatically determined.
endOffset	NoValue	he radius the pointer ends at, expressed as a ratio to the scale radius. NoValue means the radius is automatically determined.
widthRatio	NoValue	The width of the pointer relative to the default width. NoValue means the width is automatically determined.

30.33 class CDMLTableMBS

30.33.1 class CDMLTableMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a legend table.
Example:

```
// put a small table with numbers below a bar chart
Var data() As Double = Array(12.0, 18.0, 9.0)
Var c As New CDXYChartMBS(400, 340)
Call c.setPlotArea(50, 20, 320, 220)
Call c.addBarLayer(data, &h66AAEE)

Var table As CDMLTableMBS = c.addTable(200, 270, CDBaseChartMBS.kTopCenter, 3, 2) // 3 columns,
2 rows
Var heads() As String = Array("North", "South", "West")
For col As Integer = 0 To 2
Call table.setText(col, 0, heads(col))
Call table.setText(col, 1, Format(data(col), "0.0"))
Next

Var pic As Picture = c.makeChartPicture
```

Notes: Subclass of the CDDrawObjMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.33.2 Methods

30.33.3 appendCol as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends a column.

30.33.4 appendRow as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends a row.

30.33.5 getCell(col as Integer, row as Integer) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the textbox object for the cell.
Notes: The index of column and row is zero based.

30.33.6 getColCount as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of columns.

30.33.7 getColStyle(col as Integer) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the column style.
Notes: col is zero based.

30.33.8 getColWidth(col as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the width of a column.
Notes: col is zero based.

30.33.9 getHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the height of the table.

30.33.10 getRowCount as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of row.

30.33.11 getRowHeight(row as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the height of a row.
Notes: row is zero based.

30.33.12 getRowStyle(row as Integer) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the row style.
Notes: row is zero based.

30.33.13 getStyle as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the textbox defining the style of the table.

30.33.14 getWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the width of the table.

30.33.15 insertCol(col as Integer) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts a column at the given column.
Notes: col is zero based.

30.33.16 insertRow(row as Integer) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts a row on the given position.
Notes: row is zero based.

30.33.17 layout

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Layouts the table, so you can get the size.

30.33.18 setCell(col as Integer, row as Integer, width as Integer, height as Integer, text as string) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the cell to the given text.
Notes: col and row are zero based.

30.33.19 setPos(x as Integer, y as Integer, alignment as Integer = 7)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position of the table.
Notes: x and y are zero based.

30.33.20 setText(col as Integer, row as Integer, text as string) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the text of a cell.
Notes: col and row are zero based.

30.34 class CDMultiChartMBS

30.34.1 class CDMultiChartMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The MultiChart class represents multi-chart.
Example:

```
// combine two charts side by side into one picture
Var data1() As Double = Array(5.0, 8.0, 6.0, 9.0, 7.0)
Var data2() As Double = Array(3.0, 4.0, 7.0, 5.0, 8.0)

Var left As New CDXYChartMBS(300, 250)
Call left.setPlotArea(40, 20, 240, 200)
Call left.addLineLayer(data1, &h0066CC, "Sales")

Var right As New CDXYChartMBS(300, 250)
Call right.setPlotArea(40, 20, 240, 200)
Call right.addBarLayer(data2, &hFF6600, "Costs")

Var m As New CDMultiChartMBS(600, 250)
m.addChart(0, 0, left)
m.addChart(300, 0, right)

Var pic As Picture = m.makeChartPicture
// show pic in a Canvas or ImageViewer
```

Notes: A multi-chart is a container to contain multiple charts. You can use a multi- chart to combine multiple BaseChart objects (or its subclass such as PieChart, XYChart, PolarChart, AngularMeter or LinearMeter) into one image.
Subclass of the CDBaseChartMBS class.

30.34.2 Methods

30.34.3 addChart(x as Integer, y as Integer, c as CDBaseChartMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a BaseChart object (or its subclass such as PieChart, XYChart, PolarChart, AngularMeter or LinearMeter) into the multi-chart.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of a point in the multi-chart that is to align with the top-left corner of the added BaseChart.
y	(Mandatory)	The y coordinate of a point in the multi-chart that is to align with the top-left corner of the added BaseChart.
c	(Mandatory)	The BaseChart object to be added to the multi-chart.

30.34.4 Constructor(width as Integer = 640, height as Integer = 480, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 30.34.5 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0) 5479

30.34.5 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new MultiChart object.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

See also:

- 30.34.4 Constructor(width as Integer = 640, height as Integer = 480, bgColor as color, edgeColor as color, raisedEffect as Integer = 0) 5479

30.34.6 getChart(index as Integer) as CDBaseChartMBS

MBS ChartDirector Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the specified chart in the MultiChart.
Notes:

Argument	Default	Description
i	0	The index of the chart. The index of the first chart set added to the MultiChart is 0. The index of the Nth data set added to the MultiChart is N - 1.

30.34.7 getChartCount as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the number of charts in the MultiChart.
Notes: Returns the number of charts in the MultiChart.

30.34.8 setMainChart(c as CDBaseChartMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the chart that receives view port mouse actions (for zooming and scrolling support).
Notes:

Argument	Default	Description
c	(Mandatory)	The chart that is to receive view port mouse actions.

30.35 class CDMultiPagePDFMBS

30.35.1 class CDMultiPagePDFMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The MultiPagePDF class is a utility class used to create PDF documents with multiple pages.
Example:

```
// put two charts on two pages of one PDF file
Var data() As Double = Array(5.0, 8.0, 6.0, 9.0, 7.0)

Var line As New CDXYChartMBS(500, 300)
Call line.setPlotArea(50, 20, 420, 240)
Call line.addLineLayer(data, &h0066CC)

Var bars As New CDXYChartMBS(500, 300)
Call bars.setPlotArea(50, 20, 420, 240)
Call bars.addBarLayer(data, &hFF6600)

Var pdf As New CDMultiPagePDFMBS
pdf.addPage line
pdf.addPage bars
If pdf.outPDF(SpecialFolder.Desktop.Child("charts.pdf")) Then MessageBox "PDF written."
```

Notes: MultiPagePDF works by generating a PDF page for CDBaseChartMBS or CDDrawAreaMBS added to it. The CDBaseChartMBS can be a CDMultiChartMBS, and can contain free form CDML text, tables, shape and images. In this way, CDMultiPagePDFMBS can create complete PDF reports.

30.35.2 Methods

30.35.3 addPage(chart as CDBaseChartMBS)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a BaseChart object as a PDF page.
Notes: You can use BaseChart.setOutputOptions to configure the PDF page options, such as the page size, margins, etc.

MultiPagePDF will immediately generate the PDF page using the BaseChart object. You can immediately delete the BaseChart object after calling this method. That means you do not need to keep a lot of BaseChart objects in memory even if the PDF has a lot of pages.

Argument	Default	Description
c	(Mandatory)	The BaseChart object used to create the PDF page.

See also:

- 30.35.4 addPage(DrawArea as CDDrawAreaMBS) 5482

30.35.4 addPage(DrawArea as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a DrawArea object as a PDF page.
Notes: You can use DrawArea.setOutputOptions to configure the PDF page options, such as the page size, margins, etc.

MultiPagePDF will immediately generate the PDF page using the DrawArea object. You can immediately delete the DrawArea object after calling this method. That means you do not need to keep a lot of DrawArea objects in memory even if the PDF has a lot of pages.

Argument	Default	Description
d	(Mandatory)	The DrawArea object used to create the PDF page.

See also:

- 30.35.3 addPage(chart as CDBaseChartMBS) 5481

30.35.5 Constructor

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a MultiPagePDF object.

30.35.6 outPDF as String

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Outputs the PDF document in memory.
Notes: Returns a memory block containing the PDF document.
See also:

- 30.35.7 outPDF(file as FolderItem) as Boolean 5483
- 30.35.8 outPDF(path as String) as Boolean 5483

30.35.7 outPDF(file as FolderItem) as Boolean

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Outputs the PDF document as a file.
Notes:

Argument	Default	Description
filename	(Mandatory)	The filename of the PDF file.

A true value indicates no error. A false value indicates the operation is unsuccessful.

30.35.8 outPDF(path as String) as Boolean

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Outputs the PDF document as a file.
Notes:

Argument	Default	Description
filename	(Mandatory)	The filename of the PDF file.

A true value indicates no error. A false value indicates the operation is unsuccessful.

- MBS Real Studio Plugins, version 12.3pr17

30.37 class CDPieChartMBS

30.37.1 class CDPieChartMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PieChart class represents pie charts.
Example:

```
// draw a 3D pie chart into a picture
Var data() As Double = Array(25.0, 18.0, 15.0, 12.0, 8.0)
Var labels() As String = Array("Labor", "Licenses", "Taxes", "Legal", "Insurance")

Var c As New CDPieChartMBS(400, 300)
Call c.addTitle("Project Costs")
c.setPieSize(200, 160, 100)
c.set3D
c.setData(data, labels)

Var pic As Picture = c.makeChartPicture
// show pic in a Canvas or ImageViewer, or save it to a file
```

Notes: Subclass of the CDBaseChartMBS class.

30.37.2 Methods

30.37.3 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 30.37.4 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as Integer = &hFFFF0000, edgeColor as Integer = &hFF000000, raisedEffect as Integer = 0) 5486

30.37.4 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as Integer = &hFFFF0000, edgeColor as Integer = &hFF000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new PieChart object.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

See also:

- 30.37.3 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as color, edgeColor as color, raisedEffect as Integer = 0) 5485

30.37.5 sector(sectorNo as Integer) as CDSectorMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the Sector object representing a single sector in the pie chart.
Notes:

Argument	Default	Description
sectorNo	(Mandatory)	The sector number of the sector to retrieve, starting from 0. The first sector is 0. The nth sector is (n-1).

Return Value
The requested Sector object.

30.37.6 set3D(depth as Integer = -1, angle as Double = -1, shadowMode as boolean=false)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds 3D effects to the pie.
Notes:

Argument	Default	Description
depth	-1	The 3D depth of the pie in pixels. -1 means the depth is automatically determined.
angle	-1	The 3D view angle in degrees. Must be 0 - 90 for standard 3D mode, and 0 - 360 in shadow 3D mode. -1 means the angle is automatically determined.
shadowMode	false	Flag to indicate whether the pie is in standard 3D or shadow 3D mode. A true value means shadow 3D mode. A false value means standard 3D mode.

See also:

- 30.37.7 set3D(depths() as Double, angle as Double = 45, shadowMode as boolean=false) 5487

30.37.7 set3D(depths() as Double, angle as Double = 45, shadowMode as boolean=false)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds 3D effects to the pie, where each sector can have a different 3D depth.
Notes:

Argument	Default	Description
depths	(Mandatory)	An array of integers representing the 3D depths for the sectors.
angle	45	The 3D view angle in degrees. Must be 0 - 90 for standard 3D mode, and 0 - 360 in shadow 3D mode. -1 means the angle is automatically determined.
shadowMode	false	Flag to indicate whether the pie is in standard 3D or shadow 3D mode. A true value means shadow 3D mode. A false value means standard 3D mode.

See also:

- 30.37.6 set3D(depth as Integer = -1, angle as Double = -1, shadowMode as boolean=false) 5487

30.37.8 setData(data() as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the data used to draw the pie chart.
Notes:

See also:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points.
labels	[Empty_Array]	An array of text strings representing the labels of the sectors. An empty array means no sector label.

- 30.37.9 setData(data() as Double, label() as string) 5488

30.37.9 setData(data() as Double, label() as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the data used to draw the pie chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points.
labels	[Empty_Array]	An array of text strings representing the labels of the sectors. An empty array means no sector label.

See also:

- 30.37.8 setData(data() as Double) 5487

30.37.10 setDonutSize(x as Integer, y as Integer, r as Integer, r2 as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position and size of the donut in the donut chart.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of the donut center.
y	(Mandatory)	The y coordinate of the donut center.
r	(Mandatory)	The inner radius of the donut.
r2	(Mandatory)	The outer radius of the donut.

30.37.11 setExplode(sectorNo as Integer, distance as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Explode a sector from the pie.
Notes:

Argument	Default	Description
sectorNo	(Mandatory)	The sector number of the sector to be exploded from the pie, starting from 0. The first sector is 0. The nth sector is (n - 1).
distance	-1	The explosion distance in pixels. -1 means the distance is automatically determined.

30.37.12 setExplodeGroup(startSector as Integer, endSector as Integer, distance as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Explode a group of sectors from the pie.
Notes:

Argument	Default	Description
startSector	(Mandatory)	The sector number of the first sector in the sector group to be exploded. The first sector is 0. The nth sector is (n - 1).
endSector	(Mandatory)	The sector number of the last sector in the sector group to be exploded. The first sector is 0. The nth sector is (n - 1).
distance	-1	The explosion distance in pixels. -1 means the distance is automatically determined.

30.37.13 setJoinLine(joinLineColor as color, joinLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setJoinLine method, but uses color instead of integer data type for passing color values.
See also:

- 30.37.14 setJoinLine(joinLineColor as Integer, joinLineWidth as Integer = -1) 5489

30.37.14 setJoinLine(joinLineColor as Integer, joinLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color and width of the join lines used to connect the sector labels to the sector perimeter.
Notes: This method affects all sectors. To set the color and width of the join line for one particular sector only, use Sector.setJoinLine.

By default, for circular label layout, the join line color is Transparent. For side label layout, the join line color is SameAsMainColor.

Argument	Default	Description
joinLineColor	(Mandatory)	The color of the line that joins the sector perimeter with the sector label.
joinLineWidth	1	The line width of the join line.

See also:

- 30.37.13 setJoinLine(joinLineColor as color, joinLineWidth as Integer = -1) 5489

30.37.15 setLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the format of the all sector labels.
Example:

```
Var c as CDPieChartMBS

// you can use label formats like this:

c.setLabelFormat("<*block,halign=left*><*font=timesbi.ttf,size=12,underline=1*>{ label } <*/font*><*br*>US$
{ value } K ( { percent } %)")

// we can reduce that to this:

c.setLabelFormat(" { label } { value } { percent } %")

// and it shows 3 numbers. With | 1 after the variable name, we define the decimals after dot:

c.setLabelFormat(" { label } { value | 1 } { percent | 1 } %")

// and

c.setLabelFormat(" { label } { value | 1., } { percent | 1., } %")

// uses dot for thousands and comma for decimal separator.
```

Notes: This method affects all sectors. To set the label format for one particular sector only, use Sector.setLabelFormat.

The default sector label format depends on the label layout method used (see PieChart.setLabelLayout).

(The "<*br*>" above is the CDML syntax for a line break.)

Please refer to Parameter Substitution and Formatting on all available parameters and how to format them.

Label	Layout Method
Circular Layout	{ label } <*br*> { percent } %
Side Layout	{ label } ({ percent } %)

Argument	Default	Description
formatString	(Mandatory)	The format string.

30.37.16 setLabelLayout(layoutMethod as Integer, pos as Integer = -1, topBound as Integer = -1, bottomBound as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the layout method and location of the sector labels.
Notes: This method affects all sectors. To set the sector label layout method and location for one particular sector only, use Sector.setLabelLayout.

ChartDirector supports two sector label layout methods - circular layout and side layout. The layout method is determined using the layoutMethod argument, which must be one of the following predefined constants.

Constant	Value	Description
SideLayout	0	Side Label Layout
CircleLayout	1	Circular Label Layout

In the circular layout method, the sector labels are positioned around the perimeter of the pie.

In the side layout method, there is an invisible rectangle containing the pie, where the rectangle can be wider than the diameter of the pie.The sector labels are positioned on the left and right sides outside the rectangle. Because the labels can be quite far away from the sectors, join lines are typically used to connect the labels to the sectors.

The circular layout method usually uses less space and is the default layout method. However, if the pie chart contains a lot of small sectors, the labels may overlap with each others, due to insufficient space on the pie perimeter to position the labels.

The side layout method has the advantages that it can avoid label overlapping. In the side layout method, labels will automatically shift up and down to avoid overlapping.

One common issue in pie charts is the data contain a lot of small sectors. If the data are sorted, the small sectors will be crowded together instead of distributed evenly. Although the side layout method can avoid label overlapping by shifting the labels up and down, some labels may need to be shifted great distances.

Label layout can often be improved if the small sectors are near the horizontal axis. It is because the amount of vertical label space for a sector is greatest at the horizontal axis. This can be achieved by choosing an appropriate start angle (using PieChart.setStartAngle).

If the data is in ascending order (small sectors crowded at the beginning), a start angle of 45 degrees with clockwise sector layout is recommended. With this setting, the first few sectors (the smallest sectors) will be at around 45 - 135 degrees, so is near the horizontal axis (90 degrees). Similarly, if the data is in descending order (small sectors crowded at the end), a start angle of 135 degrees with clockwise sector layout can be used.

Argument	Default	Description
layoutMethod	(Mandatory)	Specify the layout method. Must be one of the predefined constants CircleLayout or SideLayout.
pos	-1	For circular layout, it is the distance between the sector perimeter and the sector label. A negative value (but not -1) means the sector label will be drawn in the interior of the sector.

For side layout, it is the distance between the pie perimeter and the left or right edges of the invisible containing rectangle (equal to the width of the rectangle minus the pie diameter and then divided by 2).

In either case, -1 means the distance is automatically determined.

topBound	-1	This parameter applies only to side label layout. It controls the top bound of the labels (the minimum y coordinate), thereby limiting the extent that the labels can be shifted up to avoid overlapping. This parameter is typically used avoid the labels from moving up too much and overlap with other chart objects (such as the chart title).
bottomBound	-1	This parameter applies only to side label layout. It controls the bottom bound of the labels (the maximum y coordinate), thereby limiting the extent which the labels can be shifted down to avoid overlapping. This parameter is typically used to avoid the labels from moving down too much and overlap with other chart objects.

30.37.17 setLabelPos(pos as Integer, joinLineColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setLabelPos method, but uses color instead of integer data type for passing color values.
See also:

- 30.37.18 setLabelPos(pos as Integer, joinLineColor as Integer = -1) 5493

30.37.18 setLabelPos(pos as Integer, joinLineColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the circular label layout method, and configure the join lines used to connect the sector labels to the sector perimeter.
Notes: This method affects all sectors. To set the sector label position or join line color for one particular sector only, use Sector.setLabelPos.

Argument	Default	Description
pos	(Mandatory)	The distance between the sector perimeter and the sector label. A negative value means the sector label will be drawn in the interior of the sector.
joinLineColor	-1	The color of the line that joins the sector perimeter with the sector label. The default is Transparent. The join line is ignored if the sector label is inside the sector.

See also:

- 30.37.17 setLabelPos(pos as Integer, joinLineColor as color) 5492

30.37.19 setLabelStyle(font as string = """, fontsize as Double = 8, fontColor as Integer = &hffff0002) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the style used to draw all sector labels.
Notes: This method affects all sectors. To set the label style for one particular sector only, use Sector.setLabelStyle.

See Font Specification for details on various font attributes.

Argument	Default	Description
font	""	The font used to draw the sector labels.
fontSize	8	The font size in points.
fontColor	TextColor	The text color for the sector labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.37.20 setLabelStyle(font as string, fontsize as Double, fontColor as color) as CDTextBoxMBS 5494

30.37.20 setLabelStyle(font as string, fontsize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setLabelStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.37.19 setLabelStyle(font as string = """, fontsize as Double = 8, fontColor as Integer = &hffff0002) as CDTextBoxMBS 5493

30.37.21 setLineColor(edgeColor as color, joinLineColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setLineColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.37.22 setLineColor(edgeColor as Integer, joinLineColor as Integer = -1) 5494

30.37.22 setLineColor(edgeColor as Integer, joinLineColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the sector edge color and join line color.
Notes: This method affects all sectors. To set the sector label position and join line color for one particular sector, use Sector.setColor.

See also:

- 30.37.21 setLineColor(edgeColor as color, joinLineColor as color) 5494

Argument	Default	Description
edgeColor	(Mandatory)	The colors for the edges of the sectors. By default, the edge color is SameAsMainColor, which means the edge color is the same as the fill color of the sector, and the sector will appear borderless.
joinLineColor	-1	The color of the line that join the sector perimeter with the sector label. By default, for circular label layout, the join line color is Transparent. For side label layout, the join line color is SameAsMainColor.

30.37.23 setPieSize(x as Integer, y as Integer, r as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position and size of the pie in the pie chart.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of the pie center.
y	(Mandatory)	The y coordinate of the pie center.
r	(Mandatory)	The radius of the pie.

30.37.24 setSectorStyle(shadingMethod as Integer, edgeColor as color, edgeWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setSectorStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.37.25 setSectorStyle(shadingMethod as Integer, edgeColor as Integer = -1, edgeWidth as Integer = -1) 5495

30.37.25 setSectorStyle(shadingMethod as Integer, edgeColor as Integer = -1, edgeWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the sector shading style, edge color and edge width.
Notes: This method affects all sectors. To set the sector shading style, edge color and edge width for one particular sector, use CDSectorMBS.setStyle.

ChartDirector supports various shading effects, which are best illustrated using examples.

The followings are textual descriptions of the shading effects.

Constant	Value	Description
DefaultShading	0	This is the default shading method. The top surfaces are shaded with flat colors. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.
FlatShading	1	All surfaces are shaded with flat colors.
LocalGradientShading	2	The top surfaces are shaded with linear gradient colors. For each sector, the gradient is from the bottom of the sector bounding box to the top of the sector bounding box, with the bottom side brighter and the top side darker. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.
GlobalGradientShading	3	The top surfaces are shaded with linear gradient colors. The gradient is from the bottom the pie bounding box to the top of the pie bounding box, with the bottom side brighter and the top side darker. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.
ConcaveShading	4	The top surfaces are shaded with a special effect so that they look concave, with the pie center appears to be depressed relative to the perimeter. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.
RoundedEdgeShading	6	The top surfaces are shaded with a special effect so that the pie looks raised with a rounded raised edge at the perimeter.
RadialShading	7	The top surfaces are shaded with radial gradient colors, with the pie center brighter and the perimeter darker. For 3D sectors, the cylindrical surfaces are shaded with cylindrical lighting effects.
RingShading	8	This effect is intended to be used with 2D donut charts only. The top surfaces are shaded with a special effect so that a 2D donut will look like a torus.

Arguments:

Argument	Default	Description
shadingMethod	(Mandatory)	The sector shading style to use, which must be one of the constants in the table above. -1 means to keep the existing value unchanged.
edgeColor	-1	The edge color of the sectors. -1 means to keep the existing value unchanged.
edgeWidth	-1	The edge width of the sectors. -1 means to keep the existing value unchanged.

See also:

- 30.37.24 setSectorStyle(shadingMethod as Integer, edgeColor as color, edgeWidth as Integer = -1) 5495

30.37.26 setStartAngle(startAngle as Double, clockWise as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the angle of the first sector in the pie and the layout direction for the sectors.
Notes: By default, the start angle is 0 degree (the upward pointing direction), and subsequent sectors are drawn clockwise.

Argument	Default	Description
startAngle	(Mandatory)	The angle to start drawing the first sector in degrees. The angle is measured from the upward pointing direction in the clockwise direction.
clockWise	true	Flag to control the layout direction of the sectors. A true value means clockwise. A false value means anti-clockwise.

30.37.27 Screenshots

30.37.28 legendpie2.jpg

Function: A pie chart with legend created using ChartDirector with the CDPieChartMBS class.

30.37.29 smallsectorpie.jpg

Function: A pie chart with small sectors created using ChartDirector with the CDPieChartMBS class.

30.37.30 threeddonutshading.jpg

Function: A donut created using ChartDirector with the CDPieChartMBS class.

30.38 class CDPlotAreaMBS

30.38.1 class CDPlotAreaMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PlotArea class represents plot areas in XY charts.
Example:

```
// change background and grid lines of the plot area of a line chart
Var data() As Double = Array(5.0, 8.0, 6.0, 11.0, 9.0)
Var c As New CDXYChartMBS(500, 300)
Var area As CDPlotAreaMBS = c.setPlotArea(50, 30, 420, 230)
area.setBackground(&hFFFFFF, &hF0F4FF, &hCCCCCC) // alternating bands
area.setGridColor(&hDDDDDD, &hDDDDDD)
Call c.addLineLayer(data, &h0066CC)

Var pic As Picture = c.makeChartPicture
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.38.2 Methods

30.38.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.38.4 getBottomY as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the bottom y pixel coordinate of the plot area.
Notes: Returns the bottom y pixel coordinate of the plot area.

30.38.5 getHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the height of the plot area.

30.38.6 getLeftX as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the left x pixel coordinate of the plot area.

30.38.7 getRightX as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the right x pixel coordinate of the plot area.
Notes: Returns the right x pixel coordinate of the plot area.

30.38.8 getTopY as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the top y pixel coordinate of the plot area.
Notes: In some cases, the top y coordinate of a box may be dynamically determined. An example is the top y coordinate of an LegendBox with alignment set to Center. To determine the top y coordinate, the size of the box must be known first. For these cases, the top y coordinate is undefined until the legend box or the entire chart has been laid out (using CDBaseChartMBS.layout or CDBaseChartMBS.layoutLegend), or the chart image has been drawn (eg. using CDBaseChartMBS.makeChart).

Arguments:
None

Return Value
The top y pixel coordinate of the plot area.

30.38.9 getWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the width of the plot area.

30.38.10 moveGridBefore(layer as CDLayerMBS=nil)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the grid lines in front of a Layer.
Notes: By default, the grid lines will be drawn at the back of the plot area, behind all the layers. This method can be used to move the grid lines in front of a given layer.

Arguments:

Argument	Default	Description
layer	nil	The Layer for the grid lines to move in front of.

30.38.11 set4QBgColor(Q1Color as color, Q2Color as color, Q3Color as color, Q4Color as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other set4QBgColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.38.12 set4QBgColor(Q1Color as Integer, Q2Color as Integer, Q3Color as Integer, Q4Color as Integer, edgeColor as Integer = -1) 5502

30.38.12 set4QBgColor(Q1Color as Integer, Q2Color as Integer, Q3Color as Integer, Q4Color as Integer, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets using 4 background plot area colors for 4 quadrants.
Notes: The first quadrant is the region defined by x > 0 and y > 0. The second quadrant is the region defined by x < 0 and y > 0. The third quadrant is the region defined by x < 0 and y < 0. The fourth quadrant is the region defined by x > 0 and y < 0. These 4 regions can be colored using 4 different background colors.

Argument	Default	Description
Q1Color	(Mandatory)	The background color to be used for the first quadrant.
Q2Color	(Mandatory)	The background color to be used for the second quadrant.
Q3Color	(Mandatory)	The background color to be used for the third quadrant.
Q4Color	(Mandatory)	The background color to be used for the fourth quadrant.
edgeColor	-1	he border color of the plot area. -1 means to use the default, which is LineColor. However, if the axes are configured in 4 quadrant mode (see XYChart.setAxisAtOrigin), the default will change to Transparent.

See also:

- 30.38.11 set4QBgColor(Q1Color as color, Q2Color as color, Q3Color as color, Q4Color as color, edgeColor as color) 5502

30.38.13 setAltBgColor(horizontal as Boolean, color1 as color, color2 as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setAltBgColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.38.14 setAltBgColor(horizontal as Boolean, color1 as Integer, color2 as Integer, edgeColor as Integer = -1) 5503

30.38.14 setAltBgColor(horizontal as Boolean, color1 as Integer, color2 as Integer, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets alternating plot area background color.
Notes: This method can be used to specify two colors that will be used alternatively to draw horizontal or vertical bands on the plot area background, using major grid lines as boundaries for the bands.

Argument	Default	Description
horizontal	(Mandatory)	true means to use horizontal bands. false means to use vertical bands.
color1	(Mandatory)	The first color to be used as the alternating background color.
color2	(Mandatory)	The second color to be used as the alternating background color.
edgeColor	-1	The border color of the plot area. -1 means to use the default, which is LineColor. However, if the axes are configured in 4 quadrant mode (see XYChart.setAxisAtOrigin), the default will change to Transparent.

See also:

- 30.38.13 setAltBgColor(horizontal as Boolean, color1 as color, color2 as color, edgeColor as color) 5503

30.38.15 setBackground(colorvalue as color, altBgColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setBackground method, but uses color instead of integer data type for passing color values.
See also:

- 30.38.16 setBackground(colorvalue as Integer, altBgColor as Integer = -1, edgeColor as Integer = -1) 5504
- 30.38.17 setBackground(file as folderitem, align as Integer = 5) 5505

30.38.16 setBackground(colorvalue as Integer, altBgColor as Integer = -1, edgeColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the background colors and the border color of the plot area.
Notes: A plot area can have one or two background colors. If it has two background colors, they are drawn alternatively as horizontal bands on the major background grid.

ChartDirector Ver 4.0 introduces two new methods PlotArea.setAltBgColor and PlotArea.set4QBgColor. They are used for vertical alternating bands, and for supporting 4 background colors for 4 quadrants.

Argument	Default	Description
color	(Mandatory)	The background color.
altBgColor	-1	The second background color. -1 means there is no second background color.
edgeColor	-1	The border color of the plot area. -1 means to use the default, which is LineColor. However, if the axes are configured in 4 quadrant mode (see XYChart.setAxisAtOrigin), the default will change to Transparent.

See also:

- 30.38.15 setBackground(colorvalue as color, altBgColor as color, edgeColor as color) 5504
- 30.38.17 setBackground(file as folderitem, align as Integer = 5) 5505

30.38.17 setBackground(file as folderitem, align as Integer = 5)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the specified image file as the background image of the plot area.
Notes: ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
img	(Mandatory)	The image file that is used as the background image of the plot area.
align	Center	The alignment of the background image relative to the plot area. See Alignment Specification for supported alignment types.

See also:

- 30.38.15 setBackground(colorvalue as color, altBgColor as color, edgeColor as color) 5504
- 30.38.16 setBackground(colorvalue as Integer, altBgColor as Integer = -1, edgeColor as Integer = -1) 5504

30.38.18 setGridAxis(xGridAxis as CDAxisMBS, yGridAxis as CDAxisMBS)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the axis used for drawing grid lines.
Notes: By default, the grid lines will be based on the ticks on the primary x-axis (CDXYChartMBS.xAxis) and primary y-axis (CDXYChartMBS.yAxis). This method may be used to specify alternative x-axis and y-axis to base the grid lines on.

Arguments:

Argument	Default	Description
xGridAxis	(Mandatory)	The x-axis used for drawing grid lines.
yGridAxis	(Mandatory)	The y-axis used for drawing grid lines.

30.38.19 setGridColor(hGridColor as color, vGridColor as color, minorHGridColor as color, minorVGridColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setGridColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.38.20 setGridColor(hGridColor as Integer, vGridColor as Integer = &hff000000, minorHGridColor as Integer = -1, minorVGridColor as Integer = -1) 5506

30.38.20 setGridColor(hGridColor as Integer, vGridColor as Integer = &hff000000, minorHGridColor as Integer = -1, minorVGridColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the horizontal and vertical grid colors of the plot area.
Notes:

Argument	Default	Description
hGridColor	(Mandatory)	The color for the horizontal grid lines associated with major ticks.
vGridColor	Transparent	The color for the vertical grid lines associated with major ticks.
minorHGridColor	-1	The color for the horizontal grid lines associated with minor ticks. -1 means the color is the same as hGridColor.
minorVGridColor	-1	The color for the vertical grid lines associated with minor ticks. -1 means the color is the same as vGridColor.

See also:

- 30.38.19 setGridColor(hGridColor as color, vGridColor as color, minorHGridColor as color, minorVGridColor as color) 5505

30.38.21 setGridWidth(hGridWidth as Integer, vGridWidth as Integer = -1, minorHGridWidth as Integer = -1, minorVGridWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the horizontal and vertical grid line width.
Notes:

Argument	Default	Description
hGridWidth	(Mandatory)	The line width for the horizontal grid lines associated with major ticks.
vGridWidth	-1	The line width for the vertical grid lines associated with major ticks. -1 means the vertical grid line width is the same as hGridWidth.
minorHGridWidth	-1	The line width for the horizontal grid lines associated with minor ticks. -1 means the color is the same as hGridWidth.
minorVGridWidth	-1	The line width for the horizontal grid lines associated with minor ticks. -1 means the color is the same as vGridWidth.

30.39 class CDPolarAreaLayerMBS

30.39.1 class CDPolarAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PolarAreaLayer class represents polar area layers.
Notes: Subclass of the CDPolarLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.
Xojo Developer Magazine

- 23.5, page 61: Polar Charts, Using the MBS Xojo ChartDirector Plugin by Stefanie Juchmes-Simonis

30.40 class CDPolarChartMBS

30.40.1 class CDPolarChartMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PolarChart class represents polar charts (including radar charts).
Example:

```
// draw a radar chart with two data series
Var data1() As Double = Array(90.0, 60.0, 65.0, 75.0, 40.0)
Var data2() As Double = Array(70.0, 80.0, 75.0, 55.0, 85.0)
Var labels() As String = Array("Speed", "Reliability", "Comfort", "Safety", "Efficiency")

Var c As New CDPolarChartMBS(450, 400)
c.setPlotArea(225, 210, 150)
Call c.addAreaLayer(data1, &h806666CC, "Model A")
Call c.addAreaLayer(data2, &h80CC6666, "Model B")
Call c.angularAxis.setLabels(labels)

Var pic As Picture = c.makeChartPicture
// show pic in a Canvas or ImageViewer, or save it to a file
```

Notes: Subclass of the CDBaseChartMBS class.

30.40.2 Methods

30.40.3 addAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addAreaLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.40.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS 5509
- 30.40.5 addAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5510
- 30.40.6 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS 5510
- 30.40.7 addAreaLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5511
- 30.40.8 addAreaLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarAreaLayerMBS 5511

30.40.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a polar area layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the area. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarAreaLayer object representing the chart layer created.
See also:

- 30.40.3 addAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5508
- 30.40.5 addAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5510
- 30.40.6 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS 5510
- 30.40.7 addAreaLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5511
- 30.40.8 addAreaLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarAreaLayerMBS 5511

30.40.5 addAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Same as the other addAreaLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.40.3 addAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5508
- 30.40.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS 5509
- 30.40.6 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS 5510
- 30.40.7 addAreaLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5511
- 30.40.8 addAreaLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarAreaLayerMBS 5511

30.40.6 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a polar area layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the area. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarAreaLayer object representing the chart layer created.
See also:

- 30.40.3 addAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5508

- 30.40.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS 5509
- 30.40.5 addAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5510
- 30.40.7 addAreaLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5511
- 30.40.8 addAreaLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarAreaLayerMBS 5511

30.40.7 addAreaLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a polar area layer to the polar chart.
See also:

- 30.40.3 addAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5508
- 30.40.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS 5509
- 30.40.5 addAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5510
- 30.40.6 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS 5510
- 30.40.8 addAreaLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarAreaLayerMBS 5511

30.40.8 addAreaLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a polar area layer to the polar chart.
See also:

- 30.40.3 addAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5508
- 30.40.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS 5509

- 30.40.5 addAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5510
- 30.40.6 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarAreaLayerMBS 5510
- 30.40.7 addAreaLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarAreaLayerMBS 5511

30.40.9 addLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addLineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.40.10 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5512
- 30.40.11 addLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5513
- 30.40.12 addLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5513
- 30.40.13 addLineLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5514
- 30.40.14 addLineLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarLineLayerMBS 5515

30.40.10 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a polar line layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarLineLayer object representing the chart layer created.
See also:

- 30.40.9 addLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5512
- 30.40.11 addLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5513
- 30.40.12 addLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5513
- 30.40.13 addLineLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5514
- 30.40.14 addLineLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarLineLayerMBS 5515

30.40.11 addLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Same as the other addLineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.40.9 addLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5512
- 30.40.10 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5512
- 30.40.12 addLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5513
- 30.40.13 addLineLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5514
- 30.40.14 addLineLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarLineLayerMBS 5515

30.40.12 addLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a polar line layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarLineLayer object representing the chart layer created.
See also:

- 30.40.9 addLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5512
- 30.40.10 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5512
- 30.40.11 addLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5513
- 30.40.13 addLineLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5514
- 30.40.14 addLineLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarLineLayerMBS 5515

30.40.13 addLineLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a polar line layer to the polar chart.
Notes: Variation taking dateTime array and color.
See also:

- 30.40.9 addLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5512
- 30.40.10 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5512
- 30.40.11 addLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5513

- 30.40.12 addLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5513
- 30.40.14 addLineLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarLineLayerMBS 5515

30.40.14 addLineLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a polar line layer to the polar chart.
Notes: Variation taking dateTime array.
See also:

- 30.40.9 addLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5512
- 30.40.10 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5512
- 30.40.11 addLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5513
- 30.40.12 addLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarLineLayerMBS 5513
- 30.40.13 addLineLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarLineLayerMBS 5514

30.40.15 addSplineAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addSplineAreaLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.40.16 addSplineAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarSplineAreaLayerMBS 5516
- 30.40.17 addSplineAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarSplineAreaLayerMBS 5516
- 30.40.18 addSplineAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineAreaLayerMBS 5517

- 30.40.19 addSplineAreaLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarSplineAreaLayerMBS 5518
- 30.40.20 addSplineAreaLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarSplineAreaLayerMBS 5518

30.40.16 addSplineAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarSplineAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a polar spline area layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the spline area. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarSplineAreaLayer object representing the chart layer created.
See also:

- 30.40.15 addSplineAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineAreaLayerMBS 5515
- 30.40.17 addSplineAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarSplineAreaLayerMBS 5516
- 30.40.18 addSplineAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineAreaLayerMBS 5517
- 30.40.19 addSplineAreaLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarSplineAreaLayerMBS 5518
- 30.40.20 addSplineAreaLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarSplineAreaLayerMBS 5518

30.40.17 addSplineAreaLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarSplineAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Same as the other addSplineAreaLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.40.15 addSplineAreaLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineAreaLayerMBS 5515
- 30.40.16 addSplineAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarSplineAreaLayerMBS 5516
- 30.40.18 addSplineAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineAreaLayerMBS 5517
- 30.40.19 addSplineAreaLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarSplineAreaLayerMBS 5518
- 30.40.20 addSplineAreaLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarSplineAreaLayerMBS 5518

30.40.18 addSplineAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a polar spline area layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the spline area. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarSplineAreaLayer object representing the chart layer created.

- 30.40.24 addSplineLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5520
- 30.40.25 addSplineLineLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5521
- 30.40.26 addSplineLineLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5521

30.40.22 addSplineLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a polar spline line layer to the polar chart.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the spline line. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A PolarSplineLineLayer object representing the chart layer created.

- 30.40.21 addSplineLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5519
- 30.40.23 addSplineLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5520

- 30.40.24 addSplineLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5520
- 30.40.25 addSplineLineLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5521
- 30.40.26 addSplineLineLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5521

30.40.23 addSplineLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Same as the other addSplineLineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.40.21 addSplineLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5519
- 30.40.22 addSplineLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5519
- 30.40.24 addSplineLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5520
- 30.40.25 addSplineLineLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5521
- 30.40.26 addSplineLineLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5521

30.40.24 addSplineLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a polar spline line layer to the polar chart.
Notes:

Return Value
A PolarSplineLineLayer object representing the chart layer created.
See also:

- 30.40.21 addSplineLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5519

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data points in the layer.
color	-1	The color to draw the spline line. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

- 30.40.22 addSplineLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5519
- 30.40.23 addSplineLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5520
- 30.40.25 addSplineLineLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5521
- 30.40.26 addSplineLineLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5521

30.40.25 addSplineLineLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a polar spline line layer to the polar chart.
See also:

- 30.40.21 addSplineLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5519
- 30.40.22 addSplineLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5519
- 30.40.23 addSplineLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5520
- 30.40.24 addSplineLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5520
- 30.40.26 addSplineLineLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5521

30.40.26 addSplineLineLayer(dates() as dateTime, colorvalue as integer = -1, name as string = "") as CDPolarSplineLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a polar spline line layer to the polar chart.
See also:

- 30.40.21 addSplineLineLayer(data() as Double, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5519
- 30.40.22 addSplineLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5519
- 30.40.23 addSplineLineLayer(dates() as date, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5520
- 30.40.24 addSplineLineLayer(dates() as date, colorvalue as Integer = -1, name as string = "") as CDPolarSplineLineLayerMBS 5520
- 30.40.25 addSplineLineLayer(dates() as dateTime, colorvalue as color, name as string = "") as CDPolarSplineLineLayerMBS 5521

30.40.27 addVectorLayer(rdata() as Double, adata() as Double, lengths() as Double, directions() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = "") as CDPolarVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a vector layer to the chart.
Notes: The vectors are specified as 4 data series, representing the radial and angular coordinates of the reference points to put the vectors, and the lengths and directions of the vectors.

By default, the vector starts from the reference point and points away from it. You may use PolarVectorLayer.setArrowAlignment to specify other options, such as for the vectors to point into the reference point, or to have the reference as a pivot at the mid-point of the vector.

ChartDirector supports specifying vectors lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.

Constant	Value	Description
PixelScale	0	The unit is measured in pixels.
RadialAxisScale	2	The unit is measured in the radial axis scale.

Return Value
A PolarVectorLayer object representing the vector layer created.
See also:

Argument	Default	Description
rData	(Mandatory)	An array of numbers representing the radial coordinates for the reference points of the vectors.
aData	(Mandatory)	An array of numbers representing the angular coordinates for the reference points of the vectors.
lengths	(Mandatory)	An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.
directions	(Mandatory)	An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.
lengthScale	PixelScale	The unit for the lengths, which must be one of the predefined constants in the table above.
color	-1	The color to draw the data points. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

- 30.40.28 addVectorLayer(rdata() as Double, adata() as Double, lengths() as Double, directions() as Double, lengthScale as Integer, colorvalue as color, name as string = "") as CDPolarVectorLayerMBS 5523

30.40.28 addVectorLayer(rdata() as Double, adata() as Double, lengths() as Double, directions() as Double, lengthScale as Integer, colorvalue as color, name as string = "") as CDPolarVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addVectorLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.40.27 addVectorLayer(rdata() as Double, adata() as Double, lengths() as Double, directions() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = "") as CDPolarVectorLayerMBS 5522

30.40.29 Constructor(width as Integer = 640, height as Integer = 480, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 30.40.30 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0) 5524

30.40.30 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new PolarChart object.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

See also:

- 30.40.29 Constructor(width as Integer = 640, height as Integer = 480, bgColor as color, edgeColor as color, raisedEffect as Integer = 0) 5523

30.40.31 getXCoor(r as Double, a as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the x pixel coordinate of a point given its radial and angular coordinates.
Notes: The radial and angular coordinates are measured using the scale of the radial and angular axes. In particular, the scale of the angular axis may not be in degrees or radians. See AngularAxis.setLabels and AngularAxis.setLinearScale on how the angular axis scale is defined.

Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

Argument	Default	Description
r	(Mandatory)	The radial coordinate of the point.
a	(Mandatory)	The angular coordinate of the point.

Return Value
The x pixel coordinate of the point.

30.40.32 getYCoor(r as Double, a as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the y pixel coordinate of a point given its radial and angular coordinates.
Notes: The radial and angular coordinates are measured using the scale of the radial and angular axes. In particular, the scale of the angular axis may not be in degrees or radians. See AngularAxis.setLabels and AngularAxis.setLinearScale on how the angular axis scale is defined.

Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

Argument	Default	Description
r	(Mandatory)	The radial coordinate of the point.
a	(Mandatory)	The angular coordinate of the point.

Return Value
The y pixel coordinate of the point.

30.40.33 setGridColor(rGridColor as color, rGridWidth as Integer, aGridColor as color, aGridWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setGridColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.40.34 setGridColor(rGridColor as Integer = &h80000000, rGridWidth as Integer = 1, aGridColor as Integer = &h80000000, aGridWidth as Integer = 1) 5525

30.40.34 setGridColor(rGridColor as Integer = &h80000000, rGridWidth as Integer = 1, aGridColor as Integer = &h80000000, aGridWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the grid colors and widths of the polar plot area.
Notes:

See also:

- 30.40.33 setGridColor(rGridColor as color, rGridWidth as Integer, aGridColor as color, aGridWidth as Integer = 1) 5525

Argument	Default	Description
rGridColor	80000000	The color of grid lines in the radial direction (from the center outwards).
rGridWidth	1	The line width for grid lines in the radial direction (from the center outwards).
aGridColor	80000000	The color of grid lines in the angular direction (concentric circles around the center).
aGridWidth	1	The line width of grid lines in the angular direction (concentric circles around the center) The line width is only used if the polar plot area is using a polygon grid (see PolarChart.setGridStyle). If circular grid is used, the line width is always 1.

30.40.35 setGridStyle(polygonGrid as boolean, gridOnTop as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configure whether to use circular grids or polygon grids, and whether the grid lines are on top of the polar plot area or are at the back.
Notes:

Argument	Default	Description
polygonGrid	(Mandatory)	A true value means polygonal grid will be used. A false value means circular grid will be used.
gridOnTop	true	A true value means the grid lines will be on top of the polar plot area. A false value means the grid lines will be at the bottom of the polar plot area.

30.40.36 setPlotArea(x as Integer, y as Integer, r as Integer, bgColor as color, edgeColor as color, edgeWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setPlotArea method, but uses color instead of integer data type for passing color values.
See also:

- 30.40.37 setPlotArea(x as Integer, y as Integer, r as Integer, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000, edgeWidth as Integer = 1) 5526

30.40.37 setPlotArea(x as Integer, y as Integer, r as Integer, bgColor as Integer = &hff000000, edgeColor as Integer = &hff000000, edgeWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position, background colors, border color and border width of the polar plot area.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of the center of the polar plot area.
y	(Mandatory)	The y coordinate of the center of the polar plot area.
r	(Mandatory)	The radius of the polar plot area in pixels.
bgColor	Transparent	The background color of the polar plot area.
edgeColor	Transparent	The border color of the polar plot area.
edgeWidth	1	The border width of the polar plot area. The border width is only used if the polar plot area is using a polygon grid (see PolarChart.setGridStyle). If circular grid is used, the border width is always 1.

See also:

- 30.40.36 setPlotArea(x as Integer, y as Integer, r as Integer, bgColor as color, edgeColor as color, edgeWidth as Integer = 1) 5526

30.40.38 setPlotAreaBg(bgColor1 as color, bgColor2 as color, altRings as boolean = true)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setPlotAreaBg method, but uses color instead of integer data type for passing color values.
See also:

- 30.40.39 setPlotAreaBg(bgColor1 as Integer, bgColor2 as Integer, altRings as boolean = true) 5527

30.40.39 setPlotAreaBg(bgColor1 as Integer, bgColor2 as Integer, altRings as boolean = true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets alternating background colors for the polar plot area.
Notes: ChartDirector supports using two alternating background colors for the polar plot area. The colors can change on the radial direction, resulting in concentric circles, on an the angular direction, resulting in alternating sectors.

See also:

- 30.40.38 setPlotAreaBg(bgColor1 as color, bgColor2 as color, altRings as boolean = true) 5527

30.40.40 setStartAngle(startAngle as Double, clockwise as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Argument	Default	Description
bgColor1	(Mandatory)	The first background color.
bgColor2	-1	The second background color. The default value of -1 means it is the same as the first background color.
altRings	true	A true value means the background colors alternate in the radial direction, resulting in concentric circles. A false value means the background colors alternates in the angular direction, resulting in alternating sectors.

Function: Sets the angle of the radial axis, and the layout direction of radial grid lines.
Notes: The default radial axis angle is 0 degree, which means the radial axis is upward pointing.

Argument	Default	Description
startAngle	(Mandatory)	The angle of the radial axis in degrees. The upward pointing direction is 0 degree, with angle measured in the clockwise direction.
clockwise	true	A true value means the radial grid line will be laid out in the clockwise direction. A false value means the radial grid lines will be laid out in the counter-clockwise direction.

30.40.41 Properties

30.40.42 angularAxis as CDAngularAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the AngularAxis object representing the angular axis of the polar chart.
Notes: (Read only property)

30.40.43 radialAxis as CDRadialAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the RadialAxis object representing the radial axis of the polar chart.
Notes: (Read only property)

30.40.44 Screenshots

30.40.45 polarbubble.jpg

Function: A polar chart created using ChartDirector with the CDPolarChartMBS class.

30.40.46 polarzones.jpg

Function: A polar chart created using ChartDirector with the CDPolarChartMBS class.

30.41 class CDPolarLayerMBS

30.41.1 class CDPolarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PolarLayer class is the base class for all PolarChart layer classes.
Example:

```
// a radar chart comparing two products with filled areas and symbols
Var labels() As String = Array("Speed", "Price", "Quality", "Design", "Support")
Var productA() As Double = Array(8.0, 6.0, 9.0, 7.0, 5.0)
Var productB() As Double = Array(6.0, 9.0, 6.0, 8.0, 8.0)

Var c As New CDPolarChartMBS(450, 400)
c.setPlotArea(225, 210, 150)
Call c.angularAxis.setLabels(labels)

Var layerA As CDPolarAreaLayerMBS = c.addAreaLayer(productA, &h806666FF, "Product A")
layerA.setDataSymbol(CDBaseChartMBS.kCircleSymbol, 9, &c6666FF, &c000000)
Var layerB As CDPolarAreaLayerMBS = c.addAreaLayer(productB, &h80FF6666, "Product B")
layerB.setLineWidth(2)

Var pic As Picture = c.makeChartPicture
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.41.2 Methods

30.41.3 addCustomDataLabel(i as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a custom data label to a data point.
Notes: See Font Specification for details on various font attributes.

Argument	Default	Description
i	(Mandatory)	The data point number for the data point. The first data point is 0, while the nth data point is (n - 1).
label	(Mandatory)	A text string representing the data label. Parameter Substitution and Formatting is supported.
font	""	The font used to draw the label.
fontSize	8	The font size used to draw the label.
fontColor	TextColor	The color used to draw the label.
fontAngle	0	The rotation angle of the label.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.41.4 addCustomDataLabel(i as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS 5533

30.41.4 addCustomDataLabel(i as Integer, label as string, font as string, fontSize as Double, fontColor as color, fontAngle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addCustomDataLabel method, but uses color instead of integer data type for passing color values.
See also:

- 30.41.3 addCustomDataLabel(i as Integer, label as string, font as string = "", fontSize as Double = 8, fontColor as Integer = &hffff0002, fontAngle as Double = 0) as CDTextBoxMBS 5532

30.41.5 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.41.6 getHTMLImageMap(url as string, queryFormat as string = """, extraAttr as string = """, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Generates an HTML image map for all data points on the layer.
Notes: This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
url	(Mandatory)	The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported. Use an empty string if no href attribute is needed.
queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the default query parameters. This is useful for specifying appending to the default.

Note that an empty string means to use the default query query parameters. To specify no query parameter, use a space character.

extraAttr	""	A text string to specify additional attributes to add to the <area> tag. Parameter Substitution and Formatting is supported.
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string containing the image map generated.

30.41.7 getImageCoor(dataItem as Integer, offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the image map coordinates of a data point.

Notes: The image map coordinates will be in the following format:

shape="rect" cords=" [x1] , [y1] , [x2] , [y2] "
This format is specially designed so that it can easily be included into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
dataItem	(Mandatory)	The data point number for the data point. The first data point is 0, while the nth data point is (n - 1).
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string representing the image map coordinates of the data points as HTML image map attributes.

30.41.8 setAngles(data() as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the angular coordinates of the data points.
Notes: Note that the angular coordinates are measured using the scale of the angular axis, which may not be in degrees or radians. See AngularAxis.setLabels and AngularAxis.setLinearScale on how the angular axis scale is defined.

If this method is not called, the first data point is assumed to have an angular coordinate of 0, and the nth data point is assumed to have an angular coordinate of (n - 1). This is common for radar charts, in which enumerated scale is used for the angular axis (see AngularAxis.setLabels).

Argument	Default	Description
angles	(Mandatory)	An array of numbers representing the angular coordinates of the data points.

30.41.9 setBorderColor(edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setBorderColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.41.10 setBorderColor(edgeColor as Integer) 5536

30.41.10 setBorderColor(edgeColor as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border color for drawing the data on the layer.
Notes: This method only applies to layers that represents data with elements that have borders (e.g. polar area layer and polar spline area layer).

Argument	Default	Description
edgeColor	(Mandatory)	The border color.

See also:

- 30.41.9 setBorderColor(edgeColor as color) 5535

30.41.11 setData(data() as Double, colorvalue as color, name as string = "")

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setData method, but uses color instead of integer data type for passing color values.
See also:

- 30.41.12 setData(data() as Double, colorvalue as Integer = -1, name as string = "") 5536

30.41.12 setData(data() as Double, colorvalue as Integer = -1, name as string = "")

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the values of the data points.
See also:

- 30.41.11 setData(data() as Double, colorvalue as color, name as string = "") 5536

30.41.13 setDataLabelFormat(formatString as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the data label format.
Notes: By default, the data label format is " { value } ". Please refer to Parameter Substitution and Formatting on available parameters and how to format them.

Argument	Default	Description
formatString	(Mandatory)	The format string.

30.41.14 setDataLabelStyle(font as string = "", fontsize as Double = 8, fontcolor as Integer = 0, fontangle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables data labels and sets their styles.
Notes:

Argument	Default	Description
font	""	The font used to draw the labels.
fontSize	8	The font size used to draw the labels.
fontColor	TextColor	The color used to draw the labels.
fontAngle	0	The rotation angle of the labels.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.
See also:

- 30.41.15 setDataLabelStyle(font as string, fontsize as Double, fontcolor as color, fontangle as Double = 0) as CDTextBoxMBS 5537

30.41.15 setDataLabelStyle(font as string, fontsize as Double, fontcolor as color, fontangle as Double = 0) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setDataLabelStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.41.14 setDataLabelStyle(font as string = "", fontsize as Double = 8, fontcolor as Integer = 0, fontangle as Double = 0) as CDTextBoxMBS 5537

30.41.16 setDataSymbol(area as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses a DrawArea object as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
obj	(Mandatory)	A DrawArea object to be used as the symbol.

See also:

- 30.41.17 setDataSymbol(image as folderitem) 5538
- 30.41.18 setDataSymbol(pic as Picture) 5539
- 30.41.19 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1) 5539
- 30.41.20 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1) 5540
- 30.41.21 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5541
- 30.41.22 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5541

30.41.17 setDataSymbol(image as folderitem)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Load an image from a file and use it as the graphics symbol to plot the data points.
Notes: ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
image	(Mandatory)	The filename of the image file. The image type is determined based on file extension, which must be png, jpg/jpeg, gif or wbmp/wmp.

See also:

- 30.41.16 setDataSymbol(area as CDDrawAreaMBS) 5538

- 30.41.18 setDataSymbol(pic as Picture) 5539
- 30.41.19 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1) 5539
- 30.41.20 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1) 5540
- 30.41.21 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5541
- 30.41.22 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5541

30.41.18 setDataSymbol(pic as Picture)

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses a picture object as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
obj	(Mandatory)	A picture object to be used as the symbol.

See also:

- 30.41.16 setDataSymbol(area as CDDrawAreaMBS) 5538
- 30.41.17 setDataSymbol(image as folderitem) 5538
- 30.41.19 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1) 5539
- 30.41.20 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1) 5540
- 30.41.21 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5541
- 30.41.22 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5541

30.41.19 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses a custom polygon as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
polygon	(Mandatory)	An array of integers representing the coordinates the polygon vertices. See Shape Specification on how the custom shape is defined.
size	11	The nominal width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means the color of the data set will be used.
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means the edge color of the data set will be used.

See also:

- 30.41.16 setDataSymbol(area as CDDrawAreaMBS) 5538
- 30.41.17 setDataSymbol(image as folderitem) 5538
- 30.41.18 setDataSymbol(pic as Picture) 5539
- 30.41.20 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1) 5540
- 30.41.21 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5541
- 30.41.22 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5541

30.41.20 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setDataSymbol method, but uses color instead of integer data type for passing color values.
See also:

- 30.41.16 setDataSymbol(area as CDDrawAreaMBS) 5538
- 30.41.17 setDataSymbol(image as folderitem) 5538
- 30.41.18 setDataSymbol(pic as Picture) 5539
- 30.41.19 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1) 5539
- 30.41.21 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5541
- 30.41.22 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5541

30.41.21 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses one of the built-in symbols as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
symbol	(Mandatory)	One of the predefined shape constants representing the symbol shape. See Shape Specification for the available built-in shapes.
size	7	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means the color of the data set will be used.
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means the edge color of the data set will be used.
lineWidth	1	The line width used for drawing the symbols.

See also:

- 30.41.17 setDataSymbol(image as folderitem) 5538
- 30.41.18 setDataSymbol(pic as Picture) 5539
- 30.41.19 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1) 5539
- 30.41.20 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1) 5540
- 30.41.22 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5541

30.41.22 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setDataSymbol method, but uses color instead of integer data type for passing color values.
See also:

- 30.41.16 setDataSymbol(area as CDDrawAreaMBS) 5538
- 30.41.17 setDataSymbol(image as folderitem) 5538
- 30.41.18 setDataSymbol(pic as Picture) 5539

- 30.41.19 setDataSymbol(polygon() as Integer, size as Integer = 11, fillcolor as Integer = -1, edgecolor as Integer = -1) 5539
- 30.41.20 setDataSymbol(polygon() as Integer, size as Integer, fillcolor as color, edgecolor as Integer = -1) 5540
- 30.41.21 setDataSymbol(symbol as Integer, size as Integer = 7, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5541

30.41.23 setHTMLImageMap(url as string, queryFormat as string = """, extraAttr as string = """)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Override the default arguments used when generating HTML image map for the layer.
Notes: BaseChart.getHTMLImageMap can be used to generate HTML image map for the whole chart. When BaseChart.getHTMLImageMap is used, the image map for all layers will be generated based on the arguments supplied to BaseChart.getHTMLImageMap.

The setHTMLImageMap method can be used to override those arguments for a chart layer, so the image map for that layer can be different.

For a detail description of image maps, please refer to BaseChart.getHTMLImageMap.

Argument	Default	Description
url	(Mandatory)	The URL to be used in the "href" attribute of the image map. Parameter Substitution and Formatting is supported.
queryFormat	""	A text string representing the template of the query parameters to be appended to the URL. Parameter Substitution and Formatting is supported.
extraAttr	""	A text string to specify additional attributes to add to the <area> tag. Parameter Substitution and Formatting is supported.

The special keyword " { default } " represents the global URL as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global URL.

Note that an empty string also means to use the global URL. To specify no URL, use the special keyword " { none } ".

To disable the entire image map, use the special keyword " { disable } ".

The special keyword " { default } " represents the global query parameters as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global query parameters.

Note that an empty string also means to use the global query parameters. To specify no query parameters, use the special keyword " { none } ".

The special keyword " { default } " represents the global additional attributes as specified in BaseChart.getHTMLImageMap. This field is useful for specifying appending to the global additional attributes.

Note that an empty string also means to use the global additional attributes. To specify no additional attributes, use the special keyword " { none } ".

30.41.24 setImageMapWidth(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the effective size of a data point for producing image maps.
Notes: For the purpose of producing image maps for the data points, the sizes of the data points are assumed to be the size of the data symbols. If no data symbol is used, an effective size is assumed. The default is 10 pixels in width and height.

Argument	Default	Description
width	(Mandatory)	The effective width and height of the data point for the purpose of producing image maps.

30.41.25 setLineWidth(w as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the line width of lines when drawing the data on the layer.
Notes:

Argument	Default	Description
w	(Mandatory)	The width of the line in pixels.

30.41.26 setSymbolOffset(offsetX as Integer, offsetY as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Offset the symbols in the x and y directions in pixel unit.
Notes:

Argument	Default	Description
xOffset	(Mandatory)	The x offset in pixels. A positive value mean shifting to the right.
yOffset	(Mandatory)	The y offset in pixels. A positive value mean shifting to the bottom.

30.41.27 setSymbolScale(data() as Double, scaleType as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the size of the symbol for each data point (for creating bubble charts).
Notes: One common usage for this method is to draw circle symbols of different sizes at each data points, creating a bubble chart.

This method supports any valid data symbols. You can create bubble charts with square bubbles, or even custom data symbols.

ChartDirector supports specifying sizes as pixels or in axis scale. The unit is specified by using the following predefined constants.

ConstantValueDescription

PixelScale	0	The unit is measured in pixels.
RadialAxisScale	2	The unit is measured in the radial axis scale.

Argument	Default	Description
zData	(Mandatory)	The sizes of the symbols, expressed using the unit defined by the scaleType argument.
scaleType	PixelScale	The unit for zData, which must be one of the predefined constants in the table above.

30.42 class CDPolarLineLayerMBS

30.42.1 class CDPolarLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PolarLineLayer class represents polar area layers.
Notes: Subclass of the CDPolarLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.
Xojo Developer Magazine

- 7.5, page 32: Easy Charts and Graphs Part 2, Using the ChartDirector Plugin

30.42.2 Methods

30.42.3 setCloseLoop(b as boolean)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies whether the polar line should form a close loop (joining the last point to the first point) or not.
Notes:

Argument	Default	Description
b	(Mandatory)	A true value means the polar line should form a close loop. A false value means the polar line should not form a close loop.

30.42.4 setGapColor(lineColor as color, lineWidth as Integer)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setGapColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.42.5 setGapColor(lineColor as Integer, lineWidth as Integer) 5545

30.42.5 setGapColor(lineColor as Integer, lineWidth as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color and style of the line used for jumping across NoValue data points.
Notes: By default, the color of the line for jumping across NoValue data points is Transparent, which means

the line will become discontinuous

Argument	Default	Description
lineColor	(Mandatory)	The line color of the line used for jumping across NoValue data points
lineWidth	-1	The line width of the line used for jumping across NoValue data points. -1 means the width will be the same as the line width of the line for drawing normal data points.

See also:

- 30.42.4 setGapColor(lineColor as color, lineWidth as Integer) 5545

30.43 class CDPolarSplineAreaLayerMBS

30.43.1 class CDPolarSplineAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PolarSplineAreaLayer class represents polar spline area layers.
Notes: Subclass of the CDPolarAreaLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.43.2 Methods

30.43.3 setTension(tension as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the tension to use when computing the spline curve.
Notes: The tension parameter should be between -1 and 1. A positive tension will make the spline tighter. The spline curve will become straight line segments when tension is 1. A negative tension will make the spline looser.

Argument	Default	Description
tension	(Mandatory)	The tension of the spline, which should be between -1 and 1.

30.44 class CDPolarSplineLineLayerMBS

30.44.1 class CDPolarSplineLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PolarSplineLineLayer class represents polar spline line layers.
Notes: Subclass of the CDPolarLineLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.44.2 Methods

30.44.3 setTension(tension as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the tension to use when computing the spline curve.
Notes: The tension parameter should be between -1 and 1. A positive tension will make the spline tighter. The spline curve will become straight line segments when tension is 1. A negative tension will make the spline looser.

Argument	Default	Description
tension	(Mandatory)	The tension of the spline, which should be between -1 and 1.

30.45 class CDPolarVectorLayerMBS

30.45.1 class CDPolarVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PolarVectorLayer class represents polar vector layers.
Notes: Subclass of the CDPolarLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.45.2 Methods

30.45.3 setArrowAlignment(alignment as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the alignment of the vector relative to the data point.
Notes:

Argument	Default	Description
alignment	(Mandatory)	A BottomCenter value means the vector will point away from the data point (the default). A TopCenter value means the vector will point into the data point. A Center value means the center of the vector will be at the data point.

30.45.4 setArrowHead(polygon() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a custom shape to be used as the arrow head.
Notes: The custom shape is specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 10 x 10 units, in which the x-axis is from left to right, and the y-axis from bottom to top. The origin is assumed to be the bottom center of the arrow (the point where the arrow head joins the arrow stem). The shape is assumed to represent an arrow pointing upwards.

As an example, the followings are the integer array that represents the standard ChartDirector vector arrow head:

-5, -5, 0, 0, 5, -5, 0, 5

ChartDirector will automatically scale the shape to the actual width and height as specified in PolarVectorLayer.setArrowHead.

Argument	Default	Description
polygon	(Mandatory)	An array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates the polygon vertices on a 10 x 10 units grid.

See also:

- 30.45.5 setArrowHead(width as Integer, height as Integer) 5550

30.45.5 setArrowHead(width as Integer, height as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the size of the arrow head.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the arrow head in pixels. The default width is 8 pixels.
height	0	The height of the arrow head in pixels. The default value of 0 means the height is the same as the width.

See also:

- 30.45.4 setArrowHead(polygon() as Integer) 5549

30.45.6 setArrowStem(polygon() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a custom shape to be used as the arrow stem.
Notes: By default, the arrow stem is just a straight line, with the line width controlled using PolarLayer.setLineWidth. The setArrowStem method can specify a custom shape for the arrow stem.

The custom shape is specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 10 x 100 units, in which the x-axis is from left to right, and the y-axis from bottom to top. The origin is assumed to be the starting point of the arrow stem, and the shape is assumed to represent an arrow stem pointing upwards.

ChartDirector will automatically scale the shape so that the total arrow length (head + stem) is the required length of the arrow as according to actual data, and the stem width is as specified in PolarLayer.setLineWidth.

Argument	Default	Description
polygon	(Mandatory)	An array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates the polygon vertices on a 10 x 100 units grid.

30.45.7 setIconSize(height as Integer, width as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the size of the icon to be used in legend box.
Notes: By default, if a legend box is available on the chart, ChartDirector will insert an legend entry if the PolarVectorLayer is named. The size of the icon will be the size of the vectors used on the chart, using a short vector length to fit the legend box.

This method can be used to override the legend box settings to specify a custom width/height for the icons of the current PolarVectorLayer.

Argument	Default	Description
height	(Mandatory)	The height of the icon in pixels.
width	0	The width of the icon in pixels. The default value of 0 means the width is automatically determined.

30.45.8 setVector(lengths() as Double, directions() as Double, lengthScale as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the lengths and directions for the vectors.
Notes: ChartDirector supports specifying lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.

ConstantValueDescription

PixelScale	0	The unit is measured in pixels.
RadialAxisScale	2	The unit is measured in the radial axis scale.

Argument	Default	Description
lengths	(Mandatory)	An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.
directions	(Mandatory)	An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.
lengthScale	PixelScale	The unit for the lengths, which must be one of the predefined constants in the table above.

30.45.9 setVectorMargin(startMargin as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the vector margin.
See also:

- 30.45.10 setVectorMargin(startMargin as Double, endMargin as Double) 5552

30.45.10 setVectorMargin(startMargin as Double, endMargin as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the vector margin.
See also:

- 30.45.9 setVectorMargin(startMargin as Double) 5552

30.46 class CDPyramidChartMBS

30.46.1 class CDPyramidChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PyramidChart class represents pyramid charts (including cone charts and funnel charts).
Example:

```
// draw a pyramid chart
Var data() As Double = Array(156.0, 123.0, 211.0, 179.0)
Var labels() As String = Array("Funds", "Bonds", "Stocks", "Cash")

Var c As New CDPyramidChartMBS(400, 400)
c.setPyramidSize(200, 200, 160, 300)
c.setData(data, labels)

Var pic As Picture = c.makeChartPicture
// show pic in a Canvas or ImageViewer, or save it to a file
```

Notes: The PyramidChart class is a subclass of BaseChart.
Subclass of the CDBaseChartMBS class.

30.46.2 Methods

30.46.3 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new PyramidChart object.
Notes: Arguments:

See also:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	kBackgroundColor	The background color of the chart.
edgeColor	kTransparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

- 30.46.4 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0) 5554

30.46.4 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 30.46.3 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0) 5553

30.46.5 getLayer(layerNo as Integer) as CDPyramidLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the PyramidLayer object representing a single pyramid layer in the pyramid chart.
Notes: You must call CDPyramidChartMBS.setData to create the layers first before calling this method.
Arguments

Argument	Default	Description
layerNo	(Mandatory)	The layer number of the pyramid layer to retrieve, starting from 0. The first pyramid layer is 0. The nth pyramid layer is (n-1).

Return Value
The requested CDPyramidLayerMBS object.

30.46.6 setCenterLabel(labelTemplate as string = ””, font as string = ””, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds labels to the center of the pyramid layers.
Notes: This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setCenterLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

Argument	Default	Description
template	” { skip } ”	The label template. ” { skip } ” means to keep the existing value unchanged.
font	” { skip } ”	The font style. ” { skip } ” means to keep the existing value unchanged.
fontSize	-1	The font size in points. -1 means to keep the existing value unchanged.
fontColor	-1	The font color. -1 means to keep the existing value unchanged.

Return Value
A CDTextBoxMBS object representing the prototype of the labels. This may be used to fine-tune the appearance of the labels.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.46.7 setCenterLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS 5555

30.46.7 setCenterLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setCenterLabel method, but uses color instead of integer data type for passing color values.
See also:

- 30.46.6 setCenterLabel(labelTemplate as string = ””, font as string = ””, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS 5555

30.46.8 setConeSize(cx as Integer, cy as Integer, radius as Integer, height as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position and size of the cone in a cone chart.
Notes: Arguments:

Argument	Default	Description
cx	(Mandatory)	The x-coordinate of the center of the cone. The center of the cone is the midpoint of the vertical axis of the cone.
cy	(Mandatory)	The y-coordinate of the center of the cone. The center of the cone is the midpoint of the vertical axis of the cone.
radius	(Mandatory)	The radius of the base of the cone.
height	(Mandatory)	The height of the cone.

30.46.9 setData(data() as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the data used to draw the pyramid chart.
Notes: Arguments:

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data values.
labels	[Empty_Array]	An array of text strings representing the labels of the layers. An empty array means no layer label.

See also:

- 30.46.10 setData(data() as Double, labels() as string) 5556

30.46.10 setData(data() as Double, labels() as string)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the data used to draw the pyramid chart.
Notes: Arguments:

See also:

- 30.46.9 setData(data() as Double) 5556

Argument	Default	Description
data	(Mandatory)	An array of numbers representing the data values.
labels	[Empty_Array]	An array of text strings representing the labels of the layers. An empty array means no layer label.

30.46.11 setFunnelSize(cx as Integer, cy as Integer, radius as Integer, height as Integer, tubeRadius as Double = 0.2, tubeHeight as Double = 0.3)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position and size of the funnel in a funnel chart.
Notes: A funnel is similar to an inverted cone, except that the vertex of the cone is replaced by a tube.

Arguments:

Argument	Default	Description
cx	(Mandatory)	The x-coordinate of the center of the funnel. The center of the funnel is the midpoint of the vertical axis of the funnel.
cy	(Mandatory)	The y-coordinate of the center of the funnel. The center of the funnel is the midpoint of the vertical axis of the funnel.
radius	(Mandatory)	The radius of the mouth of the funnel.
height	(Mandatory)	The height of the funnel, inclusive of the tube.
tubeRadius	0.2	The radius of the tube, as a ratio to the radius of the mouth of the funnel.
tubeHeight	0.3	The height (length) of the tube, as a ratio to the total height of the funnel. It must be between 0 to 1.

30.46.12 setGradientShading(startBrightness as Double, endBrightness as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets gradient shading mode.
Notes: Gradient shading only applies to 2D and 3D pyramids, and 2D cones and funnels. 3D cones and funnels always use Phong lighting (see CDPyramidChartMBS.setLighting).

The gradient is specified with two brightness values at the gradient end points. A brightness less than 1 means the color is darkened, while a brightness greater than 1 means the color is brightened. For example, a brightness of 0.5 means the color is half as bright as the original color. If the original color is red, the color will become dark red. Conversely, a brightness of 2 means the color is twice as bright as the original color. If the original color is red, the color will become light red.

For a pyramid or cone layer, the gradient is from left edge to the right edge. For a funnel chart, the gradient

is from the right edge to the left edge.

For a pyramid chart, this is the default coloring method. If this method is never called, the default brightness is from 0.75 to 2.

Arguments:

Argument	Default	Description
startBrightness	(Mandatory)	The brightness at the starting point.
endBrightness	(Mandatory)	The brightness at the ending point.

30.46.13 setJoinLine(ColorValue as color, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setJoinLine method, but uses color instead of integer data type for passing color values.
See also:

- 30.46.14 setJoinLine(ColorValue as Integer, width as Integer = -1) 5558

30.46.14 setJoinLine(ColorValue as Integer, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color and line width of the join lines that join the pyramid layers with the left and right labels.
Notes: This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use PyramidLayer.setJoinLine.

Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the join line. -1 means to keep the existing value unchanged.
width	-1	The width of the line join. -1 means to keep the existing value unchanged.

See also:

- 30.46.13 setJoinLine(ColorValue as color, width as Integer = -1) 5558

30.46.15 setJoinLineGap(pyramidGap as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the gaps of the join lines that join the pyramid layers with the left and right labels.
Notes: This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

Argument	Default	Description
pyramidGap	(Mandatory)	The gap in pixels between the starting point of the join line and the pyramid layer edge.
pyramidMargin	10	The distance in pixels between the ending point of the join line and the pyramid bounding box.
textGap	3	The gap in pixels between the label text box and the ending point of the join line.

See also:

- 30.46.16 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer) 5559
- 30.46.17 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer) 5560

30.46.16 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the gaps of the join lines that join the pyramid layers with the left and right labels.
Notes: This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

Argument	Default	Description
pyramidGap	(Mandatory)	The gap in pixels between the starting point of the join line and the pyramid layer edge.
pyramidMargin	10	The distance in pixels between the ending point of the join line and the pyramid bounding box.
textGap	3	The gap in pixels between the label text box and the ending point of the join line.

See also:

- 30.46.15 setJoinLineGap(pyramidGap as Integer) 5559
- 30.46.17 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer) 5560

30.46.17 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the gaps of the join lines that join the pyramid layers with the left and right labels.
Notes: This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

Argument	Default	Description
pyramidGap	(Mandatory)	The gap in pixels between the starting point of the join line and the pyramid layer edge.
pyramidMargin	10	The distance in pixels between the ending point of the join line and the pyramid bounding box.
textGap	3	The gap in pixels between the label text box and the ending point of the join line.

See also:

- 30.46.15 setJoinLineGap(pyramidGap as Integer) 5559
- 30.46.16 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer) 5559

30.46.18 setLayerBorder(ColorValue as color, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setLayerBorder method, but uses color instead of integer data type for passing color values.
See also:

- 30.46.19 setLayerBorder(ColorValue as Integer, width as Integer = -1) 5561

30.46.19 setLayerBorder(ColorValue as Integer, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color and line width of the layer border.
Notes: This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setLayerBorder.

Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the layer border. -1 means to keep the existing value unchanged.
width	-1	The width of the layer border. -1 means to keep the existing value unchanged.

See also:

- 30.46.18 setLayerBorder(ColorValue as color, width as Integer = -1) 5561

30.46.20 setLayerGap(layerGap as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the gaps between pyramid layers.
Notes: This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setLayerGap.

Arguments:

Argument	Default	Description
layerGap	(Mandatory)	The gap between layers as a ratio to the height of the pyramid. The gap must be greater than or equals 0. The sum of all gaps must be less than 1.

30.46.21 setLeftLabel(labelTemplate as string = ””, font as string = ””, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds labels to the left of the pyramid layers.
Notes: This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setLeftLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

Argument	Default	Description
template	” { skip } ”	The label template. ” { skip } ” means to keep the existing value unchanged.
font	” { skip } ”	The font style. ” { skip } ” means to keep the existing value unchanged.
fontSize	-1	The font size in points. -1 means to keep the existing value unchanged.
fontColor	-1	The font color. -1 means to keep the existing value unchanged.

Return Value
A CDTextBoxMBS object representing the prototype of the labels. This may be used to fine-tune the appearance of the labels.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.46.22 setLeftLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS 5562

30.46.22 setLeftLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setLeftLabel method, but uses color instead of integer data type for passing color values.
See also:

- 30.46.21 setLeftLabel(labelTemplate as string = """, font as string = """, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS 5562

30.46.23 setLighting(ambientIntensity as Double = 0.5, diffuseIntensity as Double = 0.5,specularIntensity as Double = 1, shininess as Double = 8)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets Phong lighting mode.
Notes: This method adjusts the brightness of the surfaces as according to the Phong lighting model, in which the light source is from the viewer direction and is far away.

For a cone or funnel chart, this is the default coloring method.

For a pyramid chart, only ambient and diffuse reflections are used.

Arguments:

Argument	Default	Description
ambientIntensity	0.5	The ambient reflection coefficient of the Phong lighting model.
diffuseIntensity	0.5	The diffuse reflection coefficient of the Phong lighting model.
specularIntensity	1	The specular reflection coefficient of the Phong lighting model.
shininess	8	The shininess coefficient of the Phong lighting model.

30.46.24 setPyramidSides(noOfSides as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the number of sides of the base polygon in a pyramid chart.
Notes: By default, the base of a pyramid is a square. This method can be used to change it to other regular polygon.

Arguments:

Argument	Default	Description
noOfSides	(Mandatory)	The number of sides of the base polygon in a pyramid chart.

30.46.25 setPyramidSize(cx as Integer, cy as Integer, radius as Integer, height as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position and size of the pyramid in a pyramid chart.
Notes: Arguments:

Argument	Default	Description
cx	(Mandatory)	The x-coordinate of the center of the pyramid. The center of the pyramid is the midpoint of the vertical axis of the pyramid.
cy	(Mandatory)	The y-coordinate of the center of the pyramid. The center of the pyramid is the midpoint of the vertical axis of the pyramid.
radius	(Mandatory)	For a square pyramid, it is the length of the square. For a pyramid with other regular polygonal base, it is the radius of the circumcircle of the base.
height	(Mandatory)	The height of the pyramid.

30.46.26 setRightLabel(labelTemplate as string = ””, font as string = ””, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds labels to the right of the pyramid layers.
Notes: This method affects all pyramid layers. To apply this method to one particular pyramid layer only, use CDPyramidLayerMBS.setRightLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

Argument	Default	Description
template	” { skip } ”	The label template. ” { skip } ” means to keep the existing value unchanged.
font	” { skip } ”	The font style. ” { skip } ” means to keep the existing value unchanged.
fontSize	-1	The font size in points. -1 means to keep the existing value unchanged.
fontColor	-1	The font color. -1 means to keep the existing value unchanged.

Return Value:
A TextBox object representing the prototype of the labels. This may be used to fine-tune the appearance of the labels.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.46.27 setRightLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS 5565

30.46.27 setRightLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setRightLabel method, but uses color instead of integer data type for passing color values.
See also:

- 30.46.26 setRightLabel(labelTemplate as string = """, font as string = """, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS 5564

30.46.28 setViewAngle(elevation as Double, rotation as Double = 0, twist as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the 3D view angles.
Notes: ChartDirector uses elevation, rotation and twist angles to specify the 3D view angles.

To explain the meaning of the angles, imagine the object being viewed is put at the center of a hollow sphere, and a camera (the view point) is put at the surface of the sphere, directed inwards to the center to look at the object.

The elevation angle refers to the "latitude" of the camera. An elevation angle of 0 degrees means the camera is at the "equator" pointing to the object from the side. An elevation angle of 90 degrees means the camera is at the "north pole" pointing down to the object. An angle elevation of -90 degrees means the camera is at the "south pole", pointing up to the object.

The rotation angle refers to the "longitude" of the camera. If the elevation is 0 degrees, and the rotation angle varies from 0 to 360 degrees, the camera will move around the "equator" in the easterly direction (counter-clockwise when viewed from the north pole).

The twist angle is for rotating the camera itself while still pointing to the object. For example, a twist angle of 90 degrees means you are holder the camera "vertically" instead of "horizontally". The rotation is clockwise from the view point of the person holding the camera.

Note that from the view point of the camera, the object will appear to be rotating in the opposite direction. For example, as the rotation angle rotates the camera counter-clockwise along the ”equator”, the object will appear to be rotating clockwise on the screen.

Arguments:

Argument	Default	Description
elevation	(Mandatory)	The elevation angle in degrees.
rotation	0	The rotation angle in degrees.
twist	0	The twist angle in degrees.

30.46.29 Screenshots

30.46.30 cone.jpg

Function: A pyramid chart showing a cone created using ChartDirector with the CDPyramidChartMBS class.

30.46.31 pyramidrotation.jpg

Function: A pyramid chart created using ChartDirector with the CDPyramidChartMBS class.

30.47 class CDPyramidLayerMBS

30.47.1 class CDPyramidLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PyramidLayer class represents pyramid layers (including cone and funnel layers).
Example:

```
// a sales funnel chart with labels on the left and right of each layer
Var data() As Double = Array(100.0, 60.0, 30.0, 12.0)
Var labels() As String = Array("Visitors", "Leads", "Offers", "Orders")

Var c As New CDPyramidChartMBS(500, 400)
c.setFunnelSize(250, 200, 150, 300)
c.setData(data, labels)
c.setLayerGap(0.01)
Call c.setLeftLabel(" { label } ")
Call c.setRightLabel(" { value } ( { percent | 0 } %)")

Var top As CDPyramidLayerMBS = c.getLayer(0)
top.setColor(&h3366CC)

Var pic As Picture = c.makeChartPicture
```

Notes: The PyramidLayer object is obtained using PyramidChart.getLayer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.47.2 Methods

30.47.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.47.4 setCenterLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a label to the center of the pyramid layer.
Notes: To apply this method to all pyramid layers, use CDPyramidChartMBS.setCenterLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

Argument	Default	Description
template	" { skip } "	The label template. " { skip } " means to keep the existing value unchanged.
font	" { skip } "	The font style. " { skip } " means to keep the existing value unchanged.
fontSize	-1	The font size in points. -1 means to keep the existing value unchanged.
fontColor	-1	The font color. -1 means to keep the existing value unchanged.

Return Value
A CDTextBoxMBS object representing the prototype of the label. This may be used to fine-tune the appearance of the label.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.47.5 setCenterLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS 5570

30.47.5 setCenterLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setCenterLabel method, but uses color instead of integer data type for passing color values.
See also:

- 30.47.4 setCenterLabel(labelTemplate as string = "", font as string = "", fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS 5569

30.47.6 setColor(ColorValue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setColor method, but uses color instead of integer data type for passing color values.
See also:

• 30.47.7 setColor(ColorValue as Integer) 5571

30.47.7 setColor(ColorValue as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color of the pyramid layer.
See also:

• 30.47.6 setColor(ColorValue as color) 5570

30.47.8 setJoinLine(ColorValue as color, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setJoinLine method, but uses color instead of integer data type for passing color values.
See also:

• 30.47.9 setJoinLine(ColorValue as Integer, width as Integer = -1) 5571

30.47.9 setJoinLine(ColorValue as Integer, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color and line width of the join line that joins the pyramid layer with the left and right labels.
Notes: To apply this method to all pyramid layers, use CDPyramidChartMBS.setJoinLine.

Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the join line. -1 means to keep the existing value unchanged.
width	-1	The width of the line join. -1 means to keep the existing value unchanged.

See also:

• 30.47.8 setJoinLine(ColorValue as color, width as Integer = -1) 5571

30.47.10 setJoinLineGap(pyramidGap as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the gaps of the join line that joins the pyramid layer with the left and right labels.
Notes: To apply this method to all pyramid layers, use CDPyramidChartMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

Argument	Default	Description
pyramidGap	(Mandatory)	The gap in pixels between the starting point of the join line and the pyramid layer edge.
pyramidMargin	10	The distance in pixels between the ending point of the join line and the pyramid bounding box.
textGap	3	The gap in pixels between the label text box and the ending point of the join line.

See also:

- 30.47.12 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer) 5573

30.47.11 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the gaps of the join line that joins the pyramid layer with the left and right labels.
Notes: To apply this method to all pyramid layers, use CDPyramidChartMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

See also:

Argument	Default	Description
pyramidGap	(Mandatory)	The gap in pixels between the starting point of the join line and the pyramid layer edge.
pyramidMargin	10	The distance in pixels between the ending point of the join line and the pyramid bounding box.
textGap	3	The gap in pixels between the label text box and the ending point of the join line.

- 30.47.10 setJoinLineGap(pyramidGap as Integer) 5571
- 30.47.12 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer) 5573

30.47.12 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer, textGap as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the gaps of the join line that joins the pyramid layer with the left and right labels.
Notes: To apply this method to all pyramid layers, use CDPyramidChartMBS.setJoinLineGap.

By default, the starting point of the join line connects to the pyramid layer edge with a 3 pixels gap. The join line is horizontal, and its length is such that the ending point is 10 pixels outside the pyramid bounding box. The label text box connects to the ending point with a 3 pixels gap.

This method allows the gaps and positions of the join line end points to be configured to other values.

Arguments:

Argument	Default	Description
pyramidGap	(Mandatory)	The gap in pixels between the starting point of the join line and the pyramid layer edge.
pyramidMargin	10	The distance in pixels between the ending point of the join line and the pyramid bounding box.
textGap	3	The gap in pixels between the label text box and the ending point of the join line.

See also:

- 30.47.10 setJoinLineGap(pyramidGap as Integer) 5571
- 30.47.11 setJoinLineGap(pyramidGap as Integer, pyramidMargin as Integer) 5572

30.47.13 setLayerBorder(ColorValue as color, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setLayerBorder method, but uses color instead of integer data type for passing color values.
See also:

- 30.47.14 setLayerBorder(ColorValue as Integer, width as Integer = -1) 5574

30.47.14 setLayerBorder(ColorValue as Integer, width as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color and line width of the layer border.
Notes: To apply this method to all pyramid layers, use CDPyramidChartMBS.setLayerBorder.

Arguments:

Argument	Default	Description
color	(Mandatory)	The color of the layer border. -1 means to keep the existing value unchanged.
width	-1	The width of the layer border. -1 means to keep the existing value unchanged.

See also:

- 30.47.13 setLayerBorder(ColorValue as color, width as Integer = -1) 5574

30.47.15 setLayerGap(layerGap as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the gap between this pyramid layer and the next pyramid layer.
Notes: To apply this method to all pyramid layers, use CDPyramidChartMBS.setLayerGap.

Arguments:

Argument	Default	Description
layerGap	(Mandatory)	The gap between layers as a ratio to the height of the pyramid. The gap must be greater than or equals 0. The sum of all gaps must be less than 1.

30.47.16 setLeftLabel(labelTemplate as string = ””, font as string = ””, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a label to the left of the pyramid layer.
Notes: To apply this method to all pyramid layers, use CDPyramidChartMBS.setLeftLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

Argument	Default	Description
template	” { skip } ”	The label template. ” { skip } ” means to keep the existing value unchanged.
font	” { skip } ”	The font style. ” { skip } ” means to keep the existing value unchanged.
fontSize	-1	The font size in points. -1 means to keep the existing value unchanged.
fontColor	-1	The font color. -1 means to keep the existing value unchanged.

Return Value
A CDTextBoxMBS object representing the prototype of the label. This may be used to fine-tune the appearance of the label.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.47.17 setLeftLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS 5575

30.47.17 setLeftLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setLeftLabel method, but uses color instead of integer data type for passing color values.
See also:

- 30.47.16 setLeftLabel(labelTemplate as string = ””, font as string = ””, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS 5575

30.47.18 setRightLabel(labelTemplate as string = ””, font as string = ””, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a label to the right of the pyramid layer.
Notes: To apply this method to all pyramid layers, use CDPyramidChartMBS.setRightLabel.

See Parameter Substitution and Formatting on available format parameters for the template.

See Font Specification for details on various font attributes.

Arguments:

Argument	Default	Description
template	” { skip } ”	The label template. ” { skip } ” means to keep the existing value unchanged.
font	” { skip } ”	The font style. ” { skip } ” means to keep the existing value unchanged.
fontSize	-1	The font size in points. -1 means to keep the existing value unchanged.
fontColor	-1	The font color. -1 means to keep the existing value unchanged.

Return Value
A CDTextBoxMBS object representing the prototype of the label. This may be used to fine-tune the appearance of the label.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.47.19 setRightLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS 5576

30.47.19 setRightLabel(labelTemplate as string, font as string, fontSize as Double, fontColor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setRightLabel method, but uses color instead of integer data type for passing color values.
See also:

- 30.47.18 setRightLabel(labelTemplate as string = ””, font as string = ””, fontSize as Double = 8, fontColor as Integer = -1) as CDTextBoxMBS 5576

30.48 class CDRadialAxisMBS

30.48.1 class CDRadialAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The RadialAxis class represents radial axes in polar charts.
Notes: In the current version of ChartDirector, RadialAxis is implemented as a special configuration of Axis.
Subclass of the CDAxisMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.49 class CDRanSeriesMBS

30.49.1 class CDRanSeriesMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: RanSeries is a utility class to produce random series.
Example:

```
// create random test data for a line chart
Var r As New CDRanSeriesMBS(42) // same seed gives same numbers
Var values() As Double = r.getSeries(30, 100, -5, 5, 0) // 30 values starting at 100, changing by -5 to +5, not below 0
Var dates() As Double = r.getDateSeries(30, CDBaseChartMBS.chartTime(2025, 1, 1), 86400, True) // weekdays only

Var c As New CDXYChartMBS(600, 300)
Call c.setPlotArea(50, 20, 520, 240)
Call c.addLineLayer(values, &h0066CC, "Test data")
Call c.xAxis.setLabels(dates, " { value | mm/dd } ")
Var pic As Picture = c.makeChartPicture
```

Notes: It facilitates testing and demonstrating ChartDirector programs without needing a real data source.

30.49.2 Methods

30.49.3 Constructor(seed as Integer)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a RanSeries object.
Notes:

Argument	Default	Description
seed	(Mandatory)	The seed to be used in the random number generator.

30.49.4 create(seed as Integer) as CDRanSeriesMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a RanSeries object.
Notes:

Argument	Default	Description
seed	(Mandatory)	The seed to be used in the random number generator.

30.49.5 fillDateSeries(Values() as Double, startTime as double, tickInc as double, weekDayOnly as Boolean = false)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fill an array with date/time values.
Notes:

Argument	Default	Description
ret	(Mandatory)	The array to be filled.
len	(Mandatory)	The number of values to generate.
startTime	(Mandatory)	The first date/time.
tickInc	(Mandatory)	The change in date/time for subsequent records in seconds. The value 30 * 86400 is assumed to mean 1 month (which is not a constant interval), and its multiplies are assumed to mean multiple months. In particular, the value 360 * 86400 is assumed to mean 12 months, or 1 year.
weekDayOnly	false	A true value means skipping dates that are not weekdays (Saturday and Sunday). A false value means no skipping.

30.49.6 fillSeries(Values() as Double, minValue as double, maxValue as double)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fill an array with independent random numbers.
Notes:

Argument	Default	Description
ret	(Mandatory)	The array to be filled.
len	(Mandatory)	The number of random numbers to generate.
minValue	(Mandatory)	The minimum value of the random number.
maxValue	(Mandatory)	The maximum value of the random number.

See also:

- 30.49.7 fillSeries(Values() as Double, startValue as double, minDelta as double, maxDelta as double, lowerLimit as double = -1E+308, upperLimit as double = 1E+308) 5580

30.49.7 fillSeries(Values() as Double, startValue as double, minDelta as double, maxDelta as double, lowerLimit as double = -1E+308, upperLimit as double = 1E+308)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fill an array with numbers in which the difference between adjacent numbers is random.
Notes:

Argument	Default	Description
ret	(Mandatory)	The array to be filled.
len	(Mandatory)	The number of random values to generate.
startValue	(Mandatory)	The first value in the sequence.
minDelta	(Mandatory)	The minimum change between two consecutive numbers.
maxDelta	(Mandatory)	The maximum change between two consecutive numbers.
lowerLimit	[-Infinity]	The minimum allowed value of the numbers.
upperLimit	[+Infinity]	The maximum allowed value of the numbers.

See also:

- 30.49.6 fillSeries(Values() as Double, minValue as double, maxValue as double) 5579

30.49.8 get2DSeries(xLen as Integer, yLen as Integer, minValue as Double, maxValue as Double) as Double()

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets an array of random numbers representing points on a 2D grid in which the difference between neighbouring points is random.
Notes:

Argument	Default	Description
xLen	(Mandatory)	The number of points in the grid in the x direction.
yLen	(Mandatory)	The number of points in the grid in the y direction.
minValue	(Mandatory)	The minimum value of the random number.
maxValue	(Mandatory)	The maximum value of the random number.

Returns an array of random numbers representing points on a 2D grid in which the difference between neighbouring points is random. The array will contain (xLen * yLen) elements. The element at index (y * xLen + x) represents the point at (x, y), in which x and y are integers such that 0 <= x <xLen and 0 <= y <yLen.

30.49.9 getDateSeries(len as Integer, startTime as Double, tickInc as Double, weekDayOnly as boolean = false) as Double()

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets an array of date/time values.
Notes:

Argument	Default	Description
len	(Mandatory)	The number of random values to get.
startTime	(Mandatory)	The date/time of the first record in the column.
tickInc	(Mandatory)	The change in date/time for subsequent records in seconds. The value 30 * 86400 is assumed to mean 1 month (which is not a constant interval), and its multiplies are assumed to mean multiple months. In particular, the value 360 * 86400 is assumed to mean 12 months, or 1 year.
weekDayOnly	false	A true value means skipping dates that are not weekdays (Saturday and Sunday). A %F value means no skipping.

Returns an array of date/time values.

30.49.10 getSeries(len as Integer, minValue as Double, maxValue as Double) as Double()

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets an array of numbers that fluctuate randomly.
Notes:

Argument	Default	Description
len	(Mandatory)	The number of random values to get.
startValue	(Mandatory)	The first value in the sequence.
minDelta	(Mandatory)	The minimum change between two consecutive numbers.
maxDelta	(Mandatory)	The maximum change between two consecutive numbers.
lowerLimit	[-Infinity]	The minimum allowed value of the numbers.
upperLimit	[+Infinity]	The maximum allowed value of the numbers.

Returns an array of numbers that fluctuate randomly.
See also:

- 30.49.11 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double) as Double() 5582
- 30.49.12 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) as Double() 5582
- 30.49.13 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) as Double() 5583

30.49.11 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double) as Double()

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets an array of numbers that fluctuate randomly.
Notes:

Argument	Default	Description
len	(Mandatory)	The number of random values to get.
startValue	(Mandatory)	The first value in the sequence.
minDelta	(Mandatory)	The minimum change between two consecutive numbers.
maxDelta	(Mandatory)	The maximum change between two consecutive numbers.
lowerLimit	[-Infinity]	The minimum allowed value of the numbers.
upperLimit	[+Infinity]	The maximum allowed value of the numbers.

Returns an array of numbers that fluctuate randomly.
See also:

- 30.49.10 getSeries(len as Integer, minValue as Double, maxValue as Double) as Double() 5581
- 30.49.12 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) as Double() 5582
- 30.49.13 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) as Double() 5583

30.49.12 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) as Double()

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets an array of numbers that fluctuate randomly.
Notes:

Argument	Default	Description
len	(Mandatory)	The number of random values to get.
startValue	(Mandatory)	The first value in the sequence.
minDelta	(Mandatory)	The minimum change between two consecutive numbers.
maxDelta	(Mandatory)	The maximum change between two consecutive numbers.
lowerLimit	[-Infinity]	The minimum allowed value of the numbers.
upperLimit	[+Infinity]	The maximum allowed value of the numbers.

Returns an array of numbers that fluctuate randomly.
See also:

- 30.49.10 getSeries(len as Integer, minValue as Double, maxValue as Double) as Double() 5581

- 30.49.11 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double) as Double() 5582
- 30.49.13 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) as Double() 5583

30.49.13 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) as Double()

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets an array of numbers that fluctuate randomly.
Notes:

Argument	Default	Description
len	(Mandatory)	The number of random values to get.
startValue	(Mandatory)	The first value in the sequence.
minDelta	(Mandatory)	The minimum change between two consecutive numbers.
maxDelta	(Mandatory)	The maximum change between two consecutive numbers.
lowerLimit	[-Infinity]	The minimum allowed value of the numbers.
upperLimit	[+Infinity]	The maximum allowed value of the numbers.

Returns an array of numbers that fluctuate randomly.
See also:

- 30.49.11 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double) as Double() 5582
- 30.49.12 getSeries(len as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) as Double() 5582

30.50 class CDRanTableMBS

30.50.1 class CDRanTableMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: RanTable is a utility class to produce tables with random numbers.
Example:

```
// create a random table with a date column and two value columns
Var t As New CDRanTableMBS(7, 3, 12) // seed, 3 columns, 12 rows
t.setDateCol(0, CDBaseChartMBS.chartTime(2025, 1, 1), 86400 * 30) // about monthly
t.setCol(1, 50, 100) // values between 50 and 100
t.setCol(2, 0, 20)

Var dates() As Double = t.getCol(0).Values
Var sales() As Double = t.getCol(1).Values
Var costs() As Double = t.getCol(2).Values
MessageBox sales.Count.ToString + " rows, first sales value " + Format(sales(0), "0.0")
```

Notes: It facilitates testing and demonstrating ChartDirector programs without needing a real database table.
Xojo Developer Magazine

30.50.2 Methods

30.50.3 Constructor(seed as Integer, noOfCols as Integer, noOfRows as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a RanTable object.
Notes:

Argument	Default	Description
seed	(Mandatory)	The seed to be used in the random number generator.
noOfCols	(Mandatory)	The number of columns in the random number table.
noOfRows	(Mandatory)	The number of rows in the random number table.

30.50.4 getCol(colNo as Integer) as CDArrayMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the request column as an array of numbers.
Notes:

Argument	Default	Description
i	(Mandatory)	The column to get. The first column is 0. The nth column is (n - 1).

Return Value
An array containing numbers from the requested column.

30.50.5 selectDate(colNo as Integer, minDate as Double, maxDate as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects the rows within a certain date range.
Notes: After executing this method, the RanTable will be reduced to only contain rows that are within minDate and maxDate (inclusive of both dates).

Argument	Default	Description
colNo	(Mandatory)	The date column to be used as selection criteria.
minDate	(Mandatory)	The minimum date (earliest date).
maxDate	(Mandatory)	The maximum date (latest date).

30.50.6 setCol(colNo as Integer, minValue as Double, maxValue as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fill the given column in the RanTable with random numbers in the given range.
Notes:

Argument	Default	Description
colNo	(Mandatory)	The column to fill. The first column is 0. The nth column is (n - 1).
minValue	(Mandatory)	The minimum value of the random number.
maxValue	(Mandatory)	The maximum value of the random number.

See also:

- 30.50.7 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double) 5586
- 30.50.8 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) 5586

- 30.50.9 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) 5587

30.50.7 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fill the given column in the RanTable with random numbers that fluctuates within a given speed.
Notes:

Argument	Default	Description
colNo	(Mandatory)	The column to fill. The first column is 0. The nth column is (n - 1).
startValue	(Mandatory)	The value of the first record in the column.
minDelta	(Mandatory)	The minimum change allowed for between the current random number and the previous random number. This parameter is usually negative.
maxDelta	(Mandatory)	The maximum change allowed for between the current random number and the previous random number.
lowerLimit	[-Infinity]	The minimum value of the random number.
upperLimit	[+Infinity]	The maximum value of the random number.

See also:

- 30.50.9 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) 5587

30.50.8 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fill the given column in the RanTable with random numbers that fluctuates within a given speed.
Notes:

See also:

- 30.50.6 setCol(colNo as Integer, minValue as Double, maxValue as Double) 5585
- 30.50.7 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double) 5586

Argument	Default	Description
colNo	(Mandatory)	The column to fill. The first column is 0. The nth column is (n - 1).
startValue	(Mandatory)	The value of the first record in the column.
minDelta	(Mandatory)	The minimum change allowed for between the current random number and the previous random number. This parameter is usually negative.
maxDelta	(Mandatory)	The maximum change allowed for between the current random number and the previous random number.
lowerLimit	[-Infinity]	The minimum value of the random number.
upperLimit	[+Infinity]	The maximum value of the random number.

- 30.50.9 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double) 5587

30.50.9 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fill the given column in the RanTable with random numbers that fluctuates within a given speed.
Notes:

Argument	Default	Description
colNo	(Mandatory)	The column to fill. The first column is 0. The nth column is (n - 1).
startValue	(Mandatory)	The value of the first record in the column.
minDelta	(Mandatory)	The minimum change allowed for between the current random number and the previous random number. This parameter is usually negative.
maxDelta	(Mandatory)	The maximum change allowed for between the current random number and the previous random number.
lowerLimit	[-Infinity]	The minimum value of the random number.
upperLimit	[+Infinity]	The maximum value of the random number.

- 30.50.8 setCol(colNo as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double) 5586

30.50.10 setDateCol(i as Integer, startTime as Double, tickInc as Double, weekDayOnly as boolean=false)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fill the given column in the RanTable with a date/time series.
Notes:

Argument	Default	Description
i	(Mandatory)	The column to fill. The first column is 0. The nth column is (n - 1).
startTime	(Mandatory)	The date/time of the first record in the column.
tickInc	(Mandatory)	The change in date/time for subsequent records in seconds. The value 30 * 86400 is assumed to mean 1 month (which is not a constant interval), and its multiplies are assumed to mean multiple months. In particular, the value 360 * 86400 is assumed to mean 12 months, or 1 year.
weekDayOnly	false	A true value means skipping dates that are not weekdays (Saturday and Sunday). A %F value means no skipping.

30.50.11 setHLOCCols(i as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double = 0.0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fill 4 columns in the RanTable with random high, low, open and close records.
Notes: The 4 columns will meet the constraints that for each record, the high value will be greater than or equal to the low value, and both the open and close values will be in between the high and low values.

Argument	Default	Description
i	(Mandatory)	The column number of the "high" column. The next column will be assumed to be "low", followed by "open" and "close". The column number starts at 0. The first column is 0. The nth column is (n - 1).
startValue	(Mandatory)	The initial "open" value.
minDelta	(Mandatory)	The minimum change allowed for between the current "open" and the previous "close" value, as well as between the current "close" value and the current "open" value. This parameter is usually negative.
maxDelta	(Mandatory)	The maximum change allowed for between the current "open" and the previous "close" value, as well as between the current "close" value and the current "open" value.
lowerLimit	0	The minimum value for "high", "low", "open" and "close".
upperLimit	[+Infinity]	The maximum value for "high", "low", "open" and "close".

See also:

- 30.50.12 setHLOCCols(i as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double)

30.50.12 setHLOCCols(i as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double, upperLimit as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fill 4 columns in the RanTable with random high, low, open and close records.
Notes: The 4 columns will meet the constraints that for each record, the high value will be greater than or equal to the low value, and both the open and close values will be in between the high and low values.

Argument	Default	Description
i	(Mandatory)	The column number of the "high" column. The next column will be assumed to be "low", followed by "open" and "close". The column number starts at 0. The first column is 0. The nth column is (n - 1).
startValue	(Mandatory)	The initial "open" value.
minDelta	(Mandatory)	The minimum change allowed for between the current "open" and the previous "close" value, as well as between the current "close" value and the current "open" value. This parameter is usually negative.
maxDelta	(Mandatory)	The maximum change allowed for between the current "open" and the previous "close" value, as well as between the current "close" value and the current "open" value.
lowerLimit	0	The minimum value for "high", "low", "open" and "close".
upperLimit	[+Infinity]	The maximum value for "high", "low", "open" and "close".

See also:

- 30.50.11 setHLOCCols(i as Integer, startValue as Double, minDelta as Double, maxDelta as Double, lowerLimit as Double = 0.0) 5588

30.51 class CDScatterLayerMBS

30.51.1 class CDScatterLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The ScatterLayer class represents scatter layers.
Notes: Subclass of the CDLineLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.52 class CDSectorMBS

30.52.1 class CDSectorMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Sector class represents sectors.
Example:

```
// pull out one slice of a pie chart and give it its own label format
Var data() As Double = Array(40.0, 25.0, 20.0, 15.0)
Var labels() As String = Array("Mac", "Windows", "Linux", "iOS")

Var c As New CDPieChartMBS(400, 300)
c.setPieSize(200, 150, 100)
c.setData(data, labels)

Var mac As CDSectorMBS = c.sector(0)
mac.setExplode(15) // move 15 pixels out
mac.setLabelFormat("<*font=arialbd.ttf*>{ label } : { percent } %")

Var pic As Picture = c.makeChartPicture
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.52.2 Methods

30.52.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.52.4 getImageCoor(offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the image map coordinates of the sector as HTML image map attributes.
Notes: The image map coordinates will be in the following format:

shape="poly" cords=" [x1] , [y1] , [x2] , [y2] ..."
where (x1, y1), (x2, y2) ... are vertices of a polygon that approximate the sector. The format is specially

designed so that it can easily be incorporated into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string representing the coordinates of the sector in HTML image map attribute format.

30.52.5 getLabelCoor(offsetX as Integer = 0, offsetY as Integer = 0) as string

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the image map coordinates of the sector label as HTML image map attributes.
Notes: The image map coordinates will be in the following format:

shape="rect" cords=" [x1] , [y1] , [x2] , [y2] "
where (x1, y1) and (x2, y2) are opposite corners of the box that encloses the sector label. The format is specially designed so that it can easily be incorporated into HTML image maps.

This method should be called only after creating the chart image (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). The image map cannot be determined without creating the chart image first.

Argument	Default	Description
offsetX	0	An offset to be added to all x coordinates in the image map. This is useful if the current image will be shifted and inserted into another image. In this case, the image map will need to be shifted by the same offset.
offsetY	0	An offset to be added to all y coordinates in the image map. See offsetX above for description.

Return Value
A text string representing the coordinates of the sector label in HTML image map attribute format.

30.52.6 setColor(colorvalue as color, edgeColor as color, joinLineColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.52.7 setColor(colorvalue as Integer, edgeColor as Integer = -1, joinLineColor as Integer = -1) 5593

30.52.7 setColor(colorvalue as Integer, edgeColor as Integer = -1, joinLineColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the fill color, edge color and join line color of the sector.
Notes: By default, the edge color is SameAsMainColor. For the join line color, if the circular label layout method is used, the default is Transparent, otherwise the default is SameAsMainColor.

Argument	Default	Description
color	(Mandatory)	The color of the sector.
edgeColor	-1	The edge color of the sector. -1 means the color is unchanged.
joinLineColor	-1	The color of the line that join the sector perimeter with the sector label. -1 means the color is unchanged.

See also:

- 30.52.6 setColor(colorvalue as color, edgeColor as color, joinLineColor as color) 5593

30.52.8 setExplode(distance as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Explode the sector.
Notes:

Argument	Default	Description
distance	-1	The explosion distance in pixels. -1 means the distance is automatically determined.

30.52.9 setJoinLine(joinLineColor as color, joinLineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setJoinLine method, but uses color instead of integer data type for passing color values.
See also:

- 30.52.10 setJoinLine(joinLineColor as Integer, joinLineWidth as Integer = 1) 5594

30.52.10 setJoinLine(joinLineColor as Integer, joinLineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color and width of the join line used to connect the sector label to the sector perimeter.
Notes: By default, for circular label layout, the join line color is Transparent. For side label layout, the join line color is SameAsMainColor.

Argument	Default	Description
joinLineColor	(Mandatory)	The color of the line that joins the sector perimeter with the sector label.
joinLineWidth	1	The line width of the join line.

See also:

- 30.52.9 setJoinLine(joinLineColor as color, joinLineWidth as Integer = 1) 5593

30.52.11 setLabelFormat(formatString as string = "")

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the format of the sector label.
Example:

```
Var c as CDSectorMBS

// you can use label formats like this:

c.setLabelFormat("<*block,halign=left*><*font=timesbi.ttf,size=12,underline=1*>{ label } <*/font*><*br*>US$
{ value } K ( { percent } %)")

// we can reduce that to this:

c.setLabelFormat(" { label } { value } { percent } %")

// and it shows 3 numbers. With | 1 after the variable name, we define the decimals after dot:

c.setLabelFormat(" { label } { value | 1 } { percent | 1 } %")

// and
```

c.setLabelFormat(" { label } { value | 1., } { percent | 1., } %")

// uses dot for thousands and comma for decimal separator.

Notes: To set the label format for all sectors, use PieChart.setLabelFormat.

Argument	Default	Description
formatString	(Mandatory)	The format string. See PieChart.setLabelFormat for details.

30.52.12 setLabelLayout(layoutMethod as Integer, pos as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the layout method and location of the sector label.
Notes: To set the sector label layout method and location for all sectors, use PieChart.setLabelLayout.

ChartDirector supports two sector label layout methods - circular layout and side layout. For detail descriptions, please refer to PieChart.setLabelLayout.

Argument	Default	Description
layoutMethod	(Mandatory)	Specify the layout method. Must be one of the predefined constants CircleLayout or SideLayout.
pos	-1	For circular layout, it is the distance between the sector perimeter and the sector label. A negative value (but not -1) means the sector label will be drawn in the interior of the sector.

For side layout, it is the distance between the pie perimeter and the left or right edges of the invisible containing rectangle (equal to the width of the rectangle minus the pie diameter and then divided by 2).

In either case, -1 means the distance is automatically determined.

30.52.13 setLabelPos(pos as Integer, joinLineColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setLabelPos method, but uses color instead of integer data type for passing color values.
See also:

- 30.52.14 setLabelPos(pos as Integer, joinLineColor as Integer = -1) 5596

30.52.14 setLabelPos(pos as Integer, joinLineColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the circular label layout method, and configure the join lines used to connect the sector label to the sector perimeter.
Notes: To set the sector label position or join line color for all sectors, use PieChart.setLabelPos.

Argument	Default	Description
pos	(Mandatory)	The distance between the sector perimeter and the sector label. A negative value means the sector label will be drawn in the interior of the sector.
joinLineColor	-1	The color of the line that joins the sector perimeter with the sector label. The default is Transparent. The join line is ignored if the sector label is inside the sector.

See also:

- 30.52.13 setLabelPos(pos as Integer, joinLineColor as color) 5595

30.52.15 setLabelStyle(font as string = """, fontsize as Double = 8, fontcolor as Integer = &hffff0002) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the style used to draw the sector label.
Notes: To set the label style for all sector labels, use PieChart.setLabelStyle.

See Font Specification for details on various font attributes.

Argument	Default	Description
font	""	The font used to draw the sector label.
fontSize	8	The font size in points.
fontColor	TextColor	The text color for the sector label.

Return Value
A TextBox object representing the prototype of the obj. This may be used to fine-tune the appearance of the obj.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml
See also:

- 30.52.16 setLabelStyle(font as string, fontsize as Double, fontcolor as color) as CDTextBoxMBS 5597

30.52.16 setLabelStyle(font as string, fontsize as Double, fontcolor as color) as CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setLabelStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.52.15 setLabelStyle(font as string = """, fontsize as Double = 8, fontcolor as Integer = &hffff0002) as CDTextBoxMBS 5596

30.52.17 setStyle(shadingMethod as Integer, edgeColor as color, edgeWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setStyle method, but uses color instead of integer data type for passing color values.
See also:

- 30.52.18 setStyle(shadingMethod as Integer, edgeColor as Integer = -1, edgeWidth as Integer = -1) 5597

30.52.18 setStyle(shadingMethod as Integer, edgeColor as Integer = -1, edgeWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the sector shading style, edge color and edge width.
Notes: This method is the same as CDPieChartMBS.setSectorStyle, except it only affects one sector. Please refer to CDPieChartMBS.setSectorStyle for the detail explanation of this method.

Arguments:

Argument	Default	Description
shadingMethod	(Mandatory)	The sector shading style to use. -1 means to keep the existing value unchanged.
edgeColor	-1	The edge color of the sector. -1 means to keep the existing value unchanged.
edgeWidth	-1	The edge width of the sector. -1 means to keep the existing value unchanged.

See also:

- 30.52.17 setStyle(shadingMethod as Integer, edgeColor as color, edgeWidth as Integer = -1) 5597

30.53 class CDSplineLayerMBS

30.53.1 class CDSplineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The SplineLayer class represents spline layers.
Notes: In the current version of ChartDirector, SplineLayer is implemented as a special configuration of LineLayer.
Subclass of the CDLineLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.
Xojo Developer Magazine

- 7.4, page 34: Easy Charts and Graphs, Using the ChartDirector Plugin

30.53.2 Methods

30.53.3 setMonotonicity(m as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the monotonicity constraint when computing the spline curve.
Notes: Monotonicity means a sequence is increasing or decreasing in one direction. For example, the sequence 1, 2, 3, 4 is monotonically increasing, while the sequence 1, 3, 2, 5, 4 is not monotonic.

A standard spline curve can overshoot or undershoot if the underlying points have "sharp corners". That means without any constrain, even if the data points are monotonic, the spline curve joining the points is not necessarily monotonic. It can overshoot and then "fall back".

In many charts, it may be desirable to constraint the spline curve to flow in a certain direction. For example, in a time based chart, it may be desirable to constraint the curve always flow from left to right.

ChartDirector supports the following monotonic modes.

Arguments:

30.53.4 setTension(tension as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the tension to use when computing the spline curve.
Notes: The tension parameter should be between -1 and 1. A positive tension will make the spline tighter.

Constant	Value	Description
MonotonicNone	0	The spline curve is not constraint to flow in any direction. This results in the smoothest spline curve.
MonotonicX	1	The spline curve is constraint to not overshooting or undershooting in the x-axis direction. This means if the data points are monotonic in the x-axis direction, the spline curve will also be monotonic in the x-axis direction.
MonotonicY	2	The spline curve is constraint to not overshooting or undershooting in the y-axis direction. This means if the data points are monotonic in the y-axis direction, the spline curve will also be monotonic in the y-axis direction.
MonotonicXY	3	The spline curve is constraint to not overshooting or undershooting in both the x-axis and the y-axis directions. This means if the data points are monotonic in the x-axis direction, the spline curve will also be monotonic in the x-axis direction. If the data points are monotonic in the y-axis direction, the spline curve will also be monotonic in the y-axis direction.
MonotonicAuto	4	Automatically choose between MonotonicX, MonotonicY or MonotonicXY, depending on whether the data points are monotonic in the x-axis direction, or y-axis direction, or both.

Argument	Default	Description
monotonicMode	(Mandatory)	The monotonic constraint of the spline curve. Must be be one of the constants in the above table. If this method is never called for a spline layer, the default is MonotonicAuto.

The spline curve will become straight line segments when tension is 1. A negative tension will make the spline looser.

Argument	Default	Description
tension	(Mandatory)	The tension of the spline, which should be between -1 and 1.

30.54 class CDStepLineLayerMBS

30.54.1 class CDStepLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The StepLineLayer class represents step line layers.
Notes: Subclass of the CDLineLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.54.2 Methods

30.54.3 setAlignment(a as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the alignment of the steps relative to the data points.
Notes:

Argument	Default	Description
a	(Mandatory)	The alignment of the steps relative to the data points. Must be one of the predefined constants Left, Center or Right.

30.55 class CDSurfaceChartMBS

30.55.1 class CDSurfaceChartMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The SurfaceChart class represents surface charts.
Example:

```
// draw a 3D surface for z = sin(x) * cos(y)
Var xData(), yData(), zData() As Double
For i As Integer = 0 To 20
For j As Integer = 0 To 20
xData.Add i
yData.Add j
zData.Add Sin(i / 3) * Cos(j / 3)
Next
Next

Var c As New CDSurfaceChartMBS(500, 400)
c.setPlotRegion(250, 200, 250, 250, 150)
c.setViewAngle(30, 45)
c.setData(xData, yData, zData)

Var pic As Picture = c.makeChartPicture
// show pic in a Canvas or ImageViewer, or save it to a file
```

Notes: Subclass of the CDThreeDChartMBS class.
Xojo Developer Magazine

- 7.5, page 33: Easy Charts and Graphs Part 2, Using the ChartDirector Plugin

30.55.2 Methods

30.55.3 addSurfaceLine(x() as double, y() as double, colorValue as Integer, lineWidth as Integer = -1, side as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a multi-segment line to the surface.
Notes:

See also:

- 30.55.4 addSurfaceLine(x1 as double, y1 as double, x2 as double, y2 as double, colorValue as Integer, lineWidth as Integer = -1, side as Integer = 0) 5602

Argument	Default	Description
x	(Mandatory)	An array of containing the x coordinates of the data points that define the line.
y	(Mandatory)	An array of containing the y coordinates of the data points that define the line.
color	(Mandatory)	The color of the line.
lineWidth	1	The line width (thickness).
side	0	A value of 1 means the line is drawn on the front side of the surface. A value of 0 means the line is drawn on the back side of the surface. The default value of 0 means the line is drawn on both sides of the surface.

30.55.4 addSurfaceLine(x1 as double, y1 as double, x2 as double, y2 as double, colorValue as Integer, lineWidth as Integer = -1, side as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a line segment to the surface.
Notes:

Argument	Default	Description
x1	(Mandatory)	The x data coordinate of the first end-point of the line.
y1	(Mandatory)	The y data coordinate of the first end-point of the line.
x2	(Mandatory)	The x data coordinate of the second end-point of the line.
y2	(Mandatory)	The y data coordinate of the second end-point of the line.
color	(Mandatory)	The color of the line.
lineWidth	1	The line width (thickness).
side	0	A value of 1 means the line is drawn on the front side of the surface. A value of 0 means the line is drawn on the back side of the surface. The default value of 0 means the line is drawn on both sides of the surface.

See also:

- 30.55.3 addSurfaceLine(x() as double, y() as double, colorValue as Integer, lineWidth as Integer = -1, side as Integer = 0) 5601

30.55.5 addSurfaceZone(x1 as double, y1 as double, x2 as double, y2 as double, fillColor as Integer, edgeColor as Integer = &hff000000, edgeWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a rectangular zone to the surface.
Notes:

Argument	Default	Description
x1	(Mandatory)	The x data coordinate for the first corner of the rectangle.
y1	(Mandatory)	The y data coordinate for the first corner of the rectangle.
x2	(Mandatory)	The x data coordinate for the corner opposite to the first corner.
y2	(Mandatory)	The y data coordinate for the corner opposite to the first corner.
fillColor	(Mandatory)	The fill color of the rectangle.
edgeColor	Transparent	The border color of the rectangle.
edgeWidth	1	The border width in pixels.

30.55.6 addXYProjection(offset as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a projection of the surface on the XY wall.
Notes: The XY wall is the wall containing the x axis and y axis. It is usually under the plotted surface. Because of this, the surface may block the projection, making it hard to see. To address this issue, it is common to add a bottom margin to the z-axis (see Axis.setMargin). This will move the z-axis scale and therefore the surface upwards, leaving more space between the surface and the XY wall to make the projection more visible.

This method accepts an optional offset argument that can be used to move the projection vertically. A positive offset moves the it upwards. A negative offset moves it under the XY wall. Because of this, for negative offsets, the XY wall must be hidden using ThreeDChart.setWallVisibility, otherwise the chart will not be drawn correctly.

Argument	Default	Description
offset	0	The vertical offset of the XY projection in 3D pixel coordinates. A positive offset moves it upwards. A negative offset moves it under the XY wall.

30.55.7 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new SurfaceChart object.
Notes: Arguments:

See also:

- 30.55.8 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	kBackgroundColor	The background color of the chart.
edgeColor	kTransparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

30.55.8 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 30.55.7 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0) 5603

30.55.9 getValuesAtPixel(x as Integer, y as Integer) as Double()

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the (x, y, z, w) values of the surface at the specified image pixel coordinates.
Notes: This method is valid only after the chart image has been drawn (eg. using BaseChart.makeChart, BaseChart.makeChart2 or BaseChart.makeChart3). It is typically used to provide user feedback when the mouse moves on the chart.

If w values are not provided to the surface chart, the returned w value will be set to the same as the z value. If the pixel is not on the plotted surface, the returned array will be empty or null.

Argument	Default	Description
x	(Mandatory)	The x pixel coordinate.
y	(Mandatory)	The y pixel coordinate.

Returns an array of 4 numbers representing the x, y, z and w values at the image pixel location. If the pixel is not on the plotted surface, the returned array will be empty or null.

30.55.10 setBackSideBrightness(brightness as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the back side brightness as a ratio of the front side brightness.
Notes: The surface of a surface chart has two sides. The side that is facing the positive z direction of the plot region is the front side. The side that is facing the negative z direction of the plot region is the back side.

By default, the back side brightness is half the front side brightness. This method can be used to adjust the ratio.

Arguments:

Argument	Default	Description
brightness	(Mandatory)	The ratio of the back side brightness to the front side brightness.

30.55.11 setBackSideColor(ColorValue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setBackSideColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.55.12 setBackSideColor(ColorValue as Integer) 5605

30.55.12 setBackSideColor(ColorValue as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color of the back side of the surface.
Notes: The surface of a surface chart has two sides. The side that is facing the positive z direction of the plot region is the front side. The side that is facing the negative z direction of the plot region is the back side.

By default, the back side is colored similar to the front side, but with different brightness of lighting parameters. This method can be used to color the back side with a fixed color instead.

Arguments:

See also:

- 30.55.11 setBackSideColor(ColorValue as color) 5605

Argument	Default	Description
color	(Mandatory)	The color used for the back side.

30.55.13 setBackSideLighting(ambientLight as Double, diffuseLight as Double, specularLight as Double, shininess as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the Phong lighting parameters for the back side of the surface.
Notes: The surface of a surface chart has two sides. The side that is facing the positive z direction of the plot region is the front side. The side that is facing the negative z direction of the plot region is the back side.

ChartDirector uses the Phong lighting model to adjust the brightness of the surface to make it look realistic. The default lighting parameters for the back side is half the brightness of those for the front side. This method may be used to set alternative lighting parameters for the back side.

Arguments:

Argument	Default	Description
ambientIntensity	(Mandatory)	The ambient reflection coefficient of the Phong lighting model.
diffuseIntensity	(Mandatory)	The diffuse reflection coefficient of the Phong lighting model.
specularIntensity	(Mandatory)	The specular reflection coefficient of the Phong lighting model.
shininess	(Mandatory)	The shininess coefficient of the Phong lighting model.

30.55.14 setContourColor(contourColor as color, minorContourColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setContourColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.55.15 setContourColor(contourColor as Integer, minorContourColor as Integer = -1) 5606

30.55.15 setContourColor(contourColor as Integer, minorContourColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colors of the contour lines on the surface.
Notes: The contour lines are lines that join regions of the same z value on the surface. The contour levels are determined by the ticks on the z-axis. Major ticks associate with major contour lines. Minor ticks associate

with minor contour lines.

Arguments:

Argument	Default	Description
contourColor	(Mandatory)	The color of the major contour lines.
minorContourColor	-1	The color of the minor contour lines. -1 means it is the same as the contourColor.

See also:

- 30.55.14 setContourColor(contourColor as color, minorContourColor as color) 5606

30.55.16 setData(xData() as Double, yData() as Double, zData() as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the data for the surface chart.
Notes: ChartDirector supports both gridded and scattered data. If the data points are on a rectangular grid will no missing points, they will be handled as gridded data. Otherwise, they will be handled as scattered data.

For gridded data, you may provide the x and y values of the grid, and the z values of the data points. For a 10 x 15 grid, that means the x data series should have 10 values, the y data series should have 15 values, and the z data series should have 150 values. The x and y data series should be strictly monotonic (either strictly increasing or strictly decreasing).

For both gridded and scattered data, you may also provide the (x, y, z) values of the data points. For example, for 150 data points, the x, y and z data series should each have 150 values. ChartDirector will automatically detect if the data points are gridded or scattered.

Arguments:

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x data series.
yData	(Mandatory)	An array of numbers representing the y data series.
zData	(Mandatory)	An array of numbers representing the z data series.

See also:

- 30.55.17 setData(xData() as double, yData() as double, zData() as double, wData() as double) 5608

30.55.17 setData(xData() as double, yData() as double, zData() as double, wData() as double)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the data for the surface chart.
See also:

- 30.55.16 setData(xData() as Double, yData() as Double, zData() as Double) 5607

30.55.18 setInterpolation(xSamples as Integer, ySamples as Integer = -1, isSmooth as Boolean = true)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables and sets the degree and method of interpolation of the data points.
Notes: A surface chart consists of planar patches, drawn using the data points as the vertices. To create visually smooth surfaces, we may use a large number of small planar patches. However, this requires a large number of data points.

For example, consider a plot region of which the x and y dimensions are both 400 pixels in length. To create a smooth surface, if gridded data are used, the distance between grid lines should be no more than a few pixels. Suppose a grid spacing of 8 pixels is used. The grid size will be 51 x 51, and 2601 data points will be needed.

If the number of available data points are too small to create a smooth surface, This method can be used to generate a denser grid of data points from the original data points using interpolation.

Two types of interpolation are supported. In spline surface interpolation, ChartDirector will compute a smooth surface that passes through the original data points, and sample the spline surface for the new data points. In bilinear/linear interpolation, ChartDirector will apply bilinear/linear interpolation to its vertices of the original patches to compute the new data points.

Arguments:

Argument	Default	Description
xSamples	(Mandatory)	The number of samples on the x-dimension to interpolate to.
ySamples	-1	The number of samples on the y-dimension to interpolate to. -1 means it is the same as xSamples.
isSmooth	true	A true value means to use spline surface interpolation. A false value means to use bilinear/linear interpolation.

See also:

- 30.55.19 setInterpolation(xSamples as Integer, ySamples as Integer, isSmooth as Boolean, isColorSmooth as Boolean) 5609

30.55.19 setInterpolation(xSamples as Integer, ySamples as Integer, isSmooth as Boolean, isColorSmooth as Boolean)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables and sets the degree and method of interpolation of the data points.
Notes: A surface chart consists of planar patches, drawn using the data points as the vertices. To create visually smooth surfaces, we may use a large number of small planar patches. However, this requires a large number of data points.

For example, consider a plot region of which the x and y dimensions are both 400 pixels in length. To create a smooth surface, if gridded data are used, the distance between grid lines should be no more than a few pixels. Suppose a grid spacing of 8 pixels is used. The grid size will be 51 x 51, and 2601 data points will be needed.

If the number of available data points are too small to create a smooth surface, This method can be used to generate a denser grid of data points from the original data points using interpolation.

Two types of interpolation are supported. In spline surface interpolation, ChartDirector will compute a smooth surface that passes through the original data points, and sample the spline surface for the new data points. In bilinear/linear interpolation, ChartDirector will apply bilinear/linear interpolation to its vertices of the original patches to compute the new data points.

Argument	Default	Description
xSamples	(Mandatory)	The number of samples on the x-dimension to interpolate to.
ySamples	-1	The number of samples on the y-dimension to interpolate to. -1 means it is the same as xSamples.
isSmooth	true	A true value means to use spline surface interpolation for the z values. A false value means to use bilinear/linear interpolation.
isColorSmooth	(Optional)	A true value means to use spline surface interpolation for the w values. A false value means to use bilinear/linear interpolation. If this argument is not specified, the default is to use the same interpolation method as the z values.

See also:

- 30.55.18 setInterpolation(xSamples as Integer, ySamples as Integer = -1, isSmooth as Boolean = true) 5608

30.55.20 setLighting(ambientIntensity as Double, diffuseIntensity as Double, specularIntensity as Double, shininess as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the Phong lighting parameters for the front side of the surface.
Notes: The surface of a surface chart has two sides. The side that is facing the positive z direction of the plot region is the front side. The side that is facing the negative z direction of the plot region is the back side.

ChartDirector uses the Phong lighting model to adjust the brightness of the surface to make it look realistic. The light source is assumed to be from the direction of the viewer and is far away. The default lighting parameters for the front side are 0.5 for both ambient and diffuse reflections, 1 for specular reflection and 8 for shininess.

Arguments:

Argument	Default	Description
ambientIntensity	(Mandatory)	The ambient reflection coefficient of the Phong lighting model.
diffuseIntensity	(Mandatory)	The diffuse reflection coefficient of the Phong lighting model.
specularIntensity	(Mandatory)	The specular reflection coefficient of the Phong lighting model.
shininess	(Mandatory)	The shininess coefficient of the Phong lighting model.

30.55.21 setShadingMode(shadingMode as Integer, wireWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the shading mode for the surface.
Notes: ChartDirector supports the following methods for shading the surface.

Constant	Value	Description
kSmoothShading	0	The brightness of the surface varies smoothly.
kTriangularShading	0	The surface is divided into triangular patches. The brightness of the patches varies according to their orientation. Within a patch, the brightness is constant.
kRectangularShading	0	The surface is divided into rectangular patches. The brightness of the patches varies according to their orientation. Within a patch, the brightness is constant.
kTriangularFrame	0	The surface is divided into triangular patches. Only the edges of the patches are drawn.
kRectangularFrame	0	The surface is divided into rectangular patches. Only the edges of the patches are drawn.

Arguments:

Argument	Default	Description
shadingMode	(Mandatory)	The shading mode, which must be one of the above constants.
wireWidth	1	The wire width for use with wireframe shading modes.

30.55.22 setSurfaceAxisGrid(majorXGridColor as color, majorYGridColor as color, minorXGridColor as color, minorYGridColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setSurfaceAxisGrid method, but uses color instead of integer data type for passing color values.
See also:

- 30.55.23 setSurfaceAxisGrid(majorXGridColor as Integer, majorYGridColor as Integer = -1, minorXGridColor as Integer = -1, minorYGridColor as Integer = -1) 5611

30.55.23 setSurfaceAxisGrid(majorXGridColor as Integer, majorYGridColor as Integer = -1, minorXGridColor as Integer = -1, minorYGridColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colors of the axis grid lines on the surface.
Notes: Axis grid lines are grid lines associated with the ticks on the x and y axes. Major grid lines associate with major ticks. Minor grid lines associate with minor ticks. They can be drawn on the surface of the surface chart, and on the plot region walls. This method is for the surface of the surface chart. For the plot region walls, see CDSurfaceChartMBS.setWallGrid.

Arguments:

Argument	Default	Description
majorXGridColor	(Mandatory)	The color of the major x-axis grid lines on the surface.
majorYGridColor	-1	The color of the major y-axis grid lines on the surface. -1 means it is the same as the majorXGridColor.
minorXGridColor	-1	The color of the minor x-axis grid lines on the surface. -1 means it is the same as the majorXGridColor.
minorYGridColor	-1	The color of the minor y-axis grid lines on the surface. -1 means it is the same as the majorYGridColor.

See also:

- 30.55.22 setSurfaceAxisGrid(majorXGridColor as color, majorYGridColor as color, minorXGridColor as color, minorYGridColor as color) 5611

30.55.24 setSurfaceDataGrid(xGridColor as color, yGridColor as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setSurfaceDataGrid method, but uses color instead of integer data type for passing color values.
See also:

- 30.55.25 setSurfaceDataGrid(xGridColor as Integer, yGridColor as Integer = -1) 5612

30.55.25 setSurfaceDataGrid(xGridColor as Integer, yGridColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colors of the data grid lines on the surface.
Notes: Data grid lines are grid lines that define the positions of the data points. They can be drawn on the surface of the surface chart.

Arguments:

Argument	Default	Description
xGridColor	(Mandatory)	The color of the x data grid lines.
yGridColor	-1	The color of the y data grid lines. -1 means it is the same as the yGridColor.

See also:

- 30.55.24 setSurfaceDataGrid(xGridColor as color, yGridColor as color) 5612

30.55.26 setSurfaceTexture(patternColor as color)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a texture image to the surface.
Notes: A texture is a 2D image pattern for mapping onto a 3D surface. The pattern can be defined by using BaseChart.patternColor or BaseChart.patternColor2.

One common usage of this method is to apply an image the same size as the plot region xy plane to the surface. To do this, simply use an image with width and height equals to the plot region width and depth.

See also:

- 30.55.27 setSurfaceTexture(patternColor as integer) 5613

Argument	Default	Description
patternColor	(Mandatory)	A color (normally a pattern color) that contains the texture image to be applied to the surface.

30.55.27 setSurfaceTexture(patternColor as integer)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a texture image to the surface.
Notes: A texture is a 2D image pattern for mapping onto a 3D surface. The pattern can be defined by using BaseChart.patternColor or BaseChart.patternColor2.

One common usage of this method is to apply an image the same size as the plot region xy plane to the surface. To do this, simply use an image with width and height equals to the plot region width and depth.

Argument	Default	Description
patternColor	(Mandatory)	A color (normally a pattern color) that contains the texture image to be applied to the surface.

See also:

- 30.55.26 setSurfaceTexture(patternColor as color) 5612

30.55.28 setWContourColor(wContourColor as color, wMinorContourColor as color)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colors of the w contour lines on the surface.
Notes: The w contour lines are lines that join regions of the same w value on the surface. The contour levels are determined by the ticks on the color axis. Major ticks associate with major contour lines. Minor ticks associate with minor contour lines.

Argument	Default	Description
wContourColor	(Mandatory)	The color of the major contour lines.
wMinorContourColor	-1	The color of the minor contour lines. -1 means it is the same as the contourColor.

See also:

- 30.55.29 setWContourColor(wContourColor as integer, wMinorContourColor as Integer = -1) 5614

30.55.29 setWContourColor(wContourColor as integer, wMinorContourColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colors of the w contour lines on the surface.
Notes: The w contour lines are lines that join regions of the same w value on the surface. The contour levels are determined by the ticks on the color axis. Major ticks associate with major contour lines. Minor ticks associate with minor contour lines.

Argument	Default	Description
wContourColor	(Mandatory)	The color of the major contour lines.
wMinorContourColor	-1	The color of the minor contour lines. -1 means it is the same as the contourColor.

See also:

- 30.55.28 setWContourColor(wContourColor as color, wMinorContourColor as color) 5613

30.55.30 Screenshots

30.55.31 surface.jpg

30.56 class CDTextBoxMBS

30.56.1 class CDTextBoxMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The TextBox class represents text boxes.
Example:

```
// style the title and add a note text box to a chart
Var data() As Double = Array(4.0, 7.0, 5.0, 9.0)
Var c As New CDXYChartMBS(400, 300)
Call c.setPlotArea(50, 50, 320, 210)
Call c.addLineLayer(data, &h0066CC)

Var title As CDTextBoxMBS = c.addTitle("Weekly visitors", "arialbd.ttf", 14)
title.setBackground(&hDDEEFF, &h6699CC)
title.setMargin(5)

Var note As CDTextBoxMBS = c.addText(360, 60, "Record week!", "arial.ttf", 9, &hCC0000, CDBaseChartMBS.kTo-
pRight)
note.setFontAngle(10)

Var pic As Picture = c.makeChartPicture
```

Notes: Subclass of the CDBoxMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.56.2 Methods

30.56.3 setAlignment(a as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the alignment of the text relative to the container box.
Notes:

Argument	Default	Description
a	(Mandatory)	The alignment specification. See Alignment Specification for supported alignment types.

30.56.4 setFontAngle(angle as Double, vertical as boolean=false)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the rotation angle and layout direction of the text.
Notes: See Font Specification for details on various font attributes.

Argument	Default	Description
angle	(Mandatory)	The text rotation angle. Rotation is measured in counter-clockwise direction in degrees.
vertical	false	Determine if the font is layout horizontally (from left to right) or vertically (from top to down). Vertical layout is common for Oriental languages such as Chinese, Japanese and Korean. A true value means vertical layout. A false value means horizontal layout.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

30.56.5 setFontColor(colorvalue as color)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setFontColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.56.6 setFontColor(colorvalue as Integer) 5622

30.56.6 setFontColor(colorvalue as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color of the text.
Notes: If this method is not called, TextColor will be used to draw the text.

Argument	Default	Description
color	(Mandatory)	The font color.

See also:

- 30.56.5 setFontColor(colorvalue as color) 5621

30.56.7 setFontSize(fontHeight as Double, fontWidth as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font height and width in points.
Notes: See Font Specification for details on various font attributes.

Argument	Default	Description
fontHeight	(Mandatory)	The font height in points.
fontWidth	0	The font width in points. If the font width is zero, it is assumed to be the same as the font height.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

30.56.8 setFontStyle(font as string, fontIndex as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font of the text by specifying the file that contains the font.
Notes: See Font Specification for details on various font attributes.

Argument	Default	Description
font	(Mandatory)	The font name.
fontIndex	0	The font index in case the font name refers to a font collection. An index of 0 means the first font.

See font specification here:
http://www.monkeybreadsoftware.net/faq-chartdirectorfontspecification.shtml

30.56.9 setHeight(height as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the height of the text box.
Notes: By default, the height of the text box is automatically determined to be just enough to hold the text. The setHeight method can be used to specified a fix height.

Argument	Default	Description
height	(Mandatory)	The height of the text box in pixels.

30.56.10 setMargin(leftMargin as Integer, rightMargin as Integer, topMargin as Integer, bottomMargin as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the margins of the text box in pixels.
Notes: The margins of a text box are the distances between the borders of the text box to the text inside. By default, the left and right margins are approximately half the font width, and the top and bottom margins are approximately 1/4 of the font height.

Argument	Default	Description
leftMargin	(Mandatory)	The left margin in pixels.
rightMargin	(Mandatory)	The right margin in pixels.
topMargin	(Mandatory)	The top margin in pixels.
bottomMargin	(Mandatory)	The bottom margin in pixels.

See also:

- 30.56.11 setMargin(m as Integer) 5623

30.56.11 setMargin(m as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets all margins (left, right, top, and bottom) of the text box to the same value.
Notes: The margins of a text box are the distances between the borders of the text box to the text inside. By default, the left and right margins are approximately half the font width, and the top and bottom margins

are approximately 1/4 of the font height.

Argument	Default	Description
m	(Mandatory)	The left, right, top and bottom margins in pixels.

See also:

- 30.56.10 setMargin(leftMargin as Integer, rightMargin as Integer, topMargin as Integer, bottomMargin as Integer) 5623

30.56.12 setMaxWidth(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the maximum width of the text box and wraps text if necessary.
Notes: By default, the width of the text box is automatically determined to be the length of the text. This method can be used to limit the width of the text box. If the text requires a longer width for display, it will be wrapped into multiple lines.

Argument	Default	Description
maxWidth	(Mandatory)	The maximum width of the text box in pixels.

30.56.13 setText(text as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the text to be shown in the text box.
Notes: See ChartDirector Mark Up Language on how to embed special tags in the text for sophisticated formatting.

Argument	Default	Description
text	(Mandatory)	The text to be displayed in the text box.

30.56.14 setTruncate(maxWidth as Integer, maxLines as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the maximum number of lines in the text box, and truncate the text if it exceeds the line count.

Notes: The maxWidth parameter of this method specifies the maximum width of the text box. If the text requires a longer width for display, it will be wrapped into multiple lines. However, if the number of lines exceed maxLines, the text will be truncated, with the last visible characters replaced with "...".

If maxLines is 1 (the default), the text will never be wrapped and will be truncated directly if it needs more than maxWidth for display.

Argument	Default	Description
maxWidth	(Mandatory)	The maximum width of the text box in pixels.
maxLines	1	The maximum number of lines that the text box can have. The text will be truncated if it exceeds the maximum number of lines.

30.56.15 setWidth(width as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the width of the text box and wraps text if necessary.
Notes: By default, the width of the text box is automatically determined to be the length of the text. The setWidth method can be used to specified a fix width. If the text requires a longer width for display, the text will be wrapped into multiple lines.

Argument	Default	Description
width	(Mandatory)	The width of the text box in pixels.

30.57 class CDThreeDChartMBS

30.57.1 class CDThreeDChartMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The ThreeDChart class is an abstract class containing methods that are common to all true 3D chart types.
Example:

```
// a 3D surface chart with view angle and color legend
Var xData(), yData(), zData() As Double
For yi As Integer = 0 To 20
For xi As Integer = 0 To 20
Var px As Double = (xi - 10) / 3
Var py As Double = (yi - 10) / 3
xData.Add px
yData.Add py
zData.Add Sin(px) * Cos(py)
Next
Next

Var c As New CDSurfaceChartMBS(600, 450)
c.setData(xData, yData, zData)
c.setPlotRegion(270, 220, 300, 300, 160) // center, width, depth, height
c.setViewAngle(30, 45) // elevation and rotation
Call c.setColorAxis(520, 220, CDBaseChartMBS.kLeft, 200, 1)
Call c.xAxis.setTitle("X")

Var pic As Picture = c.makeChartPicture
```

Notes: ThreeDChart is a subclass of BaseChart.
Subclass of the CDBaseChartMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 12.3pr16

30.57.2 Methods

30.57.3 colorAxis as CDColorAxisMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the ColorAxis object representing the color axis (color legend).
Notes: Returns the ColorAxis object representing the color axis.

30.57.4 Constructor

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.
Notes: The ThreeDChart class is an abstract class containing methods that are common to all true 3D chart types.
ThreeDChart is a subclass of BaseChart.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

30.57.5 getElevationAngle as double

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the elevation angle.

30.57.6 getPlotRegionDepth as integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the plot region depth.

30.57.7 getPlotRegionHeight as integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the plot region height.

30.57.8 getPlotRegionWidth as integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the plot region width.

30.57.9 getRotationAngle as double

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the rotation angle.

30.57.10 getXCoor(xValue as Double, yValue as Double, zValue as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the x pixel coordinate of a point given its x, y and z data values.
Notes: Note: You must call BaseChart.layout first before calling this method. ChartDirector needs to perform auto-scaling and layout the axis before it can compute pixel coordinates from data values.

Argument	Default	Description
x	(Mandatory)	The x data value of the point.
y	(Mandatory)	The y data value of the point.
z	(Mandatory)	The z data value of the point.

Returns the x pixel coordinate of the point.

30.57.11 getYCoor(xValue as Double, yValue as Double, zValue as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the y pixel coordinate of a point given its x, y and z data values.
Notes: You must call BaseChart.layout first before calling this method. ChartDirector needs to perform auto-scaling and layout the axis before it can compute pixel coordinates from data values.

Argument	Default	Description
x	(Mandatory)	The x data value of the point.
y	(Mandatory)	The y data value of the point.
z	(Mandatory)	The z data value of the point.

Returns the y pixel coordinate of the point.

30.57.12 setColorAxis(x as Integer, y as Integer, alignment as Integer, length as Integer, orientation as Integer) as CDColorAxisMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position, length and orientation of the color axis (color legend).
Notes:

Argument	Default	Description
x	(Mandatory)	The x-coordinate of the reference point used to position the color axis.
y	(Mandatory)	The y-coordinate of the reference point used to position the color axis.
alignment	(Mandatory)	The alignment of the color axis with respect to the reference point. For example, a value of TopLeft means the reference point is the top- left corner of the color axis. See Alignment Specification for supported alignment types..
length	(Mandatory)	The length of the color axis in pixels.
orientation	(Mandatory)	The orientation of the color axis. A value of Top/Bottom means the axis is horizontal, and the axis labels are at top/bottom side of the axis. A value of Left/Right means the axis is vertical, and the axis labels are at the left/right side of the axis.

30.57.13 setPerspective(perspective as Double)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the strength of the perspective effect.
Notes: When taking the photograph of a scene, things closer to the camera are larger in the photograph, while things farther from the camera are smaller. For example, two trees of exactly the same height but at different distances from the camera will have different heights as measured in the photograph. This is known as the perspective effect.

This method configures the strength of the perspective effect for a ThreeDChart object. The nearer part of the plot region will be magnified, while the farther part will be reduced. The average size of the plot region will be approximately unchanged.

Argument	Default	Description
perspective	(Mandatory)	The strength of the perspective effect. It approximately represents the maximum percentage magnification of the plot region, which is the same as the maximum percentage reduction. A value of 0 means no perspective effect. This value is usually between 0 to 100. If this method is never called, the default is 12.

30.57.14 setPlotRegion(cx as Integer, cy as Integer, xWidth as Integer, yDepth as Integer, zHeight as Integer)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position of the plot region.
Notes: The plot region is a 3D box, with x, y, and z axes along its border, using a right-hand cartesian coordinate system.

To create the chart image, you may imagine a camera taking a photograph of the box. The photograph can be taken at different angles, configurable with ThreeDChart.setViewAngle. The position of the plot region in the photograph is such that the center of the plot region is at a given point (cx, cy) on the image.

Argument	Default	Description
cx	(Mandatory)	The x pixel coordinate of the point on the image at which the center of the plot region is located.
cy	(Mandatory)	The y pixel coordinate of the point on the image at which the center of the plot region is located.
xWidth	(Mandatory)	The length of the x-dimension of the plot region in pixels.
yDepth	(Mandatory)	The length of the y-dimension of the plot region in pixels.
zHeight	(Mandatory)	The length of the z-dimension of the plot region in pixels.

30.57.15 setViewAngle(elevation as Double, rotation as Double = 0, twist as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the 3D view angles.
Notes: ChartDirector uses elevation, rotation and twist angles to specify the 3D view angles.

To explain the meaning of the angles, imagine the object being viewed is put at the center of a hollow sphere, and a camera (the view point) is put at the surface of the sphere, directed inwards to the center to look at the object.

The elevation angle refers to the "latitude" of the camera. An elevation angle of 0 degrees means the camera is at the "equator" pointing to the object from the side. An elevation angle of 90 degrees means the camera is at the "north pole" pointing down to the object. An angle elevation of -90 degrees means the camera is at the "south pole", pointing up to the object.

The rotation angle refers to the "longitude" of the camera. If the elevation is 0 degrees, and the rotation angle varies from 0 to 360 degrees, the camera will move around the "equator" in the easterly direction (counter-clockwise when viewed from the north pole).

The twist angle is for rotating the camera itself while still pointing to the object. For example, a twist angle of 90 degrees means you are holder the camera "vertically" instead of "horizontally". The rotation is clockwise from the view point of the person holding the camera.

Note that from the view point of the camera, the object will appear to be rotating in the opposite direction. For example, as the rotation angle rotates the camera counter-clockwise along the "equator", the object will appear to be rotating clockwise on the screen.

Note: The twist angle is not supported in the current version of ChartDirector. It should always be 0, and should be considered as a reserved argument for future use.

Argument	Default	Description
elevation	(Mandatory)	The elevation angle in degrees.
rotation	0	The rotation angle in degrees.
twist	0	The twist angle in degrees.

30.57.16 setWallColor(xyColor as color, yzColor as color, zxColor as color, borderColor as color)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color of the plot region walls.
Notes: By default, the plot region walls are light grey (eeeeee) in color, with a grey (888888) border . This method can be used to modify the colors.

Argument	Default	Description
xyColor	(Mandatory)	The color of the xy wall.
yzColor	-1	The color of the yz wall. -1 means it is the same as xyColor.
zxColor	-1	The color of the zx wall. -1 means it is the same as xyColor.
borderColor	-1	The color of the wall border. -1 means to keep the existing value unchanged.

See also:

- 30.57.17 setWallColor(xyColor as Integer, yzColor as Integer = -1, zxColor as Integer = -1, borderColor as Integer = -1) 5631

30.57.17 setWallColor(xyColor as Integer, yzColor as Integer = -1, zxColor as Integer = -1, borderColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color of the plot region walls.
Notes: By default, the plot region walls are light grey (eeeeee) in color, with a grey (888888) border . This method can be used to modify the colors.

Argument	Default	Description
xyColor	(Mandatory)	The color of the xy wall.
yzColor	-1	The color of the yz wall. -1 means it is the same as xyColor.
zxColor	-1	The color of the zx wall. -1 means it is the same as xyColor.
borderColor	-1	The color of the wall border. -1 means to keep the existing value unchanged.

See also:

- 30.57.16 setWallColor(xyColor as color, yzColor as color, zxColor as color, borderColor as color) 5631

30.57.18 setWallGrid(majorXGridColor as color, majorYGridColor as color, majorZGridColor as color, minorXGridColor as color, minorYGridColor as color, minorZGridColor as color)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the grid line colors on plot region walls.
Notes: The grid lines on the walls are associated with the ticks on the x, y and z axes. Major ticks associate with major grid lines. Minor ticks associate with minor grid lines. By default, the major grid lines are light grey (cccccc), and the minor grid lines are lighter grey (dddddd). This method can be used to modify the grid line colors.

Argument	Default	Description
majorXGridColor	(Mandatory)	The color of the major x-axis grid lines on the walls.
majorYGridColor	-1	The color of the major y-axis grid lines on the walls. -1 means it is the same as the majorXGridColor.
majorZGridColor	-1	The color of the major z-axis grid lines on the walls. -1 means it is the same as the majorXGridColor.
minorXGridColor	-1	The color of the minor x-axis grid lines on the walls. -1 means it is the same as the majorXGridColor.
minorYGridColor	-1	The color of the minor y-axis grid lines on the walls. -1 means it is the same as the majorYGridColor.
minorZGridColor	-1	The color of the minor z-axis grid lines on the walls. -1 means it is the same as the majorZGridColor.

See also:

- 30.57.19 setWallGrid(majorXGridColor as Integer, majorYGridColor as Integer = -1, majorZGridColor as Integer = -1, minorXGridColor as Integer = -1, minorYGridColor as Integer = -1, minorZGridColor as Integer = -1) 5633

30.57.19 setWallGrid(majorXGridColor as Integer, majorYGridColor as Integer = -1, majorZGridColor as Integer = -1, minorXGridColor as Integer = -1, minorYGridColor as Integer = -1, minorZGridColor as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the grid line colors on plot region walls.
Notes: The grid lines on the walls are associated with the ticks on the x, y and z axes. Major ticks associate with major grid lines. Minor ticks associate with minor grid lines. By default, the major grid lines are light grey (cccccc), and the minor grid lines are lighter grey (dddddd). This method can be used to modify the grid line colors.

Argument	Default	Description
majorXGridColor	(Mandatory)	The color of the major x-axis grid lines on the walls.
majorYGridColor	-1	The color of the major y-axis grid lines on the walls. -1 means it is the same as the majorXGridColor.
majorZGridColor	-1	The color of the major z-axis grid lines on the walls. -1 means it is the same as the majorXGridColor.
minorXGridColor	-1	The color of the minor x-axis grid lines on the walls. -1 means it is the same as the majorXGridColor.
minorYGridColor	-1	The color of the minor y-axis grid lines on the walls. -1 means it is the same as the majorYGridColor.
minorZGridColor	-1	The color of the minor z-axis grid lines on the walls. -1 means it is the same as the majorZGridColor.

See also:

- 30.57.18 setWallGrid(majorXGridColor as color, majorYGridColor as color, majorZGridColor as color, minorXGridColor as color, minorYGridColor as color, minorZGridColor as color) 5632

30.57.20 setWallThickness(xyThickness as Integer, yzThickness as Integer = -1, zxThickness as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the thickness of the plot region walls.
Notes: By default, the plot region walls are 10 pixels thick. This method can be used to modify the thickness.

Argument	Default	Description
xyThickness	(Mandatory)	The thickness of the xy wall in pixels.
yzThickness	-1	The thickness of the yz wall in pixels. -1 means it is the same as xyThickness.
zxThickness	-1	The thickness of the zx wall in pixels. -1 means it is the same as xyThickness.

30.57.21 setWallVisibility(xyVisible as boolean, yzVisible as boolean, zxVisible as boolean)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shows or hides the plot region walls.
Notes: By default, all walls are visible. This method can be used to hide some or all of the walls.

Argument	Default	Description
xyVisible	(Mandatory)	A true value means the xy wall is visible. A false value means the xy wall is hidden.
yzVisible	(Mandatory)	A true value means the yz wall is visible. A false value means the yz wall is hidden.
zxVisible	(Mandatory)	A true value means the zx wall is visible. A false value means the zx wall is hidden.

30.57.22 setZAxisPos(pos as Integer)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position of the z-axis.
Notes: In a ThreeDChart object, the z-axis can be drawn either on the left side or the right side. By default, ChartDirector will draw the z-axis on the side that is nearer to the viewer.

This method can be used to specify which side the z-axis should be drawn.

Argument	Default	Description
pos	(Mandatory)	The position of the z-axis, which must be either Left or Right.

30.57.23 Properties

30.57.24 xAxis as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the x-axis of the ThreeDChart object.
Notes: Returns the Axis object representing the x-axis of the ThreeDChart object.
(Read only property)

30.57.25 yAxis as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the y-axis of the ThreeDChart object.
Notes: Returns the Axis object representing the y-axis of the ThreeDChart object.
(Read only property)

30.57.26 zAxis as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the z-axis of the ThreeDChart object.
Notes: Returns the Axis object representing the z-axis of the ThreeDChart object.
(Read only property)

30.58 class CDThreeDScatterChartMBS

30.58.1 class CDThreeDScatterChartMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The ThreeDScatterChart class represents 3D scatter charts.
Notes: ThreeDScatterChart is a subclass of ThreeDChart.
Subclass of the CDThreeDChartMBS class.

- 3D Scatter Charts

30.58.2 Methods

30.58.3 addScatterGroup(xData() as Double, yData() as Double, zData() as Double, name as string = "", symbol as Integer = 7, symbolSize as Integer = 5, fillcolor as Integer = -1, edgeColor as Integer = -1) as CDThreeDScatterGroupMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a group of scatter symbols to the ThreeDScatterChart.
Notes: A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears as scattered.

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x values of the data points.
yData	(Mandatory)	An array of numbers representing the y values of the data points.
zData	(Mandatory)	An array of numbers representing the z values of the data points.
name	""	The name of the symbol group. The name will be used in the legend box, if one is available. An empty string means the symbol group has no name.
symbol	CircleShape	One of the predefined symbol constants to specify the symbol to use. (See Shape Specification for available built-in shapes.)
symbolSize	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette. SameAsMainColor means the color is based on the z value of the symbol as according to the ColorAxis (accessible via ThreeDChart.colorAxis).
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means using LineColor as the edge color.

Returns a ThreeDScatterGroup object representing the symbol group created.
See also:

- 30.58.4 addScatterGroup(xData() as Double, yData() as Double, zData() as Double, name as string, symbol as Integer, symbolSize as Integer, fillcolor as color, edgeColor as color) as CDThreeDScatterGroupMBS 5637

30.58.4 addScatterGroup(xData() as Double, yData() as Double, zData() as Double, name as string, symbol as Integer, symbolSize as Integer, fillcolor as color, edgeColor as color) as CDThreeDScatterGroupMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a group of scatter symbols to the ThreeDScatterChart.
Notes: A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears as scattered.

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x values of the data points.
yData	(Mandatory)	An array of numbers representing the y values of the data points.
zData	(Mandatory)	An array of numbers representing the z values of the data points.
name	""	The name of the symbol group. The name will be used in the legend box, if one is available. An empty string means the symbol group has no name.
symbol	CircleShape	One of the predefined symbol constants to specify the symbol to use. (See Shape Specification for available built-in shapes.)
symbolSize	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette. SameAsMainColor means the color is based on the z value of the symbol as according to the ColorAxis (accessible via ThreeDChart.colorAxis).
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means using LineColor as the edge color.

Returns a ThreeDScatterGroup object representing the symbol group created.
See also:

- 30.58.3 addScatterGroup(xData() as Double, yData() as Double, zData() as Double, name as string = "", symbol as Integer = 7, symbolSize as Integer = 5, fillcolor as Integer = -1, edgeColor as Integer = -1) as CDThreeDScatterGroupMBS 5636

30.58.5 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new ThreeDScatterChart object.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

See also:

- 30.58.6 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0) 5638

30.58.6 Constructor(width as Integer, height as Integer, bgColor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new ThreeDScatterChart object.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

See also:

- 30.58.5 Constructor(width as Integer = 640, height as Integer = 480, bgColor as Integer = &hffff0000, edgeColor as Integer = &hff000000, raisedEffect as Integer = 0) 5637

30.59 class CDThreeDScatterGroupMBS

30.59.1 class CDThreeDScatterGroupMBS

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The ThreeDScatterGroup class represents a group of scatter symbols in a ThreeDScatterChart object.
Example:

```
// a 3D scatter chart with two groups and drop lines to the floor
Var x1(), y1(), z1(), x2(), y2(), z2() As Double
Var r As New Random
For i As Integer = 1 To 20
x1.Add r.InRange(0, 50)
y1.Add r.InRange(0, 50)
z1.Add r.InRange(0, 50)
x2.Add r.InRange(50, 100)
y2.Add r.InRange(50, 100)
z2.Add r.InRange(50, 100)
Next

Var c As New CDThreeDScatterChartMBS(500, 450)
c.setPlotRegion(250, 220, 300, 300, 200)
c.setViewAngle(15, 30)

Var a As CDThreeDScatterGroupMBS = c.addScatterGroup(x1, y1, z1, "Group A", CDBaseChartMBS.kCircleSymbol, 10, &hFF3333)
a.setDropLine(&h888888)
Var b As CDThreeDScatterGroupMBS = c.addScatterGroup(x2, y2, z2, "Group B", CDBaseChartMBS.kDiamondSymbol, 12, &h3333FF)
b.setDropLine(&h888888)

Var pic As Picture = c.makeChartPicture
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.59.2 Methods

30.59.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.59.4 setDataSymbol(DrawArea as CDDrawAreaMBS)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses a DrawArea object as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
obj	(Mandatory)	A DrawArea object to be used as the symbol.

See also:

- 30.59.5 setDataSymbol(file as folderitem) 5640
- 30.59.6 setDataSymbol(ImageFilePath as string) 5641
- 30.59.7 setDataSymbol(pic as Picture) 5642
- 30.59.8 setDataSymbol(polygon() as Integer, size as Integer = 11, fillColor as color, edgeColor as color) 5643
- 30.59.9 setDataSymbol(polygon() as Integer, size as Integer = 11, fillColor as Integer = -1, edgeColor as Integer = -1) 5643
- 30.59.10 setDataSymbol(symbol as Integer, size as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1, lineWidth as Integer = 1) 5644
- 30.59.11 setDataSymbol(symbol as Integer, size as Integer, fillColor as color) 5645
- 30.59.12 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5646

30.59.5 setDataSymbol(file as folderitem)

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Load an image from a file and use it as the graphics symbol to plot the data points.
Notes: ChartDirector will automatically detect the image file format using the file extension, which must

either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
image	(Mandatory)	The filename of the image file. The image type is determined based on file extension, which must be png, jpg/jpeg, gif or wbmp/wmp.

See also:

- 30.59.12 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5646

30.59.6 setDataSymbol(ImageFilePath as string)

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Load an image from a file and use it as the graphics symbol to plot the data points.
Notes: ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath on the directory that ChartDirector will search for the file.

Argument	Default	Description
image	(Mandatory)	The filename of the image file. The image type is determined based on file extension, which must be png, jpg/jpeg, gif or wbmp/wmp.

- 30.59.12 setDataSymbol(symbol as Integer, size as Integer, fillColor as color, edgeColor as color, lineWidth as Integer = 1) 5646

30.59.7 setDataSymbol(pic as Picture)

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses a picture object as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
obj	(Mandatory)	A picture object to be used as the symbol.

See also:

30.59.8 setDataSymbol(polygon() as Integer, size as Integer = 11, fillColor as color, edgeColor as color)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses a custom polygon as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
polygon	(Mandatory)	An array of integers representing the coordinates the polygon vertices. See Shape Specification on how the custom shape is defined.
size	11	The nominal width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette. SameAsMainColor means the color is based on the z value of the symbol as according to the ColorAxis (accessible via ThreeDChart.colorAxis).
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means using LineColor as the edge color.

30.59.13 setDropLine

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the drop line color and width.
Notes: Drop lines are vertical lines that join the data points to the bottom of the plot region. It helps in visualizing the height of the data points.

Argument	Default	Description
dropLineColor	(Mandatory)	The color of the drop line.
dropLineWidth	1	The width of the drop line.

See also:

- 30.59.14 setDropLine(dropLineColor as color, dropLineWidth as Integer = 1) 5647
- 30.59.15 setDropLine(dropLineColor as Integer, dropLineWidth as Integer = 1) 5647

30.59.14 setDropLine(dropLineColor as color, dropLineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the drop line color and width.
Notes: Drop lines are vertical lines that join the data points to the bottom of the plot region. It helps in visualizing the height of the data points.

Argument	Default	Description
dropLineColor	(Mandatory)	The color of the drop line.
dropLineWidth	1	The width of the drop line.

See also:

- 30.59.13 setDropLine 5647
- 30.59.15 setDropLine(dropLineColor as Integer, dropLineWidth as Integer = 1) 5647

30.59.15 setDropLine(dropLineColor as Integer, dropLineWidth as Integer = 1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the drop line color and width.
Notes: Drop lines are vertical lines that join the data points to the bottom of the plot region. It helps in

Argument	Default	Description
dropLineColor	(Mandatory)	The color of the drop line.
dropLineWidth	1	The width of the drop line.

visualizing the height of the data points.

See also:

- 30.59.13 setDropLine 5647
- 30.59.14 setDropLine(dropLineColor as color, dropLineWidth as Integer = 1) 5647

30.59.16 setLegendIcon(width as Integer, height as Integer = -1, color as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses one of the built-in symbols as the graphics symbol to plot the data points.
Notes:

Argument	Default	Description
symbol	(Mandatory)	One of the predefined shape constants representing the symbol shape. See Shape Specification for the available built-in shapes.
size	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette. kSameAsMainColor means the color is based on the z value of the symbol as according to the ColorAxis (accessible via ThreeDChart.colorAxis).
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means using LineColor as the edge color.
lineWidth	1	The line width used for drawing the symbols.

See also:

- 30.59.17 setLegendIcon(width as Integer, height as Integer, color as color) 5648

30.59.17 setLegendIcon(width as Integer, height as Integer, color as color)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses one of the built-in symbols as the graphics symbol to plot the data points.
Notes:

See also:

Argument	Default	Description
symbol	(Mandatory)	One of the predefined shape constants representing the symbol shape. See Shape Specification for the available built-in shapes.
size	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette. kSameAsMainColor means the color is based on the z value of the symbol as according to the ColorAxis (accessible via ThreeDChart.colorAxis).
edgeColor	-1	The edge color used to draw the edge of the symbol. -1 means using LineColor as the edge color.
lineWidth	1	The line width used for drawing the symbols.

- 30.59.16 setLegendIcon(width as Integer, height as Integer = -1, color as Integer = -1) 5648

30.59.18 setSymbolOffset(offsetX as Integer, offsetY as Integer)

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Offset the symbols in the x and y directions in pixel unit.
Notes:

Argument	Default	Description
xOffset	(Mandatory)	The x offset in pixels. A positive value mean shifting to the right.
yOffset	(Mandatory)	The y offset in pixels. A positive value mean shifting to the bottom.

30.60 class CDTreeMapChartMBS

30.60.1 class CDTreeMapChartMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The TreeMapChart class represents tree map charts.
Example:

```
// draw a tree map of disk usage by folder
Var c As New CDTreeMapChartMBS(600, 400)
c.setPlotArea(20, 20, 560, 360)

Var sizes() As Double = Array(120.0, 80.0, 45.0, 30.0, 10.0)
Var names() As String = Array("Movies", "Photos", "Music", "Documents", "Other")

Var root As CDTreeMapNodeMBS = c.RootNode
root.setData(sizes, names)

Var level As CDTreeMapNodeMBS = c.getLevelPrototype(1)
level.setLabelFormat(" { label } <*br*>{ value } GB", "bold", 12, &cFFFFFF)

Var pic As Picture = c.makeChartPicture
// show pic in a Canvas or ImageViewer
```

Notes: Subclass of the CDBaseChartMBS class.

- News from the MBS Xojo Plugins Version 21.2

30.60.2 Methods

30.60.3 Constructor(width as integer = 640, height as integer = 480, bgColor as integer = &hffff0000, edgeColor as integer = &hff000000, raisedEffect as integer = 0)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new TreeMapChart object.
Notes:

Returns the TreeMapChart object created.
See also:

- 30.60.4 Constructor(width as integer, height as integer, bgColor as color, edgeColor as color, raisedEffect as integer = 0)

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

30.60.4 Constructor(width as integer, height as integer, bgColor as color, edgeColor as color, raisedEffect as integer = 0)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a new TreeMapChart object.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

Returns the TreeMapChart object created.
See also:

- 30.60.3 Constructor(width as integer = 640, height as integer = 480, bgColor as integer = &hffff0000, edgeColor as integer = &hff000000, raisedEffect as integer = 0) 5650

30.60.5 getLevelPrototype(index as integer) as CDTreeMapNodeMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the prototype node for the specified level.
Notes: A tree map starts with the root node. The root node contains level 1 child nodes. The level 1 child nodes can in turn contain level 2 child nodes, and so on.

A prototype node is a node that acts as the template for nodes at a certain level. For example, if the level 1 prototype node is configured to use a certain font for labels, all level 1 nodes will use that font as the default for labels.

Returns TreeMapNode object representing the prototype node for the specified level.

Argument	Default	Description
level	(Mandatory)	The node level to which the prototype node applies.

30.60.6 setMapLevel(n as integer)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the node level used to generate the image map.
Notes: By default, the image map will be based on the deepest node level. For example, if the tree map has 2 levels of nodes, the image map will be based on the level 2 nodes. The setMapLevel method can be used to specify an alternative node level for the image map.

Argument	Default	Description
level	(Mandatory)	The node level used to generate the image map.

30.60.7 setPlotArea(x as integer, y as integer, width as integer, height as integer)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the position and size of the tree map plot area.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of the top-left corner of the plot area.
y	(Mandatory)	The y coordinate of the top-left corner of the plot area.
width	(Mandatory)	The width of the plot area.
height	(Mandatory)	The height of the plot area.

30.60.8 Properties

30.60.9 RootNode as CDTreeMapNodeMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the root node of the tree map.
Notes: The root node is the starting node of the tree map. Child nodes can be added to the root node, and a second level of child nodes can be added to the first level child nodes, and so on.

(Read only property)

30.61 class CDTreeMapNodeMBS

30.61.1 class CDTreeMapNodeMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The TreeMapNode class represents tree map nodes.
Example:

```
// a tree map of disk usage with one level of child nodes
Var c As New CDTreeMapChartMBS(600, 400)
c.setPlotArea(10, 10, 580, 380)

Var sizes() As Double = Array(120.0, 80.0, 45.0, 20.0)
Var names() As String = Array("Photos", "Movies", "Music", "Documents")
Var root As CDTreeMapNodeMBS = c.RootNode
root.setData(sizes, names)

// labels and colors for all nodes of the first level
Var level1 As CDTreeMapNodeMBS = c.getLevelPrototype(1)
level1.setLabelFormat(" { label } <*br*>{ value } GB", "arialbd.ttf", 12, &hFFFFFF)
level1.setColors(-1, &hFFFFFF)

Var pic As Picture = c.makeChartPicture
```

Notes: The TreeMapChart.getRootNode method can be used to obtain the root node of a tree map chart. TreeMapNode.setData can then be used to add child nodes.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.61.2 Methods

30.61.3 addExtraField(numbers() as double)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds an array of numbers/dates to be used as an extra field in various places.
Notes: This method merely stores the data inside the node object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

Argument	Default	Description
numbers	(Mandatory)	An array of numbers/dates an extra field of the child nodes.

See also:

- 30.61.4 addExtraField(texts() as string) 5655

30.61.4 addExtraField(texts() as string)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds an array of text to be used as an extra field of the child nodes.
Notes: This method merely stores the data inside the node object. The Parameter Substitution and Formatting mechanism will determine how the data are to be used.

A common use for extra fields is to specify extra information (such as a custom serial number for the data points) to be displayed on data labels or on tool tips, or to supply extra query parameters in clickable charts. All these are achieved by specifying the extra field on the data label template or image map templates during parameter substitution.

Argument	Default	Description
texts	(Mandatory)	An array of text to be an extra field of the child nodes.

See also:

- 30.61.3 addExtraField(numbers() as double) 5654

30.61.5 Constructor

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

30.61.6 Node(Index as Integer) as CDTreeMapNodeMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the child node at the specified index.
Notes:

Argument	Default	Description
i	(Mandatory)	The index of the child node.

Returns the TreeMapNode object representing the child node at the specified index.

30.61.7 setColors(fillColor as color, edgeColor as color, raisedEffect as integer = -2147483647)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the fill and border colors and 3D border effect of the node.
Notes:

Argument	Default	Description
fillColor	(Mandatory)	The fill color of the node.
edgeColor	(Optional)	The border color of the node.
raisedEffect	(Optional)	The 3D border width. For positive values, the border ill appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument can also be used to specify CDBaseChartMBS.glassEffect, CDBaseChartMBS.softLighting, CDBaseChartMBS.cylinderEffect or CDBaseChartMBS.flatBorder effects.

See also:

- 30.61.8 setColors(fillColor as integer, edgeColor as integer = -1, raisedEffect as integer = -2147483647) 5656

30.61.8 setColors(fillColor as integer, edgeColor as integer = -1, raisedEffect as integer = -2147483647)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the fill and border colors and 3D border effect of the node.
Notes:

See also:

- 30.61.7 setColors(fillColor as color, edgeColor as color, raisedEffect as integer = -2147483647) 5656

Argument	Default	Description
fillColor	(Mandatory)	The fill color of the node.
edgeColor	(Optional)	The border color of the node.
raisedEffect	(Optional)	The 3D border width. For positive values, the border ill appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat. This argument can also be used to specify CDBaseChartMBS.glassEffect, CDBaseChartMBS.softLighting, CDBaseChartMBS.cylinderEffect or CDBaseChartMBS.flatBorder effects.

30.61.9 setData(data() as double)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the data for the child nodes.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers for the values of the child node. This array can be empty if the child nodes contains other child nodes. In this case, the value of a node will be determined as the sum of the values of its child nodes.

See also:

- 30.61.10 setData(data() as double, labels() as string) 5657
- 30.61.11 setData(data() as double, labels() as string, colors() as Color) 5658
- 30.61.12 setData(data() as double, labels() as string, colors() as Integer) 5658

30.61.10 setData(data() as double, labels() as string)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the data for the child nodes.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers for the values of the child node. This array can be empty if the child nodes contains other child nodes. In this case, the value of a node will be determined as the sum of the values of its child nodes.
labels	[Empty_Array]	An array of text strings for the node labels.

See also:

- 30.61.9 setData(data() as double) 5657

- 30.61.11 setData(data() as double, labels() as string, colors() as Color) 5658
- 30.61.12 setData(data() as double, labels() as string, colors() as Integer) 5658

30.61.11 setData(data() as double, labels() as string, colors() as Color)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the data for the child nodes.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers for the values of the child node. This array can be empty if the child nodes contains other child nodes. In this case, the value of a node will be determined as the sum of the values of its child nodes.
labels	[Empty_Array]	An array of text strings for the node labels.
colors	[Empty_Array]	An array of colors to be used as the fill colors of the child nodes. An empty array means the colors are determined by the prototype node (See CDTreeMapChartMBS.getLevelPrototype).

See also:

- 30.61.9 setData(data() as double) 5657
- 30.61.10 setData(data() as double, labels() as string) 5657
- 30.61.12 setData(data() as double, labels() as string, colors() as Integer) 5658

30.61.12 setData(data() as double, labels() as string, colors() as Integer)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the data for the child nodes.
Notes:

Argument	Default	Description
data	(Mandatory)	An array of numbers for the values of the child node. This array can be empty if the child nodes contains other child nodes. In this case, the value of a node will be determined as the sum of the values of its child nodes.
labels	[Empty_Array]	An array of text strings for the node labels.
colors	[Empty_Array]	An array of colors to be used as the fill colors of the child nodes. An empty array means the colors are determined by the prototype node (See CDTreeMapChartMBS.getLevelPrototype).

See also:

- 30.61.9 setData(data() as double) 5657

- 30.61.10 setData(data() as double, labels() as string) 5657
- 30.61.11 setData(data() as double, labels() as string, colors() as Color) 5658

30.61.13 setLabelFormat(formatString as string = " { label } ", font as string = "normal", fontSize as Integer = 10, fontColor as Integer = &hffff0002, alignment as Integer = 7)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the node label format and font style.
Notes: Please refer to Parameter Substitution and Formatting in FAQ on all available format parameters.

Argument	Default	Description
format	(Mandatory)	The format string.
font	"normal"	The font used to draw the label.
fontSize	10	The font size used to draw the labels in points.
fontColor	TextColor	The color used to draw the labels.
alignment	TopLeft	The alignment of the label inside the node. See Alignment Specification for supported alignment types.

See also:

- 30.61.14 setLabelFormat(formatString as string, font as string, fontSize as Integer, fontColor as Color, alignment as Integer = 7) 5659

30.61.14 setLabelFormat(formatString as string, font as string, fontSize as Integer, fontColor as Color, alignment as Integer = 7)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the node label format and font style.
Notes: Please refer to Parameter Substitution and Formatting in FAQ on all available format parameters.

Argument	Default	Description
format	(Mandatory)	The format string.
font	"normal"	The font used to draw the label.
fontSize	10	The font size used to draw the labels in points.
fontColor	TextColor	The color used to draw the labels.
alignment	TopLeft	The alignment of the label inside the node. See Alignment Specification for supported alignment types.

See also:

- 30.61.13 setLabelFormat(formatString as string = " { label } ", font as string = "normal", fontSize as Integer = 10, fontColor as Integer = &hffff0002, alignment as Integer = 7) 5659

30.61.15 setLayoutAspectMultiplier(multiplier as Double)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets layout aspect multiplier.

30.61.16 setLayoutAspectRatio(ratio as Double)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the layout aspect ratio.

30.61.17 setLayoutMethod(layoutMethod as Integer, layoutDirection as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the layout method used to layout the child nodes.
Notes: The layout method is specified by using the following predefined constants as the layoutMethod argument.

If a layout method argument is not specified, it will be obtained from the prototype node (see TreeMapChart.getLevelPrototype). If it is still not specified, the parent node will be used. If the node is the root node with no parent, the default is to use TreeMapSquarify with kTopLeft layout direction and without swapXY.

Argument	Default	Description
layoutMethod	(Mandatory)	The layout method used to layout the child nodes. A value of 0 means the layout method is not specified.
layoutDirection	(Optional)	The layout direction. Must be one of kTopLeft, kTopRight, kBottomLeft and kBottomRight. By default, the horizontal direction will be applied first, followed by the vertical direction.
swapXY	(Optional)	If set to true, the vertical direction will be applied first, followed by the horizontal direction. A false value means the opposite.

See also:

- 30.61.18 setLayoutMethod(layoutMethod as Integer, layoutDirection as Integer, swapXY as Boolean) 5661

30.61.18 setLayoutMethod(layoutMethod as Integer, layoutDirection as Integer, swapXY as Boolean)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the layout method used to layout the child nodes.
Notes: The layout method is specified by using the following predefined constants as the layoutMethod argument.

If a layout method argument is not specified, it will be obtained from the prototype node (see TreeMapChart.getLevelPrototype). If it is still not specified, the parent node will be used. If the node is the root node with no parent, the default is to use TreeMapSquarify with kTopLeft layout direction and without swapXY.

Argument	Default	Description
layoutMethod	(Mandatory)	The layout method used to layout the child nodes. A value of 0 means the layout method is not specified.
layoutDirection	(Optional)	The layout direction. Must be one of kTopLeft, kTopRight, kBottomLeft and kBottomRight. By default, the horizontal direction will be applied first, followed by the vertical direction.
swapXY	(Optional)	If set to true, the vertical direction will be applied first, followed by the horizontal direction. A false value means the opposite.

See also:

- 30.61.17 setLayoutMethod(layoutMethod as Integer, layoutDirection as Integer = -1) 5660

30.61.19 setPos(x as Integer, y as Integer, w as Integer, h as Integer)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the position of the node.

30.61.20 setSorting(Mode as Integer)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Layout the nodes in sorted order.
Notes: ChartDirector supports a number of layout methods (see TreeMapNode.setLayoutMethod), most them will layout the nodes in the order they appear in the data array. The setSorting can be used to layout the nodes in sorted order instead.

Argument	Default	Description
mode	(Mandatory)	The values -1, 0, 1 refer to descending, no sorting and ascending order.

30.61.21 Properties

30.61.22 BottomY as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the bottom y coordinate of the node.
Notes: This method should be used only after calling BaseChart.layout or after ChartDirector has output the chart image.
(Read only property)

30.61.23 Handle as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

30.61.24 Height as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the height of the node.
Notes: This method should be used only after calling BaseChart.layout or after ChartDirector has output the chart image.
(Read only property)

30.61.25 Label as String

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the label value of the node.
Notes: (Read only property)

30.61.26 LeftX as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the left x coordinate of the node.
Notes: This method should be used only after calling BaseChart.layout or after ChartDirector has output the chart image.
(Read only property)

30.61.27 NodeCount as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the number of child nodes.
Notes: (Read only property)

30.61.28 RightX as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the right x coordinate of the node.
Notes: This method should be used only after calling BaseChart.layout or after ChartDirector has output the chart image.
(Read only property)

30.61.29 TopY as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the top y coordinate of the node.
Notes: This method should be used only after calling BaseChart.layout or after ChartDirector has output the chart image.
(Read only property)

30.61.30 Value as Double

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the data value of the node.
Notes: (Read only property)

30.61.31 Width as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the width of the node.
Notes: This method should be used only after calling BaseChart.layout or after ChartDirector has output the chart image.
(Read only property)

30.62 class CDTrendLayerMBS

30.62.1 class CDTrendLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The TrendLayer class represents trend layers.
Example:

```
// a scatter chart with a linear trend line and its formula
Var xData() As Double = Array(1.0, 2.0, 3.0, 4.0, 5.0, 6.0, 7.0)
Var yData() As Double = Array(2.1, 3.9, 6.2, 7.8, 10.1, 12.2, 13.8)

Var c As New CDXYChartMBS(450, 320)
Call c.setPlotArea(50, 30, 370, 250)
Call c.addScatterLayer(xData, yData, "Measured", CDBaseChartMBS.kCircleShape, 8, &h3366CC)

Var trend As CDTrendLayerMBS = c.addTrendLayer(xData, yData, &hCC0000, "Trend")
trend.setLineWidth(2)
Call c.addTitle("y = " + Format(trend.getSlope, "0.00") + " x + " + Format(trend.getIntercept, "0.00"))

Var pic As Picture = c.makeChartPicture
```

Notes: The trend layer performs linear regression analysis on the data points, and represents the result as a best fit straight line with optional confidence and prediction bands.

In linear regression analysis, the data points are assumed to be related by:

y = m * x + c + err
where m and c are constants, and err is a random variable.

Linear regression analysis estimates m, c and err based on available data using the least square method. Using estimated values of m and c, the line y = m * x + c are plotted as the best fit straight line based on available data.

However, as m and c are estimations based on available data, it may not be exactly equal to the "real" m and c. In ChartDirector, the uncertainties are represented visually as a confidence band around the regression line. For example, the 95% confidence band means there are 95% probability that the "real" line is in that band.

To predict a data point (infer y given x), we can use the formula:

y = m * x + c + err
based on estimated values of m, c and err.

The uncertainties of the data point is contributed by the uncertainties in m and c, as well as err. In ChartDirector, the uncertainties of the data points are represented visually as a prediction band around the regression line. For example, a 95% prediction band means there are 95% probability that a data point will be in that band.

The prediction band is always wider than the confidence band. It is because the uncertainties of the regression line is contributed by m and c, while the uncertainties of the data points are contributed by m, c and err. The err term makes the data points less certain that the regression line.
Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.62.2 Methods

30.62.3 addConfidenceBand(confidence as Double, upperFillColor as color, upperEdgeColor as color, upperLineWidth as Integer, lowerFillColor as color, lowerEdgeColor as color, lowerLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addConfidenceBand method, but uses color instead of integer data type for passing color values.
See also:

- 30.62.4 addConfidenceBand(confidence as Double, upperFillColor as Integer, upperEdgeColor as Integer = &hFF000000, upperLineWidth as Integer = -1, lowerFillColor as Integer = -1, lowerEdgeColor as Integer = -1, lowerLineWidth as Integer = -1) 5666

30.62.4 addConfidenceBand(confidence as Double, upperFillColor as Integer, upperEdgeColor as Integer = &hFF000000, upperLineWidth as Integer = -1, lowerFillColor as Integer = -1, lowerEdgeColor as Integer = -1, lowerLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a confidence band to the trend layer.
Notes: Please refer to the description of TrendLayer on what is a confidence band.

See also:

Argument	Default	Description
confidence	(Mandatory)	The confidence level - must be between 0 - 1.
upperFillColor	(Mandatory)	The fill color for the upper side of the confidence band (the portion that is above the regression line).
upperEdgeColor	Transparent	The border color for the upper side of the confidence band (the portion that is above the regression line).
upperLineWidth	1	The border width for the upper side of the confidence band (the portion that is above the regression line).
lowerFillColor	-1	The fill color for the lower side of the confidence band (the portion that is below the regression line). -1 means the color is the same as upperFillColor.
lowerEdgeColor	-1	The border color for the lower side of the confidence band (the portion that is below the regression line). -1 means the color is the same as upperEdgeColor.
lowerLineWidth	-1	The border width for the lower side of the confidence band (the portion that is below the regression line). -1 means the color is the same as upperLineWidth.

- 30.62.3 addConfidenceBand(confidence as Double, upperFillColor as color, upperEdgeColor as color, upperLineWidth as Integer, lowerFillColor as color, lowerEdgeColor as color, lowerLineWidth as Integer = -1) 5666

30.62.5 addPredictionBand(confidence as Double, upperFillColor as color, upperEdgeColor as color, upperLineWidth as Integer, lowerFillColor as color, lowerEdgeColor as color, lowerLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addPredictionBand method, but uses color instead of integer data type for passing color values.
See also:

- 30.62.6 addPredictionBand(confidence as Double, upperFillColor as Integer, upperEdgeColor as Integer = &hFF000000, upperLineWidth as Integer = -1, lowerFillColor as Integer = -1, lowerEdgeColor as Integer = -1, lowerLineWidth as Integer = -1) 5667

30.62.6 addPredictionBand(confidence as Double, upperFillColor as Integer, upperEdgeColor as Integer = &hFF000000, upperLineWidth as Integer = -1, lowerFillColor as Integer = -1, lowerEdgeColor as Integer = -1, lowerLineWidth as Integer = -1)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a prediction band to the trend layer.
Notes: Please refer to the description of TrendLayer on what is a prediction band.

See also:

Argument	Default	Description
confidence	(Mandatory)	The confidence level - must be between 0 - 1.
upperFillColor	(Mandatory)	The fill color for the upper side of the prediction band (the portion that is above the regression line).
upperEdgeColor	Transparent	The border color for the upper side of the prediction band (the portion that is above the regression line).
upperLineWidth	1	The border width for the upper side of the prediction band (the portion that is above the regression line).
lowerFillColor	-1	The fill color for the lower side of the prediction band (the portion that is below the regression line). -1 means the color is the same as upperFillColor.
lowerEdgeColor	-1	The border color for the lower side of the prediction band (the portion that is below the regression line). -1 means the color is the same as upperEdgeColor.
lowerLineWidth	-1	The border width for the lower side of the prediction band (the portion that is below the regression line). -1 means the color is the same as upperLineWidth.

- 30.62.5 addPredictionBand(confidence as Double, upperFillColor as color, upperEdgeColor as color, upperLineWidth as Integer, lowerFillColor as color, lowerEdgeColor as color, lowerLineWidth as Integer = -1) 5667

30.62.7 getCoefficient(index as Integer) as Double

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the coefficients of the regression function.
Notes: The coefficients depend on the regression type. They are indexed as a0, a1, a2, ... in the regression type table published on TrendLayer.

30.62.8 getCorrelation as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the correlation coefficient of the trend line.

30.62.9 getIntercept as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the y-axis intercept of the trend line.

30.62.10 getLine as CDLineObjMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves an opaque LineObj representing the trend line. The opaque LineObj is to be used in XYChart.addInterLineLayer for adding coloring between lines.

30.62.11 getSlope as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the slope of the trend line.

30.62.12 getStdError as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the standard error of the trend line.

30.62.13 setImageMapWidth(w as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the effective width of the line used for producing image maps.
Notes: For thin lines, it is hard to click on the lines. So for the purpose of producing image maps for a line chart, ChartDirector can assume the line is very thick. The default is 10 pixels.

Argument	Default	Description
width	(Mandatory)	The effective width of the line used for producing image maps.

30.62.14 setRegressionType(regressionType as Integer)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the regression type to be used.
Notes: RegressionType:
Must be one of the constants kLinearRegression, kConstrainedLinearRegression, kExponentialRegression and kLogarithmicRegression, or the return value of BaseChartMBS.PolynomialRegression. They represent linear regression, constrained linear regression, exponential regression, logarithmic regression, and polynomial regression of configurable degree.

30.63 class CDTTFTextMBS

30.63.1 class CDTTFTextMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The TTFText class represents text blocks.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.63.2 Methods

30.63.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

30.63.4 destroy

MBS ChartDirector Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Destroys the text object.
Notes: Normally you don't need to call this.

30.63.5 draw(x as Integer, y as Integer, colorvalue as color, alignment as Integer = 7)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other draw method, but uses color instead of integer data type for passing color values.
See also:

- 30.63.6 draw(x as Integer, y as Integer, colorvalue as Integer, alignment as Integer = 7) 5671

30.63.6 draw(x as Integer, y as Integer, colorvalue as Integer, alignment as Integer = 7)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Draws the text block.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of a reference point to align the text.
y	(Mandatory)	The y coordinate of a reference point to align the text.
color	(Mandatory)	The color of the text.
alignment	TopLeft	The location of the text relative to the reference point. See Alignment Specification for supported alignment types.

See also:

- 30.63.5 draw(x as Integer, y as Integer, colorvalue as color, alignment as Integer = 7) 5670

30.63.7 getHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the height of the text block.

30.63.8 getLineDistance as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the distance between two lines in the text block.
Notes: Return Value
The distance between two lines in the text block in pixels.

30.63.9 getLineHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the height of a typical line in the text block.

30.63.10 getWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the width of the text block.

30.64 class CDVectorLayerMBS

30.64.1 class CDVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The VectorLayer class represents vector layers.
Notes: Subclass of the CDLayerMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

30.64.2 Methods

30.64.3 setArrowAlignment(alignment as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the alignment of the vector relative to the data point.
Notes:

Argument	Default	Description
alignment	(Mandatory)	A BottomCenter value means the vector will point away from the data point (the default). A TopCenter value means the vector will point into the data point. A Center value means the center of the vector will be at the data point.

30.64.4 setArrowHead(polygon() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a custom shape to be used as the arrow head.
Notes: The custom shape is specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 10 x 10 units, in which the x-axis is from left to right, and the y-axis from bottom to top. The origin is assumed to be the bottom center of the arrow (the point where the arrow head joins the arrow stem). The shape is assumed to represent an arrow pointing upwards.

As an example, the followings are the integer array that represents the standard ChartDirector vector arrow head:

-5, -5, 0, 0, 5, -5, 0, 5

ChartDirector will automatically scale the shape to the actual width and height as specified in VectorLayer.setArrowHead.

Argument	Default	Description
polygon	(Mandatory)	An array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates the polygon vertices on a 10 x 10 units grid.

See also:

- 30.64.5 setArrowHead(width as Integer, height as Integer = 0) 5674

30.64.5 setArrowHead(width as Integer, height as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the size of the arrow head.
Notes:

Argument	Default	Description
width	(Mandatory)	The width of the arrow head in pixels. The default width is 8 pixels.
height	0	The height of the arrow head in pixels. The default value of 0 means the height is the same as the width.

See also:

- 30.64.4 setArrowHead(polygon() as Integer) 5673

30.64.6 setArrowStem(polygon() as Integer)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a custom shape to be used as the arrow stem.
Notes: By default, the arrow stem is just a straight line, with the line width controlled using Layer.setLineWidth. The setArrowStem method can specify a custom shape for the arrow stem.

The custom shape is specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 10 x 100 units, in which the x-axis is from left to right, and the y-axis from bottom to top. The origin is assumed to be the starting point of the arrow stem, and the shape is assumed to represent an arrow stem pointing upwards.

ChartDirector will automatically scale the shape so that the total arrow length (head + stem) is the required length of the arrow as according to actual data, and the stem width is as specified in Layer.setLineWidth.

Argument	Default	Description
polygon	(Mandatory)	An array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates the polygon vertices on a 10 x 100 units grid.

30.64.7 setIconSize(height as Integer, width as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the size of the icon to be used in legend box.
Notes: By default, if a legend box is available on the chart, ChartDirector will insert an legend entry if the VectorLayer is named. The size of the icon will be the size of the vectors used on the chart, using a short vector length to fit the legend box.

This method can be used to override the legend box settings to specify a custom width/height for the icons of the current VectorLayer.

Argument	Default	Description
height	(Mandatory)	The height of the icon in pixels.
width	0	The width of the icon in pixels. The default value of 0 means the width is automatically determined.

30.64.8 setVector(lengths() as Double, directions() as Double, lengthScale as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the lengths and directions for the vectors.
Notes: ChartDirector supports specifying lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.

Constant	Value	Description
PixelScale	0	The unit is measured in pixels.
XAxisScale	1	The unit is measured in x-axis scale.
YAxisScale	2	The unit is measured in y-axis scale.

Argument	Default	Description
lengths	(Mandatory)	An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.
directions	(Mandatory)	An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.
lengthScale	PixelScale	The unit for the lengths, which must be one of the predefined constants in the table above.

30.64.9 setVectorMargin(startMargin as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the margins to shorten the vectors.
Notes: By default, vectors will be drawn from the given start points to the given end points.

In some cases, it may be desirable to shorten the vectors so that they do not start exactly at the start points and/or end exactly at the end points. For example, the vectors may be used to point to some circular symbols created by a ScatterLayer. The vectors may need to point to the perimeter of the circles, rather than their centers. This can be achieved by shortening the vectors by the radius of the circles.

Arguments:

Argument	Default	Description
startMargin	(Mandatory)	The length to shorten at the start of the vector in pixels.
endMargin	NoValue	The length to shorten at the end of the vector in pixels. NoValue means the length is the same as startMargin.

See also:

- 30.64.10 setVectorMargin(startMargin as Double, endMargin as Double) 5676

30.64.10 setVectorMargin(startMargin as Double, endMargin as Double)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the margins to shorten the vectors.
Notes: By default, vectors will be drawn from the given start points to the given end points.

In some cases, it may be desirable to shorten the vectors so that they do not start exactly at the start points and/or end exactly at the end points. For example, the vectors may be used to point to some circular symbols created by a ScatterLayer. The vectors may need to point to the perimeter of the circles, rather than their centers. This can be achieved by shortening the vectors by the radius of the circles.

Arguments:

Argument	Default	Description
startMargin	(Mandatory)	The length to shorten at the start of the vector in pixels.
endMargin	NoValue	The length to shorten at the end of the vector in pixels. NoValue means the length is the same as startMargin.

30.65 class CDViewPortControlBaseMBS

30.65.1 class CDViewPortControlBaseMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A viewport control is a user interface element to let the user visualize and manipulate the viewport managed by the CDViewPortManagerMBS.
Notes: In typical usage, the viewport control displays an "overall chart" that shows the full data range, and connects to the CDViewPortManagerMBS using ViewPortControlBase.setViewPortManager. It can then include a rectangle on the overall chart to represent the viewport in the CDViewPortManagerMBS. The region outside the rectangle can be dimmed out to highlight the viewport region. If the viewport is updated (such as if the user uses the mouse wheel to zoom in the chart), the rectangle will also update automatically.

To manipulate the viewport, the user can drag the rectangle to move the viewport (equivalent to scrolling). The user can also resize the viewport by dragging the border of the rectangle (equivalent to zooming), or drag a new rectangular region on the overall chart to be used as the new viewport, or click on a point on the chart to center the viewport at that point.

In ChartDirector, the ViewPortControlBase implements the main logic of the viewport control without the GUI framework specific functions. The actual GUI framework specific control can derive from ViewPortControlBase and implement the GUI specific part. This greatly simplifies development of the actual control.

30.65.2 Methods

30.65.3 Constructor

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

30.65.4 getProperty(attr as integer) as integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries a property by ID.

30.65.5 handleMouseDown(x as double, y as double)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Handles the mouse down.
Notes:

Argument	Default	Description
x	(Mandatory)	The x pixel coordinate of the mouse.
y	(Mandatory)	The y pixel coordinate of the mouse.

30.65.6 handleMouseMove(x as double, y as double, isDragging as boolean)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Handles the mouse move.
Notes:

Argument	Default	Description
x	(Mandatory)	The x pixel coordinate of the mouse.
y	(Mandatory)	The y pixel coordinate of the mouse.

30.65.7 handleMouseUp(x as double, y as double)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Handles the mouse up.
Notes:

Argument	Default	Description
x	(Mandatory)	The x pixel coordinate of the mouse.
y	(Mandatory)	The y pixel coordinate of the mouse.

30.65.8 isOnPlotArea(x as double, y as double) as boolean

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Determines if a point is on the plot area.
Notes:

Argument	Default	Description
x	(Mandatory)	The x pixel coordinate of the point.
y	(Mandatory)	The y pixel coordinate of the point.

30.65.9 paintViewPort

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Updates the viewport rectangle on the chart to reflect the state of the viewport.

30.65.10 setMouseMargin(mouseMargin as Integer, cornerMargin as Integer)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the margin around the viewport border for mouse drag.
Notes: The viewport border can be as thin as 1 pixel, and it is hard to position the mouse over the border to drag it. To make it easier to drag the border, dragging can start if the mouse is within a certain margin from the border.

If both vertical and horizontal zooming is allowed, the viewport corners can be dragged diagonally to resize the viewport in both directions at the same time. To distinguish between dragging the corners and the borders, if the mouse is within a certain margin from the corner when the dragging starts, it is considered to be dragging the corner.

In either case, the mouse cursor will change to let the user know if the border or corner can be dragged.

Argument	Default	Description
mouseMargin	(Mandatory)	The margin around the viewport border within which dragging of the border can start. The margin is in pixel unit. The default is 4 pixels.
cornerMargin	(Mandatory)	The margin around the viewport corner within which dragging of the corner can start. The margin is in pixel unit. The default is 8 pixels.

30.65.11 setProperty(attr as integer, value as integer)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets a property by ID.

30.65.12 setZoomScrollDirection(zoomDirection as integer, scrollDirection as integer)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the directions in which zooming and scrolling are allowed.
Notes: The viewport control uses this information to determine which type of dragging is allowed.
Arguments

Argument	Default	Description
zoomDirection	(Mandatory)	The allowable zoom direction. Must be one of the predefined constants kDirectionHorizontal, kDirectionVertical and kDirectionHorizontalVertical for horizontal, vertical and bi-directional zooming.
scrollDirection	(Mandatory)	The allowable scroll direction. Must be one of the predefined constants kDirectionHorizontal, kDirectionVertical and kDirectionHorizontalVertical for horizontal, vertical and bi-directional scrolling.

30.65.13 Properties

30.65.14 Chart as CDBaseChartMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The BaseChart object to be displayed in the viewport control.
Notes: (Read and Write property)

30.65.15 ClickToCenter as Boolean

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enables or disables centering the viewport at the clicked point.
Notes: True to enable the behaviour, false to disable it.
(Read and Write property)

30.65.16 CornerMargin as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The corner margin.
Notes: See setMouseMargin.
(Read and Write property)

30.65.17 Cursor as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the mouse cursor to be used for user feedback.
Notes: Returns kLeft, kRight, kTop or kBottom if the mouse can initiate dragging the corresponding side of the viewport. Returns kTopLeft, kTopRight, kBottomLeft or kBottomRight if the mouse can initiate dragging the corresponding corner of the viewport. Returns kCenter if the mouse is within the viewport.
(Read only property)

30.65.18 DragBorderToResize as Boolean

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enables or disables dragging the viewport border to resize it.
Notes: True to enable the behaviour, false to disable it.
(Read and Write property)

30.65.19 DragInsideToMove as Boolean

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enables or disables dragging inside the viewport to move it.
Notes: (Read and Write property)

30.65.20 DragOutsideToSelect as Boolean

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Enables or disables dragging outside the viewport to select a new viewport.
Notes: True to enable the behaviour, false to disable it.
(Read and Write property)

30.65.21 MouseMargin as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The mouse margin.
Notes: See setMouseMargin.
(Read and Write property)

30.65.22 needUpdateChart as Boolean

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks if need to update the chart in a viewport changed event.
Notes: True if need to update the chart in a viewport changed event, otherwise false.
(Read only property)

30.65.23 needUpdateDisplay as Boolean

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks if need to update the viewport control screen display.
Notes: True if need to update the viewport control screen display, otherwise false.
(Read only property)

30.65.24 needUpdateImageMap as Boolean

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Checks if need to update the image map in a viewport changed event.
Notes: True if need to update the image map in a viewport changed event, otherwise false.
(Read only property)

30.65.25 SelectionBorderColor as Color

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the border color of the selection box.
Notes:

(Read and Write property)

Argument	Default	Description
color	(Mandatory)	The border color of the selection box. The default is semi-transparent black (&c7F000000).

30.65.26 SelectionBorderWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the border width of the selection box.
Notes:

Argument	Default	Description
width	(Mandatory)	The border width of the selection box. The default is 1 pixel.

(Read and Write property)

30.65.27 ViewPortBorderColor as Color

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the viewport border color.
Notes:

Argument	Default	Description
color	(Mandatory)	The viewport border color. The default is semi-transparent black (&c7F000000).

(Read and Write property)

30.65.28 ViewPortBorderWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the viewport border width.
Notes:

(Read and Write property)

Argument	Default	Description
width	(Mandatory)	The viewport border width. The default is 1 pixel.

30.65.29 ViewPortExternalColor as Color

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the fill color for the region outside the viewport.
Notes:

Argument	Default	Description
color	(Mandatory)	The fill color for the region outside the viewport. The default is semi-transparent white (&c7FFFFFFF) to dim out the region.

(Read and Write property)

30.65.30 ViewPortFillColor as Color

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the fill color for the region inside the viewport.
Notes:

Argument	Default	Description
color	(Mandatory)	The fill color for the region inside the viewport. The default is transparent.

(Read and Write property)

30.65.31 ViewPortManager as CDViewPortManagerMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The ViewPortManager object to be associated with the viewport control.
Notes: (Read and Write property)

30.66 class CDViewPortManagerMBS

30.66.1 class CDViewPortManagerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: A view port can be imagined as a rectangular window of an underlying rectangular surface.
Notes: For example, a chart that has 10 years of data can be imagined as a very long chart. If one only displays one of the year, we can say the view port covers only 10% of the underlying chart.

With the view port concept, scrolling can be handled as moving the view port, while zooming in and out can be handled as changing the view port size.

ViewPortManager is a utility class for handling view ports. It manages mapping of the mouse and display pixel coordinates to view port coordinates, and supports various user interface constraints that limits how the view port may be changed.

View port coordinates are represented as fractions of the width or height of the underlying surface. For example, the width of a view port is represented as a fraction of the width of the underlying surface, so it must be between 0 to 1. A value of 0.1 means the view port width is 10% of the underlying surface width.

If you are using MFC, there is no need to create a ViewPortManager object directly. You may simply use the MFC CChartViewer control, which is a derived class of ViewPortManager and contains all its functions.

If you are using other GUI framework, and would like to perform zooming and scrolling functions by mouse drag, the ViewPortManager may be useful to you. The section Using ChartDirector with Other GUI Frameworks contains outlines on how the ViewPortManager may be used in general GUI frameworks.

30.66.2 Methods

30.66.3 canZoomIn(zoomDirection as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if it is possible to zoom in further at a certain direction without violating zoom in limits.
Notes: See ViewPortManager.setZoomInWidthLimit and ViewPortManager.setZoomInHeightLimit on how to configure zoom in limits.

Argument	Default	Description
zoomDirection	(Mandatory)	The zoom direction to check. Must be one of the predefined constants DirectionHorizontal, DirectionVertical and DirectionHorizontalVertical for horizontal, vertical and bi-directional zooming.

Return Value
True if can zoom in further, otherwise false.

30.66.4 canZoomOut(zoomDirection as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if it is possible to zoom out further at a certain direction without violating zoom out limits.
Notes: See ViewPortManager.setZoomOutWidthLimit and ViewPortManager.setZoomOutHeightLimit on how to configure zoom out limits.

Argument	Default	Description
zoomDirection	(Mandatory)	The zoom direction to check. Must be one of the predefined constants DirectionHorizontal, DirectionVertical and DirectionHorizontalVertical for horizontal, vertical and bi-directional zooming.

Return Value
True if can zoom out further, otherwise false.

30.66.5 clearAllRanges

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A convenience method to clear all the ranges configured using setFullRange.

30.66.6 commitPendingSyncAxis(baseChart as CDBaseChartMBS)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The commitPendingSyncAxis is a method to actually perform the function in syncLinearAxisWithViewPort, syncLogAxisWithViewPort and syncDateAxisWithViewPort.

30.66.7 Constructor

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new viewport.

30.66.8 dragTo(scrollDirection as integer, x as double, y as double) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scrolls the view port to reflect dragging of the underlying rectangular surface.
Notes: The amount of drag is measured as changed in mouse cursor coordinates since the call to ViewPortManager.startDrag. A positive change means the dragging is to the right or bottom. A negative change means the dragging is to the left or top.

The drag is considered as applying to the underlying surface. The view port moves in the opposite direction to the drag. For example, dragging the underlying surface to the right is equivalent to moving the view port to the left.

The view port may not change at all if it has reached the borders of the underlying surface.

Argument	Default	Description
scrollDirection	(Mandatory)	The allowed scroll direction. Must be one of the predefined constants DirectionHorizontal, DirectionVertical and DirectionHorizontalVertical for horizontal, vertical and bi-directional scrolling.
deltaX	(Mandatory)	The change in mouse x-coordinates. A positive change means the drag is to the right. A negative change means the drag is to the right.
deltaY	(Mandatory)	The change in mouse y-coordinates. A positive change means the drag is to the bottom. A negative change means the drag is to the top.

30.66.9 getPlotAreaHeight as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the height of the plot area in pixels.
Notes: Return Value
The height of the plot area in pixels.

30.66.10 getPlotAreaLeft as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the x-coordinate of the left side of the plot area in pixels.
Notes: Return Value
The x-coordinate of the left side of the plot area in pixels.

30.66.11 getPlotAreaTop as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the y-coordinate of the top side of the plot area in pixels.

30.66.12 getPlotAreaWidth as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the width of the plot area in pixels.

30.66.13 getValueAtViewPort(id as string, ratio as Double, isLogScale as boolean = false) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a view port coordinate to a value of the specified data scale.
Notes: Please refer to ViewPortManager.setFullRange on how to define a data scale.

Argument	Default	Description
id	(Mandatory)	The name of the data scale.
vpCoor	(Mandatory)	The view port coordinate.
isLogScale	false	true if the conversion is based on a logarithmic scale. false if the conversion is based on a non-logarithmic scale.

Returns the value of the specified data scale at the view port coordinate.

30.66.14 getViewPortAtValue(id as string, ratio as Double, isLogScale as boolean = false) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a value of the specified data scale to a view port coordinate.
Notes: Please refer to ViewPortManager.setFullRange on how to define a data scale.

Argument	Default	Description
id	(Mandatory)	The name of the data scale.
value	(Mandatory)	The value to be converted.
isLogScale	false	true if the conversion is based on a logarithmic scale. false if the conversion is based on a non-logarithmic scale.

Returns the view port coordinate at the value of the specified data scale.

30.66.15 getViewPortHeight as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the height of the view port.
Notes: The view port height is expressed as a fraction of the height of the underlying surface. It should be between 0 and 1.

30.66.16 getViewPortLeft as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the position of the left side of the view port.
Notes: The position of the view port left side is its distance from the left side of the underlying surface, as a fraction of the width of the underlying surface. It should be between 0 and 1.

30.66.17 getViewPortTop as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the position of the top side of the view port.
Notes: The position of the view port top side is its distance from the top side of the underlying surface, as a fraction of the height of the underlying surface. It should be between 0 and 1.

30.66.18 getViewPortWidth as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the width of the view port.
Notes: The view port width is expressed as a fraction of the width of the underlying surface. It should be between 0 and 1.

30.66.19 getZoomInHeightLimit as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the view port height at maximum zoom in for mouse zoom in actions.

30.66.20 getZoomInWidthLimit as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the view port width at maximum zoom in for mouse zoom in actions.

30.66.21 getZoomOutHeightLimit as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the view port height at maximum zoom out for mouse zoom out actions.

30.66.22 getZoomOutWidthLimit as Double

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the view port width at maximum zoom out for mouse zoom out actions.

30.66.23 getZoomXYRatio as double

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the enforced aspect ratio of the viewport.
Notes: The ViewPortManager.setKeepAspectRatio can be used to keep the aspect ratio unchanged. This method gets that aspect ratio.

Returns the enforced aspect ratio, or 0 if the aspect ratio is not enforced.

30.66.24 inExtendedPlotArea(x as Integer, y as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determines if a given (x, y) coordinate is within the extended plot area (the plot area plus the extra margin sets up using setPlotAreaMouseMargin).

30.66.25 inPlotArea(x as double, y as double) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Determines if a given point is within the plot area.
Notes:

Argument	Default	Description
x	(Mandatory)	The x coordinate of the point in pixel unit.
y	(Mandatory)	The y coordinate of the point in pixel unit.

Return Value
True if the point is within the plot area, otherwise false.

30.66.26 setChartMetrics(metrics as string)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the chart metrics to the ViewPortManager so it knows the positions of the necessary chart objects for supporting view ports.
Notes:

Argument	Default	Description
metrics	(Mandatory)	A text string obtained from BaseChart.getChartMetrics that represents the metrics of the chart.

30.66.27 setFullRange(ID as string, minValue as Double, maxValue as Double)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines the full range of a view port data scale.
Notes: In the ChartDirector zooming and scrolling framework, the view port coordinates are expressed as the visible fractions of the "full data scale". For example, if the "full data scale" is 10 years horizontally, a view port width of 0.1 means that 1 year of data are visible.

The setFullRange method defines the full range of a data scale and gives it a name. As ChartDirector supports multiple x-axes and y-axes, so there can be multiple data scales with different names. The name can be used in other ChartDirector APIs to convert between the view port coordinates and data scale (see

ViewPortManager.getValueAtViewPort, ViewPortManager.getViewPortAtValue), and to configure an Axis to reflect the visible data scale (see ViewPortManager.syncLinearAxisWithViewPort, ViewPortManager.syncLogAxisWithViewPort and ViewPortManager.syncDateAxisWithViewPort).

Argument	Default	Description
id	(Mandatory)	The name of the data scale.
minValue	(Mandatory)	The minimum value of the data scale.
maxValue	(Mandatory)	The maximum value of the data scale.

30.66.28 setKeepAspectRatio(value as boolean)

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Keeps the current viewport aspect ratio.
Notes: If the viewport aspect ratio is keep unchanged, ViewPortManager will ensure the vertical and horizontal directions zoom by the same ratio.

Argument	Default	Description
b	(Mandatory)	A true value ensures the vertical and horizontal directions zoom by the same ratio. A false value allows them to zoom independently.

30.66.29 setPlotAreaMouseMargin(leftMargin as Integer, rightMargin as Integer, topMargin as Integer, bottomMargin as Integer)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configures area for mouse tracking.
Notes: SetPlotAreaMouseMargin configures some margins outside the plot area, so that a mouse cursor in that region (and therefore just outside the plot area) will still be considered to be exactly at the boundary of the plot area for the purpose of triggering plot area mouse events. Without this mechanism, it would be difficult to put the mouse exactly at the edge of the plot area (as it is too easy to "overshoot" the edge). Putting the mouse exactly at the edge is very useful for "track cursors" as this tracks the first or last data point.

30.66.30 setViewPortHeight(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the height of the view port.
Notes: The view port height is expressed as a fraction of the height of the underlying surface. It should be

between 0 and 1.

Argument	Default	Description
height	(Mandatory)	The height of the view port.

30.66.31 setViewPortLeft(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position of the left side of the view port.
Notes: The position of the view port left side is its distance from the left side of the underlying surface, as a fraction of the width of the underlying surface. It should be between 0 and 1.

Argument	Default	Description
left	(Mandatory)	The position of the left side of the view port.

30.66.32 setViewPortTop(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position of the top side of the view port.
Notes: The position of the view port top side is its distance from the top side of the underlying surface, as a fraction of the height of the underlying surface. It should be between 0 and 1.

Argument	Default	Description
top	(Mandatory)	The position of the top side of the view port.

30.66.33 setViewPortWidth(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the width of the view port.
Notes: The view port width is expressed as a fraction of the width of the underlying surface. It should be between 0 and 1.

30.66.34 setZoomInHeightLimit(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Argument	Default	Description
width	(Mandatory)	The width of the view port.

Function: Sets the view port height at maximum zoom in.
Notes: In many applications, it is desirable to set a maximum zoom in level, instead of allowing the user to zoom in indefinitely.

This method determines the minimum allowed view port height. It should be between 0 and 1. The default is 0.01, which means a maximum zoom in of 100x (the view port see only 1% of the underlying surface).

Argument	Default	Description
height	(Mandatory)	The minimum allowed view port height.

30.66.35 setZoomInWidthLimit(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the view port width at maximum zoom in.
Notes: In many applications, it is desirable to set a maximum zoom in level, instead of allowing the user to zoom in indefinitely.

This method determines the minimum allowed view port width. It should be between 0 and 1. The default is 0.01, which means a maximum zoom in of 100x (the view port see only 1% of the underlying surface).

Argument	Default	Description
width	(Mandatory)	The minimum allowed view port width.

30.66.36 setZoomOutHeightLimit(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the view port height at maximum zoom in.
Notes: In many applications, it is desirable to set a maximum zoom in level, instead of allowing the user to zoom in indefinitely.

This method determines the minimum allowed view port height. It should be between 0 and 1. The default is 0.01, which means a maximum zoom in of 100x (the view port see only 1% of the underlying surface).

Argument	Default	Description
height	(Mandatory)	The minimum allowed view port height.

30.66.37 setZoomOutWidthLimit(value as Double)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the view port width at maximum zoom out for mouse zoom out actions.

30.66.38 startDrag

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Takes a snapshot of the view port to prepare for dragging.
Notes: This method must be called before calling ViewPortManager.dragTo.

30.66.39 syncDateAxisWithViewPort(id as string, axis as CDAxisMBS)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Synchronizes a date/time Axis with the part of the data scale in view port.
Notes: If the data scale has already been defined (see ViewPortManager.setFullRange on how to define a data scale), this method will compute the visible data scale based on the view port coordinates using date/time interpolation, and then sets the axis to that date/time scale.

If the data scale has not been defined, this method will define the data scale based on the axis scale and the view port coordinates using date/time extrapolation. Because the axis scale may not be known at the time of calling this method (the axis could be auto-scaled by ChartDirector, which may not occur until the chart is rendered), the definition of the data scale will not occur immediately, but will be pending until the chart is to be displayed.

If your charting code calls this method but never defines the full data scale or the view port coordinates (in which case the view port defaults to showing the complete data scale), then the first time the code is executed, the data scale will be defined to be equal to the axis scale. Subsequently, when the user zooms into the chart (which means the view port coordinates are changed), the same charting code will set up the axis scale to the range that the user has zoomed to.

Argument	Default	Description
id	(Mandatory)	The name of the data scale.
axis	(Mandatory)	The Axis object to synchronize with.

30.66.40 syncLinearAxisWithViewPort(id as string, axis as CDAxisMBS)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Synchronizes a linear Axis with the part of the data scale in view port.
Notes: If the data scale has already been defined (see ViewPortManager.setFullRange on how to define a data scale), this method will compute the visible data scale based on the view port coordinates using linear interpolation, and then sets the axis to that linear scale.

If the data scale has not been defined, this method will define the data scale based on the axis scale and the view port coordinates using linear extrapolation. Because the axis scale may not be known at the time of calling this method (the axis could be auto-scaled by ChartDirector, which may not occur until the chart is rendered), the definition of the data scale will not occur immediately, but will be pending until the chart is to be displayed.

If your charting code calls this method but never defines the full data scale or the view port coordinates (in which case the view port defaults to showing the complete data scale), then the first time the code is executed, the data scale will be defined to be equal to the axis scale. Subsequently, when the user zooms into the chart (which means the view port coordinates are changed), the same charting code will set up the axis scale to the range that the user has zoomed to.

Argument	Default	Description
id	(Mandatory)	The name of the data scale.
axis	(Mandatory)	The Axis object to synchronize with.

30.66.41 syncLogAxisWithViewPort(id as string, axis as CDAxisMBS)

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Synchronizes a logarithmic Axis with the part of the data scale in view port.
Notes: If the data scale has already been defined (see ViewPortManager.setFullRange on how to define a data scale), this method will compute the visible data scale based on the view port coordinates using logarithmic interpolation, and then sets the axis to that logarithmic scale.

If the data scale has not been defined, this method will define the data scale based on the axis scale and the view port coordinates using logarithmic extrapolation. Because the axis scale may not be known at the time of calling this method (the axis could be auto-scaled by ChartDirector, which may not occur until the chart is rendered), the definition of the data scale will not occur immediately, but will be pending until the chart is to be displayed.

If your charting code calls this method but never defines the full data scale or the view port coordinates (in which case the view port defaults to showing the complete data scale), then the first time the code is executed, the data scale will be defined to be equal to the axis scale. Subsequently, when the user zooms

into the chart (which means the view port coordinates are changed), the same charting code will set up the axis scale to the range that the user has zoomed to.

Argument	Default	Description
id	(Mandatory)	The name of the data scale.
axis	(Mandatory)	The Axis object to synchronize with.

30.66.42 updateFullRangeH(id as string, minValue as Double, maxValue as Double, updateType as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Updates the full range of a horizontal viewport data scale.
Notes:

Argument	Default	Description
id	(Mandatory)	The name of the horizontal data scale.
minValue	(Mandatory)	The new minimum value of the data scale.
maxValue	(Mandatory)	The new maximum value of the data scale.
updateType	(Mandatory)	The method to update the viewport. Must be one of ViewPortNoUpdate, KeepVisibleRange, ScrollWithMax or ScrollWithMin.

30.66.43 updateFullRangeV(id as string, minValue as Double, maxValue as Double, updateType as Integer) as boolean

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Updates the full range of a vertical viewport data scale.
Notes:

Argument	Default	Description
id	(Mandatory)	The name of the vertical data scale.
minValue	(Mandatory)	The new minimum value of the data scale.
maxValue	(Mandatory)	The new maximum value of the data scale.
updateType	(Mandatory)	The method to update the viewport. Must be one of ViewPortNoUpdate, KeepVisibleRange, ScrollWithMax or ScrollWithMin.

30.66.44 validateViewPort

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Ensures the view port left, top, width and height are within valid ranges and adjusts them if necessary.
Notes: The valid ranges of the view port width and height should be 0 to 1. The view port left should be in between 0 and (1 - view port width). The view port top should be in between 0 and (1 - view port height).

30.66.45 zoomAround(x as double, y as double, xZoomRatio as double, yZoomRatio as double) as boolean

MBS ChartDirector Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Zoom at a given point using the zoom ratio.

30.66.46 zoomAt(zoomDirection as integer, x as double, y as double, zoomRatio as double) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Zooms in/out around a certain point.
Notes: This method adjusts the view port position and size to reflect zooming in/out around the given point. If possible, the given point will be at the center of the view port after zooming in/out.

Argument	Default	Description
zoomDirection	(Mandatory)	The allowed zoom direction. Must be one of the predefined constants DirectionHorizontal, DirectionVertical and DirectionHorizontalVertical for horizontal, vertical and bi-directional zooming.
x	(Mandatory)	The x-coordinate of the point to zoom around.
y	(Mandatory)	The y-coordinate of the point to zoom around.
zoomRatio	(Mandatory)	The zoom magnification factor. For example, a value of 2 means zooming in by 2x. A value of 0.5 means zooming out by 2x.

Return Value
True if view port is changed, otherwise false. It is possible for no zooming to occur if zoom limits are reached. See ViewPortManager.setZoomInWidthLimit, ViewPortManager.setZoomOutWidthLimit, ViewPortManager.setZoomInHeightLimit and ViewPortManager.setZoomOutHeightLimit for the meaning of zoom limits.

30.66.47 zoomTo(zoomDirection as integer, x1 as double, y1 as double, x2 as double, y2 as double) as boolean

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Zooms to the selected rectangular region.
Notes: This method updates the view port position and size to reflect a rectangular region on the chart. (x1, y1) and (x2, y2) are opposite vertices of the rectangular region in pixel coordinates.

The final view port position may not exactly reflect the rectangular region because of zoom limits. See ViewPortManager.setZoomInWidthLimit, ViewPortManager.setZoomOutWidthLimit, ViewPortManager.setZoomInHeightLimit and ViewPortManager.setZoomOutHeightLimit for the meaning of zoom limits.

Argument	Default	Description
zoomDirection	(Mandatory)	The allowed zoom direction. Must be one of the predefined constants DirectionHorizontal, DirectionVertical and DirectionHorizontalVertical for horizontal, vertical and bi-directional zooming.
x1	(Mandatory)	The x-coordinate of one vertices of the selected rectangular region.
y1	(Mandatory)	The y-coordinate of one vertices of the selected rectangular region.
x2	(Mandatory)	The x-coordinate of the vertex that is opposite to the vertex (x1, y1).
y2	(Mandatory)	The y-coordinate of the vertex that is opposite to the vertex (x1, y1).

Return Value
True if view port is changed, otherwise false.

30.67 class CDXYChartMBS

30.67.1 class CDXYChartMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XYChart class represents XY charts.
Example:

```
// draw a simple line chart into a picture
Var data() As Double = Array(30.0, 28.0, 40.0, 55.0, 75.0, 68.0, 54.0)
Var labels() As String = Array("Mon", "Tue", "Wed", "Thu", "Fri", "Sat", "Sun")

Var c As New CDXYChartMBS(500, 300)
Call c.setPlotArea(50, 40, 420, 220)
Call c.addTitle("Visitors per day")

Call c.addLineLayer(data, &h3366CC, "Visitors")
Call c.xAxis.setLabels(labels)
Call c.yAxis.setTitle("Visitors")

Var pic As Picture = c.makeChartPicture
// show pic in a Canvas or ImageViewer, or save it to a file
```

Notes: Subclass of the CDBaseChartMBS class.

30.67.2 Methods

30.67.3 addAreaLayer(data() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addAreaLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDAreaLayerMBS 5702
- 30.67.5 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS 5703
- 30.67.6 addAreaLayer(dates() as date, colorvalue as color, name as string = "", depth as Integer = 0) as CDAreaLayerMBS 5704
- 30.67.7 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDAreaLayerMBS 5705
- 30.67.8 addAreaLayer(dates() as DateTime, colorvalue as color, name as string = "", depth as integer = 0) as CDAreaLayerMBS 5706
- 30.67.9 addAreaLayer(dates() as DateTime, colorvalue as integer = -1, name as string = "", depth as integer = 0) as CDAreaLayerMBS 5706

30.67.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an area chart layer to the XYChart, and specify the data set to use for drawing the area.
Notes:

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the area. -1 means that the color is automatically selected from the color palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the area layer.

Return Value
An AreaLayer object representing the area layer created.
See also:

- 30.67.3 addAreaLayer(data() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDAreaLayerMBS 5702
- 30.67.5 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS 5703
- 30.67.6 addAreaLayer(dates() as date, colorvalue as color, name as string = "", depth as Integer = 0) as CDAreaLayerMBS 5704
- 30.67.7 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDAreaLayerMBS 5705
- 30.67.8 addAreaLayer(dates() as DateTime, colorvalue as color, name as string = "", depth as integer = 0) as CDAreaLayerMBS 5706
- 30.67.9 addAreaLayer(dates() as DateTime, colorvalue as integer = -1, name as string = "", depth as integer = 0) as CDAreaLayerMBS 5706

30.67.5 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an empty area chart layer to the XYChart.
Notes: This method is typically used to add multiple data sets to a single bar layer. First an empty area chart layer is created, then the data sets can be added using Layer.addDataSet.

The dataCombineMethod parameter specifies how to combine the data sets together in the area layer. The followings methods are supported:

Return Value
An AreaLayer object representing the area layer created.
See also:

Constant	Value	Description
Stack	1	The data sets are combined by stacking up the areas.
Percentage	4	The data sets are combined similar to stacked area, except that the data are scaled so that the area always stacked up to 100. An area strip within the stacked area therefore represents the percentage of the data item relative to sum of all the data items in the stacked area.

Parameter	Default	Description
dataCombineMethod	Stack	The method to combine the data sets together in the area layer.
depth	0	The 3D depth of the area layer.

- 30.67.3 addAreaLayer(data() as Double, colorvalue as color, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5702
- 30.67.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5702
- 30.67.6 addAreaLayer(dates() as date, colorvalue as color, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5704
- 30.67.7 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5705
- 30.67.8 addAreaLayer(dates() as DateTime, colorvalue as color, name as string = """, depth as integer = 0) as CDAreaLayerMBS 5706
- 30.67.9 addAreaLayer(dates() as DateTime, colorvalue as integer = -1, name as string = """, depth as integer = 0) as CDAreaLayerMBS 5706

30.67.6 addAreaLayer(dates() as date, colorvalue as color, name as string = """, depth as Integer = 0) as CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Same as the other addAreaLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.3 addAreaLayer(data() as Double, colorvalue as color, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5702
- 30.67.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5702
- 30.67.5 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS 5703

- 30.67.7 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5705
- 30.67.8 addAreaLayer(dates() as DateTime, colorvalue as color, name as string = """, depth as integer = 0) as CDAreaLayerMBS 5706
- 30.67.9 addAreaLayer(dates() as DateTime, colorvalue as integer = -1, name as string = """, depth as integer = 0) as CDAreaLayerMBS 5706

30.67.7 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds an area chart layer to the XYChart, and specify the data set to use for drawing the area.
Notes:

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the area. -1 means that the color is automatically selected from the color palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the area layer.

Return Value
An AreaLayer object representing the area layer created.
See also:

- 30.67.3 addAreaLayer(data() as Double, colorvalue as color, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5702
- 30.67.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5702
- 30.67.5 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS 5703
- 30.67.6 addAreaLayer(dates() as date, colorvalue as color, name as string = """, depth as Integer = 0) as CDAreaLayerMBS 5704
- 30.67.8 addAreaLayer(dates() as DateTime, colorvalue as color, name as string = """, depth as integer = 0) as CDAreaLayerMBS 5706
- 30.67.9 addAreaLayer(dates() as DateTime, colorvalue as integer = -1, name as string = """, depth as integer = 0) as CDAreaLayerMBS 5706

30.67.8 addAreaLayer(dates() as DateTime, colorvalue as color, name as string = ””, depth as integer = 0) as CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an area chart layer to the XYChart, and specify the data set to use for drawing the area.
See also:

- 30.67.3 addAreaLayer(data() as Double, colorvalue as color, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5702
- 30.67.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5702
- 30.67.5 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS 5703
- 30.67.6 addAreaLayer(dates() as date, colorvalue as color, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5704
- 30.67.7 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5705
- 30.67.9 addAreaLayer(dates() as DateTime, colorvalue as integer = -1, name as string = ””, depth as integer = 0) as CDAreaLayerMBS 5706

30.67.9 addAreaLayer(dates() as DateTime, colorvalue as integer = -1, name as string = ””, depth as integer = 0) as CDAreaLayerMBS

MBS ChartDirector Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an area chart layer to the XYChart, and specify the data set to use for drawing the area.
See also:

- 30.67.3 addAreaLayer(data() as Double, colorvalue as color, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5702
- 30.67.4 addAreaLayer(data() as Double, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5702
- 30.67.5 addAreaLayer(dataCombineMethod as Integer = 1, depth as Integer = 0) as CDAreaLayerMBS 5703
- 30.67.6 addAreaLayer(dates() as date, colorvalue as color, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5704
- 30.67.7 addAreaLayer(dates() as date, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDAreaLayerMBS 5705
- 30.67.8 addAreaLayer(dates() as DateTime, colorvalue as color, name as string = ””, depth as integer = 0) as CDAreaLayerMBS 5706

30.67.10 addAxis(align as Integer, offset as Integer) as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an additional axis to the chart.
Notes: By default, ChartDirector XY charts have 2 x-axes and 2 y-axes at the 4 borders of the plot area. The addAxis method can be used to create additional axis.

The new axis will be put at one of the 4 borders of the plot area. To avoid overlapping with existing axis, the new axis will not be put exactly as the plot area border, but at an offset from it.

Parameter	Default	Description
align	(Mandatory)	Specifies which side of the plot area is the primary side of the axis. Must be one of the constants Left, Right, Top and Bottom for the 4 sides of the plot area.
offset	(Mandatory)	An offset in pixels to move the axis away from the plot area. If a negative value is used, it will mean to move the axis into the plot area.

30.67.11 addBarLayer(data() as Double, colors() as color, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addBarLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.12 addBarLayer(data() as Double, colors() as color, names() as string, depth as Integer = 0) as CDBarLayerMBS 5708
- 30.67.13 addBarLayer(data() as Double, colors() as Integer, depth as Integer = 0) as CDBarLayerMBS 5708
- 30.67.14 addBarLayer(data() as Double, colors() as Integer, names() as string, depth as Integer = 0) as CDBarLayerMBS 5710
- 30.67.15 addBarLayer(data() as Double, colorvalue as color, name as string = """, depth as Integer = 0) as CDBarLayerMBS 5710
- 30.67.16 addBarLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDBarLayerMBS 5711
- 30.67.17 addBarLayer(dataCombineMethod as Integer = 3, depth as Integer = 0) as CDBarLayerMBS 5712

30.67.12 addBarLayer(data() as Double, colors() as color, names() as string, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addBarLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.11 addBarLayer(data() as Double, colors() as color, depth as Integer = 0) as CDBarLayerMBS 5707
- 30.67.13 addBarLayer(data() as Double, colors() as Integer, depth as Integer = 0) as CDBarLayerMBS 5708
- 30.67.14 addBarLayer(data() as Double, colors() as Integer, names() as string, depth as Integer = 0) as CDBarLayerMBS 5710
- 30.67.15 addBarLayer(data() as Double, colorvalue as color, name as string = """, depth as Integer = 0) as CDBarLayerMBS 5710
- 30.67.16 addBarLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDBarLayerMBS 5711
- 30.67.17 addBarLayer(dataCombineMethod as Integer = 3, depth as Integer = 0) as CDBarLayerMBS 5712

30.67.13 addBarLayer(data() as Double, colors() as Integer, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an empty bar layer to the XYChart.
Example:

```
// Create a XYChart object of size 250 x 250 pixels
Var c as new CDXYChartMBS(250, 250)

// Add a bar chart layer using the given data
Var t as CDTextBoxMBS = c.addBarLayer(data)
t.setPos(0, -10) // move 10 up
```

Notes: This method is typically used to add multiple data sets to a single bar layer. First an empty bar layer is created, then the data sets can be added using Layer.addDataSet.

The dataCombineMethod parameter specifies how to combine the data sets together in the bar layer. The followings methods are supported:

Constant	Value	Description
Side	3	The data sets are combined by plotting the bars side by side.
Stack	1	The data sets are combined by stacking up the bar segments.
Overlay	0	The data sets are combined similar to stacked bars. However, in Overlay, one data set is assumed to already include the other data set. For example, if the data sets are "average" and "peak", the "peak" cannot be stacked on top of "average", because the "peak" already contains "average". In the Overlay style, only "peak - average" is stacked on top of "average", and so the total bar length will be "peak".
Percentage	4	The data sets are combined similar to stacked bars, except that the data in a bar are scaled so that they summed to 100. In other words, all stacked bars will be of the same length. A bar segment within a bar represents the percentage of the data item relative to sum of all the data items in the stacked bar.

Parameter	Default	Description
dataCombineMethod	Side	The method to combine the data sets together in the bar layer.
depth	0	The 3D depth of the bar layer.

Return Value
A BarLayer object representing the bar layer created.

To set some more options like transparent border of the bar, please use the methods in CDBarLayerMBS class. e.g. setBorderColor(CDXYChartMBS.kTransparent) will make them transparent.

- 30.67.17 addBarLayer(dataCombineMethod as Integer = 3, depth as Integer = 0) as CDBarLayerMBS 5712

30.67.14 addBarLayer(data() as Double, colors() as Integer, names() as string, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a multi-color bar layer to the XYChart, and specify the data set to use for drawing the bars.
Notes: A multi-color bar layer is a bar layer in which each bar has a different color. In a normal bar layer, each data set has a different color, but the bars in the same data set have the same color.

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
colors	(Mandatory)	An array of colors to draw the bars. An empty array means the colors are automatically selected from the palette.
names	[Empty_Array]	An array of text strings as the names of the bars. The names will be used in the legend box, if one is available. An empty array means that bars have no name.
depth	0	The 3D depth of the bar layer.

Return Value
A BarLayer object representing the bar layer created.

To set some more options like transparent border of the bar, please use the methods in CDBarLayerMBS class. e.g. setBorderColor(CDXYChartMBS.kTransparent) will make them transparent.

30.67.16 addBarLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a bar layer to the XYChart, and specify the data set to use for drawing the bars.
Notes:

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the bars. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the bar layer.

Return Value
A BarLayer object representing the bar layer created.

To set some more options like transparent border of the bar, please use the methods in CDBarLayerMBS class. e.g. setBorderColor(CDXYChartMBS.kTransparent) will make them transparent.

30.67.17 addBarLayer(dataCombineMethod as Integer = 3, depth as Integer = 0) as CDBarLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an empty bar layer to the XYChart.
Notes: This method is typically used to add multiple data sets to a single bar layer. First an empty bar layer is created, then the data sets can be added using
Layer.addDataSet.

The dataCombineMethod parameter specifies how to combine the data sets together in the bar layer. The followings methods are supported:

Constant	Value	Description
Side	3	The data sets are combined by plotting the bars side by side.
Stack	1	The data sets are combined by stacking up the bar segments.
Overlay	0	The data sets are combined similar to stacked bars. However, in Overlay, one data set is assumed to already include the other data set. For example, if the data sets are "average" and "peak", the "peak" cannot be stacked on top of "average", because the "peak" already contains "average". In the Overlay style, only "peak - average" is stacked on top of "average", and so the total bar length will be "peak".
Percentage	4	The data sets are combined similar to stacked bars, except that the data in a bar are scaled so that they summed to 100. In other words, all stacked bars will be of the same length. A bar segment within a bar represents the percentage of the data item relative to sum of all the data items in the stacked bar.

Return Value
A BarLayer object representing the bar layer created.

Parameter	Default	Description
dataCombineMethod	Side	The method to combine the data sets together in the bar layer.
depth	0	The 3D depth of the bar layer.

To set some more options like transparent border of the bar, please use the methods in CDBarLayerMBS class. e.g. setBorderColor(CDXYChartMBS.kTransparent) will make them transparent.

30.67.18 addBoxLayer(boxTop() as Double, boxBottom() as Double, colorvalue as color, name as string = """) as CDBoxWhiskerLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addBoxLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.19 addBoxLayer(boxTop() as Double, boxBottom() as Double, colorvalue as Integer = -1, name as string = """) as CDBoxWhiskerLayerMBS 5713

30.67.19 addBoxLayer(boxTop() as Double, boxBottom() as Double, colorvalue as Integer = -1, name as string = """) as CDBoxWhiskerLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a floating box layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes: This method is a simplification of XYChart.addBoxWhiskerLayer. Instead of adding a full box-whisker layer, only the box part is used, resulting in a chart layer displaying floating boxes.

Parameter	Default	Description
boxTop	(Mandatory)	An array of numbers representing the top edge of the box.
boxBottom	(Mandatory)	An array of numbers representing the bottom edge of the box.
color	-1	The color to draw the area. -1 means that the color is automatically selected from the color palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

Return Value
A BoxWhiskerLayer object representing the box-whisker layer created.
See also:

- 30.67.18 addBoxLayer(boxTop() as Double, boxBottom() as Double, colorvalue as color, name as string = "") as CDBoxWhiskerLayerMBS 5713

30.67.20 addBoxWhiskerLayer(boxTop() as Double, boxBottom() as Double) as CDBoxWhiskerLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a box-whisker layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes: Traditionally, each box-whisker symbol represents 5 values, which are the as maximum, 3rd quartile, median, 1st quartile and minimum of some data samples.

A vertical box-whisker symbol (on a non-swapped XY chart) consists of a vertical line joining the maximum and minimum points, a box extending from the 1st quartile point to the 3rd quartile point, and 3 horizontal mark lines at the maximum, median and minimum points.

In practice, the box-whisker symbol is not limited to representing the maximum, 3rd quartile, median, 1st quartile and minimum values. It can be used to represent any ordered values.

The boxTop and boxBottom data sets specifies the top and bottom edges of the box. The maxData, minData and midData specifies the top, bottom and middle mark lines.

You can use empty arrays to disable showing some parts of the box-whisker symbol.

For example, if you just want to show a floating box, you can use only boxTop and boxBottom and set the maxData, minData and midData to empty arrays.

Similarly, if the boxTop, boxBottom and midData are set to empty arrays, only the top and bottom mark lines and the joining center line are visible. This style is most often used as "error bands" together with line charts.

In addition to maxData, minData and midData, you can add additional mark lines to the box-whisker element by adding more data sets using Layer.addDataSet.

By default, the box-whisker symbol will be drawn using the colors specified in the fillColor, whiskerColor and edgeColor argument. The fillColor and edgeColor are used as the fill and border colors of the box, while the whiskerColor is used as the color of the center line and the mark lines.

Internally, ChartDirector maps the colors of different parts of the box-whisker symbol to data set colors as shown in the following table. You may control the colors of the box-whisker symbol in more details by setting the data set colors directly. The data set objects can be obtained using Layer.getDataSet, and the colors can be changed using DataSet.setDataColor.

Box-Whisker Symbol Color	Data Set Color
Fill color of the box	Data Color for the first data set (index = 0)
Border color of the box	Edge Color for the first data set (index = 0)
Center line color	Data Color for the second data set (index = 1)
Maximum value mark line color	Data Color for the third data set (index = 2)
Minimum value mark line color	Data Color for the fourth data set (index = 3)
Middle value mark line color	Data Color for the fifth data set (index = 4)
Mark line color for additional mark lines	Data Color for the data set representing the additional mark line

Parameter	Default	Description
boxTop	(Mandatory)	An array of numbers representing the top edge of the box.
boxBottom	(Mandatory)	An array of numbers representing the bottom edge of the box.
maxData	[Empty_Array]	An array of numbers representing the maximum value mark lines.
minData	[Empty_Array]	An array of numbers representing the minimum value mark lines.
midData	[Empty_Array]	An array of numbers representing the middle value mark lines.
fillColor	-1	The color used to fill the box. -1 means that the color is automatically selected from the palette.
whiskerColor	LineColor	The color used to draw the central line and mark lines.
edgeColor	LineColor	The color used to draw the border of the box.

Return Value
A BoxWhiskerLayer object representing the box-whisker layer created.

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a multi-color box-whisker layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes: This method is similar to XYChart.addBoxWhiskerLayer, except that the layer will be added in multi-color mode. Please refer to XYChart.addBoxWhiskerLayer on basic information of what is a box-whisker layer.

In multi-color mode, the boxes of a BoxWhiskerLayer can have different fill colors. For the whisker, instead of specifying a single whisker color for all boxes, ChartDirector computes the whisker colors by darkening or brightening the corresponding fill colors using a configurable brightness factor.

Parameter	Default	Description
boxTop	(Mandatory)	An array of numbers representing the top edge of the box.
boxBottom	(Mandatory)	An array of numbers representing the bottom edge of the box.
maxData	[Empty_Array]	An array of numbers representing the maximum value mark lines.
minData	[Empty_Array]	An array of numbers representing the minimum value mark lines.
midData	[Empty_Array]	An array of numbers representing the middle value mark lines.
fillColors	[Empty_Array]	An array of colors to be used as the fill color of the boxes. If there are insufficient colors in the array for the boxes, the remaining boxes will have their colors automatically selected from the palette.
whiskerBrightness	0.5	The brightness factor for whisker color. A value less than 1 means darkening. A value larger than 1 means brightening. A zero value means black.
names	[Empty_Array]	An array of names for the boxes to be used in the legend box, if one is configured for the chart.

Return Value
A BoxWhiskerLayer object representing the box-whisker layer created.

- 30.67.31 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as Integer, whiskerBrightness as Double = 0.5) as CDBoxWhiskerLayerMBS 5728
- 30.67.32 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as Integer, whiskerBrightness as Double, names() as string) as CDBoxWhiskerLayerMBS 5729

30.67.31 addBoxWhiskerLayer2(boxTop() as Double, boxBottom() as Double, maxData() as Double, minData() as Double, midData() as Double, fillColors() as Integer, whiskerBrightness as Double = 0.5) as CDBoxWhiskerLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a multi-color box-whisker layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes: This method is similar to XYChart.addBoxWhiskerLayer, except that the layer will be added in multi-color mode. Please refer to XYChart.addBoxWhiskerLayer on basic information of what is a box-whisker layer.

In multi-color mode, the boxes of a BoxWhiskerLayer can have different fill colors. For the whisker, instead of specifying a single whisker color for all boxes, ChartDirector computes the whisker colors by darkening or brightening the corresponding fill colors using a configurable brightness factor.

Parameter	Default	Description
boxTop	(Mandatory)	An array of numbers representing the top edge of the box.
boxBottom	(Mandatory)	An array of numbers representing the bottom edge of the box.
maxData	[Empty_Array]	An array of numbers representing the maximum value mark lines.
minData	[Empty_Array]	An array of numbers representing the minimum value mark lines.
midData	[Empty_Array]	An array of numbers representing the middle value mark lines.
fillColors	[Empty_Array]	An array of colors to be used as the fill color of the boxes. If there are insufficient colors in the array for the boxes, the remaining boxes will have their colors automatically selected from the palette.
whiskerBrightness	0.5	The brightness factor for whisker color. A value less than 1 means darkening. A value larger than 1 means brightening. A zero value means black.
names	[Empty_Array]	An array of names for the boxes to be used in the legend box, if one is configured for the chart.

Return Value
A BoxWhiskerLayer object representing the box-whisker layer created.

30.67.33 addCandleStickLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, riseColor as color, fallColor as color, edgeColor as color) as CDCandleStickLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addCandleStickLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.34 addCandleStickLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, riseColor as Integer = -1, fallColor as Integer = 0, edgeColor as Integer = &hffff0001) as CDCandleStickLayerMBS 5731

30.67.34 addCandleStickLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, riseColor as Integer = -1, fallColor as Integer = 0, edgeColor as Integer = &hffff0001) as CDCandleStickLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a candlestick layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes: By default, the candlestick symbol will be drawn using the colors specified in the riseColor, fallColor and edgeColor argument. The riseColor and fallColor are used to fill the candle depending on whether the opening value or closing value is larger. The edgeColor is used to the center line and the border of the candle.

Internally, ChartDirector maps the colors of different parts of the candlestick symbol to data set colors as shown in the following table. You may control the colors of the candlestick symbol in more details by setting the data set colors directly. The data set objects can be obtained using Layer.getDataSet, and the colors can be changed using DataSet.setDataColor.

Candlestick Symbol Color	Data Set Color
Fill color for "up" candlesticks	Data Color for the first data set (index = 0).
Fill color for "down" candlesticks	Data Color for the second data set (index = 1).
Border color	Edge Color for the first data set (index = 0).
Center line color	Edge Color for the second data set (index = 1).

Parameter	Default	Description
highData	(Mandatory)	An array of numbers representing the high values.
lowData	(Mandatory)	An array of numbers representing the low values.
openData	(Mandatory)	An array of numbers representing the opening values.
closeData	(Mandatory)	An array of numbers representing the closing values.
riseColor	FFFFFF	The color used to fill the candle if the closing value is higher than the opening value.
fallColor	000000	The color used to fill the candle if the opening value is higher than the closing value.
edgeColor	LineColor	The color used to draw the center line and the border of the candle.

Return Value
A CandleStickLayer object representing the candlestick layer created.
See also:

- 30.67.33 addCandleStickLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, riseColor as color, fallColor as color, edgeColor as color) as CDCandleStickLayerMBS 5730

30.67.35 addContourLayer(xData() as Double, yData() as Double, zData() as Double) as CDContourLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a contour layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes: ChartDirector supports both gridded and scattered data. If the data points are on a rectangular grid will no missing points, they will be handled as gridded data. Otherwise, they will be handled as scattered data.
For gridded data, you may provide the x and y values of the grid, and the z values of the data points. For a 10 x 15 grid, that means the x data series should have 10 values, the y data series should have 15 values, and the z data series should have 150 values. The x and y data series should be strictly monotonic (either strictly increasing or strictly decreasing).
For both gridded and scattered data, you may also provide the (x, y, z) values of the data points. For example, for 150 data points, the x, y and z data series should each have 150 values. ChartDirector will automatically detect if the data points are gridded or scattered.

Arguments:

Argument	Default	Description
xData	(Mandatory)	An array of numbers representing the x data series.
yData	(Mandatory)	An array of numbers representing the y data series.
zData	(Mandatory)	An array of numbers representing the z data series.

Return Value:
A ContourLayer object representing the contour layer created.

30.67.36 addDiscreteHeatMapLayer(xGrid() as double, yGrid() as Double, zData() as Double) as CDDiscreteHeatMapLayerMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a discrete heat map layer to the XYChart by specifying the cell values and positions.
Notes: The cells are assumed to be arranged as a regular grid. The xGrid and yGrid arrays can be the center coordinates of the cells or the boundary coordinates of the cells.

Suppose there are 9 cells (the zData array contains 9 values). If the xGrid and yGrid arrays each contains 3 values, the cells will be assumed to be arranged as a 3 x 3 grid, and the xGrid and yGrid will be assumed to be the center coordinates of the cells.

If the xGrid array and yGrid array each contains 4 values instead, they will be assumed to be the boundaries of the cells. The first column of cells will occupy the space between xGrid [0] and xGrid [1] , the second column between xGrid [1] and xGrid [2] , and the third column between xGrid [2] and xGrid [3] . The

same applies to the yGrid.

In general, if xGrid and yGrid contains enough values to be used as the boundary coordinates, they will be assumed to be the boundary coordinates. Otherwise they will be assumed to be the center coordinates.

Argument	Default	Description
xGrid	(Mandatory)	An array containing the x coordinates of the centers or boundaries of the cells.
yGrid	(Mandatory)	An array containing the y coordinates of the centers or boundaries of the cells.
zData	(Mandatory)	An array containing the data values of the cells.

Returns a DiscreteHeatMapLayer object representing the discrete heat map layer created.

30.67.37 addDiscreteHeatMapLayer(zData() as Double, xCount as Integer) as CDDiscreteHeatMapLayerMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a discrete heat map layer to the XYChart by specifying the cell values and the cell count in the x direction.
Notes: The zData array contains the cell values. xCount is the cell count in the x direction. The cell count in the y direction will be computed as the total cell count (the size of the zData array) divided by xCount.

The boundary of the cells will be at integer axis coordinates 0, 1, 2, ... In the x direction, the first column of cells will occupy the space between x = 0 and x = 1, the second column between x = 1 and x = 2, and so on. The same applies to the y direction. The first row of cells will be between y = 0 and y = 1, the second row between y = 1 and y = 2, and so on.

This method is often used with Axis.setLabels and Axis.setLabelOffset for axis labelling. The Axis.setLabels put labels at coordinates 0, 1, 2, ... along the axis. The Axis.setLabelOffset can offset the labels by 0.5 units, so the labels will be at 0.5, 1.5, 2.5 ... which corresponds to the center of the cells.

A similar method XYChart.addDiscreteHeatMapLayer2 allows you to specify the exact x and y coordinates for the cells.

See also:

- 30.67.36 addDiscreteHeatMapLayer(xGrid() as double, yGrid() as Double, zData() as Double) as CDDiscreteHeatMapLayerMBS 5732

Argument	Default	Description
zData	(Mandatory)	An array containing the data values of the cells.
xCount	(Mandatory)	The number of cells in the x direction. The number of cells in the y direction will be computed as the total number of cells (the size of the zData array) divided by xCount.

30.67.38 addHLOCLayer as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an empty high-low-open-close (HLOC) layer to the XYChart.
Notes: Return Value
A HLOCLayer object representing the HLOC layer created.
See also:

- 30.67.39 addHLOCLayer(highData() as Double, lowData() as Double) as CDHLOCLayerMBS 5734

- 30.67.44 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as color, downColor as color, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS 5740
- 30.67.45 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer = -1) as CDHLOCLayerMBS 5740
- 30.67.46 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS 5742

30.67.39 addHLOCLayer(highData() as Double, lowData() as Double) as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a high-low-open-close (HLOC) layer to the XYChart, and specify the data sets to use for drawing the layer.

Notes: In this method, all HLOC symbols will be drawn using the color specified in the color argument. Use XYChart.addHLOCLayer for multi-color HLOC layers.

Internally, ChartDirector maps the colors of different parts of the HLOC symbol to data set colors as shown in the following table. You may control the colors of the HLOC symbol in more details by setting the data set colors directly. The data set objects can be obtained using Layer.getDataSet, and the colors can be changed using DataSet.setDataColor.

HLOC Symbol Color	Data Set Color
Central Line	Data Color for the first data set (index = 0)
Open Mark Line	Data Color for the third data set (index = 2)
Close Mark Line	Data Color for the fourth data set (index = 3)

Parameter	Default	Description
highData	(Mandatory)	An array of numbers representing the high values. An empty array means there is no high value data available.
lowData	(Mandatory)	An array of numbers representing the low values. An empty array means there is no low value data available.
openData	[Empty_Array]	An array of numbers representing the opening values. An empty array means there is no opening value data available.
closeData	[Empty_Array]	An array of numbers representing the closing values. An empty array means there is no closing value data available.
color	-1	The color to draw the HLOC symbol. -1 means that the color is automatically selected from the palette.

Return Value
A HLOCLayer object representing the HLOC layer created.

- 30.67.45 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer = -1) as CDHLOCLayerMBS 5740
- 30.67.46 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer, leadValue as Double) as CDHLOCLayerMBS 5742

30.67.40 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double) as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a high-low-open-close (HLOC) layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes: In this method, all HLOC symbols will be drawn using the color specified in the color argument. Use XYChart.addHLOCLayer for multi-color HLOC layers.

Internally, ChartDirector maps the colors of different parts of the HLOC symbol to data set colors as shown in the following table. You may control the colors of the HLOC symbol in more details by setting the data set colors directly. The data set objects can be obtained using Layer.getDataSet, and the colors can be changed using DataSet.setDataColor.

HLOC Symbol Color	Data Set Color
Central Line	Data Color for the first data set (index = 0)
Open Mark Line	Data Color for the third data set (index = 2)
Close Mark Line	Data Color for the fourth data set (index = 3)

Parameter	Default	Description
highData	(Mandatory)	An array of numbers representing the high values. An empty array means there is no high value data available.
lowData	(Mandatory)	An array of numbers representing the low values. An empty array means there is no low value data available.
openData	[Empty_Array]	An array of numbers representing the opening values. An empty array means there is no opening value data available.
closeData	[Empty_Array]	An array of numbers representing the closing values. An empty array means there is no closing value data available.
color	-1	The color to draw the HLOC symbol. -1 means that the color is automatically selected from the palette.

Return Value
A HLOCLayer object representing the HLOC layer created.

30.67.45 addHLOCLayer(highData() as Double, lowData() as Double, openData() as Double, closeData() as Double, upColor as Integer, downColor as Integer, colorMode as Integer = -1) as CDHLOCLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a multi-color high-low-open-close (HLOC) layer to the XYChart, and specify the data sets to use for drawing the layer.
Notes: ChartDirector supports drawing the HLOC symbol using different colors depending on whether the data represents an "up" day or "down" day. ChartDirector supports different definitions of what is an "up" day and "down" day, denoted using the following constants.

Constant	Value	Description
HLOCDefault	0	Do not distinguish between "up" and "down" days and use the same color for all HLOC symbols.
HLOCOpenClose	1	An up day is a day of which the closing value is on or above the opening value. This is the same definition commonly used in candlestick charts.
HLOCUpDown	2	An up day is a day of which the closing value is on or above the closing value of the previous day.

Parameter	Default	Description
highData	(Mandatory)	An array of numbers representing the high values. An empty array means there is no high value data available.
lowData	(Mandatory)	An array of numbers representing the low values. An empty array means there is no low value data available.
openData	(Mandatory)	An array of numbers representing the opening values. An empty array means there is no opening value data available.
closeData	(Mandatory)	An array of numbers representing the closing values. An empty array means there is no closing value data available.
upColor	(Mandatory)	The color to be used on an "up" day.
downColor	(Mandatory)	The color to be used on a "down" day.
colorMode	-1	The method used to determine if a day is an "up" or "down". Must be one of the constants in the above table. The default value of -1 means the colorMode is automatically determine to be either HLOCDefault or HLOCUpDown, depending on whether upColor and downColor are the same or different.
leadValue	[-Infinity]	The lead value to act as the closing pricing before the first day, so as to determine if the first day is an "up" or "down" day.

Return Value
A HLOCLayer object representing the HLOC layer created.

30.67.47 addInterLineLayer(line1 as CDLineObjMBS, line2 as CDLineObjMBS, color12 as color, color21 as color) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addInterLineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.48 addInterLineLayer(line1 as CDLineObjMBS, line2 as CDLineObjMBS, color12 as Integer, color21 as Integer = -1) as CDInterLineLayerMBS 5744

30.67.48 addInterLineLayer(line1 as CDLineObjMBS, line2 as CDLineObjMBS, color12 as Integer, color21 as Integer = -1) as CDInterLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an inter-line layer the XYChart. An inter-line layer is used to fill the region between any two lines (straight lines, spline curves, step lines, etc).
Notes: This method expects two "line" objects representing the two lines. The line objects can be obtained using LineLayer.getLine (inherited by SplineLayer and StepLineLayer), TrendLayer.getLine, and Mark.getLine.

Parameter	Default	Description
line1	(Mandatory)	An opaque line object representing the first line.
line2	(Mandatory)	An opaque line object representing the second line.
color12	(Mandatory)	The color used to fill the region of the lines when line1 >line2.
color21	-1	The color used to fill the region of the lines when line2 >line1. -1 means this color is the same as color12.

Return Value
An InterLineLayer object representing the inter-line layer created.
See also:

- 30.67.47 addInterLineLayer(line1 as CDLineObjMBS, line2 as CDLineObjMBS, color12 as color, color21 as color) as CDInterLineLayerMBS 5743

30.67.49 addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addLineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.50 addLineLayer(data as CDArrayMBS, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDLineLayerMBS 5745
- 30.67.51 addLineLayer(data() as Double, colorvalue as color, name as string = "", depth as Integer = 0) as CDLineLayerMBS 5745
- 30.67.52 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDLineLayerMBS 5746
- 30.67.53 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS 5746
- 30.67.54 addLineLayer(fastDB as CDDataAcceleratorMBS, seriesId as string, color as integer = -1, name as string = "") as CDLineLayerMBS 5747

30.67.50 addLineLayer(data as CDArrayMBS, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a line layer to the XYChart, and specify the data set to use for drawing the line.
Notes:

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	””	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the line layer.

Return Value
A LineLayer object representing the line layer created.
See also:

- 30.67.49 addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = ””, depth as Integer = 0) as CDLineLayerMBS 5744
- 30.67.51 addLineLayer(data() as Double, colorvalue as color, name as string = ””, depth as Integer = 0) as CDLineLayerMBS 5745
- 30.67.52 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDLineLayerMBS 5746
- 30.67.53 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS 5746
- 30.67.54 addLineLayer(fastDB as CDDataAcceleratorMBS, seriesId as string, color as integer = -1, name as string = ””) as CDLineLayerMBS 5747

30.67.51 addLineLayer(data() as Double, colorvalue as color, name as string = ””, depth as Integer = 0) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addLineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.52 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5746
- 30.67.53 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS 5746
- 30.67.54 addLineLayer(fastDB as CDDataAcceleratorMBS, seriesId as string, color as integer = -1, name as string = """) as CDLineLayerMBS 5747

30.67.52 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a line layer to the XYChart, and specify the data set to use for drawing the line.
Notes:

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	"""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the line layer.

Return Value
A LineLayer object representing the line layer created.
See also:

- 30.67.49 addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5744
- 30.67.50 addLineLayer(data as CDArrayMBS, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5745
- 30.67.51 addLineLayer(data() as Double, colorvalue as color, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5745
- 30.67.53 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS 5746
- 30.67.54 addLineLayer(fastDB as CDDataAcceleratorMBS, seriesId as string, color as integer = -1, name as string = """) as CDLineLayerMBS 5747

30.67.53 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an empty line layer to the XYChart.
Notes: This method is typically used to add multiple data sets to a single line layer. First an empty line layer is created, then the data sets can be added using Layer.addDataSet.

Parameter	Default	Description
dataCombineMethod	Overlay	In this version of ChartDirector, this parameter is ignored.
depth	0	The 3D depth of the line layer.

Return Value
A LineLayer object representing the line layer created.
See also:

- 30.67.49 addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5744
- 30.67.50 addLineLayer(data as CDArrayMBS, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5745
- 30.67.51 addLineLayer(data() as Double, colorvalue as color, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5745
- 30.67.52 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = """, depth as Integer = 0) as CDLineLayerMBS 5746
- 30.67.54 addLineLayer(fastDB as CDDataAcceleratorMBS, seriesId as string, color as integer = -1, name as string = """) as CDLineLayerMBS 5747

30.67.54 addLineLayer(fastDB as CDDataAcceleratorMBS, seriesId as string, color as integer = -1, name as string = """) as CDLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a line layer using data from a DataAccelerator.
Notes: The LineLayer created using this method will use only the data series provided by the DataAccelerator. It does not support adding more data sets, that is, Layer.addDataSet or Layer.setXData should not be used. Additional LineLayer objects should be used to plot other data series.

Argument	Default	Description
fastDB	(Mandatory)	The CDDataAcceleratorMBS object that provides the x and y data values.
seriesId	(Mandatory)	The id of the data series. The DataAccelerator will provide the x data series and the y data series with the specified id to the LineLayer.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	"""	The name of the data series. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

Returns a CDLineLayerMBS object representing the line layer created.
See also:

- 30.67.49 addLineLayer(data as CDArrayMBS, colorvalue as color, name as string = ””, depth as Integer = 0) as CDLineLayerMBS 5744
- 30.67.50 addLineLayer(data as CDArrayMBS, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDLineLayerMBS 5745
- 30.67.51 addLineLayer(data() as Double, colorvalue as color, name as string = ””, depth as Integer = 0) as CDLineLayerMBS 5745
- 30.67.52 addLineLayer(data() as Double, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDLineLayerMBS 5746
- 30.67.53 addLineLayer(dataCombineMethod as Integer = 0, depth as Integer = 0) as CDLineLayerMBS 5746

30.67.55 addScatterLayer(xData() as Double, yData() as Double, name as string = ””, symbol as Integer = 1, symbolSize as Integer = 5, fillColor as Integer = -1, edgeColor as Integer = -1) as CDScatterLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a scatter chart layer to the XYChart.
Notes: A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears as scattered.

Parameter	Default	Description
xData	(Mandatory)	An array of numbers representing the x values of the data points. If no explicit x coordinates are used in the chart (eg. using an enumerated x-axis), an empty array may be used for this argument.
yData	(Mandatory)	An array of numbers representing the y values of the data points.
name	””	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
symbol	SquareShape	One of the predefined symbol constants to specify the symbol to use. (See Shape Specification for available built-in shapes.)
symbolSize	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette.
edgeColor	-1	The edge color used to draw the edge of the symbol. The default value of -1 means using LineColor as the edge color.

Return Value
A ScatterLayer object representing the scatter layer created.

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a scatter chart layer to the XYChart.
Notes: A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears

as scattered.

Parameter	Default	Description
xData	(Mandatory)	An array of numbers representing the x values of the data points. If no explicit x coordinates are used in the chart (eg. using an enumerated x-axis), an empty array may be used for this argument.
yData	(Mandatory)	An array of numbers representing the y values of the data points.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
symbol	SquareShape	One of the predefined symbol constants to specify the symbol to use. (See Shape Specification for available built-in shapes.)
symbolSize	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette.
edgeColor	-1	The edge color used to draw the edge of the symbol. The default value of -1 means using LineColor as the edge color.

Return Value
A ScatterLayer object representing the scatter layer created.

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a scatter chart layer to the XYChart.
Notes: A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears as scattered.

Parameter	Default	Description
xData	(Mandatory)	An array of numbers representing the x values of the data points. If no explicit x coordinates are used in the chart (eg. using an enumerated x-axis), an empty array may be used for this argument.
yData	(Mandatory)	An array of numbers representing the y values of the data points.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
symbol	SquareShape	One of the predefined symbol constants to specify the symbol to use. (See Shape Specification for available built-in shapes.)
symbolSize	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette.
edgeColor	-1	The edge color used to draw the edge of the symbol. The default value of -1 means using LineColor as the edge color.

Return Value
A ScatterLayer object representing the scatter layer created.

MBS ChartDirector Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a scatter chart layer to the XYChart.
Notes: A scatter chart can be considered as a special configuration of a line chart, in the data symbols are enabled and the line width is set to zero. Therefore only the data symbols are visible and the chart appears as scattered.

Parameter	Default	Description
xData	(Mandatory)	An array of numbers representing the x values of the data points. If no explicit x coordinates are used in the chart (eg. using an enumerated x-axis), an empty array may be used for this argument.
yData	(Mandatory)	An array of numbers representing the y values of the data points.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
symbol	SquareShape	One of the predefined symbol constants to specify the symbol to use. (See Shape Specification for available built-in shapes.)
symbolSize	5	The width and height of the symbol in pixels.
fillColor	-1	The color used to fill the symbol. -1 means that the color is automatically selected from the palette.
edgeColor	-1	The edge color used to draw the edge of the symbol. The default value of -1 means using LineColor as the edge color.

Return Value
A ScatterLayer object representing the scatter layer created.

30.67.69 addSplineLayer as CDSplineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a spline layer to the XYChart.
Notes: In a spline layer, the data points are connected together using cardinal spline curves (as opposed to straight lines). The "tension" of the curve can be configured using SplineLayer.setTension.

Parameter	Default	Description
data	[Empty_Array]	An array of numbers representing the data set.
color	-1	The color to draw the spline line. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

Return Value
A SplineLayer object representing the spline layer created.
See also:

- 30.67.70 addSplineLayer(data() as Double, colorvalue as color, name as string = "") as CDSplineLayerMBS 5764
- 30.67.71 addSplineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDSplineLayerMBS 5764

30.67.70 addSplineLayer(data() as Double, colorvalue as color, name as string = "") as CDSplineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addSplineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.69 addSplineLayer as CDSplineLayerMBS 5763
- 30.67.71 addSplineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDSplineLayerMBS 5764

30.67.71 addSplineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDSplineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a spline layer to the XYChart.
Notes: In a spline layer, the data points are connected together using cardinal spline curves (as opposed to straight lines). The "tension" of the curve can be configured using SplineLayer.setTension.

Parameter	Default	Description
data	[Empty_Array]	An array of numbers representing the data set.
color	-1	The color to draw the spline line. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

Return Value
A SplineLayer object representing the spline layer created.
See also:

- 30.67.69 addSplineLayer as CDSplineLayerMBS 5763
- 30.67.70 addSplineLayer(data() as Double, colorvalue as color, name as string = "") as CDSplineLayerMBS 5764

30.67.72 addStepLineLayer as CDStepLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a step line chart layer to the XYChart.
Notes: In a step line layer, the data points are connected together using steps. The alignment of the steps

relative to the data points can be configured using StepLineLayer.setAlignment.

Parameter	Default	Description
data	[Empty_Array]	An array of numbers representing the data set.
color	-1	The color to draw the step line. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.

Return Value
A StepLineLayer object representing the step line layer created.
See also:

- 30.67.73 addStepLineLayer(data() as Double, colorvalue as color, name as string = "") as CDStepLineLayerMBS 5765
- 30.67.74 addStepLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDStepLineLayerMBS 5765

30.67.73 addStepLineLayer(data() as Double, colorvalue as color, name as string = "") as CDStepLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addStepLineLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.72 addStepLineLayer as CDStepLineLayerMBS 5764
- 30.67.74 addStepLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDStepLineLayerMBS 5765

30.67.74 addStepLineLayer(data() as Double, colorvalue as Integer = -1, name as string = "") as CDStepLineLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a step line chart layer to the XYChart.
Notes: In a step line layer, the data points are connected together using steps. The alignment of the steps relative to the data points can be configured using StepLineLayer.setAlignment.

Return Value
A StepLineLayer object representing the step line layer created.

30.67.76 addTrendLayer(Data() as Double, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDTrendLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a trend chart layer to the XYChart, and specify the data set to use for drawing the trend line.
Notes:

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the line layer.

Return Value
A TrendLayer object representing the trend layer created.

30.67.77 addTrendLayer(dates() as date, colorvalue as color, name as string = ””, depth as Integer = 0) as CDTrendLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a trend chart layer to the XYChart, and specify the data set to use for drawing the trend line.
Notes:

Parameter	Default	Description
data	(Mandatory)	An array of numbers representing the data set.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	””	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the line layer.

Return Value
A TrendLayer object representing the trend layer created.

30.67.80 addTrendLayer(dates() as date, yData() as Double, colorvalue as Integer = -1, name as string = ””, depth as Integer = 0) as CDTrendLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a trend chart layer to the XYChart, and specify the x and y values for drawing the trend line.
Notes:

Parameter	Default	Description
xData	(Mandatory)	An array of numbers representing the x values of the data points.
yData	(Mandatory)	An array of numbers representing the y values of the data points.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the line layer.

Return Value
A TrendLayer object representing the trend layer created.

30.67.86 addTrendLayer(xData() as Double, yData() as Double, colorvalue as Integer = -1, name as string = "", depth as Integer = 0) as CDTrendLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a trend chart layer to the XYChart, and specify the x and y values for drawing the trend line.
Notes:

Parameter	Default	Description
xData	(Mandatory)	An array of numbers representing the x values of the data points.
yData	(Mandatory)	An array of numbers representing the y values of the data points.
color	-1	The color to draw the line. -1 means that the color is automatically selected from the palette.
name	""	The name of the data set. The name will be used in the legend box, if one is available. An empty string means the data set has no name.
depth	0	The 3D depth of the line layer.

Return Value
A TrendLayer object representing the trend layer created.

30.67.87 addVectorLayer(dates() as date, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = "") as CDVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 9.6, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds a vector layer to the chart.
Notes: The vectors are specified as 4 data series, representing the x and y coordinates of the reference points to put the vectors, and the lengths and directions of the vectors.

By default, the vector starts from the reference point and points away from it. You may use VectorLayer.setArrowAlignment to specify other options, such as for the vectors to point into the reference point, or to have the reference as a pivot at the mid-point of the vector.

ChartDirector supports specifying vectors lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.

Constant	Value	Description
PixelScale	0	The unit is measured in pixels.
XAxisScale	1	The unit is measured in x-axis scale.
YAxisScale	2	The unit is measured in y-axis scale.

Parameter	Default	Description
xData	(Mandatory)	An array of numbers representing the x coordinates for the reference points of the vectors.
yData	(Mandatory)	An array of numbers representing the y coordinates for the reference points of the vectors.
directions	(Mandatory)	An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.
lengths	(Mandatory)	An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.
lengthScale	PixelScale	The unit for the lengths, which must be one of the predefined constants in the table above.
color	-1	The color to draw the data points. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A VectorLayer object representing the vector layer created.

30.67.91 addVectorLayer(xData() as Double, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = "") as CDVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a vector layer to the chart.
Notes: The vectors are specified as 4 data series, representing the x and y coordinates of the reference

points to put the vectors, and the lengths and directions of the vectors.

By default, the vector starts from the reference point and points away from it. You may use VectorLayer.setArrowAlignment to specify other options, such as for the vectors to point into the reference point, or to have the reference as a pivot at the mid-point of the vector.

ChartDirector supports specifying vectors lengths as pixels or in axis scale. The unit is specified by using the following predefined constants.

Constant	Value	Description
PixelScale	0	The unit is measured in pixels.
XAxisScale	1	The unit is measured in x-axis scale.
YAxisScale	2	The unit is measured in y-axis scale.

Parameter	Default	Description
xData	(Mandatory)	An array of numbers representing the x coordinates for the reference points of the vectors.
yData	(Mandatory)	An array of numbers representing the y coordinates for the reference points of the vectors.
directions	(Mandatory)	An array of numbers representing the direction of the vectors as a clockwise angle in degrees, where 0 is upward pointing direction.
lengths	(Mandatory)	An array of numbers representing the lengths of the vectors, in unit as specified in the lengthScale argument.
lengthScale	PixelScale	The unit for the lengths, which must be one of the predefined constants in the table above.
color	-1	The color to draw the data points. -1 means that the color is automatically selected from the palette.
name	""	The name of the layer. The name will be used in the legend box, if one is available. An empty string means the layer has no name.

Return Value
A VectorLayer object representing the vector layer created.

30.67.92 addVectorLayer(xData() as Double, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer, colorvalue as color, name as string = "") as CDVectorLayerMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other addVectorLayer method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.87 addVectorLayer(dates() as date, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = "") as CDVectorLayerMBS 5776
- 30.67.88 addVectorLayer(dates() as date, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer, colorvalue as color, name as string = "") as CDVectorLayerMBS 5778
- 30.67.89 addVectorLayer(dates() as DateTime, yData() as double, directions() as double, lengths() as double, lengthScale as integer = 0, colorvalue as integer = -1, name as string = "") as CDVectorLayerMBS 5778
- 30.67.90 addVectorLayer(dates() as DateTime, yData() as double, directions() as double, lengths() as double, lengthScale as integer, colorvalue as color, name as string = "") as CDVectorLayerMBS 5779
- 30.67.91 addVectorLayer(xData() as Double, yData() as Double, directions() as Double, lengths() as Double, lengthScale as Integer = 0, colorvalue as Integer = -1, name as string = "") as CDVectorLayerMBS 5779

30.67.93 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as Integer = &hFFFF0000, edgeColor as Integer = &hFF000000, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new XYChart object.
Notes:

See also:

- 30.67.94 Constructor(width as Integer, height as Integer, bgcolor as color, edgeColor as color, raisedEffect as Integer = 0) 5782

Parameter	Default	Description
width	(Mandatory)	The width of the chart in pixels.
height	(Mandatory)	The height of the chart in pixels.
bgColor	BackgroundColor	The background color of the chart.
edgeColor	Transparent	The edge color of the chart.
raisedEffect	0	The 3D border width. For positive values, the border will appear raised. For negative values, the border will appear depressed. A zero value means the border will appear flat.

30.67.94 Constructor(width as Integer, height as Integer, bgcolor as color, edgeColor as color, raisedEffect as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other Constructor method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.93 Constructor(width as Integer = 640, height as Integer = 480, bgcolor as Integer = &hFFFF0000, edgeColor as Integer = &hFF000000, raisedEffect as Integer = 0) 5781

30.67.95 getLayer(i as Integer) as CDLayerMBS

MBS ChartDirector Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a Layer object based on the order in which it is being added to the chart.
Notes:

Argument	Default	Description
i	(Mandatory)	The index of the data layer. The index of the first layer added to the chart is 0. The index of the Nth layer added to the chart is N - 1.

30.67.96 getLayerByZ(i as Integer) as CDLayerMBS

MBS ChartDirector Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a Layer object based on the order in which it is being drawn.
Notes: In ChartDirector, by default, the first layer added will stay on the top of the chart. The second layer will be added under the first layer, and so on. It means The layers will be drawn in the reverse order that they are added to the chart. The ordering can be configured with Layer.moveFront or Layer.moveBack.

Argument	Default	Description
zIndex	(Mandatory)	The z-index of the required layer. The z-index of the first layer drawn is 0. The z-index for the Nth layer drawn is N - 1.

30.67.97 getLayerCount as Integer

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the number of layers in the chart.

30.67.98 getNearestXValue(xCoor as Double) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the x data value that is nearest to the specified x pixel coordinate.
Notes: This method will search all x data values in the XYChart to look for the x data value that is nearest to the given x coordinate. If there are two x data values equally near to the specified x pixel coordinate, this method will arbitrarily return one of the values.

Argument	Default	Description
xCoor	(Mandatory)	The x pixel coordinate to search for.

Returns the x data value that is nearest to the specified x coordinate.

30.67.99 getPlotArea as CDPlotAreaMBS

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the PlotArea object representing the plot area.

30.67.100 getXCoor(value as Double) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the x pixel coordinate of a point given the x data value.
Notes: Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

For a 3D chart, this method will get the pixel coordinate of the data value on the top surface of the chart.

Use Layer.getXCoor to obtain the pixel coordinate of the data value on a particular chart layer.

Parameter	Default	Description
v	(Mandatory)	The x data value.

Return Value
The x coordinate of the x data value.

30.67.101 getXValue(xCoor as Integer) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the x data value given the x pixel coordinate.
Notes: Note: This method should be used only after ChartDirector has output the chart image, or after XYChart.layoutAxes, BaseChart.layout or XYChart.packPlotArea has been called. ChartDirector needs to perform auto- scaling and layout the axis before it can convert between pixel coordinates and data values.

Argument	Default	Description
xCoor	(Mandatory)	The x pixel coordinate.

Returns the x data value at the x pixel coordinate.

30.67.102 getYCoor(value as Double, yAxis as CDAxisMBS=nil) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the y pixel coordinate of a point given the y data value.
Notes: Note: You must call BaseChart.layout first before calling this method. It is because ChartDirector needs to perform auto-scaling and determine the axis scale first before it can compute the coordinates.

For a 3D chart, this method will get the pixel coordinate of the data value on the top surface of the chart. Use Layer.getYCoor to obtain the pixel coordinate of the data value on a particular chart layer.

Parameter	Default	Description
v	(Mandatory)	The y data value.
yAxis	nil	The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

Return Value
The y coordinate of the y data value.

30.67.103 getYValue(yCoor as Integer, axis as CDAxisMBS = nil) as Double

MBS ChartDirector Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the y data value given the y pixel coordinate.
Notes: Note: This method should be used only after ChartDirector has output the chart image, or after XYChart.layoutAxes, BaseChart.layout or XYChart.packPlotArea has been called. ChartDirector needs to perform auto- scaling and layout the axis before it can convert between pixel coordinates and data values.

Argument	Default	Description
yCoor	(Mandatory)	The y pixel coordinate.
yAxis	nil	The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

Returns the y data value at the y pixel coordinate.

30.67.104 layoutAxes

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs axis auto-scaling and sets the axis positions and lengths.
Notes: ChartDirector automatically calls this method when creating the chart output (eg. using BaseChart.makeChart). There is usually no need to call this method explicitly.

However, if you would like to draw custom objects whose positions or contents depend on the axis scales, you may call this method to auto-scaling the axes before creating the chart output.

The axes will auto-scale based on the data at the time of calling this method. New data added afterwards will not affect the axis scale.

You should not modify the axis scale (eg. using Axis.setLinearScale, Axis.setLabels, etc) after calling this method.

30.67.105 packPlotArea(leftX as Integer, topY as Integer, rightX as Integer, bottomY as Integer, minWidth as Integer = 0, minHeight as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adjusts the plot area size and position to fit the plot area and the axis labels in a bounding box.

Notes: In some charts, the axis labels may vary widely and can be very short or very long. It may be difficult to determine to plot area position and size so as to reserve reasonable and sufficient space for the axis labels.
This method adjusts the size and position of the plot area, so that the plot area, together with the axis labels can fit within a given bounding box.
Note that this method only adjusts for the thickness of the primary and secondary axes, and assumes they are at the border of the plot area. For other axes, you may use Axis.getThickness to get their thickness and adjust the plot area size and position accordingly.
For this method to determine the thickness of the axes, it needs to auto-scale the axes to determine the axis labels. That means all the data should be entered to the chart before calling this method.
Furthermore, the labels generated by auto-scaling depend on the number of labels that can fit on the axis, which in turn depends on the plot area size. So even the final plot area size is determined by this method, the XYChart.setPlotArea must still be used to set a reasonable initial plot area size.
To adjust only the plot area width and horizontal position, and leave the height and vertical position unchanged, simply use a bounding box with zero height (eg. set both topY and bottomY to 0). Similarly, to adjust only the height and vertical position, use a bounding box with zero width.
In some extreme cases, the axis labels may be so long that the plot area needs to adjust to an unreasonably small size, or even zero in size. For example, the axis labels may be names entered by the user, and the user may enter a name thousands of characters long. These extreme cases should be avoided by checking and limiting the length of the labels before passing the labels to ChartDirector. This method also has a safeguard for these unreasonable labels by ensuring the plot area will not shrink below a given minimum size.

Arguments:

Argument	Default	Description
leftX	(Mandatory)	The left x coordinate of the bounding box.
topY	(Mandatory)	The top y coordinate of the bounding box.
rightX	(Mandatory)	The right x coordinate of the bounding box.
bottomY	(Mandatory)	The bottom y coordinate of the bounding box.
minWidth	0	The minimum width the plot area can adjust to.
minHeight	0	The minimum height the plot area can adjust to.

30.67.106 setAxisAtOrigin(originMode as Integer = 3, symmetryMode as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the chart into 4 quadrant mode. The axes may intersect at origin inside the plot area (as opposed to at the border of the plot area).
Notes: By default, ChartDirector puts the axes at the border of the plot area. This ensures the axes and the axes labels will not block the contents of the plot area.

However, in some cases, it may be desirable for the axes to intersect at the origin. The axes may need to move inside the plot area.

ChartDirector allows you to move the primary x-axis and/or y-axis to so that they intersect with the zero point of the other axis. The following constants represent different possibilities:

Constant	Value	Description
XAxisAtOrigin	1	Move the x-axis so that it will intersect with the zero point of the y-axis, if that point exists.
YAxisAtOrigin	2	Move the y-axis so that it will intersect with the zero point of the x-axis, if that point exists.
XYAxisAtOrigin	3	Move the x-axis so that it will intersect with the zero point of the y-axis, if that point exists. Move the y-axis so that it will intersect with the zero point of the x-axis, if that point exists.

In addition to ensure the axes intersects at the origin, ChartDirector allows you to control if the axes are symmetrical about the origin with the following flags. Multiple flags can be specified by "or" them together.

Constant	Value	Description
XAxisSymmetric	1	Adjust the x-axis so that it becomes symmetrical about the zero point, that is, the positive and negative part of the x-axis will be of the same length.
XAxisSymmetricIfNeeded	2	Adjust the x-axis will be symmetrical about the zero point if the axis scale needs both positive and negative values.
YAxisSymmetric	4	Adjust the y-axis so that it becomes symmetrical about the zero point, that is, the positive and negative part of the y-axis will be of the same length.
YAxisSymmetricIfNeeded	8	Adjust the y-axis will be symmetrical about the zero point if the axis scale needs both positive and negative values.
XYAxisSymmetric	16	Adjust the x-axes and y-axes so that they become symmetrical about the zero point. The positive and negative parts of the x-axes and the y-axes will all be of the same length.
XYAxisSymmetricIfNeeded	32	Adjust the x-axes and y-axes so that they become symmetrical about the zero point. However, if an axis does not need both positive and negative values, it will not be adjusted.

Parameter	Default	Description
originMode	XYAxisAtOrigin	predefined constants to determine which axis needs to move to intersect with the zero point of the other axis.
symmetryMode	0	Flags to determine if the axes need to be symmetrical about the origin.

30.67.107 setClipping(margin as Integer = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enables clipping on the plot area.
Notes: In normal usage, ChartDirector will auto-scale the axis to ensure all the data points will be within

the plot area.

However, if manual scaling is used (e.g. using Axis.setLinearScale), it is possible to choose an axis scale such that some data points will be outside the plot area. So some of the data representation (bars, lines, etc) will be outside the plot area.

This method can be used to clip the plot area, so that any data representation that is outside the plot area will not be drawn.

Parameter	Default	Description
margin	0	Additional margin, measured in pixels, to be added to the 4 sides of the plot area for the purpose of clipping. A positive value means the clipping region will be larger than the plot area. A negative value means the clipping region will be smaller than the plot area. The default value of 0 means the clipping region is equal to the plot area.

30.67.108 setPlotArea(x as Integer, y as Integer, width as Integer, height as Integer, bgColor as color, altBgColor as color, edgeColor as color, hGridColor as color, vGridColor as color) as CDPlotAreaMBS

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other setPlotArea method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.109 setPlotArea(x as Integer, y as Integer, width as Integer, height as Integer, bgColor as Integer = &hff000000, altBgColor as Integer = -1, edgeColor as Integer = -1, hGridColor as Integer = &hc0c0c0, vGridColor as Integer = &hff000000) as CDPlotAreaMBS 5789

30.67.109 setPlotArea(x as Integer, y as Integer, width as Integer, height as Integer, bgColor as Integer = &hff000000, altBgColor as Integer = -1, edgeColor as Integer = -1, hGridColor as Integer = &hc0c0c0, vGridColor as Integer = &hff000000) as CDPlotAreaMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the position, size, background colors, edge color and grid colors of the plot area.
Notes:

Return Value
A PlotArea object representing the plot area.
See also:

Parameter	Default	Description
x	(Mandatory)	The x coordinate of the left of the plot area.
y	(Mandatory)	The y coordinate of the top of the plot area.
width	(Mandatory)	The width of the plot area in pixels.
height	(Mandatory)	The height of the plot area in pixels.
bgColor	Transparent	The background color of the plot area.
altBgColor	-1	The second background color of the plot area. -1 means there is no second background color. If there is a second background color, the two background colors will be used alternatively as horizontal bands on the background grid.
edgeColor	-1	The border color of the plot area. -1 means to use the default, which is LineColor. However, if the axes are configured in 4 quadrant mode (see XYChart.setAxisAtOrigin), the default will change to Transparent.
hGridColor	C0C0C0	The horizontal grid color.
vGridColor	Transparent	The vertical grid color.

- 30.67.108 setPlotArea(x as Integer, y as Integer, width as Integer, height as Integer, bgColor as color, altBgColor as color, edgeColor as color, hGridColor as color, vGridColor as color) as CDPlotAreaMBS 5789

30.67.110 setTrimData(startPos as Integer, len as Integer = &h7fffffff)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Uses only a subset of the data series to draw charts.
Notes: In finance charts, "lead data" are commonly needed to plot technical indicators. For example, to show a 20-days moving average line for 30 days, one needs 50 days of data. It is because computing 20-days moving average requires 20 days of "lead data". The setTrimData method is a convenience method for trimming off these "lead data" so they will not appear on the chart.

Parameter	Default	Description
startPos	(Mandatory)	The index for the first data position to use for plotting charts.
len	7FFFFFFF	The length of the data points used for plotting charts.

30.67.111 setXAxisOnTop(value as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Interchange the position of the primary x-axis and the secondary x-axis.
Notes: By default, the primary x-axis is the x-axis on the bottom side of the plot area (left side if XYChart.swapXY is in effect), and the secondary x-axis is on the top side of the plot area (right side if XYChart.swapXY is in effect). This method can be used to interchange their positions.

Parameter	Default	Description
b	true	A true value means to interchange the positions of the primary and secondary x-axes. A false value means using the default positions for the primary and secondary x-axes.

30.67.112 setYAxisOnRight(value as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Interchange the position of the primary y-axis and the secondary y-axis.
Notes: By default, the primary y-axis is the y-axis on the left side of the plot area (bottom side if XYChart.swapXY is in effect), and the secondary y-axis is on the right side of the plot area (top side if XYChart.swapXY is in effect). This method can be used to interchange their positions.

Parameter	Default	Description
b	true	A true value means to interchange the positions of the primary and secondary y-axes. A false value means using the default positions for the primary and secondary y-axes.

30.67.113 swapXY(value as boolean=true)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Swap the position of the x and y axes, so the x-axes will become vertical, and the y-axes will become horizontal.
Notes: After swapping the x and y axes, the charts will appear rotated. For example, the bars in a bar chart will become horizontal instead of vertical, and the area in a stacked area chart will grow from left to right (instead of bottom to top).

Parameter	Default	Description
b	true	A true value means the x and y axes will be swapped. A false value means the x and y axes not be swapped.

30.67.114 syncYAxis(slope as Double = 1, intercept as Double = 0)

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a linear formula to synchronize the secondary y-axis scale to the primary y-axis scale.
Notes: The formula is in the format:

y2 = y1 * slope + intercept

This method is usually used if the two y-axes represent the same measurement using different units. Examples including temperature in Celsius and in Fahrenheit, and length in meters and feet.

Parameter	Default	Description
slope	1	The slope parameter for the formula linking the secondary y-axis to the primary y-axis.
intercept	0	The intercept parameter for the formula linking the secondary y-axis to the primary y-axis.

30.67.115 xScaleColor(scale() as double) as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an x-scale color. An x-scale is a color that will vary depending on the x value of the pixel.
Notes:

Argument	Default	Description
colorStops	(Mandatory)	An array that defines the mapping from data values to colors. Please refer to ColorAxis.setColorScale for the format of this array.

Returns a 32-bit integer representing the x scale color.

30.67.116 xZoneColor(threshold as Double, belowColor as color, aboveColor as color) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other xZoneColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.117 xZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer) as Integer 5792

30.67.117 xZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a x-zone color. A x-zone will change from one color to another depending on a threshold value on the x-axis.
Notes: For example, if a x-zone color is used as the line color in a line layer, the line will switch from one color to another when its passes through a certain value on the x-axis. Similarly, if a x-zone color is used as the fill color in an area layer, the area will switch from one color to another when it passes through a certain value on the x-axis.

The two colors used in a x-zone color can be other dynamic colors. For example, one color could be a solid color, while the other color could be a dash line color (see !BaseChart.dashLineColor). When this x-zone color is as the line color, the line will change from a solid style to a dash line style when the line passes through a certain value on the x-axis

You may create x-zone colors with more than 2 zones by cascading multiple x-zone colors.

For a 3D chart, this method will get the zone color at the top surface of the chart. Use Layer.xZoneColor to obtain the zone color for a particular chart layer.

threshold	(Mandatory)	The x value serving as the threshold for switching between two colors.
belowColor	(Mandatory)	The color to use when the x-axis value of the pixel is smaller than the threshold.
aboveColor	(Mandatory)	The color to use when the x-axis value of the pixel is greater than the threshold.

Return Value
A 32-bit integer representing the x-zone color.
See also:

- 30.67.116 xZoneColor(threshold as Double, belowColor as color, aboveColor as color) as Integer 5792

30.67.118 yScaleColor(scale() as double, yAxis as CDAxisMBS = nil) as Integer

MBS ChartDirector Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a y-scale color. An y-scale is a color that will vary depending on the y value of the pixel.
Notes:

Argument	Default	Description
colorStops	(Mandatory)	An array that defines the mapping from data values to colors. Please refer to ColorAxis.setColorScale for the format of this array.
yAxis	nil	The y-axis to use to determine the pixel coordinates of data values. The y-axis may be obtained using XYChart.yAxis, XYChart.yAxis2 or XYChart.addAxis. The default is to use the primary y-axis.

Returns a 32-bit integer representing the y scale color.

30.67.119 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAxisMBS=nil) as Integer

MBS ChartDirector Plugin, Plugin Version: 11.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Same as the other yZoneColor method, but uses color instead of integer data type for passing color values.
See also:

- 30.67.120 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS=nil) as Integer 5794

30.67.120 yZoneColor(threshold as Double, belowColor as Integer, aboveColor as Integer, yAxis as CDAxisMBS=nil) as Integer

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a x-zone color. A x-zone will change from one color to another depending on a threshold value on the x-axis.
Notes: For example, if a x-zone color is used as the line color in a line layer, the line will switch from one color to another when its passes through a certain value on the x-axis. Similarly, if a x-zone color is used as the fill color in an area layer, the area will switch from one color to another when it passes through a certain value on the x-axis.

The two colors used in a x-zone color can be other dynamic colors. For example, one color could be a solid color, while the other color could be a dash line color (see !BaseChart.dashLineColor). When this x-zone color is as the line color, the line will change from a solid style to a dash line style when the line passes through a certain value on the x-axis

You may create x-zone colors with more than 2 zones by cascading multiple x-zone colors.

For a 3D chart, this method will get the zone color at the top surface of the chart. Use Layer.xZoneColor to obtain the zone color for a particular chart layer.

Parameter	Default	Description
threshold	(Mandatory)	The x value serving as the threshold for switching between two colors.
belowColor	(Mandatory)	The color to use when the x-axis value of the pixel is smaller than the threshold.
aboveColor	(Mandatory)	The color to use when the x-axis value of the pixel is greater than the threshold.

Return Value
A 32-bit integer representing the x-zone color.
See also:

- 30.67.119 yZoneColor(threshold as Double, belowColor as color, aboveColor as color, yAxis as CDAx-

isMBS=nil) as Integer 5794

30.67.121 Properties

30.67.122 xAxis as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the Axis object representing primary x-axis of the XYChart.
Notes: By default, the primary x-axis is the x-axis on the bottom side of the plot area (left side if XYChart.swapXY is in effect), and the secondary x-axis is on the top side of the plot area (right side if XYChart.swapXY is in effect). You may interchange their positions using XYChart.setXAxisOnTop.

Return Value
The Axis object representing the primary x-axis of the XYChart.
(Read only property)

30.67.123 xAxis2 as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the Axis object representing secondary x-axis of the XYChart.
Notes: By default, the primary x-axis is the x-axis on the bottom side of the plot area (left side if XYChart.swapXY is in effect), and the secondary x-axis is on the top side of the plot area (right side if XYChart.swapXY is in effect). You may interchange their positions using XYChart.setXAxisOnTop.

Return Value
The Axis object representing the secondary x-axis of the XYChart.
(Read only property)

30.67.124 yAxis as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the Axis object representing primary y-axis of the XYChart.
Notes: Return Value
The Axis object representing the primary y-axis of the XYChart.
(Read only property)

30.67.125 yAxis2 as CDAxisMBS

MBS ChartDirector Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the Axis object representing secondary y-axis of the XYChart.
Notes: By default, the primary y-axis is the y-axis on the left side of the plot area (bottom side if XYChart.swapXY is in effect), and the secondary y-axis is on the right side of the plot area (top side if XYChart.swapXY is in effect). You may interchange their positions using XYChart.setYAxisOnRight.

Return Value
The Axis object representing the secondary y-axis of the XYChart.
(Read only property)

30.67.126 Screenshots

30.67.127 linefill.jpg

Function: A line chart created using ChartDirector with the CDXYChartMBS class.

30.67.128 softlightbar.jpg

Function: A bar chart created using ChartDirector with the CDXYChartMBS class.

Chapter 31

Claris FileMaker Data API

31.1 class FMAdminMBS

31.1.1 class FMAdminMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for FileMaker Server Admin API.
Example:

```
Var d As New FMAdminMBS

d.Password = "admin"
d.Username = "admin"
d.Server = "localhost"

Var r As FMResponseMBS = d.Login

If r = Nil Then
MessageBox "Failed?"
else
MessageBox r.ErrorMessage
End If
```

Notes: Our plugin does re-login if the session expired as well as login if needed.

For use with Claris Server or FileMaker Server.
Subclass of the FMConnectionMBS class.

31.1.2 Methods

31.1.3 Constructor

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

31.1.4 CreateBackupSchedule(schedule as Dictionary) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a Backup schedule.
Notes: Please pass Backup Schedule as dictionary:

name	string [1 .. 31] characters ^(?!\s*$).+	Schedule name. This parameter cannot be an empty string or a string of whitespace characters.
backupType	dictionary	Parameters for the backup schedule.
sendEmail	Array of strings	Email addresses to send notifications to. An empty array disables sending email. Note: SMTP configuration is required for sending email.
enabled	boolean	To enable a schedule to run, or to find out whether the schedule is enabled to run. If you create a schedule without specifying this parameter, the default value 'false' is used.
onceType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run on the specified date and time.
weeklyType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run weekly on one or more days.
everyndaysType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule that has a specific interval in days, such as every 2, 3, or 4 days.

31.1.5 CreateFileMakerScriptSchedule(schedule as Dictionary) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a FileMaker Script schedule.
Notes: The parameter for creating a FileMaker Script Schedule as dictionary:

name	string [1 .. 31] characters ^(?!\s*$).+	Schedule name. This parameter cannot be an empty string or a string of whitespace characters.
filemakerScriptType	dictionary	Parameters for the FileMaker script schedule.
sendEmail	Array of strings	Email addresses to send notifications to. An empty array disables sending email. Note: SMTP configuration is required for sending email.
enabled	boolean	To enable a schedule to run, or to find out whether the schedule is enabled to run. If you create a schedule without specifying this parameter, the default value 'false' is used.
onceType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run on the specified date and time.
weeklyType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run weekly on one or more days.
everyndaysType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule that has a specific interval in days, such as every 2, 3, or 4 days.

31.1.6 CreateMessageSchedule(schedule as Dictionary) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a message schedule.
Notes: Create Message Schedule Parameters as dictionary:

name	string [1 .. 31] characters ^(?!\s*$).+	Schedule name. This parameter cannot be an empty string or a string of whitespace characters.
messageType	dictionary	Parameters for the message schedule.
sendEmail	Array of strings	Email addresses to send notifications to. An empty array disables sending email. Note: SMTP configuration is required for sending email.
enabled	boolean	To enable a schedule to run, or to find out whether the schedule is enabled to run. If you create a schedule without specifying this parameter, the default value 'false' is used.
onceType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run on the specified date and time.
weeklyType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run weekly on one or more days.
everyndaysType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule that has a specific interval in days, such as every 2, 3, or 4 days.

31.1.7 CreateScriptSequenceSchedule(schedule as Dictionary) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a Script Sequence schedule.
Notes: Pass Script Sequence Schedule Parameter as dictionary:

31.1.8 CreateSystemScriptSchedule(schedule as Dictionary) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

name	string [1 .. 31] characters ^(?!\s*$).+	Schedule name. This parameter cannot be an empty string or a string of whitespace characters.
scriptSequenceType	dictionary	Parameters for the script sequence schedule.
sendEmail	Array of strings	Email addresses to send notifications to. An empty array disables sending email. Note: SMTP configuration is required for sending email.
enabled	boolean	To enable a schedule to run, or to find out whether the schedule is enabled to run. If you create a schedule without specifying this parameter, the default value 'false' is used.
onceType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run on the specified date and time.
weeklyType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run weekly on one or more days.
everyndaysType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule that has a specific interval in days, such as every 2, 3, or 4 days.

Function: Create a System Script schedule.
Notes: Pass System Script Schedule Parameters as dictionary:

name	string [1 .. 31] characters ^(?!\s*$).+	Schedule name. This parameter cannot be an empty string or a string of whitespace characters.
systemScriptType	dictionary	Parameters for the system script schedule.
sendEmail	Array of strings	Email addresses to send notifications to. An empty array disables sending email. Note: SMTP configuration is required for sending email.
enabled	boolean	To enable a schedule to run, or to find out whether the schedule is enabled to run. If you create a schedule without specifying this parameter, the default value 'false' is used.
onceType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run on the specified date and time.
weeklyType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run weekly on one or more days.
everyndaysType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule that has a specific interval in days, such as every 2, 3, or 4 days.

31.1.9 CreateVerifySchedule(schedule as Dictionary) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a Verify schedule.
Notes: Pass Verify Schedule Parameters as dictionary:

31.1.10 DeleteSchedule(scheduleID as Integer) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Delete a schedule specified by the schedule ID.
Notes: scheduleID: ID of the schedule, a value ,â• 2. Schedule ID 1 is reserved by FileMaker Server.

name	string [1 .. 31] characters ^(?!\s*$).+	Schedule name. This parameter cannot be an empty string or a string of whitespace characters.
verifyType	dictionary	Parameters for the verify schedule.
sendEmail	Array of strings	Email addresses to send notifications to. An empty array disables sending email. Note: SMTP configuration is required for sending email.
enabled	boolean	To enable a schedule to run, or to find out whether the schedule is enabled to run. If you create a schedule without specifying this parameter, the default value 'false' is used.
onceType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run on the specified date and time.
weeklyType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run weekly on one or more days.
everyndaysType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule that has a specific interval in days, such as every 2, 3, or 4 days.

31.1.11 DisconnectClient(ClientID as Integer, messageText as String = "", graceTime as Integer = -1) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Disconnect a FileMaker client.
Notes:

ClientID	integer >= 1	ID of the client to disconnect.
messageText	string [0 .. 200] characters	The text message to send to the client that is being disconnected.
graceTime	integer [0 .. 3600]	The number of seconds to wait before disconnecting the client. Default: 90

31.1.12 DuplicateSchedule(scheduleID as Integer) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Duplicate a schedule specified by the schedule ID.
Notes: ScheduleID: The schedule ID for the schedule to duplicate, a value ,â• 2. Schedule ID 1 is reserved by FileMaker Server.

31.1.13 EditSchedule(scheduleID as Integer, schedule as Dictionary) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Edit or run a schedule specified by scheduleID.
Notes: Each parameter is optional, but at least one parameter is required.

To run a schedule, set the 'status' parameter to 'RUNNING'.
Use this call to run a schedule. Use the GetSchedule API call to verify the results.
You can not change schedule type in edit schedule api.

Parameters for dictionary:

name	string [1 .. 31] characters ^(?!\s*$).+	Schedule name. This parameter cannot be an empty string or a string of whitespace characters.
status	string	Value: "RUNNING". Whether to run the schedule.
onceType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run on the specified date and time.
weeklyType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule to run weekly on one or more days.
everyndaysType	dictionary	If used with POST or PATCH, allows you to create or edit a schedule that has a specific interval in days, such as every 2, 3, or 4 days.
sendEmail	Array of strings	Email addresses to send notifications to. An empty array disables sending email. Note: SMTP configuration is required for sending email.
enabled	boolean	To enable a schedule to run, or to find out whether the schedule is enabled to run. If you create a schedule without specifying this parameter, the default value 'false' is used.
backupType	dictionary	Parameters for the backup schedule.
filemakerScriptType	dictionary	Parameters for the FileMaker script schedule.
messageType	dictionary	Parameters for the message schedule.
scriptSequenceType	dictionary	Parameters for the script sequence schedule.
systemScriptType	dictionary	Parameters for the system script schedule.
verifyType	dictionary	Parameters for the verify schedule.

31.1.14 GetDataAPISettings as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the FileMaker Data API settings.

31.1.15 GetPHPSettings as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the PHP settings.

31.1.16 GetSchedule(scheduleID as Integer) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get a schedule specified by the schedule ID.
Notes: scheduleID: ID of the schedule, value ,â• 2. Schedule ID 1 is reserved by FileMaker Server.

31.1.17 GetServerGeneralSettings as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the server general settings.

31.1.18 GetServerSecuritySetting as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the server security setting..

31.1.19 GetServerStatus as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the Database Server status.

31.1.20 GetWebDirectSettings as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the FileMaker WebDirect settings.

31.1.21 GetWPESettings as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the Web Publishing Engine settings for all machines.
See also:

- 31.1.22 GetWPESettings(MachineID as Integer) as FMResponseMBS 5805

31.1.22 GetWPESettings(MachineID as Integer) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the Web Publishing Engine settings for a single machine.
Notes: MachineID: ID of machine, a value ,â • 1.
See also:

- 31.1.21 GetWPESettings as FMResponseMBS 5805

31.1.23 GetXDBCSettings as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the ODBC/JDBC settings.

31.1.24 GetXMLSettings as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the XML settings.

31.1.25 ListClients as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: List the connected clients.

31.1.26 ListDatabases as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: List all hosted databases.

31.1.27 ListSchedules as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: List all schedules.

31.1.28 Login as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Request an access token from the host using the root administrator account name and password.
Example:

```
Var d As New FMAdminMBS

d.Password = "admin"
```

```
d.Username = "admin"
d.Server = "localhost"

Var r As FMResponseMBS = d.Login

If r = Nil Then
MessageBox "Failed?"
else
MessageBox r.ErrorMessage
End If
```

Notes: Please either set UserName and Password before calling this.
If you don't call Login explicitly or the session token expired, the plugin will call it for you.

31.1.29 Logout as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Invalidate the specified JSON Web Token.
Notes: Clears session token property.

31.1.30 PerformDatabaseOperations(DatabaseID as Integer, status as String, key as string = "",saveKey as boolean = false, messageText as string = "", force as boolean = false) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Open, close, pause, or resume the specified database.
Notes:

status	Enum: "OPENED" "PAUSED" "RESUMED" "CLOSED"	Status of the database.
key	string	The password required to open an encrypted database. Required and allowed only if status = OPENED. Note: FileMaker Admin API does not validate the encryption key. You receive an error code of 0 even if you enter an invalid key.
saveKey	boolean	Allow the host to save the encryption password. Allowed only if status = OPENED.
messageText	string [0 .. 200] characters	The text message to send to the client being disconnected. Required and allowed only if status = CLOSED.
force	boolean	Forces databases to be closed and disconnects connected clients. Overrides the graceTime option. Allowed only if status = CLOSED.

See also:

- 31.1.31 PerformDatabaseOperations(status as String, force as boolean = false) as FMResponseMBS 5808

31.1.31 PerformDatabaseOperations(status as String, force as boolean = false) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Open, close, pause, or resume all databases.
Notes: status: "OPENED", "PAUSED", "RESUMED", "CLOSED". Status of the database.
force: Forces databases to be closed and disconnects connected clients. Overrides the graceTime option. Allowed only if status = CLOSED.
See also:

- 31.1.30 PerformDatabaseOperations(DatabaseID as Integer, status as String, key as string = "",saveKey as boolean = false, messageText as string = "", force as boolean = false) as FMResponseMBS 5807

31.1.32 SendMessageToClient(clientID as Integer, messageText as String) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Send a message to a FileMaker client.
Notes: You cannot send a message to a client that is connected via FileMaker Data API. You receive an error code of 0 even if the client is connected via FileMaker Data API.

messageText: The text message to send to the client. This parameter cannot be an empty string or a string of whitespace characters.

31.1.33 UpdateDataAPISettings(enabled as Boolean) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Update the FileMaker Data API settings.
Notes: enabled: allows you to enable or disable FileMaker Data API.

31.1.34 UpdatePHPSettings(settings as Dictionary) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Update the PHP settings. Parameters are optional, but at least one parameter is required.
Notes: PHP Configuration dictionary:

characterEncoding	string	Enum: "UTF-8" "ISO-8859-1". The default character encoding for PHP.
dataPreValidation	boolean	Whether the record data should be validated before committing changes to the Database Server.
enabled	boolean	If used with GET, specifies whether Custom Web Publishing with PHP is enabled or disabled. If used with PATCH, allows you to enable or disable Custom Web Publishing with PHP.
errorMessageLanguage	string	Enum: "en" "it" "de" "fr" "ja". The language used for error messages for PHP.
useFileMakerPhp	boolean	Whether to use the FileMaker version of the PHP engine rather than your own version of PHP.

31.1.35 UpdateServerGeneralSettings(settings as Dictionary) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Update the server general settings. All parameters are optional, but at least one parameter is required.
Notes: Provide Server General Settings via dictionary with following keys:

cacheSize	integer >= 64	Cache memory (in megabytes) allocated by the server. The maximum setting is not enforced, but allocating more memory than what the system can manage will impact server performance.
maxFiles	integer [1 .. 125]	Maximum number of databases that can be hosted.
maxProConnections	integer [0 .. 2000]	Maximum number of FileMaker Pro client connections.
maxPSOS	integer [0 .. 500]	Maximum number of script sessions that can run on the server simultaneously.
openDatabasesOnStart	boolean	Automatically open databases that are in the database folders when the Database Server starts.
startupRestorationEnabled	boolean	Enable/Disable database auto restoration. If you change this setting, you need to restart FileMaker Server for the change to take effect.
startupRestorationLogPath	string ^(?!\s*$).+	The folder path to save restoration logs. If you change this setting, you need to restart FileMaker Server for the change to take effect. This parameter cannot be an empty string or a string of whitespace characters.
useSchedules	boolean	Allow enabled schedules to run.
autostartDBS	boolean	Whether the Database Server should start automatically. If autostartDBS is set to false, autostartWPE is also set to false.
autostartWPE	boolean	Whether the Web Publishing Engine should start automatically. If autostart-DBS is set to false, autostartWPE can't be set to true.

31.1.36 UpdateServerSecuritySetting(requireSecureDB as Boolean) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Update the server security setting.
Notes: requireSecureDB: If set to true, only databases with password-protected accounts that have the Full Access privilege set can be opened for hosting. Applies only to the default and additional folders.

31.1.37 UpdateServerStatus(status as String, messageText as String = """, graceTime as Integer = -1) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Run or stop the Database Server.
Notes: status: "RUNNING" or "STOPPED"
Allows you to start or stop FileMaker Database Server.

messageText: Up to 200 characters. The message to send to the FileMaker client when stopping the Database Server.
graceTime: The length of seconds to delay before stopping the Database Server. Default is 90 and range is 0 to 3600.

If messageText is empty or graceTime is negative, we don't include the value in the request.

31.1.38 UpdateWebDirectSettings(enabled as Boolean) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Update the FileMaker WebDirect settings.
Notes: enabled: allows you to enable or disable FileMaker WebDirect.

31.1.39 UpdateWPESettings(machineID as Integer, enabled as Boolean) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Update the Web Publishing Engine settings.
Notes:

machineID	integer >= 1	ID of machine
enabled	boolean	Allows you to enable or disable Web Publishing Engine.

31.1.40 UpdateXDBCSettings(enabled as Boolean) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Update the ODBC and JDBC settings.
Notes: enabled: allows you to enable or disable ODBC/JDBC.

31.1.41 UpdateXMLSettings(enabled as Boolean) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Update the XML settings.
Notes: enabled: allows you to enable or disable XML.

31.1.42 Constants

Database Operations

Constant	Value	Description
kDatabaseOperationClose	"CLOSED"	Close database.
kDatabaseOperationOpen	"OPENED"	Open database.
kDatabaseOperationPause	"PAUSED"	Pause database.
kDatabaseOperationResume	"RESUMED"	Resume database.

Server Status

Constant	Value	Description
kServerStatusRunning	"RUNNING"	Start server
kServerStatusStopped	"STOPPED"	Stop server

31.2 class FMConnectionMBS

31.2.1 class FMConnectionMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The base class for a server connection.
Notes: Please see subclsses FMDataMBS for data API and FMAdminMBS for admin API.

Our plugin does re-login if the session expired as well as login if needed.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

31.2.2 Methods

31.2.3 Constructor

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.
Notes: Please use subclasses FMDataMBS and FMAdminMBS.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

31.2.4 Login as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs login.
Notes: On success, updates SessionToken property.
If you don't call Login explicitly or the session token expired, the plugin will call it for you.

31.2.5 Logout as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs logout.

31.2.6 SendRequest(HTTPMethod as String, Query as String, Body as String = "") as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The method to sends a request to the server.
Notes: This is to help with future API calls not yet supported or in case you like to do one yourself instead of using our existing methods.
If body contains something, we pass it with the request.

31.2.7 Properties

31.2.8 CAPath as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The path for the cacert.pem file with the valid root certificates.
Notes: If set, we can verify SSL certificates.
(Read and Write property)

31.2.9 Headers as Dictionary

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Additional headers to include with each request.
Example:

```
Var d As New FMAdminMBS
// optional headers
d.Headers.Value("User-Agent") = "FileMaker Admin API Test 1.0"
```

Notes: (Read and Write property)

31.2.10 IncludeDataInDebugMessages as Boolean

MBS CURL Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable debug logs to contain the data sent/received.
Notes: A setting for all connections.
(Read and Write property)

31.2.11 Password as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The password to use for basic authorization.
Notes: (Read and Write property)

31.2.12 Server as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The server to use.
Notes: Set to IP or domain name.
We prepend https:// when doing the request.
(Read and Write property)

31.2.13 SessionToken as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The session token for the current session.
Notes: Automatically set when doing login.
(Read and Write property)

31.2.14 Username as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The user name to use for basic authorization.
Notes: (Read and Write property)

31.2.15 Version as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: FileMaker Data API version requested.
Notes: currently v1, v2 or vLatest are allowed.
vLatest is default.
(Read and Write property)

31.3 class FMContainerUploadMBS

31.3.1 class FMContainerUploadMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a container upload.
Example:

```
// upload a picture into a container field of a FileMaker record
// d is a logged in FMDataMBS with the Layout set, see FMDataMBS
Var d As FMDataMBS // your connection
If d = Nil Then Return

Var upload As New FMContainerUploadMBS
upload.RecordId = "12"
upload.ContainerFieldName = "Photo"
upload.FileName = "logo.png"
upload.MimeType = "image/png"
upload.SetPicture LogoMBS(200)

Var r As FMResponseMBS = d.UploadToContainerField(upload)
MessageBox r.ErrorMessage
```

Blog Entries

- Connect to Claris FileMaker Server from Xojo via Data API
- MBS Xojo Plugins, version 20.4pr7

31.3.2 Methods

31.3.3 Constructor

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

31.3.4 SetPicture(Pic as Picture)

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets data with picture.
Notes: Convenience function to upload pictures.

We create PNG representation of the picture, set mime type and dataMemory property.

31.3.5 Properties

31.3.6 ContainerFieldName as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Container Field Name.
Notes: (Read and Write property)

31.3.7 ContainerFieldRepetition as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Container Field Repetition
Notes: Optional.
(Read and Write property)

31.3.8 DataMemory as MemoryBlock

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data to send for the container as memoryblock.
Notes: We provide DataMemory and DataString to avoid conversion between those.
Setting this clears DataString.
(Read and Write property)

31.3.9 DataString as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The data to send for the container as string.
Notes: We provide DataMemory and DataString to avoid conversion between those.
Setting this clears DataMemory.
(Read and Write property)

31.3.10 FileName as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file name for the upload.
Notes: (Read and Write property)

31.3.11 MimeType as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mime type.
Notes: (Read and Write property)

31.3.12 ModId as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Modification ID of record.
Notes: (Read and Write property)

31.3.13 RecordId as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Record ID.
Notes: (Read and Write property)

31.4 class FMDataMBS

31.4.1 class FMDataMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a FileMaker Server Data API connection.
Example:

```
Var d As New FMDataMBS

d.Password = "admin"
d.Username = "admin"
d.Server = "localhost"
d.Database = "test"

Var r As FMResponseMBS = d.Login

If r = Nil Then
MessageBox "Failed?"
else
MessageBox r.ErrorMessage
End If
```

Notes: Our plugin does re-login if the session expired as well as login if needed.

For use with Claris Server or FileMaker Server.
Subclass of the FMConnectionMBS class.

- 18.6, page 9: News

31.4.2 Methods

31.4.3 Constructor

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

31.4.4 CreateRecord(request as FMRequestMBS) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a new record.
Notes: Please set layout property before calling this.

31.4.5 DatabaseNames as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieve a list of hosted FileMaker databases.

31.4.6 DeleteRecord(request as FMRequestMBS = nil, recordId as String) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Delete a record by recordId.
Notes: Please set layout property before calling this.

31.4.7 DuplicateRecord(request as FMRequestMBS = nil, recordId as String) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Duplicate a record by recordId.
Notes: Please set layout property before calling this.

31.4.8 EditRecord(request as FMRequestMBS = nil, recordId as String) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Edit a record by recordId.
Notes: Please set layout property before calling this.

31.4.9 ExecuteScript(scriptName as String, scriptParam as String = "") as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Execute Script.
Notes: Runs the script server side synchronously.
You can pass a script parameter.

The response contains the error code and/or the result of the script.

When using FileMaker Data API to run a script, make sure that the script has a unique name. If there are multiple scripts with the same name, FileMaker Data API cannot control which script is called, even if the scripts are in different folders.

31.4.10 FindRecords(request as FMRequestMBS = nil, query as String) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Find Records in a Layout.
Example:

```
var connection as FMDataMBS // your connection

// which layout to use
connection.Layout = LayoutMenu.Text

// see
// https://help.claris.com/en/data-api-guide/content/perform-find-request.html

Var request As New FMRequestMBS

// just query first 100 records
request.offset = 1
request.limit = 100
```

```
// e.g. [ { "Name" : "=Test" } ]
response = connection.FindRecords(request, queryField.Text.Trim)
¬¥
```

Notes: Please set layout property before calling this.

Query: JSON with Fields and Find criteria in the following query schema:
[{ "<fieldName>": "<fieldValue>", "omit" : "true" ... } , ...]

see also FileMaker's documentation:
https://help.claris.com/en/data-api-guide/content/perform-find-request.html

31.4.11 GetRecord(request as FMRequestMBS = nil, recordId as String) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get a record by recordId.
Notes: Please set layout property before calling this.

31.4.12 GetRecords(request as FMRequestMBS = nil) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get records.
Notes: Please set layout property before calling this.

31.4.13 LayoutMetadata(recordId as String) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves layout metadata for a FileMaker database.
Notes: RecordID: Record ID to retrieve related value list data

31.4.14 LayoutNames as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves a list of layouts for a FileMaker database.

31.4.15 Login as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Login to a FileMaker database.
Example:

```
Var d As New FMDataMBS

d.Password = "admin"
d.Username = "admin"
d.Server = "localhost"
d.Database = "test"

Var r As FMResponseMBS = d.Login

If r = Nil Then
MessageBox "Failed?"
else
MessageBox r.ErrorMessage
End If
```

Notes: Please either set UserName and Password or OAuthRequestId and OAuthIdentifier.
If you don't call Login explicitly or the session token expired, the plugin will call it for you.
See also:

- 31.4.16 Login(dataSources() as FMDataSourceMBS) as FMResponseMBS 5823

31.4.16 Login(dataSources() as FMDataSourceMBS) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Login to a FileMaker database.
Notes: Please either set UserName and Password or OAuthRequestId and OAuthIdentifier.

dataSources: External FileMaker Data Source Authentication.

Clears session token property.
If you don't call Login explicitly or the session token expired, the plugin will call it for you.
See also:

- 31.4.15 Login as FMResponseMBS 5823

31.4.17 Logout as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Log out of a FileMaker database.
Notes: Clears session token property.

31.4.18 ProductInfo as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves information about the Claris FileMaker Server or Claris FileMaker Cloud host.
Notes: Result property in FMResponseMBS is a dictionary with entries including buildDate, name, version, dateFormat, timeFormat and timeStampFormat.

31.4.19 ScriptNames as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves a list of scripts for a FileMaker database.

31.4.20 SetGlobalFields(globalFields as Dictionary) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set Global Fields.
Notes: globalFields: A dictionary that contains field-value pairs to set global fields in a target database. Field names must be Fully Qualified.

31.4.21 UploadToContainerField(Upload as FMContainerUploadMBS) as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Upload a single file into a container field.
Notes: upload: File to upload into container field

31.4.22 ValidateSession as FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validate session token.

31.4.23 Properties

31.4.24 Database as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the current database.
Notes: (Read and Write property)

31.4.25 Layout as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The layout to use.
Notes: (Read and Write property)

31.4.26 OAuthIdentifier as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Provide the OAuth login Request ID.
Notes: (Read and Write property)

31.4.27 OAuthRequestId as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Provide the OAuth login Identifier.
Notes: (Read and Write property)

31.5 class FMDataSourceMBS

31.5.1 class FMDataSourceMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for external FileMaker Data Source Authentication.
Notes: If both "oAuthRequestId" and "oAuthIdentifier" are supplied, FileMaker Data API will perform an OAuth login.
This feature only supports databases hosted on the same FileMaker Server.
Blog Entries

- Connect to Claris FileMaker Server from Xojo via Data API

31.5.2 Methods

31.5.3 Constructor

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

31.5.4 Properties

31.5.5 Database as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the external database file.
Notes: (Read only property)

31.5.6 oAuthIdentifier as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The URL query value for "identifier" in FileMaker Server OAuth workflow.
Notes: If both "oAuthRequestId" and "oAuthIdentifier" are supplied, FileMaker Data API will perform an OAuth login.
(Read only property)

31.5.7 oAuthRequestId as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The X-FMS-Request-ID header value returned from '/oauth/getoauthurl' in FileMaker Server OAuth workflow.
Notes: If both "oAuthRequestId" and "oAuthIdentifier" are supplied, FileMaker Data API will perform an OAuth login.
(Read only property)

31.5.8 Password as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The password to login to solution.
Notes: (Read only property)

31.5.9 UserName as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The username to login to solution.
Notes: (Read only property)

31.6 class FMRequestMBS

31.6.1 class FMRequestMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to encapsulate parameters for various FileMaker Data API queries.
Example:

```
// create a record in a FileMaker database with the Data API and run a script afterwards
Var d As New FMDataMBS
d.Server = "fms.example.com"
d.Database = "Contacts"
d.Username = "api"
d.Password = "secret"
d.Layout = "Contacts"
Call d.Login

Var fields As New Dictionary
fields.Value("FirstName") = "John"
fields.Value("LastName") = "Smith"

Var request As New FMRequestMBS
request.FieldData = fields
request.scriptName = "Send Welcome Mail"
request.scriptParam = "John"

Var r As FMResponseMBS = d.CreateRecord(request)
MessageBox r.ErrorCode.ToString + " " + r.ErrorMessage + EndOfLine + r.ResultJSON
Call d.Logout
```

Notes: Not set properties are not included in request to server.
And not all properties used for all queries.

31.6.2 Methods

31.6.3 Constructor

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

31.6.4 portal as String()

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the portal result set to return.
Notes: Use the portal object name or portal table name. If this parameter is omitted, the API will return all portal objects and records in the layout. For best performance, pass the portal object name or portal table name.

31.6.5 setPortal(portal() as String)

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the portal result set to return.
Notes: Use the portal object name or portal table name. If this parameter is omitted, the API will return all portal objects and records in the layout. For best performance, pass the portal object name or portal table name.

31.6.6 Properties

31.6.7 FieldData as Dictionary

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A dictionary that contains field-value pairs for fields in the target layout.
Notes: If empty dictionary is provided as a data value, an empty record is created with any auto enter values defined in the current table,Äôs schema.
(Read and Write property)

31.6.8 layoutResponse as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The layout to switch to when processing response.
Notes: (Read and Write property)

31.6.9 limit as Integer

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum number of records that should be returned. If not specified, the default value is 100.
Notes: Default value is -1 for the plugin to not specify it in the request.
(Read and Write property)

31.6.10 ModId as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last modification ID.
Notes: When you use modId, a record is edited only when the modId matches.
Only for editing records.
(Read and Write property)

31.6.11 offset as Integer

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The record number of the first record in the range of records.
Notes: Default value is -1 for the plugin to not specify it in the request.
(Read and Write property)

31.6.12 PortalData as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A JSON object that contains portal row values in the target layout.
Notes: The format mirrors the portalData format from Get Records.
(Read and Write property)

31.6.13 scriptName as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the FileMaker script to be run after the action specified by the API call and after the subsequent sort.
Notes: Pass parameter via scriptParam property.

(Read and Write property)

31.6.14 scriptParam as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A parameter for the FileMaker script named by scriptName.
Notes: (Read and Write property)

31.6.15 scriptPrerequestName as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the FileMaker script to be run before the action specified by the API call and the subsequent sort.
Notes: Pass parameter via scriptPrerequestParam property.
(Read and Write property)

31.6.16 scriptPrerequestParam as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A parameter for the FileMaker script named by script.prerequest.
Notes: (Read and Write property)

31.6.17 scriptPresortName as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the FileMaker script to be run after the action specified by the API call but before the subsequent sort.
Notes: Pass parameter via scriptPresortParam property.
(Read and Write property)

31.6.18 scriptPresortParam as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A parameter for the FileMaker script named by scriptPresortName.
Notes: (Read and Write property)

31.6.19 sort as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Field name and sort order of the result set.
Notes: The order in which the criteria are specified determines the precedence. Records are returned in the original creation order if a sort order is not provided. The default sort order is "ascend".
A JSON value, e.g.:
[{ "fieldName": "LastName", "sortOrder": "ascend" } , { "fieldName": "FirstName", "sortOrder": "ascend" }]
(Read and Write property)

31.7 class FMResponseMBS

31.7.1 class FMResponseMBS

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a response from FileMaker Server.
Example:

```
// log in to FileMaker Data API and list the layouts of a database
Var fm As New FMDataMBS
fm.Server = "https://fms.example.com"
fm.Database = "Contacts"
fm.Username = "admin"
fm.Password = "secret"

Var r As FMResponseMBS = fm.Login
If r.ErrorCode <>0 Then
MessageBox "Login failed: " + r.ErrorMessage + " " + r.CURLErrorMessage
Return
End If
r = fm.LayoutNames
System.DebugLog "HTTP " + r.ResponseCode.ToString + ": " + r.ResultJSON
Call fm.Logout
```

Notes: We provide error status properties, the body sent and result returned.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

31.7.2 Methods

31.7.3 Constructor

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

31.7.4 Properties

31.7.5 BodySent as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The body we sent for inspection.
Notes: (Read only property)

31.7.6 CURLErrorCode as Integer

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error code from CURL.
Notes: Value is zero for success.
(Read only property)

31.7.7 CURLErrorMessage as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error message from CURL.
Notes: (Read only property)

31.7.8 DebugMessages as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The CURL debug messages.
Notes: (Read only property)

31.7.9 EffectiveURL as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The effective URL used.
Notes: (Read only property)

31.7.10 ErrorCode as Integer

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error code from FileMaker server.
Notes: Value is zero for no error.
Value is -1 if higher level things went wrong like the CURL transfer.
(Read only property)

31.7.11 ErrorMessage as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error message.
Notes: May be CURL error message if the transfer failed.
(Read only property)

31.7.12 RawResultJSON as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The RAW result from server.
Notes: Includes the wrapper and error message entries.
Inner response entry is used to fill ResultJSON and Result properties.
(Read only property)

31.7.13 ResponseCode as Integer

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The response code from the HTTP request.
Notes: Usually 200 for success. Or 401 for authorization error.
(Read only property)

31.7.14 Result as Variant

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parsed result.
Notes: Provided as variant with arrays, dictionary, numbers and strings as needed.
Arrays are arrays of variant and may contain values.

(Read only property)

31.7.15 ResultJSON as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The JSON from the result.
Notes: Extracted response from RawResultJSON.
Available parsed as Xojo data via result property.
(Read only property)

Chapter 32

Clipboard

32.1 class ClipboardMBS

32.1.1 class ClipboardMBS

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: A clipboard class for Mac OS.
Notes: For all datatypes, the available function is faster than the size function. And the both functions are faster than the getter function.

This is older Carbon API. You may want to prefer NSPasteboardMBS class with new projects.
Only available in Mac 32 bit applications. Will not be ported to 64 bit.
Blog Entries

- Windows, Xojo and the Clipboard
- MBS Real Studio Plugins, version 13.1pr12

32.1.2 Methods

32.1.3 AddData(FlavorType as string,data as string)

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Adds data to the scrap.

32.1.4 AddText(Text as string)

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Adds text to the scrap.

32.1.5 AddUnicodeText(Text as string)

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Adds unicode text to the clipboard.
Notes: UTF16 encoded strings only.

32.1.6 clear

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Clears the clipboard.
Notes: You must clear before you add something.

32.1.7 close

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

32.1.8 DataAvailable(FlavorType as string) as boolean

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Whether data is available.

32.1.9 DataSize(FlavorType as string) as Integer

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Returns the byte size of the selected data.

32.1.10 GetData(FlavorType as string) as string

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Returns the data of a given type.
Example:

```
// Take PICT data from clipboard

Var c as ClipboardMBS
Var s as string

c=new ClipboardMBS

if c.DataAvailable("PICT") then

s=c.GetData("PICT")

if s<>"" then
Backdrop=BuildPictureWithPicHandleDataMBS(s)
end if
end if
```

32.1.11 GetText as string

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Returns text from the clipboard.

32.1.12 GetUnicodeText as string

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Returns the unicode text from the scrap.
Notes: UTF16 encoded strings only.

32.1.13 PictAvailable as boolean

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Whether a pict handle picture is on the clipboard.

32.1.14 ScrapFlavorCount as Integer

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: The number of flavor in the clipboard.
Example:

```
Var clip as ClipboardMBS
Var i,c,c1,c2 as Integer
Var s as string

clip=new ClipboardMBS

c=clip.ScrapFlavorCount

s=str(c)+" types: "

c1=c-1
c2=c-2

for i=0 to c2
s=S+clip.ScrapFlavorType(i)+", "
next

if c>0 then
s=S+clip.ScrapFlavorType(c1)
end if

MessageBox s
```

Notes: Calling this function recreates the internal flavor list in the Xojo clipboard object.

32.1.15 ScrapFlavorFlags(index as Integer) as Integer

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Returns the flags of the given flavor.
Notes: Index goes from 0 to count-1.
Returns 0 on any error.

Flags are a combination of type values:
1 - private data (Sender only)
2 - translated data

32.1.16 ScrapFlavorType(index as Integer) as string

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Returns the type of the given flavor.
Notes: Index goes from 0 to count-1.
Returns "" on any error.

32.1.17 TextAvailable as boolean

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Whether text is available.

32.1.18 TextSize as Integer

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: The length of the text available on the clipboard.

32.1.19 UnicodeTextAvailable as boolean

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: Whether unicode text is available.
Notes: UTF16 encoded strings only.

32.1.20 UnicodeTextSize as Integer

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: The length of the unicode text.
Notes: UTF16 encoded strings only.

32.1.21 Properties

32.1.22 Handle as Integer

MBS MacClassic Plugin, Plugin Version: 4.1, Platform: macOS, Targets: Desktop only.

Function: The handle to the clipboard.
Notes: Carbon only.
(Read only property)

32.2 class NSPasteboardItemDataProviderMBS

32.2.1 class NSPasteboardItemDataProviderMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: This protocol is implemented by the data provider of a pasteboard item to provide the data for a particular UTI type.
Notes: You can specify an object as a pasteboard data provider for a pasteboard item using NSPasteboard-ItemMBS's setDataProviderForTypes method. The data provider must implement this protocol to provide data upon request.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr11

32.2.2 Methods

32.2.3 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.

32.2.4 Destructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

32.2.5 Properties

32.2.6 Handle as Integer

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

32.2.7 Events

32.2.8 Finished(Pasteboard as NSPasteboardMBS)

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Informs the receiver that the pasteboard no longer needs the data provider for any of its pasteboard items.
Notes: One data provider can provide data for more than one pasteboard item. This method is called when the pasteboard no longer needs the data provider for any of its pasteboard items. This can be either because the data provider has fulfilled all promises, or because ownership of the pasteboard has changed.

Available in OS X v10.6 and later.

32.2.9 provideDataForType(Pasteboard as NSPasteboardMBS, item as NSPasteboardItemMBS, type as string)

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Asks the receiver to provide data for a specified type to a given pasteboard. (required)
Notes: pasteboard: A pasteboard to which the receiver has promised to provide data.
item: A pasteboard item for which the receiver has promised to provide data
type: A UTI type string.

The receiver was previously set as the provider using setDataProviderForTypes.
Available in OS X v10.6 and later.

32.3 class NSPasteboardItemMBS

32.3.1 class NSPasteboardItemMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: NSPasteboardItem is a generic class to represent an item on a pasteboard.
Example:

```
Var n as new NSPasteboardItemMBS

Var type as string = NSPasteboardmbs.NSPasteboardTypeString
n.stringForType(type) = "Hello World"
MessageBox n.stringForType(type)
```

Notes: There are three main uses for an NSPasteboardItem object:

Providing data on the pasteboard.
You can create one or more pasteboard items, set data or data providers for types, and write to them pasteboard.

Customizing data already on the pasteboard.
As a delegate or subclass, you can retrieve the pasteboard items currently on the pasteboard, read the existing types and data and set new data and data providers for types as needed.

Retrieving data from the pasteboard.
You can retrieve pasteboard items from the pasteboard then read the data for types you're interested in.

A pasteboard item can be associated with a single pasteboard. When you create an item, it can be written to any pasteboard. When you pass an item to a pasteboard in writeObjects, that item becomes bound to the pasteboard it was written to. When you retrieve items from a pasteboard using pasteboardItems, the returned items are associated with the messaged pasteboard. Passing an item that is already associated with a pasteboard into writeObjects: causes an exception to be raised.

Pasteboard items are intended to be used during a single pasteboard interaction, not held onto and used repeatedly. A pasteboard item is only valid until the owner of the pasteboard changes.

Important: If a pasteboard item is stale because the pasteboard owner has changed, it returns nil or false values from its methods.

- MBS Xojo Plugins, version 25.3pr1

- MBS Real Studio Plugins, version 13.1pr11

32.3.2 Methods

32.3.3 availableTypeFromArray(types() as string) as string

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns from a given array of types the first type contained in the pasteboard item, according to the ordering of types.
Notes: types: An array of strings representing UTIs, arranged in order of preference (most preferred as the 0th element in the array).

Returns the first (according to the sender's ordering of types) type in types contained in the pasteboard item, or nil if the receiver does not contain any types given in types.

The method checks for UTI conformance of the requested types, preferring an exact match to conformance. Available in OS X v10.6 and later.

32.3.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.

32.3.5 Destructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

32.3.6 detectMetadata(types() as String, theDelegate as NSPasteboardMBS.detectValuesCompletedMBS, tag as variant = nil)

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Determines available metadata from the specified metadata types for this pasteboard item, without notifying the user.
Notes: Because this method only gives access to limited types of metadata and doesn,Äôt allow the app to access the contents, the system doesn,Äôt notify the user about reading the contents of the pasteboard.

For details about the metadata returned for each type.

types: The metadata types to detect on the pasteboard item.
theDelegate: A delegate that the system invokes after detecting metadata on the pasteboard item. The delegate receives either a dictionary with the metadata types found on the pasteboard item or an error if detection failed. The dictionary keys specify the matched metadata types, and the values specify the corresponding metadata.
tag: a value passed on to the delegate.

Requires macOS 15.4 or newer.

32.3.7 detectPatterns(patterns() as String, theDelegate as NSPasteboardMBS.detectPatternsCompletedMBS, tag as variant = nil)

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Determines whether this pasteboard item matches the specified patterns, without notifying the user.
Notes: Because this method only gives an indication of whether a pasteboard item matches a particular pattern and doesn,Äôt allow the app to access the contents, the system doesn,Äôt notify the user about reading the contents of the pasteboard.

patterns: The patterns to detect on the pasteboard item.
theDelegate: A delegate that the system invokes after detecting patterns on the pasteboard item. The delegate receives either a set with the patterns found on the pasteboard item or an error if detection failed.
tag: a value passed on to the delegate.

Requires macOS 15.4 or newer.

32.3.8 detectValues(patterns() as String, theDelegate as NSPasteboardMBS.detectValuesCompletedMBS, tag as variant = nil)

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Determines whether this pasteboard item matches the specified patterns, reading the contents if it finds a match.
Notes: Important: Calling this method notifies the user that the app has read the contents of the pasteboard, if a match is found.

For details about the types returned for each pattern, see shared methods.

patterns: The patterns to detect on the pasteboard item.
theDelegate: A delegate that the system invokes after detecting patterns on the pasteboard item. The delegate returns either dictionary with the patterns found on the pasteboard item or an error if detection failed. The dictionary keys specify the matched patterns, and the values specify the corresponding content of the pasteboard.
tag: a value passed on to the delegate.

Requires macOS 15.4 or newer.

32.3.9 setDataProviderForType(dataProvider as NSPasteboardItemDataProviderMBS, types() as string) as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the data provider for the specified types.
Notes: dataProvider: A pasteboard data provider.
types: An array of strings indicating the UTIs for the data representations dataProvider may provide.

Returns true if the data provider was set successfully, otherwise false.

This method registers the data provider to be messaged to provide the data for any of the specified types when requested.
Available in OS X v10.6 and later.

32.3.10 types as string()

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of UTI strings of the data types supported by the receiver.
Notes: Available in OS X v10.6 and later.

32.3.11 Properties

32.3.12 dataProvider as NSPasteboardItemDataProviderMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last dataprovider used with setDataProviderForTypes.
Notes: You should keep your dataprovider alive, so the object is not destroyed while pasteboarditem is used.
In this property we keep a reference to the data provider for you.

(Read and Write property)

32.3.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

32.3.14 dataForType(type as string) as memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The value for a specified type as a memoryblock object.
Example:

```
Var n as new NSPasteboardItemMBS

Var data as MemoryBlock = "Hello World"
Var type as string = NSPasteboardmbs.NSPasteboardTypeString
n.dataForType(type) = data

Var d as MemoryBlock = n.dataForType(type)
MessageBox DefineEncoding(d, encodings.UTF8)
```

Notes: (Read and Write computed property)

32.3.15 propertyListForType(type as string) as Variant

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The value for a specified type as a property list.
Notes: Stores a property list object (array, dictionary, string, numbers, memoryblocks)
Available in OS X v10.6 and later.
(Read and Write computed property)

32.3.16 stringForType(type as string) as string

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The value for the specified type as a string.
Example:

```
Var n as new NSPasteboardItemMBS

Var type as string = NSPasteboardmbs.NSPasteboardTypeString
n.stringForType(type) = "Hello World"
MessageBox n.stringForType(type)
```

Notes: type: A UTI type string.

Available in OS X v10.6 and later.
(Read and Write computed property)

32.4 class NSPasteboardMBS

32.4.1 class NSPasteboardMBS

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for the clipboard access on Cocoa.
Example:

```
Var p as new NSPasteboardMBS

MessageBox join(p.types,EndOfLine)
```

Notes: NSPasteboard objects transfer data to and from the pasteboard server. The server is shared by all running applications. It contains data that the user has cut or copied, as well as other data that one application wants to transfer to another. NSPasteboard objects are an application's sole interface to the server and to all pasteboard operations.

An NSPasteboard object is also used to transfer data between applications and service providers listed in each application's Services menu. The drag pasteboard (NSDragPboard) is used to transfer data that is being dragged by the user.

The plugin class NSPasteboardMBS does not implement all features of the NSPasteboard. If you miss something, please email us.

32.4.2 Methods

32.4.3 accessBehavior as Integer

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The current pasteboard access behavior.
Example:

```
Var pb As NSPasteboardMBS = NSPasteboardMBS.generalPasteboard

Var accessBehavior As Integer = pb.accessBehavior

Select Case accessBehavior
Case pb.AccessBehaviorAlwaysAllow
MessageBox "AccessBehaviorAlwaysAllow"
Case pb.AccessBehaviorAlwaysDeny
MessageBox "AccessBehaviorAlwaysDeny"
Case pb.AccessBehaviorAsk
MessageBox "AccessBehaviorAsk"
Case pb.AccessBehaviorDefault
MessageBox "AccessBehaviorDefault"
End Select
```

Notes: The user can customize this behavior per-app in System Settings for any app that has triggered a pasteboard access alert in the past.

Returns AccessBehaviorAlwaysAllow on macOS 15.4.
Value is -1 if unknown, e.g. on older macOS versions.

32.4.4 addType(type as string) as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds promises for the specified types to the first pasteboard item.
Notes: types: An array of strings, each of which specifies a type of data that can be provided to the pasteboard.

Returns the new change count, or 0 if there was an error adding the types.

This method adds promises for the specified types to the first pasteboard item.

You use this methods to declare additional types of data for the first pasteboard item in the receiver. You can also use it to replace existing types added by a previous declareTypes or addTypes call.

The types parameter specifies the types of data you are promising to the pasteboard. The types should be ordered according to the preference of the source application, with the most preferred type coming first (typically, the richest representation). New types are added to the end of the list containing any existing types, if any.

If you specify a type that has already been declared, this method replaces the owner of that type with the value in newOwner. In addition, any data already already written to the pasteboard for that type is removed.

32.4.5 addTypes(types() as string) as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds promises for the specified types to the first pasteboard item.
Notes: types: An array of strings, each of which specifies a type of data that can be provided to the pasteboard.

Returns the new change count, or 0 if there was an error adding the types.

This method adds promises for the specified types to the first pasteboard item.

You use this methods to declare additional types of data for the first pasteboard item in the receiver. You can also use it to replace existing types added by a previous declareTypes or addTypes call.

The types parameter specifies the types of data you are promising to the pasteboard. The types should be ordered according to the preference of the source application, with the most preferred type coming first (typically, the richest representation). New types are added to the end of the list containing any existing types, if any.

If you specify a type that has already been declared, this method replaces the owner of that type with the value in newOwner. In addition, any data already already written to the pasteboard for that type is removed.

32.4.6 changeCount as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's change count.
Example:

```
Var p as new NSPasteboardMBS(NSPasteboardMBS.NSGeneralPboard)
```

MessageBox str(p.changeCount)

Notes: The change count starts at zero when a client creates the receiver and becomes the first owner. The change count subsequently increments each time the pasteboard ownership changes.

The change count is also returned from clearContents and declareTypes. You can therefore record the change count at the time that you take ownership of the pasteboard and later compare it with the value returned from changeCount to determine whether you still have ownership.

32.4.7 clearContents as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Clears the existing contents of the pasteboard.
Example:

Var p as new NSPasteboardMBS(NSPasteboardMBS.NSGeneralPboard)

MessageBox str(p.clearContents)

Notes: Clears the existing contents of the pasteboard, preparing it for new contents. This is the first step in providing data on the pasteboard.

Available in Mac OS X v10.6 and later.

32.4.8 Constructor

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new NSPasteboardMBS object linked to the general NSPasteboard object.
Example:

Var p as new NSPasteboardMBS

MessageBox join(p.types,EndOfLine)

Notes: On success the handle property is not 0.
See also:

- 32.4.9 Constructor(name as string)

32.4.9 Constructor(name as string)

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new NSPasteboardMBS object linked to the pasteboard with the specified name.
Example:

```
Var p as new NSPasteboardMBS(NSPasteboardMBS.NSFindPboard)

// shows last find string
MessageBox p.stringForType(p.NSPasteboardTypeString)
```

Notes: On success the handle property is not 0.
See also:

- 32.4.8 Constructor 5854

32.4.10 declareType(type as string) as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Prepares the receiver for a change in its contents by declaring the new types of data it will contain.
Notes: type: An strings that specify the type of data that may be added to the new pasteboard. The types should be ordered according to the preference of the source application, with the most preferred type coming first (typically, the richest representation).

Returns the receiver's new change count.

This method is the equivalent of invoking clearContents, implicitly writing the first pasteboard item, and then calling addTypes to promise types for the first pasteboard item.

In Mac OS X v10.5 and earlier, this method is the first step in writing data to the pasteboard and must precede the messages that actually write the data. A declareTypes message essentially changes the contents of the receiver: It invalidates the current contents of the receiver and increments its change count.

32.4.11 declareTypes(types() as string) as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Prepares the receiver for a change in its contents by declaring the new types of data it will contain.
Notes: type: An array of Strings that specify the types of data that may be added to the new pasteboard. The types should be ordered according to the preference of the source application, with the most preferred

type coming first (typically, the richest representation).

Returns the receiver's new change count.

This method is the equivalent of invoking clearContents, implicitly writing the first pasteboard item, and then calling addTypes to promise types for the first pasteboard item.

In Mac OS X v10.5 and earlier, this method is the first step in writing data to the pasteboard and must precede the messages that actually write the data. A declareTypes message essentially changes the contents of the receiver: It invalidates the current contents of the receiver and increments its change count.

32.4.12 detectMetadata(types() as String, theDelegate as detectValuesCompletedMBS, tag as variant = nil)

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Determines available metadata from the specified metadata types for the first pasteboard item, without notifying the user.
Notes: Because this method only gives access to limited types of metadata and doesn,Äôt allow the app to access the contents, the system doesn,Äôt notify the user about reading the contents of the pasteboard.

For details about the metadata returned for each type, see 'NSPasteboardMetadataType'.

types The metadata types to detect on the pasteboard.
theDelegate: A delegate that the system invokes after detecting metadata on the pasteboard. The delegate receives either a dictionary with the metadata types found on the pasteboard or an error if detection failed. The dictionary keys specify the matched metadata types, and the values specify the corresponding metadata.
tag: a value passed on to the delegate.

Requires macOS 15.4 or newer.

32.4.13 detectPatterns(patterns() as String, theDelegate as detectPatternsCompletedMBS, tag as variant = nil)

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Determines whether the first pasteboard item matches the specified patterns, without notifying the user.
Example:

```
Var pb As NSPasteboardMBS = NSPasteboardMBS.generalPasteboard
```

Var patterns() As String
patterns.Add pb.NSPasteboardDetectionPatternEmailAddress

pb.detectPatterns patterns, AddressOf detectPatternsCompleted

Notes: Because this method only gives an indication of whether a pasteboard item matches a particular pattern and doesn,Äôt allow the app to access the contents, the system doesn,Äôt notify the user about reading the contents of the pasteboard.

patterns: The patterns to detect on the pasteboard.
theDelegate: A delegate that the system invokes after detecting patterns on the pasteboard. The delegate receives either a set with the patterns found on the pasteboard or an error if detection failed.
tag: a value passed on to the delegate.

Requires macOS 15.4 or newer.

32.4.14 detectValues(patterns() as String, theDelegate as detectValuesCompletedMBS, tag as variant = nil)

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Determines whether the first pasteboard item matches the specified patterns, reading the contents if it finds a match.
Notes: Important: Calling this method notifies the user that the app has read the contents of the pasteboard, if a match is found.

For details about the types returned for each pattern, see shared methods.

patterns: The patterns to detect on the pasteboard.
theDelegate: A delegate that the system invokes after detecting patterns on the pasteboard. The delegate returns either dictionary with the patterns found on the pasteboard or an error if detection failed. The dictionary keys specify the matched patterns, and the values specify the corresponding content of the pasteboard.
tag: a value passed on to the delegate.

Requires macOS 15.4 or newer.

32.4.15 generalPasteboard as NSPasteboardMBS

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the general NSPasteboard object.
Example:

```
Var p as NSPasteboardMBS = NSPasteboardMBS.generalPasteboard
MessageBox join(p.types,EndOfLine)
```

32.4.16 name as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's name.
Example:

```
Var p as new NSPasteboardMBS

MessageBox p.name
```

32.4.17 NSColorPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: NSColor data.
On Mac OS X v10.6 and later, use NSPasteboardTypeColor (and you read and write colors directly to and from the pasteboard).

32.4.18 NSDragPboard as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the names for pasteboards.
Example:

```
Var p as new NSPasteboardMBS(NSPasteboardMBS.NSDragPboard)
MessageBox p.name
```

Notes: The pasteboard that stores data to be moved as the result of a drag operation.
For additional information on working with the drag pasteboard, see Drag and Drop Programming Topics for Cocoa.

32.4.19 NSFilenamesPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: An array of strings designating one or more filenames.
On Mac OS X v10.6 and later, use writeObjects to write file URLs to the pasteboard.

32.4.20 NSFilesPromisePboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: Promised files.
On Mac OS X v10.6 and later, use kPasteboardTypeFileURLPromise instead.
For information on promised files, see Dragging Files in Drag and Drop Programming Topics for Cocoa.

32.4.21 NSFindPboard as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the names for pasteboards.
Example:

```
Var p as new NSPasteboardMBS(NSPasteboardMBS.NSFindPboard)
MessageBox p.name
```

Notes: The pasteboard that holds information about the current state of the active application's find panel. This information permits users to enter a search string into the find panel, then switch to another application to conduct another search.

32.4.22 NSFontPboard as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the names for pasteboards.
Example:

```
Var p as new NSPasteboardMBS(NSPasteboardMBS.NSFontPboard)
MessageBox p.name
```

Notes: The pasteboard that holds font and character information and supports Copy Font and Paste Font commands that may be implemented in a text editor.

32.4.23 NSFontPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: Font and character information.
On Mac OS X v10.6 and later, use NSPasteboardTypeFont instead.

32.4.24 NSGeneralPboard as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the names for pasteboards.
Example:

```
Var p as new NSPasteboardMBS(NSPasteboardMBS.NSGeneralPboard)
MessageBox p.name
```

Notes: The pasteboard that's used for ordinary cut, copy, and paste operations.
This pasteboard holds the contents of the last selection that's been cut or copied.

32.4.25 NSHTMLPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: HTML (which an NSTextView object can read from, but not write to).
On Mac OS X v10.6 and later, use NSPasteboardTypeHTML instead.

32.4.26 NSInkTextPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: Ink text data.
On Mac OS X v10.6 and later, use kUTTypeInkText instead.
For information on ink text objects, see Using Ink Services in Your Application.

32.4.27 NSMultipleTextSelectionPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: Multiple text selection.
On Mac OS X v10.6 and later, use NSPasteboardTypeMultipleTextSelection instead.
Available in Mac OS X v10.5 and later.

32.4.28 NSPasteboardDetectionPatternCalendarEvent as string

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pattern that indicates the pasteboard detects a string that contains a calendar event.
Notes: Returns array of DDMatchCalendarEvent values

32.4.29 NSPasteboardDetectionPatternEmailAddress as string

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pattern that indicates the pasteboard detects a string that contains an email address.
Notes: Returns array of DDMatchEmailAddress values

32.4.30 NSPasteboardDetectionPatternFlightNumber as string

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pattern that indicates the pasteboard detects a string that contains a flight number.
Notes: Returns array of DDMatchFlightNumber values

32.4.31 NSPasteboardDetectionPatternLink as string

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pattern that indicates the pasteboard detects a string that contains a URL.
Notes: Returns array of DDMatchLink values

32.4.32 NSPasteboardDetectionPatternMoneyAmount as string

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pattern that indicates the pasteboard detects a string that contains an amount of money.
Notes: Returns array of DDMatchMoneyAmount values

32.4.33 NSPasteboardDetectionPatternNumber as string

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pattern that indicates the pasteboard detects a string that consists of a numeric value.
Notes: Returns number value

32.4.34 NSPasteboardDetectionPatternPhoneNumber as string

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pattern that indicates the pasteboard detects a string that contains a phone number.
Notes: Returns array of DDMatchPhoneNumber values

32.4.35 NSPasteboardDetectionPatternPostalAddress as string

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pattern that indicates the pasteboard detects a string that contains a postal address.
Notes: Returns array of DDMatchPostalAddress values

32.4.36 NSPasteboardDetectionPatternProbableWebSearch as string

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pattern that indicates the pasteboard detects a string suitable for use as a web search term.
Notes: Returns string value, suitable for implementing "Paste and Search".

32.4.37 NSPasteboardDetectionPatternProbableWebURL as string

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pattern that indicates the pasteboard detects a string that consists of a web URL.
Notes: Returns string value, suitable for implementing "Paste and Go".

32.4.38 NSPasteboardDetectionPatternShipmentTrackingNumber as string

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A pattern that indicates the pasteboard detects a string that contains a parcel tracking number and carrier.
Notes: Returns array of DDMatchShipmentTrackingNumber values

32.4.39 NSPasteboardMetadataTypeContentType as string

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: A metadata type that returns the content type if the pasteboard detects a reference to a file.
Notes: UTType value for the detected content type of the file URL, if a file URL type is present.

32.4.40 NSPasteboardTypeColor as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: Color data (an NSColor object).
Available in Mac OS X v10.6 and later.

32.4.41 NSPasteboardTypeFindPanelSearchOptions as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: Type for the Find panel metadata property list.
Available in Mac OS X v10.6 and later.

32.4.42 NSPasteboardTypeFont as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: Font and character information.
Available in Mac OS X v10.6 and later.

32.4.43 NSPasteboardTypeHTML as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: HTML data.
Available in Mac OS X v10.6 and later.

32.4.44 NSPasteboardTypeMultipleTextSelection as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: Multiple text selection.
Available in Mac OS X v10.6 and later.

32.4.45 NSPasteboardTypePDF as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: PDF data.
Available in Mac OS X v10.6 and later.

32.4.46 NSPasteboardTypePNG as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: PNG image data.
Available in Mac OS X v10.6 and later.

32.4.47 NSPasteboardTypeRTF as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: Rich Text Format (RTF) data.
Available in Mac OS X v10.6 and later.

32.4.48 NSPasteboardTypeRTFD as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: RTFD formatted file contents.
Available in Mac OS X v10.6 and later.

32.4.49 NSPasteboardTypeRuler as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: Paragraph formatting information.
Available in Mac OS X v10.6 and later.

32.4.50 NSPasteboardTypeSound as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: Sound data (an NSSound object).
Available in Mac OS X v10.6 and later.

32.4.51 NSPasteboardTypeString as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: String data.
Available in Mac OS X v10.6 and later.

32.4.52 NSPasteboardTypeTabularText as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: A string containing tab-separated fields of text.
Available in Mac OS X v10.6 and later.

32.4.53 NSPasteboardTypeTIFF as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the constants for defining UTIs for common pasteboard data types.
Notes: Tag Image File Format (TIFF) data.
Available in Mac OS X v10.6 and later.

32.4.54 NSPDFPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: PDF data.
On Mac OS X v10.6 and later, use NSPasteboardTypePDF instead.

32.4.55 NSPICTPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: QuickDraw picture data.
The PICT format was formally deprecated in Mac OS X v10.4 along with QuickDraw. You should not be explicitly providing or looking for PICT data on the pasteboard.
To aid in this deprecation, if PICT is the only image type on the pasteboard, as is sometimes the case when copying images from 32-bit Carbon applications, a translated image type will be automatically reported and provided by NSPasteboard. The translated type is added to the types array ahead of PICT so that the deprecated PICT format is not the preferred format. In addition, when an application provides image data to NSPasteboard, the Carbon Pasteboard Manager will automatically make a PICT translation available to 32-bit Carbon applications.
Although NSPICTPboardType, and its UTI equivalent kUTTypePICT, will appear in a pasteboard's type array retrieved from the existing NSPasteboard API, it may cease to be reported in future releases.

32.4.56 NSPostScriptPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: Encapsulated PostScript (EPS) code.
On Mac OS X v10.6 and later, use @"com.adobe.encapsulated-postscript" instead.

32.4.57 NSRTFDPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: RTFD formatted file contents.
On Mac OS X v10.6 and later, use NSPasteboardTypeRTFD instead.

32.4.58 NSRTFPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: Rich Text Format (RTF) data.
On Mac OS X v10.6 and later, use NSPasteboardTypeRTF instead.

32.4.59 NSRulerPboard as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the names for pasteboards.
Example:

```
Var p as new NSPasteboardMBS(NSPasteboardMBS.NSRulerPboard)
MessageBox p.name
```

Notes: The pasteboard that holds information about paragraph formats in support of the Copy Ruler and Paste Ruler commands that may be implemented in a text editor.

32.4.60 NSRulerPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: Paragraph formatting information.
On Mac OS X v10.6 and later, use NSPasteboardTypeRuler instead.

32.4.61 NSStringPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: String data.
On Mac OS X v10.6 and later, use NSPasteboardTypeString instead.

32.4.62 NSTabularTextPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: A string containing tab-separated fields of text.
On Mac OS X v10.6 and later, use NSPasteboardTypeTabularText instead.

32.4.63 NSTIFFPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: Tag Image File Format (TIFF) data.
On Mac OS X v10.6 and later, use NSPasteboardTypeTIFF instead.

32.4.64 NSURLPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: NSURL data for one file or resource.
On Mac OS X v10.6 and later, use writeObjects: to write URLs directly to the pasteboard instead.
On Mac OS X v10.5 and earlier: to write an URL to a pasteboard you use writeToPasteboard: (NSURL); to get an URL from a pasteboard you use URLFromPasteboard: (NSURL).

32.4.65 NSVCardPboardType as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the common pasteboard data types.
Notes: VCard data.
On Mac OS X v10.6 and later, use kUTTypeVCard instead.

32.4.66 pasteboardItems as NSPasteboardItemMBS()

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns all the items held by the receiver.
Notes: Returns all the items held by the receiver, or nil if there is an error retrieving pasteboard items. Available in OS X v10.6 and later.

32.4.67 pasteboardWithName(name as string) as NSPasteboardMBS

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the pasteboard with the specified name.
Example:

```
Var p as NSPasteboardMBS = NSPasteboardMBS.pasteboardWithName(NSPasteboardMBS.NSFindPboard)

// shows last find string
MessageBox p.stringForType(p.NSPasteboardTypeString)
```

32.4.68 pasteboardWithUniqueName as NSPasteboardMBS

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns a new pasteboard with a name that is guaranteed to be unique with respect to other pasteboards on the computer.
Notes: This method is useful for applications that implement their own interprocess communication using pasteboards.

32.4.69 releaseGlobally

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Releases the receiver's resources in the pasteboard server.
Notes: After this method is invoked, no other application can use the receiver.

A temporary, privately named pasteboard can be released this way when it is no longer needed, but a standard pasteboard should never be released globally.

32.4.70 SetPasteboardItems(items() as NSPasteboardItemMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Writes pasteboard items to the pasteboard.
Notes: Returns true if the array was successfully added, otherwise false.
See also:

- 32.4.71 SetPasteboardItems(items() as Variant) as boolean 5870

32.4.71 SetPasteboardItems(items() as Variant) as boolean

MBS MacBase Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Writes pasteboard items to the pasteboard.
Example:

```
Var paths() As String

paths.Add "/Users/cs/Pictures/test1.jpg"
paths.Add "/Users/cs/Pictures/test2.png"
paths.Add "/Users/cs/Pictures/test3.jpg"

Var n As NSPasteboardMBS = NSPasteboardMBS.generalPasteboard

Var files() As Variant
For Each path As String In paths

files.Add new FolderItem(path, FolderItem.PathModes.Native)

Next

Call n.clearContents

If n.SetPasteboardItems(files) Then
Break // okay
Else
Break // failed
End If
```

Notes: This method allows you to mix NSPasteboardItemMBS, folderitem, NSURLMBS, strings, NSAttributedStringMBS and other data to put on clipboard.
Returns true if the array was successfully added, otherwise false.
See also:

- 32.4.70 SetPasteboardItems(items() as NSPasteboardItemMBS) as Boolean 5870

32.4.72 types as string()

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of the receiver's supported data types.
Example:

```
Var p as new NSPasteboardMBS

MessageBox join(p.types,EndOfLine)
```

Notes: An array of Strings containing the union of the types of data declared for all the pasteboard items on the receiver. The returned types are listed in the order they were declared.

You must send a types or availableTypeFromArray message before reading any data from an NSPasteboard object.

32.4.73 URLFromPasteboard as string

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Reads the URL string off of pasteboard.
Notes: Returns "" if pasteboard does not contain data of type NSURLPboardType.

32.4.74 writeURLToPasteboard(URL as string)

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Writes the receiver to pasteboard.
Notes: You must declare an NSURLPboardType data type for pasteboard before invoking this method; otherwise it returns without doing anything.

32.4.75 Properties

32.4.76 Handle as Integer

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference to the NSPasteBoard object.
Example:

```
Var p as new NSPasteboardMBS
```

MessageBox hex(p.Handle)

Notes: (Read and Write property)

32.4.77 dataForType(type as string) as Memoryblock

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the data for the specified type from the first item in the receiver that contains the type or sets the given data as the representation for the specified type for the first item on the receiver.
Example:

```
Var p as new NSPasteboardMBS

// may have chr(0) on the end!
MessageBox p.dataForType(p.NSPasteboardTypeString)
```

Notes: Returns a data object containing the data for the specified type from the first item in the receiver that contains the type, or "" if the contents of the pasteboard changed since they were last checked.

This method may also return nil if the pasteboard server cannot supply the data in time—for example, if the pasteboard's owner is slow in responding to a pasteboard:provideDataForType: message and the interprocess communication times out.

Errors other than a timeout raise a NSPasteboardCommunicationException (a NSExceptionMBS in Xojo).

If "" is returned, the application should put up a panel informing the user that it was unable to carry out the paste operation.

For standard text data types such as string, RTF, and RTFD, the text data from each item is returned as one combined result separated by newlines.
(Read and Write computed property)

32.4.78 propertyListForType(type as string) as Variant

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The property list for the specified type from the first item in the receiver that contains the type.
Notes: dataType: The pasteboard data type containing the property-list data.

The property list for the specified type from the first item in the receiver that contains the type. This object

consists of NSArray, NSData, NSDictionary, or NSString objects—or any combination thereof.

This method invokes the dataForType method.
You must send types or availableTypeFromArray before invoking propertyListForType.
(Read and Write computed property)

32.4.79 stringForType(type as string) as string

MBS MacBase Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get/Set the given string as the representation for the specified type for the first item on the receiver.
Example:

```
Var p as new NSPasteboardMBS

MessageBox p.stringForType(p.NSPasteboardTypeString)
```

Notes: A concatenation of the strings for the specified type from all the items in the receiver that contain the type, or nil if none of the items contain strings of the specified type.

This method invokes dataForType to obtain the string. If the string cannot be obtained, stringForType returns "". See dataForType for a description of what will cause "" to be returned.

In Mac OS X v10.6 and later, if the receiver contains multiple items that can provide string, RTF, or RTFD data, the text data from each item is returned as a combined result separated by newlines.
(Read and Write computed property)

32.4.80 Constants

Access Behavior

Constant	Value	Description
AccessBehaviorAlwaysAllow	2	The system will automatically allow all pasteboard access, without notifying the user. The app is listed in the corresponding System Settings pane.
AccessBehaviorAlwaysDeny	3	The system will automatically deny all pasteboard access, without notifying the user. However, access that is both user originated and paste related will always be allowed, and will not result in a notification. The app is listed in the corresponding System Settings pane.
AccessBehaviorAsk	1	The system will notify the user and ask for permission before granting pasteboard access. However, access that is both user originated and paste related will always be allowed, and will not result in a notification. The app is listed in the corresponding System Settings pane.
AccessBehaviorDefault	0	The default behavior for the General pasteboard is to ask upon programmatic access. All other pasteboards default to always allow access. If an app has never triggered a pasteboard access alert, its General pasteboard will report '.default' behavior. Such an app is not shown in the corresponding System Settings pane. Once programmatic pasteboard access triggers the first pasteboard access alert, the state automatically changes to '.ask'. At this point the app starts being shown in System Settings, where the user can toggle the behavior between '.ask', '.alwaysAllow', and '.alwaysDeny'.

32.4.81 Delegates

32.4.82 detectPatternsCompletedMBS(pasteboard as NSPasteboardMBS, requestedPatterns() as String, detectedPatterns() as String, Error as NSErrorMBS, tag as Variant)

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The delegate to be called by detectPatterns.

32.4.83 detectValuesCompletedMBS(pasteboard as NSPasteboardMBS, requestedPatterns() as String, patterns as Dictionary, Error as NSErrorMBS, tag as Variant)

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The delegate to be called by detectValues.
Notes: Also called by detectMetadataForTypes, where we pass types in requestedPatterns parameter and detectedMetadata in patterns parameter.

Chapter 33

Clipper

33.1 class ClipperEngineMBS

33.1.1 class ClipperEngineMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Clipper class encapsulates boolean operations on polygons (intersection, union, difference and XOR), which is also called polygon clipping.
Example:

```
// intersect two overlapping squares
Var square1 As New ClipperPathMBS
square1.Append(0, 0)
square1.Append(100, 0)
square1.Append(100, 100)
square1.Append(0, 100)

Var square2 As ClipperPathMBS = square1.TranslatePath(50, 50)

Var engine As New ClipperEngineMBS
Call engine.AddPath(square1, ClipperMBS.PolyType.Subject, True)
Call engine.AddPath(square2, ClipperMBS.PolyType.Clip, True)

Var solution As New ClipperPathsMBS
If engine.Execute(ClipperMBS.ClipType.Intersection, solution, ClipperMBS.PolyFillType.EvenOdd) Then
For i As Integer = 0 To solution.Count - 1
Var path As ClipperPathMBS = solution.Value(i)
MessageBox "Result polygon with " + path.Count.ToString + " points, area " + path.Area.ToString
Next
End If
```

Notes: Input polygons, both subject and clip sets, are passed to a Clipper object by its AddPath and AddPaths methods, and the clipping operation is performed by calling its Execute method. Multiple boolean operations can be performed on the same input polygon sets by repeat calls to Execute.

33.1.2 Methods

33.1.3 AddPath(path as ClipperPathMBS, PolyType as ClipperMBS.PolyType, Closed as Boolean) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Any number of subject and clip paths can be added to a clipping task, either individually via the AddPath() method, or as groups via the AddPaths() method, or even using both methods.
Notes: 'Subject' paths may be either open (lines) or closed (polygons) or even a mixture of both, but 'clipping' paths must always be closed. Clipper allows polygons to clip both lines and other polygons, but doesn't allow lines to clip either lines or polygons.

With closed paths, orientation should conform with the filling rule that will be passed via Clippper's Execute method.

Path Coordinate range:
Path coordinates must be between ¬± &h3FFFFFFFFFFFFFFF (¬± 4.6e+18), otherwise a range error will be thrown when attempting to add the path to the Clipper object. If coordinates can be kept between ¬± 0x3FFFFFFF (¬± 1.0e+9), a modest increase in performance (approx. 15-20%) over the larger range can be achieved by avoiding large integer math.

Return Value:
The function will return false if the path is invalid for clipping. A path is invalid for clipping when:

- it has less than 2 vertices
- it has 2 vertices but is not an open path
- the vertices are all co-linear and it is not an open path

Returns true on success.

- 33.1.4 AddPath(path as ClipperPathMBS, PolyType as Integer, Closed as Boolean) as Boolean 5877

33.1.4 AddPath(path as ClipperPathMBS, PolyType as Integer, Closed as Boolean) as Boolean

MBS Tools Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Any number of subject and clip paths can be added to a clipping task, either individually via the AddPath() method, or as groups via the AddPaths() method, or even using both methods.
See also:

- 33.1.3 AddPath(path as ClipperPathMBS, PolyType as ClipperMBS.PolyType, Closed as Boolean) as Boolean 5876

33.1.5 AddPaths(paths as ClipperPathsMBS, PolyType as ClipperMBS.PolyType, Closed as Boolean) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Any number of subject and clip paths can be added to a clipping task, either individually via the AddPath() method, or as groups via the AddPaths() method, or even using both methods.
Notes: 'Subject' paths may be either open (lines) or closed (polygons) or even a mixture of both, but 'clipping' paths must always be closed. Clipper allows polygons to clip both lines and other polygons, but doesn't allow lines to clip either lines or polygons.

With closed paths, orientation should conform with the filling rule that will be passed via Clippper's Execute method.

Path Coordinate range:
Path coordinates must be between ¬± &h3FFFFFFFFFFFFFFF (¬± 4.6e+18), otherwise a range error will be thrown when attempting to add the path to the Clipper object. If coordinates can be kept between ¬± 0x3FFFFFFF (¬± 1.0e+9), a modest increase in performance (approx. 15-20%) over the larger range can be achieved by avoiding large integer math.

Return Value:
The function will return false if the path is invalid for clipping. A path is invalid for clipping when:

- it has less than 2 vertices
- it has 2 vertices but is not an open path
- the vertices are all co-linear and it is not an open path

Returns true on success.
See also:

- 33.1.6 AddPaths(paths as ClipperPathsMBS, PolyType as Integer, Closed as Boolean) as Boolean 5878

33.1.6 AddPaths(paths as ClipperPathsMBS, PolyType as Integer, Closed as Boolean) as Boolean

MBS Tools Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Any number of subject and clip paths can be added to a clipping task, either individually via the AddPath() method, or as groups via the AddPaths() method, or even using both methods.
See also:

- 33.1.5 AddPaths(paths as ClipperPathsMBS, PolyType as ClipperMBS.PolyType, Closed as Boolean) as Boolean 5877

33.1.7 Clear

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Clear method removes any existing subject and clip polygons allowing the Clipper object to be reused for clipping operations on different polygon sets.

33.1.8 Constructor(initOptions as integer = 0)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Clipper constructor creates an instance of the Clipper class.
Notes: One or more InitOptions may be passed as a parameter to set the corresponding properties. (These properties can still be set or reset after construction.)

Options:

ReverseSolution	1
StrictlySimple	2
PreserveCollinear	4

33.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes the clipper engine.
See also:

- 33.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5879

- 33.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5880
- 33.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5881
- 33.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5882
- 33.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5883
- 33.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5883

33.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes the clipper engine.
See also:

- 33.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5878
- 33.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5880
- 33.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5880
- 33.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5881
- 33.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5882
- 33.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5883
- 33.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5883

33.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes the clipper engine.
See also:

- 33.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5878
- 33.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5879
- 33.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5880
- 33.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5881
- 33.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5882
- 33.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5883
- 33.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5883

33.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes the clipper engine.
See also:

- 33.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5878
- 33.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5879
- 33.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5880
- 33.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5881

- 33.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5882
- 33.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5883
- 33.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5883

33.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes the clipper engine.
Notes: Once subject and clip paths have been assigned (via AddPath and/or AddPaths), Execute can then perform the clipping operation (intersection, union, difference or XOR) specified by the clipType parameter.

The solution parameter can be either a Paths or PolyTree. The Paths is simpler than the PolyTree. Because of this it is quicker to populate and hence clipping performance is a little better (it's roughly 10% faster). However, the PolyTree class provides more information about the returned paths which may be important to users. Firstly, the PolyTree class preserves nested parent-child polygon relationships (ie outer polygons owning/containing holes and holes owning/containing other outer polygons etc). Also, only the PolyTree class can differentiate between open and closed paths since each PolyNode has an IsOpen property. (The Path structure has no member indicating whether it's open or closed.) For this reason, when open paths are passed to a Clipper object, the user must use a PolyTree object as the solution parameter, otherwise an exception will be raised.

When a PolyTree object is used in a clipping operation on open paths, two ancillary functions have been provided to quickly separate out open and closed paths from the solution - ClipperMBS.OpenPathsFromPolyTree and ClipperMBS.ClosedPathsFromPolyTree. PolyTreeToPaths is also available to convert path data to a Paths structure (irrespective of whether they're open or closed).

There are several things to note about the solution paths returned:

- they aren't in any specific order
- they should never overlap or be self-intersecting (but see notes on rounding)
- holes will be oriented opposite outer polygons
- the solution fill type can be considered either EvenOdd or NonZero since it will comply with either filling rule
- polygons may rarely share a common edge (though this is now very rare as of version 6)

The subjFillType and clipFillType parameters define the polygon fill rule to be applied to the polygons (ie closed paths) in the subject and clip paths respectively. (It's usual though obviously not essential that both sets of polygons use the same fill rule.)

Execute can be called multiple times without reassigning subject and clip polygons (ie when different clipping operations are required on the same polygon sets).

33.1.16 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, subjFillType as Integer, clipFillType as Integer) as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes the clipper engine.
See also:

- 33.1.9 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5878

- 33.1.10 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPathsMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5879
- 33.1.11 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, fillType as ClipperMBS.PolyFillType) as Boolean 5880
- 33.1.12 Execute(clipType as ClipperMBS.ClipType, byref solution as ClipperPolyTreeMBS, subjFillType as ClipperMBS.PolyFillType, clipFillType as ClipperMBS.PolyFillType) as Boolean 5880
- 33.1.13 Execute(clipType as Integer, byref solution as ClipperPathsMBS, fillType as Integer) as Boolean 5881
- 33.1.14 Execute(clipType as Integer, byref solution as ClipperPathsMBS, subjFillType as Integer, clipFillType as Integer) as Boolean 5882
- 33.1.15 Execute(clipType as Integer, byref solution as ClipperPolyTreeMBS, fillType as Integer) as Boolean 5883

33.1.17 GetBounds(byref left as integer, byref top as integer, byref right as integer, byref bottom as integer)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method returns the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.
Notes: This call is more efficient than querying all bounds properties.

33.1.18 Properties

33.1.19 BoundsBottom as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Bottom of bounds.
Notes: This method returns the bottom value of the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.
(Read only property)

33.1.20 BoundsLeft as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Left of bounds.
Notes: This method returns the left value of the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.

(Read only property)

33.1.21 BoundsRight as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Right of bounds.
Notes: This method returns the right value of the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.
(Read only property)

33.1.22 BoundsTop as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Top of bounds.
Notes: This method returns the top value of the axis-aligned bounding rectangle of all polygons that have been added to the Clipper object.
(Read only property)

33.1.23 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

33.1.24 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

33.1.25 PreserveCollinear as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to preserve collinear in input polygons.
Notes: By default, when three or more vertices are collinear in input polygons (subject or clip), the Clipper object removes the 'inner' vertices before clipping. When enabled the PreserveCollinear property prevents this default behavior to allow these inner vertices to appear in the solution.
(Read and Write property)

33.1.26 ReverseSolution as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: When this property is set to true, polygons returned in the solution parameter of the Execute() method will have orientations opposite to their normal orientations.
Notes: (Read and Write property)

33.1.27 StrictlySimple as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to do strictly simple polygon.
Notes: Terminology:

- A simple polygon is one that does not self-intersect.
- A weakly simple polygon is a simple polygon that contains 'touching' vertices, or 'touching' edges.
- A strictly simple polygon is a simple polygon that does not contain 'touching' vertices, or 'touching' edges.

Vertices 'touch' if they share the same coordinates (and are not adjacent). An edge touches another if one of its end vertices touches another edge excluding its adjacent edges, or if they are co-linear and overlapping (including adjacent edges).

Polygons returned by clipping operations (see Clipper.Execute()) should always be simple polygons. When the StrictlySimply property is enabled, polygons returned will be strictly simple, otherwise they may be weakly simple. It's computationally expensive ensuring polygons are strictly simple and so this property is disabled by default.

Note: There's currently no guarantee that polygons will be strictly simple since 'simplifying' is still a work in progress.
(Read and Write property)

33.1.28 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes: You can store here whatever value you like.
(Read and Write property)

33.2 class ClipperExceptionMBS

33.2.1 class ClipperExceptionMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception class for clipper.
Notes: Subclass of the RuntimeException class.

33.3 module ClipperMBS

33.3.1 module ClipperMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The central module for Clipper library methods.
Example:

```
// calculate the area of a polygon and move it with the Clipper library
Var points() As ClipperPointMBS
points.Add New ClipperPointMBS(0, 0)
points.Add New ClipperPointMBS(100, 0)
points.Add New ClipperPointMBS(100, 50)
points.Add New ClipperPointMBS(0, 50)
Var path As New ClipperPathMBS(points)

Var moved As ClipperPathMBS = ClipperMBS.TranslatePath(path, 10, 20)
MessageBox "Area: " + ClipperMBS.Area(path).ToString + ", moved area: " + ClipperMBS.Area(moved).ToString
// 5000
```

33.3.2 Methods

33.3.3 Area(path as ClipperPathMBS) as double

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function returns the area of the supplied polygon.
Notes: It's assumed that the path is closed and does not self-intersect. Depending on orientation, this value may be positive or negative. If Orientation is true, then the area will be positive and conversely, if Orientation is false, then the area will be negative.

33.3.4 CleanPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, distance as double = 1.415)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a clean polygon.
Notes: Removes vertices:
that join co-linear edges, or join edges that are almost co-linear (such that if the vertex was moved no more than the specified distance the edges would be co-linear)
that are within the specified distance of an adjacent vertex
that are within the specified distance of a semi-adjacent vertex together with their out-lying vertices
Vertices are semi-adjacent when they are separated by a single (out-lying) vertex.

The distance parameter's default value is approximately ,àö2 so that a vertex will be removed when adjacent or semi-adjacent vertices having their corresponding X and Y coordinates differing by no more than 1 unit. (If the egdes are semi-adjacent the out-lying vertex will be removed too.)

This function is overloaded. In the first definition, the InPoly and OutPolys parameters can reference the same Path object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.

- 33.3.5 CleanPolygon(Poly as ClipperPathMBS, distance as double = 1.415) 5890

33.3.5 CleanPolygon(Poly as ClipperPathMBS, distance as double = 1.415)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a clean polygon.
Notes: Removes vertices:
that join co-linear edges, or join edges that are almost co-linear (such that if the vertex was moved no more than the specified distance the edges would be co-linear)
that are within the specified distance of an adjacent vertex
that are within the specified distance of a semi-adjacent vertex together with their out-lying vertices
Vertices are semi-adjacent when they are separated by a single (out-lying) vertex.

The distance parameter's default value is approximately ,àö2 so that a vertex will be removed when adjacent or semi-adjacent vertices having their corresponding X and Y coordinates differing by no more than 1 unit. (If the egdes are semi-adjacent the out-lying vertex will be removed too.)

This function is overloaded. In the first definition, the in_poly and out_poly parameters can reference the same Path object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.
See also:

- 33.3.4 CleanPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, distance as double = 1.415) 5890

33.3.6 CleanPolygons(InPoly as ClipperPathsMBS, byref OutPolys as ClipperPathsMBS, distance as double = 1.415)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates clean polygons.
Notes: Removes vertices:
that join co-linear edges, or join edges that are almost co-linear (such that if the vertex was moved no more than the specified distance the edges would be co-linear)
that are within the specified distance of an adjacent vertex
that are within the specified distance of a semi-adjacent vertex together with their out-lying vertices
Vertices are semi-adjacent when they are separated by a single (out-lying) vertex.

The distance parameter's default value is approximately ,àö2 so that a vertex will be removed when adjacent or semi-adjacent vertices having their corresponding X and Y coordinates differing by no more than 1 unit. (If the egdes are semi-adjacent the out-lying vertex will be removed too.)

This function is overloaded. In the first definition, the InPoly and OutPoly parameters can reference the same Paths object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.
See also:

- 33.3.7 CleanPolygons(Poly as ClipperPathsMBS, distance as double = 1.415) 5891

33.3.7 CleanPolygons(Poly as ClipperPathsMBS, distance as double = 1.415)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates clean polygons.
Notes: Removes vertices:
that join co-linear edges, or join edges that are almost co-linear (such that if the vertex was moved no more than the specified distance the edges would be co-linear)
that are within the specified distance of an adjacent vertex
that are within the specified distance of a semi-adjacent vertex together with their out-lying vertices
Vertices are semi-adjacent when they are separated by a single (out-lying) vertex.

The distance parameter's default value is approximately ,àö2 so that a vertex will be removed when adjacent or semi-adjacent vertices having their corresponding X and Y coordinates differing by no more than 1 unit. (If the egdes are semi-adjacent the out-lying vertex will be removed too.)

This function is overloaded. In the first definition, the InPoly and OutPoly parameters can reference the

same Paths object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.
See also:

- 33.3.6 CleanPolygons(InPoly as ClipperPathsMBS, byref OutPolys as ClipperPathsMBS, distance as double = 1.415) 5891

33.3.8 ClosedPathsFromPolyTree(polytree as ClipperPolyTreeMBS, byref paths as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function filters out open paths from the PolyTree structure and returns only closed paths in a Paths structure.

33.3.9 EllipsePoints(Left as Double, Top as Double, Right as Double, Bottom as Double) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an ellipse as path of points with given bounding rectangle.
Example:

```
Var p as ClipperPathMBS = ClipperMBS.EllipsePoints(100,100,300,300)
```

33.3.10 MinkowskiDiff(poly1 as ClipperPathMBS, poly2 as ClipperPathMBS, byref solution as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates Minkowski Difference.
Notes: Minkowski Difference is performed by subtracting each point in a polygon from the set of points in an open or closed path. A key feature of Minkowski Difference is that when it's applied to two polygons, the resulting polygon will contain the coordinate space origin whenever the two polygons touch or overlap. (This function is often used to determine when polygons collide.)

In the image on the left the blue polygon is the 'minkowski difference' of the two red boxes. The black dot represents the coordinate space origin.

33.3.11 MinkowskiSum(pattern as ClipperPathMBS, path as ClipperPathMBS, byref solution as ClipperPathsMBS, pathIsClosed as boolean)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates Minkowski sum.
Notes: Minkowski Addition is performed by adding each point in a polygon 'pattern' to the set of points in an open or closed path. The resulting polygon (or polygons) defines the region that the 'pattern' would pass over in moving from the beginning to the end of the 'path'.
See also:

- 33.3.12 MinkowskiSum(pattern as ClipperPathMBS, paths as ClipperPathsMBS, byref solution as ClipperPathsMBS, pathIsClosed as boolean) 5893

33.3.12 MinkowskiSum(pattern as ClipperPathMBS, paths as ClipperPathsMBS, byref solution as ClipperPathsMBS, pathIsClosed as boolean)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates Minkowski sum.
Notes: Minkowski Addition is performed by adding each point in a polygon 'pattern' to the set of points in an open or closed path. The resulting polygon (or polygons) defines the region that the 'pattern' would pass over in moving from the beginning to the end of the 'path'.
See also:

- 33.3.11 MinkowskiSum(pattern as ClipperPathMBS, path as ClipperPathMBS, byref solution as ClipperPathsMBS, pathIsClosed as boolean) 5893

33.3.13 OpenPathsFromPolyTree(polytree as ClipperPolyTreeMBS, byref paths as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function filters out closed paths from the PolyTree structure and returns only open paths in a Paths structure.

33.3.14 Orientation(path as ClipperPathMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries orientation of path.
Notes: Orientation is only important to closed paths. Given that vertices are declared in a specific order, orientation refers to the direction (clockwise or counter-clockwise) that these vertices progress around a closed path.

Orientation is also dependent on axis direction:

- On Y-axis positive upward displays, Orientation will return true if the polygon's orientation is counter-clockwise.
- On Y-axis positive downward displays, Orientation will return true if the polygon's orientation is clockwise.

Notes:

- Self-intersecting polygons have indeterminate orientations in which case this function won't return a meaningful value.
- The majority of 2D graphic display libraries (eg GDI, GDI+, XLib, Cairo, AGG, Graphics32) and even the SVG file format have their coordinate origins at the top-left corner of their respective viewports with their Y axes increasing downward. However, some display libraries (eg Quartz, OpenGL) have their coordinate origins undefined or in the classic bottom-left position with their Y axes increasing upward.
- For Non-Zero filled polygons, the orientation of holes must be opposite that of outer polygons.
- For closed paths (polygons) in the solution returned by Clipper's Execute method, their orientations will always be true for outer polygons and false for hole polygons (unless the ReverseSolution property has been enabled).

33.3.15 PointInPolygon(path as ClipperPathMBS, pt as ClipperPointMBS) as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns 0 when false, -1 when pt is on poly and +1 when pt is in poly.
Notes: It's assumed that 'poly' is closed and does not self-intersect.

33.3.16 PolyTreeToPaths(polytree as ClipperPolyTreeMBS, byref paths as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function converts a PolyTree structure into a Paths structure.

33.3.17 ReversePath(path as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reverses the vertex order (and hence orientation) in the specified path.

33.3.18 ReversePaths(paths as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reverses the vertex order (and hence orientation) in each contained path.

33.3.19 SimplifyPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType = ClipperMBS.PolyFillType.EvenOdd)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes self-intersections from the supplied polygon (by performing a boolean union operation using the nominated PolyFillType).
Notes: Polygons with non-contiguous duplicate vertices (ie 'touching') will be split into two polygons.

Note: There's currently no guarantee that polygons will be strictly simple since 'simplifying' is still a work in progress.
See also:

- 33.3.20 SimplifyPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, fillType as Integer) 5895

33.3.20 SimplifyPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, fillType as Integer)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes self-intersections from the supplied polygon (by performing a boolean union operation using the nominated PolyFillType).
Notes: Polygons with non-contiguous duplicate vertices (ie 'touching') will be split into two polygons.

Note: There's currently no guarantee that polygons will be strictly simple since 'simplifying' is still a work in progress.
See also:

- 33.3.19 SimplifyPolygon(InPoly as ClipperPathMBS, byref OutPolys as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType = ClipperMBS.PolyFillType.EvenOdd) 5895

33.3.21 SimplifyPolygons(InPolys as ClipperPathsMBS, byref OutPolys as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType = ClipperMBS.PolyFillType.EvenOdd)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes self-intersections from the supplied polygons (by performing a boolean union operation using the nominated PolyFillType).
Notes: Polygons with non-contiguous duplicate vertices (ie 'vertices are touching') will be split into two polygons.

This function is overloaded. In the first definition, the InPolys and OutPolys parameters can reference the same Paths object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.

Note: There's currently no guarantee that polygons will be strictly simple since 'simplifying' is still a work in progress.

- 33.3.24 SimplifyPolygons(Polys as ClipperPathsMBS, fillType as Integer) 5897

33.3.22 SimplifyPolygons(InPolys as ClipperPathsMBS, byref OutPolys as ClipperPathsMBS, fillType as Integer)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes self-intersections from the supplied polygons (by performing a boolean union operation using the nominated PolyFillType).
Notes: Polygons with non-contiguous duplicate vertices (ie 'vertices are touching') will be split into two polygons.

This function is overloaded. In the first definition, the InPolys and OutPolys parameters can reference the same Paths object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.

Note: There's currently no guarantee that polygons will be strictly simple since 'simplifying' is still a work in progress.

- 33.3.24 SimplifyPolygons(Polys as ClipperPathsMBS, fillType as Integer) 5897

33.3.23 SimplifyPolygons(Polys as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType = ClipperMBS.PolyFillType.EvenOdd)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes self-intersections from the supplied polygons (by performing a boolean union operation using the nominated PolyFillType).
Notes: Polygons with non-contiguous duplicate vertices (ie 'vertices are touching') will be split into two polygons.

This function is overloaded. In the first definition, the InPolys and OutPolys parameters can reference the same Paths object though in that case the calling code might be clearer if the second definition (accepting a single Paths parameter) is used.

Note: There's currently no guarantee that polygons will be strictly simple since 'simplifying' is still a work in progress.

- 33.3.24 SimplifyPolygons(Polys as ClipperPathsMBS, fillType as Integer) 5897

33.3.24 SimplifyPolygons(Polys as ClipperPathsMBS, fillType as Integer)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes self-intersections from the supplied polygons (by performing a boolean union operation using the nominated PolyFillType).
Notes: Polygons with non-contiguous duplicate vertices (ie 'vertices are touching') will be split into two polygons.

This function is overloaded. In the first definition, the InPolys and OutPolys parameters can reference the same Paths object though in that case the calling code might be clearer if the second definition (accepting

a single Paths parameter) is used.

Note: There's currently no guarantee that polygons will be strictly simple since 'simplifying' is still a work in progress.
See also:

- 33.3.21 SimplifyPolygons(InPolys as ClipperPathsMBS, byref OutPolys as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType = ClipperMBS.PolyFillType.EvenOdd) 5896

- 33.3.23 SimplifyPolygons(Polys as ClipperPathsMBS, fillType as ClipperMBS.PolyFillType = ClipperMBS.PolyFillType.EvenOdd) 5897

33.3.25 TranslatePath(path as ClipperPathMBS, delta as ClipperPointMBS) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Offsets each point in path by x and y.
Notes: Returns a new path.
See also:

- 33.3.26 TranslatePath(path as ClipperPathMBS, x as Int64, y as Int64) as ClipperPathMBS 5898

33.3.26 TranslatePath(path as ClipperPathMBS, x as Int64, y as Int64) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Offsets each point in path by x and y.
Notes: Returns a new path.
See also:

- 33.3.25 TranslatePath(path as ClipperPathMBS, delta as ClipperPointMBS) as ClipperPathMBS 5898

33.3.27 Version as string

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the version of the Clipper library used.

33.3.28 Constants

Constants

Constant	Value	Description
hiRange	&h3FFFFFFFFFFFFFFF	The higher range.
loRange	&h3FFFFFFF	The lower range.

33.4 class ClipperOffsetMBS

33.4.1 class ClipperOffsetMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The ClipperOffset class encapsulates the process of offsetting (inflating/deflating) both open and closed paths using a number of different join types and end types.
Example:

```
// grow a rectangle by 10 units with rounded corners
Var rect As New ClipperPathMBS
rect.Append(0, 0)
rect.Append(100, 0)
rect.Append(100, 50)
rect.Append(0, 50)

Var offset As New ClipperOffsetMBS
offset.AddPath(rect, ClipperMBS.JoinType.Round, ClipperMBS.EndType.ClosedPolygon)

Var solution As New ClipperPathsMBS
offset.Execute(solution, 10.0) // use a negative value to shrink

If solution.Count >0 Then
Var grown As ClipperPathMBS = solution.Value(0)
MessageBox "Area before: " + rect.Area.ToString + EndOfLine + "Area after: " + grown.Area.ToString +
EndOfLine + _
"Points: " + grown.Count.ToString
End If
```

Notes: Preconditions for offsetting:
1. The orientations of closed paths must be consistent such that outer polygons share the same orientation, and any holes have the opposite orientation (ie non-zero filling). Open paths must be oriented with closed outer polygons.
2. Polygons must not self-intersect.

Limitations:
When offsetting, small artefacts may appear where polygons overlap. To avoid these artefacts, offset overlapping polygons separately.

33.4.2 Methods

33.4.3 AddPath(path as ClipperPathMBS, joinType as ClipperMBS.JoinType, endType as ClipperMBS.EndType)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Path to a ClipperOffset object in preparation for offsetting.
Notes: Any number of paths can be added, and each has its own JoinType and EndType. All 'outer' Paths must have the same orientation, and any 'hole' paths must have reverse orientation. Closed paths must have at least 3 vertices. Open paths may have as few as one vertex. Open paths can only be offset with positive deltas.
See also:

- 33.4.4 AddPath(path as ClipperPathMBS, joinType as Integer, endType as Integer) 5901

33.4.4 AddPath(path as ClipperPathMBS, joinType as Integer, endType as Integer)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a Path to a ClipperOffset object in preparation for offsetting.
Notes: Any number of paths can be added, and each has its own JoinType and EndType. All 'outer' Paths must have the same orientation, and any 'hole' paths must have reverse orientation. Closed paths must have at least 3 vertices. Open paths may have as few as one vertex. Open paths can only be offset with positive deltas.
See also:

- 33.4.3 AddPath(path as ClipperPathMBS, joinType as ClipperMBS.JoinType, endType as ClipperMBS.EndType) 5901

33.4.5 AddPaths(paths as ClipperPathsMBS, joinType as ClipperMBS.JoinType, endType as ClipperMBS.EndType)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds Paths to a ClipperOffset object in preparation for offsetting.
Notes: Any number of paths can be added, and each path has its own JoinType and EndType. All 'outer' Paths must have the same orientation, and any 'hole' paths must have reverse orientation. Closed paths must have at least 3 vertices. Open paths may have as few as one vertex. Open paths can only be offset with positive deltas.
See also:

- 33.4.6 AddPaths(paths as ClipperPathsMBS, joinType as Integer, endType as Integer) 5902

33.4.6 AddPaths(paths as ClipperPathsMBS, joinType as Integer, endType as Integer)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds Paths to a ClipperOffset object in preparation for offsetting.
Notes: Any number of paths can be added, and each path has its own JoinType and EndType. All 'outer' Paths must have the same orientation, and any 'hole' paths must have reverse orientation. Closed paths must have at least 3 vertices. Open paths may have as few as one vertex. Open paths can only be offset with positive deltas.
See also:

- 33.4.5 AddPaths(paths as ClipperPathsMBS, joinType as ClipperMBS.JoinType, endType as ClipperMBS.EndType) 5901

33.4.7 Clear

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method clears all paths from the ClipperOffset object, allowing new paths to be assigned.

33.4.8 Constructor(miterLimit as double = 2.0, roundPrecision as double = 0.25)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the clipper offset.
Notes: The ClipperOffset constructor takes 2 optional parameters: MiterLimit and ArcTolerance. Thes two parameters corresponds to properties of the same name. MiterLimit is only relevant when JoinType is jtMiter, and ArcTolerance is only relevant when JoinType is jtRound or when EndType is etOpenRound.

33.4.9 Execute(byref Paths as ClipperPathsMBS, delta as double)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes the clipper offset engine.
Notes: This method takes two parameters. The first is the structure that receives the result of the offset operation (either a PolyTree or a Paths structure). The second parameter is the amount to which the supplied paths will be offset. Negative delta values shrink polygons and positive delta expand them.

This method can be called multiple times, offsetting the same paths by different amounts (ie using different deltas).
See also:

• 33.4.10 Execute(byref PolyTree as ClipperPolyTreeMBS, delta as double) 5903

33.4.10 Execute(byref PolyTree as ClipperPolyTreeMBS, delta as double)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Executes the clipper offset engine.
Notes: This method takes two parameters. The first is the structure that receives the result of the offset operation (either a PolyTree or a Paths structure). The second parameter is the amount to which the supplied paths will be offset. Negative delta values shrink polygons and positive delta expand them.

This method can be called multiple times, offsetting the same paths by different amounts (ie using different deltas).
See also:

• 33.4.9 Execute(byref Paths as ClipperPathsMBS, delta as double) 5902

33.4.11 Properties

33.4.12 ArcTolerance as Double

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The arc tolerance.
Notes: Firstly, this field/property is only relevant when JoinType = jtRound and/or EndType = etRound.

Since flattened paths can never perfectly represent arcs, this field/property specifies a maximum acceptable imprecision ('tolerance') when arcs are approximated in an offsetting operation. Smaller values will increase 'smoothness' up to a point though at a cost of performance and in creating more vertices to construct the arc.

The default ArcTolerance is 0.25 units. This means that the maximum distance the flattened path will deviate from the 'true' arc will be no more than 0.25 units (before rounding).

Reducing tolerances below 0.25 will not improve smoothness since vertex coordinates will still be rounded to integer values. The only way to achieve sub-integer precision is through coordinate scaling before and after offsetting (see example below).

It's important to make ArcTolerance a sensible fraction of the offset delta (arc radius). Large tolerances relative to the offset delta will produce poor arc approximations but, just as importantly, very small tolerances will substantially slow offsetting performance while providing unnecessary degrees of precision. This is most likely to be an issue when offsetting polygons whose coordinates have been scaled to preserve floating point precision.

Example:
Imagine a set of polygons (defined in floating point coordinates) that is to be offset by 10 units using round joins, and the solution is to retain floating point precision up to at least 6 decimal places.
To preserve this degree of floating point precision, and given that Clipper and ClipperOffset both operate on integer coordinates, the polygon coordinates will be scaled up by 108 (and rounded to integers) prior to offsetting. Both offset delta and ArcTolerance will also need to be scaled by this same factor. If ArcTolerance was left unscaled at the default 0.25 units, every arc in the solution would contain a fraction of 44 THOUSAND vertices while the final arc imprecision would be 0.25 √ó 10-8 units (ie once scaling was reversed). However, if 0.1 units was an acceptable imprecision in the final unscaled solution, then ArcTolerance should be set to 0.1 √ó scaling_factor (0.1 √ó 108). Now if scaling is applied equally to both ArcTolerance and to Delta Offset, then in this example the number of vertices (steps) defining each arc would be a fraction of 23.

The formula for the number of steps in a full circular arc is ... Pi / acos(1 - arc_tolerance / abs(delta))
(Read and Write property)

33.4.13 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

33.4.14 MiterLimit as Double

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The miter limit.
Notes: This property sets the maximum distance in multiples of delta that vertices can be offset from their original positions before squaring is applied. (Squaring truncates a miter by 'cutting it off' at 1 √ó delta distance from the original vertex.)

The default value for MiterLimit is 2 (ie twice delta). This is also the smallest MiterLimit that's allowed. If mitering was unrestricted (ie without any squaring), then offsets at very acute angles would generate unacceptably long 'spikes'.
(Read and Write property)

33.4.15 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: To avoid Xojo freeing the parent too quick, we keep a reference here.

(Read only property)

33.4.16 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes: You can store here whatever value you like.
(Read and Write property)

33.5 class ClipperPathMBS

33.5.1 class ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This class contains a sequence of IntPoint vertices defining a single contour (see also terminology).
Example:

```
// build a triangle and check its area and which points are inside
Var path As New ClipperPathMBS
path.Append(0, 0)
path.Append(200, 0)
path.Append(100, 150)

Var inside As New ClipperPointMBS(100, 50)
Var outside As New ClipperPointMBS(10, 140)

// PointInPolygon returns 0 for outside, 1 for inside and -1 for a point on the edge
MessageBox "Points: " + path.Count.ToString + EndOfLine + _
"Area: " + path.Area.ToString + EndOfLine + _
"Orientation: " + path.Orientation.ToString + EndOfLine + _
"100/50 inside: " + path.PointInPolygon(inside).ToString + EndOfLine + _
"10/140 inside: " + path.PointInPolygon(outside).ToString
```

Notes: Paths may be open and represent a series of line segments bounded by 2 or more vertices, or they may be closed and represent polygons. Whether or not a path is open depends on context. Closed paths may be 'outer' contours or 'hole' contours. Which they are depends on orientation.

Multiple paths can be grouped into a Paths class: ClipperPathsMBS.

33.5.2 Methods

33.5.3 Append(item as ClipperPointMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends a new point to the path.
See also:

- 33.5.4 Append(X as Int64, Y as Int64)

33.5.4 Append(X as Int64, Y as Int64)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends a new path.
Notes: Without creating intermediate Xojo ClipperPointMBS object.
See also:

- 33.5.3 Append(item as ClipperPointMBS) 5906

33.5.5 Area as double

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This function returns the area of the supplied polygon.
Example:

```
Var points() as ClipperPointMBS

points.Add new ClipperPointMBS(1,2)
points.Add new ClipperPointMBS(4,2)
points.Add new ClipperPointMBS(4,6)
points.Add new ClipperPointMBS(1,6)

Var path as new ClipperPathMBS(points)
Var area as Double = path.Area
```

Notes: It's assumed that the path is closed and does not self-intersect. Depending on orientation, this value may be positive or negative. If Orientation is true, then the area will be positive and conversely, if Orientation is false, then the area will be negative.

33.5.6 Clear

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the path.

33.5.7 Constructor

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new empty path.
See also:

- 33.5.8 Constructor(otherPath as ClipperPathMBS) 5908
- 33.5.9 Constructor(points() as ClipperPointMBS) 5908

33.5.8 Constructor(otherPath as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new path with the copy of old path.
See also:

- 33.5.7 Constructor 5907
- 33.5.9 Constructor(points() as ClipperPointMBS) 5908

33.5.9 Constructor(points() as ClipperPointMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new path with given points.
See also:

- 33.5.7 Constructor 5907
- 33.5.8 Constructor(otherPath as ClipperPathMBS) 5908

33.5.10 Equal(otherPath as ClipperPathMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if two paths are equal.
Notes: Returns true if both are equal.

33.5.11 Insert(Index as Integer, item as ClipperPointMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts a point into the path at given index.
Notes: Index = 0 adds as first path.

33.5.12 Orientation as boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries orientation of path.
Example:

```
Var points() as ClipperPointMBS

points.Add new ClipperPointMBS(1,2)
points.Add new ClipperPointMBS(4,2)
points.Add new ClipperPointMBS(4,6)
points.Add new ClipperPointMBS(1,6)

Var path as new ClipperPathMBS(points)
Var Orientation as boolean = path.Orientation
```

Notes: Orientation is only important to closed paths. Given that vertices are declared in a specific order, orientation refers to the direction (clockwise or counter-clockwise) that these vertices progress around a closed path.

Orientation is also dependent on axis direction:

- On Y-axis positive upward displays, Orientation will return true if the polygon's orientation is counter-clockwise.
- On Y-axis positive downward displays, Orientation will return true if the polygon's orientation is clockwise.

Notes:

- Self-intersecting polygons have indeterminate orientations in which case this function won't return a meaningful value.
- The majority of 2D graphic display libraries (eg GDI, GDI+, XLib, Cairo, AGG, Graphics32) and even the SVG file format have their coordinate origins at the top-left corner of their respective viewports with their Y axes increasing downward. However, some display libraries (eg Quartz, OpenGL) have their coordinate origins undefined or in the classic bottom-left position with their Y axes increasing upward.
- For Non-Zero filled polygons, the orientation of holes must be opposite that of outer polygons.
- For closed paths (polygons) in the solution returned by Clipper's Execute method, their orientations will always be true for outer polygons and false for hole polygons (unless the ReverseSolution property has been enabled).

33.5.13 PointInPolygon(pt as ClipperPointMBS) as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns 0 when false, -1 when pt is on poly and +1 when pt is in poly.
Example:

```
Var points() as ClipperPointMBS

points.Add new ClipperPointMBS(1,2)
points.Add new ClipperPointMBS(4,2)
points.Add new ClipperPointMBS(4,6)
points.Add new ClipperPointMBS(1,6)

Var path as new ClipperPathMBS(points)

Var b1 as Integer = path.PointInPolygon(new ClipperPointMBS(2,2)) // -1 on line
Var b2 as Integer = path.PointInPolygon(new ClipperPointMBS(2,22)) // 0 outside
Var b3 as Integer = path.PointInPolygon(new ClipperPointMBS(2,3)) // 1 = inside
```

Notes: It's assumed that 'poly' is closed and does not self-intersect.

33.5.14 Remove(index as integer)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a point.

33.5.15 ReversePath

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reverses the vertex order (and hence orientation) in the specified path.

33.5.16 TranslatePath(delta as ClipperPointMBS) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Offsets each point in path by x and y.
Notes: Returns a new path.
See also:

- 33.5.17 TranslatePath(x as Int64, y as Int64) as ClipperPathMBS

33.5.17 TranslatePath(x as Int64, y as Int64) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Offsets each point in path by x and y.
Notes: Returns a new path.
See also:

- 33.5.16 TranslatePath(delta as ClipperPointMBS) as ClipperPathMBS 5910

33.5.18 Values as ClipperPointMBS()

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates copy of path as Xojo array or ClipperPointMBS.

33.5.19 ValuesToArray(dest() as ClipperPointMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds ClipperPointMBS objects for the points in the path to the Xojo array.
Notes: Mainly for older Xojo versions where the plugin can't create an array for you.

33.5.20 Properties

33.5.21 Count as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns number of points in path.
Notes: (Read only property)

33.5.22 Empty as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if path is empty.
Notes: (Read only property)

33.5.23 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

33.5.24 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

33.5.25 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes: You can store here whatever value you like.
(Read and Write property)

33.5.26 Value(Index as Integer) as ClipperPointMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries or sets a value in the path.
Notes: Raises exception if out of bounds.
(Read and Write computed property)

33.6 class ClipperPathsMBS

33.6.1 class ClipperPathsMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a list of paths.
Example:

```
// combine several squares into one outline with a union
Var squares As New ClipperPathsMBS
For i As Integer = 0 To 2
Var square As New ClipperPathMBS
square.Append(i * 40, 0)
square.Append(i * 40 + 50, 0)
square.Append(i * 40 + 50, 50)
square.Append(i * 40, 50)
squares.Append square
Next

Var engine As New ClipperEngineMBS
Call engine.AddPaths(squares, ClipperMBS.PolyType.Subject, True)

Var solution As New ClipperPathsMBS
If engine.Execute(ClipperMBS.ClipType.Union, solution, ClipperMBS.PolyFillType.NonZero) Then
MessageBox squares.Count.ToString + " squares merged into " + solution.Count.ToString + " polygon(s)"
End If
```

Notes: This class is fundamental to the Clipper Library. It's a list or array of one or more Path structures. (The Path structure contains an ordered list of vertices that make a single contour.)

Paths may open (a series of line segments), or they may closed (polygons). Whether or not a path is open depends on context. Closed paths may be 'outer' contours or 'hole' contours. Which they are depends on orientation.

33.6.2 Methods

33.6.3 Append(item as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends a new path to the paths.

33.6.4 Clear

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the path.

33.6.5 Constructor

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new empty path.
See also:

- 33.6.6 Constructor(otherPaths as ClipperPathsMBS) 5914

33.6.6 Constructor(otherPaths as ClipperPathsMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new paths list with the copy of old paths list.
See also:

- 33.6.5 Constructor 5914

33.6.7 Equal(otherPaths as ClipperPathsMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if two path lists are equal.
Notes: Returns true if both are equal.

33.6.8 Insert(Index as Integer, item as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts a path into the path list at given index.
Notes: Index = 0 adds as first point.

33.6.9 Remove(index as integer)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a path.

33.6.10 Reverse

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reverses the vertex order (and hence orientation) in the specified paths.

33.6.11 Values as ClipperPathMBS()

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates copy of path list as Xojo array or ClipperPathMBS.

33.6.12 ValuesToArray(dest() as ClipperPathMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds ClipperPathMBS objects for the paths in the path list to the Xojo array.
Notes: Mainly for older Xojo versions where the plugin can't create an array for you.

33.6.13 Properties

33.6.14 Count as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns number of paths in paths.
Notes: (Read only property)

33.6.15 Empty as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if path list is empty.
Notes: (Read only property)

33.6.16 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

33.6.17 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

33.6.18 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes: You can store here whatever value you like.
(Read and Write property)

33.6.19 Value(Index as Integer) as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries or sets a value in the path.
Notes: Raises exception if out of bounds.
(Read and Write computed property)

33.7 class ClipperPointMBS

33.7.1 class ClipperPointMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a point.
Notes: All functions accept nil as a point with values 0/0.

33.7.2 Methods

33.7.3 Constructor(x as Int64 = 0, y as Int64 = 0)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new point with given values.

33.7.4 Equal(other as ClipperPointMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two points.
Notes: Returns true if both have same value.
All functions accept nil as a point with values 0/0.

33.7.5 Point(x as Int64 = 0, y as Int64 = 0) as ClipperPointMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new point with given values.

33.7.6 Properties

33.7.7 X as Int64

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x coordinate.
Notes: (Read and Write property)

33.7.8 Y as Int64

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y coordinate.
Notes: (Read and Write property)

33.8 class ClipperPolyNodeMBS

33.8.1 class ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a poly node.
Example:

```
// walk through a poly tree from ClipperEngineMBS.Execute and show nesting
// tree is a ClipperPolyTreeMBS filled by Execute, see there
Var tree As ClipperPolyTreeMBS // your result
If tree = Nil Then Return

Var node As ClipperPolyNodeMBS = tree.First
While node <>Nil
Var depth As Integer = 0
Var p As ClipperPolyNodeMBS = node.ParentNode
While p <>Nil
depth = depth + 1
p = p.ParentNode
Wend
System.DebugLog "Depth " + depth.ToString + ", hole " + node.IsHole.ToString + ", children " +
node.ChildCount.ToString
node = node.NextNode
Wend
```

Notes: PolyNodes are encapsulated within a PolyTree container, and together provide a data structure representing the parent-child relationships of polygon contours returned by Clipper's Execute method.

A PolyNode object represents a single polygon. Its IsHole property indicates whether it's an outer or a hole. PolyNodes may own any number of PolyNode children (Childs), where children of outer polygons are holes, and children of holes are (nested) outer polygons.

33.8.2 Methods

33.8.3 Constructor

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor for a new object.

33.8.4 Properties

33.8.5 ChildCount as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of PolyNode Childs directly owned by the PolyNode object.
Notes: (Read only property)

33.8.6 Childs as ClipperPolyNodesMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The children.
Notes: A read-only list of PolyNode.
Outer PolyNode childs contain hole PolyNodes, and hole PolyNode childs contain nested outer PolyNodes.
(Read only property)

33.8.7 Contour as ClipperPathMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a path list which contains any number of vertices.
Notes: (Read and Write property)

33.8.8 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

33.8.9 IsHole as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true when the PolyNode's polygon (Contour) is a hole.
Notes: Children of outer polygons are always holes, and children of holes are always (nested) outer polygons.
The IsHole property of a PolyTree object is undefined but its children are always top-level outer polygons.
(Read only property)

33.8.10 IsOpen as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true when the PolyNode's Contour results from a clipping operation on an open contour (path).
Notes: Only top-level PolyNodes can contain open contours.
(Read only property)

33.8.11 NextNode as ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The returned Polynode will be the first child if any, otherwise the next sibling, otherwise the next sibling of the Parent etc.
Notes: A PolyTree can be traversed very easily by calling First() followed by NextNode in a loop until the returned object is a nil reference ...
(Read only property)

33.8.12 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

33.8.13 ParentNode as ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the parent PolyNode.
Notes: The PolyTree object (which is also a PolyNode) does not have a parent and will return a null pointer.
(Read only property)

33.8.14 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes: You can store here whatever value you like.

(Read and Write property)

33.9 class ClipperPolyNodesMBS

33.9.1 class ClipperPolyNodesMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the node list.
Example:

```
// list the direct children of a poly node, e.g. the holes inside an outer contour
// node is a ClipperPolyNodeMBS, see ClipperPolyTreeMBS
Var node As ClipperPolyNodeMBS // your node
If node = Nil Then Return

Var children As ClipperPolyNodesMBS = node.Childs
For i As Integer = 0 To children.Count - 1
Var child As ClipperPolyNodeMBS = children.Value(i)
System.DebugLog "Child " + i.ToString + ": area " + child.Contour.Area.ToString
Next
```

33.9.2 Methods

33.9.3 Append(item as ClipperPolyNodeMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends a new node to the node list.

33.9.4 Clear

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the node list.

33.9.5 Constructor

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new empty node list.
See also:

- 33.9.6 Constructor(otherPolyNodes as ClipperPolyNodesMBS) 5924

33.9.6 Constructor(otherPolyNodes as ClipperPolyNodesMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new poly node list with the copy of old poly node list.
See also:

- 33.9.5 Constructor 5923

33.9.7 Equal(otherPolyNodes as ClipperPolyNodesMBS) as boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if two node lists are equal.
Notes: Returns true if both are equal.

33.9.8 Insert(Index as Integer, item as ClipperPolyNodeMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts a poly node into the node list at given index.
Notes: Index = 0 adds as first node.

33.9.9 Remove(index as integer)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a node.

33.9.10 Values as ClipperPolyNodeMBS()

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates copy of node list as Xojo array or ClipperPolyNodeMBS.

33.9.11 Properties

33.9.12 Count as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns number of nodes.
Notes: (Read only property)

33.9.13 Empty as Boolean

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if list is empty.
Notes: (Read only property)

33.9.14 Handle as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

33.9.15 Owner as Variant

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: To avoid Xojo freeing the parent too quick, we keep a reference here.
(Read only property)

33.9.16 Tag as Variant

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes: You can store here whatever value you like.
(Read and Write property)

33.9.17 Value(Index as Integer) as ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries or sets a value in the node list.
Notes: Raises exception if out of bounds.

(Read and Write computed property)

33.10 class ClipperPolyTreeMBS

33.10.1 class ClipperPolyTreeMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: PolyTree is intended as a read-only data structure that should only be used to receive solutions from clipping and offsetting operations.
Example:

```
// subtract a small square from a big one and find outer contours and holes
Var big As New ClipperPathMBS
big.Append(0, 0)
big.Append(100, 0)
big.Append(100, 100)
big.Append(0, 100)
Var small As New ClipperPathMBS
small.Append(25, 25)
small.Append(75, 25)
small.Append(75, 75)
small.Append(25, 75)

Var engine As New ClipperEngineMBS
Call engine.AddPath(big, ClipperMBS.PolyType.Subject, True)
Call engine.AddPath(small, ClipperMBS.PolyType.Clip, True)

Var tree As New ClipperPolyTreeMBS
If engine.Execute(ClipperMBS.ClipType.Difference, tree, ClipperMBS.PolyFillType.EvenOdd, ClipperMBS.Poly-
FillType.EvenOdd) Then
Var node As ClipperPolyNodeMBS = tree.First
While node <>Nil
System.DebugLog "Contour with " + node.Contour.Count.ToString + " points, hole: " + node.IsHole.ToString
node = node.NextNode
Wend
MessageBox tree.Total.ToString + " contours"
End If
```

Notes: It's an alternative to the Paths data structure which also receives these solutions. PolyTree's two major advantages over the Paths structure are: it properly represents the parent-child relationships of the returned polygons; it differentiates between open and closed paths. However, since PolyTree is a more complex structure than the Paths structure, and since it's more computationally expensive to process (the Execute method being roughly 5-10% slower), it should used only be when parent-child polygon relationships are needed, or when open paths are being 'clipped'.

An empty PolyTree object can be passed as the solution parameter in ClipperEngineMBS.Execute and in ClipperOffsetMBS.Execute. Once the clipping or offseting operation is completed, the method returns with the PolyTree structure filled with data representing the solution.

A PolyTree object is a container for any number of PolyNode children, with each contained PolyNode representing a single polygon contour (either an outer or hole polygon). PolyTree itself is a specialized PolyNode whose immediate children represent the top-level outer polygons of the solution. (Its own Contour property is always empty.) The contained top-level PolyNodes may contain their own PolyNode children representing hole polygons that may also contain children representing nested outer polygons etc. Children of outers will always be holes, and children of holes will always be outers.

PolyTrees can also contain open paths. Open paths will always be represented by top level PolyNodes. Two functions are provided to quickly separate out open and closed paths from a polytree - OpenPathsFromPolyTree and ClosedPathsFromPolyTree.
Subclass of the ClipperPolyNodeMBS class.

33.10.2 Methods

33.10.3 Clear

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method clears any PolyNode children contained by PolyTree the object.
Notes: Clear does not need to be called explicitly. The Clipper.Execute method that accepts a PolyTree parameter will automatically clear the PolyTree object before propagating it with new PolyNodes. Likewise, PolyTree's destructor will also automatically clear any contained PolyNodes.

33.10.4 Constructor

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new empty polytree.
See also:

- 33.10.5 Constructor(otherPolyNodes as ClipperPolyTreeMBS) 5928

33.10.5 Constructor(otherPolyNodes as ClipperPolyTreeMBS)

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of an existing poly tree.
See also:

- 33.10.4 Constructor 5928

33.10.6 Properties

33.10.7 First as ClipperPolyNodeMBS

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The first node.
Notes: This method returns the first outer polygon contour if any, otherwise a null pointer.

This function is almost equivalent to calling Childs [0] except that when a PolyTree object is empty (has no children), calling Childs [0] would raise an out of range exception.
(Read only property)

33.10.8 Total as Integer

MBS Tools Plugin, Plugin Version: 18.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the total number of PolyNodes (polygons) contained within the PolyTree.
Notes: This value is not to be confused with ChildCount which returns the number of immediate children only (Childs) contained by PolyTree.
(Read only property)

Chapter 34

CloudKit

34.1 class CKAcceptSharesOperationMBS

34.1.1 class CKAcceptSharesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: An operation that accepts shared records.
Example:

```
// accept a share, so the shared records appear in the shared database
// metadata is a CKShareMetadataMBS, e.g. from CKFetchShareMetadataOperationMBS
// MyAcceptOperation is a subclass of CKAcceptSharesOperationMBS with the events implemented.
// Operation is a property of the window: Operation As MyAcceptOperation
Var metadata As CKShareMetadataMBS // your share metadata
If metadata = Nil Then Return

Var list() As CKShareMetadataMBS
list.Add metadata
Operation = New MyAcceptOperation(list)
CKContainerMBS.defaultContainer.addOperation Operation

// in MyAcceptOperation:
Sub perShareCompleted(shareMetadata As CKShareMetadataMBS, acceptedShare As CKShareMBS, error
As NSErrorMBS) Handles perShareCompleted
If error <>Nil Then
System.DebugLog error.localizedDescription
Else
System.DebugLog "Share accepted."
End If
End Sub
```

```
Sub acceptSharesCompleted(operationError As NSErrorMBS) Handles acceptSharesCompleted
End Sub
```

Notes: Subclass of the CKOperationMBS class.
Blog Entries

- MBS Xojo Plugins, version 21.3pr1

34.1.2 Methods

34.1.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to process share metadata.
Notes: You can use the returned CKAcceptSharesOperation only once. When executed, this query object processes the share metadata.
See also:

- 34.1.4 Constructor(shareMetadatas() as CKShareMetadataMBS) 5932

34.1.4 Constructor(shareMetadatas() as CKShareMetadataMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to process the specified share objects.
Notes: shareMetadatas: An array of CKShareMetadataMBS objects. This parameter is used to initialize the value in the shareMetadatas property. If you specify nil, you must assign an appropriate value to the shareMetadatas property before executing the operation.
See also:

- 34.1.3 Constructor 5932

34.1.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.1.6 setShareMetadatas(shareMetadatas() as CKShareMetadataMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the metadata of the shares that you want to process.
Notes: Use this property to view or change the metadata of the share objects you want to process. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

34.1.7 shareMetadatas as CKShareMetadataMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The metadata of the shares that you want to process.
Notes: Use this property to view or change the metadata of the share objects you want to process. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

34.1.8 Events

34.1.9 acceptSharesCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: This event is called when the operation completes.
Notes: The Completed event of the underlying NSOperation is also called if both are set. If the error is CKErrorPartialFailure, the error,Äôs userInfo dictionary contains a dictionary of shareURL objects to errors keyed off of CKPartialErrorsByItemIDKey. This call happens as soon as the server has seen all record changes and may be invoked while the server is processing the side effects of those changes.

The event is executed serially with respect to the other progress blocks of the operation. If you intend to use this event to process results, update the value of this property before executing the operation or submitting the operation object to a queue.

34.1.10 perShareCompleted(shareMetadata as CKShareMetadataMBS, acceptedShare as CKShareMBS, error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute for each share metadata that the server has processed.
Notes: If the error is nil the share was successfully accepted. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

34.2 class CKAssetMBS

34.2.1 class CKAssetMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The class for a file.

34.2.2 Methods

34.2.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.2.4 Constructor(file as FolderItem)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initialize an asset to be saved with the content at the given file.
See also:

- 34.2.5 Constructor(URL as String) 5935

34.2.5 Constructor(URL as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initialize an asset to be saved with the content at the given file URL.
See also:

- 34.2.4 Constructor(file as FolderItem) 5935

34.2.6 Properties

34.2.7 fileURL as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The URL to the file.
Notes: Local file URL where fetched records are cached and saved records originate from.
(Read only property)

34.2.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.3 class CKContainerMBS

34.3.1 class CKContainerMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: An encapsulation of content associated with an app, including content that is accessible to all users and content that is available only to a specific user.
Example:

```
// check whether the user is logged into iCloud before using CloudKit
// The app needs the iCloud entitlement and must be code signed.
// MyContainer is a subclass of CKContainerMBS with the accountStatusCompleted event implemented.
// Container is a property of the window: Container As MyContainer
Container = New MyContainer(CKContainerMBS.defaultContainer)
Container.accountStatus

// in MyContainer:
Sub accountStatusCompleted(accountStatus As Integer, error As NSErrorMBS, tag As Variant) Handles
accountStatusCompleted
If accountStatus = CKContainerMBS.CKAccountStatusAvailable Then
System.DebugLog "iCloud account available."
ElseIf error <>Nil Then
System.DebugLog error.localizedDescription
Else
System.DebugLog "No iCloud account, status " + accountStatus.ToString
End If
End Sub
```

Notes: A container object manages all explicit and implicit attempts to access the contents of the container.

Every app has a default container object that manages its own native content. If you develop a suite of apps, you can also access any container objects for which you have the appropriate entitlements. Each new container distinguishes between publicly available data and data that is private to the current user. Private data is always stored in the appropriate container directory in the user,Äôs iCloud account.

- MBS Xojo Plugins, version 21.2pr4

34.3.2 Methods

34.3.3 accountStatus(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Reports whether the current user,Äôs iCloud account can be accessed.
Notes: This method determines the status of the current user,Äôs iCloud account asynchronously, reporting the results to the block in the completionHandler parameter. Call this method before accessing the private database to determine whether that database is available. While your app is running, use the NSUbiquityIdentityDidChangeNotification notification to detect account changes and call this method again to retrieve the status for the new account.

34.3.4 addOperation(operation as CKOperationMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Queues an operation for execution in the current container.
Notes: operation: The CKOperationMBS to enqueue. Make sure the operation object you provide is fully configured and ready to be enqueued. Do not change the settings of this object after calling this method.

This method adds the operation object to an operation queue managed by the container itself. Operation objects in the container,Äôs queue execute concurrently with default priorities in background threads.

This method changes the operation object,Äôs container (if any) to the current container.

34.3.5 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.3.6 CKAccountChangedNotification as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The account changed notification name.

34.3.7 CKCurrentUserDefaultName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The default name for the current user.

34.3.8 CKErrorDomain as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The error domain name for CloudKit.

34.3.9 CKErrorRetryAfterKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the user dictionary keys for error dictionaries.
Notes: On CKErrorServiceUnavailable or CKErrorRequestRateLimited errors the userInfo dictionary may contain a number that specifies the period of time in seconds after which the client may retry the request.

34.3.10 CKOwnerDefaultName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The user ID representing the current user. Use this value when creating zone IDs.

34.3.11 CKPartialErrorsByItemIDKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: When a CKErrorPartialFailure happens this key will be set in the error's userInfo dictionary.
Notes: The value of this key will be a dictionary, and the values will be errors for individual items with the keys being the item IDs that failed.

34.3.12 CKRecordChangedErrorAncestorRecordKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the error details keys.
Notes: If the server rejects a record save because it has been modified since the last time it was read, a

CKErrorServerRecordChanged error will be returned and it will contain versions of the record in its user-Info dictionary. Apply your custom conflict resolution logic to the server record (CKServerRecordKey) and attempt a save of that record.

34.3.13 CKRecordChangedErrorClientRecordKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the error details keys.
Notes: If the server rejects a record save because it has been modified since the last time it was read, a CKErrorServerRecordChanged error will be returned and it will contain versions of the record in its user-Info dictionary. Apply your custom conflict resolution logic to the server record (CKServerRecordKey) and attempt a save of that record.

34.3.14 CKRecordChangedErrorServerRecordKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the error details keys.
Notes: If the server rejects a record save because it has been modified since the last time it was read, a CKErrorServerRecordChanged error will be returned and it will contain versions of the record in its user-Info dictionary. Apply your custom conflict resolution logic to the server record (CKServerRecordKey) and attempt a save of that record.

34.3.15 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The constructor.
See also:

- 34.3.16 Constructor(Container as CKContainerMBS) 5940

34.3.16 Constructor(Container as CKContainerMBS)

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Creates a new object for an container reference.
Notes: Allows you to initialize with your subclass to fill events.
See also:

- 34.3.15 Constructor 5940

34.3.17 containerWithIdentifier(name as string) as CKContainerMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns the container object associated with the specified identifier.
Notes: containerIdentifier: The bundle identifier of the app whose container you want to access. The bundle identifier must be in the app,Äôs com.apple.developer.icloud-container-identifiers entitlement. This parameter must not be nil.

Returns the container object for the designated app,Äôs content, or nil if the container cannot be found.

The specified identifier must correspond to one of the ubiquity containers listed in the iCloud capabilities section of your Xcode project. Including the identifier with your app,Äôs capabilities adds the corresponding entitlements to your app. To access your app,Äôs default container, use the defaultContainer method instead.

34.3.18 defaultContainer as CKContainerMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns the default container object for managing the current app,Äôs content.
Notes: Returns the container object associated with the current app,Äôs content. This method always returns a valid container object.

Use this method to retrieve the container for your app,Äôs native content. This container is the one your app typically uses to store its data. If you want the container for a different app, create and initialize that container using the containerWithIdentifier method.

During development, the returned container object points to a development version of your app,Äôs container. When you ship your app, the returned object points to the live production environment.

34.3.19 discoverAllContactUserInfos(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Retrieves information about all discoverable users that are known to the current user.
Notes: Use this method to retrieve information about other users of the app. This method returns information about those users who meet the following criteria:

- There is contact information for the user in the current user,Äôs address book.
- The user has run the app.

- The user has granted the CKApplicationPermissionUserDiscoverability permission to your app for this container.

This method searches for the users asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverAllContactsOperationMBS object and configure the desired priority.

34.3.20 discoverAllIdentities(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Fetches all user records that match an entry in the user,Äôs address book.
Notes: This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverAllContactsOperation object and configure the desired priority.

34.3.21 discoverUserIdentityWithEmailAddress(emailAddress as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns the user record ID associated in the user,Äôs contacts with the email address.
Notes: email: The email address used to locate the user.

Use this method to retrieve the ID of a user that is known to the current user. The user you are searching for must meet the following criteria:

- The user must be in the current user,Äôs address book.
- The user must have run the app.
- The user must have granted the userDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

34.3.22 discoverUserIdentityWithPhoneNumber(phoneNumber as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns the user record ID associated in the user,Äôs contacts with the phone number.
Notes: phoneNumber: The phone number used to locate the user.

Use this method to retrieve the ID of a user that is known to the current user. The user you are searching for must meet the following criteria:

- The user must be in the current user,Äôs address book.
- The user must have run the app.
- The user must have granted the userDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

34.3.23 discoverUserIdentityWithUserRecordID(userRecordID as CKRecordIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Retrieves information about a single user based on the ID of the corresponding user record.
Notes: userRecordID: The ID of the user record.

Use this method to retrieve information about a user for which you already have a user record ID. The user you are searching for must meet the following criteria:

- The user must have run the app.
- The user must have granted the userDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

34.3.24 discoverUserInfoWithEmailAddress(emailAddress as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Retrieves information about a single user based on that user,Äôs email address.
Notes: email: The iCloud email address of the user you want to locate.

Use this method to retrieve the ID of a user that is known to the current user. The user you are searching for must meet the following criteria:

- The user must be in the current user,Äôs address book.
- The user must have run the app.
- The user must have granted the CKApplicationPermissionUserDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

34.3.25 discoverUserInfoWithUserRecordID(userRecordID as CKRecordIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Retrieves information about a single user based on the ID of the corresponding user record.
Notes: userRecordID: The ID of the user record.

Use this method to retrieve information about a user for which you already have a user record ID. The user you are searching for must meet the following criteria:

- The user must have run the app.
- The user must have granted the CKApplicationPermissionUserDiscoverability permission for this container.

This method searches for the user asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKDiscoverUserInfosOperationMBS object and configure the desired priority.

34.3.26 fetchAllLongLivedOperationIDs(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns the identifiers of the running or recently completed long-lived operations.
Notes: A long-lived operation is an operation that continues to run after the app exits, described in CKOperationMBS. To get the operation object for an identifier, use the fetchLongLivedOperationWithID method.

34.3.27 fetchLongLivedOperationWithID(operationID as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns the running or recently completed long-lived operation specified by the operation identifier.
Notes: operationID: The identifier of the long-lived operation you want to fetch.

A long-lived operation is an operation that continues to run after the app exits, described in CKOperationMBS. To receive the callbacks for a long-lived operations, set its completion block and add it to an operation queue.

34.3.28 fetchShareParticipantWithEmailAddress(emailAddress as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Retrieves information about a single share participant (a person who accepted a shared record) based on that participant,Äôs email address.
Notes: emailAddress: The iCloud email address of the share participant you want to locate.

This method searches for the share participant asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKFetchShareParticipantsOperationMBS object and configure the desired priority.

34.3.29 fetchShareParticipantWithPhoneNumber(phoneNumber as string, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Retrieves information about a single share participant (a person who accepted a shared record) based on that participant,Äôs phone number.
Notes: phoneNumber: The phone number used to locate the share participant.

This method searches for the share participant asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKFetchShareParticipantsOperationMBS object and configure the desired priority.

34.3.30 fetchShareParticipantWithUserRecordID(userRecordID as CKRecordIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Retrieves information about a single share participant based on the ID of the corresponding user record.
Notes: userRecordID: The ID of the user record.

This method searches for the share participant asynchronously and with a low priority. If you want the task to execute with a higher priority, create a CKFetchShareParticipantsOperationMBS object and configure the desired priority.

34.3.31 fetchUserRecordID(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns the user record ID associated with the current user.
Notes: At startup time, fetching the user record ID may take longer while CloudKit makes the initial iCloud account request. After the initial fetch, accessing the user record ID should take less time. If no iCloud account is associated with the device, or if access to the user,Äôs iCloud account is restricted, this method returns an error of type CKErrorNotAuthenticated.

34.3.32 registerCloudKitShare(Share as CKShareMBS, ServiceItems as Variant)

MBS Mac64bit Plugin, Plugin Version: 21.3, Platform: macOS, Targets: All.

Function: Registers a CloudKit share for the user to modify.
Example:

```
// The following example shows how to create an item provider with an existing share. It then invokes the cloud-sharing service with the provider and presents the share,Äôs configuration to the user.

Public Sub modifyShare(share as CKShareMBS, container as CKContainerMBS)
// Create an item provider and register a share that
// already exists on the server.

Var itemProvider As New NSSharingServiceItemsMBS
container.registerCloudKitShare(share, itemProvider)

// Create and invoke the cloud-sharing service to
// present the share configuration to the user.
Var service As NSSharingServiceMBS
```

service = NSSharingServiceMBS.sharingServiceNamed(NSSharingServiceMBS.NSSharingServiceNameCloudSharing)

```
If service <>Nil Then
If service.canPerformWithItems(itemProvider) then
service.performWithItems(itemProvider)
end if
End If

End Sub
```

Notes: share: The CloudKit share to modify.
self: The CloudKit container that stores the shared records.
ServiceItems: the NSSharingServiceItemsMBS object to add the item provider.

Use this method when the CloudKit share already exists on the server and you want to update it. The behavior of the sharing service depends on the role of the current user. An owner can edit the share,Äôs configuration, which includes managing participants and their permissions. A participant can view the share,Äôs configuration and choose to stop participating.
If you,Äôre unsure which container to use, fetch the share,Äôs metadata using CKFetchShareMetadataOperationMBS. Then initialize an instance of CKContainer using the metadata,Äôs containerIdentifier property.
Use the NSCloudSharingServiceMBS events to respond to any changes the sharing service makes.

To create a new share, use the registerCloudKitShareWithPreparationHandler method instead.

34.3.33 registerCloudKitShareWithPreparationHandler(ServiceItems as Variant, tag as variant = nil)

MBS Mac64bit Plugin, Plugin Version: 21.3, Platform: macOS, Targets: All.

Function: Registers a handler that prepares a new CloudKit share.
Notes: Calls registerCloudKitShareWithPreparationHandler event to let you fill in code.

ServiceItems: the NSSharingServiceItemsMBS object to add the item provider.
Tag: Variant passed through.

Use this method to share a hierarchy of CloudKit records with other iCloud users. When the service invokes the handler, create an instance of CKShare with a root record. Save the share to the server using CKModifyRecordsOperationMBS. The root record (and its hierarchy) must already exist on the server or be part of the same save operation. After the share saves, call preparationCompletionHandler with the saved share and its container. If the save fails, pass the error to the completion handler instead. Invoking the sharing service with a share you register using this method prompts the user to begin sharing.
Use the NSCloudSharingServiceMBS events to respond to any changes the sharing service makes.

See also:

- 34.3.57 registerCloudKitShareWithPreparationHandler(ServiceItems as Variant, byref share as CKShareMBS, byref container as CKContainerMBS, byref error as NSErrorMBS, tag as variant) 5955

34.3.34 requestApplicationPermission(applicationPermission as Integer, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Requests the specified permission from the user to make the user,Äôs identity discoverable.
Notes: applicationPermission: The requested permission. This requested permission applies to the current container only and will not impact permissions granted for other containers. For a list of possible values, see CKApplicationPermissions.

To implement social features in your app, it is possible to correlate a user record with the user,Äôs actual name, but your app must get permission from the user to do so. Making a user record discoverable to the friends (contacts) of that user involves calling the requestApplicationPermission method and asking for the CKApplicationPermissionUserDiscoverability permission. When you call that method, CloudKit asks the user on your behalf whether the user record should be made discoverable. If the user grants the request, that user,Äôs contacts can discover that user,Äôs true identity when running the app. To discover the contacts of the current user, you use the discoverAllContactUserInfos method or one of several other methods to get the related user information.

The first time you request a permission on any of the user,Äôs devices, the user is prompted to grant or deny the request. Once the user grants or denies a permission, subsequent requests for the same permission (on the same or separate devices), do not prompt the user again.

This method runs asynchronously and delivers the results to the block you provide.

34.3.35 statusForApplicationPermission(applicationPermission as Integer, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Checks the status of the specified permission asynchronously.
Notes: applicationPermission: The permission whose status you want to check. For a list of possible values, see CKApplicationPermissions.

Use this method to determine the extra capabilities granted to your app by the user. If your app has not yet requested a specific permission, calling this method may yield the value CKApplicationPermissionStatusInitialState for the permission. When that value is returned, call the requestApplicationPermission method to

request the permission from the user.

34.3.36 Properties

34.3.37 containerIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The string that identifies the app,Äôs container.
Notes: Use the value in this property to distinguish between different container objects in your app.
(Read only property)

34.3.38 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.3.39 privateCloudDatabase as CKDatabaseMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The database containing the user,Äôs private data.
Notes: The database in this property is available only if the device has an active iCloud account. Access to the database is limited to the user of that iCloud account by default. The current user owns all content in the private database and is allowed to read and write that content. Data in the private database is not visible in the developer portal or to any other users.

Data stored in the private database counts against the storage quota of the current user,Äôs iCloud account.

If there is no active iCloud account on the user,Äôs device, this property still returns a valid database object, but attempts to use that object will return errors. To determine if there is an active iCloud account on the device, use the accountStatus method.
(Read only property)

34.3.40 publicCloudDatabase as CKDatabaseMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The database containing the data shared by all users.
Notes: The database in this property is available regardless of whether the user,Äôs device has an active iCloud account. The contents of the public database are readable by all users of the app, and users have write access to the records (and other data objects) they create. Data in the public database is also visible in the developer portal, where you can assign roles to users and restrict access as needed.

Data stored in the public database counts against your app,Äôs iCloud storage quota and not against the quota of any single user.
(Read only property)

34.3.41 sharedCloudDatabase as CKDatabaseMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The database containing shared user data.
Notes: The database in this property is available only if the device has an active iCloud account. Permissions on the database are limited to the user based on the permissions of the enclosing CKShareMBS object (representing the record that has been shared). The current user does not own the content in the shared database and is allowed to read and write that content only if that permission has been granted in the CKShareMBS. Data in the shared database is not visible in the developer portal or to any user who has not been granted access.

Data stored in the shared database does not count against the storage quota of the current user,Äôs iCloud account.

If there is no active iCloud account on the user,Äôs device, this property still returns a valid database object, but attempts to use the object will return errors. To determine whether the device has an active iCloud account use the accountStatus method.
(Read only property)

34.3.42 Events

34.3.43 accountStatusCompleted(accountStatus as Integer, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to be called when accountStatus is returned.
Notes: accountStatus: The status of the current user,Äôs iCloud account.
error: An error object, or nil if the status is determined successfully. Use the information in the error object to determine whether the problem has a workaround.

34.3.44 discoverAllContactUserInfosCompleted(userRecordID() as CKDiscoveredUserInfoMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for discoverAllContactUserInfos method.
Notes: Your block must be capable of executing on any thread of the app. This block returns no value and takes the following parameters:

userInfos: An array of CKDiscoveredUserInfoMBS objects. Each object in the array contains information about the user, including the ID of the corresponding user record. If no users are discovered, the provided array is empty.
error: An error object if a problem occurs, or nil if the IDs are retrieved successfully.

34.3.45 discoverAllIdentitiesWithCompleted(userRecordID() as CKUserIdentityMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for discoverAllIdentities method.
Notes: This event returns no value and takes the following parameters:

userIdentities: An array of CKUserIdentityMBS objects that match entries in the user,Äôs contacts.
error: An error object if a problem occurs or nil if the fetch completed successfully.

34.3.46 discoverUserIdentityWithEmailAddressCompleted(emailAddress as String, userInfo as CKUserIdentityMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for discoverUserIdentityWithEmailAddress method.
Notes: This event returns no value and takes the following parameters:

userInfo: The user (CKUserIdentityMBS object) associated with the email address, or nil if an identity could not be located.
error: An error object if a problem occurs or nil if the CKUserIdentityMBS is retrieved successfully.

34.3.47 discoverUserIdentityWithPhoneNumberCompleted(phoneNumber as String,user-Info as CKUserIdentityMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for discoverUserIdentityWithPhoneNumber method.
Notes: This event returns no value and takes the following parameters:

userInfo: The user (CKUserIdentityMBS object) associated with the phone number, or nil if an identity could not be located.
error: An error object if a problem occurs, or nil if the CKUserIdentityMBS is retrieved successfully.

34.3.48 discoverUserIdentityWithUserRecordIDCompleted(userRecordID as CK-RecordIDMBS, userInfo as CKUserIdentityMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for discoverUserIdentityWithUserRecordID.
Notes: This event returns no value and takes the following parameters:

userInfo
An object containing information about the user, or nil if the user is not found.

error
An error object if a problem occurs, or nil if the ID is retrieved successfully.

34.3.49 discoverUserInfoWithEmailAddressCompleted(emailAddress as String, userInfo as CKDiscoveredUserInfoMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for discoverUserInfoWithEmailAddress method.
Notes: This event returns no value and takes the following parameters:

userInfo: An object containing information about the user or nil if the user is not found.
error: An error object if a problem occurs or nil if the ID is retrieved successfully.

34.3.50 discoverUserInfoWithUserRecordIDCompleted(userRecordID as CKRecordIDMBS, userInfo as CKDiscoveredUserInfoMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The block to execute with the results for discoverUserInfoWithUserRecordID method.
Notes: This event returns no value and takes the following parameters:

userInfo: An object containing information about the user or nil if the user is not found.
error: An error object if a problem occurs or nil if the ID is retrieved successfully.

34.3.51 fetchAllLongLivedOperationIDsCompleted(outstandingOperationIDs() as String, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event called for fetchAllLongLivedOperationIDs method.
Notes: outstandingOperationsByIDs: An array containing the identifiers for all the active long-lived operations. If a long-lived operation is canceled or completed, it is no longer an active operation, and its identifier will not be included in this array. An operation is complete if the app successfully receives the completion callback.
error: An error object, or nil if the fetch is successful.

34.3.52 fetchLongLivedOperationWithIDCompleted(operationID as String, outstandingOperation as CKOperationMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event called when fetchLongLivedOperationWithID finished.
Notes: outstandingOperation: The proxy object for the corresponding long-lived operation. If a long-lived operation was canceled or completed, this is nil.
error: An error object, or nil if the fetch is successful.

34.3.53 fetchShareParticipantWithEmailAddressCompleted(emailAddress as String, shareParticipant as CKShareParticipantMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for fetchShareParticipantWithEmailAddress method.
Notes: This event returns no value and takes the following parameters:

shareParticipant: An object containing information about the share participant, or nil if the participant is not found.
error: An error object if a problem occurs, or nil if the participant is retrieved successfully.

34.3.54 fetchShareParticipantWithPhoneNumberCompleted(phoneNumber as String,shareParticipant as CKShareParticipantMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for fetchShareParticipantWithPhoneNumber method.
Notes: shareParticipant: An object containing information about the share participant, or nil if the participant is not found.
error: An error object if a problem occurs, or nil if the participant is retrieved successfully.

34.3.55 fetchShareParticipantWithUserRecordIDCompleted(userRecordID as CKRecordIDMBS, shareParticipant as CKShareParticipantMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event called for fetchShareParticipantWithUserRecordID.
Notes: This event returns no value and takes the following parameters:

shareParticipant: An object containing information about the share participant, or nil if the participant is not found.
error: An error object if a problem occurs, or nil if the participant is retrieved successfully.

34.3.56 fetchUserRecordIDCompleted(userRecordID as CKRecordIDMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for fetchUserRecordID method.
Notes: recordID: The ID of the user record for the current user, or nil if the current device is not configured with an iCloud account.
error: An error object if a problem occurs, or nil if the record ID is retrieved successfully.

34.3.57 registerCloudKitShareWithPreparationHandler(ServiceItems as Variant, byref share as CKShareMBS, byref container as CKContainerMBS, byref error as NSErrorMBS, tag as variant)

MBS Mac64bit Plugin, Plugin Version: 21.3, Platform: macOS, Targets: All.

Function: The event called by registerCloudKitShareWithPreparationHandler method.
Notes: ServiceItems: the NSSharingServiceItemsMBS object to add the item provider.
Tag: Variant passed through.
share: The share to use.
container: The container to use.
error: The error you encountered.
See also:

- 34.3.33 registerCloudKitShareWithPreparationHandler(ServiceItems as Variant, tag as variant = nil) 5947

34.3.58 requestApplicationPermissionCompleted(applicationPermissionStatus as Integer, accountStatus as Integer, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for requestApplicationPermission method.

34.3.59 statusForApplicationPermissionCompleted(applicationPermissionStatus as Integer, accountStatus as Integer, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for statusForApplicationPermission method.

34.3.60 Constants

Constants

Constant	Value	Description
CKApplicationPermissionStatusCouldNotComplete	1	One of the constants indicating whether the app has been permission. An error occurred during the getting or setting of the app p the provided NSErrorMBS object for more information.
CKApplicationPermissionStatusDenied	2	One of the constants indicating whether the app has been permission. The user denied access to the permission.
CKApplicationPermissionStatusGranted	3	One of the constants indicating whether the app has been permission. The user granted access to the permission.
CKApplicationPermissionStatusInitialState	0	One of the constants indicating whether the app has been permission. The user has not yet decided whether to grant this permi questApplicationPermission method to ask the user to gran
CKApplicationPermissionUserDiscoverability	1	The current user is discoverable (through the user,Äôs emai users of the app.

Status

Constant	Value	Description
CKAccountStatusAvailable	1	The user,Äôs iCloud account is available and may be used by this app.
CKAccountStatusCouldNotDetermine	0	An error occurred during an attempt to retrieve the account status. Co the provided NSError object for more information.
CKAccountStatusNoAccount	3	The user,Äôs iCloud account is not available because no account inform has been provided for this device.
CKAccountStatusRestricted	2	The user,Äôs iCloud account is not available. Access was denied due to Par Controls or Mobile Device Management restrictions.

Errors

Constant	Value	Description
ErrorAlreadyShared	30	A record/share cannot be saved, doing so would cause a hierarchy of rec to exist in multiple shares.
ErrorAssetFileModified	17	Asset file content was modified while being saved.
ErrorAssetFileNotFound	16	Asset file was not found.
ErrorBadContainer	5	Un-provisioned or unauthorized container. Try provisioning the containe fore retrying the operation.
ErrorBadDatabase	24	Operation could not be completed on the given database. Likely cause attempting to modify zones in the public database.
ErrorBatchRequestFailed	22	One of the items in this batch operation failed in a zone with atomic upd so the entire batch was rejected.
ErrorChangeTokenExpired	21	The previousServerChangeToken value is too old and the client must re- from scratch.
ErrorConstraintViolation	19	The server rejected the request because there was a conflict with a unique
ErrorIncompatibleVersion	18	App version is less than the minimum allowed version.
ErrorInternalError	1	CloudKit.framework encountered an error. This is a non-recoverable erro
ErrorInvalidArguments	12	Bad client request (bad record graph, malformed predicate)
ErrorLimitExceeded	27	The request to the server was too large. Retry this request as a smaller b
ErrorManagedAccountRestricted	32	Request was rejected due to a managed account restriction.
ErrorMissingEntitlement	8	Missing entitlement
ErrorNetworkFailure	4	Network error (available but CFNetwork gave us an error)
ErrorNetworkUnavailable	3	Network not available
ErrorNotAuthenticated	9	Not authenticated (writing without being logged in, no user record)
ErrorOperationCancelled	20	A CKOperation was explicitly cancelled.
ErrorPartialFailure	2	Some items failed, but the operation succeeded overall. Check CKPartia rorsByItemIDKey in the userInfo dictionary for more details.
ErrorParticipantMayNeedVerification	33	Share Metadata cannot be determined, because the user is not a memb the share. There are invited participants on the share with email addr or phone numbers not associated with any iCloud account. The user ma able to join the share if they can associate one of those email addresse phone numbers with their iCloud account via the system Share Accept Call UIApplication's openURL on this share URL to have the user attem verify their information.
ErrorPermissionFailure	10	Access failure (save, fetch, or shareAccept)
ErrorQuotaExceeded	25	Saving a record would exceed quota
ErrorReferenceViolation	31	The target of a record's parent or share reference was not found.
ErrorRequestRateLimited	7	Client is being rate limited
ErrorResultsTruncated	13	Results Truncated. Deprecated and will not be returned.
ErrorServerRecordChanged	14	The record was rejected because the version on the server was different.
ErrorServerRejectedRequest	15	The server rejected this request. This is a non-recoverable error.
ErrorServiceUnavailable	6	Service unavailable
ErrorTooManyParticipants	29	A share cannot be saved because there are too many participants attache the share.
ErrorUnknownItem	11	Record does not exist
ErrorUserDeletedZone	28	The user deleted this zone through the settings UI. Your client should e remove its local data or prompt the user before attempting to re-upload data to this zone.
ErrorZoneBusy	23	The server is too busy to handle this zone operation. Try the operation a in a few seconds.
ErrorZoneNotFound	26	The specified zone does not exist on the server.

34.4 class CKDatabaseMBS

34.4.1 class CKDatabaseMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A conduit for accessing and for performing operations on the public and private data of an app container.
Example:

```
// save a new record in the private iCloud database of the user
// The app needs the iCloud entitlement and must be code signed.
// MyDatabase is a subclass of CKDatabaseMBS with the saveRecordCompleted event implemented.
// Database is a property of the window: Database As MyDatabase
Database = New MyDatabase(CKContainerMBS.defaultContainer.privateCloudDatabase)

Var record As New CKRecordMBS("Note")
record.objectForKey("title") = "Shopping"
record.objectForKey("text") = "Milk, Bread"
Database.saveRecord record

// in MyDatabase:
Sub saveRecordCompleted(record As CKRecordMBS, error As NSErrorMBS, tag As Variant) Handles
saveRecordCompleted
If error <>Nil Then
System.DebugLog "Failed: " + error.localizedDescription
Else
System.DebugLog "Saved " + record.recordID.recordName
End If
End Sub
```

Notes: An app container has a public database whose data is accessible to all users and a private database whose data is accessible only to the current user. A database object takes requests for data and applies them to the appropriate part of the container.

You do not create database objects yourself, nor should you subclass CKDatabaseMBS. Your app,Äôs CKContainerMBS objects provide the CKDatabaseMBS objects you use to access the associated data. Use database objects as-is to perform operations on data.

The public database is always available, regardless of whether the device has an an active iCloud account. When no iCloud account is available, your app may fetch records and perform queries on the public database, but it may not save changes. (Saving records to the public database requires an active iCloud account to identify the owner of those records.) Access to the private database always requires an active iCloud account on the device.

- MBS Xojo Plugins, version 21.2pr3

34.4.2 Methods

34.4.3 addOperation(operation as CKDatabaseOperationMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Executes the specified operation asynchronously against the current database.
Notes: operation: The operation object to execute. You must configure the operation object with any dependencies and completion handlers before calling this method. If this parameter is nil, the method does nothing.

Do not change the properties of the operation object after calling this method. Prior to executing the operation, this method sets the operation object,Äôs database property to the current database, replacing any previously assigned database.

This method executes the operation object with the priority you assigned to the object through its queuePriority property.

34.4.4 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.4.5 Constructor(Container as CKContainerMBS, databaseScope as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Retrieves the database with the appropriate scope.
Notes: databaseScope: The scope of the database you want returned.

Returns an initialized CKDatabase object with the appropriate scope.
This convenience method returns the database associated with the specified container that is of the scope

requested.
See also:

- 34.4.6 Constructor(Database as CKDatabaseMBS) 5960

34.4.6 Constructor(Database as CKDatabaseMBS)

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Creates a new object for an database reference.
Notes: Allows you to initialize with your subclass to fill events.
See also:

- 34.4.5 Constructor(Container as CKContainerMBS, databaseScope as Integer) 5959

34.4.7 deleteRecordWithID(recordID as CKRecordIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Deletes the specified record asynchronously, with a low priority, from the current database.
Notes: recordID: The ID of the record you want to delete. This method throws an exception if this parameter is nil.

Deleting a record may trigger additional deletions if the record was referenced by other records. This method reports only the ID of the record you asked to delete. CloudKit does not report deletions triggered by owning relationships between records.

This method deletes the record with a low priority, which may cause the task to execute after higher-priority tasks. To delete records more urgently, create a CKModifyRecordsOperationMBS object with the desired priority. You can also use that operation object to delete multiple records simultaneously.

34.4.8 deleteRecordWithIDSync(recordID as CKRecordIDMBS, byref error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Deletes the specified record synchronously, with a low priority, from the current database.
Notes: recordID: The ID of the record you want to delete. This method throws an exception if this parameter is nil.

Deleting a record may trigger additional deletions if the record was referenced by other records. This method reports only the ID of the record you asked to delete. CloudKit does not report deletions triggered by owning

relationships between records.

This method deletes the record with a low priority, which may cause the task to execute after higher-priority tasks. To delete records more urgently, create a CKModifyRecordsOperationMBS object with the desired priority. You can also use that operation object to delete multiple records simultaneously.

34.4.9 deleteRecordZone(zoneID as CKRecordZoneIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Deletes one record zone (and its contents) asynchronously, with a low priority, from the current database.
Notes: zoneID: The ID of the zone you want to delete. This method throws an exception if this parameter is nil.

Deleting a zone permanently deletes the zone and all records in that zone. After deleting the zone, you can use the same ID to create a new empty zone.

This method deletes the record zone with a low priority, which may cause the task to execute after higher-priority tasks. To delete the record zone more urgently, create a CKModifyRecordZonesOperationMBS object with the desired priority. You can also use that operation object to delete multiple record zones simultaneously.

34.4.10 deleteSubscriptionWithID(subscriptionID as String, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Deletes one subscription object asynchronously, with a low priority, from the current database.
Notes: subscriptionID: The ID of the subscription object to delete. This method throws an exception if this parameter is nil.

Deleting a subscription stops the subscription from watching its changed records and sending alerts.

This method deletes the subscription object with a low priority, which may cause the task to execute after higher-priority tasks. To delete the subscription more urgently, create a CKModifySubscriptionsOperationMBS object with the desired priority. You can also use that operation object to delete multiple subscription objects simultaneously.

34.4.11 fetchAllRecordZones(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Fetches all record zones asynchronously, with a low priority, from the current database.
Notes: Use this method to locate the record zones in this database. Record zones represent groups of records with a common purpose.

This method fetches record zones with a low priority, which may cause the task to execute after higher-priority tasks. To fetch record zones more urgently, create a CKFetchRecordZonesOperationMBS object with the desired priority.

34.4.12 fetchAllSubscriptions(tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Fetches all subscription objects asynchronously, with a low priority, from the current database.
Notes: Use this method to locate the subscriptions in the current database. Subscriptions represent persistent queries on the server. A subscription can be used to alert the app when records change.

This method fetches the subscription objects with a low priority, which may cause the task to execute after higher-priority tasks. To fetch subscriptions more urgently, create a CKFetchSubscriptionsOperationMBS object with the desired priority.

34.4.13 fetchRecordWithID(recordID as CKRecordIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Fetches one record asynchronously, with a low priority, from the current database.
Notes: recordID: The ID of the record you want to fetch. This method throws an exception if this parameter is nil.

Use this method to fetch records that are not urgent to your app,Äôs execution. This method fetches the record with a low priority, which may cause the fetch to execute after higher-priority tasks. To fetch records more urgently, create a CKFetchRecordsOperation object with the desired priority. You can also use that operation object to fetch multiple records simultaneously.

34.4.14 fetchRecordWithIDSync(recordID as CKRecordIDMBS, byref record as CKRecordMBS, byref error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Fetches one record synchronously, with a low priority, from the current database.
Notes: recordID: The ID of the record you want to fetch. This method throws an exception if this parameter is nil.
record: The requested record object. If no such record is found, this parameter is nil.
error: An error object, or nil if the record was fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

Use this method to fetch records that are not urgent to your app,Äôs execution. This method fetches the record with a low priority, which may cause the fetch to execute after higher-priority tasks. To fetch records more urgently, create a CKFetchRecordsOperation object with the desired priority. You can also use that operation object to fetch multiple records simultaneously.

34.4.15 fetchRecordZoneWithID(zoneID as CKRecordZoneIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Fetches one record zone asynchronously, with a low priority, from the current database.
Notes: zoneID: The ID of the record zone. This method throws an exception if this parameter is nil.

Use this method to retrieve a record zone whose ID you already know. You might retrieve a record zone object so that you can assess its capabilities.

This method fetches the record zone with a low priority, which may cause the task to execute after higher-priority tasks. To fetch the record zone more urgently, create a CKFetchRecordZonesOperationMBS object with the desired priority. You can also use that operation object to fetch multiple record zones simultaneously.

34.4.16 fetchSubscriptionWithID(subscriptionID as String, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Fetches one subscription object asynchronously, wiht a low priority, from the current database.
Notes: subscriptionID: The ID of the subscription object. This method throws an exception if this parameter is nil.

Use this method to retrieve a subscription object whose ID you already know. You might retrieve a subscrip-

tion object so that you can assess its attributes or update the notification information used to generate alerts.

This method fetches the subscription object with a low priority, which may cause the task to execute after higher-priority tasks. To fetch the subscription more urgently, create a CKFetchSubscriptionsOperationMBS object with the desired priority. You can also use that operation object to fetch multiple subscription objects simultaneously.

34.4.17 performQuery(query as CKQueryMBS, zoneID as CKRecordZoneIDMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Searches the specified zone asynchronously for records that match the query parameters.
Notes: query: The query object containing the parameters for the search. This method throws an exception if this parameter is nil. For information about how to construct queries, see CKQueryMBS.
zoneID: The ID of the zone to search. Search results are limited to records in the specified zone. Specify nil to search the default zone of the database.

Use this method to execute searches against the current database. Do not use this method when the number of returned records is potentially more than a few hundred records; when more records are needed, create an execute a CKQueryOperationMBS instead of calling performQuery:inZoneWithID on the CKDatabaseMBS. For efficiency, all queries automatically limit the number of returned records based on current conditions. If your query hits the maximum value, this method returns only the first portion of the overall results. The number of returned records should be sufficient in most cases, but to get the entire set of records you must create and execute a CKQueryOperationMBS object instead. Query operations also return a maximum number of results, but when they do, they provide a cursor object that you can use to fetch the next batch of results.

You can search any content that is represented by a CKRecord object, including user records. You cannot use this method to search for CKSubscriptionMBS or CKRecordZoneMBS objects.

34.4.18 saveRecord(record as CKRecordMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Saves one record asynchronously, with a low priority, to the current database, if the record has never been saved or if it is newer than the version on the server.
Notes: record: The record to save. This method throws an exception if this parameter is nil.

This method saves the record only if it has never been saved before or if it is newer than the version on the server. You cannot use this method to overwrite newer versions of a record on the server.

This method saves the record with a low priority, which may cause the task to execute after higher-priority tasks. To save records more urgently, create a CKModifyRecordsOperationMBS object with the desired priority. You can also use that operation object to save multiple records simultaneously.

34.4.19 saveRecordSync(record as CKRecordMBS, byref error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Saves one record synchronously, with a low priority, to the current database, if the record has never been saved or if it is newer than the version on the server.
Notes: record: The record to save. This method throws an exception if this parameter is nil.

This method saves the record only if it has never been saved before or if it is newer than the version on the server. You cannot use this method to overwrite newer versions of a record on the server.

This method saves the record with a low priority, which may cause the task to execute after higher-priority tasks. To save records more urgently, create a CKModifyRecordsOperationMBS object with the desired priority. You can also use that operation object to save multiple records simultaneously.

34.4.20 saveRecordZone(zone as CKRecordZoneMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Saves one record zone asynchronously, with a low priority, to the current database.
Notes: zone: The zone you want to save to the database. This method throws an exception if this parameter is nil.

Use this method to save a record zone to the database so that you can subsequently store records in it. Record zones must be saved before you attempt to save any records that reside in that zone. Because this method executes asynchronously, use the completion handler to verify that the zone was saved successfully before attempting to save any records.

This method saves the record zone with a low priority, which may cause the task to execute after higher-priority tasks. To save the record zone more urgently, create a CKModifyRecordZonesOperationMBS object with the priority you want. You can also use that operation object to save multiple record zones all at once.

34.4.21 saveSubscription(subscription as CKSubscriptionMBS, tag as Variant = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Saves one subscription object asynchronously, with a low priority, to the current database.
Notes: subscription: The subscription object you want to save to the database. This method throws an exception if this parameter is nil.

Use this method to save a subscription to the database so that the subsription can begin watching for changes.

This method saves the subscription object with a low priority, which may cause the task to execute after higher-priority tasks. To save the subscription more urgently, create a CKModifySubscriptionsOperationMBS object with the desired priority. You can also use that operation object to save multiple subscription objects simultaneously.

34.4.22 Properties

34.4.23 databaseScope as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The type of database (public, private, or shared).
Notes: (Read only property)

34.4.24 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.4.25 Events

34.4.26 deleteRecordWithIDCompleted(recordID as CKRecordIDMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The block to execute with the results for deleteRecordWithID method.
Notes: recordID: The ID of the record you attempted to delete.
error: An error object, or nil if the record zone was deleted successfully. Use the information in the error object to determine whether a problem has a workaround.

34.4.27 deleteRecordZoneWithIDCompleted(zoneID as CKRecordZoneIDMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The block to execute with the results for deleteRecordZone method.
Notes: zoneID: The ID of the zone that you tried to delete.
error: An error object, or nil if the record zone was deleted successfully. Use the information in the error object to determine whether a problem has a workaround.

34.4.28 deleteSubscriptionWithIDCompleted(subscriptionID as String, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for deleteSubscriptionWithID method.
Notes: subscriptionID: The ID of the subscription object you attempted to delete.
error: An error object, or nil if the subscription was deleted successfully. Use the information in the error object to determine whether a problem has a workaround.

34.4.29 fetchAllRecordZonesCompleted(zones() as CKRecordZoneMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for fetchAllRecordZones method.
Notes: zones: An array of CKRecordZoneMBS objects. The returned array always contains at least one record zone corresponding to the default zone.
error: An error object, or nil if the record zones were fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

34.4.30 fetchAllSubscriptionsCompleted(subscriptions() as CKSubscriptionMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for fetchAllSubscriptions.
Notes: subscriptions: An array of CKSubscription objects. If the subscription objects cannot be retrieved, the array is empty.
error: An error object, or nil if the subscriptions were fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

34.4.31 fetchRecordWithIDCompleted(recordID as CKRecordIDMBS, record as CKRecordMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results.
Notes: record: The requested record object. If no such record is found, this parameter is nil.
error: An error object, or nil if the record was fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

34.4.32 fetchRecordZoneWithIDCompleted(zoneID as CKRecordZoneIDMBS, zone as CKRecordZoneMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for fetchRecordZoneWithID method.
Notes: zone: The requested CKRecordZone object or nil if the object is not found or cannot be retrieved.
error: An error object, or nil if the record zone was fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

34.4.33 fetchSubscriptionWithIDCompleted(subscriptionID as String, subscription as CKSubscriptionMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for fetchSubscriptionWithID.
Notes: subscription: The requested subscription object or nil if the object is not found or cannot be retrieved.
error: An error object, or nil if the subscription was fetched successfully. Use the information in the error object to determine whether a problem has a workaround.

34.4.34 performQueryCompleted(query as CKQueryMBS, zoneID as CKRecordZoneIDMBS, results() as CKRecordMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the search results.
Notes: The event to execute with the search results for performQuery method.

results: An array containing zero or more CKRecord objects. The returned records correspond to the records in the specified zone that match the parameters of the query.

error: An error object, or nil if the query was completed successfully. Use the information in the error object to determine whether a problem has a workaround.

34.4.35 saveRecordCompleted(record as CKRecordMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for saveRecord.
Notes: record: The record object you attempted to save.
error: An error object, or nil if the record was saved successfully. Use the information in the error object to determine whether a problem has a workaround.

34.4.36 saveRecordZoneCompleted(zone as CKRecordZoneMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results for saveRecordZone method.
Notes: zone: The CKRecordZone object you attempted to save.
error: An error object, or nil if the record zone was saved successfully. Use the information in the error object to determine whether a problem has a workaround.

34.4.37 saveSubscriptionCompleted(subscription as CKSubscriptionMBS, error as NSErrorMBS, tag as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The block to execute with the results for saveSubscription method.
Notes: subscription: The subscription object you attempted to save.
error: An error object, or nil if the subscription was saved successfully. Use the information in the error object to determine whether a problem has a workaround.

34.4.38 Constants

Database Scopes

Constant	Value	Description
ScopePrivate	2	The private database.
ScopePublic	1	The public database.
ScopeShared	3	The shared database.

34.5 class CKDatabaseNotificationMBS

34.5.1 class CKDatabaseNotificationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A notification object about a database.
Notes: Subclass of the CKNotificationMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

34.5.2 Methods

34.5.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.

34.5.4 Properties

34.5.5 databaseScope as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The database scope.
Notes: (Read only property)

34.6 class CKDatabaseOperationMBS

34.6.1 class CKDatabaseOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The CKDatabaseOperation class is an abstract parent class for operations that act on the public or private databases in a container.
Notes: Database operations typically involve fetching and saving records and other database objects, as well as queries on the contents of the database. You use the property of this class to tell the operation object which database to use when executing its task. Do not subclass this class or create instances of it. Instead, create instances of one of its concrete subclasses.

Available on macOS 10.12 or newer.
Subclass of the CKOperationMBS class.

34.6.2 Methods

34.6.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The constructor.

34.6.4 Properties

34.6.5 database as CKDatabaseMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The database that is the target of the operation.
Notes: For operations you plan to execute from your own custom queue, use this property to specify the target database. Setting the database also sets the corresponding container, inherited from the CKOperationMBS parent class. If the value of this property is nil, the operation targets the private database of the app,Äôs default container.

The default value of this property is nil.
(Read and Write property)

34.7 class CKDatabaseSubscriptionMBS

34.7.1 class CKDatabaseSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A subscription for database changes.
Notes: Subclass of the CKSubscriptionMBS class.

34.7.2 Methods

34.7.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.12 and newer in 64-bit application.

34.7.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.
See also:

- 34.7.5 Constructor(subscriptionID as string) 5973

34.7.5 Constructor(subscriptionID as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The constructor.
See also:

- 34.7.4 Constructor 5973

34.7.6 copy as CKDatabaseSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.7.7 Properties

34.7.8 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The record type.
Notes: (Read and Write property)

34.8 class CKDiscoverAllContactsOperationMBS

34.8.1 class CKDiscoverAllContactsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CKDiscoverAllUserIdentitiesOperationMBS instead. **Function:** A CKDiscoverAllContactsOperation object retrieves the IDs of all discoverable users that are also in the user,Äôs address book.
Notes: The search of the user,Äôs address book does not return any personal data about the user,Äôs contacts. The search returns only the IDs of the corresponding user records, which contain only data that your app puts there. CloudKit uses the address book information to identify users of the app that the current user knows. Because the system accesses the address book instead of your app, the system does not display a prompt to the user when that access occurs.

Users of an app must opt in to discoverability before their user records can be accessed. To opt in for a user, your app must call the requestApplicationPermission:completion: method of your container object and request the userDiscoverability permission. Calling that method prompts the user to grant or deny the permission.

If you assign a completion block to the completionBlock property of the operation object, the completion block is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

No Address Book access dialog will be displayed.
Available in OS X 10.10 and newer. Deprecated in 10.12 in favor of CKDiscoverAllUserIdentitiesOperationMBS classes.
Subclass of the CKOperationMBS class.

- MBS Xojo Plugins, version 20.3pr7

34.8.2 Methods

34.8.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The constructor.

34.8.4 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.8.5 Events

34.8.6 discoverAllContactsCompleted(userInfos() as CKDiscoveredUserInfoMBS, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to use to process the search results.
Notes: The event has no return value and takes the following parameters:

userRecordIDs: An array of CKDiscoveredUserInfoMBS objects. Each ID corresponds to a user of the app who opts in to discovery by other known users. Use this ID to retrieve the corresponding user record.
operationError: An error object containing information about a problem, or nil if the user record IDs are retrieved successfully.

This event is executed only once, at the conclusion of the operation. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

34.9 class CKDiscoverAllUserIdentitiesOperationMBS

34.9.1 class CKDiscoverAllUserIdentitiesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: An operation that finds all discoverable users in the device,Äôs contacts.
Notes: The operation will not generate a dialog indicating that the contacts are being accessed.

Available in OS X 10.12 and newer.
Subclass of the CKOperationMBS class.

34.9.2 Methods

34.9.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to search the device,Äôs contacts.
Notes: You can use the returned CKDiscoverAllUserIdentitiesOperationMBS only once. When executed, this query object performs a new search and returns a batch of results.

34.9.4 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.9.5 Events

34.9.6 discoverAllUserIdentitiesCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the results.
Notes: operationError: An error object that contains the information about a problem or nil if the results are retrieved successfully.

This event is executed only once and represents your last chance to process the operation results. It is executed after all of the individual progress blocks but before the operation,Äôs completed event. The block is executed serially with respect to the other progress blocks of the operation. If you intend to use this

block to process results, update the value of this property before executing the operation or submitting the operation object to a queue.

34.9.7 userIdentityDiscovered(identity as CKUserIdentityMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute for each user identity returned.
Notes: identity: A CKUserIdentityMBS object that was discovered in the device,Äôs contacts.

This event is executed once for each identity that is discovered. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

34.10 class CKDiscoveredUserInfoMBS

34.10.1 class CKDiscoveredUserInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CKUserIdentityMBS instead. **Function:** A CKDiscoveredUserInfo object contains information about a discoverable user in a database.
Notes: You do not create instances of this class yourself. Instead, use a CKDiscoverAllContactsOperation object or other means to retrieve these objects.

Available in OS X 10.10 and newer.
Deprecated in OS X 10.12 in favor of CKUserIdentityMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 20.3pr7

34.10.2 Methods

34.10.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.10.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.

34.10.5 Properties

34.10.6 displayContact as Variant

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Contains the given and family name of the user who is not associated with the local Address Book.

Notes: DisplayContact is not associated with the local Address Book. It is a wrapper around information known to the CloudKit server, including first and last names.

Value is a CNContactMBS. We use variant to reduce dependency to other plugins.
(Read only property)

34.10.7 firstName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The first name of the user.
Notes: (Read only property)

34.10.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.10.9 lastName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The last name of the user.
Notes: (Read only property)

34.10.10 userRecordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ID of the user record.
Notes: Use this value to retrieve the user record associated with the specified user. The user record does not contain any personal information about the user by default. Your app can add data to the user record but should not add any sensitive user data to it.
(Read only property)

34.11 class CKDiscoverUserIdentitiesOperationMBS

34.11.1 class CKDiscoverUserIdentitiesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: An operation that fetches user identities.
Example:

```
// find out which of your contacts use the app, by email address
// The app needs the iCloud entitlement and must be code signed.
// MyDiscoverOperation is a subclass of CKDiscoverUserIdentitiesOperationMBS with the events implemented.
// Operation is a property of the window: Operation As MyDiscoverOperation
Var emails() As String = Array("john@example.com", "jane@example.com")
Operation = New MyDiscoverOperation(CKUserIdentityLookupInfoMBS.lookupInfosWithEmails(emails))
CKContainerMBS.defaultContainer.addOperation Operation

// in MyDiscoverOperation:
Sub userIdentityDiscovered(identity As CKUserIdentityMBS, lookupInfo As CKUserIdentityLookupInfoMBS)
Handles userIdentityDiscovered
System.DebugLog lookupInfo.emailAddress + " is " + identity.nameComponents.givenName
End Sub

Sub discoverUserIdentitiesCompleted(operationError As NSErrorMBS) Handles discoverUserIdentitiesCompleted
If operationError <>Nil Then System.DebugLog operationError.localizedDescription
End Sub
```

Notes: Subclass of the CKOperationMBS class.

34.11.2 Methods

34.11.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to discover user identities.
Notes: You can use the returned CKDiscoverUserIdentitiesOperation only once. When executed, this query object processes the share metadata.
See also:

- 34.11.4 Constructor(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS) 5982

34.11.4 Constructor(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to discover all user identities associated with the specified lookup info.
Notes: userIdentityLookupInfos: An array of CKUserIdentityLookupInfoMBS objects. This parameter is used to initialize the value in the userIdentityLookupInfos property. If you specify nil, you must assign an appropriate value to the userIdentityLookupInfos property before executing the operation.

Returns an initialized operation object.
See also:

- 34.11.3 Constructor 5981

34.11.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.11.6 setUserIdentityLookupInfos(IDs() as CKUserIdentityLookupInfoMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the lookup info (email address, phone number, or record ID) used to discover user identities.
Notes: Use this property to view or change the lookup info used to discover user identities. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

34.11.7 userIdentityLookupInfos as CKUserIdentityLookupInfoMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The lookup info (email address, phone number, or record ID) used to discover user identities.
Notes: Use this property to view or change the lookup info used to discover user identities. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

34.11.8 Events

34.11.9 discoverUserIdentitiesCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The block to execute when the operation has completed.
Notes: This block is called when the operation completes. The completionBlock of the underlying NSOperationMBS is also called if both are set. This block is executed serially with respect to the other progress blocks of the operation. If you intend to use this block to process results, update the value of this property before executing the operation or submitting the operation object to a queue.

34.11.10 userIdentityDiscovered(identity as CKUserIdentityMBS, lookupInfo as CKUserIdentityLookupInfoMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute for each user identity that has been discovered.
Notes: Each time the event is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

34.12 class CKDiscoverUserInfosOperationMBS

34.12.1 class CKDiscoverUserInfosOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CKDiscoverUserIdentitiesOperationMBS instead. **Function:** A CKDiscoverUserInfosOperation object retrieves the IDs for discoverable users whose email addresses or user record IDs you already know.
Notes: This operation returns information about the corresponding users.

Users of an app must opt in to discoverability before their user records can be accessed. To opt in for a user, your app must call the requestApplicationPermission:completion: method of your container object and request the userDiscoverability permission. Calling that method prompts the user to grant or deny the permission.

If you assign a completed event of the operation object, the completed event is called after the operation executes and returns its results to you. You can use a completed event to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completed event you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKOperationMBS class.

34.12.2 Methods

34.12.3 Constructor(emailAddresses() as String, userRecordIDs() as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes the operation object with the specified email addresses.
Notes: emailAddresses: An array of strings, each of which contains a single email address to look for. The value you specify is used to initialize the value of the emailAddresses property. If you specify nil for this parameter, assign at least one email address to the emailAddresses property before executing the operation object.
userRecordIDs: An array of CKRecordIDMBS objects, each of which contains the ID of a user record to look for. The value you specify is used to initialize the value of the userRecordIDs property. If you specify nil for this parameter, assign at least one email address to the userRecordIDs property before executing the operation object.

The email addresses you specify need not belong to users in the current user,Äôs address book. The users associated with those email addresses must be discoverable for their user record ID to be returned.

34.12.4 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.12.5 emailAddresses as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The email addresses of the users whose information you want to retrieve.
Notes: This property contains an array of strings, each of which corresponds to a single email address. Use this property to add or remove email addresses to the operation. If you intend to change the property value, do so before executing the operation or submitting the operation object to a queue.

The default value of this property is set to the email addresses you specify in the Constructor.

34.12.6 setEmailAddresses(emails() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the email addresses of the users whose information you want to retrieve.
Notes: This property contains an array of strings, each of which corresponds to a single email address. Use this property to add or remove email addresses to the operation. If you intend to change the property value, do so before executing the operation or submitting the operation object to a queue.

The default value of this property is set to the email addresses you specify in the Constructor.

34.12.7 setUserRecordIDs(IDs() as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the IDs of the users whose information you want to retrieve.
Notes: This property contains an array of CKRecordIDMBS objects, each of which corresponds to the ID of a user record. Use this property to add or remove record IDs to the operation. If you intend to change the value of this property, you must do so before executing the operation or submitting the operation object to a queue.

The default value of this property is set to the record IDs you specify in the Constructor.

34.12.8 userRecordIDs as CKRecordIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The IDs of the users whose information you want to retrieve.
Notes: This property contains an array of CKRecordIDMBS objects, each of which corresponds to the ID of a user record. Use this property to add or remove record IDs to the operation. If you intend to change the value of this property, you must do so before executing the operation or submitting the operation object to a queue.

The default value of this property is set to the record IDs you specify in the Constructor.

34.12.9 Events

34.12.10 discoverUserInfosCompleted(emailsToUserInfos as Dictionary, userRecordIDsToUserInfos as Dictionary, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to use to process the search results.
Notes: The event has no return value and takes the following parameters:

emailsToUserInfos: A dictionary whose keys are events with the email addresses you provided in the emailAddresses property. The value of each key is a CKDiscoveredUserInfo object that identifies the user associated with the email address. Use that object to get the user,Äôs name and fetch the corresponding user record.
userRecordIDsToUserInfos: A dictionary whose keys are the CKRecordIDMBS objects you provided. The value of each key is a CKDiscoveredUserInfo object that identifies the user associated with the user record. You can use that object to get the user,Äôs name.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

This event is executed only once, at the conclusion of the operation. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

34.13 class CKFetchDatabaseChangesOperationMBS

34.13.1 class CKFetchDatabaseChangesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: An operation that fetches changes to the database.
Example:

```
// find out which zones changed since the last sync
// The app needs the iCloud entitlement and must be code signed.
// MyChangesOperation is a subclass of CKFetchDatabaseChangesOperationMBS with the events implemented.
// Operation is a property of the window: Operation As MyChangesOperation
// LastToken is a property of the window: LastToken As CKServerChangeTokenMBS
Operation = New MyChangesOperation(LastToken) // Nil for the first sync
Operation.fetchAllChanges = True
CKContainerMBS.defaultContainer.privateCloudDatabase.addOperation Operation

// in MyChangesOperation:
Sub recordZoneWithIDChanged(zoneID As CKRecordZoneIDMBS) Handles recordZoneWithIDChanged
System.DebugLog "Changed zone: " + zoneID.zoneName // fetch it with CKFetchRecordZoneChangesOperationMBS
End Sub

Sub recordZoneWithIDWasDeleted(zoneID As CKRecordZoneIDMBS) Handles recordZoneWithIDWasDeleted
System.DebugLog "Deleted zone: " + zoneID.zoneName
End Sub

Sub fetchDatabaseChangesCompleted(serverChangeToken As CKServerChangeTokenMBS, moreComing As Boolean, operationError As NSErrorMBS) Handles fetchDatabaseChangesCompleted
If operationError = Nil Then
System.DebugLog "Done, store the new token for the next sync."
End If
End Sub
```

Notes: Subclass of the CKDatabaseOperationMBS class.

34.13.2 Methods

34.13.3 Constructor(previousServerChangeToken as CKServerChangeTokenMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured with the previous change token.

Notes: previousServerChangeToken: The previous change token.

Returns an initialized operation object.

After initializing the operation, assign a block to the fetchDatabaseChangesCompletionBlock property to process the results.

If a change anchor from a previous CKFetchDatabaseChangesOperation is passed in, only the zones that have changed since that anchor will be returned.

This per-database CKServerChangeToken is not to be confused with the per-recordZone CKServerChangeToken from CKFetchRecordZoneChangesOperationMBS.

If this is your first fetch or if you wish to re-fetch all zones, pass nil for the change token. Change tokens are opaque and clients should not infer any behavior based on their content.

34.13.4 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.13.5 Properties

34.13.6 fetchAllChanges as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Configuration setting to control whether this operation makes repeated calls to the server.
Notes: When this property is set to true, the operation sends repeated requests to the server until all record zone changes have been fetched. When this property is set to false, it is the responsibility of the caller to issue subsequent fetch-change operations when moreComing is true in a fetchDatabaseChangesCompleted invocation.

fetchAllChanges is true by default.
(Read and Write property)

34.13.7 previousServerChangeToken as CKServerChangeTokenMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The change token from a previous fetch operation.
Notes: Assign the token you received previously from the fetchDatabaseChangesCompleted event to this property. Doing so yields only the changes that have occurred since your last fetch operation. If you specify nil for this parameter, the operation starts fetching changes at the beginning.
(Read and Write property)

34.13.8 resultsLimit as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The maximum number of results to fetch with this operation.
Notes: Use this property to limit the number of changes processed in one operation. When the results limit is reached, the operation object updates the original token you provided and returns it to you to let you know that more results are available.
(Read and Write property)

34.13.9 Events

34.13.10 changeTokenUpdated(serverChangeToken as CKServerChangeTokenMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute when the change token has changed.
Notes: This event will be executed periodically, giving you an updated change token so that already-fetched record zone changes do not need to be re-fetched on a subsequent operation.

34.13.11 fetchDatabaseChangesCompleted(serverChangeToken as CKServerChangeTokenMBS, moreComing as Boolean, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute when the operation completes.
Notes: serverChangeToken: The current server change token to be stored and used in subsequent CKFetchDatabaseChangesOperation instances.
moreComing: Indicates if this is the last record zone change. If fetchAllChanges is false, it is the responsibility of the client to create additional CKFetchDatabaseChangesOperation instances for the additional changes.
operationError: An error object containing information about a problem, or nil if the results are retrieved

successfully.

The client is responsible for saving the change token at the end of the operation and passing it into the next call to CKFetchDatabaseChangesOperationMBS. If the server returns a CKErrorChangeTokenExpired error, the previousServerChangeToken value was too old and the client should toss its local cache and re-fetch the changes in this record zone starting with a nil previousServerChangeToken.

34.13.12 recordZoneWithIDChanged(zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The block that processes a single record zone change.
Notes: The event returns no value and takes the following parameter:

zoneID: The CKRecordZoneID corresponding to the record zone that changed.

34.13.13 recordZoneWithIDWasDeleted(zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event that processes a single record zone deletion.
Notes: The event returns no value and takes the following parameter:

zoneID: The CKRecordZoneID corresponding to the record zone that was deleted.

34.14 class CKFetchRecordChangesOperationMBS

34.14.1 class CKFetchRecordChangesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKFetchRecordChangesOperation object reports on the changed and deleted records in the specified record zone.
Notes: Use this type of operation object to optimize fetch operations for locally managed sets of records. Specifically, use it when you maintain a local cache of your record data and need to synchronize that cache periodically with the server.

To get the most benefit out of a CKFetchRecordChangesOperation object, you must maintain a local cache of the records from the specified zone. Each time you fetch changes from that zone, the server provides a token that identifies your request. With each subsequent fetch request, you initialize the operation object with the token from the previous request, and the server returns only the records that changed since that request.

The blocks you assign to process the fetched records are executed serially on an internal queue managed by the operation. Your blocks must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

The completed event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

Available in 10.10 and newer and deprecated with 10.12.
Subclass of the CKDatabaseOperationMBS class.

34.14.2 Methods

34.14.3 Constructor(recordZoneID as CKRecordZoneIDMBS, previousServerChangeToken as CKServerChangeTokenMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to fetch changes in the specified record zone.
Notes: recordZoneID: The zone containing the records you want to fetch. The zone can be a custom zone. Syncing the default zone is not supported.
previousServerChangeToken: The change token from a previous fetch operation. This is the token passed to your fetchRecordChangesCompleted event during a previous fetch operation. Use this token to limit the

returned data to only those changes that have occurred since you last made the same fetch request. If you specify nil for this parameter, the operation object fetches all records and their contents.

Returns an initialized operation object.

When initializing the operation object, use the token from a previous fetch request if you have one. You can archive tokens and write them to disk for later use if needed.

The returned operation object is configured to retrieve all changed fields of the record, including any assets stored in those fields. If you want to minimize the amount of data returned even further, configure the desiredKeys property with the subset of keys whose values you want to fetch.

After initializing the operation, associate at least one progress block with the operation object (excluding the completion block) to process the results.

34.14.4 desiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The fields to fetch for the requested records.
Notes: Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and include at least one field name from each record type.

If you intend to specify the desired set of keys, set the value of this property before executing the operation or submitting it to a queue.

34.14.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.14.6 setDesiredKeys(desiredKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the fields to fetch for the requested records.
Notes: Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and include at least one field name from each record type.

If you intend to specify the desired set of keys, set the value of this property before executing the operation or submitting it to a queue.

34.14.7 Properties

34.14.8 moreComing as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A Boolean value indicating that more results are available.
Notes: If the server is unable to deliver all of the changed results with this operation object, it sets this property to true before executing the fetchRecordChangesCompleted event. To fetch the remaining changes, create a new CKFetchRecordChangesOperationMBS object using the change token returned by the server. (Read only property)

34.14.9 previousServerChangeToken as CKServerChangeTokenMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The token that identifies the starting point for retrieving changes.
Notes: Each fetch request returns a unique token in addition to any changes. The token is passed as a parameter to your fetchRecordChangesCompleted event. During a subsequent fetch request, providing the previous token causes the server to return only the changes that have occurred since the last fetch request. Tokens are opaque data objects that you can write to disk safely and reuse later.

Typically, you set the value of this property when you initialize the operation object. If you intend to change the record zone, update the value of the property before executing the operation or submitting it to a queue. (Read and Write property)

34.14.10 recordZoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ID of the record zone whose records you want to fetch.
Notes: Typically, you set the value of this property when you initialize the operation object. If you intend to change the record zone, update the value before executing the operation or submitting it to a queue.
(Read and Write property)

34.14.11 resultsLimit as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function:

The maximum number of changed records to report with this operation object.
Language
Notes:

Use this property to limit the number of results in situations where you expect the number of changed records might be large. The default value is 0, which causes the server to choose an appropriate number of results to return based on dynamic conditions.

When the number of returned results exceeds the results limit, the operation object sets the moreComing property to true before executing the fetchRecordChangesCompleted event. In your event, check the value of that property, and if it is true, create a new CKFetchRecordChangesOperationMBS object to fetch more results.
(Read and Write property)

34.14.12 Events

34.14.13 fetchRecordChangesCompleted(serverChangeToken as CKServerChangeTokenMBS, clientChangeTokenData as MemoryBlock, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute when all changes have been reported.
Notes: The block returns no value and takes the following parameters:

serverChangeToken: The new change token from the server. You can store this token locally and use it during subsequent fetch operations to limit the results to records that changed since this operation executed.
clientChangeToken: The last client change token received from this device. If this change token is not the last change token you provided, the server may not have received the associated changes.

operationError: An error object containing information about a problem, or nil if the changes are retrieved successfully.

Your implementation of this block should check the moreComing property of the operation object to ensure that the server was able to deliver all results. If that property is set to true, you must create another operation object (using the value in the serverChangeToken parameter) to fetch any remaining changes.

The operation object executes this block only once, at the conclusion of the operation. It is executed after all individual change blocks but before the operation,Äôs completed event. The block is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

34.14.14 recordChanged(record as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the contents of a changed record.
Notes: The event returns no value and takes the following parameters:

record: The record that changed. If you specified a value for the desiredKeys property, the record only contains the fields specified in the desiredKeys property.

The operation object executes this event once for each record in the zone that changed since the previous fetch request. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation. If no records changed, the block is not executed.

If you intend to use this event to process results, set it before executing the operation or submitting it to a queue.

34.14.15 recordWithIDWasDeleted(recordID as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The block to execute with the ID of a record that was deleted.
Notes: The block returns no value and takes the following parameters:

recordID: The ID of the record that was deleted.

The operation object executes this block once for each record in the zone that was deleted since the previous fetch request. Each time the event is executed, it is executed serially with respect to the other progress blocks of the operation. If no records were deleted, this event is not executed.

If you intend to use this event to process results, set it before executing the operation or submitting it to a queue.

34.15 class CKFetchRecordsOperationMBS

34.15.1 class CKFetchRecordsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKFetchRecordsOperation object retrieves CKRecord objects (whose IDs you already know) from iCloud.
Example:

```
// load two records by their IDs
// The app needs the iCloud entitlement and must be code signed.
// MyFetchOperation is a subclass of CKFetchRecordsOperationMBS with the events implemented.
// Operation is a property of the window: Operation As MyFetchOperation
Var ids() As CKRecordIDMBS
ids.Add New CKRecordIDMBS("note-1")
ids.Add New CKRecordIDMBS("note-2")

Operation = New MyFetchOperation(ids)
CKContainerMBS.defaultContainer.privateCloudDatabase.addOperation Operation

// in MyFetchOperation:
Sub RecordCompleted(record As CKRecordMBS, recordID As CKRecordIDMBS, error As NSErrorMBS)
Handles RecordCompleted
If error <>Nil Then
System.DebugLog recordID.recordName + ": " + error.localizedDescription
Else
System.DebugLog recordID.recordName + ": " + record.objectForKey("title").StringValue
End If
End Sub

Sub fetchRecordsCompleted(recordsByRecordID As Dictionary, operationError As NSErrorMBS) Handles
fetchRecordsCompleted
System.DebugLog "Done."
End Sub
```

Notes: Use this operation to retrieve the entire contents of each record or only a subset of its contained values. As records become available, the operation object reports progress about the state of the operation to several different blocks, which you can use to process the results.

Fetching records is a common use of CloudKit, even if your app does not cache record IDs locally. For example, when you fetch a record related to the current record through a CKReference object, you use the ID in the reference to perform the fetch.

The blocks you assign to process the fetched records are executed serially on an internal queue managed by the fetch records operation. Your blocks must be capable of executing on a background thread, so any tasks

that require access to the main thread must be redirected accordingly.

In addition to data records, a fetch records operation can fetch the current user record. The fetchCurrentUserRecordOperation() method returns a specially configured operation object that retrieves the current user record. That record is a standard CKRecord object whose contents are empty initially. You can add data to the user record and save it as needed. Because a discoverable user record can be accessed by other users of the app, never store sensitive personal information such as passwords in the user record. If you must store sensitive information about a user, do so in a separate record that is accessible only to that user.

The completed event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKDatabaseOperationMBS class.

34.15.2 Methods

34.15.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The constructor.
See also:

- 34.15.4 Constructor(recordIDs() as CKRecordIDMBS) 5998

34.15.4 Constructor(recordIDs() as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to fetch the records with the specified IDs.
Notes: recordIDs: An array of CKRecordIDMBS objects representing the records you want to retrieve. This parameter is used to initialize the value in the recordIDs property. If specify nil, you must assign an appropriate value to the recordIDs property before executing the operation.

If any of the objects in the array are not CKRecordIDMBS objects, this method raises an exception.

Returns an initialized operation object.

The returned operation object is configured to retrieve all fields of the record, including any assets stored in those fields. If you want to minimize the amount of data returned initially, configure the desiredKeys property with the subset of keys whose values you want to retrieve.

See also:

- 34.15.3 Constructor 5998

34.15.5 desiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The fields to fetch for the requested records.
Notes: Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value of this property is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and should include at least one field name from each record type.

If you intend to specify a value other than nil, do so before executing the operation or submitting the operation object to a queue.

34.15.6 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.15.7 fetchCurrentUserRecordOperation as CKFetchRecordsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns an operation object that can be used to fetch the current user record.
Notes: The returned operation object searches for the single record corresponding to the current user record. You must associate at least one progress block with the operation object (excluding the completed event) to process the results.

34.15.8 recordIDs as CKRecordIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The array of IDs corresponding to the records to fetch.
Notes: Use this property to view or change the IDs of the records you want to retrieve. Each item in the array must be a CKRecordIDMBS object. If you used the fetchCurrentUserRecordOperation method to create the operation object, the contents of this property are ignored and the value is set to nil.

If you intend to specify a value other than nil, do so before executing the operation or submitting the operation object to a queue. The records you fetch do not need to be in the same record zone. The record ID for each record provides the zone information needed by the server to fetch the corresponding record.

34.15.9 setDesiredKeys(desiredKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Set the fields to fetch for the requested records.
Notes: Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value of this property is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and should include at least one field name from each record type.

If you intend to specify a value other than nil, do so before executing the operation or submitting the operation object to a queue.

34.15.10 setRecordIDs(IDs() as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the array of IDs corresponding to the records to fetch.
Notes: Use this property to view or change the IDs of the records you want to retrieve. Each item in the array must be a CKRecordIDMBS object. If you used the fetchCurrentUserRecordOperation method to create the operation object, the contents of this property are ignored and the value is set to nil.

If you intend to specify a value other than nil, do so before executing the operation or submitting the operation object to a queue. The records you fetch do not need to be in the same record zone. The record ID for each record provides the zone information needed by the server to fetch the corresponding record.

34.15.11 Events

34.15.12 fetchRecordsCompleted(recordsByRecordID as Dictionary, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute after all records are fetched or have received appropriate errors.
Notes: The event returns no value and takes the following parameters:

recordsByRecordID: A dictionary containing the records that are retrieved successfully. Each key in the dictionary is a CKRecordID object corresponding to a record you requested. The value of each key is the corresponding CKRecord object that was retrieved from the database.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this event only once and is your last chance to process the operation results. The event is executed after all of the individual progress events but before the operation,Äôs completed event. The event is executed serially with respect to the other progress events of the operation.

This event reports an error of type CKErrorPartialFailure when it retrieves only some of the records successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is an NSDictionary object. The keys of that dictionary are the IDs of the records that were not retrieved, and the corresponding values are error objects containing information about what happened.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

34.15.13 RecordCompleted(record as CKRecordMBS, recordID as CKRecordIDMBS, error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute when the results of a single record are available.
Notes: The event returns no value and takes the following parameters:

record: The retrieved record, or nil if the specified record cannot be retrieved.
recordID: The ID of the record. This value corresponds to one of the IDs you specified in the recordIDs property.
error: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this block once for each record ID in the recordIDs property. Each time the

block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

34.15.14 RecordProgress(recordID as CKRecordIDMBS, progress as Double)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with progress information for individual records.
Notes: The event returns no value and takes the following parameters:

recordID: The ID of the record that is being retrieved.
progress: The amount of the record that has been downloaded, represented as a percentage of the total. The range of this value is 0.0 to 1.0, where 0.0 means nothing has been downloaded, and 1.0 means the download is complete.

The operation object executes this block zero or more times for each record ID in the recordIDs property. Each time the block is executed, it is executed serially with respect to the other progress events of the operation. You can use this event to track the ongoing progress of the download operation and possibly to provide feedback to the user.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

34.16 class CKFetchRecordZoneChangesOperationMBS

34.16.1 class CKFetchRecordZoneChangesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: An operation that fetches record changes across the given record zone.
Example:

```
// fetch all changed and deleted records of a zone
// The app needs the iCloud entitlement and must be code signed.
// MyZoneChangesOperation is a subclass of CKFetchRecordZoneChangesOperationMBS with the events implemented.
// Operation is a property of the window: Operation As MyZoneChangesOperation
Var zones() As CKRecordZoneIDMBS
zones.Add New CKRecordZoneIDMBS("Notes", CKContainerMBS.CKCurrentUserDefaultName)

Operation = New MyZoneChangesOperation(zones)
Operation.fetchAllChanges = True
CKContainerMBS.defaultContainer.privateCloudDatabase.addOperation Operation

// in MyZoneChangesOperation:
Sub recordChanged(record As CKRecordMBS) Handles recordChanged
System.DebugLog "Changed: " + record.recordID.recordName // update your local copy
End Sub

Sub recordWithIDWasDeleted(recordID As CKRecordIDMBS, recordType As String) Handles recordWithIDWasDeleted
System.DebugLog "Deleted: " + recordID.recordName
End Sub

Sub recordZoneFetchCompleted(recordZoneID As CKRecordZoneIDMBS, serverChangeToken As CKServerChangeTokenMBS, clientChangeTokenData As MemoryBlock, moreComing As Boolean, recordZoneError As NSErrorMBS) Handles recordZoneFetchCompleted
System.DebugLog "Zone " + recordZoneID.zoneName + " done, store the token for the next sync."
End Sub
```

Notes: Subclass of the CKDatabaseOperationMBS class.

34.16.2 Methods

34.16.3 Constructor(recordZoneIDs() as CKRecordZoneIDMBS, optionsByRecordZoneID as Dictionary = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to fetch record zone changes.
Notes: The returned operation object is configured to retrieve all record zones passed in. If you want to minimize the amount of data returned even further, configure the CKFetchRecordZoneChangesOptionsMBS property for each record zone.

After initializing the operation, associate at least one progress block with the operation object (excluding the completion block) to process the results.

optionsByRecordZoneID: The options per zone.
recordZoneIDs: The record zones that should be fetched.

34.16.4 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.16.5 recordZoneIDs as CKRecordZoneIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The IDs of the record zones whose records you want to fetch.
Notes: Typically, you set the value of this property when you initialize the operation object. If you intend to change the record zones, update the value before executing the operation or submitting it to a queue.

34.16.6 setRecordZoneIDs(IDs() as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the IDs of the record zones whose records you want to fetch.
Notes: Typically, you set the value of this property when you initialize the operation object. If you intend to change the record zones, update the value before executing the operation or submitting it to a queue.

34.16.7 Properties

34.16.8 fetchAllChanges as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether repeated requests should be sent to the server.
Notes: If true, this operation sends repeated requests to the server until CKFetchRecordZoneChangesOperationMBS is false. The server calls recordZoneFetchCompletionBlock with an incremental change token after every request. The default value is true.
(Read and Write property)

34.16.9 optionsByRecordZoneID as Dictionary

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Options for each zone that is retrieved from the server.
Notes: Each CKRecordZoneIDMBS can have its own CKFetchRecordZoneChangesOptionsMBS object that allows you to configure what is fetched for that zone. See CKFetchRecordZoneChangesOptionsMBS for details on what options can be set.
(Read and Write property)

34.16.10 Events

34.16.11 fetchRecordZoneChangesCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to use to process the record zone changes.
Notes: The event has no return value and takes the following parameter:

operationError: An error object containing information about a problem, or nil if the record zone changes were retrieved successfully.

34.16.12 recordChanged(record as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The block to execute with the contents of a changed record.
Notes: The block returns no value and takes the following parameter:

record: The record that changed. If you specified a value for the desiredKeys property, the record only contains the fields specified in the desiredKeys property.

The operation object executes this block once for each record in the zone that changed since the previous fetch request. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation. If no records changed, the block is not executed.

If you intend to use this block to process results, set it before executing the operation or submitting it to a queue.

34.16.13 recordWithIDWasDeleted(recordID as CKRecordIDMBS, recordType as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the ID of a record that was deleted.
Notes: The event returns no value and takes the following parameter:

recordID: The ID of the record that was deleted.

The operation object executes this block once for each record that was deleted since the previous fetch request. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation. If no records were deleted, this block is not executed.

If you intend to use this block to process results, set it before executing the operation or submitting it to a queue.

34.16.14 recordZoneChangeTokensUpdated(recordZoneID as CKRecordZoneIDMBS, serverChangeToken as CKServerChangeTokenMBS, clientChangeTokenData as MemoryBlock)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute when the change token has been updated.
Notes: The event returns no value and takes the following parameters:

recordZoneID: The ID of the zone with the updated token.
serverChangeToken: The new change token from the server. You can store this token locally and use it during subsequent fetch operations to limit the results to records that changed since this operation executed.
clientChangeTokenData: The last client change token received from this device. If this change token is not

the last change token you provided, the server may not have received the associated changes.

The operation object executes this block once for each record zone. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this block to process results, set it before executing the operation or submitting it to a queue.

34.16.15 recordZoneFetchCompleted(recordZoneID as CKRecordZoneIDMBS, serverChangeToken as CKServerChangeTokenMBS, clientChangeTokenData as MemoryBlock, moreComing as boolean, recordZoneError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute when the fetch for a zone has completed.
Notes: The block returns no value and takes the following parameters:

recordZoneID: The ID of the zone with the updated token.
serverChangeToken: The current server change token to be stored and used in subsequent CKFetchRecordZoneChangesOperation instances.
clientChangeTokenData: The last client change token received from this device. If this change token is not the last change token you provided, the server may not have received the associated changes.
moreComing: Indicates if this is the last record zone change. If fetchAllChanges is false, it is the responsibility of the client to create additional CKFetchRecordZoneChangesOperationMBS instances for the additional changes.
recordZoneError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The client is responsible for saving the change token at the end of the operation and passing it into the next call to CKFetchRecordZoneChangesOperationMBS. Each time the block is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting it to a queue.

34.17 class CKFetchRecordZoneChangesOptionsMBS

34.17.1 class CKFetchRecordZoneChangesOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Options when fetching record zone changes.
Example:

```
// fetch only changes after the last sync and only some fields of a zone
// token is the CKServerChangeTokenMBS you stored from the last sync
Var token As CKServerChangeTokenMBS // your saved token

Var options As New CKFetchRecordZoneChangesOptionsMBS
options.previousServerChangeToken = token
options.resultsLimit = 100
Var keys() As String = Array("title", "modified")
options.setDesiredKeys keys

Var zoneID As New CKRecordZoneIDMBS("Notes", CKContainerMBS.CKCurrentUserDefaultName)
Var optionsByZone As New Dictionary
optionsByZone.Value(zoneID) = options

Var zones() As CKRecordZoneIDMBS
zones.Add zoneID
Var op As New CKFetchRecordZoneChangesOperationMBS(zones, optionsByZone)
// use a subclass with the events and add it to the private database, see CKFetchRecordZoneChangesOperationMBS
```

34.17.2 Methods

34.17.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The constructor.

34.17.4 desiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The fields to fetch for the requested records.
Notes: Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target

records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and include at least one field name from each record type.

If you intend to specify the desired set of keys, set the value of this property before executing the operation or submitting it to a queue.

34.17.5 setDesiredKeys(desiredKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the fields to fetch for the requested records.
Notes: Use this property to limit the amount of data retrieved for each record during the fetch operation. This property contains an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the keys in this property are included in the returned record. The default value is nil, which causes all keys of the record to be fetched.

Because the records you fetch can be of different types, the array should contain the merged set of all field names for the requested records and include at least one field name from each record type.

If you intend to specify the desired set of keys, set the value of this property before executing the operation or submitting it to a queue.

34.17.6 Properties

34.17.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.17.8 previousServerChangeToken as CKServerChangeTokenMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The token that identifies the starting point for retrieving changes.
Notes: Each fetch request returns a unique token in addition to any changes. The token is passed as a

parameter to your fetchRecordChangesCompleted event. During a subsequent fetch request, providing the previous token causes the server to return only the changes that have occurred since the last fetch request. Tokens are opaque data objects that you can write to disk safely and reuse later.

Typically, you set the value of this property when you initialize the operation object. If you intend to change the record zone, update the value of the property before executing the operation or submitting it to a queue.
(Read and Write property)

34.17.9 resultsLimit as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The maximum number of changed records to report with this operation object.
Notes: Use this property to limit the number of results in situations where you expect the number of changed records might be large. The default value is 0, which causes the server to choose an appropriate number of results to return based on dynamic conditions.

When the number of returned results exceeds the results limit, the operation object sets the moreComing property to true before executing the fetchRecordChangesCompleted event. In your block, check the value of that property, and if it is true, create a new CKFetchRecordChangesOperationMBS object to fetch more results.
(Read and Write property)

34.18 class CKFetchRecordZonesOperationMBS

34.18.1 class CKFetchRecordZonesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKFetchRecordZonesOperation object retrieves CKRecordZone objects (whose IDs you already know) from iCloud.
Example:

```
// list all custom zones in the private database
// The app needs the iCloud entitlement and must be code signed.
// MyZonesOperation is a subclass of CKFetchRecordZonesOperationMBS with the fetchRecordZonesCompleted event implemented.
// Operation is a property of the window: Operation As MyZonesOperation
Operation = New MyZonesOperation
Var zoneIDs() As CKRecordZoneIDMBS // empty = all zones
Operation.setRecordZoneIDs zoneIDs
CKContainerMBS.defaultContainer.privateCloudDatabase.addOperation Operation

// in MyZonesOperation:
Sub fetchRecordZonesCompleted(recordZonesByZoneID As Dictionary, operationError As NSErrorMBS) Handles fetchRecordZonesCompleted
If operationError <>Nil Then
System.DebugLog operationError.localizedDescription
Return
End If
For Each entry As DictionaryEntry In recordZonesByZoneID
Var zone As CKRecordZoneMBS = entry.Value
System.DebugLog zone.zoneID.zoneName
Next
End Sub
```

Notes: Use this operation object to fetch record zones so that you can ascertain their capabilities.

The completed event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKDatabaseOperationMBS class.

34.18.2 Methods

34.18.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The default constructor.
See also:

- 34.18.4 Constructor(recordZoneIDs() as CKRecordZoneIDMBS) 6012

34.18.4 Constructor(recordZoneIDs() as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to fetch the specified record zones.
Notes: zoneIDs: An array of CKRecordZoneID objects representing the zones you want to retrieve. This parameter is used to initialize the value in the recordZoneIDs property. If you specify nil, you must assign a value to the recordZoneIDs property before executing the operation.

Returns an initialized operation object.
See also:

- 34.18.3 Constructor 6012

34.18.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.18.6 fetchAllRecordZonesOperation as CKFetchRecordZonesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns an operation object that can be used to fetch all record zones in the current database.

34.18.7 recordZoneIDs as CKRecordZoneIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The IDs of the record zones you want to retrieve.
Notes: Use this property to view or change the IDs of the record zones you want to retrieve. Each item

in the array must be a CKRecordZoneID object. If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

If you used the fetchAllRecordZonesOperationMBS method to create the operation object, the contents of this property are ignored and the default value is set to nil.

34.18.8 setRecordZoneIDs(IDs() as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the IDs of the record zones you want to retrieve.
Notes: Use this property to view or change the IDs of the record zones you want to retrieve. Each item in the array must be a CKRecordZoneID object. If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

If you used the fetchAllRecordZonesOperationMBS method to create the operation object, the contents of this property are ignored and the default value is set to nil.

34.18.9 Events

34.18.10 fetchRecordZonesCompleted(recordZonesByZoneID as Dictionary, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the fetch results.
Notes: The event returns no value and takes the following parameters:

recordZonesByZoneID: A dictionary that maps the requested IDs to the retrieved objects. The keys in the dictionary are the CKRecordZoneID objects you requested, and the values are the corresponding CKRecordZone objects.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this block only once and it is your only chance to process the operation results. The block is executed before the operation,Äôs completion block. Your block must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it retrieves only some of the record zones successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the record zones that were not retrieved, and the corresponding values are error objects containing information about what happened.

34.19 class CKFetchShareMetadataOperationMBS

34.19.1 class CKFetchShareMetadataOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: An operation that fetches shared record metadata for one or more shares.
Example:

```
// read the details of a share link someone sent you
// The app needs the iCloud entitlement and must be code signed.
// MyShareMetadataOperation is a subclass of CKFetchShareMetadataOperationMBS with the events implemented.
// Operation is a property of the window: Operation As MyShareMetadataOperation
Var urls() As String = Array("https://www.icloud.com/share/0abcDEF")
Operation = New MyShareMetadataOperation(urls)
Operation.shouldFetchRootRecord = True
CKContainerMBS.defaultContainer.addOperation Operation

// in MyShareMetadataOperation:
Sub ShareMetadataFetched(shareURL As String, shareMetadata As CKShareMetadataMBS, error As NSErrorMBS) Handles ShareMetadataFetched
If error <>Nil Then
System.DebugLog error.localizedDescription
Else
System.DebugLog "Shared by " + shareMetadata.ownerIdentity.nameComponents.givenName
// accept it with CKAcceptSharesOperationMBS
End If
End Sub

Sub fetchShareMetadataCompleted(operationError As NSErrorMBS) Handles fetchShareMetadataCompleted
System.DebugLog "Done."
End Sub
```

Notes: This operation may be run in any container that the client has access to.
Subclass of the CKOperationMBS class.

34.19.2 Methods

34.19.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.12 and newer in 64-bit application.

34.19.4 Constructor(URLs() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to fetch the metadata for the specified shares.
Notes: shareURLs: An array of URLs. This parameter is used to initialize the value in the shareURLs property. If you specify nil, you must assign an appropriate value to the shareURLs property before executing the operation.

Returns an initialized operation object.

34.19.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.19.6 rootRecordDesiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Keys to be fetched if the root record is to be fetched.
Notes: This property declares which user-defined keys should be fetched and added to the resulting root record. This property is only consulted if shouldFetchRootRecord is set to true.

If this property is set to nil, the entire root record is downloaded.
If this property is set to an empty array, no user fields are downloaded.

This property defaults to nil.

34.19.7 setRootRecordDesiredKeys(rootRecordDesiredKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the keys to be fetched if the root record is to be fetched.
Notes: This property declares which user-defined keys should be fetched and added to the resulting root record. This property is only consulted if shouldFetchRootRecord is set to true.

If this property is set to nil, the entire root record is downloaded.
If this property is set to an empty array, no user fields are downloaded.

This property defaults to nil.

34.19.8 setShareURLs(URLs() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the URLs of the shares that you want to process.
Notes: Use this property to view or change the URLs of the share objects that you want to fetch. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

34.19.9 shareURLs as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The URLs of the shares that you want to process.
Notes: Use this property to view or change the URLs of the share objects that you want to fetch. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

34.19.10 Properties

34.19.11 shouldFetchRootRecord as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A flag to indicate whether the root record should be retrieved.
Notes: If this property is set to true, the resulting CKShareMetadataMBS has a rootRecord object filled out.
The resulting CKShareMetadata has a rootRecordID property regardless of the value of this property.
This property defaults to false.
(Read and Write property)

34.19.12 Events

34.19.13 fetchShareMetadataCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute when the operation has completed.
Notes: This block is called when the operation completes. The Complete of the underlying NSOperation is also called if both are implemented.

The event is executed serially with respect to the other progress events of the operation. If you intend to use this event to process results, update the value of this property before executing the operation or submitting the operation object to a queue.

34.19.14 ShareMetadataFetched(shareURL as String, shareMetadata as CKShareMetadataMBS, error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute for each share metadata that has been fetched from the server.
Notes: If error is nil then the share was successfully accepted. Each time the event is executed, it is executed serially with respect to the other progress blocks of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

34.20 class CKFetchShareParticipantsOperationMBS

34.20.1 class CKFetchShareParticipantsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: An operation that fetches the participants of a shared record.
Example:

```
// look up participants by email to add them to a share
// share is a CKShareMBS you own
// MyParticipantsOperation is a subclass of CKFetchShareParticipantsOperationMBS with the events implemented.
// Operation is a property of the window: Operation As MyParticipantsOperation
// Share is a property of the window: Share As CKShareMBS
Var emails() As String = Array("jane@example.com")
Operation = New MyParticipantsOperation(CKUserIdentityLookupInfoMBS.lookupInfosWithEmails(emails))
CKContainerMBS.defaultContainer.addOperation Operation

// in MyParticipantsOperation:
Sub shareParticipantFetched(participant As CKShareParticipantMBS) Handles shareParticipantFetched
// add it to your share and save the share again
System.DebugLog "Found participant " + participant.userIdentity.lookupInfo.emailAddress
End Sub

Sub fetchShareParticipantsCompleted(operationError As NSErrorMBS) Handles fetchShareParticipantsCompleted
If operationError <>Nil Then System.DebugLog operationError.localizedDescription
End Sub
```

Notes: Subclass of the CKOperationMBS class.

34.20.2 Methods

34.20.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to fetch share participants.
Notes: You can use the returned CKFetchShareParticipantsOperation only once. When executed, this query object fetches the share participants.

Note
If userIdentityLookupInfos is not set prior to executing the operation, it returns immediately with no results.
See also:

• 34.20.4 Constructor(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS) 6020

34.20.4 Constructor(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to fetch the specified share participants.
Notes: userIdentityLookupInfos: An array of CKUserIdentityLookupInfoMBS objects. This parameter is used to initialize the value in the userIdentityLookupInfos property. If you specify nil, you must assign an appropriate value to the userIdentityLookupInfosuserIdentityLookupInfos property before executing this operation.

Returns an initialized operation object.
See also:

• 34.20.3 Constructor 6019

34.20.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.20.6 setUserIdentityLookupInfos(userIdentityLookupInfos() as CKUserIdentityLookupInfoMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the user identities that are used to fetch the share participants.
Notes: Use this property to view or change the user identities you want to fetch against. If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

Note
If userIdentityLookupInfos is not set prior to executing the operation, it returns immediately with no results.

34.20.7 userIdentityLookupInfos as CKUserIdentityLookupInfoMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The user identities that are used to fetch the share participants.
Notes: Use this property to view or change the user identities you want to fetch against. If you intend to

specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.

Note
If userIdentityLookupInfos is not set prior to executing the operation, it returns immediately with no results.

34.20.8 Events

34.20.9 fetchShareParticipantsCompleted(operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute when the operation has completed.
Notes: This event is called when the operation complete. The Comepleted of the underlying NSOperation is also called if both are set.

The event is executed serially with respect to the other progress blocks of the operation. If you intend to use this event to process results, update the value of this property before executing the operation or submitting the operation object to the queue.

34.20.10 shareParticipantFetched(participant as CKShareParticipantMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute for each share participant that has been fetched from the server.
Notes: Each time the event is executed, it is executed serially with respect to the other progress events of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue.

34.21 class CKFetchSubscriptionsOperationMBS

34.21.1 class CKFetchSubscriptionsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKFetchSubscriptionsOperation object retrieves CKSubscription objects (whose IDs you already know) from iCloud and can fetch all subscriptions associated with the current user.
Example:

```
// list all CloudKit subscriptions of the app in the private database
// The app needs the iCloud entitlement and must be code signed.
// MySubscriptionsOperation is a subclass of CKFetchSubscriptionsOperationMBS with the fetchSubscriptionCompleted event implemented.
// Operation is a property of the window: Operation As MySubscriptionsOperation
Operation = New MySubscriptionsOperation
Var ids() As String // empty = all subscriptions
Operation.setSubscriptionIDs ids
CKContainerMBS.defaultContainer.privateCloudDatabase.addOperation Operation

// in MySubscriptionsOperation:
Sub fetchSubscriptionCompleted(subscriptionsBySubscriptionID As Dictionary, operationError As NSErrorMBS) Handles fetchSubscriptionCompleted
If operationError <>Nil Then
System.DebugLog operationError.localizedDescription
Return
End If
For Each entry As DictionaryEntry In subscriptionsBySubscriptionID
System.DebugLog "Subscription: " + entry.Key.StringValue
Next
End Sub
```

Notes: You might fetch subscription objects so you can examine or modify their parameters; for example, to adjust the delivery options for push notifications generated by the subscription.

The completion event is called after the operation executes and returns its results to you. You can use a completion block to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKDatabaseOperationMBS class.

34.21.2 Methods

34.21.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The constructor.
See also:

- 34.21.4 Constructor(subscriptionIDs() as String) 6023

34.21.4 Constructor(subscriptionIDs() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to fetch the specified subscriptions.
Notes: subscriptionIDs: An array of strings, each of which contains the ID of a subscription object you want to retrieve. This parameter is used to initialize the value in the subscriptionIDs property. If you specify nil, you must assign an appropriate value to the subscriptionIDs property before executing the operation.

Returns an initialized operation object.
See also:

- 34.21.3 Constructor 6023

34.21.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.21.6 fetchAllSubscriptionsOperation as CKFetchSubscriptionsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns an operation object that retrieves all of the user,Äôs subscription objects in the current database.
Notes: Returns a newly allocated operation object that fetches the active subscription objects operating on behalf of the current user.

34.21.7 setSubscriptionIDs(emails() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the IDs of the subscription objects you want to retrieve.
Notes: Use this property to view or change the IDs of the subscription objects you want to retrieve. Each item in the array must be a string whose value is the ID of the subscription object you want to retrieve. If you intend to specify or change the value for this property, do so before executing the operation or submitting the operation object to a queue.

If you used the fetchAllSubscriptionsOperation method to create the operation object, the contents of this property are ignored and its value is set to nil.

34.21.8 subscriptionIDs as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The IDs of the subscription objects you want to retrieve.
Notes: Use this property to view or change the IDs of the subscription objects you want to retrieve. Each item in the array must be a string whose value is the ID of the subscription object you want to retrieve. If you intend to specify or change the value for this property, do so before executing the operation or submitting the operation object to a queue.

If you used the fetchAllSubscriptionsOperation method to create the operation object, the contents of this property are ignored and its value is set to nil.

34.21.9 Events

34.21.10 fetchSubscriptionCompleted(subscriptionsBySubscriptionID as Dictionary, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with the fetch results.
Notes: The event returns no value and takes the following parameters:

subscriptionsBySubscriptionID: A dictionary that maps the requested IDs to the retrieved objects. The keys in the dictionary are the NSString objects with the IDs of the subscription objects you requested and the values are the corresponding CKSubscription objects.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this block only once and it is your only chance to process the operation results. The block is executed before the operation,Äôs completion block. Your block must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it retrieves only some of the subscriptions successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the subscriptions that were not retrieved and the corresponding values are error objects containing information about what happened.

34.22 class CKFetchWebAuthTokenOperationMBS

34.22.1 class CKFetchWebAuthTokenOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The CKFetchWebAuthTokenOperation object fetches a web authentication token given an API token that you obtain from CloudKit Dashboard.
Notes: Use the add method in the CKDatabase class to add this operation to the operation queue of the public database.
Subclass of the CKDatabaseOperationMBS class.

34.22.2 Methods

34.22.3 Constructor(APIToken as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a CKFetchWebAuthTokenOperationMBS object with the specified API token.
Notes: APIToken: An API token that allows access to an app,Äôs container.

34.22.4 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.22.5 Properties

34.22.6 APIToken as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: An API token that allows access to an app,Äôs container.
Notes: (Read and Write property)

34.22.7 Events

34.22.8 fetchWebAuthTokenCompleted(webAuthToken as string, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute when this CKFetchWebAuthTokenOperation object fetches the web authentication token.
Notes: The event returns no value and takes the following parameters:

webAuthToken: If the operation is successful, the web authentication token; otherwise, nil.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

The operation object executes this block only once and it is your only chance to process the operation results. Your block must be capable of executing on a background thread, so any tasks that require access to the main thread must be redirected accordingly.

34.23 class CKLocationSortDescriptorMBS

34.23.1 class CKLocationSortDescriptorMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKLocationSortDescriptor object sorts records containing location data based on their distance from a location that you specify.
Notes: You can add a location sort descriptor to your queries when searching for records. At creation time, you must provide the sort descriptor with a key whose value is a CLLocation object. The sort descriptor uses the value of that key to perform the sort.

Distances are computed by drawing a direct line between the two locations that follows the curvature of the Earth. Distances do not take into account altitude changes between the two locations.
Subclass of the NSSortDescriptorMBS class.

34.23.2 Methods

34.23.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.23.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Private constructor.
See also:

- 34.23.5 Constructor(key as string, relativeLocation as Variant) 6028

34.23.5 Constructor(key as string, relativeLocation as Variant)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a location sort descriptor object.
Notes: key: The name of the key whose value is a CLLocationMBS object. The key must belong to the records being sorted. The sort descriptor uses this key to retrieve the corresponding value from the record.
relativeLocation: The reference location to use when sorting. Records are sorted based on their distance to

this location.

Returns an initialized location sort descriptor object, or nil if the object cannot be initialized.

During sorting, the sort descriptor computes the distance between the value in the relativeLocation parameter and the location value found in the specified key of each record. It then sorts the records in ascending order using the distance between the two points. You cannot change the sort order.

relativeLocation must be a CLLocationMBS object.
See also:

- 34.23.4 Constructor 6028

34.23.6 Properties

34.23.7 relativeLocation as Variant

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The reference location against which records are sorted.
Notes: Value is a CLLocationMBS. We use variant to reduce dependency to other plugins.
(Read only property)

34.24 class CKModifyRecordsOperationMBS

34.24.1 class CKModifyRecordsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKModifyRecordsOperationMBS object saves changes to one or more CKRecordMBS objects.
Example:

```
// save two records and delete one in a single operation
// The app needs the iCloud entitlement and must be code signed.
// MyModifyOperation is a subclass of CKModifyRecordsOperationMBS with the modifyRecordsCompleted
event implemented.
// Operation is a property of the window: Operation As MyModifyOperation
Var note1 As New CKRecordMBS("Note", New CKRecordIDMBS("note-1"))
note1.objectForKey("title") = "Shopping"
Var note2 As New CKRecordMBS("Note", New CKRecordIDMBS("note-2"))
note2.objectForKey("title") = "Holiday"

Var toSave() As CKRecordMBS = Array(note1, note2)
Var toDelete() As CKRecordIDMBS = Array(New CKRecordIDMBS("note-old"))

Operation = New MyModifyOperation(toSave, toDelete)
Operation.atomic = True // all or nothing, needs a custom zone
CKContainerMBS.defaultContainer.privateCloudDatabase.addOperation Operation

// in MyModifyOperation:
Sub modifyRecordsCompleted(savedRecords() As CKRecordMBS, deletedRecordIDs() As CKRecordIDMBS,
operationError As NSErrorMBS) Handles modifyRecordsCompleted
If operationError <>Nil Then
System.DebugLog operationError.localizedDescription
Else
System.DebugLog savedRecords.Count.ToString + " saved, " + deletedRecordIDs.Count.ToString + " deleted"
End If
End Sub
```

Notes: After modifying the fields of a record, use this type of operation object to save those changes to a database. You also use instances of this class to delete records permanently from a database.

see
https://developer.apple.com/reference/cloudkit/ckmodifyrecordsoperation
Subclass of the CKDatabaseOperationMBS class.
Blog Entries

- MBS Xojo Plugins, version 21.2pr8

34.24.2 Methods

34.24.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The constructor.
See also:

- 34.24.4 Constructor(recordsToSave() as CKRecordMBS, recordIDsToDelete() as CKRecordIDMBS) 6031

34.24.4 Constructor(recordsToSave() as CKRecordMBS, recordIDsToDelete() as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to save and delete the specified records.
Notes: recordsToSave: An array of CKRecordMBS objects representing the records to save, if any. You may specify nil for this parameter.
recordIDsToDelete: An array of CKRecordIDMBS objects representing the records you want to delete, if any. You may specify nil for this parameter.

Returns an initialized operation object.

The records you intend to save or delete must all reside in the same database, which you can specify when you configure the operation object. Saving a record that is not in the current database creates it in the database. Trying to delete a record that does not exist in the current database returns an error for that record.
See also:

- 34.24.3 Constructor 6031

34.24.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.24.6 recordIDsToDelete as CKRecordIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The IDs of the records to delete permanently from the database.
Notes: This property contains the array of CKRecordID objects that identify the records to delete. The initial contents of the array are set to the records you specified in the Constructor.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

When deleting records, the operation object reports progress only on the records you specify in this property. Deleting records can trigger the deletion of related records if there is an owner-owned relationship between the records involving a CKReference object. When additional deletions occur, they are not reported to the progress blocks of this object. For that reason, it is important to understand the implications of the ownership model you use when you relate records to each other through a CKReference object. For more information about owner-owned relationships, see CKReference.

34.24.7 recordsToSave as CKRecordMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The records to save to the database.
Notes: This property contains the array of CKRecordMBS objects that you want to save. The initial contents of the array are set to the records you specified in the constructor. You can modify this array as needed before executing the operation. The records must all target the same database but may belong to different zones in the database.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

34.24.8 setrecordIDsToDelete(IDs() as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the IDs of the records to delete permanently from the database.
Notes: This property contains the array of CKRecordID objects that identify the records to delete. The initial contents of the array are set to the records you specified in the Constructor.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

When deleting records, the operation object reports progress only on the records you specify in this property. Deleting records can trigger the deletion of related records if there is an owner-owned relationship between the records involving a CKReference object. When additional deletions occur, they are not reported to the progress blocks of this object. For that reason, it is important to understand the implications of the

ownership model you use when you relate records to each other through a CKReference object. For more information about owner-owned relationships, see CKReference.

34.24.9 setRecordsToSave(IDs() as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the records to save to the database.
Notes: This property contains the array of CKRecordMBS objects that you want to save. The initial contents of the array are set to the records you specified in the constructor. You can modify this array as needed before executing the operation. The records must all target the same database but may belong to different zones in the database.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.

34.24.10 Properties

34.24.11 atomic as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the entire operation fails when one or more records in the same zone cannot be written.
Notes: Modifying records atomically prevents you from updating your data in a way that would leave it in an inconsistent state. You use atomic updates when you want to write multiple records to the same record zone. If there is a failure to modify any of the records in a particular zone, no changes are made to the other records in that same zone. The zone itself must have the CKRecordZoneCapabilityAtomic capability for this behavior to apply. If a record zone does not support the atomic capability, setting this property has no effect.

The default value of this property is true, which causes all modifications within a single record zone to be made atomically. If your operation object contains records in multiple record zones, a failure in one zone does not prevent modifications to records in a different zone. Changing the value of this property to false causes the records to be modified individually, regardless of whether the record zone supports atomic modifications. (Read and Write property)

34.24.12 clientChangeTokenData as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A data token used to track client-side changes to records.
Notes: When you modify records from a fetch operation, specify a client-generated data token using this

property to indicate which version of the record you last modified. Compare the data token you supplied to the data token in the next record fetch to confirm the server has successfully received the device,Äôs last modify request.

The default value is nil.

If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.
(Read and Write property)

34.24.13 savePolicy as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The policy to apply when the server contains a newer version of a specific record.
Notes: Each record has a change tag that allows the server to track when that record was saved. When you save a record, CloudKit compares the change tag in your local copy of the record with the one on the server. If the two tags do not match—meaning that there is a potential conflict—the server uses the value in this property to determine how to proceed.

The default value of this property is CKRecordSaveIfServerRecordUnchanged. If you intend to change the value of this property, do so before executing the operation or submitting the operation object to a queue.
(Read and Write property)

34.24.14 Events

34.24.15 modifyRecordsCompleted(savedRecords() as CKRecordMBS, deletedRecordIDs() as CKRecordIDMBS, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute after the status of all changes is known.
Notes: The event returns no value and takes the following parameters:

savedRecords: The array of CKRecordMBS objects you tried to save.
deletedRecordIDs: The array of CKRecordIDMBS objects corresponding to the records you tried to delete.
operationError: An error object containing information about a problem, or nil if the results are saved successfully.

This event is executed only once and represents your last chance to process the operation results. It is executed after all individual progress blocks have completed but before the operation,Äôs completion block.

The block is executed serially with respect to the other progress blocks of the operation.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it saves or deletes only some of the records successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the records that were not saved or deleted, and the corresponding values are error objects containing information about what happened.

34.24.16 RecordCompleted(record as CKRecordMBS, error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute when the save results of a single record are known.
Notes: The event returns no value and takes the following parameters:

record: A CKRecordMBS object that you attempted to save.
error: An error object containing information about a problem, or nil if the record was saved successfully.

This block is executed once for each record in the recordsToSave property. Each time the block is executed, it is executed serially with respect to the other progress events of the operation.

If you intend to use this event to process results, set it before executing the operation or submitting the operation object to a queue. Use this block to take any actions after the status of saving the record is known.

34.24.17 RecordProgress(record as CKRecordMBS, progress as Double)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute with progress information for an individual record.
Notes: The block returns no value and takes the following parameters:

record: The CKRecordMBS object that is in the process of being saved.
progress: The amount of progress toward saving the record, expressed as a percentage of its total size. This value is a number between 0.0 and 1.0, where 0.0 means none of the record is saved and 1.0 means the entire record has been saved.

The operation object executes this block zero or more times for each record in the recordsToSave property. Each time the block is executed, it is executed serially with respect to the other progress blocks of the

operation.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue. Use this block to track the ongoing progress of the upload operation and possibly to provide feedback to the user.

34.24.18 Constants

Constants

Constant	Value	Description
SaveAllKeys	2	One of the constants indicating the policy to apply when saving records. A policy that saves all keys of the record (including those that have not changed) to the server, overwriting any values currently on the server. Keys present only on the server remain unchanged.
SaveChangedKeys	1	One of the constants indicating the policy to apply when saving records. A policy that saves only those fields of the record that actually changed, overwriting any values currently on the server. Unmodified fields are left untouched.
SaveIfServerRecordUnchanged	0	One of the constants indicating the policy to apply when saving records. A policy that saves the record only if the local copy of the record is based on the record still on the server. The server maintains a change tag for each record automatically. When you fetch a record, that change tag is included with the rest of the record,Äôs data. If the change tag in your local record matches the change tag of the record on the server, the save operation proceeds normally. If the server record contains a newer change tag, the record is not saved and an error of type CKErrorServerRecordChanged is reported.

34.25 class CKModifyRecordZonesOperationMBS

34.25.1 class CKModifyRecordZonesOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKModifyRecordZonesOperationMBS object saves or deletes record zones.
Example:

```
// create a new zone and delete an old one in one operation
// The app needs the iCloud entitlement and must be code signed.
// MyZoneOperation is a subclass of CKModifyRecordZonesOperationMBS with the modifyRecordZonesCompleted event implemented.
// Operation is a property of the window: Operation As MyZoneOperation
Var toSave() As CKRecordZoneMBS
toSave.Add New CKRecordZoneMBS("Projects")
Var toDelete() As CKRecordZoneIDMBS
toDelete.Add New CKRecordZoneIDMBS("OldStuff", CKContainerMBS.CKCurrentUserDefaultName)

Operation = New MyZoneOperation(toSave, toDelete)
CKContainerMBS.defaultContainer.privateCloudDatabase.addOperation Operation

// in MyZoneOperation:
Sub modifyRecordZonesCompleted(savedRecordZones() As CKRecordZoneMBS, deletedRecordZoneIDs() As CKRecordZoneIDMBS, operationError As NSErrorMBS) Handles modifyRecordZonesCompleted
If operationError <>Nil Then
System.DebugLog operationError.localizedDescription
Else
System.DebugLog savedRecordZones.Count.ToString + " zones saved, " + deletedRecordZoneIDs.Count.ToString + " deleted"
End If
End Sub
```

Notes: After creating one or more record zones, use this operation object to save those zones to the database. You can also use it to delete existing zones and the records they contain.

The completion event is called after the operation executes and returns its results to you. You can use a completion event to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion block you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.
Subclass of the CKDatabaseOperationMBS class.

34.25.2 Methods

34.25.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The constructor.
See also:

- 34.25.4 Constructor(recordZonesToSave() as CKRecordZoneMBS, recordZoneIDsToDelete() as CKRecordZoneIDMBS) 6038

34.25.4 Constructor(recordZonesToSave() as CKRecordZoneMBS, recordZoneIDsToDelete() as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to save and delete the specified record zones.
Notes: recordZonesToSave: An array of CKRecordZoneMBS objects representing the record zones to save. You may specify nil for this parameter.
recordZoneIDsToDelete: An array of CKRecordZoneIDMBS objects representing the record zones you want to delete, if any. You may specify nil for this parameter.

Returns an initialized operation object.

The record zones you intend to save or delete must all reside in the same database, which you specify when configuring the operation object. Deleting a record zone also deletes any records it contains. Trying to delete a record zone that does not exist in the current database returns an error.
See also:

- 34.25.3 Constructor 6038

34.25.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.25.6 recordZoneIDsToDelete as CKRecordZoneIDMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The IDs of the record zones to delete permanently from the database.
Notes: This property contains an array of CKRecordZoneIDMBS objects identifying the zones you want to delete. You set the initial contents of this property with the Constructor. You can assign a new array as needed before executing the operation. The record zones must all be located in the same database. You may specify nil or an empty array for this property.

If you intend to change the value of this property, do so before executing the operation or submitting it to a queue.

34.25.7 recordZonesToSave as CKRecordZoneMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The record zones to save to the database.
Notes: This property contains an array of CKRecordZoneMBS objects representing the zones you want to save. You set the initial contents of this property with the Constructor. You can assign a new array as needed before executing the operation. The record zones must all target the same database. You may specify nil or an empty array for this property.

If you intend to change the value of this property, do so before executing the operation or submitting it to a queue.

34.25.8 setRecordZoneIDsToDelete(IDs() as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Set the IDs of the record zones to delete permanently from the database.

34.25.9 setRecordZonesToSave(IDs() as CKRecordZoneMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the record zones to save to the database.

34.25.10 Events

34.25.11 modifyRecordZonesCompleted(savedRecordZones() as CKRecordZoneMBS, deletedRecordZoneIDs() as CKRecordZoneIDMBS, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute after the status of all changes is known.
Notes: The event returns no value and takes the following parameters:

savedRecordZones: An array of CKRecordZone objects you tried to save.
deletedRecordZoneIDs: An array of CKRecordZoneID objects corresponding to the record zones you tried to delete.
operationError: An error object containing information about a problem, or nil if the results are saved successfully.

This block is executed only once and represents your only chance to process the operation results. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This event reports an error of type CKErrorPartialFailure when it saves or deletes only some of the record zones successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the record zones that were not saved or deleted, and the corresponding values are error objects containing information about what happened.

34.26 class CKModifySubscriptionsOperationMBS

34.26.1 class CKModifySubscriptionsOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKModifySubscriptionsOperation object saves changes to one or more CKSubscription objects.
Example:

```
// save a new subscription and delete an old one in one operation
// The app needs the iCloud entitlement and must be code signed.
// MyModifySubscriptions is a subclass of CKModifySubscriptionsOperationMBS with the modifySubscriptionsCompleted event implemented.
// Operation is a property of the window: Operation As MyModifySubscriptions
Var predicate As NSPredicateMBS = NSPredicateMBS.predicateWithFormat("TRUEPREDICATE")
Var toSave() As CKSubscriptionMBS
toSave.Add New CKQuerySubscriptionMBS("Note", predicate, "notes-changed", CKQuerySubscriptionMBS.OptionsFiresOnRecordUpdate)
Var toDelete() As String = Array("old-subscription")

Operation = New MyModifySubscriptions(toSave, toDelete)
CKContainerMBS.defaultContainer.privateCloudDatabase.addOperation Operation

// in MyModifySubscriptions:
Sub modifySubscriptionsCompleted(savedSubscriptions() As CKSubscriptionMBS, deletedSubscriptionIDs() As String, operationError As NSErrorMBS) Handles modifySubscriptionsCompleted
If operationError <>Nil Then
System.DebugLog operationError.localizedDescription
Else
System.DebugLog savedSubscriptions.Count.ToString + " saved, " + deletedSubscriptionIDs.Count.ToString + " deleted"
End If
End Sub
```

Notes: After creating or changing the configuration of a subscription object, use this type of operation object to save those changes to an iCloud container. You also use instances of this class to delete subscriptions permanently from a database.

The complete event is called after the operation executes and returns its results to you. You can use a completion event to perform housekeeping chores related to the operation, but do not use it to process the results of the operation itself. Any completion event you specify should be prepared to handle the failure of the operation to complete its task, whether due to an error or an explicit cancellation.

Available in macOS 10.10 and newer in 64-bit applications.
Subclass of the CKDatabaseOperationMBS class.

34.26.2 Methods

34.26.3 Constructor(subscriptionsToSave() as CKSubscriptionMBS, subscriptionIDsToDelete() as String = nil)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to save and delete the specified subscriptions.
Notes: subscriptionsToSave: An array of CKSubscription objects representing the subscriptions to save or update. You may specify nil for this parameter.
subscriptionIDsToDelete: An array of strings representing the IDs of the subscriptions you want to delete, if any. You may specify nil for this parameter.

The subscriptions you intend to save or delete must all reside in the same container, which you must specify when configuring the operation object. Saving a subscription that is not in the current database creates it in the database. Trying to delete a subscription that does not exist in the current database returns an error for that subscription.

34.26.4 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.26.5 setSubscriptionIDsToDelete(SubscriptionIDsToDelete() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the IDs of the subscriptions you want to delete permanently from the database.

34.26.6 setSubscriptionsToSave(IDs() as CKSubscriptionMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the subscriptions to save to the database.

34.26.7 subscriptionIDsToDelete as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The IDs of the subscriptions you want to delete permanently from the database.
Notes: This property contains the array of strings that identify the subscriptions to delete. The initial contents of the array are set to the records you specified with the Constructor.

If you intend to change the set of subscriptions to be deleted, update the value of this property before executing the operation or submitting the operation object to a queue.

34.26.8 subscriptionsToSave as CKSubscriptionMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The subscriptions to save to the database.
Notes: This property contains the array of CKSubscriptionMBS objects that you want to save. The initial contents of the array are set to the subscriptions you specified with the Constructor. You can modify this array as needed before executing the operation. After saving the subscription objects, the server begins applying the criteria from those objects to the contents of the database, generating push notifications as appropriate.

If you intend to change the set of subscriptions to be saved, update the value of this property before executing the operation or submitting the operation object to a queue.

34.26.9 Events

34.26.10 modifySubscriptionsCompleted(savedSubscriptions() as CKSubscriptionMBS, deletedSubscriptionIDs() as String, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute after the status of all changes is known.
Notes: The event returns no value and takes the following parameters:

savedSubscriptions: The array of CKSubscription objects you tried to save.
deletedSubscriptionIDs: An array of NSString objects corresponding to the subscriptions you tried to delete.
operationError: An error object containing information about a problem, or nil if the results are saved successfully.

The operation object executes this block only once and represents your last chance to process the operation results. The block is executed on a background thread of your app. If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

This block reports an error of type CKErrorPartialFailure when it saves or delete only some of the subscriptions successfully. The userInfo dictionary of the error contains a CKPartialErrorsByItemIDKey key whose value is a dictionary. The keys of that dictionary are the IDs of the subscriptions that were not saved or deleted, and the corresponding values are error objects containing information about what happened.

34.27 class CKNotificationIDMBS

34.27.1 class CKNotificationIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKNotificationID object uniquely identifies a push notification sent from a container.
Notes: You do not create notification IDs directly. The server creates them when it creates the CKNotification objects that correspond to the push notifications sent to your app. You can compare two IDs using the isEqual method to determine if two notification objects are the same. This class defines no methods or properties.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

34.27.2 Methods

34.27.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.27.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.

34.27.5 IsEqual(Other as CKNotificationIDMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Checks if two objects are equal.

34.27.6 Properties

34.27.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.28 class CKNotificationInfoMBS

34.28.1 class CKNotificationInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKNotificationInfo object specifies the push notification data that the server sends to your app when a subscription finds a match.
Example:

```
// define what a CloudKit push notification shows
Var info As New CKNotificationInfoMBS
info.alertBody = "A new note was added."
info.soundName = "default"
info.shouldBadge = True
info.shouldSendContentAvailable = True // wake the app in the background

// include these fields of the record in the notification
Var keys() As String = Array("title")
info.setDesiredKeys keys

// this is meant for the notificationInfo property of a CKSubscriptionMBS
```

Notes: When configuring a CKSubscriptionMBS object, create one of these objects and use it to specify the type of push notifications you want generated when the subscription,Äôs trigger condition is met. You can provide a message for an alert panel, information about the sounds to play, and information about whether the app should be badged. You can also ask the server to provide information about the record that triggered the notification.

see
https://developer.apple.com/reference/cloudkit/cknotificationinfo

34.28.2 Methods

34.28.3 alertLocalizationArgs as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The array of fields to use when building an alert message.
Notes: Use of this property is optional. This property contains an array of strings, each of which corresponds to a field of the record that triggered the push notification. Those names are used to retrieve the corresponding values from the record. The values themselves must be string, integer, double, or dates. Do not specify keys with other values. String values that are greater than 100 characters in length may be truncated when added to the push notification.

If you use %@ for your substitution variables, those variables are replaced by walking the array in order. If you use variables of the form %n$ @, where n is an integer, n represents the index (starting at 1) of the item in the array to use. Thus, the first item in the array replaces the variable %1$ @, the second item replaces the variable %2$ @, and so on. You can use indexed substitution variables to change the order of items in the resulting string, which might be necessary when you localize your app,Äôs messages.

34.28.4 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.28.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The constructor.

34.28.6 copy as CKNotificationInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.28.7 desiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The names of fields to include in the push notification payload.
Notes: This property contains an array of strings, each of which corresponds to the name of a field in the record that triggered the notification. When a push notification is delivered, the keys and their corresponding values are included in the payload of the push notification. You can include a maximum of three keys in the array.

For the keys you specify, the allowable values are string, integer, double, CLLocationMBS, date, and CKReferenceMBS. You cannot specify keys whose values contain other data types. String values that are greater than 100 characters in length may be truncated when added to the push notification.

34.28.8 setAlertLocalizationArgs(args() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the array of fields to use when building an alert message.
Notes: Use of this property is optional. This property contains an array of strings, each of which corresponds to a field of the record that triggered the push notification. Those names are used to retrieve the corresponding values from the record. The values themselves must be string, integer, double, or dates. Do not specify keys with other values. String values that are greater than 100 characters in length may be truncated when added to the push notification.

If you use %@ for your substitution variables, those variables are replaced by walking the array in order. If you use variables of the form %n$ @, where n is an integer, n represents the index (starting at 1) of the item in the array to use. Thus, the first item in the array replaces the variable %1$ @, the second item replaces the variable %2$ @, and so on. You can use indexed substitution variables to change the order of items in the resulting string, which might be necessary when you localize your app,Äôs messages.

34.28.9 setDesiredKeys(desiredKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the names of fields to include in the push notification payload.
Notes: This property contains an array of strings, each of which corresponds to the name of a field in the record that triggered the notification. When a push notification is delivered, the keys and their corresponding values are included in the payload of the push notification. You can include a maximum of three keys in the array.

For the keys you specify, the allowable values are string, integer, double, CLLocationMBS, date, and CKReferenceMBS. You cannot specify keys whose values contain other data types. String values that are greater than 100 characters in length may be truncated when added to the push notification.

34.28.10 Properties

34.28.11 alertActionLocalizationKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The key that identifies the text to use for the action button in the alert panel.
Notes: This property identifies the text to use for the button to open your app. Specifically, it contains the name of a key to look up in the app,Äôs Localizable.strings file, the value of which is used for the button title.

Specifying a value for this property is optional. When its value is nil, the alert panel triggered by the push notification contains only an OK button to dismiss the alert. When its value is not nil, the alert panel

contains one button to dismiss the alert and a second button to open your app.
(Read and Write property)

34.28.12 alertBody as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The text to use for the alert message.
Notes: Use of this property is optional. If you set its value, the corresponding push notification causes the device to display an alert with the specified message. If you want to use a localized string for the alert message, specify a value for the alertLocalizationKey property instead.
(Read and Write property)

34.28.13 alertLaunchImage as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The filename of an image to use as a launch image.
Notes: Use of this property is optional. If you specify a value, the string is used to locate an image file in the app bundle. That image is displayed as a launch image when the user launches the app after receiving a push notification.
(Read and Write property)

34.28.14 alertLocalizationKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The key that identifies the localized string to use for the alert message.
Notes: Use of this property is optional. If you set its value, the corresponding push notification causes the device to display an alert on the user,Äôs device. The push notification obtains the text for the alert by looking up the specified key in your app,Äôs Localizable.strings file. If you specify a value for this property, the value in the alertBody property is ignored.

For information about localizing string resources, see Internationalization and Localization Guide.
(Read and Write property)

34.28.15 category as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Name of the action group corresponding to this notification.
Notes: Categories allow you to present custom actions to the user on your push notifications. For more information, read UIMutableUserNotificationCategory.
(Read and Write property)

34.28.16 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.28.17 shouldBadge as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A Boolean setting that controls whether a badge value should be incremented.
Notes: The default value of this property is false. Setting it to true causes the system to increment the current badge count for the app whenever the corresponding push notification is delivered.
(Read and Write property)

34.28.18 shouldSendContentAvailable as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the push notification should include the content-available flag.
Notes: When this property is true, the server includes the content-available flag in the push notification,Äôs payload. That flag causes the system to wake or launch an app that is not currently running. The app is then given background execution time to download any data related to the push notification, such as the set of records that changed. If the app is already running in the foreground, the inclusion of this flag has no additional effect and the notification is delivered to the app delegate for processing as usual.

The default value of this property is false.
(Read and Write property)

34.28.19 soundName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The name of the sound file to play when a notification arrives.
Notes: Use of this property is optional. If you specify a value, the string is used to locate a sound file in the app bundle. That sound file is played as an alert when a push notification arrives on the user,Äôs device. If the specified sound file does not exist, or if you specify the string default for this property, the system plays the default alert sound.
(Read and Write property)

34.29 class CKNotificationMBS

34.29.1 class CKNotificationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKNotificationMBS object represents a push notification that was sent to your app.
Notes: Notification objects wrap the data associated with a push notification. Use notification objects to wrap recently received push notification data or to fetch notification objects representing already delivered push notifications from a container. In both cases, the information in the notification object tells you what changed.

The CKNotificationMBS class itself is an abstract class. When you create a new notification object from a payload dictionary, the constructor instantiates a subclass of the appropriate type. Similarly, when you fetch notifications from a container, what you receive are instances of a concrete subclass. The base CKNotificationMBS class provides information about the push notification and how it was delivered. Specific subclasses contain specific data indicating what change actually occurred.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

34.29.2 Methods

34.29.3 alertLocalizationArgs as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The array of fields used to build the alert message
Notes: This property contains an array of NSString objects, each of which corresponds to a field of the record that triggered the push notification. Use the field values to replace any substitution variables in the alert strings specified by the notificationFromRemoteNotificationDictionary or Identifying the Notification Object properties. The field values must be string, integer, double, or dates. String values that are greater than 100 characters in length may be truncated when added to the push notification.

If you used %@ for your substitution variables, those variables are replaced by walking the array in order. If you use variables of the form %n$ @, where n is an integer, n represents the index (starting at 1) of the item in the array to use. Thus, the first item in the array replaces the variable %1$ @, the second item replaces the variable %2$ @, and so on. You can use indexed substitution variables to change the order of items in the resulting string, which might be necessary when you localize your app,Äôs messages.

34.29.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.

34.29.5 notificationFromRemoteNotificationDictionary(notificationDictionary as Dictionary) as CKNotificationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates and returns a new notification object using the specified payload data.
Notes: notificationDictionary: The payload data for the push notification. This dictionary is the same one passed to your app delegate,Äôs didReceiveRemoteNotification method. This parameter must not be nil.

Returns a new notification object initialized with the payload data.

Use this method to initialize a notification object from a push notification received by your app.

34.29.6 Properties

34.29.7 alertActionLocalizationKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The key that identifies the text to use for the action button in the alert panel.
Notes: When this property is nil, the alert panel triggered by the push notification contains only an OK button to dismiss the alert. When this property is not nil, the alert panel contains one button to dismiss the alert and a second button to open your app. This property identifies the text to use for the button to open your app. Specifically, it contains the name of a key to look up in the app,Äôs Localizable.strings file, the value of which is used for the button title.
(Read only property)

34.29.8 alertBody as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The text of the alert message.
Notes: This property contains the nonlocalized version of the message string displayed by the alert.
(Read only property)

34.29.9 alertLaunchImage as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The filename of the launch image displayed when your app is launched from the push notification alert.
Notes: The string in this property is used to locate an image file in the app bundle.
(Read only property)

34.29.10 alertLocalizationKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The key that identifies the localized string to use for the alert message.
Notes: When delivered to your app, the push notification gets the text for the alert by looking up the specified key in your app,Äôs Localizable.strings file. When this property is set, the value in the notificationFromRemoteNotificationDictionary property is ignored.
(Read only property)

34.29.11 badge as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The current badge value.
Notes: The value of this property is the integer value displayed in the app,Äôs badge at the time the push notification was sent.
(Read only property)

34.29.12 category as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Name of the action group corresponding to this notification.
Notes: Categories allow you to present custom actions to the user on your push notifications. For more information, read UIMutableUserNotificationCategory.
(Read only property)

34.29.13 containerIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ID of the container whose content triggered the notification.
Notes: (Read only property)

34.29.14 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.29.15 isPruned as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether some push notification content was removed prior to delivery.
Notes: see
https://developer.apple.com/reference/cloudkit/cknotification/1428088-ispruned
(Read only property)

34.29.16 notificationID as CKNotificationIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ID of the notification.
Notes: (Read only property)

34.29.17 notificationType as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The type of event that generated the notification.
Notes: Different notification types correspond to different subclasses of CKNotificationMBS, so you can use the value in this property to determine how to handle the notification data.
(Read only property)

34.29.18 soundName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The name of the sound file to play when a notification arrives.
Notes: This property contains the string used to locate a sound file in your app,Äôs bundle. That sound file is played as an alert when a push notification arrives on the user,Äôs device. If the specified sound file does not exist, or if you specify the string default for this property, the system plays the default alert sound.
(Read only property)

34.29.19 subscriptionID as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The identifier of the subscription that caused this notification to fire.
Notes: (Read only property)

34.29.20 Constants

Notification Types

Constant	Value	Description
TypeDatabase	4	A notification generated when the contents of a database changed.
TypeQuery	1	A notification generated based on the conditions set forth in a subscription object.
TypeReadNotification	3	A notification that your app previously marked as read using a CKMarkNotificationsReadOperationMBS object.
TypeRecordZone	2	A notification generated when the contents of a record zone changed.

34.30 class CKOperationConfigurationMBS

34.30.1 class CKOperationConfigurationMBS

MBS Mac64bit Plugin, Plugin Version: 21.4, Platforms: macOS, iOS, Targets: All.

Function: An object that describes how a CloudKit operation behaves.
Example:

Var operationConfiguration As CKOperationConfigurationMBS = New CKOperationConfigurationMBS()
operationConfiguration.timeoutIntervalForRequest = 30
operationConfiguration.timeoutIntervalForResource = 30
operationConfiguration.QualityOfService = CKOperationConfigurationMBS.NSQualityOfServiceUserInitiated

Notes: Requires macOS 10.13, iOS 11.0 or newer.
Blog Entries

- News from the MBS Xojo Plugins Version 21.4
- MBS Xojo Plugins, version 21.4pr1

34.30.2 Methods

34.30.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 21.4, Platforms: macOS, iOS, Targets: All.

Function: The constructor.

34.30.4 Properties

34.30.5 AllowsCellularAccess as Boolean

MBS Mac64bit Plugin, Plugin Version: 21.4, Platforms: macOS, iOS, Targets: All.

Function: A Boolean value that indicates whether operations that use this configuration can send data over the cellular network.
Notes: (Read and Write property)

34.30.6 Container as CKContainerMBS

MBS Mac64bit Plugin, Plugin Version: 21.4, Platforms: macOS, iOS, Targets: All.

Function: The configuration,Äôs container.
Notes: If you don,Äôt provide a container, CloudKit uses the default container that CKContainerMBS provides.
(Read and Write property)

34.30.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 21.4, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.30.8 LongLived as Boolean

MBS Mac64bit Plugin, Plugin Version: 21.4, Platforms: macOS, iOS, Targets: All.

Function: A Boolean value that indicates whether the operations that use this configuration are long-lived.
Notes: (Read and Write property)

34.30.9 QualityOfService as Integer

MBS Mac64bit Plugin, Plugin Version: 21.4, Platforms: macOS, iOS, Targets: All.

Function: The priority that the system uses when it allocates resources to the operations that use this configuration.
Notes: (Read and Write property)

34.30.10 timeoutIntervalForRequest as Double

MBS Mac64bit Plugin, Plugin Version: 21.4, Platforms: macOS, iOS, Targets: All.

Function: The maximum amount of time that a request can take.
Notes: In seconds.
(Read and Write property)

34.30.11 timeoutIntervalForResource as Double

MBS Mac64bit Plugin, Plugin Version: 21.4, Platforms: macOS, iOS, Targets: All.

Function: The maximum amount of time that a resource request can take.
Notes: In seconds.
(Read and Write property)

34.30.12 Constants

Quality of Service Constants

Constant	Value	Description
NSQualityOfServiceBackground	&h09	Background QoS is used for work that is not user initiated or visible. In gener a user is unaware that this work is even happening and it will run in the mo efficient manner while giving the most deference to higher QoS work. F example, pre-fetching content, search indexing, backups, and syncing of da with external systems.
NSQualityOfServiceDefault	-1	Default QoS indicates the absence of QoS information. Whenever possible Q information will be inferred from other sources. If such inference is not possib a QoS between UserInitiated and Utility will be used.
NSQualityOfServiceUserInitiated	&h19	UserInitiated QoS is used for performing work that has been explicitly r quested by the user and for which results must be immediately presented order to allow for further user interaction. For example, loading an email aft a user has selected it in a message list.
NSQualityOfServiceUserInteractive	&h21	UserInteractive QoS is used for work directly involved in providing an intera tive UI such as processing events or drawing to the screen.
NSQualityOfServiceUtility	&h11	Utility QoS is used for performing work which the user is unlikely to be i mediately waiting for the results. This work may have been requested the user or initiated automatically, does not prevent the user from further i teraction, often operates at user-visible timescales and may have its progre indicated to the user by a non-modal progress indicator. This work will r in an energy-efficient manner, in deference to higher QoS work when resourc are constrained. For example, periodic content updates or bulk file operatio such as media import.

34.31 class CKOperationMBS

34.31.1 class CKOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The abstract base class for all operations that can be executed against a CloudKit database.
Notes: see
https://developer.apple.com/reference/cloudkit/ckoperation
Blog Entries

- MBS Xojo Plugins, version 21.4pr1
- MBS Xojo Plugins, version 17.3pr3

34.31.2 Methods

34.31.3 cancel

MBS Mac64bit Plugin, Plugin Version: 17.2, Platform: macOS, Targets: All.

Function: Advises the operation object that it should stop executing its task.
Notes: This method does not force your operation code to stop. The code for your operation must invoke the isCancelled method periodically to determine whether the operation should be stopped. Once cancelled, an operation cannot be restarted.

If the operation is already finished executing, this method has no effect. Canceling an operation that is currently in an operation queue, but not yet executing, causes it to be removed from the queue (although not necessarily right away).

34.31.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The constructor.

34.31.5 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.31.6 isCancelled as boolean

MBS Mac64bit Plugin, Plugin Version: 17.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the operation has been cancelled.
Notes: True if the operation was explicitly cancelled by an invocation of the operation's cancel method; otherwise, false. This method may return true even if the operation is currently executing.

Discussion
Canceling an operation does not actively stop the operation's code from executing. An operation object is responsible for calling this method periodically and stopping itself if the method returns true.

34.31.7 isExecuting as boolean

MBS Mac64bit Plugin, Plugin Version: 17.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the operation is currently executing.
Notes: True if the operation is executing; otherwise, false if the operation has not been started or is already finished.

34.31.8 isFinished as boolean

MBS Mac64bit Plugin, Plugin Version: 17.2, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the operation is done executing.
Notes: True if the operation is no longer executing; otherwise, false.

34.31.9 start

MBS Mac64bit Plugin, Plugin Version: 17.2, Platform: macOS, Targets: All.

Function: Begins the execution of the operation.
Notes: The default implementation of this method configures the execution environment for a non-concurrent operation and invokes the operation's main method. As part of the default configuration, this method performs several checks to ensure that the non-concurrent operation can actually run and generates appropriate KVO notifications for each change in the operation's state. If the operation's operation has already been performed, was cancelled, or is not yet ready to run, this method throws an NSInvalidArgumentException exception. If the operation is to be performed on a separate thread, this method may return before the operation itself completes on the other thread.

34.31.10 Properties

34.31.11 allowsCellularAccess as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CKOperationConfigurationMBS instead. **Function:** A Boolean value indicating whether the operation object may send data over the cell network.
Notes: When you send or receive many records, or when you send records with large assets, you might set this property to false to avoid consuming too much of the user,Äôs cellular data bandwidth. For operations involving only a few records, it is fine to leave this property set to true, which is the default.

When this property is set to false, the operation executes normally but fails if Wi-Fi is not available.
(Read and Write property)

34.31.12 configuration as CKOperationConfigurationMBS

MBS Mac64bit Plugin, Plugin Version: 21.4, Platform: macOS, Targets: All.

Function: The operation,Äôs configuration.
Notes: Requires macOS 10.13, iOS 11.0 or newer.
(Read and Write property)

34.31.13 container as CKContainerMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CKOperationConfigurationMBS instead. **Function:** The container to use for the operation.
Notes: The container sets the context for where the operation should perform its work. The addOperation method of both the CKContainerMBS and CKDatabaseMBS classes implicitly sets the value of this property to their container.

If you execute the operation yourself, either directly or using a custom operation queue, it is recommended that you set the value of this property explicitly. If the value is nil when you execute an operation, the operation object implicitly executes against your app,Äôs default container.
(Read and Write property)

34.31.14 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 17.2, Platform: macOS, Targets: All.

Function: The handle to the internal used NSOperation reference.
Notes: (Read and Write property)

34.31.15 longLived as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CKOperationConfigurationMBS instead. **Function:** A Boolean value indicating whether the operation is long-lived.
Notes: To create a long-lived operation, set to true. The default value is false. If the operation is running or is a long-lived operation fetched from a CKContainer object, changing this property value has no effect.

For more information on long-lived operations, read Long-Lived Operations.
(Read and Write property)

34.31.16 operationID as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A unique identifier for a long-lived operation.
Notes: Use this property to fetch a long-lived operation using the fetchLongLivedOperationWithID method in the CKContainer class. For more information on long-lived operations, read Long-Lived Operations.
(Read only property)

34.31.17 timeoutIntervalForRequest as Double

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CKOperationConfigurationMBS instead. **Function:** The timeout interval to use when waiting for additional data.
Notes: This property determines the request timeout interval for the operation. The request timeout interval controls how long (in seconds) the operation should wait for additional data to arrive before giving up. The timer associated with this value is reset whenever new data arrives. When the request timer reaches the specified interval without receiving any new data, it triggers a timeout.

The default value is 60 seconds.
(Read and Write property)

34.31.18 timeoutIntervalForResource as Double

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CKOperationConfigurationMBS instead. **Function:** The maximum amount of time that a resource request should be allowed to take.
Notes: This property determines the resource timeout interval for this operation. The resource timeout interval controls how long (in seconds) to wait for the entire operation to complete before giving up. The resource timer starts when the operation is initiated and counts until either the operation completes or this timeout interval is reached, whichever comes first.

The default value is 7 days.
(Read and Write property)

34.31.19 Events

34.31.20 Completed

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The operation completed.

34.31.21 LongLivedOperationWasPersisted

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute when the server starts storing callbacks for this long-lived operation.
Notes: If your app exits before this event is called, the long-lived operation identifier is not included in the results of the fetchAllLongLivedOperationIDs method.

For more information on long-lived operations, read Long-Lived Operations.

34.32 class CKQueryCursorMBS

34.32.1 class CKQueryCursorMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKQueryCursor object is an opaque data object that marks the stopping point for a query and the starting point for retrieving the remaining results.
Notes: You do not create instances of this class yourself. When fetching records using a CKQueryOperation object, if the number of results exceeds the results limit value set for the query, the server provides you with a query cursor object. Use that cursor object to initialize a new CKQueryOperationMBS and retrieve the next batch of results for the same query.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

34.32.2 Methods

34.32.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.32.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.

34.32.5 copy as CKQueryCursorMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.32.6 Properties

34.32.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.33 class CKQueryMBS

34.33.1 class CKQueryMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKQuery object manages the criteria to apply when searching for records in a database.
Example:

```
// search the public database for all Note records with a given title
// MyDatabase is a subclass of CKDatabaseMBS with the performQueryCompleted event implemented.
// Database is a property of the window: Database As MyDatabase
Database = New MyDatabase(CKContainerMBS.defaultContainer.publicCloudDatabase)

Var predicate As NSPredicateMBS = NSPredicateMBS.predicateWithFormat("title = 'Shopping'")
Var query As New CKQueryMBS("Note", predicate)
Database.performQuery(query, Nil)

// in MyDatabase:
Sub performQueryCompleted(query As CKQueryMBS, zoneID As CKRecordZoneIDMBS, results() As CK-
RecordMBS, error As NSErrorMBS, tag As Variant) Handles performQueryCompleted
If error <>Nil Then
System.DebugLog error.localizedDescription
Return
End If
For Each record As CKRecordMBS In results
System.DebugLog record.stringForKey("title")
Next
End Sub
```

Notes: You create a query object as the first step in the search process. The query object stores the search parameters, including the type of records to search, the match criteria (predicate) to apply, and the sort parameters to apply to the results. The second step is to use the query object to initialize a CKQueryOperation object, which you then execute to generate the results.

see
https://developer.apple.com/reference/cloudkit/ckquery

34.33.2 Methods

34.33.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.

Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.33.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.
See also:

- 34.33.5 Constructor(RecordType as String, predicate as NSPredicateMBS) 6069

34.33.5 Constructor(RecordType as String, predicate as NSPredicateMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a query object with the specified parameters.
Notes: recordType: The type of record to search. Specify the name of one of your app,Äôs supported record types. This method throws an exception if this parameter is nil or contains an empty string.
predicate: The search predicate to apply to the prospective records. Only records matching the predicate criteria are returned in the search results. For guidelines on how to construct predicates for your queries, see Predicate Rules for Query Objects. This parameter must not be nil.

Returns an initialized query object.

Discussion
You cannot change the record type and predicate of a query object after you create it. If you want to search for a different set of records using a different set of search criteria, create a new query object. You can add sort descriptors to the query and change them later as needed.

You cannot query for user records and executing a query where the record type is set to CKRecordTypeUserRecordMBS results in an error. You must fetch user records directly using their ID.
See also:

- 34.33.4 Constructor 6069

34.33.6 setSortDescriptors(sortDescriptors() as NSSortDescriptorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the sort descriptors to use when organizing the query results.

34.33.7 sortDescriptors as NSSortDescriptorMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The sort descriptors to use when organizing the query results.
Notes: This property contains an array of NSSortDescriptor objects. You can add sort descriptors to a query object and change them later as needed. Each sort descriptor contains a field name of the intended record type and information about whether to sort values in that field in ascending or descending order. The default value of this property is nil, which means that records are returned in an indeterminate order.

The order of the items in the array matches the order in which the sort descriptors are applied to the results. In other words, the first sort descriptor in the array is applied first, followed by the second sort descriptor if needed, and the third, and so on.

34.33.8 Properties

34.33.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.33.10 predicate as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The search criteria to use when matching records.
Notes: A predicate contains one or more expressions that evaluate to true or false. Expressions are often value-based comparisons, but predicates support other types of operators, including string comparisons and aggregate operations. For guidelines on how to construct predicates for your queries, see Predicate Rules for Query Objects.

This property is set at initialization time and cannot be changed later.
(Read only property)

34.33.11 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The record type to search.
Notes: Searches return only records of the specified type. This property is set at initialization time and

cannot be changed later.

The record type is an app-specific string that you use to distinguish among the records of your app. The records of a given type all represent different instances of the same information. For example, an employee record type might store the employee,Äôs name, phone number, and a reference to the employee,Äôs manager.
(Read only property)

34.34 class CKQueryNotificationMBS

34.34.1 class CKQueryNotificationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKQueryNotification object represents a push notification that was generated by a subscription object.
Notes: Subscription objects represent persistent queries on the server. When the server detects a change related to a subscription, it sends a push notification to the client that created the subscription and logs the push notification in the container. You use instances of this class to get information about the record involved in the push notification.

see
https://developer.apple.com/reference/cloudkit/ckquerynotification
Subclass of the CKNotificationMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

34.34.2 Methods

34.34.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.

34.34.4 Properties

34.34.5 databaseScope as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The database scope.
Notes: (Read only property)

34.34.6 isPublicDatabase as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the record is in the public database.
Notes: The value of this property is true if the record is in the public database, or false if it is in the current

user,Äôs private database.
(Read only property)

34.34.7 queryNotificationReason as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event that triggered the delivery of the push notification.
Notes: Subscription-initiated notifications are triggered by the creation, deletion, or updating of a single record. The record in question must match the predicate specified by the subscription object for an event to be triggered.
(Read only property)

34.34.8 recordFields as Dictionary

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A dictionary of the fields that changed.
Notes: For updated and newly created records, this property contains the desired keys requested by the subscription object. When you configure the CKNotificationInfoMBS object of a subscription object, you can specify the names of one or more fields in the desiredKeys property of that notification information object. When a push notification is triggered, the values for each of those keys is retrieved from the record and included in the push notification,Äôs payload, space permitting.

For query notification objects fetched from a container, all keys and values are present. For query notification objects generated from an incoming push notification, one or more keys and values may be missing. Push notification payloads are limited in size, and record fields are one of the first pieces of data to be excluded when that size limit is exceeded. For information about the order in which fields are removed, see the overview of this class.
(Read only property)

34.34.9 recordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The identifier of the record that was created, deleted, or updated.
Notes: Use this identifier to fetch the record from the container. Check the value of the isPublicDatabase property to determine which database to fetch it from.
(Read only property)

34.34.10 Constants

Reasons

Constant	Value	Description
ReasonRecordCreated	1	A record matching the subscription,Äôs predicate was created.
ReasonRecordDeleted	3	A record matching the subscription,Äôs predicate was deleted.
ReasonRecordUpdated	2	A record matching the subscription,Äôs predicate was updated.

34.35 class CKQueryOperationMBS

34.35.1 class CKQueryOperationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKQueryOperation object is a concrete operation that you can use to execute queries against a database.
Example:

```
// load the newest 50 notes and only the fields we need
// The app needs the iCloud entitlement and must be code signed.
// MyQueryOperation is a subclass of CKQueryOperationMBS with the events implemented.
// Operation is a property of the window: Operation As MyQueryOperation
Var query As New CKQueryMBS("Note", NSPredicateMBS.predicateWithFormat("TRUEPREDICATE"))
Operation = New MyQueryOperation(query)
Operation.resultsLimit = 50

Var keys() As String = Array("title", "text")
Operation.setDesiredKeys keys

CKContainerMBS.defaultContainer.privateCloudDatabase.addOperation Operation

// in MyQueryOperation:
Sub recordFetched(record As CKRecordMBS) Handles recordFetched
System.DebugLog record.objectForKey("title").StringValue
End Sub

Sub queryCompleted(cursor As CKQueryCursorMBS, operationError As NSErrorMBS) Handles queryCompleted
If operationError <>Nil Then
System.DebugLog operationError.localizedDescription
ElseIf cursor <>Nil Then
System.DebugLog "More results available, start a new operation with the cursor."
End If
End Sub
```

Notes: A query operation takes the query parameters you provide and applies those parameters to the specified database and zone, delivering any matching records asynchronously to the blocks that you provide.

see
https://developer.apple.com/reference/cloudkit/ckqueryoperation
Subclass of the CKDatabaseOperationMBS class.
Blog Entries

- MBS Xojo Plugins, version 21.4pr1

34.35.2 Methods

34.35.3 CKQueryOperationMaximumResults as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A placeholder value representing the maximum number of results to retrieve.
Notes: The value of this constant does not correspond to the actual number of records. The actual maximum value is determined dynamically by the server based on various conditions.

34.35.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The constructor.
See also:

- 34.35.5 Constructor(query as CKQueryMBS) 6076
- 34.35.6 Constructor(queryCursor as CKQueryCursorMBS) 6076

34.35.5 Constructor(query as CKQueryMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object configured to search for records in the specified zone.
Notes: query: The query to use during the search. This parameter must not be nil.

Returns an initialized operation object.

You can use the returned CKQueryOperationMBS object only once to perform a search, but the object you specify in the query parameter can be reused as needed. When executed, this query object performs a new search and returns the first batch of results. If there are more results available, you must create a separate query object using the provided cursor object.
See also:

- 34.35.4 Constructor 6076
- 34.35.6 Constructor(queryCursor as CKQueryCursorMBS) 6076

34.35.6 Constructor(queryCursor as CKQueryCursorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns an operation object that returns more results from a previous search.
Notes: cursor: The cursor object identifying the previous search. This value is passed to the completion block of the previous search.

Returns an initialized operation object ready to continue the search.

Use this method to initialize a query operation that retrieves the next batch of results from a previous search. When executing searches based on a cursor, do not cache cursor objects for a long time before using them. A cursor is not a snapshot of the previous search results; it stores a relative offset into the results list. An operation object created using a cursor performs a new search, sorts the new set of results, and uses the previous offset value to determine where the next batch of results starts.
See also:

- 34.35.4 Constructor 6076
- 34.35.5 Constructor(query as CKQueryMBS) 6076

34.35.7 desiredKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The fields to retrieve for the requested records.
Notes: Use this property to limit the amount of data retrieved for each record during the search operation. The value is an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the specified keys are included in the returned record. If you specify nil, the operation retrieves all keys for the record. The default value of this property is nil.

If you intend to specify a value, you must do so before executing the operation or submitting the operation object to a queue.

34.35.8 Destructor

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Destructor

34.35.9 setDesiredKeys(desiredKeys() as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets the fields to retrieve for the requested records.
Notes: Use this property to limit the amount of data retrieved for each record during the search operation.

The value is an array of strings, each of which contains the name of a field from the target records. When you retrieve a given record, only fields whose names match one of the specified keys are included in the returned record. If you specify nil, the operation retrieves all keys for the record. The default value of this property is nil.

If you intend to specify a value, you must do so before executing the operation or submitting the operation object to a queue.

34.35.10 Properties

34.35.11 cursor as CKQueryCursorMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The data cursor to use for continuing the search.
Notes: You set the initial value of this property with the Constructor. When you use a cursor, the contents of the query property are ignored. The data cursor stored in this property is an opaque object that is provided to you by the server.

If you intend to specify or change the value in this property, do so before executing the operation or submitting the operation object to a queue.
(Read and Write property)

34.35.12 query as CKQueryMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The query to use for the search.
Notes: You set the initial value of this property with the Constructor method. When the value in the cursor property is nil, the query operation uses the CKQueryMBS object in this property to execute a new search and return the results to your completion handler. If the cursor value is not nil, the cursor is used instead.

If you intend to specify or change the value of this property, do so before executing the operation or submitting the operation object to a queue.
(Read and Write property)

34.35.13 resultsLimit as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The maximum number of records to return at one time.

Notes: For most queries, leave the value of this property set to the default value, which is represented by the CKQueryOperationMaximumResults constant. When using that value, the server chooses a limit that aims to provide an optimal number of results that returns as many records as possible while minimizing delays in receiving those records. However, if you know that you want to process a fixed number of results, change the value of this property accordingly.
(Read and Write property)

34.35.14 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ID of the zone containing the records to search.
Notes: When set, the value of this property limits the scope of the search to the records in the specified zone. If no zone is specified, the search takes place on all zones.

When you initialize the operation object using the Constructor method, the value of this property is set to nil and any changes you make to the property are ignored. When the operation object is executed, the cursor object provides the zone information from the initial search that generated the cursor.
(Read and Write property)

34.35.15 Events

34.35.16 queryCompleted(cursor as CKQueryCursorMBS, operationError as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The block to execute with the search results.
Notes: The block returns no value and takes the following parameters:

cursor: A CKQueryCursorMBS object that indicates there are more results to fetch or nil if the results parameter contains all of the remaining search results. Use the provided object to initialize a new query operation object when you are ready to retrieve the next batch of results.
operationError: An error object containing information about a problem, or nil if the results are retrieved successfully.

This block is executed only once and represents your last chance to process the operation results. It is executed after all of the individual progress blocks but before the operation,Äôs completion block. The block is executed serially with respect to the other progress blocks of the operation. If you intend to use this block to process results, update the value of this property before executing the operation or submitting the operation object to a queue.

When the results of a query operation are known, the operation object uses this block to deliver the available set of records to your app. If the number of records exceeds the value in resultsLimit, the operation object provides an opaque data object in the cursor parameter of your block that you can use to retrieve the next batch of results. You must create a separate operation object using that cursor to get the next batch of results.

34.35.17 recordFetched(record as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The event to execute for each record returned by the query.
Notes: record: A CKRecordMBS object matching the search criteria.

After identifying and sorting the records, the operation object executes this block once for each record in the sorted results. The block is executed serially with respect to all progress blocks of the operation object, so you can expect only one block at a time to be executing for this operation object.

If you intend to use this block to process results, set it before executing the operation or submitting the operation object to a queue.

Warning
Query indexes are updated asynchronously so they are not guaranteed to be current. If you query for records that you recently changed and not allow enough time for those changes to be processed, the query results may be incorrect. The results may not contain the correct records and the records may be out of order.

34.36 class CKQuerySubscriptionMBS

34.36.1 class CKQuerySubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Subscription that fires whenever a change matches the specified predicate.
Example:

```
// get a push notification when someone adds a new Note record
// The app needs the iCloud entitlement, push notifications and must be code signed.
// MyDatabase is a subclass of CKDatabaseMBS with the saveSubscriptionCompleted event implemented.
// Database is a property of the window: Database As MyDatabase
Database = New MyDatabase(CKContainerMBS.defaultContainer.privateCloudDatabase)

Var predicate As NSPredicateMBS = NSPredicateMBS.predicateWithFormat("TRUEPREDICATE")
Var subscription As New CKQuerySubscriptionMBS("Note", predicate, "new-notes", CKQuerySubscription-
MBS.OptionsFiresOnRecordCreation)
Database.saveSubscription subscription

// in MyDatabase:
Sub saveSubscriptionCompleted(subscription As CKSubscriptionMBS, error As NSErrorMBS, tag As Vari-
ant) Handles saveSubscriptionCompleted
If error <>Nil Then
System.DebugLog error.localizedDescription
Else
System.DebugLog "Subscription " + subscription.subscriptionID + " saved."
End If
End Sub
```

Notes: Subclass of the CKSubscriptionMBS class.

34.36.2 Methods

34.36.3 Constructor(RecordType as String, predicate as NSPredicateMBS, query-SubscriptionOptions as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a query-based subscription that monitors records with the specified options.
Notes: recordType: The string that identifies the type of records to track. You are responsible for naming your app,Äôs record types. This parameter must not be nil or an empty string.
predicate: The matching criteria to apply to the records. This parameter must not be nil. For information about the operators that are supported in search predicates, see the discussion in CKQuery.

querySubscriptionOptions: A bitmask of the configuration options for the subscription. Specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.

Returns a subscription object initialized to track record-related changes.

The object returned by this method is configured as a query-based subscription searching records in the target dabatase. The subscription monitors the specified type of records in all of the user,Äôs record zones and generates push notifications when the search criteria are met.
See also:

- 34.36.4 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer) 6082

34.36.4 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a query-based subscription that monitors records with the specified options.
Notes: recordType: The string that identifies the type of records to track. You are responsible for naming your app,Äôs record types. This parameter must not be nil or an empty string.
predicate: The matching criteria to apply to the records. This parameter must not be nil. For information about the operators that are supported in search predicates, see the discussion in CKQuery.
subscriptionID: The unique name of the subscription. This string must be unique in the specified database and must not be nil.
querySubscriptionOptions: A bitmask of the configuration options for the subscription. Specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.

Returns a subscription object initialized to track record-related changes.

The object returned by this method is configured as a query-based subscription searching records in the target dabatase. The subscription monitors the specified type of records in all of the user,Äôs record zones and generates push notifications when the search criteria are met.
See also:

- 34.36.3 Constructor(RecordType as String, predicate as NSPredicateMBS, querySubscriptionOptions as Integer) 6081

34.36.5 copy as CKQuerySubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.36.6 Properties

34.36.7 predicate as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The matching criteria to apply to records.
Notes: A query-based subscription uses its search predicate to identify potential matches for records. It combines the predicate information with the value in the querySubscriptionOptions property to determine the conditions under which to send a push notification to the app.

The search predicate defines the records that the subscription object monitors for changes. The value in this property is used only if the subscriptionType property is set to CKSubscriptionTypeQueryMBS; otherwise, it is ignored.
(Read only property)

34.36.8 querySubscriptionOptions as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Option flags describing the firing behavior of the subscription
Notes: Set the value of this property at initialization time. When configuring a query-based subscription, one of the following values must be specified:

CKQuerySubscriptionOptionsFiresOnRecordCreation
CKQuerySubscriptionOptionsFiresOnRecordUpdate
CKQuerySubscriptionsFiresOnRecordDeletion

If an option flag is not set, an NSInvalidArgumentException is thrown.
(Read only property)

34.36.9 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The record type being monitored in a query-based subscription. (read-only)
Notes: The value of this property applies only to query-based subscriptions and is set automatically by the Constructor. For all other types of subscription objects, the value of this property is ignored and set to nil.

(Read only property)

34.36.10 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Zone that this query subscription is scoped to.
Notes: The value of this property applies both to query-based subscriptions and zone-based subscriptions. Specifying a record zone limits the search scope to the records in that zone. In the case of a zone-based subscription, the search encompasses all records in the zone. For a query-based subscription, the search encompasses only records of a specific type in that zone.

For zone-based subscriptions, the value of this property is set automatically by the Constructor. For all other subscription types, the default value is nil. To apply a zone to a query-based subscriptions, you must assign a value explicitly.
(Read only property)

34.36.11 Constants

Option Flags

Constant	Value	Description
OptionsFiresOnce	8	Fire only once.
OptionsFiresOnRecordCreation	1	Fire at record creation.
OptionsFiresOnRecordDeletion	4	Fire on record deletion.
OptionsFiresOnRecordUpdate	2	Fire on record update.

34.37 class CKRecordIDMBS

34.37.1 class CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKRecordID object uniquely identifies a record in a database.
Example:

```
// create a record with your own record name, so you can find it again later
// The app needs the iCloud entitlement and must be code signed.
Var recordID As New CKRecordIDMBS("settings-main")
Var record As New CKRecordMBS("Settings", recordID)
record.objectForKey("theme") = "dark"

MessageBox "Record name: " + record.recordID.recordName + EndOfLine + _
"Same ID: " + record.recordID.IsEqual(New CKRecordIDMBS("settings-main")).ToString

// save it with CKDatabaseMBS.saveRecord and load it with CKDatabaseMBS.fetchRecordWithID
```

Notes: Record ID objects are normally created automatically when you create a new record, but you might also create IDs in several specific situations. For example, you must create record ID objects when you want to save a record in a zone other than the default zone. You can also create record ID objects when you want to retrieve records whose IDs you know from a database.

see
https://developer.apple.com/reference/cloudkit/ckrecordid

34.37.2 Methods

34.37.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.37.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.
See also:

- 34.37.5 Constructor(recordName as string) 6086
- 34.37.6 Constructor(recordName as string, zoneID as CKRecordZoneIDMBS) 6086

34.37.5 Constructor(recordName as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a new record ID with the specified name in the default zone.
Notes: recordName: The name to use to identify the record. The string must contain only ASCII characters and must not exceed 255 characters. If you specify nil or an empty string for this parameter, this method throws an exception.

Returns an initialized record ID object or nil if the object cannot be created.

Use this method when you are creating or searching for records in the default zone.
See also:

- 34.37.4 Constructor 6085
- 34.37.6 Constructor(recordName as string, zoneID as CKRecordZoneIDMBS) 6086

34.37.6 Constructor(recordName as string, zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a new record ID with the specified name and zone information.
Notes: recordName: The name to use to identify the record. The string must contain only ASCII characters and must not exceed 255 characters. If you specify nil or an empty string for this parameter, this method throws an exception.
zoneID: The ID of the zone in which to place the record. This parameter must not be nil.

Returns an initialized record ID object or nil if the object cannot be created.

Use this method when you create or search for records in a zone other than the default zone. The value in the zoneID parameter must represent a zone that already exists in the database. If the record zone does not exist yet, save the corresponding CKRecordZoneMBS object to the database before attempting to save any CKRecordMBS objects in that zone.
See also:

- 34.37.4 Constructor 6085
- 34.37.5 Constructor(recordName as string) 6086

34.37.7 copy as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.37.8 IsEqual(Other as CKRecordIDMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Checks if two objects are equal.

34.37.9 Properties

34.37.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.37.11 recordName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The unique name of the record.
Notes: (Read only property)

34.37.12 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ID of the zone containing the record.
Notes: (Read only property)

34.38 class CKRecordMBS

34.38.1 class CKRecordMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A dictionary of key-value pairs that you use to fetch and save the data of your app.
Example:

```
// create a record, set values and read them back
Var record As New CKRecordMBS("Person")
record.objectForKey("name") = "John"
record.objectForKey("age") = 42

Var lines() As String
For Each key As String In record.allKeys
lines.Add key + ": " + record.objectForKey(key).StringValue
Next
MessageBox record.recordType + EndOfLine + String.FromArray(lines, EndOfLine)

// save it with CKDatabaseMBS.saveRecord
```

Notes: Records are the fundamental objects you use to manage data in CloudKit. You may define any number of record types for your app, with each record type corresponding to a different type of information you need. Within a given record type, you then define one or more fields, each of which has a name and a data value. Records can contain simple data types such as strings and numbers or more complex types such as geographic locations or pointers to other records.

An important step in using CloudKit is defining the record types your app supports. Each new record object contains no keys or values initially. During development, you can add new keys and values at any time. The first time you set a value for a key and save the record, the server associates that type with the key for all records of the same type. (The CKRecordMBS class does not enforce these type constraints or do any local validation of a record,Äôs contents; those constraints are enforced by the server when you save records.)

Note

The ability to add new keys is only possible during development. When you deploy to a production environment, the server returns an error when you try to specify an unknown record type or try to save a record containing unknown keys.
Although records act like dictionaries, there are still limitations to the types of values you can assign to keys. The following are the object types that the CKRecord class supports. Attempting to specify objects of any other type is a programmer error and will fail. Fields of all types are searchable unless otherwise noted.

34.38.2 Methods

34.38.3 allKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns an array of strings corresponding to all keys currently in the record.
Notes: Returns an array of strings. The returned array contains only the keys that have corresponding values in the record. If no keys are set for the record, this method returns an empty array.

This method may not return all possible keys in the record. Specifically, the method does not return keys whose values are nil.

34.38.4 allTokens as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns an array of strings that you can use for full-text searches of the field,Äôs string-based values.
Notes: Returns an array of strings containing data from the records string-based fields.

When performing your own full-text searches, you can use this method to get a list of strings for your search. The method acts only on keys whose values are NSString objects. It breaks each value string apart at whitespace boundaries, creates new strings for each word, adds the new strings to an array, and returns the array. This tokenized version of the record,Äôs string values makes it easier to do string-based comparisons of individual words.

34.38.5 archive(byref error as NSErrorMBS) as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Archives the content of this record via NSKeyedArchiver.
Example:

```
Var ckRecord As New CKRecordMBS("MyType")

// archive
Var e1 As NSErrorMBS
Var encodedRecordValue As String = ckRecord.archive(e1)

// unarchive
Var e2 As NSErrorMBS
Var decodedRecord As CKRecordMBS = CKRecordMBS.Unarchive(encodedRecordValue, e2)

MessageBox "OK "+decodedRecord.recordType
```

Notes: In case of error returns nil and sets error.

34.38.6 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.38.7 changedKeys as String()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns an array of strings representing the keys that have changed recently.
Notes: An array of strings, each of which represents a key whose value has changed since the record was downloaded or saved. If no keys have changed, this method returns an empty array.

34.38.8 CKRecordTypeUserRecord as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The record type for an user record.

34.38.9 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.
See also:

- 34.38.10 Constructor(Coder as NSCoderMBS) 6091
- 34.38.11 Constructor(RecordType as String) 6091
- 34.38.12 Constructor(RecordType as String, recordID as CKRecordIDMBS) 6092
- 34.38.13 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS) 6093

34.38.10 Constructor(Coder as NSCoderMBS)

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Initializes record by reading from coder.
Notes: e.g. use with NSKeyedUnarchiverMBS class.
See also:

- 34.38.9 Constructor 6090
- 34.38.11 Constructor(RecordType as String) 6091
- 34.38.12 Constructor(RecordType as String, recordID as CKRecordIDMBS) 6092
- 34.38.13 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS) 6093

34.38.11 Constructor(RecordType as String)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a new record of the specified type.
Example:

```
// Create a new record of type "employee".
Var myRecord as new CKRecordMBS("employee")
```

Notes: recordType: A string reflecting the type of record that you want to create. This string becomes the type of record thereafter and cannot be changed. You define the record types that your app supports and use them to distinguish between records with different types of data. This parameter must not be nil or contain an empty string.

Record type names must consist of one or more alphanumeric characters and must start with a letter. Type names may include underscore characters as long as they do not start with that character. Spaces are not allowed in the names.

Returns an initialized record object or nil if the record cannot be created.

Use this method to initialize a new record object in the default zone of the database. The newly created record contains no data in any of its fields and is assigned a unique ID.

New records exist only in memory until you explicitly save them to iCloud. In addition, new records are sparse by default and have no values assigned to the fields you defined. (In fact, until you set the value of a key explicitly, getting the value of a key in a new record returns nil.) Even though a record has an associated type, that type information is ignored until you save the record.

Save the record using a CKModifyRecordsOperationMBS object or using the saveRecord method of CKDatabaseMBS to transfer the record,Äôs contents to the server.

- 34.38.9 Constructor 6090
- 34.38.10 Constructor(Coder as NSCoderMBS) 6091
- 34.38.12 Constructor(RecordType as String, recordID as CKRecordIDMBS) 6092
- 34.38.13 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS) 6093

34.38.12 Constructor(RecordType as String, recordID as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a record using an ID that you provide.
Notes: recordType: A string reflecting the type of record that you want to create. Define the record types that your app supports, and use them to distinguish between records with different types of data. This parameter must not be nil or contain an empty string. Record type names consist of one or more alphanumeric characters and start with a letter. Type names may include underscore characters if they do not start with that character. Spaces are not allowed in record type names.
recordID: The ID to assign to the record itself. When creating the ID, you can specify the zone in which to place the record. The ID cannot currently be in use by any other record and must not be nil.

Returns an initialized record object or nil if the record cannot be created.

Discussion
Use this method to initialize a new record object with the specified ID. The newly created record contains no data.

Upon creation, record objects exist only in memory on the local device. Save the record using a CKModifyRecordsOperationMBS object or using the saveRecord method of CKDatabaseMBS to transfer the record,Äôs contents to the server.
See also:

- 34.38.9 Constructor 6090

- 34.38.10 Constructor(Coder as NSCoderMBS) 6091
- 34.38.11 Constructor(RecordType as String) 6091
- 34.38.13 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS) 6093

34.38.13 Constructor(RecordType as String, zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a record in the specified zone.
Notes: recordType: A string reflecting the type of record that you want to create. Define the record types that your app supports, and use them to distinguish between records with different types of data. This parameter must not be nil or contain an empty string. Record type names consist of one or more alphanumeric characters and start with a letter. Type names may include underscore characters if they do not start with that character. Spaces are not allowed in record type names.
zoneID: The ID of the record zone in which to place the record.

Returns an initialized record object, or nil if the record cannot be created.

Use this method to initialize a new record object in the specified record zone.

Upon creation, the new record contains no data and exists only in memory on the local device. Save the record using a CKModifyRecordsOperationMBS object or using the saveRecord:completion: method of CKDatabase to transfer the record,Äôs contents to the server.

- 34.38.12 Constructor(RecordType as String, recordID as CKRecordIDMBS) 6092

34.38.14 copy as CKRecordMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.38.15 encodeSystemFieldsWithCoder(Coder as NSCoderMBS)

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Encodes the record,Äôs system fields using the specified archiver.
Notes: Use this method to encode the record,Äôs metadata that CloudKit provides. Every record has keys that the system defines that correspond to record metadata, such as the record ID, record type, creation date, and so on. This method encodes those keys in the specified archiver. This method doesn,Äôt include any keys you add to the record. It also doesn,Äôt encode the keys that the changedKeys() method returns. You might use this method when you want to store only the system metadata because you store the actual record data elsewhere.

use with NSKeyedArchiverMBS class.

34.38.16 encodeWithCoder(Coder as NSCoderMBS)

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Encodes this record with the given coder.
Notes: Best pass instance of NSKeyedArchiverMBS to encode.

34.38.17 setParentReferenceFromRecord(parentRecord as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates and sets a reference object for a parent from its record.
Notes: parentRecord: A record that you want to set as the parent to this record.

This method creates and sets a CKReferenceMBS object for the CKRecordMBS passed in. The resulting CKReferenceMBS will have its action set to none.

34.38.18 setParentReferenceFromRecordID(parentRecordID as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Sets parent via Record ID.

34.38.19 Unarchive(Data as MemoryBlock, byref error as NSErrorMBS) as CKRecordMBS

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Archives the data of to a new CKRecord via NSKeyedUnarchiver.
Example:

```
Var ckRecord As New CKRecordMBS("MyType")

// archive
Var e1 As NSErrorMBS
Var encodedRecordValue As String = ckRecord.archive(e1)

// unarchive
Var e2 As NSErrorMBS
Var decodedRecord As CKRecordMBS = CKRecordMBS.Unarchive(encodedRecordValue, e2)

MessageBox "OK "+decodedRecord.recordType
```

Notes: In case of error returns nil and sets error.

34.38.20 Properties

34.38.21 creationDate as Date

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time when the record was first saved to the server.
Notes: The creation date reflects the time at which a record with the current record,Äôs ID was created on the server. For new instances of this class, the value of this property is initially set to nil. When you save the record to the server, the value is updated with the appropriate creation date for the record.
(Read only property)

34.38.22 creationDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time when the record was first saved to the server.
Notes: The creation date reflects the time at which a record with the current record,Äôs ID was created on the server. For new instances of this class, the value of this property is initially set to nil. When you save the record to the server, the value is updated with the appropriate creation date for the record.
(Read only property)

34.38.23 creatorUserRecordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ID of the user who created the record.
Notes: Use the value in this property to retrieve the user record of the user who created this record. Every

user of the app has a unique user record that is empty by default. Apps can add data to the user record on behalf of the user but should not store sensitive data in it.
(Read only property)

34.38.24 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.38.25 lastModifiedUserRecordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ID of the user who last modified the record.
Notes: Use the value in this property to retrieve the user record of the user who last modified this record. Every user of the app has a unique user record that is empty by default. Apps can add data to the user record on behalf of the user but should not store sensitive data in it.
(Read only property)

34.38.26 modificationDate as Date

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time when the record was last saved to the server.
Notes: The modification date reflects the time at which a record with the current record,Äôs ID was last saved to the server. For new instances of this class, the value of this property is initially set to nil. When you save the record to the server, the value is updated with the appropriate modification date for the record.
(Read only property)

34.38.27 modificationDateTime as DateTime

MBS Mac64bit Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time when the record was last saved to the server.
Notes: The modification date reflects the time at which a record with the current record,Äôs ID was last saved to the server. For new instances of this class, the value of this property is initially set to nil. When you save the record to the server, the value is updated with the appropriate modification date for the record.
(Read only property)

34.38.28 parent as CKReferenceMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A reference to the parent record to this record.
Notes: A parent reference is used to teach CloudKit about the hierarchy of your records. This hierarchy of records will be shared if the share reference is set on a record.

A parent record reference must have a none set.

The target of a parent reference must exist at save time —either already on the server, or part of the same CKModifyRecordsOperationMBS batch.

You are encouraged to set up the parent relationships as part of normal record saves, even if you are not planning on sharing records at this time. This allows you to share and unshare a hiearchy of records at a later date by only modifying the ,Äútop level,Äù record, setting or clear its share reference.
(Read and Write property)

34.38.29 recordChangeTag as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A string containing the server change token for the record.
Notes: When you fetch a record from the server, you get the current version of that record as it exists on the server. However, at any time after you fetch a record, other users might save a newer version of the record to the server. Every time a record is saved, the server updates the record,Äôs change token to a new value. When you save your instance of the record to the server, the server compares the token in your record with the token on the server. If the two tokens match, the server knows that you modified the latest version of the record and that your changes can be applied right away. If the two tokens do not match, the server applies the save policy your app specified to determine how to proceed.

In your own code, you can use change tokens to distinguish between two different versions of the same record.
(Read only property)

34.38.30 recordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The unique ID of the record.
Notes: The ID of a new record is always set at initialization time. If you use the Constructor method to initialize the record, the ID is derived from the CKRecordIDMBS object you provide. In all other cases, the record generates a UUID and bases its ID on that value. The ID of a record never changes over the lifetime

of that record.

When you save a new record object to the server, the server validates the uniqueness of the record but reports an error only if the save policy calls for it. Specifically, it reports an error when the save policy is set to ifServerRecordUnchanged, which is the default. For other save policies, the server overwrites the contents of the existing record accordingly.
(Read only property)

34.38.31 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The app-defined string that identifies the type of the record.
Notes: Use this string to differentiate between different record types in your app. The string is primarily for your benefit, so choose type names that reflect the data in the corresponding records.
(Read only property)

34.38.32 share as CKReferenceMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A reference to the share associated with the sharing of this record.
Notes: The share property (CKReferenceMBS) on a record will be removed when the corresponding CKShare object is deleted from the server. Send this record in the same batch as the share that is being deleted, and this record,Äôs share property will be updated.

Sharing is only supported in zones with the CKRecordZoneCapabilitySharing capability. The default zone does not support sharing.

If any records have a parent reference to this record, they are implicitly shared alongside this record.

Note

Records in a hierarchy must only exist within one share. If a child record in a hierarchy already has a share reference set, you will get a CKErrorAlreadyShared error if you try to share any of that record,Äôs parents.
(Read only property)

34.38.33 dataForKey(key as string) as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The value for the given key stored in the record as data.
Notes: If assign nil as value, CloudKit removes any object that the record associates with the key.
(Read and Write computed property)

34.38.34 objectForKey(key as string) as Variant

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The value for the given key stored in the record.
Notes: key: The string that identifies a field in the record. Key names consist of one or more alphanumeric characters and start with a letter. You may also include underscore characters if you do not use an underscore as the first character in the name. Spaces are not allowed in key names.

Returns the object associated with the specified key or nil if no such key exists in the record.

New records do not contain any keys or values initially. Values are always one of the object types listed in Supported Data Types.

You access the fields of a CKRecord object the same way you access key-value pairs in an NSMutableDictionary. The CKRecord class defines the objectForKey: and setObject:forKey: methods for getting and setting values. It also supports dictionary index notation.

If assign nil as value, CloudKit removes any object that the record associates with the key.
(Read and Write computed property)

34.38.35 stringForKey(key as string) as string

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The value for the given key stored in the record as string.
Notes: If field contains a number, we convert it to string for you.

If assign "" as value, we put in an empty string. To clear the key, pass nil via objectForKey assignment.
(Read and Write computed property)

34.39 class CKRecordZoneIDMBS

34.39.1 class CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKRecordZoneID object uniquely identifies a record zone in a database.
Example:

```
// identify a custom zone of the current user and put a record into it
Var zoneID As New CKRecordZoneIDMBS("Notes", CKContainerMBS.CKCurrentUserDefaultName)
Var recordID As New CKRecordIDMBS("note-1", zoneID)
Var record As New CKRecordMBS("Note", recordID)

MessageBox "Zone: " + record.recordID.zoneID.zoneName + EndOfLine + _
"Owner: " + record.recordID.zoneID.ownerName + EndOfLine + _
"Same zone: " + zoneID.IsEqual(New CKRecordZoneIDMBS("Notes", CKContainerMBS.CKCurrentUserDefaultName)).ToString
```

Notes: Zones are a way to group related records together. You create zone ID objects when you want to fetch an existing zone object or create a new zone with a specific name.

Overview
A record zone ID distinguishes one zone from another by a name string and the ID of the user that created the zone. Both strings must be ASCII strings that do not exceed 255 characters. For automatically created record zones, the ID name string is based on a UUID and is therefore guaranteed to be unique. When creating your own record zone ID objects, you are free to use names that have more meaning to your app or to the user, providing each zone name is unique within the specified database. The owner name must be either the current user name (obtained from the fetchUserRecordID method) or the name of another user.

When creating new record zones, make the name string in the record zone ID unique in the target database. Public databases do not support custom zones, and zones in a private database can only be created by the user that owns the database.

This class is not intended to be subclassed.

Interacting with Record Zone IDs
After you create a CKRecordZoneIDMBS object, interactions with that object typically include:

- Creating a CKRecordIDMBS object so that you can fetch or create records in that zone.
- Retrieving an existing CKRecordZoneMBS object from the database.

You do not need to create a CKRecordZoneIDMBS object in order to create a CKRecordZoneMBS object.

The CKRecordZoneMBS class has initialization methods that create a record zone ID using the name string you provide.

Creating Record Zone IDs to Use with Records
To create a new record in a custom zone, first create a CKRecordZoneIDMBS object that specifies the zone name. Use the record zone ID to create a CKRecordID and then use the record ID to create the record itself.

Fetching a Record Zone Object from the Database
To fetch a CKRecordZoneMBS object from a database, use a CKFetchRecordZonesOperationMBS object or the fetchRecordZoneWithID method of the CKDatabaseMBS class. Both techniques take a CKRecordZoneIDMBS object that you provide and retrieve the corresponding record zone object asynchronously. If you use the operation object, you can retrieve multiple record zones at the same time.

34.39.2 Methods

34.39.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.39.4 Constructor(zoneName as string, ownerName as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a record zone ID with the specified name and owner.
Notes: zoneName: The name that identifies the record zone. The string must contain only ASCII characters and must not exceed 255 characters. To specify the default zone of the current database, pass the CKRecordZoneDefaultName constant for this parameter. This parameter must not be nil or the empty string.
ownerName: The user who created the record zone. To specify the current user, use the CKOwnerDefaultName constant. If you specify nil or an empty string for this parameter, this method throws an exception.

Returns an initialized record zone ID object or nil if the object cannot be created.

Use this method to create a record zone ID for use in creating or fetching a record zone.

34.39.5 copy as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.39.6 IsEqual(Other as CKRecordZoneIDMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Checks if two objects are equal.

34.39.7 Properties

34.39.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.39.9 ownerName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ID of the user who owns the record zone.
Notes: (Read only property)

34.39.10 zoneName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The unique name of the record zone.
Notes: (Read only property)

34.40 class CKRecordZoneMBS

34.40.1 class CKRecordZoneMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A definition of a custom area for organizing related records in a database.
Example:

```
// create a custom zone in the private database to group related records
// The app needs the iCloud entitlement and must be code signed.
// MyDatabase is a subclass of CKDatabaseMBS with the saveRecordZoneCompleted event implemented.
// Database is a property of the window: Database As MyDatabase
Database = New MyDatabase(CKContainerMBS.defaultContainer.privateCloudDatabase)
Database.saveRecordZone New CKRecordZoneMBS("Notes")

// in MyDatabase:
Sub saveRecordZoneCompleted(zone As CKRecordZoneMBS, error As NSErrorMBS, tag As Variant) Handles saveRecordZoneCompleted
If error <>Nil Then
System.DebugLog error.localizedDescription
Return
End If

// now create records in this zone
Var record As New CKRecordMBS("Note", zone.zoneID)
record.objectForKey("title") = "First note"
Me.saveRecord record
End Sub
```

Notes: Zones are an important part of how you organize your data. The public and private databases have a single default zone. In the private database you can use CKRecordZoneMBS objects to create additional custom zones as needed. Use custom zones to arrange and encapsulate groups of related records in the private database. Custom zones support other capabilities too, such as the ability to write multiple records as a single atomic transaction.

Treat each custom zone as a single unit of data that is separate from every other zone in the database. Inside the zone, you add records as you would anywhere else. You can also create links between the records inside a zone by using the CKReferenceMBS class. However, the CKReferenceMBS class does not support cross-zone linking, so each reference object must point to a record in the same zone as the current record.

Use the CKRecordZoneMBS class as-is and do not subclass.

Creating a Custom Record Zone
For the most part, you use instances of this class to create and manage custom zones. Although you can

use this class to retrieve a database,Äôs default zone, most operations act on records in the default zone by default, so you rarely need to specify it explicitly.

To create a custom zone, use CKRecordZoneMBS to create the zone object, and then save that zone to the user,Äôs private database using a CKModifyRecordZonesOperationMBS object. You cannot save any records in the zone until you save it to the database. When creating records, explicitly specify the zone ID if you want the records to reside in a specific zone; otherwise, they will be saved to the default zone. You cannot create custom zones in a public database.

After creating a CKRecordZoneMBS object and saving it to the database, you do not interact with the object much. Instead, most interactions occur with its associated CKRecordZoneIDMBS object, which you use to refer to the zone when creating records.

34.40.2 Methods

34.40.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.40.4 CKRecordZoneDefaultName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The name of the default zone.
Notes: Use this constant when you need to refer to the default zone by name, perhaps when creating a zone ID. The default zone has no special capabilities.

34.40.5 Constructor(zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a record zone object using the specified ID.
Notes: zoneID: The ID for the new zone. This parameter must not be nil.

Returns the new custom zone, or nil if the zone cannot be created.

Use this method when you want to create a new record zone based on the information in a zone ID. After

creating the zone, save it to the server using a CKModifyRecordZonesOperationMBS object or the save method of the CKDatabaseMBS class.

Do not use this method to create a CKRecordZoneMBS object corresponding to a zone that already exists in the database. If the zone exists, fetch it using a CKFetchRecordZonesOperationMBS object or the fetch method of the CKDatabaseMBS class.
See also:

- 34.40.6 Constructor(zoneName as string) 6105

34.40.6 Constructor(zoneName as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a record zone object with the specified name.
Notes: zoneName: The name of the new zone. Zone names inside a user,Äôs private database are unique, consist of ASCII characters, are no longer than 255 characters, and do not start with an underscore (_) character. One way to ensure the uniqueness of zone names is to create a string based on a UUID, but you can also use other techniques.

If this parameter is nil or is an empty string, the method throws an exception.

Returns the new custom zone, or nil if the zone cannot be created.

Use this method to create a new record zone. The new zone has the name you provide and the zone,Äôs owner is set to the current user. After creating the zone, save it to the server using a CKModifyRecordZonesOperationMBS object or the saveRecordZone method of the CKDatabase class. You must save the zone to the server before attempting to save any records to that zone.

Do not use this method to create a CKRecordZone object corresponding to a zone that already exists in the database. If the zone exists, fetch it using a CKFetchRecordZonesOperationMBS object or the fetchRecordZoneWithID method of the CKDatabase class.
See also:

- 34.40.5 Constructor(zoneID as CKRecordZoneIDMBS) 6104

34.40.7 copy as CKRecordZoneMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.40.8 defaultRecordZone as CKRecordZoneMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns the default zone for records.
Notes: The default record zone for a database.

Always use this method to retrieve the default zone for a database. The returned object can be used to specify the default zone for either the public or private database of a container. You do not need to save the returned zone object before using it. The owner of the zone is set to CKOwnerDefaultName, which corresponds to the current user.

The default zone of a database is a convenient place to store and access records. Whenever you do not explicitly assign a zone to a record, CloudKit puts the record in the default zone.

The disadvantage of using the default zone for storing records is that it does not have any special capabilities. You cannot save a group of records to iCloud atomically in the default zone. Similarly, you cannot use a CKFetchRecordChangesOperationMBS object on records in the default zone.

34.40.9 Properties

34.40.10 capabilities as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The capabilities supported by the zone.
Notes: The server determines the capabilities of the zone and sets the value of this property when you save the record zone. Always check this property before performing tasks that require a specific capability.

Typically, default zones do not support any special capabilities. Custom zones in a private database normally support all options.

For more information about what you can do with specific capabilities, see Capabilities* constants.
(Read only property)

34.40.11 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.40.12 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The unique ID of the zone.
Notes: The zone ID contains the name of the zone and the name of the user who owns the zone. Use this property to access both of those values.
(Read only property)

34.40.13 Constants

Capabilities

Constant	Value	Description
CapabilityAtomic	2	A capability that allows changes to multiple records to be made atomically. When you use a CKModifyRecordsOperationMBS object to save records, if the server is unable to save the changes for one record, it does not save the changes for any of the records. When combined with the CKRecordSaveIfServerRecordUnchanged policy of the operation object, this behavior prevents your app from overwriting changes to a group of records if one of the records was modified elsewhere.
CapabilityFetchChanges	1	A capability that allows you to fetch only the changed values in records. This capability makes the creation of offline caches more efficient. Instead of fetching the entire record every time, use a CKFetchRecordChangesOperationMBS object to fetch only the values that changed, and use the returned data to update your caches. Doing so minimizes the amount of data you receive from the server. You can still fetch the entire record using a CKFetchRecordsOperationMBS object if you want.
CapabilitySharing	4	Sharing

34.41 class CKRecordZoneNotificationMBS

34.41.1 class CKRecordZoneNotificationMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A notification that is caused by changes to the contents of a record zone.
Notes: Zone-related changes occur when existing records in the zone are modified, when new records are added, and when existing records are deleted. Use instances of this class to determine which zone triggered the notification.

You do not create instances of this class directly. When your app receives a push notification, call the notificationFromRemoteNotificationDictionary method of CKNotificationMBS to generate a notification object of the appropriate type. You can also fetch previously delivered notifications from a container using a CKFetchNotificationChangesOperationMBS object. If the notification was triggered due to a record zone change, the operation object delivers an instance of CKRecordZoneNotificationMBS with its notificationType property set to CKNotificationTypeRecordZoneMBS. Use the record zone notification object to get the record zone information and other push-related data.

If a push notification,Äôs payload is too large, pieces of data may be dropped until the payload meets the allowed size limit. The data that alerts the user is the most important and is dropped last. Data values in this class are among the first to be dropped, with values being dropped in the following order:

1. containerIdentifier—defined in the CKNotification class.
2. recordZoneID
3. Other properties of the CKNotification class.

Subclass of the CKNotificationMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

34.41.2 Methods

34.41.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.

34.41.4 Properties

34.41.5 databaseScope as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The type of database (public, private, or shared) associated with the zone.
Notes: For more details on the values returned, see CKDatabaseMBS.Scope* constants.
(Read only property)

34.41.6 recordZoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ID of the zone that changed.
Notes: Use the value of this property to fetch the corresponding zone from the database.
(Read only property)

34.42 class CKRecordZoneSubscriptionMBS

34.42.1 class CKRecordZoneSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A subscription that causes a push notification to fire whenever any change happens in the specified record zone.
Notes: Subclass of the CKSubscriptionMBS class.

34.42.2 Methods

34.42.3 Constructor(zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a subscription object that monitors all records in the specified record zone.
Notes: zoneID: The ID of the record zone containing the records you want to monitor. This parameter must not be nil.

Returns a subscription object initialized to track changes to the contents of the specified record zone.

The object returned by this method is configured as a zone-based subscription, which generates a push notification when any changes are made to the records in the specified zone.
See also:

- 34.42.4 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string) 6110

34.42.4 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a subscription object that monitors the specified zone and has a custom name that you provide.
Notes: zoneID: The ID of the record zone containing the records you want to monitor. This parameter must not be nil.
subscriptionID: The unique name of the subscription object. This string must be unique for each subscription object in the container. This parameter must not be nil.

Returns a subscription object initialized to track changes to the contents of a record zone.

The CKRecordZoneSubscriptionMBS returned by this method is configured as a zone-based subscription,

which generates a push notification when any changes are made to the records in the specified zone.
See also:

- 34.42.3 Constructor(zoneID as CKRecordZoneIDMBS) 6110

34.42.5 copy as CKRecordZoneSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.42.6 Properties

34.42.7 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The record type being monitored in a query-based subscription. (read-only)
Notes: The value of this property applies only to query-based subscriptions and is set automatically by the CKRecordZoneSubscriptionMBS and CKRecordZoneSubscriptionMBS methods. For all other types of subscription objects, the value of this property is ignored and set to nil.
(Read and Write property)

34.42.8 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Zone that the specified query subscription is scoped to.
Notes: The value of this property applies both to query-based subscriptions and zone-based subscriptions. Specifying a record zone limits the search scope to the records in that zone. In the case of a zone-based subscription, the search encompasses all records in the zone. For a query-based subscription, the search encompasses only records of recordType in that zone.

For zone-based subscriptions, the value of this property is set automatically by the CKRecordZoneSubscriptionMBS or CKRecordZoneSubscriptionMBS methods. For all other subscription types, the default value is nil. To apply a zone to a query-based subscription, you must assign a value explicitly.
(Read only property)

34.43 class CKReferenceMBS

34.43.1 class CKReferenceMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKReference object creates a many-to-one relationship between records in your database.
Example:

```
// link a task record to its project record
// The task is deleted automatically when the project is deleted.
Var project As New CKRecordMBS("Project", New CKRecordIDMBS("project-1"))
project.objectForKey("name") = "Website"

Var task As New CKRecordMBS("Task", New CKRecordIDMBS("task-1"))
task.objectForKey("title") = "Write texts"
task.objectForKey("project") = New CKReferenceMBS(project, CKReferenceMBS.ActionDeleteSelf)

// save both records, e.g. with one CKModifyRecordsOperationMBS
```

Notes: Each reference object stores information about the one record that is the target of the reference. You then save the reference object in the fields of one or more records to create a link from those records to the target. Both records must be located in the same zone of the same database.

see
https://developer.apple.com/reference/cloudkit/ckreference

34.43.2 Methods

34.43.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.43.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.
See also:

- 34.43.5 Constructor(record as CKRecordMBS, action as Integer = 0) 6113
- 34.43.6 Constructor(recordID as CKRecordIDMBS, action as Integer = 0) 6113

34.43.5 Constructor(record as CKRecordMBS, action as Integer = 0)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a reference object that points to the specified record object.
Notes: record: The target record of the reference.
action: The ownership options to put in place for the records. If you specify the deleteSelf option, the object referred to by the recordID parameter becomes the owner of any objects that use this reference object. For a list of possible values, see CKReferenceAction.

Returns an initialized reference object that points to the specified record, or nil if the reference cannot be initialized.

Use this method to initialize a reference to a local record object. The local record can be one that you just created or one that you fetched previously from the server.

When you create a reference object for use in a search predicate, the predicate ignores the value in the action parameter. Search predicates use only the ID of the record during their comparison.
See also:

- 34.43.4 Constructor 6112
- 34.43.6 Constructor(recordID as CKRecordIDMBS, action as Integer = 0) 6113

34.43.6 Constructor(recordID as CKRecordIDMBS, action as Integer = 0)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a reference object that points to the record with the specified ID.
Notes: recordID: The ID of the target record. This method throws an exception if you specify nil for this parameter.
action: The ownership option to put in place between the target record and any records that incorporate this reference object. If you specify the deleteSelf option, the record referred to by the recordID parameter owns (or acts as the parent) of any objects that use this reference object. For a list of possible values, see CKReferenceActionMBS.

Returns an initialized reference object that points to the specified record, or nil if the reference cannot be initialized.

Use this method when you have only the ID of the record that is to become the target of a link. You might

use this method if you saved only the ID of the record to a local data cache.

When you create a reference object for use in a search predicate, the predicate ignores the value in the action parameter. Search predicates use only the ID of the record during their comparison.
See also:

- 34.43.4 Constructor 6112
- 34.43.5 Constructor(record as CKRecordMBS, action as Integer = 0) 6113

34.43.7 copy as CKReferenceMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.43.8 Properties

34.43.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.43.10 recordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ID of the referenced record.
Notes: Use the ID in this property to fetch the record on the other end of the link.
(Read only property)

34.43.11 referenceAction as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ownership behavior for the records.
Notes: The value in this property determines what action, if any, to take when the target of the reference object—that is, the object pointed to in the recordID property—is deleted. When this property is set to deleteSelf, deleting the target object deletes any records that contain that reference in one of their fields. When this property is set to none, deleting the target object does not delete any additional objects.

(Read only property)

34.43.12 Constants

Actions

Constant	Value	Description
ActionDeleteSelf	1	The delete action for referenced records. Deleting a record also deletes any records containing CKReferenceMBS objects that point to that record. The deletion of the additional records may trigger a cascade deletion of more records. The deletions are asynchronous in the default zone and immediate in a custom zone.
ActionNone	0	No action when a referenced record is deleted. Deleting a parent record does not delete the children that refer to that parent. The CKReference object still contains the ID of the deleted record and is not updated automatically.

34.44 class CKServerChangeTokenMBS

34.44.1 class CKServerChangeTokenMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A CKServerChangeTokenMBS object is an opaque data object that identifies a specific version of a record.
Example:

```
// save a change token to a file, so the next sync only fetches newer changes
// token is a CKServerChangeTokenMBS, e.g. from CKFetchDatabaseChangesOperationMBS
Var token As CKServerChangeTokenMBS // your token
Var file As FolderItem = SpecialFolder.ApplicationData.Child("MyApp-changetoken.data")
Var error As NSErrorMBS

If token <>Nil Then
Var data As MemoryBlock = token.Archive(error)
If data <>Nil Then
Var output As BinaryStream = BinaryStream.Create(file, True)
output.Write data
output.Close
End If
End If

// at the next start, load it again
If file.Exists Then
Var input As BinaryStream = BinaryStream.Open(file)
Var saved As MemoryBlock = input.Read(input.Length)
input.Close
Var restored As CKServerChangeTokenMBS = CKServerChangeTokenMBS.Unarchive(saved, error)
// pass restored to New CKFetchDatabaseChangesOperationMBS(restored)
End If
```

Notes: You do not create instances of this class yourself. When fetching records using a CKFetchRecordChangesOperation object, the server provides one of these objects along with the record changes. The next time you fetch the records, pass the previous token to the server. Passing the previous token tells the server what portions of the records to fetch and return to your app.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- News from the MBS Xojo Plugins Version 21.2

- MBS Xojo Plugins, version 21.2pr5

34.44.2 Methods

34.44.3 Archive(byref error as NSErrorMBS) as MemoryBlock

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Archives the token.
Notes: You may do Base64 on top of the memoryblock before storing in e.g. a XML or JSON block.
Uses NSKeyedArchiver internally.

34.44.4 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.44.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.

34.44.6 copy as CKServerChangeTokenMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.44.7 IsEqual(Other as CKServerChangeTokenMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Checks if two objects are equal.

34.44.8 Unarchive(Data as MemoryBlock, byref error as NSErrorMBS) as CKServerChangeTokenMBS

MBS Mac64bit Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Unarchives the token.
Notes: If you used Base64 previously, don't forget to do Base64 Decode before passing in data.
Uses NSKeyedUnarchiver internally.

34.44.9 Properties

34.44.10 description as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The description text.
Notes: (Read only property)

34.44.11 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.45 class CKShareMBS

34.45.1 class CKShareMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A reference to a shared record.
Example:

```
// share a record with other iCloud users, read only
// The app needs the iCloud entitlement and must be code signed. Shared records must be in a custom zone.
// MyModifyOperation is a subclass of CKModifyRecordsOperationMBS with the modifyRecordsCompleted event implemented.
// Operation is a property of the window: Operation As MyModifyOperation
Var zoneID As New CKRecordZoneIDMBS("Notes", CKContainerMBS.CKCurrentUserDefaultName)
Var note As New CKRecordMBS("Note", zoneID)
note.objectForKey("title") = "Shared shopping list"

Var share As New CKShareMBS(note)
share.objectForKey(CKShareMBS.CKShareTitleKey) = "Shopping list"
share.publicPermission = CKShareParticipantMBS.CKShareParticipantPermissionReadOnly

// root record and share must be saved together
Var toSave() As CKRecordMBS
toSave.Add note
toSave.Add share
Var toDelete() As CKRecordIDMBS
Operation = New MyModifyOperation(toSave, toDelete)
CKContainerMBS.defaultContainer.privateCloudDatabase.addOperation Operation

// in MyModifyOperation:
Sub modifyRecordsCompleted(savedRecords() As CKRecordMBS, deletedRecordIDs() As CKRecordIDMBS,
operationError As NSErrorMBS) Handles modifyRecordsCompleted
If operationError <>Nil Then
System.DebugLog operationError.localizedDescription
Return
End If
For Each r As CKRecordMBS In savedRecords
If r IsA CKShareMBS Then System.DebugLog "Send this link: " + CKShareMBS(r).URL
Next
End Sub
```

Notes: Available in macOS 10.12 and newer.
Subclass of the CKRecordMBS class.
Blog Entries

- MBS Xojo Plugins, version 21.5pr2
- MBS Xojo Plugins, version 21.3pr4

34.45.2 Methods

34.45.3 addParticipant(participant as CKShareParticipantMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Adds a participant to this share.
Notes: participant: The participant to be added to this share.

If a participant with a matching userIdentity already exists in this share, that existing participant,Äôs properties are updated; no new participant is added.

To modify the list of participants, a share must have publicPermission set to CKShareParticipantPermissionNone. You cannot mix and match private users and public users in the same share. Only certain participant types may be added via this API; see CKShareParticipantMBS.

34.45.4 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.12 and newer in 64-bit application.

34.45.5 CKRecordTypeShare as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The type of record for a share.

34.45.6 CKShareThumbnailImageDataKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the predefined keys in the CKRecordTypeShare schema.
Notes: They're used by the out of process UI flow to send a share, and as part of the share acceptance flow. These are optional.

Value is a data blob suitable to pass into NSImageMBS.imageWithData.

34.45.7 CKShareTitleKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the predefined keys in the CKRecordTypeShare schema.
Notes: They're used by the out of process UI flow to send a share, and as part of the share acceptance flow. These are optional.

Value is a string. Example for a recipe sharing app: "Pot Roast"

34.45.8 CKShareTypeKey as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the predefined keys in the CKRecordTypeShare schema.
Notes: They're used by the out of process UI flow to send a share, and as part of the share acceptance flow. These are optional.

Value is a string representing a UTI. Example for a recipe sharing app: "com.mycompany.recipe"

34.45.9 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.

- 34.45.15 Constructor(zoneID as CKRecordZoneIDMBS) 6124

34.45.13 Constructor(rootRecord as CKRecordMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a share object.
Notes: When saving a newly created CKShare, you must save the share and its rootRecord in the same CKModifyRecordsOperationMBS batch.

- 34.45.15 Constructor(zoneID as CKRecordZoneIDMBS) 6124

34.45.14 Constructor(rootRecord as CKRecordMBS, shareID as CKRecordIDMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a share object.
Notes: rootRecord: The record being shared.
shareID: The CKRecordID associated with this share.

When saving a newly created CKShare, save the share and its rootRecord in the same CKModifyRecordsOperationMBS batch.

- 34.45.15 Constructor(zoneID as CKRecordZoneIDMBS) 6124

34.45.15 Constructor(zoneID as CKRecordZoneIDMBS)

MBS Mac64bit Plugin, Plugin Version: 21.3, Platform: macOS, Targets: All.

Function: Creates a new share for the specified record zone.
Notes: ZoneID: The ID of the record zone to share.

A shared record zone must have the CKRecordZoneCapabilityZoneWideSharing capability. Custom record zones that you create in the user,Äôs private database have this capability by default. A record zone, and the records it contains, can take part in only a single share.

After accepting a share invite, CloudKit adds the records of the shared record zone to a new zone in the participant,Äôs shared database. Use CKFetchDatabaseChangesOperationMBS to fetch the ID of the new record zone. Then configure CKFetchRecordZoneChangesOperationMBS with that record zone ID and execute the operation to fetch the records.
If you use CKFetchShareMetadataOperationMBS to fetch the metadata for a shared record zone, the operation ignores the shouldFetchRootRecord and rootRecordDesiredKeys properties because, unlike a shared record hierarchy, a record zone doesn,Äôt have a nominated root record.

Available in macOS 12 or later.

34.45.16 participants as CKShareParticipantMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: An array containing metadata objects for all participants in this share.
Notes: The participants array contains all participants on the share that the current user has permissions to see. At a minimum, this array includes the owner and the current user.

34.45.17 removeParticipant(participant as CKShareParticipantMBS)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Removes a participant from the share.
Notes: participant: The participant to be removed from this share.

To modify the list of participants, a share must have publicPermission set to CKShareParticipantPermissionNone. You cannot mix and match private users and public users in the same share. Only certain participant types may be added via this API; see CKShareParticipantMBS.

34.45.18 Properties

34.45.19 currentUserParticipant as CKShareParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The current user,Äôs metadata for this share.
Notes: This computed property accesses the participants property and returns the CKShareParticipant that is associated with the current user.
(Read only property)

34.45.20 owner as CKShareParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The share owner,Äôs metadata.
Notes: This computed property accesses the participants property and returns the CKShareParticipant that is associated with the owner of this share.
(Read only property)

34.45.21 publicPermission as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Definition of permissions new users joining this share will have initially.
Notes: Shares with publicPermission more permissive than CKShareParticipantPermissionNone are joinable by any user with access to the share,Äôs URL. If the value is set to CKShareParticipantPermissionReadWrite, then those users can also create and modify records in the share. By default, public permission is CKShareParticipantPermissionNone. Changing the public permission to CKShareParticipantPermissionNone results in all public participants being removed when the share is saved.
(Read and Write property)

34.45.22 URL as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A URL that can be used to invite participants to this share.
Notes: This property is only available after a share record has been saved to the server. This URL is stable and is tied to the rootRecord. If you share a rootRecord, delete the share, and then re-share the same rootRecord via a newly created share, that newly created share,Äôs URL will be identical to the prior share,Äôs URL.
(Read only property)

34.46 class CKShareMetadataMBS

34.46.1 class CKShareMetadataMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A reference to the metadata for a shared record.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 21.3pr1

34.46.2 Methods

34.46.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.12 and newer in 64-bit application.

34.46.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.

34.46.5 copy as CKShareMetadataMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.46.6 Properties

34.46.7 containerIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The unique identifier for the container associated with this share.
Notes: This read only property can be used to fetch the container associated with this share.
(Read only property)

34.46.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.46.9 ownerIdentity as CKUserIdentityMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The identity of the owner of the associated share.
Notes: This read only property is used to access the owner of the share.
(Read only property)

34.46.10 participantPermission as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Permissions associated with the user who retrieved the metadata for this share.
Notes: This property reflects the permissions associated with the participant who invoked the CKFetchShareMetadataOperationMBS.
(Read only property)

34.46.11 participantStatus as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The participation status of the user who retrieved the metadata for this share.
Notes: This property reflects the status of the participant who invoked the CKFetchShareMetadataOperationMBS. See CKShareParticipantMBS for the statuses available.
(Read only property)

34.46.12 participantType as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The type of the user who retrieved the metadata for this share.
Notes: This property reflects the participantType of the participant who invoked the CKFetchShareMetadataOperationMBS. See CKShareParticipantMBS for the types available.
(Read only property)

34.46.13 rootRecord as CKRecordMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The root record associated with this share.
Notes: This read only property contains a reference to the root record associated with this share. This property can be nil if the CKFetchShareMetadataOperationMBS did not set shouldFetchRootRecord to true.
(Read only property)

34.46.14 rootRecordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The unique identifier for the root record associated with this share.
Notes: This property is populated even if shouldFetchRootRecord is set to false on the CKFetchShareMetadataOperationMBS and can be used to retrieve the rootRecord if the record was not retrieved with the metadata.
(Read only property)

34.46.15 share as CKShareMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The associated share.
Notes: This read only property contains a reference to the CKShareMBS that this CKShareMetadataMBS is associated with.
(Read only property)

34.47 class CKShareParticipantMBS

34.47.1 class CKShareParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A reference to a person who accepted a shared record..
Example:

```
// list who a shared CloudKit record is shared with and whether they accepted
// share is a CKShareMBS, e.g. fetched from your CKDatabaseMBS
Var share As CKShareMBS // your share
If share = Nil Then Return

For Each p As CKShareParticipantMBS In share.participants
Var name As String = "unknown"
If p.userIdentity <>Nil And p.userIdentity.nameComponents <>Nil Then
name = p.userIdentity.nameComponents.givenName + " " + p.userIdentity.nameComponents.familyName
End If
Var accepted As Boolean = p.acceptanceStatus = CKShareParticipantMBS.CKShareParticipantAcceptanceS-
tatusAccepted
Var canWrite As Boolean = p.permission = CKShareParticipantMBS.CKShareParticipantPermissionRead-
Write
System.DebugLog name + ": accepted " + accepted.ToString + ", can write " + canWrite.ToString
Next
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

34.47.2 Methods

34.47.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.47.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.

34.47.5 copy as CKShareParticipantMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.47.6 Properties

34.47.7 acceptanceStatus as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The current state of the user,Äôs acceptance of this share. (read-only)
Notes: This property contains the current state of the participant,Äôs acceptance of this share. For a list of possible values, see CKShareParticipantAcceptanceStatus* constants.
(Read only property)

34.47.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.47.9 permission as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The permission level that the user has for this share.
Notes: This property controls the permissions that the participant has for this share. For a list of possible values, see CKShareParticipantPermission* constants.
(Read and Write property)

34.47.10 role as Integer

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: All.

Function: The participant,Äôs role for the share.
Notes: The property controls the participant role for the share.
For a list of possible values, see CKShareParticipantRole* constants.
(Read and Write property)

34.47.11 type as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use role instead. **Function:** The participant type.
Notes: The property controls the participant type for the share.
For a list of possible values, see CKShareParticipantType* constants.
(Read and Write property)

34.47.12 userIdentity as CKUserIdentityMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The identity of the participant. (read-only)
Notes: This property contains a reference to the user identity for the share participant.
(Read only property)

34.47.13 Constants

Acceptance Status

Constant	Value	Description
CKShareParticipantAcceptanceStatusAccepted	2	The participant has accepted the share request.
CKShareParticipantAcceptanceStatusPending	1	The participant has not accepted the share request.
CKShareParticipantAcceptanceStatusRemoved	3	The participant was removed from the share.
CKShareParticipantAcceptanceStatusUnknown	0	The participant,Äôs status is unknown.

Permissions

Constant	Value	Description
CKShareParticipantPermissionNone	1	The participant does not have any permissions for this share.
CKShareParticipantPermissionReadOnly	2	The participant has read only permissions for this share.
CKShareParticipantPermissionReadWrite	3	The participant has full read and write permissions for this share.
CKShareParticipantPermissionUnknown	0	The current status of the participant,Äôs permissions is unknown.

Participant Roles.

Constant	Value	Description
CKShareParticipantRoleOwner	1	The participant is the owner of the share. As owner, the user can add pri users to the share.
CKShareParticipantRolePrivateUser	3	The participant is a private user and can access the share.
CKShareParticipantRolePublicUser	4	The participant is a private user and can access the share.
CKShareParticipantRoleUnknown	0	The type of the participant cannot be determined.

Participant Types.

Constant	Value	Description
CKShareParticipantTypeOwner	1	The participant is the owner of the share. As owner, the user can add pri users to the share.
CKShareParticipantTypePrivateUser	3	The participant is a private user and can access the share.
CKShareParticipantTypePublicUser	4	The participant is a public user. Public users are ‚Äúself-added‚Äù when participant accesses the shareURL. Owners cannot add public users.
CKShareParticipantTypeUnknown	0	The type of the participant cannot be determined.

34.48 class CKSubscriptionMBS

34.48.1 class CKSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Use a CKSubscription object to track changes occurring on the server.
Notes: A subscription acts like a persistent query on the server that can track the creation, deletion, and modification of records. When changes occur, they trigger the delivery of push notifications so that your app can respond appropriately.

see
https://developer.apple.com/reference/cloudkit/cksubscription

Available in 10.10 in 64-bit, but most is deprecated by Apple with 10.12.

34.48.2 Methods

34.48.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.10 and newer in 64-bit application.

34.48.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.
See also:

- 34.48.5 Constructor(RecordType as String, predicate as NSPredicateMBS, querySubscriptionOptions as Integer) 6135
- 34.48.6 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer) 6135
- 34.48.7 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string, subscriptionOptions as Integer) 6136
- 34.48.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer) 6137

34.48.5 Constructor(RecordType as String, predicate as NSPredicateMBS, querySubscriptionOptions as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a query-based subscription that monitors records with the specified options.
Notes: recordType: The string that identifies the type of records to track. You are responsible for naming your app,Äôs record types. This parameter must not be nil or an empty string.
predicate: The matching criteria to apply to the records. This parameter must not be nil. For information about the operators that are supported in search predicates, see the discussion in CKQueryMBS.
subscriptionOptions: A bitmask of the configuration options for the subscription. You must specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.

Returns a subscription object initialized to track record-related changes.

The object returned by this method is configured as a query-based subscription for searching records in the target database. The subscription monitors the specified type of records in all of the user,Äôs record zones and generates push notifications when the search criteria are met.

34.48.6 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a query-based subscription that monitors records with the specified options.
Notes: recordType: The string that identifies the type of records to track. You are responsible for naming your app,Äôs record types. This parameter must not be nil or an empty string.
predicate: The matching criteria to apply to the records. This parameter must not be nil. For information about the operators that are supported in search predicates, see the discussion in CKQueryMBS.
subscriptionOptions: A bitmask of the configuration options for the subscription. You must specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.

Returns a subscription object initialized to track record-related changes.

The object returned by this method is configured as a query-based subscription for searching records in the target database. The subscription monitors the specified type of records in all of the user,Äôs record zones and generates push notifications when the search criteria are met.

- 34.48.7 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string, subscriptionOptions as Integer) 6136
- 34.48.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer) 6137

34.48.7 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string, subscriptionOptions as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a subscription object that monitors the specified zone and has a custom name that you provide.
Notes: zoneID: The ID of the record zone containing the records you want to monitor. This parameter must not be nil.
subscriptionID: The unique name of the subscription object. This string must be unique for all other subscription objects in the container. This parameter must not be nil.
subscriptionOptions: The configuration options for the subscription. You must specify 0 for this parameter. Zone subscriptions currently do not support any options.

Returns a subscription object initialized to track changes to the contents of a record zone.

The object returned by this method is configured as a zone-based subscription, which generates a push notification when any changes are made to the records in the specified zone.

- 34.48.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer) 6137

34.48.8 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionOptions as Integer)

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a subscription object that monitors all records in the specified record zone.
Notes: zoneID: The ID of the record zone containing the records you want to monitor. This parameter must not be nil.
subscriptionOptions: The configuration options for the subscription. You must specify 0 for this parameter. Zone subscriptions currently do not support any options.

Returns a subscription object initialized to track changes to the contents of a record zone.

The object returned by this method is configured as a zone-based subscription, which generates a push notification when any changes are made to the records in the specified zone.

- 34.48.6 Constructor(RecordType as String, predicate as NSPredicateMBS, subscriptionID as string, querySubscriptionOptions as Integer) 6135
- 34.48.7 Constructor(zoneID as CKRecordZoneIDMBS, subscriptionID as string, subscriptionOptions as Integer) 6136

34.48.9 copy as CKSubscriptionMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.48.10 Properties

34.48.11 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.48.12 notificationInfo as CKNotificationInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The configuration data for push notifications sent by the subscription.
Notes: If you want your subscription,Äôs push notifications to alert the user to corresponding changes, assign a value to this property. The server uses the information in the CKNotificationInfoMBS object to determine the delivery options for notifications. For example, you can specify the alert text to display and the name of a special sound file to play. When a push notification involves a record, you can also specify which fields of the record to include in the push notification,Äôs payload data.

If you do not assign a value to this property, the server still sends push notifications to your app but those notifications do not cause the system to alert the user. The default value of this property is nil.
(Read only property)

34.48.13 predicate as NSPredicateMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The matching criteria to apply to records.
Notes: A query-based subscription uses its search predicate to identify potential matches for records. It combines the predicate information with the value in the subscriptionOptions property to determine the conditions under which to send a push notification to the app.

The search predicate defines the records that the subscription object monitors for changes. The value in this property is used only if the subscriptionTypeMBS property is set to CKSubscriptionTypeQuery; otherwise, it is ignored.
(Read only property)

34.48.14 recordType as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The record type being monitored in a query-based subscription.
Notes: The value of this property applies only to query-based subscriptions and is set automatically by the constructors. For all other types of subscription objects, the value of this property is ignored and set to nil.
(Read only property)

34.48.15 subscriptionID as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The unique identifier for the subscription.
Notes: If you initialize the subscription object using the constructor, the default value of this property is set to the value provided by those methods. In all other cases, an ID based on a UUID is generated for you automatically.
(Read only property)

34.48.16 subscriptionOptions as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The options for triggering notifications.
Notes: Set the value of this property at initialization time. When configuring a query-based subscription, you must specify at least one of the following values: CKSubscriptionOptionsFiresOnRecordCreation, CKSubscriptionOptionsFiresOnRecordUpdate, or CKSubscriptionOptionsFiresOnRecordDeletion.
(Read only property)

34.48.17 subscriptionType as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The type of behavior provided by the subscription.
Notes: The value of this property is set automatically at creation time. Use it to distinguish between query-based subscriptions and those that monitor specific types of data.
(Read only property)

34.48.18 zoneID as CKRecordZoneIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ID of the record zone to monitor.
Notes: The value of this property applies both to query-based subscriptions and zone-based subscriptions. Specifying a record zone limits the search scope to the records in that zone. In the case of a zone-based subscription, the search encompasses all records in the zone. For a query-based subscription, the search encompasses only records of a specific type in that zone.

For zone-based subscriptions, the value of this property is set automatically by the constructor. For all other subscription types, the default value is nil. To apply a zone to a query-based subscriptions, you must assign a value explicitly.
(Read only property)

34.48.19 Constants

Configuration Options

Constant	Value	Description
OptionsFiresOnce	8	An option for sending a push notification only one time. After sending the push notification, the server deletes the subscription object. This option applies only to query-based subscriptions.
OptionsFiresOnRecordCreation	1	An option for generating a push notification when a record that matches the search criteria in the predicate property is created. This option applies only to query-based subscriptions subscriptions.
OptionsFiresOnRecordDeletion	4	An option for generating a push notification when a record that matched the search criteria in the predicate property was deleted. This option applies only to query-based subscriptions.
OptionsFiresOnRecordUpdate	2	An option for generating a push notification when changes are made to the fields of a record that cause the record to match the search criteria specified in the predicate property. This option applies only to query-based subscriptions.

Subscription Types

Constant	Value	Description
TypeDatabase	3	A constant indicating the subscription is a query-based subscription. This type of subscription tracks the creation, modification, or deletion of a specific type of record.
TypeQuery	1	A constant indicating the subscription is a query-based subscription. This type of subscription tracks the creation, modification, or deletion of a specific type of record.
TypeRecordZone	2	A constant indicating the subscription is a zone-based subscription. The subscription tracks changes to records in a specific record zone.

34.49 class CKUserIdentityLookupInfoMBS

34.49.1 class CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: An object that represents information you use to fetch users.
Example:

```
// describe users to look up by email address or phone number
Var byMail As CKUserIdentityLookupInfoMBS = CKUserIdentityLookupInfoMBS.lookupInfosWithEmailAd-
dress("john@example.com")
Var byPhone As CKUserIdentityLookupInfoMBS = CKUserIdentityLookupInfoMBS.lookupInfosWithWith-
PhoneNumber("+49 170 1234567")

Var infos() As CKUserIdentityLookupInfoMBS
infos.Add byMail
infos.Add byPhone
MessageBox infos.Count.ToString + " lookups: " + byMail.emailAddress + ", " + byPhone.phoneNumber

// pass infos to CKDiscoverUserIdentitiesOperationMBS or CKFetchShareParticipantsOperationMBS
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

34.49.2 Methods

34.49.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.12 and newer in 64-bit application.

34.49.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.
Notes: Please use the shared methods to constructor instances.
This constructor is private to make sure you don't create an object from this class by error. Please use designated functions to create objects.

34.49.5 copy as CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.49.6 lookupInfosWithEmailAddress(emailAddress as string) as CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns an array of user identity lookup objects configured with email addresses as the search criteria.
Notes: emails: An array of strings that represent the email addresses to use to configure the CKUserIdentityLookupInfoMBS objects.

Returns an array of CKUserIdentityLookupInfoMBS objects that are configured with the email addresses that were passed in.
May return nil in case of error.

Once initialized, these objects can be passed into a CKDiscoverUserIdentitiesOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentity objects for the user.

34.49.7 lookupInfosWithEmails(emailAddresses() as string) as CKUserIdentityLookupInfoMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns an array of user identity lookup objects configured with email addresses as the search criteria.
Notes: emails: An array of strings that represent the email addresses to use to configure the CKUserIdentityLookupInfoMBS objects.

Returns an array of CKUserIdentityLookupInfoMBS objects that are configured with the email addresses that were passed in.
May return nil in case of error.

Once initialized, these objects can be passed into a CKDiscoverUserIdentitiesOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentityMBS objects for the user.

34.49.8 lookupInfosWithPhoneNumbers(phoneNumbers() as string) as CKUserIdentityLookupInfoMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns an array of user identity lookup objects configured with phone numbers as the search criteria.
Notes: phoneNumbers: An array of strings that represent the phone numbers to use to configure the CKUserIdentityLookupInfoMBS objects.

Returns an array of CKUserIdentityLookupInfoMBS objects that are configured with the phone numbers that were passed in.
May return nil in case of error.

Once initialized, these objects can be passed into a CKDiscoverUserIdentitiesOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentityMBS objects for the user.

34.49.9 lookupInfosWithRecordIDs(userRecordIDs() as CKRecordIDMBS) as CKUserIdentityLookupInfoMBS()

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns an array of user identity lookup objects configured with phone numbers as the search criteria.
Notes: userRecordIDs: An array of CKRecordIDMBS objects that are used to configure the CKUserIdentityLookupInfoMBS objects.

Returns an array of CKUserIdentityLookupInfoMBS objects that are configured with the CKRecordIDMBS objects that were passed in.one

34.49.10 lookupInfosWithUserRecordID(userRecordID as CKRecordIDMBS) as CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a look up info object with the user record ID property configured.
Notes: userRecordID: The user record ID to use to look up the user.

Returns an user identity lookup object initialized to look up a user by the user,Äôs record ID, or nil if the object cannot be initialized.

Once initialized, this object can be passed into CKDiscoverUserIdentitiesOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentityMBS for the user.

34.49.11 lookupInfosWithWithPhoneNumber(phoneNumber as string) as CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Initializes and returns a look up info object with the phone number property configured.
Notes: phoneNumber: The phone number to use to look up the user.

Returns an user identity lookup object initialized to look up a user by the user,Äôs phone number, or nil if the object cannot be initialized.

Once initialized, this object can be passed into a CKDiscoverUserIdentitiesOperationMBS, or a CKFetchShareParticipantsOperationMBS to retrieve the CKUserIdentityMBS for the user.

34.49.12 Properties

34.49.13 emailAddress as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The email address of the user whose information you want to retrieve.
Notes: This property corresponds to a single email address associated with the user whose information you wish to look up.
(Read only property)

34.49.14 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.49.15 phoneNumber as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The phone number of the user whose information you want to retrieve.
Notes: This property corresponds to a single phone number associated with the user whose information you wish to look up.
(Read only property)

34.49.16 userRecordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The ID of the user record.
Notes: Use this value to retrieve the user record associated with the specified user. The user record does not contain any personal information about the user by default. Your app can add data to the user record but should not add any sensitive user data to it.
(Read only property)

34.50 class CKUserIdentityMBS

34.50.1 class CKUserIdentityMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A reference to a user.
Example:

```
// find out the name of the current iCloud user for your CloudKit container
// MyContainer is a subclass of CKContainerMBS with the events implemented.
// Container is a property of the window: Container As MyContainer
Container = New MyContainer(CKContainerMBS.defaultContainer)
Container.fetchUserRecordID

// in MyContainer:
Sub fetchUserRecordIDCompleted(userRecordID As CKRecordIDMBS, error As NSErrorMBS, tag As Variant) Handles fetchUserRecordIDCompleted
If userRecordID <>Nil Then discoverUserIdentityWithUserRecordID(userRecordID)
End Sub

Sub discoverUserIdentityWithUserRecordIDCompleted(userRecordID As CKRecordIDMBS, userInfo As CKUserIdentityMBS, error As NSErrorMBS, tag As Variant) Handles discoverUserIdentityWithUserRecordIDCompleted
If userInfo <>Nil Then
System.DebugLog "iCloud user: " + userInfo.localizedDisplayName + ", has iCloud account: " + userInfo.hasiCloudAccount.ToString
End If
End Sub
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

34.50.2 Methods

34.50.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.12 and newer in 64-bit application.

34.50.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The private constructor.

34.50.5 copy as CKUserIdentityMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.50.6 Properties

34.50.7 description as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The description text.
Notes: (Read only property)

34.50.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.50.9 hasiCloudAccount as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether this user has an iCloud account.
Notes: The value is true if this CKUserIdentity has an iCloud account associated with it; otherwise, false. (Read only property)

34.50.10 localizedDisplayName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The localized display name.
Notes: (Read only property)

34.50.11 lookupInfo as CKUserIdentityLookupInfoMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The information (phone number, email address, etc.) used to retrieve this user.
Notes: The information that is passed into a CKDiscoverUserIdentitiesOperationMBS or CKFetchShareParticipantsOperationMBS object to retrieve the user identity.
(Read only property)

34.50.12 nameComponents as NSPersonNameComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The name of the user associated with the specified user identity object.
Notes: This property can be used to display the name of the user associated with this CKUserIdentity object.
(Read only property)

34.50.13 userRecordID as CKRecordIDMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Unique identifier for this record.
Notes: This property is the unique identifier associated with this CKUserIdentity.
(Read only property)

34.51 class NSPersonNameComponentsMBS

34.51.1 class NSPersonNameComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: An NSPersonNameComponents object encapsulates the components of a person's name in an extendable, object-oriented manner.
Example:

```
// put a name together from its parts
Var name As New NSPersonNameComponentsMBS
name.namePrefix = "Dr."
name.givenName = "Jane"
name.middleName = "Mary"
name.familyName = "Smith"
name.nickname = "Janie"

MessageBox name.formatted.text
```

Notes: It is used to specify a person's name by providing the components comprising a full name: given name, middle name, family name, prefix, suffix, nickname, and phonetic representation.

34.51.2 Methods

34.51.3 Available as Boolean

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Should be true for OS X 10.11 and newer.

34.51.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The constructor.

34.51.5 copy as NSPersonNameComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Creates a copy of this object.

34.51.6 formatted as NSAttributedStringMBS

MBS Mac64bit Plugin, Plugin Version: 21.5, Platform: macOS, Targets: All.

Function: Provides a formatted representation of the name.
Example:

```
// This example needs a window with TextArea1.
Var n As New NSPersonNameComponentsMBS

n.familyName = "Smith"
n.givenName = "Bob"

Var a As NSAttributedStringMBS = n.formatted

Var tv As NSTextViewMBS = TextArea1.NSTextViewMBS
tv.textStorage.setAttributedString a
```

34.51.7 Properties

34.51.8 familyName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Name bestowed upon an individual to denote membership in a group or family. (for example, ,ÄúAppleseed,Äù).
Notes: (Read and Write property)

34.51.9 givenName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Name bestowed upon an individual to differentiate them from other members of a group that share a family name (for example, ,ÄúJohnathan,Äù).
Notes: (Read and Write property)

34.51.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

34.51.11 middleName as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Secondary name bestowed upon an individual to differentiate them from others that have the same given name (for example, ,ÄúMaple,Äù).
Notes: (Read and Write property)

34.51.12 namePrefix as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The portion of a name,Äôs full form of address that precedes the name itself (for example, ,ÄúDr.,,Äù ,ÄúMr.,,Äù ,ÄúMs.,Äù).
Notes: (Read and Write property)

34.51.13 nameSuffix as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The portion of a name,Äôs full form of address that follows the name itself (for example, ,ÄúEsq.,,Äù ,ÄúJr.,,Äù ,ÄúPh.D.,Äù).
Notes: (Read and Write property)

34.51.14 nickname as String

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Name substituted for the purposes of familiarity (for example, ”Johnny”).
Notes: (Read and Write property)

34.51.15 phoneticRepresentation as NSPersonNameComponentsMBS

MBS Mac64bit Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The phonetic representation name components of the receiver.
Notes: Each component of the receiver with a value should have a corresponding value for any value set for this property. nil by default.
(Read and Write property)

Chapter 35

Cocoa

35.1 class CADisplayLinkMBS

35.1.1 class CADisplayLinkMBS

MBS MacCocoa Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: A timer object that allows your app to synchronize its drawing to the refresh rate of the display.
Example:

```
// This example needs a window with Canvas1.
// redraw a canvas in sync with the refresh rate of the display
// MyDisplayLink is a subclass of CADisplayLinkMBS with the Action event implemented.
// Link is a property of the window: Link As MyDisplayLink
Link = New MyDisplayLink(Canvas1)
Link.tag = Canvas1

// when done: Link.invalidate

// in MyDisplayLink:
Sub Action() Handles Action
// timestamp is the time of the last frame, use it to calculate animation positions
Var c As DesktopCanvas = Me.tag
c.Refresh
End Sub
```

Notes: Your app initializes a new display link by providing an Action event to call when the system updates the screen. The event can read the display link,Äôs timestamp property to retrieve the time the system displayed the previous frame. For example, an app that displays movies might use timestamp to calculate which video frame to display next. An app that performs its own animations might use timestamp to determine where and how visible objects appear in the upcoming frame.

The duration property provides the amount of time between frames at the maximumFramesPerSecond. To calculate the actual frame duration, use targetTimestamp - timestamp. You can use this value in your app to calculate the frame rate of the display, the approximate time the system displays the next frame, and to adjust the drawing behavior so that the next frame is ready in time to display.

Your app can disable notifications by setting paused to true. Also, if your app can,Äôt provide frames in the time the system provides, you may want to choose a slower frame rate. An app with a slower but consistent frame rate appears smoother to the user than an app that skips frames. You can define the number of frames per second by setting preferredFramesPerSecond.

When your app finishes with a display link, call invalidate to remove it from all run loops and to disassociate it from the target.

Xojo Developer Magazine

- 24.2, page 8: News

35.1.2 Methods

35.1.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Creates a display link for a target that calls its selector.
See also:

- 35.1.4 Constructor(target as Variant) 6154

35.1.4 Constructor(target as Variant)

MBS MacCocoa Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Creates a display link timer based on the given target.
Notes: The target on iOS may be

- nil

- MobileControl
- MobileScreen
- iOSControl
- iOSScreen
- NSScreenMBS object for the screen

The target on macOS may be:

- NSViewMBS
- Window
- DesktopWindow
- RectControl
- DesktopUIControl
- NSScreenMBS object for the screen

Raises an exception if called with wrong
See also:

- 35.1.3 Constructor 6154

35.1.5 invalidate

MBS MacCocoa Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: Removes the display link from all run loop modes.
Notes: This method is thread safe, so you can call it from a thread separate to the one in which the display link runs.

35.1.6 Properties

35.1.7 duration as Double

MBS MacCocoa Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The time interval between screen refresh updates.
Notes: This value is in an undefined state until the system calls the target,Äôs selector at least once.

You calculate the expected amount of time your app has to render each frame by using targetTimestamp-timestamp. Use targetTimestamp-CACurrentMediaTime to calculate the actual amount of time.
(Read only property)

35.1.8 frameInterval as Double

MBS MacCocoa Plugin, Plugin Version: 26.0, Platform: iOS, Targets: iOS only.

Function: The number of frames that must pass before the display link notifies the target again.
Notes: The default value is 1, which results in the system notifying your app at the refresh rate of the display. If you set the value to a value greater than 1, the display link notifies your app at a fraction of the native refresh rate. For example, setting the interval to 2 causes the display link to fire every other frame, providing half the frame rate.

Setting this value to less than 1 results in undefined behavior and is a programmer error.
(Read and Write property)

35.1.9 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

35.1.10 paused as Boolean

MBS MacCocoa Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: A boolean value that indicates whether the system suspends the display link,Äôs notifications to the target.
Notes: The default value is false. If true, the display link doesn,Äôt send notifications to the target.

This property is thread safe, so you can set it from a thread separate to the one in which the display link runs.
(Read and Write property)

35.1.11 preferredFramesPerSecond as Double

MBS MacCocoa Plugin, Plugin Version: 26.0, Platform: iOS, Targets: iOS only.

Function: A frequency your app prefers for frame updates, affecting how often the system invokes your delegate,Äôs callback.
Notes: The display link makes a best attempt to invoke your app,Äôs callback at the frequency value you set to this property. However, the system also takes into account the device,Äôs hardware capabilities and the other tasks your game or app is running.

In iOS 15 and later, the system can change the available range of frame rates because it factors in system policies and a person,Äôs preferences. For example, Low Power Mode, critical thermal state, and accessibility settings can affect the system,Äôs frame rate.

The system typically provides a consistent frame rate by choosing one that,Äôs a factor of the display,Äôs maximum refresh rate. For example, a display link could invoke your callback 60 times per second for a display with a refresh rate of 60 hertz. However, the display link could invoke your callback less frequently, such as 30, 20, or 15 times per second, by setting a smaller value.

The property defaults to 0, which is equivalent to the display,Äôs maximum refresh rate, such as a UIScreen instance,Äôs maximumFramesPerSecond property.
(Read and Write property)

35.1.12 tag as Variant

MBS MacCocoa Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: A value you can use in your app however you like.
Notes: (Read and Write property)

35.1.13 targetTimestamp as Double

MBS MacCocoa Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The time interval that represents when the next frame displays.
Notes: You can use the target timestamp to cancel or pause long running processes that may overrun the available time between frames in order to maintain a consistent frame rate.
(Read only property)

35.1.14 timestamp as Double

MBS MacCocoa Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The time interval that represents when the last frame displayed.
Notes: If you need to calculate what to display next, use targetTimestamp instead.

(Read only property)

35.1.15 Events

35.1.16 Action

MBS MacCocoa Plugin, Plugin Version: 26.0, Platforms: macOS, iOS, Targets: All.

Function: The action event.

35.2 control CocoaControlMBS

35.2.1 control CocoaControlMBS

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The control to embed NSViews into a Xojo window.
Notes: Due the way Cocoa event handling works, the keydown event handler (and others) do not work with this control. To actually get an event, you'd have to use a subclass of CustomNSViewMBS and handle events there. In the CustomNSViewMBS you add the actual view you like to have. So all events not handled by this view, fall through to your CustomNSViewMBS.
On Carbon the RS framework intercepts events and calls keydown event.
Requires the window being composite for Carbon targets which is currently not available for modal windows in Xojo.

35.2.2 Properties

35.2.3 Available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether this control can work.
Notes: Returns true on Mac OS X 10.5 (or newer) and false on any other OS.
(Read only property)

35.2.4 View as NSViewMBS

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The view used with this control.
Notes: You define this view in the GetView event.
(Read only property)

35.2.5 WantsFocus as Boolean

MBS MacFrameworks Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Whether this control wants to have focus.
Notes: By default this is true.
(Read and Write property)

35.2.6 Events

35.2.7 Close

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & Web.

Function: The control is about to close.

35.2.8 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop & Web.

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.2.9 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop & Web.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.2.10 EnableMenuItems

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop & Web.

Function: The event where you can enable menu items.

35.2.11 GetView as NSViewMBS

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & Web.

Function: Asks your application which NSView should be used.
Example:

```
// an example on how to use this event:

Function GetView() As NSViewMBS
Var n as NSTextViewMBS

// create a textview:

n=new NSTextViewMBS(0, 0, CocoaControlMBS1.Width, CocoaControlMBS1.Height)
n.ContinuousSpellCheckingEnabled=true
Return n

End Function
```

Notes: Return a NSView setup as you like.
You may also want to keep a reference to the view you use for easier access.

35.2.12 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop & Web.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.2.13 MouseDrag(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop & Web.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.2.14 MouseUp(x as Integer, y as Integer)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop & Web.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.2.15 Open

MBS MacFrameworks Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & Web.

Function: The control is about to was created and you can initialize it.

35.2.16 ScaleFactorChanged(NewFactor as Double)

MBS MacFrameworks Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop & Web.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.3 module DictionaryServiceMBS

35.3.1 module DictionaryServiceMBS

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The Dictionary Services module.
Example:

```
// look up a word in the macOS dictionary
Var definition As String = DictionaryServiceMBS.TextDefinition("serendipity")
If definition = "" Then
MessageBox "Not found."
Else
MessageBox definition
End If
```

Notes: Dictionary Services provides functions that let you access dictionaries programmatically from within your application.

A dictionary is any look-up reference that is built using the Dictionary Development Kit. The contents of a dictionary can serve many purposes. The most typical use is to provide definitions for a single language, but you can create content for a thesaurus, bilingual dictionaries (such as English-Japanese), in-house glossaries, and professional dictionaries (such as legal, medical, and technical).

Available in Mac OS X v10.5 and later.

- MBS Xojo Plugins, version 25.6pr1

35.3.2 Methods

35.3.3 GetTermRangeInString(text as string, offset as Integer=0) as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Determines the range of the longest word or phrase with respect to an offset.
Notes: text: Text that contains the word or phrase to look up.
offset: A character offset in the textString parameter.

Return Value

The range that specifies the location, around the specified offset, of the word or phrase, or the value -1. The range is stored in the RangePosition and RangeLength properties and the function returns true. On any

error it returns false.

You can use this function to determine the range of text that contains a word or phrase. After you determine the range, you can pass the result to the functions TextDefinition and Show.

To see how this works, follow these steps:
In Mac OS X v10.5 or later, open Text Edit.
Type It is a foggy day in San Francisco, California.
Control-click Francisco (don't select it). Then, choose "Lookup in Dictionary".

Note that the Dictionary window appears with a definition of San Francisco. The function GetTermRangeInString automatically detected the range of the phrase San Francisco, using Francisco as the text string to search for and a character offset in this string. The function expanded the range until it found a possible match.

You can also point the cursor at the word Francisco and, without making a selection or clicking, type Command-Control-D. GetTermRangeInString detects the range.

The function GetTermRangeInString only returns the range. You must call TextDefinition to copy the definition and Show to display the definition in a Dictionary window.

Available in Mac OS X v10.5 and later.

35.3.4 RangeLength as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The length from the range.
Notes: This value set by the GetTermRangeInString function.
(Read and Write computed property)

35.3.5 RangePosition as Integer

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The position from the range.
Notes: This value set by the GetTermRangeInString function.
(Read and Write computed property)

35.3.6 Show(text as string, start as Integer = 0, length as Integer = 0, textOriginX as Double = 0, textOriginY as Double = 0) as boolean

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Displays dictionary search result in a dictionary window.
Notes: text: Text that contains the word or phrase to look up.

start and length:
If you are using this function to show the results associated with text selected by the user, then provide the selection range of the textString parameter. If you are using this function to show the results associated with calling the DCSGetTermRangeInString function, then provide the range returned by that function.

This function opens a window to display the definition of a word or phrase.

Available in Mac OS X v10.5 and later.

35.3.7 TextDefinition(text as string, position as Integer=0, length as Integer=0) as string

MBS MacFrameworks Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the definition associated with the provided text range.
Notes: text: Text that contains the word or phrase to look up.

position and length: A range that specifies the location of the word or phrase in the textString parameter. If text string exactly specifies the word or phrase that you want to look up, you can pass the range of the text string. For example, for the word make, you would pass (0,4) to specify the range.

If the textString parameter contains the word or phrase, but does not specify it exactly, then pass the range returned by the function GetTermRangeInString.

Return Value:
The definition of the word or phrase, as plain text. The returned text does not contain any elements that are marked with a priority attribute whose value is 2.

This function returns the description of the first matching record found in the active dictionaries. It searches first in the default word definition dictionary which, in the English environment, is the Oxford dictionary.

Available in Mac OS X v10.5 and later.

35.4 class NSAlertMBS

35.4.1 class NSAlertMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The class for a standard Cocoa alert.
Example:

```
Var a As New NSAlertMBS

a.alertStyle = NSAlertMBS.NSCriticalAlertStyle
a.messageText = "Should be do it?"

Var actionButton As NSButtonMBS = a.addButtonWithTitle("Do it!")
actionButton.hasDestructiveAction = True
actionButton.keyEquivalent = encodings.UTF8.Chr(13) // enter

Var cancelButton As NSButtonMBS = a.addButtonWithTitle("Cancel")
cancelButton.keyEquivalent = encodings.UTF8.Chr(27) // esc

Var e As Integer = a.runModal

If e = a.NSAlertFirstButtonReturn Then
MessageBox "Do it!"
End If
```

Xojo Developer Magazine

- 20.3, page 10: News
- 12.4, page 9: News

35.4.2 Methods

35.4.3 addButtonWithTitle(title as string) as Variant

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Customize the buttons in the alert panel.
Example:

```
// make dialog
Var a as NSAlertMBS = NSAlertMBS.alertWithMessageText("Hello World", "First Button", "Second Button")

// add button
Var thirdButton as NSButtonMBS = a.addButtonWithTitle("Third Button")

// and show dialog
call a.runModal
```

Notes: Buttons are added from right to left (for left to right languages).
Returns NSButtonMBS object.

35.4.4 alertWithError(error as NSErrorMBS) as NSAlertMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Given an NSError, create an NSAlert that can be used to present the error to the user.
Notes: The error's localized description, recovery suggestion, and recovery options will be used to set the alert's message text, informative text, and button titles, respectively.

35.4.5 alertWithMessageText(MessageText as string, defaultButton as string = "", alternateButton as string = "", otherButton as string = "", informativeText as string = "") as NSAlertMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new alert with given property values.

35.4.6 beginSheetModalForWindow(win as DesktopWindow)

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Begins a sheet on the document window.
Notes: If the alert has an alertStyle of NSCriticalAlertStyle, it will be shown as a "critical" sheet; it will otherwise be presented as a normal sheet.
Calls later SheetDidEnd event with the result.

Please keep a reference to the dialog object alive to avoid trouble.
e.g. store reference in parent window, global property or app property.
See also:

- 35.4.7 beginSheetModalForWindow(win as NSWindowMBS) 6168
- 35.4.8 beginSheetModalForWindow(win as window) 6168

35.4.7 beginSheetModalForWindow(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Begins a sheet on the document window.
Notes: If the alert has an alertStyle of NSCriticalAlertStyle, it will be shown as a "critical" sheet; it will otherwise be presented as a normal sheet.
Calls later SheetDidEnd event with the result.

Please keep a reference to the dialog object alive to avoid trouble.
e.g. store reference in parent window, global property or app property.
See also:

- 35.4.6 beginSheetModalForWindow(win as DesktopWindow) 6167
- 35.4.8 beginSheetModalForWindow(win as window) 6168

35.4.8 beginSheetModalForWindow(win as window)

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Begins a sheet on the document window.
Notes: If the alert has an alertStyle of NSCriticalAlertStyle, it will be shown as a "critical" sheet; it will otherwise be presented as a normal sheet.
Calls later SheetDidEnd event with the result.

Please keep a reference to the dialog object alive to avoid trouble.
e.g. store reference in parent window, global property or app property.
See also:

- 35.4.6 beginSheetModalForWindow(win as DesktopWindow) 6167
- 35.4.7 beginSheetModalForWindow(win as NSWindowMBS) 6168

35.4.9 buttons as Variant()

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Get the buttons, where the rightmost button is at index 0.
Example:

```
Var a as NSAlertMBS = NSAlertMBS.alertWithMessageText("Hello World", "First Button", "Second Button")
Var buttons() as Variant = a.buttons

for each b as NSButtonMBS in buttons
MessageBox b.title
next
```

Notes: Returns NSButtonMBS array.

35.4.10 close

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Closes the alert sheet.
Notes: The SheetDidEnd event will not run.

35.4.11 Constructor

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The constructor for an empty alert.
Notes: Use properties to configure the dialog.

35.4.12 Destructor

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The destructor.

35.4.13 layout

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Performs the layout for the dialog.
Notes: Can be used to indicate that the alert panel should do immediate layout, overriding the default behavior of laying out lazily just before showing panel. You should only call this method if you want to do your own custom layout after it returns. You should call this method only after you have finished with NSAlert customization, including setting message and informative text, and adding buttons and an accessory view if needed. You can make layout changes after this method returns, in particular to adjust the frame of an accessory view. Note that the standard layout of the alert may change in the future, so layout customization should be done with caution.

35.4.14 runModal as Integer

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Run the alert as an application-modal panel and return the result.
Example:

```
Var a As New NSAlertMBS

a.messageText = "Should be do it?"

// OK button is added by default
Var e As Integer = a.runModal
```

35.4.15 SetTextAlignment(value as Integer)

MBS MacCocoa Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Changes text alignment for dialog to left text alignment.
Notes: on macOS Big Sur and later, the default alignment is center.
If you show multiple lines of text, it may be easier to read with left alignment.

This calls layout method to layout the dialog.

See NSParagraphStyleMBS or NSTextMBS class for the alignment constants.

35.4.16 Properties

35.4.17 accessoryView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The accessory view displayed in the alert panel.

Notes: By default, the accessory view is positioned below the informative text and the suppression button (if any) and above the alert buttons, left-aligned with the informative text. If you want to customize the location of the accessory view, you must first call layout method.
(Read and Write property)

35.4.18 alertStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The alert style.
Notes: Value can be:

NSWarningAlertStyle	0	Warning
NSInformationalAlertStyle	1	Information
NSCriticalAlertStyle	2	Critical Error

(Read and Write property)

35.4.19 helpAnchor as String

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The help anchor to use.
Notes: (Read and Write property)

35.4.20 icon as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Custom icon for dialog.
Notes: By default uses the image named NSApplicationIcon.
(Read and Write property)

35.4.21 informativeText as String

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The informative text.
Notes: (Read and Write property)

35.4.22 messageText as String

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The message text.
Notes: (Read and Write property)

35.4.23 showsHelp as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Whether to show help button.
Notes: True adds a help button to the alert panel. When the help button is pressed, the delegate is first consulted. If the event does not implement ShowHelp event or returns false, then NSHelpManager.openHelpAnchor is called with a nil book and the anchor specified by HelpAnchor, if any. An exception will be raised if the delegate returns false and there is no help anchor set.
(Read and Write property)

35.4.24 ShowsSuppressionButton as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Indicates whether or not the alert should contain a suppression checkbox.
Notes: The default is false. This checkbox is typically used to give the user an option to not show this alert again. If shown, the suppression button will have a default localized title similar to @"Do not show this message again". You can customize this title using alert.suppressionButton.Title. When the alert is dismissed, you can get the state of the suppression button, using [[alert suppressionButton] state] and store the result in user defaults, for example. This setting can then be checked before showing the alert again. By default, the suppression button is positioned below the informative text, and above the accessory view (if any) and the alert buttons, and left-aligned with the informative text. However do not count on the placement of this button, since it might be moved if the alert panel user interface is changed in the future. If you need a checkbox for purposes other than suppression text, it is recommended you create your own using an accessory view.
(Read and Write property)

35.4.25 suppressionButton as Variant

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Returns a suppression button which may be customized, including the title and the initial state.
Example:

```
// make dialog
Var a as NSAlertMBS = NSAlertMBS.alertWithMessageText("Hello World", "First Button", "Second But-
```

```
ton")

// get button
Var suppressionButton as NSButtonMBS = a.suppressionButton

// change title
suppressionButton.title = "Hello World Button"

// want to show it
a.ShowsSuppressionButton = true

// and show dialog
call a.runModal
```

Notes: You can also use this method to get the state of the button after the alert is dismissed, which may be stored in user defaults and checked before showing the alert again. In order to show the suppression button in the alert panel, you must set ShowsSuppressionButton to true.
Returns NSButtonMBS object.
(Read only property)

35.4.26 TimedOut as Boolean

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop only.

Function: Whether we got a timeout.
Notes: This is set to true when a timeout occurred.
(Read only property)

35.4.27 timeOut as Double

MBS MacCocoa Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop only.

Function: Timeout for the dialog.
Notes: Set this to the number of seconds after which the dialog should close.
(Read and Write property)

35.4.28 window as Variant

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Returns the application-modal panel or the document-modal sheet corresponding to this alert.
Notes: (Read only property)

35.4.29 Events

35.4.30 SheetDidEnd(returnCode as Integer)

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The sheet did finish.

35.4.31 ShowHelp as boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Show custom help.
Notes: See ShowHelp property.

35.4.32 Constants

Return codes

Constant	Value	Description
NSAlertFirstButtonReturn	1000	First (rightmost) button
NSAlertSecondButtonReturn	1001	Second button.
NSAlertThirdButtonReturn	1002	Third button.

Alert styles.

Constant	Value	Description
NSCriticalAlertStyle	2	Critical Error
NSInformationalAlertStyle	1	Informational Alert
NSWarningAlertStyle	0	Warning Alert (Default style)

35.5 class NSAnimationContextMBS

35.5.1 class NSAnimationContextMBS

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: The Cocoa class for the context of a NSAnimation.
Example:

```
// This example needs a window with Button1.
// fade out a button over two seconds
NSAnimationContextMBS.beginGrouping
NSAnimationContextMBS.currentContext.duration = 2.0
Button1.NSViewMBS.animator.alphaValue = 0.0
NSAnimationContextMBS.endGrouping
```

Notes: Available in Mac OS X v10.5 and later.
Blog Entries

- MBS Xojo Plugins, version 21.3pr1

35.5.2 Methods

35.5.3 beginGrouping

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Creates a new animation grouping.
Notes: Available in Mac OS X v10.5 and later.

35.5.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Creates a new NSAnimationContextMBS object with the current animation context.
Notes: Available in Mac OS X v10.5 and later.

35.5.5 currentContext as NSAnimationContextMBS

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the current animation context.
Notes: Available in Mac OS X v10.5 and later.

35.5.6 endGrouping

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Ends the current animation grouping.
Notes: Available in Mac OS X v10.5 and later.

35.5.7 Properties

35.5.8 allowsImplicitAnimation as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.3, Platform: macOS, Targets: All.

Function: Determine if animations are enabled or not for animations that occur as a result of another property change.
Example:

```
Var collectionView as NSCollectionViewMBS // your control

Var context As NSAnimationContextMBS = NSAnimationContextMBS.currentContext
context.beginGrouping
context.allowsImplicitAnimation = True
context.duration = 0.5

Var view As Variant = collectionView.animator
Var animator As NSCollectionViewMBS = view

// scroll to top
Var itemPaths() As NSIndexPathMBS
itemPaths.Add NSIndexPathMBS.indexPathForItem(0)

animator.scrollToItems(itemPaths, NSCollectionViewMBS.NSCollectionViewScrollPositionTop)

context.endGrouping
```

Notes: The default value is false.
(Read and Write property)

35.5.9 duration as Double

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: The duration used when animating object properties that support animation.
Example:

NSAnimationContextMBS.currentContext.duration = 0.5

Notes: Any animations that occur as a result of setting the values of animatable properties in the current context will run for this duration.

Available in Mac OS X v10.5 and later.
(Read and Write property)

35.5.10 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: The internal reference to the NSAnimationContext object.
Notes: (Read and Write property)

35.6 class NSAnimationMBS

35.6.1 class NSAnimationMBS

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Objects of the NSAnimation class manage the timing and progress of animations in the user interface.
Example:

```
// This example needs a window with ProgressBar1.
// animate a progress bar over 2 seconds with ease in and out
// Animation is a property of the window: Animation As NSAnimationMBS
Animation = New NSAnimationMBS(2.0, NSAnimationMBS.NSAnimationEaseInOut)
Animation.animationBlockingMode = NSAnimationMBS.NSAnimationNonblocking
Animation.frameRate = 30
AddHandler Animation.CurrentProgressChanged, AddressOf AnimationProgress
Animation.startAnimation

// a method in the window:
Sub AnimationProgress(sender As NSAnimationMBS, progress As Double)
// currentValue applies the animation curve to the linear progress
ProgressBar1.Value = sender.currentValue * 100
End Sub
```

Notes: The class also lets you link together multiple animations so that when one animation ends another one starts. It does not provide any drawing support for animation and does not directly deal with views, targets, or actions.

NSAnimation objects have several characteristics, including duration, frame rate, and animation curve, which describes the relative speed of the animation over its course. You can set progress marks in an animation, each of which specifies a percentage of the animation completed; when an animation reaches a progress mark, it notifies its delegate and posts a notification to any observers. Animations execute in one of three blocking modes: blocking, non-blocking on the main thread, and non-blocking on a separate thread. The non-blocking modes permit the handling of user events while the animation is running.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr11

35.6.2 Methods

35.6.3 clearStartAnimation

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Clears linkage to another animation that causes the receiver to start.

35.6.4 clearStopAnimation

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Clears linkage to another animation that causes the receiver to stop.

35.6.5 Constructor(duration as Double, animationCurve as Integer)

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Initializes the object with the specified duration and animation-curve values.
Notes: duration: The number of seconds over which the animation occurs. Specifying a negative number raises an exception.
animationCurve: An NSAnimationCurve constant that describes the relative speed of the animation over its course; if it is zero, the default curve (NSAnimationEaseInOut) is used.

You can always later change the duration of an NSAnimation object by sending it a setDuration: message, even while the animation is running. See "Constants" for descriptions of the NSAnimationCurve constants.

35.6.6 currentValue as Double

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the current value of the effect based on the current progress.

35.6.7 Destructor

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The destructor.

35.6.8 isAnimating as boolean

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the receiver is currently animating.
Notes: True if the receiver is animating, false otherwise.

35.6.9 startAnimation

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Starts the animation represented by the receiver.
Notes: The receiver retains itself and is then autoreleased at the end of the animation or when it receives stopAnimation. If the blocking mode is NSAnimationBlocking, the method only returns after the animation has completed or the delegate sends it stopAnimation. If the receiver has a progress of 1.0, it starts again at 0.0.

35.6.10 stopAnimation

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Stops the animation represented by the receiver.
Notes: The current progress of the receiver is not reset. When this method is sent to instances of NSViewAnimation (a subclass of NSAnimation) the receiver moves to the end frame location.

35.6.11 Properties

35.6.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: The internal reference to the animation object.
Notes: (Read and Write property)

35.6.13 animationBlockingMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: The blocking mode of the receiver.
Notes: A constant representing the blocking mode the animation is next scheduled to run under. See "NSAnimationBlockingMode" for valid values.

If the constant is NSAnimationNonblocking, the animation runs in the main thread in one of the standard run-loop modes or in a mode returned from runLoopModesForAnimating. If animationBlockingMode is NSAnimationNonblockingThreaded, a new thread is spawned to run the animation.

The default mode is NSAnimationBlocking, which means that the animation runs on the main thread in a custom run-loop mode that blocks user events. The new blocking mode takes effect the next time the receiver is started and has no effect on an animation underway.

(Read and Write computed property)

35.6.14 animationCurve as Integer

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: The animation curve the receiver is running under.
Notes: The animation curve describes the relative frame rate over the course of the animation. See NSAnimation* constants.
(Read and Write computed property)

35.6.15 currentProgress as Double

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: The current progress of the receiver.
Notes: The current progress is a value between 0.0 and 1.0 that represents the percentage of the animation currently completed.
(Read and Write computed property)

35.6.16 duration as Double

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: The duration of the animation, in seconds.
Notes: (Read and Write computed property)

35.6.17 frameRate as Double

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: The frame rate of the animation.
Notes: The frame rate is the number of updates per second. It is not guaranteed to be accurate because of differences between systems on the time needed to process a frame.
(Read and Write computed property)

35.6.18 Events

35.6.19 CurrentProgressChanged(progress as Double)

MBS MacFrameworks Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: The event called whenever the current value changes.

35.6.20 Constants

Constants

Constant	Value	Description
NSAnimationBlocking	0	One of the constants to indicate the blocking mode of an NSAnimation obj when it is running. Requests the animation to run in the main thread in a custom run-loop mo that blocks user input. This is the default.
NSAnimationEaseIn	1	One of the constants to describe the curve of an animation—that is, the relat speed of an animation from start to finish. Describes an animation that slows down as it reaches the end.
NSAnimationEaseInOut	0	One of the constants to describe the curve of an animation—that is, the relat speed of an animation from start to finish. Describes an S-curve in which the animation slowly speeds up and then slo down near the end of the animation. This constant is the default.
NSAnimationEaseOut	2	One of the constants to describe the curve of an animation—that is, the relat speed of an animation from start to finish. Describes an animation that slowly speeds up from the start.
NSAnimationLinear	3	One of the constants to describe the curve of an animation—that is, the relat speed of an animation from start to finish. Describes an animation in which there is no change in frame rate.
NSAnimationNonblocking	1	One of the constants to indicate the blocking mode of an NSAnimation obj when it is running. Requests the animation to run in a standard or specified run-loop mode tl allows user input.
NSAnimationNonblockingThreaded	2	One of the constants to indicate the blocking mode of an NSAnimation obj when it is running. Requests the animation to run in a separate thread that is spawned by t NSAnimation object. The secondary thread has its own run loop.

35.7 class NSAppearanceMBS

35.7.1 class NSAppearanceMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The appearance class.
Example:

```
// check for dark mode and switch the window to the light appearance
Var current As NSAppearanceMBS = NSAppearanceMBS.effectiveAppearance(Self)
If current <>Nil Then
System.DebugLog "Current appearance: " + current.name
End If

Var light As NSAppearanceMBS = NSAppearanceMBS.appearanceNamed(NSAppearanceMBS.NSAppearanceNameAqua)
NSAppearanceMBS.setAppearance(Self, light)

// pass Nil to follow the system setting again
// NSAppearanceMBS.setAppearance(Self, Nil)
```

Notes: An NSAppearance object represents a file that specifies a standard or custom appearance that applies to a subset of UI elements in an app. An app can contain multiple appearance files and—because NSAppearance conforms to NSCoding—you can use Interface Builder to assign UI elements to an appearance.

Typically, you customize a window by using Xcode to create an appearance file that contains the views you want to customize and the custom art that should be applied to them. Xcode transforms the file,Äôs art content into a runtime format that AppKit can draw when the specified views are displayed.

If the art for a specific view can,Äôt be found, AppKit searches for the art in the appearances of the view,Äôs ancestors. A nil appearance means that a view uses the default Aqua appearance; a non-nil appearance means that the view uses an ancestor,Äôs appearance.

When AppKit draws a control, it automatically sets the current appearance on the current thread to the control,Äôs appearance. The current appearance can influence the actual drawing path and the return values you get when you access system fonts and colors. The current appearance also affects the appearance of text and images, such as the text and template images that can be displayed in a toolbar.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

35.7.2 Methods

35.7.3 appearance(item as Variant) as NSAppearanceMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The appearance of the receiver, in an NSAppearance object.
Example:

```
// check NSMenuItemMBS
Var n As New NSMenuItemMBS(EditCopy)
Var e1 As NSAppearanceMBS = NSAppearanceMBS.Appearance(n)

// check MenuItem
Var e2 As NSAppearanceMBS = NSAppearanceMBS.Appearance(EditCopy)

// check NSMenuMBS
Var e3 As NSAppearanceMBS = NSAppearanceMBS.Appearance(n.menu)

Break
```

Notes: The default value for this property is nil, which means that the receiver uses the appearance it inherits from the nearest ancestor that has set an appearance. When you set appearance to a non-nil value, the receiver and the views it contains use the specified appearance.

Version 20.5 of MBS Plugin can accept application or NSApplicationMBS objects to query appearance of whole app.

Version 24.2 accepts NSMenuMBS, MenuItem, DesktopMenuItem and NSMenuItemMBS objects here.

35.7.4 appearanceNamed(name as string) as NSAppearanceMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Returns the NSAppearance object with the specified name.
Notes: name: The name of a standard or custom appearance.
Returns a standard or custom appearance object.

When you specify a standard appearance name—such as NSAppearanceNameAqua—this method returns a built-in appearance. If you specify a custom appearance name, this method searches the main bundle for an appearance file that has the specified name.
Available in OS X v10.9 and later.
See also:

- 35.7.5 appearanceNamed(name as string, bundle as NSBundleMBS) as NSAppearanceMBS 6185

35.7.5 appearanceNamed(name as string, bundle as NSBundleMBS) as NSAppearanceMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Creates an NSAppearance object initialized to the specified appearance file in the specified bundle.
Notes: name: The name of the appearance file to search for, without any path information.
bundle: The bundle in which to search for the appearance file. If bundle is nil, this method searches in the main bundle.

Returns an initialized appearance object, or nil if an error occurs.
Available in OS X v10.9 and later.
See also:

- 35.7.4 appearanceNamed(name as string) as NSAppearanceMBS 6185

35.7.6 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Whether this class is available.

35.7.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

35.7.8 currentAppearance as NSAppearanceMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Returns the NSAppearance object that,Äôs set on the current thread.
Example:

```
MessageBox NSAppearanceMBS.currentAppearance.name
```

Notes: When a UI element draws on the screen, it automatically sets the appearance that it,Äôs using on the current thread.
Available in OS X v10.9 and later.

35.7.9 effectiveAppearance(item as Variant) as NSAppearanceMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The appearance that will be used when the receiver is drawn onscreen, in an NSAppearance object.
Example:

```
// try three variants to get appearance for menu items

// check NSMenuItemMBS
Var n As New NSMenuItemMBS(EditCopy)
Var e1 As NSAppearanceMBS = NSAppearanceMBS.effectiveAppearance(n)

// check MenuItem
Var e2 As NSAppearanceMBS = NSAppearanceMBS.effectiveAppearance(EditCopy)

// check NSMenuMBS
Var e3 As NSAppearanceMBS = NSAppearanceMBS.effectiveAppearance(n.menu)

Break
```

Notes: The default value for this property is provided by the nearest ancestor of the receiver that has set an appearance.
You can use this property to ensure that an offscreen view sets the appropriate current appearance when it draws onscreen.
Available in OS X v10.9 and later.

Version 20.5 of MBS Plugin can accept application or NSApplicationMBS objects to query appearance of

whole app.

Version 24.2 accepts NSMenuMBS, MenuItem, DesktopMenuItem and NSMenuItemMBS objects here.

35.7.10 NSAppearanceNameAccessibilityHighContrastAqua as string

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop only.

Function: A high-contrast version of the standard light system appearance.
Notes: Don't assign an NSAppearanceMBS object with this type directly to one of your views. Instead, assign a light appearance to your view. AppKit then returns this type when the user enables the Increase Contrast option in the Accessibility system preferences.
Available on MacOS 10.14 or newer.

35.7.11 NSAppearanceNameAccessibilityHighContrastDarkAqua as string

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop only.

Function: A high-contrast version of the standard dark system appearance.
Notes: Don't assign an NSAppearanceMBS object with this type directly to one of your views. Instead, assign a dark appearance to your view. AppKit then returns this type when the user enables the Increase Contrast option in the Accessibility system preferences.
Available on MacOS 10.14 or newer.

35.7.12 NSAppearanceNameAccessibilityHighContrastVibrantDark as string

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop only.

Function: A high-contrast version of the dark vibrant appearance.
Notes: Don't assign an NSAppearanceMBS object with this type directly to one of your views. Instead, assign a dark appearance to your view. AppKit then returns this type when the user enables the Increase Contrast option in the Accessibility system preferences and the view's allowsVibrancy property is true.
Available on MacOS 10.14 or newer.

35.7.13 NSAppearanceNameAccessibilityHighContrastVibrantLight as string

MBS MacFrameworks Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop only.

Function: A high-contrast version of the light vibrant appearance.
Notes: Don't assign an NSAppearanceMBS object with this type directly to one of your views. Instead, assign a light appearance to your view. AppKit then returns this type when the user enables the Increase

Contrast option in the Accessibility system preferences and the view's allowsVibrancy property is true.
Available on MacOS 10.14 or newer.

35.7.14 NSAppearanceNameAqua as string

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The name of the standard Aqua appearance.

35.7.15 NSAppearanceNameDarkAqua as string

MBS MacFrameworks Plugin, Plugin Version: 20.3, Platform: macOS, Targets: Desktop only.

Function: The name of the dark mode Aqua appearance.

35.7.16 NSAppearanceNameLightContent as string

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The name of the standard appearance that can be used by controls in light content areas (not including window-frame areas).

35.7.17 NSAppearanceNameVibrantDark as string

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The name of the vibrant dark appearance.
Notes: Available on Mac OS X 10.10 and newer.
Should only be set on an NSVisualEffectView, or one of its container subviews.

35.7.18 NSAppearanceNameVibrantLight as string

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The name of the vibrant dark appearance.
Notes: Available on Mac OS X 10.10 and newer.
Should only be set on an NSVisualEffectView, or one of its container subviews.

35.7.19 setAppearance(item as Variant, appearance as NSAppearanceMBS)

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Sets the appearance of the receiver, in an NSAppearance object.
Example:

```
// set the app to dark mode
Var a As NSAppearanceMBS = NSAppearanceMBS.appearanceNamed(NSAppearanceMBS.NSAppearanceNameDarkAqua)
NSAppearanceMBS.setAppearance(app, a)
```

Notes: The default value for this property is nil, which means that the receiver uses the appearance it inherits from the nearest ancestor that has set an appearance. When you set appearance to a non-nil value, the receiver and the views it contains use the specified appearance.

Version 20.5 of MBS Plugin can accept application or NSApplicationMBS objects to set appearance of whole app.

35.7.20 setCurrentAppearance(appearance as NSAppearanceMBS = nil)

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Sets the current appearance to the specified NSAppearance object.
Notes: appearance: The NSAppearance object that should be used for the window or view, or nil to specify the default appearance.

When you set an appearance on a window, all views in that window—including the window background and controls in both the frame and content areas—use that appearance. By default, AppKit sets the current appearance for standard windows and views during window drawing, so you don't need to use this method unless you want to change the current appearance of a specific window or view.

You can use this method to set the current appearance for an offscreen view to the appearance that will be used when the view is drawn. To do this, use the offscreen view,Äôs effectiveAppearance for the appearance parameter.

Available in OS X v10.9 and later.

35.7.21 Properties

35.7.22 allowsVibrancy as Boolean

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Query allowsVibrancy to see if the given appearance actually needs vibrant drawing.
Notes: You may want to draw differently if the current appearance is vibrant.
(Read only property)

35.7.23 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

35.7.24 name as String

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The name of the appearance.
Example:

MessageBox NSAppearanceMBS.currentAppearance.name

Notes: (Read only property)

35.8 class NSApplicationDelegateMBS

35.8.1 class NSApplicationDelegateMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The class for an Cocoa application delegate.
Example:

```
// add items to the Dock menu and reopen the main window on Dock click
// MyAppDelegate is a subclass of NSApplicationDelegateMBS with the events implemented.
// AppDelegate is a property of the app: AppDelegate As MyAppDelegate
AppDelegate = New MyAppDelegate

// in MyAppDelegate:
Function applicationDockMenu() As NSMenuMBS Handles applicationDockMenu
Var m As New NSMenuMBS
m.addItem New NSMenuItemMBS("New Document")
Return m
End Function

Function applicationShouldHandleReopen(hasVisibleWindows As Boolean) As Boolean Handles applicationShouldHandleReopen
If Not hasVisibleWindows Then System.DebugLog "Show the main window again here."
Return True
End Function
```

Notes: Please install in app Constructor as App.Open event may be too late.

Using this class you can get application related events before (!) the app class gets it. And of course more events than just the onces the app class have.

Only for Cocoa desktop targets.

In general the plugin calls first the event. Depending on the result it may pass the event to the Xojo application delegate. If you have no code in the plugin event, everything just passes through and you should not see a difference.

The plugin application delegate is installed with the Constructor and uninstalled in the Destructor.

The original delegate from Xojo is preserved and all messages are forwarded to it. Also when this object is destroyed, the old delegate is restored.

35.8.2 Events

35.8.3 applicationDidBecomeActive(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center immediately after the application becomes active.

35.8.4 applicationDidChangeScreenParameters(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center when the configuration of the displays attached to the computer is changed (either programmatically or when the user changes settings in the Displays control panel).

35.8.5 applicationDidDecodeRestorableState(coder as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This event gives you the chance to restore your own state.

35.8.6 applicationDidFailToRegisterForRemoteNotificationsWithError(error as NSErrorMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Application failed to register for remote notifications.
Notes: Check your provisioning profile for entitlements.

Available on Mac OS X 10.7 or newer.

35.8.7 applicationDidFinishLaunching(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center after the application has been launched and initialized but before it has received its first event.
Notes: Delegates can implement this method to perform further initialization. This method is called after the application's main run loop has been started but before it has processed any events. If the application was launched by the user opening a file, the delegate's applicationOpenFile method is called before this method. If you want to perform initialization before any files are opened, implement the applicationWillFinishLaunching method in your delegate, which is called before applicationOpenFile.)

35.8.8 applicationDidHide(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center immediately after the application is hidden.

35.8.9 applicationDidReceiveRemoteNotification(userInfo as Dictionary)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A notification was received.
Notes: The dictionary contains payload like this:

key "aps" contains another dictionary. This second dictionary contains keys like "alert", "badge" and "sound".

Available on Mac OS X 10.7 or newer.

35.8.10 applicationDidRegisterForRemoteNotificationsWithDeviceToken(deviceToken as memoryblock)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Application registered for remote notifications.
Notes: Tell your server the device token ID and use it in your push notifications.
Distinguish between iOS and Mac versions of your app!

Available on Mac OS X 10.7 or newer.

35.8.11 applicationDidResignActive(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center immediately after the application is deactivated.

35.8.12 applicationDidUnhide(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center immediately after the application is made visible.

35.8.13 applicationDidUpdate(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center immediately after the application object updates its windows.

35.8.14 applicationDockMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to supply a dock menu for the application dynamically.
Notes: Return the menu to display in the dock. Or nil for having no/default menu.

35.8.15 applicationOpenFile(filename as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate to open a single file.
Notes: filename: The path of the file to open.

Return yes if the file was successfully opened or false if it was not.

Sent directly by application to the delegate. The method should open the file filename, returning true if the file is successfully opened, and false otherwise. If the user started up the application by double-clicking a file, the delegate receives the applicationOpenFile message before receiving applicationDidFinishLaunching. (applicationWillFinishLaunching is sent before applicationOpenFile.)

If you return false, the plugin will pass the event to the default Xojo runtime application delegate, so the OpenDocument event can fire.

35.8.16 applicationOpenFiles(filenames() as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate to open multiple files.
Notes: sender: The application object associated with the delegate.
filenames: An array of strings containing the names of the files to open..

Identical to applicationOpenFile except that the receiver opens multiple files corresponding to the file names in the filenames array. Delegates should invoke the replyToOpenOrPrint method upon success or failure, or when the user cancels the operation.

If you add code to this event, it is possible that OpenDocument event in Xojo does not fire.

35.8.17 applicationOpenFileWithoutUI(filename as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate to open a file programmatically.
Notes: filename: The name of the file to open.

Return true if the file was successfully opened or false if it was not.

Sent directly by sender to the delegate to request that the file filename be opened as a linked file. The

method should open the file without bringing up its application's user interface—that is, work with the file is under programmatic control of sender, rather than under keyboard control of the user.

If you add code to this event, it is possible that OpenDocument event in Xojo does not fire.

35.8.18 applicationOpenTempFile(filename as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate to open a temporary file.
Notes: filename: The name of the temporary file to open.

True if the file was successfully opened or false if it was not.

Sent directly by application to the delegate. The method should attempt to open the file filename, returning true if the file is successfully opened, and false otherwise.

By design, a file opened through this method is assumed to be temporary—it's the application's responsibility to remove the file at the appropriate time.

If you add code to this event, it is possible that OpenDocument event in Xojo does not fire.

35.8.19 applicationOpenUntitledFile as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate to open an untitled file.
Notes: Return true if the file was successfully opened or false if it was not.
Sent directly by application to the delegate to request that a new, untitled file be opened.

If you return false, the plugin will pass the event to the default Xojo runtime application delegate.

If you add code to this event, it is possible that OpenDocument event in Xojo does not fire.

35.8.20 applicationPrintFile(filename as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent when the user starts up the application on the command line with the -NSPrint option.

Notes: filename: The name of the file to print.

Returns true if the file was successfully printed or false if it was not.

This message is sent directly by application to the delegate. The application terminates (using the terminate method) after this method returns.

If at all possible, this method should print the file without displaying the user interface. For example, if you pass the -NSPrint option to the TextEdit application, TextEdit assumes you want to print the entire contents of the specified file. However, if the application opens more complex documents, you may want to display a panel that lets the user choose exactly what they want to print.

35.8.21 applicationPrintFiles(fileNames() as string, printSettings as dictionary, showPrintPanels as boolean) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Prints a group of files.
Notes: fileNames: An array of strings, each of which contains the name of a file to print.

printSettings: A dictionary containing NSPrintInfo-compatible print job attributes.

showPrintPanels: A Boolean that specifies whether the print panel should be displayed for each file printed. Print progress indicators will be presented even if this value is false.

Return a constant indicating whether printing was successful. For a list of possible values, see NSPrinting* constants.

Return NSPrintingReplyLater if the result of printing cannot be returned immediately, for example, if printing will cause the presentation of a sheet. If your method returns NSPrintingReplyLater it must always invoke the NSApplicationMBS method replyToOpenOrPrint when the entire print operation has been completed, successfully or not.

35.8.22 applicationShouldHandleReopen(hasVisibleWindows as boolean) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the application to the delegate prior to default behavior to reopen (rapp) AppleEvents.
Notes: flag: Indicates whether the NSApplication object found any visible windows in your application. You can use this value as an indication of whether the application would do anything if you return true.

Return true if you want the application to perform its normal tasks or false if you want the application to do nothing.

These events are sent whenever the Finder reactivates an already running application because someone double-clicked it again or used the dock to activate it.

By default the Application Kit will handle this event by checking whether there are any visible NSWindow (not NSPanel) objects, and, if there are none, it goes through the standard untitled document creation (the same as it does if application is launched without any document to open). For most document-based applications, an untitled document will be created.

The application delegate will also get a chance to respond to the normal untitled document delegate methods. If you implement this method in your application delegate, it will be called before any of the default behavior happens. If you return true, then NSApplication will proceed as normal. If you return false, then NSApplication will do nothing. So, you can either implement this method with a version that does nothing, and return false if you do not want anything to happen at all (not recommended), or you can implement this method, handle the event yourself in some custom way, and return false.

Miniaturized windows, windows in the Dock, are considered visible by this method, and cause flag to return true, despite the fact that miniaturized windows return false when sent an isVisible message.

Having no code in the event will tell the plugin to return true.

35.8.23 applicationShouldOpenUntitledFile as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Invoked immediately before opening an untitled file.
Notes: Return true if the application should open a new untitled file or false if it should not.

Use this method to decide whether the application should open a new, untitled file. Note that applicationOpenUntitledFile is invoked if this method returns true.

If you return false here, the NewDocument event in Xojo may not fire.
Having no code in this event is the same as returning true.

35.8.24 applicationShouldTerminate as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent to notify the delegate that the application is about to terminate..
Notes: One of the values defined in NSTerminate* constants indicating whether the application should terminate.

This method is called after the application's Quit menu item has been selected, or after the terminate method has been called. Generally, you should return NSTerminateNow to allow the termination to complete, but you can cancel the termination process or delay it somewhat as needed. For example, you might delay termination to finish processing some critical data but then terminate the application as soon as you are done by calling the replyToApplicationShouldTerminate method.

35.8.25 applicationShouldTerminateAfterLastWindowClosed as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the user closes the last window the application has open.
Notes: Return false if the application should not be terminated when its last window is closed; otherwise, true to terminate the application.

The application sends this message to your delegate when the application's last window is closed. It sends this message regardless of whether there are still panels open. (A panel in this case is defined as being an instance of NSPanel or one of its subclasses.)

If your implementation returns false, control returns to the main event loop and the application is not terminated. If you return true, your delegate's applicationShouldTerminate method is subsequently invoked to confirm that the application should be terminated.

Having no code in this event is the same as returning false.

35.8.26 applicationWillBecomeActive(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center immediately before the application becomes active.

35.8.27 applicationWillEncodeRestorableState(coder as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Event called to give you chance to encode any additional state into the NSCoder.
Notes: If the restorable state managed by the delegate changes, you must call NSApplicationMBS.invalidateRestorableState so that it will be re-encoded.

35.8.28 applicationWillFinishLaunching(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center immediately before the application object is initialized.

35.8.29 applicationWillHide(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center immediately before the application is hidden.

35.8.30 applicationWillPresentError(error as NSErrorMBS) as NSErrorMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent to the delegate before the specified application presents an error message to the user.
Notes: error: The error object that is used to construct the error message. Your implementation of this method can return a new NSError object or the same one in this parameter.

Return the error object to display.

You can implement this delegate method to customize the presentation of any error presented by your application, as long as no code in your application overrides either of the NSResponder methods presentError in a way that prevents errors from being passed down the responder chain to the application object.

Your implementation of this delegate method can examine error and, if its localized description or recovery information is unhelpfully generic, return an error object with specific localized text that is more suitable for presentation in alert sheets and dialogs. If you do this, always use the domain and error code of the NSError object to distinguish between errors whose presentation you want to customize and those you do not. Don't make decisions based on the localized description, recovery suggestion, or recovery options because parsing localized text is problematic. If you decide not to customize the error presentation, just return the passed-in error object.

If you have no code in this event or you return nil, the plugin passes the given error back to the Cocoa runtime.

35.8.31 applicationWillResignActive(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center immediately before the application is deactivated.

35.8.32 applicationWillTerminate(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center immediately before the application terminates.

35.8.33 applicationWillUnhide(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center immediately after the application is unhidden.

35.8.34 applicationWillUpdate(Notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sent by the default notification center immediately before the application object updates its windows.

35.8.35 restoreWindowWithIdentifier(identifier as string, state as NSCoderMBS, byref resultWindow as Variant, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Invoked to request that a window be restored.
Notes: If you plan to use this event, please initialize the NSApplicationDelegateMBS subclass in app.constructor.

identifier: The unique interface item identifier string that was previously associated with the window. Use this string to determine which window to create.
state: A NSCoderMBS object containing the window state information. This coder object contains the combined restorable state of the window, which can include the state of the window, its delegate, window controller, and document object. You can use this state to determine which window to create.

Pass back with the parameters:
The window that was created or nil if the window could not be created.
An error object if the window was not recognized or could not be created for whatever reason; otherwise, specify nil. In OS X 10.7, the error parameter is ignored.

Return true if the window was restored; otherwise false.

If the receiver knows how to restore the identified window, it should invoke the completion handler with the window, possibly creating it. It is acceptable to use a pre-existing window, though you should not pass the same window to more than one completion handler. If the receiver cannot restore the identified window (for example, the window referenced a document that has been deleted), it should invoke the completion handler with a nil window.

The receiver is application is passed the identifier of the window, which allows it to quickly check for known windows. For example, you might give your preferences window an identifier of "preferences" in the nib, and then check for that identifier in your implementation. The receiver is also passed the NSCoder instance containing the combined restorable state of the window, its delegate, the window controller, and any document. The receiver may decode information previously stored in the coder to determine what window to restore.

Available in OS X v10.7 and later.

The plugin implements this method for NSApplication and forwards the message to this event.
If you return true, please set either error or resultWindow values. resultWindow must be an NSWindowMBS or a window object.

35.8.36 userDidAcceptCloudKitShareWithMetadata(metadata as Variant)

MBS MacCocoa Plugin, Plugin Version: 21.2, Platform: macOS, Targets: Desktop only.

Function: Tells you that the app has access to shared information in CloudKit.
Example:

```
// sample implementation of the event:

Sub userDidAcceptCloudKitShareWithMetadata(metadata as Variant) Handles userDidAcceptCloudKit-
ShareWithMetadata
Var c As CKShareMetadataMBS = metadata
```

```
Message "User did accept CloudKit share: "+c.containerIdentifier
End Sub
```

Notes: metadata is a CKShareMetadataMBS class.

metdata: Information about the CloudKit data that is available to the app. Use this object to retrieve information about the CKShare object and the associated records that are available.

Use this method to respond to a CloudKit Sharing invitation. In your implementation, accept the share by scheduling a CKAcceptSharesOperationMBS object that contains the provided metadata object. After the user accepts the share, you can begin fetching records and incorporating the resulting data into your app. The system launches the app, as necessary, before calling this method.

35.8.37 Constants

Print Reply Constants

Constant	Value	Description
NSPrintingCancelled	0	Printing was cancelled.
NSPrintingFailure	3	Printing failed.
NSPrintingReplyLater	2	The result of printing cannot be returned immediately, for example, if printing will cause the presentation of a sheet. If your method returns NSPrintingReplyLater it must always invoke replyToOpenOrPrint when the entire print operation has been completed, successfully or not.
NSPrintingSuccess	1	Printing was successful.

Terminate Reply Constants

Constant	Value	Description
NSTerminateCancel	0	The application should not be terminated.
NSTerminateLater	2	It may be OK to proceed with termination later. Returning this value causes Cocoa to run the run loop in the NSModalPanelRunLoopMode until your application subsequently calls replyToApplicationShouldTerminate with the value true or false. This return value is for delegates that need to provide document modal alerts (sheets) in order to decide whether to quit.
NSTerminateNow	1	It is OK to proceed with termination.

35.9 class NSApplicationMBS

35.9.1 class NSApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The cocoa application class.
Example:

```
Var a as NSApplicationMBS = NSApplicationMBS.sharedApplication

// set a custom picture

Var p as Picture = LogoMBS(500)
Var n as new NSImageMBS(p)
a.applicationIconImage = n

// restore
'a.applicationIconImage = nil
```

Notes: The plugin only implements a small subset of what's available in Cocoa. If you miss something, please send us an email.

You can get an instance of this class using one of three ways:

- app.NSApplicationMBS function
- new NSApplicationMBS
- NSApplicationMBS.sharedInstance

35.9.2 Methods

35.9.3 activateIgnoringOtherApps(flag as boolean)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Makes the receiver the active application.
Notes: flag: If false, the application is activated only if no other application is currently active. If true, the application activates regardless.

The flag parameter is normally set to false. When the Finder launches an application, using a value of false for flag allows the application to become active if the user waits for it to launch, but the application remains unobtrusive if the user activates another application. Regardless of the setting of flag, there may be a time lag before the application activates—you should not assume the application will be active immediately after sending this message.

You rarely need to invoke this method. Under most circumstances, the Application Kit takes care of proper activation. However, you might find this method useful if you implement your own methods for inter-application communication.

You don't need to send this message to make one of the application's NSWindows key. When you send a makeKeyWindow message to an NSWindow object, you ensure that it is the key window when the application is active.

35.9.4 addWindowsItem(win as NSWindowMBS, title as string, isFilename as boolean)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Adds an item to the Window menu for a given window.
Notes: win: The window being added to the menu. If this window object already exists in the Window menu, this method has no effect.
Title: The string to display for the window's menu item. How the string is interpreted is dependent on the value in the isFilename parameter.
isFilename: If false, title appears literally in the menu; otherwise, title is assumed to be a converted pathname

with the name of the file preceding the path (the way the NSWindow method setTitleWithRepresentedFilename shows a title)

You rarely need to invoke this method directly because Cocoa places an item in the Window menu automatically whenever you set the title of an NSWindow object.

35.9.5 arrangeInFront

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Arranges windows listed in the Window menu in front of all other windows.
Example:

```
Var a as new NSApplicationMBS
a.arrangeInFront
```

Notes: Windows associated with the application but not listed in the Window menu are not ordered to the front.

35.9.6 cancelUserAttentionRequest(request as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Cancels a previous user attention request.
Notes: request: The request identifier returned by the requestUserAttention method.

A request is also canceled automatically by user activation of the application.

35.9.7 changeWindowsItem(win as NSWindowMBS, title as string, isFilename as boolean)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Changes the item for a given window in the Window menu to a given string.
Notes: win: The window whose title you want to change in the Window menu. If win is not in the Window menu, this method adds it.
title: The string to display for the window's menu item. How the string is interpreted is dependent on the value in the isFilename parameter.
isFilename: If false, title appears literally in the menu; otherwise, title is assumed to be a converted pathname with the name of the file preceding the path (the way the NSWindow method setTitleWithRepresentedFilename shows a title)

35.9.8 completeStateRestoration

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Completes the extended state restoration.
Notes: This method informs the application that the extended state restoration is completed for the balancing .

If a window has some state that may take a long time to restore, such as a web page, you may use this method and methods to completeStateRestoration to extend the period of this crash protection beyond the default.

You call extendStateRestoration within your implementation of restoreWindowWithIdentifier. You would then call completeStateRestoration some time after the window is fully restored. If the app crashes in the interim, then it may offer to discard restorable state on the next launch.

The extendStateRestoration and completeStateRestoration method act as a counter. Each call to extendStateRestorationincrements the counter, and must be matched with a corresponding call to completeStateRestoration which decrements it. When the counter reaches zero, the app is considered to have been fully restored, and any further calls are silently ignored.

This method is thread safe.
Available in OS X v10.7 and later.

35.9.9 Constructor

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The constructor.
Example:

```
Var n as new NSApplicationMBS

n.dockTile.badgeLabel = "Hello"
n.dockTile.showsApplicationBadge = true
```

Notes: Creates an object which points to the shared NSApplication instance.

35.9.10 deactivate

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Deactivates the receiver.
Example:

Var a as new NSApplicationMBS

a.deactivate

Notes: Normally, you shouldn't invoke this method—the Application Kit is responsible for proper deactivation.

35.9.11 disableRelaunchOnLogin

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Disable relaunching this app on login, if the app was running at the time the user logged out.
Notes: These methods increment and decrement a counter respectively; if the counter is 0 at the time the user logs out, then the app may be relaunched when the user logs back in. The counter is initially zero, so by default apps are relaunched.

If your app should not be relaunched because it launches via some other mechanism (e.g. launchd), then the recommended usage is to call disableRelaunchOnLogin once, and never pair it with an enable call.

If your app should not be relaunched because it triggers a restart (e.g. an installer), then the recommended usage is to call disableRelaunchOnLogin immediately before you attempt to trigger a restart, and enableRelaunchOnLogin immediately after. This is because the user may cancel restarting; if the user later restarts for another reason, then your app should be brought back.

These methods are thread safe.
Available on Mac OS X 10.7 or newer.

35.9.12 discardEventsMatchingMask(mask as Integer, beforeEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 17.5, Platform: macOS, Targets: Desktop only.

Function: Removes all events matching the given mask and generated before the specified event.
Notes: mask: Contains one or more flags indicating the types of events to discard. The constants section of the NSEvent class defines the constants you can add together to create this mask. The discussion section also lists some of the constants that are typically used.

lastEvent: A marker event that you use to indicate which events should be discarded. Events that occurred before this event are discarded but those that occurred after it are not.

Use this method to ignore any events that occurred before a specific event. For example, suppose your app has a tracking loop that you exit when the user releases the mouse button. You could use this method, specifying NSAnyEventMask as the mask argument and the ending mouse-up event as the lastEvent argument, to discard all events that occurred while you were tracking mouse movements in your loop. Passing the mouse-up event as lastEvent ensures that any events that might have occurred after the mouse-up event (that is, that appear in the queue after the mouse-up event) are not discarded.

Typically, you send this message to an NSWindow object, rather than to the app object. Discarding events for a window clears out all of the events for that window only, leaving events for other windows in place.

For the mask parameter, you can add together event type constants such as the following:

- NSLeftMouseDownMask
- NSLeftMouseUpMask
- NSRightMouseDownMask
- NSRightMouseUpMask
- NSMouseMovedMask
- NSLeftMouseDraggedMask
- NSRightMouseDraggedMask
- NSMouseEnteredMask
- NSMouseExitedMask
- NSKeyDownMask
- NSKeyUpMask
- NSFlagsChangedMask
- NSPeriodicMask
- NSCursorUpdateMask
- NSAnyEventMask

This method can also be called in subthreads. Events posted in subthreads bubble up in the main thread event queue.

35.9.13 enabledRemoteNotificationTypes as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns what badges you enabled.
Notes: Available on Mac OS X 10.7 or newer.

35.9.14 enableRelaunchOnLogin

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Enable relaunching this app on login, if the app was running at the time the user logged out.
Notes: These methods increment and decrement a counter respectively; if the counter is 0 at the time the user logs out, then the app may be relaunched when the user logs back in. The counter is initially zero, so by default apps are relaunched.

If your app should not be relaunched because it launches via some other mechanism (e.g. launchd), then the recommended usage is to call disableRelaunchOnLogin once, and never pair it with an enable call.

If your app should not be relaunched because it triggers a restart (e.g. an installer), then the recommended usage is to call disableRelaunchOnLogin immediately before you attempt to trigger a restart, and enableRelaunchOnLogin immediately after. This is because the user may cancel restarting; if the user later restarts for another reason, then your app should be brought back.

These methods are thread safe.
Available on Mac OS X 10.7 or newer.

35.9.15 extendStateRestoration

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Allows an application to extend its state restoration period.
Notes: This method allows an application to extend the state restoration period beyond the usual. For example, the app crashes before state restoration is complete, then it may offer to discard restorable state on the next launch.

If a window has some state that may take a long time to restore, such as a web page, you may use this method and methods to completeStateRestoration to extend the period of this crash protection beyond the default.

You call extendStateRestoration within your implementation of restoreWindowWithIdentifier. You would then call completeStateRestoration some time after the window is fully restored. If the app crashes in the

interim, then it may offer to discard restorable state on the next launch.

The extendStateRestoration and completeStateRestoration method act as a counter. Each call to extendStateRestoration increments the counter, and must be matched with a corresponding call to completeStateRestoration which decrements it. When the counter reaches zero, the app is considered to have been fully restored, and any further calls are silently ignored.

This method is thread safe.
Available in OS X v10.7 and later.

35.9.16 hide

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Hides all the receiver's windows, and the next application in line is activated.
Example:

NSApplicationMBS.sharedApplication.hide

Notes: This method is usually invoked when the user chooses Hide in the application's main menu. When this method begins, it posts an NSApplicationWillHideNotification to the default notification center. When it completes successfully, it posts an NSApplicationDidHideNotification.

35.9.17 hideOtherApplications

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Hides all applications, except the receiver.
Example:

NSApplicationMBS.sharedApplication.hideOtherApplications

35.9.18 invalidateRestorableState

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invalidates the restorable state.
Notes: applicationWillEncodeRestorableState event will be called soon in your NSApplicationDelegateMBS subclass to get a new state encoded.

35.9.19 miniaturizeAll

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Miniaturizes all the receiver's windows.
Example:

```
NSApplicationMBS.sharedApplication.miniaturizeAll
```

35.9.20 modalWindow as NSWindowMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns the modal window that the receiver is displaying.
Example:

```
// show title of current dialog
MessageBox NSApplicationMBS.sharedApplication.modalWindow.Title
```

Notes: Returns the modal window being displayed or nil if no modal window is being displayed.

This method returns the current standalone modal window. It does not return sheets that are attached to other windows. If you need to retrieve a sheet window, use the attachedSheet method of NSWindow.

35.9.21 nextEventMatchingMask(mask as Integer, untilDate as date, mode as String, dequeueFlag as boolean) as NSEventMBS

MBS MacCocoa Plugin, Plugin Version: 17.5, Platform: macOS, Targets: Desktop only.

Function: Returns the next event matching a given mask, or nil if no such event is found before a specified expiration date.
Example:

```
Function MouseDown(X As Integer, Y As Integer) Handles MouseDown as Boolean
// in mousedown event

Var a as NSApplicationMBS = NSApplicationMBS.sharedApplication

// check current event
Var e as NSEventMBS = a.currentEvent

// check next mouse up event
Var d as new date
d.Second = d.Second + 2 // maximum 2 seconds wait time
Var n as NSEventMBS = a.nextEventMatchingMask(NSEventMBS.NSLeftMouseUpMask, d, NSRunLoopMBS.NS-
```

DefaultRunLoopMode, false)

```
// e->mouseDown
// e->mouseUp, if already available

Break
End Function
```

Notes: mask: Contains one or more flags indicating the types of events to return. The constants section of the NSEvent class defines the constants you can add together to create this mask. The discardEvents-MatchingMask method also lists several of these constants.
expiration: The expiration date for the current event request. Specifying nil for this parameter is equivalent to returning a date object using the distantPast method.
mode: The run loop mode in which to run while looking for events. The mode you specify also determines which timers and run-loop observers may fire while the app waits for the event.
flag: Specify true if you want the event removed from the queue.

Returns the event object whose type matches one of the event types specified by the mask parameter.

You can use this method to short circuit normal event dispatching and get your own events. For example, you may want to do this in response to a mouse-down event in order to track the mouse while its button is down. (In such an example, you would pass the appropriate event types for mouse-dragged and mouse-up events to the mask parameter and specify the NSEventTrackingRunLoopMode run loop mode.) Events that do not match one of the specified event types are left in the queue.
You can specify one of the run loop modes defined by AppKit or a custom run loop mode used specifically by your app. AppKit defines the following run-loop modes:

- NSDefaultRunLoopMode
- NSEventTrackingRunLoopMode
- NSModalPanelRunLoopMode
- NSConnectionReplyMode

See also:

- 35.9.22 nextEventMatchingMask(mask as Integer, untilDate as dateTime, mode as String, dequeueFlag as boolean) as NSEventMBS 6213

35.9.22 nextEventMatchingMask(mask as Integer, untilDate as dateTime, mode as String, dequeueFlag as boolean) as NSEventMBS

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: Returns the next event matching a given mask, or nil if no such event is found before a specified expiration date.
See also:

- 35.9.21 nextEventMatchingMask(mask as Integer, untilDate as date, mode as String, dequeueFlag as boolean) as NSEventMBS 6212

35.9.23 NSAppKitVersionNumber as Double

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: This constant identifies the installed version of the Application Kit framework.
Example:

```
const NSAppKitVersionNumber10_0 = 577
const NSAppKitVersionNumber10_1 = 620
const NSAppKitVersionNumber10_2 = 663
const NSAppKitVersionNumber10_2_3 = 663.6
const NSAppKitVersionNumber10_3 = 743
const NSAppKitVersionNumber10_3_2 = 743.14
const NSAppKitVersionNumber10_3_3 = 743.2
const NSAppKitVersionNumber10_3_5 = 743.24
const NSAppKitVersionNumber10_3_7 = 743.33
const NSAppKitVersionNumber10_3_9 = 743.36
const NSAppKitVersionNumber10_4 = 824
const NSAppKitVersionNumber10_4_1 = 824.1
const NSAppKitVersionNumber10_4_3 = 824.23
const NSAppKitVersionNumber10_4_4 = 824.33
const NSAppKitVersionNumber10_4_7 = 824.41
const NSAppKitVersionNumber10_5 = 949
const NSAppKitVersionNumber10_5_2 = 949.27
const NSAppKitVersionNumber10_5_3 = 949.33
const NSAppKitVersionNumber10_6 = 1038
const NSAppKitVersionNumber10_7 = 1138
const NSAppKitVersionNumber10_7_2 = 1138.23

if NSApplicationMBS.NSAppKitVersionNumber >= NSAppKitVersionNumber10_5 then
MessageBox "This is Mac OS X 10.5 or newer."
end if
```

Notes: See NSAppKitVersionNumber* constants.

35.9.24 NSApplicationDidBecomeActiveNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted immediately after the application becomes active.
The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

35.9.25 NSApplicationDidChangeScreenParametersNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted when the configuration of the displays attached to the computer is changed.
The configuration change can be made either programmatically or when the user changes settings in the Displays control panel. The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

35.9.26 NSApplicationDidFinishLaunchingNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted at the end of the finishLaunching method to indicate that the application has completed launching and is ready to run.
The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

35.9.27 NSApplicationDidFinishRestoringWindowsNotification as string

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Posted when the application is finished restoring windows.
Notes: The notification is posted when the application is finished restoring windows, that is, when all the completion handlers from restoreWindowWithIdentifier have been called. This is always posted after NSApplicationWillFinishLaunchingNotification, but may be posted before or after NSApplicationDidFinishLaunchingNotification, depending on whether clients copy the completion handlers and invoke them later. If there were no windows to restore, then this notification is still posted at the corresponding point in app launch (between NSApplicationWillFinishLaunchingNotification and NSApplicationDidFinishLaunchingNotification).

The notification object is sharedApplication. This notification does not contain a userInfo dictionary.
Available in OS X v10.7 and later.

35.9.28 NSApplicationDidHideNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted at the end of the hide method to indicate that the application is now hidden.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

35.9.29 NSApplicationDidResignActiveNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted immediately after the application gives up its active status to another application.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

35.9.30 NSApplicationDidUnhideNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted at the end of the unhideWithoutActivation method to indicate that the application is now visible.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

35.9.31 NSApplicationDidUpdateNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted at the end of the updateWindows method to indicate that the application has finished updating its windows.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

35.9.32 NSApplicationLaunchIsDefaultLaunchKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the keys for the userinfo dictionary on didFinishLaunching.
Notes: The following key is present in the userInfo of NSApplicationDidFinishLaunchingNotification or in the didFinishLaunching event. Its value is a number containing a bool. It will be false if the app was launched to open or print a file, to perform a Service, if the app had saved state that will be restored, or if

the app launch was in some other sense not a "default" launch. Otherwise its value will be true.

Available on Mac OS X 10.7 or newer.

35.9.33 NSApplicationLaunchRemoteNotificationKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the keys for the userinfo dictionary on didFinishLaunching.
Notes: User info keys for NSApplicationDidFinishLaunchingNotification.
Available on Mac OS X 10.7 or newer.

35.9.34 NSApplicationLaunchUserNotificationKey as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the user info keys for NSApplicationDidFinishLaunchingNotification.
Example:

```
Sub applicationDidFinishLaunching(Notification as NSNotificationMBS)
Var userInfo as Dictionary = Notification.userInfo
Var key as string = NSApplicationMBS.NSApplicationLaunchUserNotificationKey
Var UserNotification as NSUserNotificationMBS = userInfo.Lookup(key, nil)

if UserNotification <>nil then
MessageBox UserNotification.identifier+": "+UserNotification.informativeText
end if
End Sub
```

Notes: This key is present in the userInfo of NSApplicationDidFinishLaunchingNotification. It will be present if your application was launched because a user activated a notification in the Notification Center. Its value is an NSUserNotification object.
Available in Mac OS X 10.8.

35.9.35 NSApplicationWillBecomeActiveNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted immediately after the application becomes active.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

35.9.36 NSApplicationWillFinishLaunchingNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted at the start of the finishLaunching method to indicate that the application has completed its initialization process and is about to finish launching.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

35.9.37 NSApplicationWillHideNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted at the start of the hide method to indicate that the application is about to be hidden.
The notification object is NSApp. This notification does not contain a userInfo dictionary.

35.9.38 NSApplicationWillResignActiveNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted immediately before the application gives up its active status to another application.
The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

35.9.39 NSApplicationWillTerminateNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted by the terminate method to indicate that the application will terminate.
Posted only if the delegate method applicationShouldTerminate returns true. The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

35.9.40 NSApplicationWillUnhideNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted at the start of the unhideWithoutActivation method to indicate that the application is about to become visible.

The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

35.9.41 NSApplicationWillUpdateNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: One of the notification names.
Notes: Posted at the start of the updateWindows method to indicate that the application is about to update its windows.
The notification object is sharedApplication. This notification does not contain a userInfo dictionary.

35.9.42 orderFrontCharacterPalette

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Opens the character palette.
Example:

```
Var a as new NSApplicationMBS
a.orderFrontCharacterPalette
```

Notes: Available in Mac OS X v10.3 and later.
This shows the special characters palette.

35.9.43 orderFrontStandardAboutPanel

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays a standard About window.
Example:

```
Var a as new NSApplicationMBS

a.orderFrontStandardAboutPanel
```

Notes: This method calls orderFrontStandardAboutPanelWithOptions with a nil argument. See orderFrontStandardAboutPanelWithOptions for a description of what's displayed.

35.9.44 orderFrontStandardAboutPanelWithOptions(options as dictionary)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays a standard About window with information from a given options dictionary.
Example:

```
Var a As New NSApplicationMBS

// this image has no mask, so you'll see a white border
Var p As Picture = LogoMBS(500)
Var n As New NSImageMBS(p)
Var options As New Dictionary

// show window with default values
'a.orderFrontStandardAboutPanel

// we overwrite default values with new values
Var s As NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Written by Christian Schmitz")
Var m As NSMutableAttributedStringMBS = s.mutableCopy

// add link
m.addAttribute(m.NSLinkAttributeName, "https://www.mbsplugins.de", New NSRangeMBS(11, 17))

options.Value("Credits") = m
options.Value("ApplicationName") = "MyCoolApp"
options.Value("Version") = "1.2.3"
options.Value("Copyright") = "©2011 Monkeybread Software"
options.Value("ApplicationIcon") = n

a.orderFrontStandardAboutPanelWithOptions(options)

Exception ex As NSExceptionMBS
MessageBox ex.message
```

Notes: options: A dictionary whose keys define the contents of the About window. See the discussion for a description of the available keys.

The following strings are keys that can occur in optionsDictionary:

35.9.45 OverlayApplicationIconImage(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Overlays the image.
Example:

```
// draw a picture with a red dot on the top left
```

Key	Description
" "	An NSAttributedStringMBS displayed in the info area of the panel. If not specified, this method then looks for a file named "Credits.html", "Credits.rtf", and "Credits.rtfd", in that order, in the bundle returned by the NSBundle class method mainBundle. The first file found is used. If none is found, the info area is left blank.
"ApplicationName"	A string displayed as the application's name. If not specified, this method then uses the value of CFBundleName (localizable). If neither is found, this method uses the process name.
"ApplicationIcon"	A NSImageMBS object displayed as the application's icon. If not specified, this method then looks for an image named "NSApplicationIcon", using NSImageMBS.imageNamed("NSApplicationIcon"). If neither is available, this method uses the generic application icon.
"Version"	A string with the build version number of the application ("58.4"), displayed as "(v58.4)". If not specified, obtain from the CFBundleVersion key in infoDictionary; if not specified, leave blank (the "(v)" is not displayed).
"Copyright"	A string with a line of copyright information. If not specified, this method then looks for the value of NSHumanReadableCopyright in the localized version infoDictionary. If neither is available, this method leaves the space blank.
"ApplicationVersion"	A string with the application version ("Mac OS X", "3", "WebObjects 4.5", "AppleWorks 6",...). If not specified, obtain from the CFBundleShortVersionString key in infoDictionary. If neither is available, the build version, if available, is printed alone, as "Version x.x".

```
Var p as new Picture(512,512,32)

Var g as Graphics = p.Graphics
g.ForeColor = &cFF0000
g.FillRect 0,0,128,128

g = p.mask.Graphics

g.ForeColor = &cFFFFFF
g.Fillrect 0,0,512,512
g.ForeColor = &c000000
g.Filloval 0,0,128,128

Backdrop = p

// create nsimage
Var n as new NSImageMBS(p,p.mask)

// and overlay over original image
NSApplicationMBS.sharedApplication.OverlayApplicationIconImage n
```

Notes: Same as setting applicationIconImage, but instead overlays the original image with the new image. This way you can show custom badges. For normal text badges, use NSDockTileMBS class.

Pass image = nil to reset application dock icon.

Size of the image seems to be 128 Pixel by default, but could go up to 1024 in the future. Plugin scales up or down as needed for you.

35.9.46 postEvent(e as NSEventMBS, atStart as boolean)

MBS MacCocoa Plugin, Plugin Version: 17.5, Platform: macOS, Targets: Desktop only.

Function: Adds a given event to the receiver,Äôs event queue.
Notes: anEvent: The event object to post to the queue.
flag: Specify true to add the event to the front of the queue; otherwise, specify false to add the event to the back of the queue.

This method can also be called in subthreads. Events posted in subthreads bubble up in the main thread event queue.

35.9.47 preventWindowOrdering

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Suppresses the usual window ordering in handling the most recent mouse-down event.
Notes: This method is only useful for mouse-down events when you want to prevent the window that receives the event from being ordered to the front.

35.9.48 registerForRemoteNotificationTypes(type as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Registers for remote notifications.
Example:

NSApplicationMBS.sharedApplication.registerForRemoteNotificationTypes NSApplicationMBS.NSRemoteNotificationTypeBadge

Notes: Only applications distributed through the Mac App Store may use Push notifications.

Type can only be NSRemoteNotificationTypeBadge currently for Mac OS X 10.7.0.

Available on Mac OS X 10.7 or newer.

35.9.49 removeWindowsItem(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Removes the Window menu item for a given window.
Notes: Win: The window whose menu item is to be removed.

This method doesn't prevent the item from being automatically added again. Use the excludedFromWindowsMenu method of NSWindow if you want the item to remain excluded from the Window menu.

35.9.50 replyToApplicationShouldTerminate(reply as boolean)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Responds to NSTerminateLater once the application knows whether it can terminate.
Notes: souldTerminate: Specify true if you want the application to terminate; otherwise, specify false.

If your application delegate returns NSTerminateLater from its applicationShouldTerminate event, your code must subsequently call this method to let the NSApplication object know whether it can actually terminate itself.

35.9.51 replyToOpenOrPrint(reply as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Handles errors that might occur when the user attempts to open or print files.
Notes: reply: The error that occurred. For a list of possible values, see "Constants."

Delegates should invoke this method if an error is encountered in the applicationOpenFiles or applicationPrintFiles delegate methods.

35.9.52 requestUserAttention(type as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Starts a user attention request.
Example:

```
Var a as NSApplicationMBS = NSApplicationMBS.sharedApplication

if not a.isActive then // only when we are in background
call a.requestUserAttention(a.NSInformationalRequest) // dock bounces
end if
```

Notes: requestType: The severity of the request. Can be NSInformationalRequest or NSCriticalRequest.

Returns the identifier for the request. You can use this value to cancel the request later using the cancelUserAttentionRequest method.

Activating the application cancels the user attention request. A spoken notification will occur if spoken notifications are enabled. Sending requestUserAttention to an application that is already active has no effect.

If the inactive application presents a modal panel, this method will be invoked with NSCriticalRequest automatically. The modal panel is not brought to the front for an inactive application.

35.9.53 runModalForWindow(win as NSWindowMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: Starts a modal event loop for the specified window.
Notes: win: The window to be displayed modally. If it is not already visible, the window is centered on the screen using the value in its center method and made visible and key. If it is already visible, it is simply made key.

Returns an integer indicating the reason that this method returned.

This method runs a modal event loop for the specified window synchronously. It displays the specified window, makes it key, starts the run loop, and processes events for that window. (You do not need to show the window yourself.) While the app is in that loop, it does not respond to any other events (including mouse, keyboard, or window-close events) unless they are associated with the window. It also does not perform any tasks (such as firing timers) that are not associated with the modal run loop. In other words, this method consumes only enough CPU time to process events and dispatch them to the action methods associated with the modal window.

You can exit the modal loop by calling the stopModal, stopModalWithCode, or abortModal methods from your modal window code. If you use the stopModalWithCode method to stop the modal event loop, this method returns the argument passed to stopModalWithCode. If you use stopModal instead, this method

returns the constant NSModalResponseStop (-1000). If you use abortModal, this method returns the constant NSModalResponseAbort (-1001).

35.9.54 runPageLayout

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays the app's page layout panel, an instance of NSPageLayout.
Example:

NSApplicationMBS.sharedApplication.runPageLayout

Notes: If the NSPageLayout instance does not exist, this method creates one. This method is typically invoked when the user chooses Page Setup from the application's FIle menu.

35.9.55 sendEvent(theEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Dispatches an event to other objects.
Notes: You rarely invoke sendEvent directly, although you might want to override this method to perform some action on every event. sendEvent messages are sent from the main event loop (the run method). sendEvent is the method that dispatches events to the appropriate responders—NSApp handles application events, the NSWindow object indicated in the event record handles window-related events, and mouse and key events are forwarded to the appropriate NSWindow object for further dispatching.

If you need to override sendEvent method, please call MBS support.

35.9.56 sharedApplication as NSApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns the application instance, creating it if it doesn't exist yet.
Notes: The plugin makes sure that there is only one application object by returning the same object each time.

35.9.57 showHelp

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Shows help.
Example:

```
NSApplicationMBS.sharedApplication.showHelp
```

Notes: If your project is properly registered, and the necessary keys have been set in the property list, this method launches Help Viewer and displays the first page of your app,Äôs help book.

35.9.58 showWritingTools

MBS MacCocoa Plugin, Plugin Version: 25.0, Platform: macOS, Targets: Desktop only.

Function: Shows writing tools.
Example:

```
// e.g. in menu command
NSApplicationMBS.sharedApplication.showWritingTools
```

Notes: For Apple Intelligence.
Requires macOS 15.2 or iOS 18.2.

Sends the request to the focussed control.

35.9.59 startDictation

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Starts dictation.
Example:

```
NSApplicationMBS.sharedApplication.startDictation
```

Notes: For Mac OS X 10.8.

35.9.60 stopDictation

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Stops dictation.
Notes: For Mac OS X 10.8.

35.9.61 terminate

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Terminates the receiver.
Example:

NSApplicationMBS.sharedApplication.terminate

Notes: This method is typically invoked when the user chooses Quit or Exit from the application's menu.

When invoked, this method performs several steps to process the termination request. First, it asks the application's document controller (if one exists) to save any unsaved changes in its documents. During this process, the document controller can cancel termination in response to input from the user. If the document controller does not cancel the operation, this method then calls the delegate's applicationShouldTerminate method. If applicationShouldTerminate returns NSTerminateCancel, the termination process is aborted and control is handed back to the main event loop. If the method returns NSTerminateLater, the application runs its run loop in the NSModalPanelRunLoopMode mode until the replyToApplicationShouldTerminate method is called with the value true or false. If the applicationShouldTerminate method returns NSTerminateNow, this method posts a NSApplicationWillTerminateNotification notification to the default notification center.

Do not bother to put final cleanup code in your application's main() function—it will never be executed. If cleanup is necessary, perform that cleanup in the delegate's applicationWillTerminate method.

35.9.62 unhide

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Restores hidden windows to the screen and makes the receiver active.
Example:

NSApplicationMBS.sharedApplication.unhide

35.9.63 unhideAllApplications

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Unhides all applications, including the receiver.
Example:

NSApplicationMBS.sharedApplication.unhideAllApplications

Notes: This action causes each application to order its windows to the front, which could obscure the currently active window in the active application.

35.9.64 unhideWithoutActivation

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Restores hidden windows without activating their owner (the receiver).
Example:

NSApplicationMBS.sharedApplication.unhideWithoutActivation

Notes: When this method begins, it posts an NSApplicationWillUnhideNotification to the default notification center. If it completes successfully, it posts an NSApplicationDidUnhideNotification.

35.9.65 unregisterForRemoteNotifications

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Unregisters for remote notifications.
Example:

NSApplicationMBS.sharedApplication.unregisterForRemoteNotifications

Notes: Available on Mac OS X 10.7 or newer.

35.9.66 updateWindows

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sends an update message to each onscreen window.
Notes: This method is invoked automatically in the main event loop after each event when running in NSDefaultRunLoopMode or NSModalRunLoopMode. This method is not invoked automatically when running in NSEventTrackingRunLoopMode.

When this method begins, it posts an NSApplicationWillUpdateNotification to the default notification center. When it successfully completes, it posts an NSApplicationDidUpdateNotification.

35.9.67 updateWindowsItem(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Updates the Window menu item for a given window to reflect the edited status of that window.
Notes: win: The window whose menu item is to be updated.

You rarely need to invoke this method because it is invoked automatically when the edit status of an NSWindow object is set.

35.9.68 windows as NSWindowMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns an array containing the receiver's window objects.
Example:

```
// show all window titles in message boxes
for each w as NSWindowMBS in NSApplicationMBS.sharedApplication.windows
MessageBox w.Title
next
```

Notes: Returns an array of NSWindow objects. This array includes both onscreen and offscreen windows.

Returns nil in case of an error.
This list may include closed windows, if they are still in memory.

35.9.69 windowWithWindowNumber(windowNumber as Integer) as NSWindowMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns the window corresponding to the specified window number.
Example:

```
Var w as window = Window1
w.Title = "This is our test window"

// get a window ID somewhere
Var WindowID as Integer = CGWindowMBS.GetWindowID(w)

// now find back the window
Var n as NSWindowMBS = NSApplicationMBS.sharedApplication.windowWithWindowNumber(windowid)

MessageBox n.Title
```

Notes: windowNumber: The unique window number associated with the desired NSWindow object.

Returns the desired window object or nil if the window could not be found.

35.9.70 Properties

35.9.71 activationPolicy as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The application's activation policy.
Notes: Currently, NSApplicationActivationPolicyNone and NSApplicationActivationPolicyAccessory may be changed to NSApplicationActivationPolicyRegular, but other modifications are not supported.

Update: Seems to work better newer MacOS versions, so between 10.6 and 10.15 Apple implemented more transitions.

Available in Mac OS X v10.6 and later.
(Read and Write property)

35.9.72 applicationIconImage as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The image used for the receiver's icon.
Example:

```
Var pic as Picture = LogoMBS(500)
Var mask as new Picture(500, 500, 32)
Var g as Graphics = mask.Graphics

g.ForeColor = &cFFFFFF
g.FillRect 0,0,g.Width, g.Height
g.ForeColor = &c000000
g.FillOval 0,0,g.Width, g.Height

Var n as new NSImageMBS(pic,mask)

NSApplicationMBS.sharedApplication.applicationIconImage = n
```

Notes: An image containing the application's icon.

This property can set the icon in the dock application tile. This method scales the image as necessary so

that it fits in the dock tile. You can use this method to change your application icon while running. To restore your application's original icon, you pass nil to this method.
(Read and Write property)

35.9.73 currentEvent as NSEventMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Returns the current event, the last event the receiver retrieved from the event queue.
Example:

```
Var e as NSEventMBS = NSApplicationMBS.sharedApplication.currentEvent
```

Notes: The last event object retrieved by the application.

NSApp receives events and forwards them to the affected NSWindow objects, which then distribute them to the objects in its view hierarchy.

Only for Cocoa applications.
(Read only property)

35.9.74 currentSystemPresentationOptions as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns the set of application presentation options that are currently in effect for the system.
Example:

```
Var a as new NSApplicationMBS

MessageBox "currentSystemPresentationOptions: "+str(a.currentSystemPresentationOptions)
```

Notes: The presentation options. See NSApplicationPresentation* constants and combine them using a C bitwise OR operator.

These are the presentation options that have been put into effect by the currently active application.
(Read only property)

35.9.75 dockTile as NSDockTileMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Returns the application's Dock tile.
Example:

```
Var a as new NSApplicationMBS

a.dockTile.badgeLabel = "Hello"
```

Notes: Available in Mac OS X v10.5 and later.

Returns NSDockTileMBS object for the dock tile.
(Read only property)

35.9.76 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: The internal reference to the NSApplication object.
Notes: (Read and Write property)

35.9.77 helpMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The help menu used by the application.
Notes: If helpMenu is nil, the system will append the help to an appropriate menu and will not return a reference to that menu when this method is called.

Available in Mac OS X v10.6 and later.

If helpMenu is a non-nil menu it is set as the Help menu, and Spotlight for Help will be installed in it. If helpMenu is nil, AppKit will install Spotlight for Help into a menu of its choosing, and that menu is not returned from helpMenu.

If you wish to completely suppress Spotlight for Help, you can set a menu that does not appear in the menu bar.

NSApplication retains its Help menu and releases it when a different menu is set.
(Read and Write property)

35.9.78 isActive as Boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether this is the active application.
Example:

```
Var a as NSApplicationMBS = NSApplicationMBS.sharedApplication
MessageBox "isActive:" +str(a.isActive)
```

Notes: True if this is the active application; false otherwise.
(Read only property)

35.9.79 isFullKeyboardAccessEnabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns that status of Full Keyboard Access set in the Keyboard preference pane.
Example:

```
Var a as NSApplicationMBS = NSApplicationMBS.sharedApplication
MessageBox "isFullKeyboardAccessEnabled:" +str(a.isFullKeyboardAccessEnabled)
```

Notes: True if Full Keyboard Access is enabled, otherwise false.

You may use this status to implement your own key loop or to implement in-control tabbing behavior similar to NSTableView.

Available in Mac OS X v10.6 and later.
(Read only property)

35.9.80 isHidden as Boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the receiver is hidden.
Example:

```
MessageBox str(NSApplicationMBS.sharedApplication.isHidden)
```

Notes: True if the receiver is hidden, false otherwise.
(Read only property)

35.9.81 isRunning as Boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the main event loop is running.
Example:

```
MessageBox str(NSApplicationMBS.sharedApplication.isRunning)
```

Notes: True if the main event loop is running; false otherwise.
False means the stop: method was invoked.

Should always be true for a Xojo application.
(Read only property)

35.9.82 keyWindow as NSWindowMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Returns the window that currently receives keyboard events.
Example:

```
// title of front window
MessageBox NSApplicationMBS.sharedApplication.keyWindow.Title
```

Notes: The window object currently receiving keyboard events or nil if there is no key window.
This method might return nil if the application hasn't finished loading yet or if the receiver is not active.

Does return nil in Carbon applications.
(Read only property)

35.9.83 mainMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The menu object representing the application's menu bar.
Example:

```
// shows titles of the menus in a Cocoa app
```

```
Var m as NSMenuMBS = NSApplicationMBS.sharedApplication.mainMenu

if m<>nil then
Var c as Integer = m.numberOfItems-1
for i as Integer = 0 to c

MessageBox m.Item(i).Title
next
end if
```

Notes: Returns nil on a Carbon application.
(Read and Write property)

35.9.84 mainWindow as NSWindowMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Returns the main window.
Example:

```
// shows title in Cocoa, but not in Carbon
MessageBox NSApplicationMBS.sharedApplication.mainWindow.Title
```

Notes: The application's main window or nil if there is no main window.
This method might return nil if the application hasn't finished loading, if the receiver is not active, or if the application is hidden.
(Read only property)

35.9.85 presentationOptions as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The presentation options that should be in effect for the system when this application is active.
Example:

```
Var a as new NSApplicationMBS

// hide dock
a.presentationOptions = NSApplicationMBS.NSApplicationPresentationAutoHideDock
```

Notes: Available in Mac OS X v10.6 and later.

Only certain combinations of "NSApplicationPresentationOptions" flags are supported. When given an invalid combination of option flags this method raises an exception NSInvalidArgumentException exception..

See NSApplicationPresentation* constants.
(Read and Write property)

35.9.86 servicesProvider as NSServiceProviderMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Registers or queries the service provider.
Notes: The service provider is an object that performs all services the application provides to other applications. When another application requests a service from the receiver, it sends the service request to aProvider. Service requests can arrive immediately after the service provider is set, so invoke this method only when your application is ready to receive requests.

Please keep an object reference around so the object is not going out of scope too early!
(Read and Write property)

35.9.87 userInterfaceLayoutDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 16.3, Platform: macOS, Targets: All.

Function: The layout direction of the user interface.
Notes: This property contains the general user interface layout flow directions. For a list of possible values, see NSUserInterfaceLayoutDirection.

NSUserInterfaceLayoutDirectionLeftToRight = 0
NSUserInterfaceLayoutDirectionRightToLeft = 1

Available in OS X v10.6 and later.
(Read only property)

35.9.88 windowsMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The window menu or nil if such a menu does not exist or has not yet been created.
Notes: (Read and Write property)

35.9.89 WritingToolsAvailable as Boolean

MBS MacCocoa Plugin, Plugin Version: 25.0, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether Writing Tools features are currently available.
Example:

Var Available As Boolean = NSApplicationMBS.WritingToolsAvailable
Break

Notes: The value of this property is ‘true‘ when Writing Tools features are available, and ‘false‘ when they aren,Äôt. Writing Tools support might be unavailable because of device constraints or because the system isn,Äôt ready to process Writing Tools requests.

Can be queried on older macOS or iOS versions, where it always returns false.
(Read only property)

35.9.90 Constants

Constants

Constant	Value	Description
NSRemoteNotificationTypeAlert	4	One of the notification type constants. Available in Mac OS X 10.8.
NSRemoteNotificationTypeBadge	1	One of the notification type constants.
NSRemoteNotificationTypeNone	0	One of the notification type constants.
NSRemoteNotificationTypeSound	2	One of the notification type constants. Available in Mac OS X 10.8.

Activation Policy Constants

Constant	Value	Description
NSApplicationActivationPolicyAccessory	1	The application does not appear in the Dock and does not have a m but it may be activated programmatically or by clicking on one of its This corresponds to value of the LSUIElement key in the application's being 1. Available in Mac OS X v10.6 and later.
NSApplicationActivationPolicyProhibited	2	The application does not appear in the Dock and may not create or be activated. This corresponds to the value of the LSBackground in the application's Info.plist being 1. This is also the default for u executables that do not have Info.plists. Available in Mac OS X v10.6 and later.
NSApplicationActivationPolicyRegular	0	The application is an ordinary app that appears in the Dock and ma user interface. This is the default for bundled apps, unless overridd Info.plist. Available in Mac OS X v10.6 and later.

Presentation Option Constants.

Constant	Value	Description
NSApplicationPresentationAutoHideDock	1	
NSApplicationPresentationAutoHideMenuBar	4	
NSApplicationPresentationAutoHideToolbar	2048	Fullscreen window toolbar is detached from windo toHidden menu bar. May be used only when both FullScreen and NSApplicationPresentationAutoHi Available on Mac OS X 10.7 or newer.
NSApplicationPresentationDefault	0	
NSApplicationPresentationDisableAppleMenu	16	
NSApplicationPresentationDisableCursorLocationAssistance	4096	"Shake mouse pointer to locate" is disabled for th
NSApplicationPresentationDisableForceQuit	64	
NSApplicationPresentationDisableHideApplication	256	
NSApplicationPresentationDisableMenuBarTransparency	512	
NSApplicationPresentationDisableProcessSwitching	32	
NSApplicationPresentationDisableScreenCornerInteractions	32768	Disable screen corner interactions when the applica Dock or hideDock must also be set for this option
NSApplicationPresentationDisableSessionTermination	128	
NSApplicationPresentationFullScreen	1024	Application is in fullscreen mode. Available on Mac OS X 10.7 or newer.
NSApplicationPresentationHideDock	2	
NSApplicationPresentationHideMenuBar	8	

Request type constants.

Constant	Value	Description
NSCriticalRequest	0	The user attention request is a critical request. The dock icon will bounce until either the application becomes active or the request is canceled.
NSInformationalRequest	10	The user attention request is an informational request. The dock icon will bounce for one second. The request, though, remains active until either the application becomes active or the request is canceled.

35.10 class NSAutoreleasePoolMBS

35.10.1 class NSAutoreleasePoolMBS

MBS Main Plugin, Plugin Version: 8.5, Platform: macOS, Targets: All.

Function: The class for memory management in Cocoa.
Example:

```
Var pool as NSAutoreleasePoolMBS

sub MyThread.Run
pool=new NSAutoreleasePoolMBS
// do work
end sub
```

Notes: If you use threads, you need to create a NSAutoreleasePoolMBS on the start to have correct Cocoa memory manager.
Blog Entries

- REALbasic 2009r4 and MBS Plugins

35.10.2 Methods

35.10.3 Constructor

MBS Main Plugin, Plugin Version: 8.5, Platform: macOS, Targets: All.

Function: The constructor to create a new Autorelease Pool.
Example:

```
// Cleanup memory for Cocoa objects

Sub Action() // in Timer
static LastPool as NSAutoreleasePoolMBS = nil
static CurrentPool as NSAutoreleasePoolMBS = nil

LastPool = CurrentPool
CurrentPool = new NSAutoreleasePoolMBS
End Sub
```

Notes: The example code above is not needed in Xojo 2009r4 and above as the runtime does it automatically for you.

35.10.4 Properties

35.10.5 Handle as Integer

MBS Main Plugin, Plugin Version: 8.5, Platform: macOS, Targets: All.

Function: The handle to the internally used NSAutoreleasePool object.
Notes: (Read and Write property)

35.11 Globals

35.11.1 NSLogMBS(message as string)

MBS Main Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Writes a message to the Console.app on Mac OS X.
Example:

```
Sub Log(message as string)
if TargetMacOS then
NSLogMBS message
else
System.DebugLog message
end if

End Sub
```

Notes: As with Mac OS X 10.8 the system.debugLog method does not write to Console.app. So use this function.

- MBS Real Studio Plugins, version 12.3pr16

35.11.2 NSStringArraySortMBS(texts() as string, options as Integer) as string()

MBS Main Plugin, Plugin Version: 16.1, Platforms: macOS, iOS, Targets: All.

Function: Sorts array of string with options.
Example:

```
// constants for the function:
const NSCaseInsensitiveSearch = 1
const NSLiteralSearch = 2
const NSBackwardsSearch = 4
const NSAnchoredSearch = 8
const NSNumericSearch = 64
const NSDiacriticInsensitiveSearch = 128
const NSWidthInsensitiveSearch = 256
const NSForcedOrderingSearch = 512

const NSOrderedAscending = -1
const NSOrderedSame = 0
const NSOrderedDescending = 1

// test array
```

```
Var a() as string = array("Test 1", "Test 2", "Test 12")

// sort with Cocoa sorting
Var r() as string = NSStringArraySortMBS(a, NSDiacriticInsensitiveSearch + _
NSWidthInsensitiveSearch + _
NSCaseInsensitiveSearch + _
NSNumericSearch)

// sort with xojo
a.sort

// show result
MessageBox "Cocoa: "+Join(r,", ")+EndOfLine+_
"Xojo: "+Join(a, ", ")
```

Notes: This function allows you to use NSStringCompareMBS for array sorting.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.1pr5

35.11.3 NSStringCompareMBS(s as string, t as string, options as Integer) as Integer

MBS Main Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Compares two things using the Cocoa string functions.
Example:

```
// constants for the function:
const NSCaseInsensitiveSearch = 1
const NSLiteralSearch = 2
const NSBackwardsSearch = 4
const NSAnchoredSearch = 8
const NSNumericSearch = 64
const NSDiacriticInsensitiveSearch = 128
const NSWidthInsensitiveSearch = 256
const NSForcedOrderingSearch = 512

const NSOrderedAscending = -1
const NSOrderedSame = 0
const NSOrderedDescending = 1

if NSStringCompareMBS("Hello","hello", NSCaseInsensitiveSearch)=0 then
MessageBox "equal (correct)"
else
MessageBox "not equal"
end if
```

```
if NSStringCompareMBS("Hello","hello", 0)=0 then
MessageBox "equal"
else
MessageBox "not equal (correct)"
end if

if NSStringCompareMBS("Hello","Hell√", NSDiacriticInsensitiveSearch)=0 then
MessageBox "equal (correct)"
else
MessageBox "not equal"
end if
```

Notes: Following constants can be used for the compare:

NSCaseInsensitiveSearch	1	Case Insensitive
NSLiteralSearch	2	Exact character-by-character equivalence
NSBackwardsSearch	4	Search from end of source string
NSAnchoredSearch	8	Search is limited to start (or end, if NSBackwardsSearch) of source string
NSNumericSearch	64	Added in 10.2; Numbers within strings are compared using numeric value, that is, Foo2.txt <Foo7.txt <Foo25.txt; only applies to compare methods, not find
NSDiacriticInsensitiveSearch	128	If specified, ignores diacritics (o-umlaut = o)
NSWidthInsensitiveSearch	256	If specified, ignores width differences ('a' = UFF41)
NSForcedOrderingSearch	512	If specified, comparisons are forced to return either NSOrderedAscending or NSOrderedDescending if the strings are equivalent but not strictly equal, for stability when sorting (e.g. "aaa" >"AAA" with NSCaseInsensitiveSearch specified)

The constants NSDiacriticInsensitiveSearch, NSWidthInsensitiveSearch and NSForcedOrderingSearch are only for Mac OS X 10.5 and newer versions.

Returns value constants:

NSOrderedAscending	-1
NSOrderedSame	0
NSOrderedDescending	1

- MonkeyBread Software Releases the MBS REALbasic plug-ins 8.6

35.11.4 NSMakePointMBS(x as Double, y as Double) as NSPointMBS

MBS Main Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Creates a NSPoint object based on coordinates.
Example:

```
// move a window so its bottom left corner is at 100/100 in screen coordinates
Self.NSWindowMBS.setFrameOrigin NSMakePointMBS(100, 100)
```

Blog Entries

- MBS REALbasic plug-ins version 9.4

35.11.5 NSMakeRangeMBS(location as UInt32, length as UInt32) as NSRangeMBS

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a new range with the given values.
Example:

```
// select characters 6 to 10 in a Cocoa text view
// This example needs a window with TextArea1.
TextArea1.Text = "Hello World and more"
Var range As NSRangeMBS = NSMakeRangeMBS(6, 5) // location 6, length 5
TextArea1.NSTextViewMBS.selectedRange = range
```

35.11.6 NSMakeRectMBS(x as Double, y as Double, w as Double, h as Double) as NSRectMBS

MBS Main Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Creates a NSRect object based on coordinates and size.
Example:

```
// move and resize a window with Cocoa coordinates (origin is bottom left)
Var frame As NSRectMBS = NSMakeRectMBS(100, 100, 600, 400)
Self.NSWindowMBS.setFrame(frame, True)
```

Blog Entries

- MBS REALbasic plug-ins version 9.4

35.11.7 NSMakeSizeMBS(w as Double, h as Double) as NSSizeMBS

MBS Main Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Creates a NSSize object based on a size.
Example:

```
// set the minimum size of a window with Cocoa
Self.NSWindowMBS.minSize = NSMakeSizeMBS(400, 300)
```

35.11.8 CenterResizeAddWindowMBS(win as window)

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Adds a window to the list of center resizing windows.
Notes: Please call in open event of window.

35.11.9 CenterResizeInstallMBS

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Installs the center resize function.
Notes: The plugin can provide for Xojo and Xojo the center based window resizing.
Call this method early in app.open to prepare everything.

Than register windows with CenterResizeAddWindowMBS in window open event and unregister with CenterResizeRemoveWindowMBS in window close event. This works for all windows you register.

35.11.10 CenterResizeRemoveWindowMBS(win as window)

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Removes a window from the list of center resizing windows.
Notes: Please call in Close event of window.

35.12 class NSBundleMBS

35.12.1 class NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: An NSBundle object represents a location in the file system that groups code and resources that can be used in a program.
Example:

```
MessageBox NSBundleMBS.mainBundle.bundlePath
```

Notes: NSBundle objects locate program resources, dynamically load and unload executable code, and assist in localization. You build a bundle in Xcode using one of these project types: Application, Framework, plug-ins.
Although bundle structures vary depending on the target platform and the type of bundle you are building, the NSBundle class hides this underlying structure in most (but not all) cases. Many of the methods you use to load resources from a bundle automatically locate the appropriate starting directory and look for resources in known places.

35.12.2 Methods

35.12.3 allBundles as NSBundleMBS()

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns an array of all the application's non-framework bundles.
Example:

```
Var a(-1) as NSBundleMBS = NSBundleMBS.allBundles
Var lines(-1) as string

for each n as NSBundleMBS in a
lines.Add n.bundlePath
next

MessageBox Join(lines,EndOfLine)
```

Notes: The returned array includes the main bundle and all bundles that have been dynamically created but doesn't contain any bundles that represent frameworks.

35.12.4 allFrameworks as NSBundleMBS()

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns an array of all of the application's bundles that represent frameworks.
Example:

```
Var a(-1) as NSBundleMBS = NSBundleMBS.allFrameworks
Var lines(-1) as string

for each n as NSBundleMBS in a
lines.Add n.bundlePath
next

MessageBox Join(lines,EndOfLine)
```

Notes: Returns an array of all of the application's bundles that represent frameworks. Only frameworks with one or more Objective-C classes in them are included.

The returned array includes frameworks that are linked into an application when the application is built and bundles for frameworks that have been dynamically created.

35.12.5 builtInPlugInsFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiver's subdirectory containing plug-ins.
Example:

```
MessageBox NSBundleMBS.mainBundle.builtInPlugInsFolder.DisplayName
```

Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

35.12.6 builtInPlugInsPath as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiver's subdirectory containing plug-ins.
Example:

MessageBox NSBundleMBS.mainBundle.builtInPlugInsPath

Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

35.12.7 bundleFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiver's bundle directory.
Example:

MessageBox NSBundleMBS.mainBundle.bundleFolder.DisplayName

35.12.8 bundleIdentifier as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the receiver's bundle identifier.
Example:

Var n as NSBundleMBS = NSBundleMBS.mainBundle
MessageBox n.bundleIdentifier

Notes: Returns the receiver's bundle identifier, which is defined by the CFBundleIdentifier key in the bundle's information property list.

35.12.9 bundlePath as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiver's bundle directory.
Example:

MessageBox NSBundleMBS.mainBundle.bundlePath

35.12.10 bundleWithIdentifier(identifier as string) as NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the previously created NSBundle instance that has the specified bundle identifier.
Example:

```
// create with path
Var x as NSBundleMBS = NSBundleMBS.bundleWithPath(SpecialFolder.Applications.Child("iTunes.app"))
MessageBox x.bundlePath

// once the bundle is known it will be in the allBundles array and be found with bundleWithIdentifier:
Var n as NSBundleMBS = NSBundleMBS.bundleWithIdentifier("com.apple.iTunes")
MessageBox n.bundlePath
```

Notes: The previously created NSBundle instance that has the bundle identifier identifier. Returns nil if the requested bundle is not found.

This method is typically used by frameworks and plug-ins to locate their own bundle at runtime. This method may be somewhat more efficient than trying to locate the bundle using the bundleForClass method.

35.12.11 bundleWithPath(path as folderitem) as NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns an NSBundle object that corresponds to the specified directory.
Example:

```
// create with path
Var x as NSBundleMBS = NSBundleMBS.bundleWithPath(SpecialFolder.Applications.Child("iTunes.app"))
MessageBox x.bundlePath
```

Notes: Returns the NSBundle object that corresponds to fullPath, or nil if fullPath does not identify an accessible bundle directory.

This method allocates and initializes the returned object if there is no existing NSBundle associated with fullPath, in which case it returns the existing object.
See also:

- 35.12.12 bundleWithPath(path as string) as NSBundleMBS 6250

35.12.12 bundleWithPath(path as string) as NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns an NSBundle object that corresponds to the specified directory.
Example:

```
// create with path
Var x as NSBundleMBS = NSBundleMBS.bundleWithPath("/Applications/iTunes.app")
MessageBox x.bundlePath
```

Notes: Returns the NSBundle object that corresponds to fullPath, or nil if fullPath does not identify an accessible bundle directory.

This method allocates and initializes the returned object if there is no existing NSBundle associated with fullPath, in which case it returns the existing object.
See also:

- 35.12.11 bundleWithPath(path as folderitem) as NSBundleMBS 6250

35.12.13 Constructor(path as folderitem)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates an NSBundle object that corresponds to the specified directory.
Example:

```
Var n as new NSBundleMBS(SpecialFolder.Applications.Child("iTunes.app"))
Var d as Dictionary = n.infoDictionary
MessageBox d.Value("CFBundleName")
```

Notes: Creates the NSBundle object that corresponds to fullPath, or fails if fullPath does not identify an accessible bundle directory. On failure the handle property is 0.

This method allocates and initializes the returned object if there is no existing NSBundle associated with fullPath, in which case it returns the existing object.
See also:

- 35.12.14 Constructor(path as string) 6251

35.12.14 Constructor(path as string)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates an NSBundle object that corresponds to the specified directory.
Example:

```
Var n as new NSBundleMBS("/Applications/iTunes.app")
Var d as Dictionary = n.infoDictionary
MessageBox d.Value("CFBundleName")
```

Notes: Creates the NSBundle object that corresponds to fullPath, or fails if fullPath does not identify an accessible bundle directory. On failure the handle property is 0.

This method allocates and initializes the returned object if there is no existing NSBundle associated with fullPath, in which case it returns the existing object.
See also:

- 35.12.13 Constructor(path as folderitem) 6251

35.12.15 developmentLocalization as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the localization used to create the bundle.
Example:

```
MessageBox NSBundleMBS.mainBundle.developmentLocalization
```

Notes: The returned localization corresponds to the value in the CFBundleDevelopmentRegion key of the bundle's property list (Info.plist).

35.12.16 executableArchitectures as Integer()

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns an array of numbers indicating the architecture types supported by the bundle's executable.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.app")
Var b as new NSBundleMBS(f)

Var lines(-1) as string

for each e as Integer in b.executableArchitectures
Var s as string
Select case e
case NSBundleMBS.NSBundleExecutableArchitectureI386
s="i386"
case NSBundleMBS.NSBundleExecutableArchitecturePPC
s="PPC"
case NSBundleMBS.NSBundleExecutableArchitecturePPC64
s="PPC 64-bit"
case NSBundleMBS.NSBundleExecutableArchitectureX86_64
s="x86 64-bit"
```

```
case 12
s="iPhone"
else
s=Str(e)
end Select
lines.Add hex(e)+": "+s
next

MessageBox Join(lines,EndOfLine)
```

Notes: This method scans the bundle's Mach-O executable and returns all of the architecture types it finds. Because they are taken directly from the executable, the returned values may not always correspond to one of the well-known CPU types defined in "Mach-O Architecture."

35.12.17 executableFile as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiver's executable file.
Example:

```
MessageBox NSBundleMBS.mainBundle.executableFile.NativePath
```

35.12.18 executablePath as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiver's executable file.
Example:

```
MessageBox NSBundleMBS.mainBundle.executablePath
```

35.12.19 infoDictionary as dictionary

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns a dictionary that contains information about the receiver.
Example:

```
Var n as new NSBundleMBS(SpecialFolder.Applications.Child("iTunes.app"))
Var d as Dictionary = n.infoDictionary
Var lines(-1) as string

for each key as Variant in d.keys
```

```
Var value as Variant = d.Value(key)

// special handle folderitems
if value isa FolderItem then
Var f as FolderItem = value
value = f.Name
end if

lines.Add key.StringValue + " ->"+value.StringValue
next

MessageBox Join(lines,EndOfLine)
```

Notes: Returns a dictionary, constructed from the bundle's Info.plist file, that contains information about the receiver. If the bundle does not contain an Info.plist file, a valid dictionary is returned but this dictionary contains only private keys that are used internally by the NSBundle class. The NSBundle class may add extra keys to this dictionary for its own use.

35.12.20 isLoaded as boolean

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Obtains information about the load status of a bundle.
Example:

```
MessageBox str(NSBundleMBS.mainBundle.isLoaded) // mainbundle is always loaded
```

Notes: Returns true if the bundle's code is currently loaded, otherwise false.

35.12.21 load as boolean

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Dynamically loads the bundle's executable code into a running program, if the code has not already been loaded.
Notes: Returns true if the method successfully loads the bundle's code or if the code has already been loaded, otherwise false.

You can use this method to load the code associated with a dynamically loaded bundle, such as a plug-in or framework. Prior to Mac OS X version 10.5, a bundle would attempt to load its code—if it had any—only once. Once loaded, you could not unload that code. In Mac OS X version 10.5 and later, you can unload a bundle's executable code using the unload method.
You don't need to load a bundle's executable code to search the bundle's resources.

35.12.22 localizations as string()

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns a list of all the localizations contained within the receiver's bundle.
Example:

```
MessageBox join(NSBundleMBS.mainBundle.localizations,EndOfLine)
```

Notes: Returna an array, containing strings, that specifies all the localizations contained within the receiver's bundle.

35.12.23 localizedInfoDictionary as dictionary

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns a dictionary with the keys from the bundle's localized property list.
Example:

```
Var n as new NSBundleMBS(SpecialFolder.Applications.Child("iTunes.app"))
Var d as Dictionary = n.localizedInfoDictionary
Var lines(-1) as string

for each key as Variant in d.keys
Var value as Variant = d.Value(key)

// special handle folderitems
if value isa FolderItem then
Var f as FolderItem = value
value = f.Name
end if

lines.Add key.StringValue + " ->"+value.StringValue
next

MessageBox Join(lines,EndOfLine)
```

Notes: Returns a dictionary with the keys from the bundle's localized property list (InfoPlist.strings).

This method uses the preferred localization for the current user when determining which resources to return. If the preferred localization is not available, this method chooses the most appropriate localization found in the bundle.

35.12.24 localizedStringForKey(key as string, value as string="", tableName as string="") as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns a localized version of the string designated by the specified key and residing in the specified table.
Notes: key: The key for a string in the table identified by tableName.
value: The value to return if key is "" or if a localized string for key can't be found in the table.
tableName: The receiver's string table to search. If tableName is an empty string, the method attempts to use the table in Localizable.strings.

Returns a localized version of the string designated by key in table tableName. If value is nil or an empty string, and a localized string is not found in the table, returns key. If key and value are both nil, returns the empty string.

For more details about string localization and the specification of a .strings file, see "Working With Localized Strings."
Using the user default NSShowNonLocalizedStrings, you can alter the behavior of localizedStringForKey to log a message when the method can't find a localized string. If you set this default to true (in the global domain or in the application's domain), then when the method can't find a localized string in the table, it logs a message to the console and capitalizes key before returning it.
The following example cycles through a static array of keys when a button is clicked, gets the value for each key from a strings table named Buttons.strings, and sets the button title with the returned value:

35.12.25 mainBundle as NSBundleMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the NSBundle object that corresponds to the directory where the current application executable is located.
Example:

MessageBox NSBundleMBS.mainBundle.bundlePath

Notes: Returns the NSBundle object that corresponds to the directory where the application executable is located, or nil if a bundle object could not be created.

This method allocates and initializes a bundle object if one doesn't already exist. The new object corresponds to the directory where the application executable is located. Be sure to check the return value to make sure you have a valid bundle. This method may return a valid bundle object even for unbundled applications.
In general, the main bundle corresponds to an application file package or application wrapper: a directory that bears the name of the application and is marked by a ".app" extension.

35.12.26 pathForImageResource(name as string) as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the location of the specified image resource file.
Notes: name: The name of the image resource file, without any pathname information. Including a filename extension is optional.

Returns the absolute pathname of the resource file or nil if the file was not found.

Image resources are those files in the bundle that are recognized by the NSImage class, including those that can be converted using the Image IO framework.

35.12.27 pathForResource(name as string, extension as string) as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname for the resource identified by the specified name and file extension.
Notes: name: The name of the resource file.
extension: If extension is an empty string, the extension is assumed not to exist and the file URL is the first file encountered that exactly matches name.

Returns the full pathname for the resource file or nil if the file could not be located.

The method first looks for a matching resource file in the non-localized resource directory of the specified bundle. (In Mac OS X, this directory is typically called Resources but in iPhone OS, it is the main bundle directory.) If a matching resource file is not found, it then looks in the top level of any available language-specific ".lproj" directories. (The search order for the language-specific directories corresponds to the user's preferences.) It does not recurse through other subdirectories at any of these locations. For more details see Bundles and Localization.
The following code fragment gets the path to a plist within the bundle, and loads it into a dictionary.
See also:

- 35.12.28 pathForResource(name as string, extension as string, subpath as string) as folderitem 6257
- 35.12.29 pathForResource(name as string, extension as string, subpath as string, localizationName as string) as folderitem 6258

35.12.28 pathForResource(name as string, extension as string, subpath as string) as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname for the resource identified by the specified name and file extension and located in the specified bundle subdirectory.
Notes: name: The name of the resource file.
extension: If extension is an empty string, the extension is assumed not to exist and the file URL is the first file encountered that exactly matches name.
subpath: The name of the bundle subdirectory.

Returns the full pathname for the resource file or nil if the file could not be located.

If subpath is "", this method searches the top-level nonlocalized resource directory and the top-level of any language-specific directories. (In Mac OS X, the top-level nonlocalized resource directory is typically called Resources but in iPhone OS, it is the main bundle directory.) For example, suppose you have a Mac OS X application with a modern bundle and you specify "Documentation" for the subpath parameter. This method would first look in the Contents/Resources/Documentation directory of the bundle, followed by the Documentation subdirectories of each language-specific .lproj directory. (The search order for the language-specific directories corresponds to the user's preferences.) This method does not recurse through any other subdirectories at any of these locations. For more details see Bundles and Localization.
See also:

- 35.12.27 pathForResource(name as string, extension as string) as folderitem 6257
- 35.12.29 pathForResource(name as string, extension as string, subpath as string, localizationName as string) as folderitem 6258

35.12.29 pathForResource(name as string, extension as string, subpath as string, localizationName as string) as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname for the resource identified by the specified name and file extension, located in the specified bundle subdirectory, and limited to global resources and those associated with the specified localization.
Notes: name: The name of the resource file.
extension: If extension is an empty string, the extension is assumed not to exist and the file URL is the first file encountered that exactly matches name.
subpath: The name of the bundle subdirectory to search.
localizationName: The name of the localization. This parameter should correspond to the name of one of the bundle's language-specific resource directories without the .lproj extension.

Returns the full pathname for the resource file or nil if the file could not be located.

This method is equivalent to pathForResource:ofType, except that only nonlocalized resources and those in the language-specific .lproj directory specified by localizationName are searched.

There should typically be little reason to use this method—see Getting the Current Language and Locale.
See also:

- 35.12.27 pathForResource(name as string, extension as string) as folderitem 6257
- 35.12.28 pathForResource(name as string, extension as string, subpath as string) as folderitem 6257

35.12.30 pathForSoundResource(name as string) as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the location of the specified sound resource file.
Notes: name: The name of the sound resource file, without any pathname information. Including a filename extension is optional

Returns the folderitme of the resource file or nil if the file was not found.

Sound resources are those files in the bundle that are recognized by the NSSound class. The types of sound files can be determined by calling the soundUnfilteredFileTypes method of NSSound.

35.12.31 preferredLocalizations as string()

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns an array of strings indicating the actual localizations contained in the receiver's bundle.
Notes: An array of strings, each of which identifies the a localization in the receiver's bundle. The localizations in the array are not returned in any particular order.

35.12.32 privateFrameworksFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiver's subdirectory containing frameworks.
Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

35.12.33 privateFrameworksPath as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiver's subdirectory containing frameworks.
Notes: This method returns the appropriate path for modern application and framework bundles. This

method may not return a path for non-standard bundle formats or for some older bundle formats.

35.12.34 resourceFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiving bundle's subdirectory containing resources.

35.12.35 resourcePath as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiving bundle's subdirectory containing resources.

35.12.36 sharedFrameworksFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiver's subdirectory containing shared frameworks.
Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

35.12.37 sharedFrameworksPath as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiver's subdirectory containing shared frameworks.
Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

35.12.38 sharedSupportFolder as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiver's subdirectory containing shared support files.
Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

35.12.39 sharedSupportPath as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the full pathname of the receiver's subdirectory containing shared support files.
Notes: This method returns the appropriate path for modern application and framework bundles. This method may not return a path for non-standard bundle formats or for some older bundle formats.

35.12.40 unload as boolean

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Unloads the code associated with the receiver.
Notes: Returns true if the bundle was successfully unloaded or was not already loaded; otherwise, false if the bundle could not be unloaded.

This method attempts to unload a bundle's executable code using the underlying dynamic loader (typically dyld). You may use this method to unload plug-in and framework bundles when you no longer need the code they contain. You should use this method to unload bundles that were loaded using the methods of the NSBundle class only. Do not use this method to unload bundles that were originally loaded using the bundle-manipulation functions in Core Foundation.
It is the responsibility of the caller to ensure that no in-memory objects or data structures refer to the code being unloaded. For example, if you have an object whose class is defined in a bundle, you must release that object prior to unloading the bundle. Similarly, your code should not attempt to access any symbols defined in an unloaded bundle.

Prior to Mac OS X version 10.5, code could not be unloaded once loaded, and this method would always return false. In Mac OS X version 10.5 and later, you can unload a bundle's executable code using this method.

Available in Mac OS X v10.5 and later.

35.12.41 Properties

35.12.42 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: The internal reference to the NSBundle object.
Example:

MessageBox hex(NSBundleMBS.mainBundle.Handle)

Notes: (Read and Write property)

35.12.43 Constants

Architectures

Constant	Value	Description
NSBundleExecutableArchitectureARM64	&h0100000c	Specifies the 64-bit ARM architecture.
NSBundleExecutableArchitectureI386	7	Specifies the 32-bit Intel architecture. Available in Mac OS X v10.5 and later.
NSBundleExecutableArchitecturePPC	&h12	Specifies the 32-bit PowerPC architecture. Available in Mac OS X v10.5 and later.
NSBundleExecutableArchitecturePPC64	&h01000012	Specifies the 64-bit PowerPC architecture. Available in Mac OS X v10.5 and later.
NSBundleExecutableArchitectureX86_64	&h01000007	Specifies the 64-bit Intel architecture. Available in Mac OS X v10.5 and later.

35.13 class NSCalendarMBS

35.13.1 class NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The calendar class for Cocoa.
Example:

```
// add one month and two days to today with the current calendar
Var cal As NSCalendarMBS = NSCalendarMBS.currentCalendar

Var c As New NSDateComponentsMBS
c.month = 1
c.day = 2

Var d As DateTime = cal.dateTimeByAddingComponents(c, DateTime.Now)
MessageBox cal.calendarIdentifier + ": " + d.ToString
```

35.13.2 Methods

35.13.3 AMSymbol as string

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: The symbol used to represent ,ÄúAM,Äù for this calendar.

35.13.4 autoupdatingCurrentCalendar as NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the current logical calendar for the current user.
Notes: Settings you get from this calendar do change as the user's settings change (contrast with currentCalendar).

Note that if you cache values based on the calendar or related information those caches will of course not be automatically updated by the updating of the calendar object.

Available in Mac OS X v10.5 and later.

35.13.5 calendarIdentifier as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the identifier for the receiver.

35.13.6 calendarWithIdentifier(identifier as String) as NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Creates a new calendar specified by a given identifier.
Notes: identifier: The identifier for the new calendar. For valid identifiers, see Calendar Identifiers.

Returns he initialized calendar, or nil if the identifier is unknown (if, for example, it is either an unrecognized string or the calendar is not supported by the current version of the operating system).

The returned calendar defaults to the current locale and default time zone.

35.13.7 componentsInTimeZone(timezone as NSTimeZoneMBS, date as Date) as NSDateComponentsMBS

MBS MacBase Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns all the date components of a date, as if in a given time zone (instead of the receiving calendar,Äôs time zone).
Notes: timezone: The time zone to use when returning the components. This value overrides the time zone of the receiving NSCalendar.
date: The date for which to perform the calculation.

Returns an NSDateComponents object containing all the components from the given date, calculated using the given time zone.

See also:

- 35.13.8 componentsInTimeZone(timezone as NSTimeZoneMBS, date as DateTime) as NSDateComponentsMBS 6265

35.13.8 componentsInTimeZone(timezone as NSTimeZoneMBS, date as DateTime) as NSDateComponentsMBS

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Returns all the date components of a date, as if in a given time zone (instead of the receiving calendar,Äôs time zone).
Notes: timezone: The time zone to use when returning the components. This value overrides the time zone of the receiving NSCalendar.
date: The date for which to perform the calculation.

Returns an NSDateComponents object containing all the components from the given date, calculated using the given time zone.
See also:

- 35.13.7 componentsInTimeZone(timezone as NSTimeZoneMBS, date as Date) as NSDateComponentsMBS 6264

35.13.9 Constructor

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Creates new calendar object with current calendar.
See also:

- 35.13.10 Constructor(identifier as string) 6265

35.13.10 Constructor(identifier as string)

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Initializes a newly-allocated NSCalendar object for the calendar specified by a given identifier.
See also:

- 35.13.9 Constructor 6265

35.13.11 copy as NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns a copy of the calendar object.

35.13.12 currentCalendar as NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the logical calendar for the current user.
Notes: The returned calendar is formed from the settings for the current user's chosen system locale overlaid with any custom settings the user has specified in System Preferences. Settings you get from this calendar do not change as System Preferences are changed, so that your operations are consistent (contrast with autoupdatingCurrentCalendar).

35.13.13 dateByAddingComponents(components as NSDateComponentsMBS, toDate as Date, Options as Integer = 0) as Date

MBS MacBase Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a date representing the absolute time calculated by adding given components to a given date.
Notes: components: The components to add to date.
date: The date to which comps are added.
options: Options for the calculation. See NSCalendarOptions in Apple documentation for possible values.

If you specify no options, overflow in a unit carries into the higher units (as in typical addition).

Returns a new date representing the absolute time calculated by adding to date the calendrical components specified by comps using the options specified by opts. Returns nil if date falls outside the defined range of the receiver or if the computation cannot be performed.

35.13.14 dateFromComponents(components as NSDateComponentsMBS) as Date

MBS MacBase Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a date representing the absolute time calculated from given components.
Notes: components: The components from which to calculate the returned date.

Returns a new Date object representing the absolute time calculated from comps. Returns nil if the receiver cannot convert the components given in comps into an NSDate object.

35.13.15 dateTimeByAddingComponents(components as NSDateComponentsMBS, toDate as DateTime, Options as Integer = 0) as DateTime

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Returns a date representing the absolute time calculated by adding given components to a given date.
Notes: components: The components to add to date.
date: The date to which comps are added.
options: Options for the calculation. See NSCalendarOptions in Apple documentation for possible values.

If you specify no options, overflow in a unit carries into the higher units (as in typical addition).

Returns a new date representing the absolute time calculated by adding to date the calendrical components specified by comps using the options specified by opts. Returns nil if date falls outside the defined range of the receiver or if the computation cannot be performed.

35.13.16 dateTimeFromComponents(components as NSDateComponentsMBS) as DateTime

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Returns a date representing the absolute time calculated from given components.
Notes: components: The components from which to calculate the returned date.

Returns a new Date object representing the absolute time calculated from comps. Returns nil if the receiver cannot convert the components given in comps into an NSDate object.

35.13.17 description as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The description for this timezone.

35.13.18 NSCalendarIdentifierBuddhist as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Buddhist calendar.

35.13.19 NSCalendarIdentifierChinese as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Chinese calendar.

35.13.20 NSCalendarIdentifierCoptic as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Coptic calendar.

35.13.21 NSCalendarIdentifierEthiopicAmeteAlem as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Ethiopic (Amete Alem) calendar.

35.13.22 NSCalendarIdentifierEthiopicAmeteMihret as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Ethiopic (Amete Mihret) calendar.

35.13.23 NSCalendarIdentifierGregorian as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Gregorian calendar.

35.13.24 NSCalendarIdentifierHebrew as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Hebrew calendar.

35.13.25 NSCalendarIdentifierIndian as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Indian calendar.

35.13.26 NSCalendarIdentifierIslamic as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Islamic calendar.

35.13.27 NSCalendarIdentifierIslamicCivil as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Islamic civil calendar.

35.13.28 NSCalendarIdentifierIslamicTabular as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for a tabular Islamic calendar.

35.13.29 NSCalendarIdentifierIslamicUmmAlQura as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Islamic Umm al-Qura calendar.

35.13.30 NSCalendarIdentifierISO8601 as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the ISO8601 calendar.

35.13.31 NSCalendarIdentifierJapanese as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Japanese calendar.

35.13.32 NSCalendarIdentifierPersian as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Persian calendar.

35.13.33 NSCalendarIdentifierRepublicOfChina as String

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: Identifier for the Republic of China calendar.

35.13.34 PMSymbol as string

MBS MacBase Plugin, Plugin Version: 22.5, Platform: macOS, Targets: All.

Function: The symbol used to represent ,ÄúPM,Äù for this calendar.

35.13.35 Print

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Writes the calendar to debug output.
Notes: This may help for debugging and you see output in console app.

35.13.36 Properties

35.13.37 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

35.13.38 firstWeekday as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The index of the first weekday.
Notes: (Read and Write computed property)

35.13.39 locale as NSLocaleMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The locale.
Notes: (Read and Write computed property)

35.13.40 minimumDaysInFirstWeek as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The minimum number of days in the first week.
Notes: (Read and Write computed property)

35.13.41 timeZone as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The time zone.
Notes: (Read and Write computed property)

35.13.42 Constants

Calendar Units

Constant	Value	Description
kCFCalendarUnitDay	16	Specifies the day unit.
kCFCalendarUnitEra	2	Specifies the era unit.
kCFCalendarUnitHour	32	Specifies the hour unit.
kCFCalendarUnitMinute	64	Specifies the minute unit.
kCFCalendarUnitMonth	8	Specifies the month unit.
kCFCalendarUnitQuarter	2048	Specifies the quarter-year unit.
kCFCalendarUnitSecond	128	Specifies the second unit.
kCFCalendarUnitWeekday	256	Specifies the weekday unit. The weekday units are the numbers 1-N (where for the Gregorian cal N=7 and 1 is Sunday).
kCFCalendarUnitWeekdayOrdinal	512	Specifies the ordinal weekday unit. The weekday ordinal unit describes ordinal position within the month u the corresponding weekday unit. For example, in the Gregorian calen weekday ordinal unit of 2 for a weekday unit 3 indicates "the second Tu in the month".
kCFCalendarUnitWeekOfMonth	4096	Specifies the original week of a month calendar unit.
kCFCalendarUnitWeekOfYear	8192	Specifies the original week of the year calendar unit.
kCFCalendarUnitYear	4)	Specifies the year unit.
kCFCalendarUnitYearForWeekOfYear	16384	Specifies the relative year for a week within a year calendar unit.

35.14 class NSCharacterSetMBS

35.14.1 class NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: An NSCharacterSet object represents a set of Unicode-compliant characters.
Example:

```
// get the Symbol font
Var n as NSFontMBS = NSFontMBS.fontWithName("Symbol",10)

// what characters are defined for this font?
Var c as NSCharacterSetMBS = n.coveredCharacterSet

// display a string with all the characters
MessageBox c.StringValue
```

Notes: NSString and NSScanner objects use NSCharacterSet objects to group characters together for searching operations, so that they can find any of a particular set of characters during a search. The cluster's two public classes, NSCharacterSet and NSMutableCharacterSet, declare the programmatic interface for static and dynamic character sets, respectively.

The objects you create using these classes are referred to as character set objects (and when no confusion will result, merely as character sets). Because of the nature of class clusters, character set objects aren't actual instances of the NSCharacterSet or NSMutableCharacterSet classes but of one of their private subclasses. Although a character set object's class is private, its interface is public, as declared by these abstract superclasses, NSCharacterSet and NSMutableCharacterSet. The character set classes adopt the NSCopying and NSMutableCopying protocols, making it convenient to convert a character set of one type to the other.

The NSCharacterSet class declares the programmatic interface for an object that manages a set of Unicode characters (see the NSString class cluster specification for information on Unicode). NSCharacterSet's principal primitive method, characterIsMember:, provides the basis for all other instance methods in its interface. A subclass of NSCharacterSet needs only to implement this method, plus mutableCopyWithZone:, for proper behavior. For optimal performance, a subclass should also override bitmapRepresentation, which otherwise works by invoking characterIsMember: for every possible Unicode value.

NSCharacterSet is "toll-free bridged" with its Cocoa Foundation counterpart, CFCharacterSet Reference. This means that the Core Foundation type is interchangeable in function or method calls with the bridged Foundation object. Therefore, in a method where you see an NSCharacterSet * parameter, you can pass a CFCharacterSetRef, and in a function where you see a CFCharacterSetRef parameter, you can pass an NSCharacterSet instance (you cast one type to the other to suppress compiler warnings). See Interchangeable Data Types for more information on toll-free bridging.

The mutable subclass of NSCharacterSet is NSMutableCharacterSet.

35.14.2 Methods

35.14.3 alphanumericCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing the characters in the categories Letters, Marks, and Numbers.
Example:

```
Var n as NSCharacterSetMBS = NSCharacterSetMBS.alphanumericCharacterSet
MessageBox left(n,200) // show only first 200 chars
```

Notes: Informally, this set is the set of all characters used as basic units of alphabets, syllabaries, ideographs, and digits.

35.14.4 bitmapRepresentation as MemoryBlock

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a memoryblock object encoding the receiver in binary format.
Notes: This format is suitable for saving to a file or otherwise transmitting or archiving.
A raw bitmap representation of a character set is a byte array of 2^16 bits (that is, 8192 bytes). The value of the bit at position n represents the presence in the character set of the character with decimal Unicode value n.

35.14.5 capitalizedLetterCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing the characters in the category of Titlecase Letters.
Example:

```
Var n as NSCharacterSetMBS = NSCharacterSetMBS.capitalizedLetterCharacterSet
MessageBox n
```

35.14.6 characterIsMember(Character as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given character is in the receiver.
Example:

```
// get the Symbol font
Var n as NSFontMBS = NSFontMBS.fontWithName("Arial",10)

// what characters are defined for this font?
Var c as NSCharacterSetMBS = n.coveredCharacterSet

// is letter A part of this font?
MessageBox "A included: "+str(c.characterIsMember(asc("A")))
```

35.14.7 characterSetWithBitmapRepresentation(data as MemoryBlock) as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing characters determined by a given bitmap representation.
Notes: This method is useful for creating a character set object with data from a file or other external data source.

A raw bitmap representation of a character set is a byte array of 2^16 bits (that is, 8192 bytes). The value of the bit at position n represents the presence in the character set of the character with decimal Unicode value n.

35.14.8 characterSetWithCharactersInString(aString as string) as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing the characters in a given string.
Example:

```
Var n as NSCharacterSetMBS = NSCharacterSetMBS.characterSetWithCharactersInString("Hello World")
MessageBox n
```

Notes: A character set containing the characters in aString. Returns an empty character set if aString is empty.

35.14.9 characterSetWithContentsOfFile(aString as string) as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set read from the bitmap representation stored in the file a given path.
Notes: To read a bitmap representation from any file, use the NSData methoddataWithContentsOfFile and pass the result to characterSetWithBitmapRepresentation.

This method doesn't use filenames to check for the uniqueness of the character sets it creates. To prevent duplication of character sets in memory, cache them and make them available through an API that checks whether the requested set has already been loaded.
See also:

- 35.14.10 characterSetWithContentsOfFile(file as folderitem) as NSCharacterSetMBS 6276

35.14.10 characterSetWithContentsOfFile(file as folderitem) as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set read from the bitmap representation stored in the file a given path.
Notes: To read a bitmap representation from any file, use the NSData.methoddataWithContentsOfFile and pass the result to characterSetWithBitmapRepresentation.
