This method doesn't use filenames to check for the uniqueness of the character sets it creates. To prevent duplication of character sets in memory, cache them and make them available through an API that checks whether the requested set has already been loaded.

- 35.14.9 characterSetWithContentsOfFile(aString as string) as NSCharacterSetMBS 6276

35.14.11 characterSetWithRange(r as NSRangeMBS) as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing characters with Unicode values in a given range.
Example:

```
Var r as NSRangeMBS = NSMakeRangeMBS(asc("a"),26) // all small letters
Var n as NSCharacterSetMBS = NSCharacterSetMBS.characterSetWithRange(r)
```

MessageBox n

Notes: r: A range of Unicode values.

r.location is the value of the first character to return; aRange.location + r.length-1 is the value of the last.

Returns a character set containing characters whose Unicode values are given by aRange. If aRange.length is 0, returns an empty character set.

This code excerpt creates a character set object containing the lowercase English alphabetic characters:

35.14.12 componentsSeparatedByCharactersInSet(s as string) as String()

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Returns an array containing substrings from the receiver that have been divided by characters in a given set.
Notes: self: A character set containing the characters to use to split the receiver. Must not be nil.
s: The text to process.

Returns an array of string containing substrings from the receiver that have been divided by characters in separator.

The substrings in the array appear in the order they did in the receiver. Adjacent occurrences of the separator characters produce empty strings in the result. Similarly, if the string begins or ends with separator characters, the first or last substring, respectively, is empty.

35.14.13 Constructor

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The constructor to create an empty character set.

35.14.14 controlCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing the characters in the categories of Control or Format Characters.

Notes: These characters are specifically the Unicode values U+0000 to U+001F and U+007F to U+009F.

35.14.15 copy as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a copy of the character set.

35.14.16 decimalDigitCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing the characters in the category of Decimal Numbers.
Example:

```
Var n as NSCharacterSetMBS = NSCharacterSetMBS.decimalDigitCharacterSet
MessageBox n
```

Notes: Informally, this set is the set of all characters used to represent the decimal values 0 through 9. These characters include, for example, the decimal digits of the Indic scripts and Arabic.

35.14.17 decomposableCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing all individual Unicode characters that can also be represented as composed character sequences.
Notes: Returns a character set containing all individual Unicode characters that can also be represented as composed character sequences (such as for letters with accents), by the definition of "standard decomposition" in version 3.2 of the Unicode character encoding standard.

These characters include compatibility characters as well as pre-composed characters.

Note: This character set doesn't currently include the Hangul characters defined in version 2.0 of the Unicode standard.

35.14.18 hasMemberInPlane(thePlane as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the receiver has at least one member in a given character plane.
Notes: This method makes it easier to find the plane containing the members of the current character set. The Basic Multilingual Plane is plane 0.

35.14.19 illegalCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing values in the category of Non-Characters or that have not yet been defined in version 3.2 of the Unicode standard.

35.14.20 invertedSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing only characters that don't exist in the receiver.
Notes: Inverting an immutable character set is much more efficient than inverting a mutable character set.

35.14.21 isSupersetOfSet(theOtherSet as NSCharacterSetMBS) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the receiver is a superset of another given character set.
Notes: Returns true if the receiver is a superset of theOtherSet, otherwise false.
Available in Mac OS X v10.2 and later.

35.14.22 letterCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing the characters in the categories Letters and Marks.
Example:

```
Var n as NSCharacterSetMBS = NSCharacterSetMBS.letterCharacterSet
MessageBox n
```

Notes: Informally, this set is the set of all characters used as letters of alphabets and ideographs.

35.14.23 longCharacterIsMember(theLongChar as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a given long character is a member of the receiver.
Notes: Returns true if theLongChar is in the receiver, otherwise false.
This method supports the specification of 32-bit characters.
Available in Mac OS X v10.2 and later.

35.14.24 lowercaseLetterCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing the characters in the category of Lowercase Letters.
Example:

```
Var n as NSCharacterSetMBS = NSCharacterSetMBS.lowercaseLetterCharacterSet
MessageBox n
```

Notes: Informally, this set is the set of all characters used as lowercase letters in alphabets that make case distinctions.

35.14.25 mutableCopy as NSMutableCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a mutable copy of the characterset.

35.14.26 newlineCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing the newline characters.
Example:

```
Var n as NSCharacterSetMBS = NSCharacterSetMBS.newlineCharacterSet
MessageBox n
```

Notes: A character set containing the newline characters (U+000A–U+000D, U+0085).
Available in Mac OS X v10.5 and later.

35.14.27 nonBaseCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing the characters in the category of Marks.
Example:

```
Var n as NSCharacterSetMBS = NSCharacterSetMBS.nonBaseCharacterSet
MessageBox n
```

Notes: This set is also defined as all legal Unicode characters with a non-spacing priority greater than 0. Informally, this set is the set of all characters used as modifiers of base characters.

35.14.28 Operator_Convert as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a string containing all characters in this set.
Example:

```
Var r as NSRangeMBS = NSMakeRangeMBS(asc("a"),26) // all small letters
Var n as NSCharacterSetMBS = NSCharacterSetMBS.characterSetWithRange(r)
MessageBox n
```

Notes: This way you can use a characterset directly with functions expecting a string like MessageBox.

35.14.29 punctuationCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing the characters in the category of Punctuation.
Example:

```
Var n as NSCharacterSetMBS = NSCharacterSetMBS.punctuationCharacterSet
MessageBox n
```

Notes: Informally, this set is the set of all non-whitespace characters used to separate linguistic units in scripts, such as periods, dashes, parentheses, and so on.

35.14.30 rangeOfCharacterFromSet(s as string, options as Integer = 0, searchRange as NSRangeMBS = nil) as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Finds and returns the range in the receiver of the first character from a given character set found in a given range with given options.
Notes: self: A character set. This value must not be nil.
s: The text to process:
options: A mask specifying search options. The following options may be specified by combining them with bitwise OR operator: NSAnchoredSearch (8), NSBackwardsSearch (4).
searchRange: Optional, the range in which to search. The range must not exceed the bounds of the receiver.

Raises a NSException if search range is invalid.

Returns the range in the receiver of the first character found from set within search range. Returns a range of { NSNotFound, 0 } if none of the characters in aSet are found.

Because pre-composed characters in set can match composed character sequences in the receiver, the length of the returned range can be greater than 1. For example, if you search for "√º" in the string "stru¬®del", the returned range is { 3,2 } .

Special Considerations
This method detects all invalid ranges (including those with negative lengths). For applications linked against OS X v10.6 and later, this error causes an exception; for applications linked against earlier releases, this error causes a warning, which is displayed just once per application execution.

35.14.31 stringByTrimmingCharactersInSet(s as string) as String

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Returns a new string made by removing from both ends of the receiver characters contained in a given character set.
Notes: Retruns a new string made by removing from both ends of the receiver characters contained in set. If the receiver is composed entirely of characters from set, the empty string is returned.

Use whitespaceCharacterSet or whitespaceAndNewlineCharacterSet to remove whitespace around strings.

35.14.32 symbolCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing the characters in the category of Symbols.
Example:

```
Var n as NSCharacterSetMBS = NSCharacterSetMBS.symbolCharacterSet
MessageBox n
```

Notes: These characters include, for example, the dollar sign ($) and the plus (+) sign.
Available in Mac OS X v10.3 and later.

35.14.33 uppercaseLetterCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing the characters in the categories of Uppercase Letters and Titlecase Letters.
Example:

```
Var n as NSCharacterSetMBS = NSCharacterSetMBS.uppercaseLetterCharacterSet
MessageBox n
```

Notes: Informally, this set is the set of all characters used as uppercase letters in alphabets that make case distinctions.

35.14.34 whitespaceAndNewlineCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing only the whitespace characters space (U+0020) and tab (U+0009) and the newline and nextline characters (U+000A–U+000D, U+0085).
Example:

```
Var n as NSCharacterSetMBS = NSCharacterSetMBS.whitespaceAndNewlineCharacterSet
MessageBox n
```

35.14.35 whitespaceCharacterSet as NSCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a character set containing only the in-line whitespace characters space (U+0020) and tab (U+0009).
Example:

```
Var n as NSCharacterSetMBS = NSCharacterSetMBS.whitespaceCharacterSet
```

```
MessageBox n
```

Notes: This set doesn't contain the newline or carriage return characters.

35.14.36 Properties

35.14.37 CharacterCount as Integer

MBS MacBase Plugin, Plugin Version: 24.1, Platform: macOS, Targets: All.

Function: Queries the character count for this character set.
Notes: (Read only property)

35.14.38 Handle as Integer

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

35.14.39 StringValue as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a string containing all characters in this set.
Example:

```
// get the Symbol font
Var n as NSFontMBS = NSFontMBS.fontWithName("Symbol",10)

// what characters are defined for this font?
Var c as NSCharacterSetMBS = n.coveredCharacterSet

// display a string with all the characters
MessageBox c.StringValue
```

Notes: Changed to property in v24.1.
(Read only property)

35.14.40 Constants

Constants

Constant	Value	Description
NSOpenStepUnicodeReservedBase	&hF400	A constant to specify lower bound for a Unicode character range reserve Apple's corporate use. Specifies lower bound for a Unicode character range reserved for Apple's porate use (the range is 0xF400–0xF8FF).

35.15 class NSCoderMBS

35.15.1 class NSCoderMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The plugin class for NSCoder.
Example:

```
// make archiver
Var a as new NSKeyedArchiverMBS

// add a string
a.encodeString "Hello World", "Greeting"

// finish
a.finishEncoding

// query data
Var m as MemoryBlock = a.archiverData

// start unarchiver
Var u as new NSKeyedUnarchiverMBS(m)

// query and display a value
Var s as string = u.decodeString("Greeting")
MessageBox s
```

Notes: The NSCoder abstract class declares the interface used by concrete subclasses to transfer objects and other Objective-C data items between memory and some other format. This capability provides the basis for archiving (where objects and data items are stored on disk) and distribution (where objects and data items are copied between different processes or threads). The concrete subclasses provided by Foundation for these purposes are NSArchiver, NSUnarchiver, NSKeyedArchiver, NSKeyedUnarchiver, and NSPortCoder. Concrete subclasses of NSCoder are referred to in general as coder classes, and instances of these classes as coder objects (or simply coders). A coder object that can only encode values is referred to as an encoder object, and one that can only decode values as a decoder object.

NSCoder operates on objects, scalars, C arrays, structures, and strings, and on pointers to these types. It does not handle types whose implementation varies across platforms, such as union, void *, function pointers, and long chains of pointers. A coder object stores object type information along with the data, so an object decoded from a stream of bytes is normally of the same class as the object that was originally encoded into the stream. An object can change its class when encoded, however; this is described in Archives and Serializations Programming Guide.

For details of how to create a subclass of NSCoder, see "Subclassing NSCoder" in Archives and Serializations Programming Guide.

The plugin implements this class because it is needed to encode and decode the window state.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Real Studio Plugins, version 11.3pr2
- MBS Real Studio Plugins, version 11.2pr11

35.15.2 Methods

35.15.3 allowsKeyedCoding as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the receiver supports keyed coding of objects.
Notes: The default implementation returns false. Concrete subclasses that support keyed coding, such as NSKeyedArchiver, need to override this method to return true.

35.15.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

35.15.5 containsValueForKey(key as string) as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether an encoded value is available for a string.

35.15.6 decodeBool(key as string) as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Decodes and returns a boolean value that was previously encoded with encodeBool and associated with the string key.

35.15.7 decodeBytes(key as string) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Decodes a buffer of data whose types are unspecified.

35.15.8 decodeCFObjectMBS(key as string) as Variant

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Decodes CFObject object.
Notes: This is a special convenience methods to decode CF* classes which are bridged to Cocoa objects. Like CFDictionary, CFURL, CFData, CFString, CFNumber, CFArray and a few others.

35.15.9 decodeDictionary(key as string) as Dictionary

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Decodes a dictionary.

35.15.10 decodeDouble(key as string) as Double

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Decodes and returns a double value that was previously encoded with either encodeFloat or encodeDouble and associated with the string key.

35.15.11 decodeFloat(key as string) as single

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Decodes and returns a float value that was previously encoded with encodeFloat or encodeDouble and associated with the string key.

35.15.12 decodeInt32(key as string) as Int32

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Decodes and returns a 32-bit integer value that was previously encoded with encodeInt, encodeInteger, encodeInt32, or encodeInt64 and associated with the string key.

Notes: If the encoded integer does not fit into a 32-bit integer, the method raises an NSRangeException.

35.15.13 decodeInt64(key as string) as Int64

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Decodes and returns a 64-bit integer value that was previously encoded with encodeInt, encodeInteger, encodeInt32, or encodeInt64 and associated with the string key.

35.15.14 decodeNSURLFile(key as string) as folderitem

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Decodes an NSURL and returns folderitem.

35.15.15 decodeNSURLString(key as string) as String

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Decodes an NSURL and returns string.

35.15.16 decodePoint(key as string) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Decodes a point object.

35.15.17 decodeRect(key as string) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Decodes a rectangle.

35.15.18 decodeSize(key as string) as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Decodes a size object.

35.15.19 decodeString(key as string) as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Decodes a string.

35.15.20 decodeTypedStream(Data as MemoryBlock) as variant

MBS MacBase Plugin, Plugin Version: 23.2, Platform: macOS, Targets: All.

Function: Decodes an old and deprecated typedstream data block.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("test.bin")
Var b As BinaryStream = BinaryStream.Open(f)
Var s As String = b.Read(B.Length)
Var v As Variant = NSCoderMBS.decodeTypedStream(s)

Break // check in debugger
```

35.15.21 encodeBool(value as boolean, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Encodes value and associates it with the string key.

35.15.22 encodeBytes(value as MemoryBlock, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Encodes a buffer of data whose types are unspecified.

35.15.23 encodeCFObjectMBS(value as Variant, key as string)

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Encodes a CFObject.
Notes: This is a special convenience methods to encode CF* classes which are bridged to Cocoa objects.

Like CFDictionary, CFURL, CFData, CFString, CFNumber, CFArray and a few others.

35.15.24 encodeDictionary(value as Dictionary, key as string)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Encodes a dictionary.
Notes: Not all objects can be inside the dictionary.
Cocoa objects, string, booleans and numbers are okay.

35.15.25 encodeDouble(value as Double, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Encodes value and associates it with the string key.

35.15.26 encodeFloat(value as single, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Encodes value and associates it with the string key.

35.15.27 encodeInt32(value as Int32, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Encodes the 32-bit integer value and associates it with the string key.

35.15.28 encodeInt64(value as Int64, key as string)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Encodes the 64-bit integer value and associates it with the string key.

35.15.29 encodeNSURLFile(value as folderitem, key as string)

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Encodes a folderitem as NSURL.

35.15.30 encodeNSURLString(value as String, key as string)

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Encodes a string with URL as NSURL object.

35.15.31 encodePoint(value as NSPointMBS, key as string)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Encodes a point object.

35.15.32 encodeRect(value as NSRectMBS, key as string)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Encodes a rectangle.

35.15.33 encodeSize(value as NSSizeMBS, key as string)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Encodes a size object.

35.15.34 encodeString(value as string, key as string)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Encodes a string.

35.15.35 systemVersion as Integer

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: During encoding, this method should return the system version currently in effect.
Notes: During decoding, this method should return the version that was in effect when the data was encoded.

By default, this method returns the current system version, which is appropriate for encoding but not for decoding. Subclasses that implement decoding must override this method to return the system version of the data being decoded.

35.15.36 Properties

35.15.37 Handle as Integer

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The internal reference for this object.
Notes: (Read and Write property)

35.16 class NSCursorMBS

35.16.1 class NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Instances of the NSCursor class manage the appearance of the cursor.
Example:

```
Var im As NSImageMBS
Var p As Picture
Var m As Picture
Var theCursor As NSCursorMBS
Var test As Boolean

// create a blue ball picture
p = New Picture(16,16,32)
p.Graphics.ForeColor = &c0000FF
p.Graphics.FillRect 0,0,16,16

m = New Picture(16,16,32)
m.Graphics.ForeColor = &c000000
m.Graphics.Filloval 0,0,16,16

// Create a new NSImage
im=New NSImageMBS(p,m)

// Create a cursor from the NSImage
theCursor=New NSCursorMBS(im, 10, 10)

Title = Str(theCursor.Handle)

// Make this the active cursor
theCursor.set

// display picture
p.Mask.Graphics.DrawPicture m,0,0
Backdrop = p

// so you see it for a second before RB resets the cursor
DelayMBS 1.0
```

Notes: In Cocoa, you can change the currently displayed cursor based on the position of the mouse over one of your views. You might use this technique to provide visual feedback about what actions the user can take with the mouse. For example, you might display one of the resize cursors whenever the mouse moves over a portion of your view that acts as a custom resizing handle. To set this up, you associate a cursor object with one or more cursor rectangles in the view.

Cursor rectangles are a specialized type of tracking rectangles, which are used to monitor the mouse location in a view. Views implement cursor rectangles using tracking rectangles but provide methods for setting and refreshing cursor rectangles that are distinct from the generic tracking rectangle interface. For information on how to set up cursor rectangles, see "Handling Tracking-Rectangle and Cursor-Update Events in Views".

35.16.2 Methods

35.16.3 arrowCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the default cursor, the arrow cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.arrowCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: The default cursor, a slanted arrow with its hot spot at the tip. The arrow cursor is the one you're used to seeing over buttons, scrollers, and many other objects in the window system.

35.16.4 closedHandCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the closed-hand system cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.closedHandCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

35.16.5 Constructor(image as NSImageMBS, foregroundColorHint as NSColorMBS, backgroundColorHint as NSColorMBS, HotSpotX as Double, HotSpotY as Double)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Initializes the cursor with the specified image and hot spot.
See also:

- 35.16.6 Constructor(image as NSImageMBS, HotSpotX as Double, HotSpotY as Double) 6296

35.16.6 Constructor(image as NSImageMBS, HotSpotX as Double, HotSpotY as Double)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Initializes the cursor with the specified image and hot spot.
See also:

- 35.16.5 Constructor(image as NSImageMBS, foregroundColorHint as NSColorMBS, backgroundColorHint as NSColorMBS, HotSpotX as Double, HotSpotY as Double) 6296

35.16.7 contextualMenuCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the contextual menu system cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.contextualMenuCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: Available in Mac OS X v10.6 and later.

35.16.8 crosshairCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the cross-hair system cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.crosshairCursor
```

```
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: This cursor is used for situations when precise location is required (where the lines cross is the hot spot).

35.16.9 currentCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the application's current cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.currentCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: The top cursor on the application's cursor stack. This cursor may not be the visible cursor on the screen if a different application is currently active.

35.16.10 currentSystemCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the current system cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.currentSystemCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: Returns a cursor whose image and hot spot match those of the currently-displayed cursor on the system.
This method returns the current system cursor regardless of which application set the cursor, and whether Cocoa or Carbon APIs were used to set it.
This method replaces the now deprecated QDGetCursorData function.
Available in Mac OS X v10.6 and later.

35.16.11 disappearingItemCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns a cursor indicating that the current operation will result in a disappearing item.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.disappearingItemCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: The system cursor that indicates that the current operation will result in a disappearing item (for example, when dragging an item from the dock or a toolbar).

Available in Mac OS X v10.3 and later.

35.16.12 dragCopyCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a cursor indicating that the current operation will result in a copy action.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.dragCopyCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: Available in Mac OS X v10.6 and later.

35.16.13 dragLinkCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a cursor indicating that the current operation will result in a link action.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.dragLinkCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: Available in Mac OS X v10.6 and later.

35.16.14 hide

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Makes the current cursor invisible.
Notes: If another cursor becomes current, that cursor will be invisible, too. It will remain invisible until you invoke the unhide method.

hide overrides setHiddenUntilMouseMoves.

35.16.15 hotSpotX as Double

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the position of the cursor's hot spot.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.arrowCursor

MessageBox str(c.hotSpotX)+"/"+str(c.hotSpotY)
```

Notes: The point describing the position of the hot spot, specified according to the cursor's flipped coordinate system.

For a more complete explanation, see the class description.

Note that an NSCursor object is immutable: you cannot change its hot spot after it's created. Instead, use the Constructor to create a new cursor with the new settings.

35.16.16 hotSpotY as Double

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the position of the cursor's hot spot.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.arrowCursor
```

```
MessageBox str(c.hotSpotX)+"/"+str(c.hotSpotY)
```

Notes: The point describing the position of the hot spot, specified according to the cursor's flipped coordinate system.

For a more complete explanation, see the class description.

Note that an NSCursor object is immutable: you cannot change its hot spot after it's created. Instead, use the Constructor to create a new cursor with the new settings.

35.16.17 IBeamCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns a cursor that looks like a capital I with a tiny crossbeam at its middle.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.IBeamCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: The I-beam cursor. This is the cursor that you're used to seeing over editable or selectable text. The I-beam cursor's default hot spot is where the crossbeam intersects the I.

35.16.18 IBeamCursorForVerticalLayout as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns a cursor that looks like a capital I with a tiny crossbeam at its middle.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.IBeamCursorForVerticalLayout
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: Available in Mac OS X 10.7.

35.16.19 image as NSImageMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's image.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.arrowCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: The cursor image or nil if none exists

Note that an NSCursor object is immutable: you cannot change its image after it's created. Instead, use the constructor to create a new cursor with the new settings.

35.16.20 isSetOnMouseEntered as boolean

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether the receiver becomes current on receiving a mouseEntered message.
Notes: True if the receiver will become current when it receives a mouseEntered message; otherwise, false.

To receive such a message, the receiver must first be assigned a cursor rectangle. This assignment can be made using the NSView method addCursorRect. For a more complete explanation, see the class description.

35.16.21 isSetOnMouseExited as boolean

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether the receiver becomes current when it receives a mouseExited: message.
Notes: True if the receiver becomes current when it receives a mouseExited: message; otherwise, false.

To receive such a message, the receiver must first be assigned a cursor rectangle. This assignment can be made using the NSView method addCursorRect. For a more complete explanation, see the class description.

35.16.22 mouseEntered(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Automatically sent to the receiver when the cursor enters a cursor rectangle owned by the receiver.
Notes: If used after setOnMouseEntered has been called with an argument of true, mouseEntered can make the receiver the current cursor.

In your programs, you won't invoke mouseEntered explicitly. It's only included in the class interface so you can override it.

For a more complete explanation, see "Handling Tracking-Rectangle and Cursor-Update Events in Views" and the NSView method addTrackingRect

35.16.23 mouseExited(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Automatically sent to the receiver when the cursor exits a cursor rectangle owned by the receiver.
Notes: Like mouseEntered, this message is part of the class interface only so you can override it.

For a more complete explanation, see "Handling Tracking-Rectangle and Cursor-Update Events in Views" and the NSView method addTrackingRect.

35.16.24 openHandCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the open-hand system cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.openHandCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: Available in Mac OS X v10.3 and later.

35.16.25 operationNotAllowedCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns the operation not allowed cursor.
Notes: This cursor indicates that the operation that is being attempted, perhaps dragging to an item that can't accept the drag type, is being denied.

Available in Mac OS X v10.6 and later.

35.16.26 pointingHandCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the pointing-hand system cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.pointingHandCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: The pointing-hand cursor. The tip of the pointing finger is the hot spot.

35.16.27 pop

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sends a pop message to the receiver's class.
See also:

- 35.16.28 pop 6303

35.16.28 pop

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Pops the current cursor off the top of the stack.
Notes: The new object on the top of the stack becomes the current cursor. If the current cursor is the only cursor on the stack, this method does nothing.
See also:

- 35.16.27 pop 6303

35.16.29 push

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Puts the receiver on top of the cursor stack and makes it the current cursor.

35.16.30 resizeDownCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the resize-down system cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.resizeDownCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: The resize-down cursor. This cursor is used when moving or resizing an object to indicate that the user can move only in the indicated direction.

Available in Mac OS X v10.3 and later.

35.16.31 resizeLeftCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the resize-left system cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.resizeLeftCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: The resize-left cursor. This cursor is used when moving or resizing an object to indicate that the user can move only in the indicated direction.

Available in Mac OS X v10.3 and later.

35.16.32 resizeLeftRightCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the resize-left-and-right system cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.resizeLeftRightCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: The resize-left-and-right cursor. This cursor is used when moving or resizing an object and the object can be moved left or right.

Available in Mac OS X v10.3 and later.

35.16.33 resizeRightCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the resize-right system cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.resizeRightCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: The resize-right cursor. This cursor is used when moving or resizing an object to indicate that the user can move only in the indicated direction.

Available in Mac OS X v10.3 and later.

35.16.34 resizeUpCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the resize-up system cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.resizeUpCursor
Var i as NSImageMBS = c.image
```

```
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: The resize-up cursor. This cursor is used when moving or resizing an object to indicate that the user can move only in the indicated direction.

Available in Mac OS X v10.3 and later.

35.16.35 resizeUpDownCursor as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the resize-up-and-down system cursor.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.resizeUpDownCursor
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

Notes: The resize-up-and-down cursor. This cursor is used when moving or resizing an object and the object can be moved up or down.

Available in Mac OS X v10.3 and later.

35.16.36 ringCursorWithDiameter(diameter as Double) as NSCursorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Creates a ring cursor with the given size.
Example:

```
// shows cursor in window
Var c as NSCursorMBS = NSCursorMBS.ringCursorWithDiameter(20)
Var i as NSImageMBS = c.image
Window1.Backdrop=i.CopyPictureWithMask
```

35.16.37 set

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Makes the receiver the current cursor.

Notes: If your application is not the front application, the system will ignore this set message!

35.16.38 setHiddenUntilMouseMoves(value as boolean)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sets whether the cursor is hidden until the mouse moves.
Notes: value: True to hide the cursor until one of the following occurs:
The mouse moves.
You invoke the method again, with flag set to false.

Do not try to counter this method by invoking unhide. The results are undefined.

35.16.39 setOnMouseEntered(flag as boolean)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: pecifies whether the receiver accepts mouseEntered: events.
Notes: True if the receiver accepts future mouseEntered event messages; otherwise it ignores them.

Accepting mouseEntered event messages allows the cursor to be made the current cursor when the cursor enters a view's cursor rectangle.

35.16.40 setOnMouseExited(flag as boolean)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sets whether the receiver accepts mouseExited events.
Notes: flag: True if the receiver accepts future mouseExited: event messages; otherwise it ignores them.

Accepting mouseExited event messages allows the cursor to be made the current cursor when the cursor exits a view's cursor rectangle.

35.16.41 unhide

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Negates an earlier call to hide by showing the current cursor.

35.16.42 Properties

35.16.43 Handle as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: The internal used NSCursor reference.
Notes: (Read and Write property)

35.17 class NSDateComponentsMBS

35.17.1 class NSDateComponentsMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: NSDateComponents encapsulates the components of a date in an extendable, object-oriented manner.
Example:

```
// build a date from its parts and read the weekday
Var c As New NSDateComponentsMBS
c.year = 2025
c.month = 12
c.day = 24
c.hour = 18

Var cal As NSCalendarMBS = NSCalendarMBS.currentCalendar
Var d As DateTime = cal.dateTimeFromComponents(c)

// split it again into components
Var parts As NSDateComponentsMBS = cal.componentsInTimeZone(NSTimeZoneMBS.localTimeZone, d)
MessageBox d.ToString + EndOfLine + "Weekday: " + parts.weekday.ToString + ", week of year: " +
parts.weekOfYear.ToString
```

Notes: It is used to specify a date by providing the temporal components that make up a date and time: hour, minutes, seconds, day, month, year, and so on. It can also be used to specify a duration of time, for example, 5 hours and 16 minutes. An NSDateComponents object is not required to define all the component fields. When a new instance of NSDateComponents is created the date components are set to NSUndefinedDateComponent.

35.17.2 Methods

35.17.3 Constructor

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Creates new date components object.

35.17.4 copy as NSDateComponentsMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns a copy of the date component object.

35.17.5 isValidDateInCalendar(calendar as NSCalendarMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the current combination of properties represents a date which exists in the specified calendar.
Notes: calendar: The calendar for which to use in the calculation.

Returns yes if the date corresponding to the receiver's values is valid and exists in the given calendar, otherwise no.

If the timeZone property is set on the receiver, the time zone property value is used.
This property should not be used for NSDateComponents objects that represent relative quantities of calendar components.

35.17.6 NSUndefinedDateComponent as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: This constant specifies that an NSDateComponents component is undefined.

35.17.7 Print

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Writes the date components to debug output.
Notes: This may help for debugging and you see output in console app.

35.17.8 Properties

35.17.9 calendar as NSCalendarMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The calendar.
Notes: (Read and Write property)

35.17.10 date as date

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date.
Notes: Available in Mac OS X v10.7 and later.
(Read only property)

35.17.11 dateTime as DateTime

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The date.
Notes: Available in Mac OS X v10.7 and later.
(Read only property)

35.17.12 day as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The number of day units.
Notes: (Read and Write property)

35.17.13 description as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns description of the calendar object.
Notes: (Read only property)

35.17.14 era as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The number of era units.
Notes: (Read and Write property)

35.17.15 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

35.17.16 hour as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The number of hour units.
Notes: (Read and Write property)

35.17.17 isLeapMonth as Boolean

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Whether it is leap month.
Notes: Available on Mac OS X 10.8.
(Read and Write property)

35.17.18 isValidDate as Boolean

MBS MacBase Plugin, Plugin Version: 20.1, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the current combination of properties represents a date which exists in the current calendar.
Notes: If the timeZone property is set on the receiver, the time zone property value is used. If the calendar property is not set on the receiver, nil is returned.
(Read only property)

35.17.19 minute as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The number of minute units.
Notes: (Read and Write property)

35.17.20 month as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The number of month units.
Notes: (Read and Write property)

35.17.21 quarter as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The number of quarters.
Notes: (Read and Write property)

35.17.22 second as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The number of second units.
Notes: (Read and Write property)

35.17.23 timeZone as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The time zone.
Notes: (Read and Write property)

35.17.24 week as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The number of week units.
Notes: (Read and Write property)

35.17.25 weekday as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The number of weekday units.
Notes: Weekday units are the numbers 1 through n, where n is the number of days in the week. For example, in the Gregorian calendar, n is 7 and Sunday is represented by 1.
(Read and Write property)

35.17.26 weekdayOrdinal as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The ordinal number of weekday units.
Notes: Weekday ordinal units represent the position of the weekday within the next larger calendar unit, such as the month. For example, 2 is the weekday ordinal unit for the second Friday of the month.
(Read and Write property)

35.17.27 weekOfMonth as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The week of the month.
Notes: (Read and Write property)

35.17.28 weekOfYear as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The week of the year.
Notes: (Read and Write property)

35.17.29 year as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The number of year unit.
Notes: (Read and Write property)

35.17.30 yearForWeekOfYear as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The year for the week of the year.
Notes: (Read and Write property)

35.18 class NSDateIntervalMBS

35.18.1 class NSDateIntervalMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An object representing the span of time between a specific start date and end date.
Example:

```
// check whether a date falls into a time span
Var startDate As DateTime = DateTime.Now
Var endDate As DateTime = startDate.AddInterval(0, 0, 7) // one week
Var interval As New NSDateIntervalMBS(startDate, endDate)

Var check As DateTime = startDate.AddInterval(0, 0, 3)
If interval.containsDateTime(check) Then
MessageBox "Inside, the interval has " + interval.duration.ToString + " seconds."
End If
```

Notes: An NSDateIntervalMBS object represents a closed interval between two dates. The NSDateIntervalMBS class provides a programmatic interface for calculating the duration of a time interval and determining whether a date falls within it, as well as comparing date intervals and checking to see whether they intersect.
An NSDateIntervalMBS object consists of a startDate and an endDate. The startDate and endDate of a date interval can be equal, in which case its duration is 0. However, endDate cannot occur earlier than startDate.
You can use the NSDateIntervalFormatter class to create string representations of NSDateIntervalMBS objects that are suitable for display in the current locale.

35.18.2 Methods

35.18.3 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Checks whether the class is available.
Notes: Returns true on MacOS 10.12 or newer.

35.18.4 compare(DateInterval as NSDateIntervalMBS) as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Compares the receiver with the specified date interval.
Notes: dateInterval: The date interval with which to compare the receiver.

Returns an NSComparisonResult value that indicates the temporal ordering of the receiver and a given date interval:
NSOrderedAscending (-1) if the receiver,Äôs startDate occurs earlier than that of dateInterval, or both startDate values are equal and the duration of the receiver is less than that of dateInterval.
NSOrderedDescending (1) if the receiver,Äôs startDate occurs later than that of dateInterval, or both startDate values are equal and the duration of the receiver is greater than that of dateInterval.
NSOrderedSame (0) if the receiver,Äôs startDate and duration values are equal to those of dateInterval.

35.18.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Initializes a date interval by setting the start and end date to the current date.
See also:

- 35.18.6 Constructor(startDate as date, duration as double) 6317
- 35.18.7 Constructor(startDate as date, endDate as date) 6318
- 35.18.8 Constructor(startDate as dateTime, endDate as dateTime) 6318

35.18.6 Constructor(startDate as date, duration as double)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a date interval with a given start date and duration.
Notes: startDate: The start date of the date interval.
duration: The duration from the start date for the date interval.

This method raises an NSExceptionMBS if duration is less than 0.
See also:

- 35.18.5 Constructor 6317
- 35.18.7 Constructor(startDate as date, endDate as date) 6318
- 35.18.8 Constructor(startDate as dateTime, endDate as dateTime) 6318

35.18.7 Constructor(startDate as date, endDate as date)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a date interval from a given start date and end date.
Notes: startDate: The start date of the date interval.
endDate: The end date of the date interval.

This method raises an NSExceptionMBS if endDate occurs earlier than startDate.
See also:

- 35.18.5 Constructor 6317
- 35.18.6 Constructor(startDate as date, duration as double) 6317
- 35.18.8 Constructor(startDate as dateTime, endDate as dateTime) 6318

35.18.8 Constructor(startDate as dateTime, endDate as dateTime)

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Initializes a date interval from a given start date and end date.
Notes: startDate: The start date of the date interval.
endDate: The end date of the date interval.

This method raises an NSExceptionMBS if endDate occurs earlier than startDate.
See also:

- 35.18.5 Constructor 6317
- 35.18.6 Constructor(startDate as date, duration as double) 6317
- 35.18.7 Constructor(startDate as date, endDate as date) 6318

35.18.9 containsDate(date as date) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the receiver contains the specified date.
Notes: date: The date for which to test membership of the date interval.

Returns true if the receiver contains date. Otherwise, false.

35.18.10 containsDateTime(date as dateTime) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Indicates whether the receiver contains the specified date.
Notes: date: The date for which to test membership of the date interval.

Returns true if the receiver contains date. Otherwise, false.

35.18.11 copy as NSDateIntervalMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

35.18.12 intersectionWithDateInterval(DateInterval as NSDateIntervalMBS) as NSDateIntervalMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Returns the intersection between the receiver and the specified date interval.
Notes: dateInterval: The date interval with which to calculate the intersection of the receiver.

Returns a date interval for the intersection of the receiver and dateInterval, or nil if no intersection occurs.

Calculating the intersection of date intervals is a commutative and associative operation. The intersection of a date interval with itself is equal to itself.

35.18.13 intersectsDateInterval(DateInterval as NSDateIntervalMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Indicates whether the receiver intersects with the specified date interval.
Notes: dateInterval: The date interval with which to check the receiver for intersection.

See intersectionWithDateInterval for more information about determining whether two date intervals intersect.

35.18.14 isEqualToDateInterval(DateInterval as NSDateIntervalMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Indicates whether the receiver is equal to the specified date interval.
Notes: dateInterval: The date interval with which to check the receiver for equality.

Returns true if the startDate and duration of dateInterval and the receiver are equal. Otherwise, false.

35.18.15 Operator_Compare(DateInterval as NSDateIntervalMBS) as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The compare operator to use in Xojo.

35.18.16 Properties

35.18.17 duration as Double

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The duration of the date interval.
Notes: In seconds.
(Read only property)

35.18.18 endDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The end date of the date interval.
Notes: (Read only property)

35.18.19 endDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The end date of the date interval.
Notes: (Read only property)

35.18.20 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

35.18.21 startDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The start date of the date interval.
Notes: (Read only property)

35.18.22 startDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The start date of the date interval.
Notes: (Read only property)

35.19 class NSDirectoryEnumeratorMBS

35.19.1 class NSDirectoryEnumeratorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: An NSDirectoryEnumerator object enumerates the contents of a directory, returning the pathnames of all files and directories contained within that directory.
Example:

```
Var d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
Var f as string = d.nextObject

while len(f)>0
List.AddRow f

f=d.nextObject
wend
```

Notes: These pathnames are relative to the directory.

An enumeration is recursive, including the files of all subdirectories, and crosses device boundaries. An enumeration does not resolve symbolic links, or attempt to traverse symbolic links that point to directories.
Subclass of the NSEnumeratorMBS class.
Blog Entries

- NSBundleMBS and NSDirectoryEnumeratorMBS

35.19.2 Methods

35.19.3 Constructor(folder as folderitem)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSDirectoryEnumerator object that enumerates the contents of the directory at a given path.
Example:

```
Var d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)

MessageBox d.nextObject // shows ".DS_Store" or some other file name
```

Notes: An NSDirectoryEnumerator object that enumerates the contents of the directory at path.
If path is a filename, the method returns an enumerator object that enumerates no files—the first call to nextObject will return nil.

Because the enumeration is deep—that is, it lists the contents of all subdirectories—this enumerator object is useful for performing actions that involve large file-system subtrees. This method does not resolve symbolic links encountered in the traversal process, nor does it recurse through them if they point to a directory.
See also:

- 35.19.4 Constructor(path as string) 6323

35.19.4 Constructor(path as string)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSDirectoryEnumerator object that enumerates the contents of the directory at a given path.
Example:

```
Var d as new NSDirectoryEnumeratorMBS("/Applications")
Var f as FolderItem = d.nextFile

while f<>Nil
List.AddRow f.Name

// if this is a folder, we skip the sub folders
d.skipDescendents

f=d.nextFile
wend
```

Notes: An NSDirectoryEnumerator object that enumerates the contents of the directory at path.
If path is a filename, the method returns an enumerator object that enumerates no files—the first call to nextObject will return nil.

Because the enumeration is deep—that is, it lists the contents of all subdirectories—this enumerator object is useful for performing actions that involve large file-system subtrees. This method does not resolve symbolic links encountered in the traversal process, nor does it recurse through them if they point to a directory.
See also:

- 35.19.3 Constructor(folder as folderitem) 6322

35.19.5 Destructor

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: The destructor for this class.

35.19.6 directoryAttributes as dictionary

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns an Dictionary object that contains the attributes of the directory at which enumeration started.

35.19.7 fileAttributes as dictionary

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns an object that contains the attributes of the most recently returned file or subdirectory (as referenced by the pathname).
Example:

```
Var d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
Var f as FolderItem = d.nextFile

while f<>Nil
List.AddRow f.Name

Var di as Dictionary = d.fileAttributes
Var size as int64 = di.Value(d.NSFileSize)

List.AddRow f.Name+" ("+str(size)+" Bytes)"

f=d.nextFile
wend
```

35.19.8 level as Integer

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the number of levels deep the current object is in the directory hierarchy being enumerated.
Example:

```
Var d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
Var f as FolderItem = d.nextFile

while f<>Nil
List.AddRow f.Name+" "+str(d.level)

f=d.nextFile
wend
```

Notes: Available in Mac OS X v10.6 and later.

35.19.9 nextFile as folderitem

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the next folderitem from the collection being enumerated.
Example:

```
Var d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
Var f as string = d.nextObject

while len(f)>0
List.AddRow f

f=d.nextObject
wend
```

Notes: The next folderitem from the collection being enumerated, or nil when all objects have been enumerated.

Same as nextObject, but returns a folderitem.

35.19.10 NSFileAppendOnly as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates whether the file is read-only.

35.19.11 NSFileBusy as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates whether the file is busy.

35.19.12 NSFileCreationDate as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's creation date.

35.19.13 NSFileDeviceIdentifier as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the identifier for the device on which the file resides.

35.19.14 NSFileExtensionHidden as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: he key in a file attribute dictionary whose value indicates whether the file's extension is hidden.

35.19.15 NSFileGroupOwnerAccountID as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's group ID.

35.19.16 NSFileGroupOwnerAccountName as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the group name of the file's owner.

35.19.17 NSFileHFSCreatorCode as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's HFS creator code.

35.19.18 NSFileHFSTypeCode as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's HFS type code.

35.19.19 NSFileImmutable as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates whether the file is mutable.

35.19.20 NSFileModificationDate as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's last modified date.

35.19.21 NSFileOwnerAccountID as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's owner's account ID.

35.19.22 NSFileOwnerAccountName as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the name of the file's owner.

35.19.23 NSFilePosixPermissions as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's Posix permissions.

35.19.24 NSFileReferenceCount as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's reference count.

35.19.25 NSFileSize as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Example:

```
Var d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
Var f as FolderItem = d.nextFile

while f<>Nil
List.AddRow f.Name

Var di as Dictionary = d.fileAttributes
Var size as int64 = di.Value(d.NSFileSize)

List.AddRow f.Name+" ("+str(size)+" Bytes)"

f=d.nextFile
wend
```

Notes: The key in a file attribute dictionary whose value indicates the file's size in bytes.

35.19.26 NSFileSystemFileNumber as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's filesystem file number.

35.19.27 NSFileSystemFreeNodes as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file system attribute dictionary dictionary whose value indicates the number of free nodes in the file system.

35.19.28 NSFileSystemFreeSize as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file system attribute dictionary whose value indicates the amount of free space on the file system.

35.19.29 NSFileSystemNodes as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file system attribute dictionary dictionary whose value indicates the number of free nodes in the file system.

35.19.30 NSFileSystemNumber as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file system attribute dictionary dictionary whose value indicates the filesystem number of the file system.

35.19.31 NSFileSystemSize as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file system attribute dictionary whose value indicates the size of the file system.

35.19.32 NSFileType as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the attributes dictionaries.
Notes: The key in a file attribute dictionary whose value indicates the file's type.

35.19.33 NSFileTypeBlockSpecial as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the file type property.
Notes: Block special file

35.19.34 NSFileTypeCharacterSpecial as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the file type property.
Notes: Character special file

35.19.35 NSFileTypeDirectory as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the file type property.
Notes: Directory

35.19.36 NSFileTypeRegular as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the file type property.
Notes: Regular file

35.19.37 NSFileTypeSocket as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the file type property.
Notes: Socket

35.19.38 NSFileTypeSymbolicLink as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the file type property.
Notes: Symbolic link

35.19.39 NSFileTypeUnknown as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: One of the constants for the file type property.
Notes: Unknown

35.19.40 Path as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: The path used in the constructor.

35.19.41 skipDescendents

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Causes the receiver to skip recursion into the most recently obtained subdirectory.

35.20 class NSDockTileMBS

35.20.1 class NSDockTileMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The cocoa class to customize the dock tile.
Notes: The NSDockTile class lets you customize the visual representation for your application's miniaturized windows and application icon as they appear in the Dock. You do not create Dock tile objects explicitly in your application. Instead, you retrieve the Dock tile for an existing window or for the application by calling that object's dockTile method.

Typically, you do not subclass the NSDockTile class. Instead, you use the methods of the class to make the following customizations:

- Badge the tile with a custom string.
- Remove or show the application icon badge.
- Draw the tile content yourself.

If you decide to draw the tile content yourself, you must provide a custom content view to handle the drawing.

Application Dock Tiles

An application Dock tile defaults to display the application's applicationIconImage.

The application Dock tile never shows a smaller application icon badge.

Whether using the default or custom view, the application Dock tile may be badged with a short custom string.

Window Dock Tiles

A window Dock tile defaults to display a miniaturized version of the windows contents with a badge derived from the application Dock icon, including any customized application Dock icon. The default window Dock tile image may not be badged with a custom string.

A window Dock tile can use a custom view to draw the Dock icon. If a custom view is used, no application badge will be added, but the text label will be overlaid on top of the icon.

Available in Mac OS X v10.5 and later.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 11.2pr9

35.20.2 Methods

35.20.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

35.20.4 display

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Redraws the dock tile's content.
Notes: If a custom content view is provided, Cocoa calls the drawRect method of that view (and its subviews) to draw the tile's content.

You can call this method to force the redrawing of the dock tile contents. You might do this if the contents of the underlying application or window change in a way that would require a refreshing of the tile. Some types of system activity, such as resizing the dock, may trigger automatic redraws of the tile. In most cases, however, your application is responsible for triggering redraws.

Cocoa does not automatically redraw the contents of your dock tile. Instead, your application must explicitly send display messages to the dock tile object whenever the contents of your view change and need to be redrawn.

35.20.5 owner as Variant

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Returns the object represented by the dock tile.
Example:

```
Var d as NSDockTileMBS = NSApplicationMBS.sharedApplication.dockTile

if d<>nil then
Var t as Introspection.TypeInfo = Introspection.GetType(d.owner)
MessageBox t.FullName // shows NSApplicationMBS
```

```
end if
```

Notes: The object represented by the dock tile. This is either the NSApplicationMBS object or one of your application's NSWindowMBS objects.

35.20.6 size as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Returns the size of the tile.
Example:

```
Var d as NSDockTileMBS = NSApplicationMBS.sharedApplication.dockTile

if d<>nil then
MessageBox str(D.size.Width)+" x "+str(d.size.Height)
// 128 x 128 in Mac OS X 10.5 and 10.6
end if
```

Notes: The size returned by this method corresponds to the size of the backing store in the dock, which may be bigger than the actual tile displayed on the screen.

35.20.7 Properties

35.20.8 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The internal reference to the docktile object.
Notes: (Read and Write property)

35.20.9 badgeLabel as string

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The tile's current badge label.
Example:

```
Var d as NSDockTileMBS = NSApplicationMBS.sharedApplication.dockTile

if d<>nil then
// this works in Carbon and Cocoa applications :-)
```

```
d.badgeLabel = "Hello"
d.showsApplicationBadge = true
end if
```

Notes: The localized string to be displayed in the tile's badging area. This string may be empty.
(Read and Write computed property)

35.20.10 contentView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The view used to draw the dock tile contents.
Notes: The view you specify should be height and width resizable.

Cocoa does not automatically redraw the contents of your dock tile. Instead, your application must explicitly send display messages to the dock tile object whenever the contents of your view change and need to be redrawn. Your dock tile view is responsible for drawing the entire contents of the dock tile. Your view does not need to draw the application or custom string badges.
(Read and Write computed property)

35.20.11 showsApplicationBadge as boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Whether the tile should be badged with the application's icon.
Example:

```
Var d as NSDockTileMBS = NSApplicationMBS.sharedApplication.dockTile

if d<>nil then
// this works in Carbon and Cocoa applications :-)

d.badgeLabel = "Hello"
d.showsApplicationBadge = true
end if
```

Notes: Miniaturized windows include the application badge by default to convey the associated application to the user. In Mac OS X v10.5 and later, application tiles do not support the application badge. A miniaturized window with a custom view does not draw the application badge.

The application icon is positioned automatically in the tile by the NSDockTile object.
(Read and Write computed property)

35.21 class NSEdgeInsetsMBS

35.21.1 class NSEdgeInsetsMBS

MBS Main Plugin, Plugin Version: 21.0, Platforms: macOS, iOS, Targets: All.

Function: A description of the distance between the edges of two rectangles.
Example:

```
// This example needs a window with NSCollectionViewControlMBS1.
// leave a margin of 20 points around the items of a collection view
Var layout As New NSCollectionViewFlowLayoutMBS
layout.sectionInset = New NSEdgeInsetsMBS(20, 20, 20, 20) // top, left, bottom, right
layout.itemSize = NSMakeSizeMBS(100, 100)

NSCollectionViewControlMBS1.View.collectionViewLayout = layout
```

Notes: Edge insets describe the distance between the edges of one rectangle to a related rectangle that can be described by measuring a constant but edge-specific distance from each edge.
A common use for this structure is to describe the relationship between a view,Äôs frame and its alignment rectangle.

- MBS Xojo Plugins, version 20.6pr2

35.21.2 Methods

35.21.3 Constructor

MBS Main Plugin, Plugin Version: 21.0, Platforms: macOS, iOS, Targets: All.

Function: The constructor to create an edge insets object with all values zero.
See also:

- 35.21.4 Constructor(p as Ptr) 6337
- 35.21.5 Constructor(top as double, left as double, bottom as double, right as double) 6338

35.21.4 Constructor(p as Ptr)

MBS Main Plugin, Plugin Version: 21.0, Platforms: macOS, iOS, Targets: All.

Function: The constructor to take a ptr to an NSEdgeInsets structure.
See also:

- 35.21.3 Constructor 6337

• 35.21.5 Constructor(top as double, left as double, bottom as double, right as double) 6338

35.21.5 Constructor(top as double, left as double, bottom as double, right as double)

MBS Main Plugin, Plugin Version: 21.0, Platforms: macOS, iOS, Targets: All.

Function: Creates an edge inset with given values.
Example:

```
Var e As New NSEdgeInsetsMBS(10, 20, 10, 20)

Break // see in debugger
```

See also:

• 35.21.3 Constructor 6337

• 35.21.4 Constructor(p as Ptr) 6337

35.21.6 Equal(other as NSEdgeInsetsMBS) as boolean

MBS Main Plugin, Plugin Version: 21.0, Platforms: macOS, iOS, Targets: All.

Function: Returns true if both edge insets are equal.

35.21.7 Properties

35.21.8 Bottom as Double

MBS Main Plugin, Plugin Version: 21.0, Platforms: macOS, iOS, Targets: All.

Function: The distance from the bottom of the source rectangle to the bottom of the result rectangle.
Notes: (Read and Write property)

35.21.9 Handle as Ptr

MBS Main Plugin, Plugin Version: 21.0, Platforms: macOS, iOS, Targets: All.

Function: The ptr to the NSEdgeInsets structure.
Notes: (Read only property)

35.21.10 Left as Double

MBS Main Plugin, Plugin Version: 21.0, Platforms: macOS, iOS, Targets: All.

Function: The distance from the left side of the source rectangle to the left side of the result rectangle.
Notes: (Read and Write property)

35.21.11 Right as Double

MBS Main Plugin, Plugin Version: 21.0, Platforms: macOS, iOS, Targets: All.

Function: The distance from the right side of the source rectangle to the right side of the result rectangle.
Notes: (Read and Write property)

35.21.12 Top as Double

MBS Main Plugin, Plugin Version: 21.0, Platforms: macOS, iOS, Targets: All.

Function: The distance from the top of the source rectangle to the top of the result rectangle.
Notes: (Read and Write property)

35.22 class NSEnumeratorMBS

35.22.1 class NSEnumeratorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: NSEnumerator is an abstract class, instances of whose subclasses enumerate collections of other objects, such as arrays and dictionaries.
Example:

```
Var d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)
MessageBox d.nextObject
```

Notes: You send nextObject repeatedly to a newly created NSEnumerator object to have it return the next object in the original collection. When the collection is exhausted, nil is returned. You cannot "reset" an enumerator after it has exhausted its collection. To enumerate a collection again, you need a new enumerator. This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- NSBundleMBS and NSDirectoryEnumeratorMBS

35.22.2 Methods

35.22.3 allObjects as Variant()

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns an array of objects the receiver has yet to enumerate.
Example:

```
Var d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)

Var a(-1) as Variant = d.allObjects
Var lines(-1) as string

for each v as Variant in a
lines.Add v
next

MessageBox Join(lines, EndOfLine) // shows all stuff on desktop
```

Notes: Put another way, the array returned by this method does not contain objects that have already been enumerated with previous nextObject messages.
Invoking this method exhausts the enumerator's collection so that subsequent invocations of nextObject return nil.

35.22.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

35.22.5 nextObject as Variant

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the next object from the collection being enumerated.
Example:

```
Var d as new NSDirectoryEnumeratorMBS(SpecialFolder.Desktop)

MessageBox d.nextObject // shows ".DS_Store" or some other file name
```

Notes: The next object from the collection being enumerated, or nil when all objects have been enumerated.

35.22.6 Properties

35.22.7 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: The internal reference to the NSEnumerator object.
Notes: (Read and Write property)

35.23 class NSErrorMBS

35.23.1 class NSErrorMBS

MBS Main Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: The class for error information in the Cocoa World.
Example:

```
// create an error with a description, e.g. to pass it to a Cocoa function
Var info As New Dictionary
info.Value(NSErrorMBS.NSLocalizedDescriptionKey) = "The file could not be found."
info.Value(NSErrorMBS.NSLocalizedRecoverySuggestionErrorKey) = "Please check the path."

Var e As New NSErrorMBS(NSErrorMBS.NSCocoaErrorDomain, 4, info)

// most plugin functions return errors in this class, so check it like this
MessageBox e.domain + " " + e.code.ToString + ": " + e.localizedDescription
```

35.23.2 Methods

35.23.3 Constructor(Domain as String, Code as Integer, UserInfo as dictionary = nil)

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Initializes error for a given domain and code with a given userInfo dictionary.
Notes: domain: The error domain—this can be one of the predefined NSError domains, or an arbitrary string describing a custom domain. domain must not be nil.
code: The error code for the error.
dict: The userInfo dictionary for the error. userInfo may be nil.

Returns an NSErrorMBS object initialized for domain with the specified error code and the dictionary of arbitrary data userInfo.
See also:

- 35.23.4 Constructor(Handle as Integer) 6343

35.23.4 Constructor(Handle as Integer)

MBS Main Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The constructor for a handle value of NSError.
Notes: Retains reference number and destructor later releases it.
Handle must be a NSError reference number and should not be zero.
See also:

- 35.23.3 Constructor(Domain as String, Code as Integer, UserInfo as dictionary = nil) 6343

35.23.5 error(Domain as String, Code as Integer, UserInfo as dictionary = nil) as NSErrorMBS

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Creates and initializes an NSError object for a given domain and code with a given userInfo dictionary.
Notes: domain: The error domain—this can be one of the predefined NSError domains, or an arbitrary string describing a custom domain. domain must not be nil.
code: The error code for the error.
dict: The userInfo dictionary for the error. userInfo may be nil.

Returns an NSErrorMBS object for domain with the specified error code and the dictionary of arbitrary data userInfo.

35.23.6 NSCocoaErrorDomain as String

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: The cocoa error domain.

35.23.7 NSFilePathErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: One of the user info dictionary keys.
Notes: Contains the file path of the error.

35.23.8 NSLocalizedDescriptionKey as String

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: One of the user info dictionary keys.
Notes: The corresponding value is a localized string representation of the error that, if present, will be returned by localizedDescription.

35.23.9 NSLocalizedFailureReasonErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: One of the user info dictionary keys.
Notes: The corresponding value is a localized string representation containing the reason for the failure that, if present, will be returned by localizedFailureReason.

35.23.10 NSLocalizedRecoveryOptionsErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: One of the user info dictionary keys.
Notes: The corresponding value is an array containing the localized titles of buttons appropriate for displaying in an alert panel.

The first string is the title of the right-most and default button, the second the one to the left, and so on. The recovery options should be appropriate for the recovery suggestion returned by localizedRecoverySuggestion.

35.23.11 NSLocalizedRecoverySuggestionErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: One of the user info dictionary keys.
Notes: The corresponding value is a string containing the localized recovery suggestion for the error.

This string is suitable for displaying as the secondary message in an alert panel.

35.23.12 NSMachErrorDomain as String

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Error domain for Mach errors.

35.23.13 NSOSStatusErrorDomain as String

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Error domain for Mac OS 9/Carbon errors.

35.23.14 NSPOSIXErrorDomain as String

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Error domain for unix errors.

35.23.15 NSRecoveryAttempterErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: One of the user info dictionary keys.
Notes: The corresponding value is an object that conforms to the NSErrorRecoveryAttempting informal protocol.

The recovery attempter must be an object that can correctly interpret an index into the array returned by recoveryAttempter.

35.23.16 NSStringEncodingErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: One of the user info dictionary keys.
Notes: The corresponding value is an NSNumber object containing the NSStringEncoding value.

35.23.17 NSUnderlyingErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: One of the user info dictionary keys.
Notes: The corresponding value is an error that was encountered in an underlying implementation and caused the error that the receiver represents to occur.

35.23.18 NSURLErrorKey as String

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: One of the user info dictionary keys.
Notes: The corresponding value is an NSURL object.

35.23.19 Properties

35.23.20 code as Integer

MBS Main Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: This is a domain specific error code.
Notes: (Read only property)

35.23.21 description as string

MBS Main Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: Returns the description for this object.
Notes: (Read only property)

35.23.22 domain as string

MBS Main Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: The error domain.
Notes: Domains are described by names that are arbitrary strings used to differentiate groups of codes; for custom domain using reverse-DNS naming will help avoid conflicts.
(Read only property)

35.23.23 Handle as Integer

MBS Main Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: The internal used handle for the NSError reference.
Notes: (Read and Write property)

35.23.24 localizedDescription as string

MBS Main Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: The localized error description.
Example:

```
Var f as FolderItem=SpecialFolder.Desktop.Child("test.mov")
Var q as new QTKitMovieMBS(f)
Var e as NSErrorMBS
```

```
f=SpecialFolder.Desktop.Child("test2.aif")

MessageBox str(q.Handle)

if q.exportToFile(f,e,"AIFF","soun","") then
MessageBox "ok"
else
MessageBox "Fail"
end if

if e<>Nil then
MessageBox e.localizedDescription
end if
```

Notes: The primary user-presentable message for the error. This method can be overridden by subclassers wishing to present better error strings. By default this looks for NSLocalizedDescriptionKey in the user info. If not present, it manufactures a string from the domain and code. Also, for some of the built-in domains it knows about, it might try to fetch an error string by calling a domain-specific function. In the absence of a custom error string, the manufactured one might not be suitable for presentation to the user, but can be used in logs or debugging.
(Read only property)

35.23.25 localizedFailureReason as string

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a string containing the localized explanation of the reason for the error.
Notes: A string containing the localized explanation of the reason for the error. By default this method returns the object in the user info dictionary for the key NSLocalizedFailureReasonErrorKey.
This method can be overridden by subclasses to present customized error strings.
Available in Mac OS X v10.4 and later.
(Read only property)

35.23.26 localizedRecoverySuggestion as string

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a string containing the localized recovery suggestion for the error.
Notes: Returns a string containing the localized recovery suggestion for the error. By default this method returns the object in the user info dictionary for the key NSLocalizedRecoverySuggestionErrorKey. If the user info dictionary doesn't contain a value for NSLocalizedRecoverySuggestionErrorKey, nil is returned.

The returned string is suitable for displaying as the secondary message in an alert panel.

This method can be overridden by subclasses to present customized recovery suggestion strings.

Available in Mac OS X v10.4 and later.
(Read only property)

35.23.27 userInfo as dictionary

MBS Main Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the receiver's user info dictionary.
Notes: The receiver's user info dictionary, or nil if the user info dictionary has not been set.
(Read only property)

35.24 class NSEventMBS

35.24.1 class NSEventMBS

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop & iOS.

Function: The Cocoa class for an user event.
Example:

```
// check which modifier keys are pressed for the event currently processed
Var e As NSEventMBS = NSApplicationMBS.sharedApplication.currentEvent
If e = Nil Then Return

Var keys() As String
If BitAnd(e.modifierFlags, NSEventMBS.NSCommandKeyMask) <>0 Then keys.Add "Command"
If BitAnd(e.modifierFlags, NSEventMBS.NSShiftKeyMask) <>0 Then keys.Add "Shift"

Var p As NSPointMBS = NSEventMBS.mouseLocation
MessageBox "Modifiers: " + String.FromArray(keys, ", ") + EndOfLine + _
"Mouse on screen: " + p.x.ToString + "/" + p.y.ToString
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

35.24.2 Methods

35.24.3 allTouches as NSTouchMBS()

MBS MacBase Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns all touch objects associated with the event.
Example:

```
Var e As NSEventMBS = NSApplicationMBS.sharedApplication.currentEvent
Var touches() As NSTouchMBS = e.allTouches

Break
```

Notes: If the touches originate in different views or windows, each NSTouchMBS object may have a different responder object.

35.24.4 coalescedTouchesForTouch(touch as NSTouchMBS) as NSTouchMBS()

MBS MacBase Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns all of the touch objects associated with the specified main touch.
Notes: touch: A touch that occurred in the Touch Bar. The method uses this object to determine which additional touch objects to return.

Returns an array that contains the NSTouch objects AppKit generated since the last event, but didn,Äôt deliver. This method returns nil if the object in the touch parameter isn,Äôt associated with the current event.

Use this method to obtain additional touch objects that the system received but didn,Äôt deliver to your app. You might use these extra touch objects to create a more precise path for the touch sequence.
AppKit coalesces touches only when they occur in the Touch Bar; it doesn,Äôt coalesce touch events on the track pad. This method returns the complete sequence of touches since the last event, and it returns them in the same order the system reported them. The last object in the array is a copy of the same object you provided in the touch parameter.

35.24.5 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

35.24.6 doubleClickInterval as Double

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the time, in seconds, in which a second mouse click must occur in order to be considered a double click.

Notes: This is a system setting, overriding this method will have no effect.
Available in Mac OS X v10.6 and later.

35.24.7 eventWithCGEvent(CGEventRef as Integer) as NSEventMBS

MBS MacBase Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an event object that is based on a Core Graphics type of event.
Notes: The returned object retains the CGEventRef object (cgEvent) until it (the Xojo and Objective-C object) is freed—it then releases the CGEventRef object. If no Cocoa event corresponds to the CGEventRef object, this method returns nil.

35.24.8 isMouseCoalescingEnabled as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Indicates whether mouse-movement event coalescing is enabled.
Notes: Available in Mac OS X v10.5 and later.

35.24.9 keyEvent(Type as Integer, LocationX as Double, LocationY as Double, modifierFlags as Integer, timeStamp as double, windowNumber as Integer, characters as String, charactersIgnoringModifiers as String, isARepeat as boolean, keyCode as Integer) as NSEventMBS

MBS MacBase Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: Returns a new NSEventMBS object describing a key event.
Notes: type: One of the following event-type constants: NSKeyDown, NSKeyUp, NSFlagsChanged. If anything else is specified, an NSInternalInconsistencyException is raised.
location: The cursor location in the base coordinate system of the window specified by windowNum.
modifierFlags: An integer bit field containing any of the modifier key masks.
timeStamp: The time the event occurred in seconds since system startup.
windowNumber: An integer that identifies the window device associated with the event, which is associated with the NSWindow that will receive the event.
characters: A string of characters associated with the key event. Though most key events contain only one character, it is possible for a single keypress to generate a series of characters.
unmodCharacters: The string of characters generated by the key event as if no modifier key had been pressed (except for Shift). This argument is useful for getting the ,Äúbasic,Äù key value in a hardware-independent manner.
isARepeat: True if the key event is a repeat caused by the user holding the key down, false if the key event is new.
keyCode: A number that identifies the keyboard key associated with the key event. Its value is hardware-

independent.

Returns the created NSEvent instance or nil if the instance could not be created.

35.24.10 keyRepeatDelay as Double

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the length of time a key must be held down in order to generate the first key repeat event.
Notes: This is a system setting, overriding this method will have no effect.
Available in Mac OS X v10.6 and later.

35.24.11 keyRepeatInterval as Double

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the length between subsequent key repeat events being posted.
Notes: This is a system setting, overriding this method will have no effect.
Available in Mac OS X v10.6 and later.

35.24.12 modifierFlagsGlobal as UInt32

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the currently pressed modifier flags.
Notes: This returns the state of devices combined with synthesized events at the moment, independent of which events have been delivered via the event stream.
Available in Mac OS X v10.6 and later.

35.24.13 mouseEvent(Type as Integer, LocationX as Double, LocationY as Double, modifierFlags as Integer, timeStamp as double, windowNumber as Integer, eventNumber as Integer, clickCount as Integer, pressure as Single) as NSEventMBS

MBS MacBase Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: Returns a new NSEvent object describing a mouse-down, -up, -moved, or -dragged event.
Notes: type: One of the modifier key masks described in NSEventType, or an NSInternalInconsistencyException is raised.

location: The cursor location in the base coordinate system of the window specified by windowNumber.
flags: An integer bit field containing any of the modifier key masks described in Getting Unicode Values, combined using the C bitwise OR operator.
timeStamp: The time the event occurred in seconds since system startup.
windowNumber: An integer that identifies the window device associated with the event, which is associated with the NSWindow that will receive the event.
eventNumber: An identifier for the new event. It,Äôs normally taken from a counter for mouse events, which continually increases as the application runs.
clickNumber: The number of mouse clicks associated with the mouse event.
pressure: A value from 0.0 to 1.0 indicating the pressure applied to the input device on a mouse event, used for an appropriate device such as a graphics tablet. For devices that aren,Äôt pressure-sensitive, the value should be either 0.0 or 1.0.

Returns the created NSEventMBS instance or nil if the instance could not be created.

35.24.14 mouseLocation as NSPointMBS

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Reports the current mouse position in screen coordinates.
Notes: This method is similar to the NSWindow method mouseLocationOutsideOfEventStream. It returns the location regardless of the current event or pending events. The difference between these methods is that mouseLocationOutsideOfEventStream returns a point in the receiving window's coordinates and mouseLocation returns the same information in screen coordinates.

Note: The y coordinate in the returned point starts from a base of 1, not 0.

35.24.15 otherEvent(Type as Integer, LocationX as Double, LocationY as Double, modifierFlags as Integer, timeStamp as double, windowNumber as Integer, SubType as Integer, Data1 as Integer, Data2 as Integer) as NSEventMBS

MBS MacBase Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: Returns a new NSEventMBS object describing a custom event.
Notes: type: One of the following event-type constants: NSAppKitDefined, NSSystemDefined, NSApplicationDefined or NSPeriodic.
If type is anything else, an NSInternalInconsistencyException is raised. Your code should only create events of type NSApplicationDefined.
location: The cursor location in the base coordinate system of the window specified by windowNum.
flags: An integer bit field containing any of the modifier key masks.
time: The time the event occurred in seconds since system startup.
windowNumber: An integer that identifies the window device associated with the event, which is associated

with the NSWindow that will receive the event.
subtype: A numeric identifier that further differentiates custom events of types NSAppKitDefined, NSSystemDefined, and NSApplicationDefined. NSPeriodic events don,Äôt use this attribute.
data1: Additional data associated with the event. NSPeriodic events don,Äôt use these attributes.
data2: Additional data associated with the event. NSPeriodic events don,Äôt use these attributes.

Returns the created NSEvent object or nil if the object couldn't be created.

35.24.16 predictedTouchesForTouch(touch as NSTouchMBS) as NSTouchMBS()

MBS MacBase Plugin, Plugin Version: 24.2, Platform: macOS, Targets: iOS only.

Function: Returns an array of touches that are predicted to occur for the specified touch.
Notes: touch: A main touch object that was reported with the event. The touch object you specify is used to determine which sequence of additional touches is returned.

Returns an array of NSTouchMBS objects representing the set of touches that the system predicts will occur next. The order of the objects in the array matches the order in which the touches are expected to be delivered to your app. This array does not include the original touch you specified in the touch parameter. The return value is nil if the object in the touch parameter is not associated with the current event.

Use this method to minimize the apparent latency between the user's touch input and the rendering of your onscreen content. Processing touch input from the user and translating that information into drawing commands takes time, and turning those drawing commands into rendered content takes additional time. If the user's finger or Apple Pencil is moving fast enough, these delays can result in a noticeable gap between the current touch location and the rendered content. To minimize the perceived lag, use the predicted touches of this method as additional, temporary input to your content.
The touches returned by this method represent the system's estimation of where the user's touch input will be, based on the user's past input. Append these touches only temporarily to the structures you use for drawing or updating your content, and discard them as soon as you receive a new event with fresh touches. When used in conjunction with coalesced touches and efficient drawing code, you can create the perception that the user's input is being handled immediately, with little or no lag. That perception improves the user experience of drawing apps or of any app that let users manipulate objects directly onscreen.

35.24.17 pressedMouseButtons as UInt32

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the indices of the currently depressed mouse buttons.
Notes: The indices of the currently depressed mouse buttons.

A return value of 1 «0 corresponds to left the mouse, 1 «1 corresponds to the right mouse, 1«n, n >=2 to

other mouse buttons.

This returns the state of devices combined with synthesized events at the moment, independent of which events have been delivered via the event stream, so this method is not suitable for tracking.

Available in Mac OS X v10.6 and later.

35.24.18 setMouseCoalescingEnabled(Value as boolean)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether mouse-movement event coalescing is enabled.
Notes: This method affects mouse-moved, mouse-dragged, and tablet events. Mouse-movement event coalescing is enabled by default.

Available in Mac OS X v10.5 and later.

35.24.19 touchesForView(view as NSViewMBS) as NSTouchMBS()

MBS MacBase Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns the touch objects from the event that belong to the specified view.

35.24.20 touchesForWindow(win as NSWindowMBS) as NSTouchMBS()

MBS MacBase Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: iOS only.

Function: Returns the touch objects from the event that belong to the specified window.

35.24.21 touchesMatchingPhase(Phase as Integer, view as NSViewMBS = nil) as NSTouchMBS()

MBS MacBase Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: Returns the touch objects associated with the specified phase.
Notes: phase: The touch phase for which you want touches.
view: The view for which touches are wanted. Touches that target this view, or any of the view,Äôs descendants will be returned. Passing nil as the view gets all touches regardless of their targeted view.

Returns an array of applicable NSTouchMBS objects.
This method is only valid for gesture events (gesture, magnify, swipe, rotate, etc.).

35.24.22 Properties

35.24.23 absoluteX as Integer

MBS MacBase Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop only.

Function: Reports the absolute x coordinate of a pointing device on its tablet at full tablet resolution.
Notes: For the coordinate to be valid, the receiver should represent an event generated by a tablet pointing device (otherwise 0 is returned). This method is valid only for mouse events with a subtype of NSTabletPointEventSubtype and for events of type NSTabletPoint. Use this value if you want to scale from tablet location to screen location yourself; otherwise use the class method mouseLocation or the instance method locationInWindow.

Available in Mac OS X v10.4 and later.
(Read only property)

35.24.24 absoluteY as Integer

MBS MacBase Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop only.

Function: Reports the absolute y coordinate of a pointing device on its tablet at full tablet resolution.
Notes: For the coordinate to be valid, the receiver should represent an event generated by a tablet pointing device (otherwise 0 is returned). This method is valid only for mouse events with a subtype of NSTabletPointEventSubtype and for events of type NSTabletPoint. Use this value if you want to scale from tablet location to screen location yourself; otherwise use the class method mouseLocation or the instance method locationInWindow.

Available in Mac OS X v10.4 and later.
(Read only property)

35.24.25 absoluteZ as Integer

MBS MacBase Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop only.

Function: Reports the absolute z coordinate of pointing device on its tablet at full tablet resolution.
Notes: For the coordinate to be valid, the receiver should represent an event generated by a tablet pointing device (otherwise 0 is returned). The z coordinate does not represent pressure. It registers the depth coordinate returned by some tablet devices with wheels; if the device is something other than these, 0 is returned.

This method is valid only for mouse events with a subtype of NSTabletPointEventSubtype and for events of type NSTabletPoint.

Available in Mac OS X v10.4 and later.
(Read only property)

35.24.26 associatedEventsMask as Integer

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The event mask describing the various events that you may also get during this event sequence.
Notes: This message is valid for Mouse events. Useful for determining if the input device issuing this mouse event can also simultaneously issue NSEventTypePressure events.
(Read only property)

35.24.27 buttonMask as Integer

MBS MacBase Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a bit mask identifying the buttons pressed when the tablet event represented by the receiver was generated.
Notes: Use one or more of the button-mask constants described in Constants to determine which buttons of the pointing device are pressed. This method is valid only for mouse events with a subtype of NSTabletPointEventSubtype and for events of type NSTabletPoint.

Available in Mac OS X v10.4 and later.

Constants to use:

NSPenTipMask=1	The pen tip is activated.
NSPenLowerSideMask=2	The button on the lower side of the device is activated.
NSPenUpperSideMask=4	The button on the upper side of the device is activated.

(Read only property)

35.24.28 buttonNumber as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the button number for the mouse button that generated an NSOtherMouse... event.
Notes: This method is intended for use with the NSOtherMouseDown, NSOtherMouseUp, and NSOtherMouseDragged events, but will return values for NSLeftMouse... and NSRightMouse... events also.
(Read only property)

35.24.29 capabilityMask as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a mask whose set bits indicate the capabilities of the tablet device that generated the event represented by the receiver.
Notes: These bits are vendor-defined. This method is valid only for mouse events with a subtype of NSTabletProximityEventSubtype and for events of type NSTabletProximity.

Available in Mac OS X v10.4 and later.
(Read only property)

35.24.30 CGEventRef as Integer

MBS MacBase Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: The Core Graphics event object corresponding to this event.
Notes: The CGEventRef opaque type returned. If no CGEventRef object corresponding to the NSEvent object can be created, this method returns 0.
(Read only property)

35.24.31 characters as string

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the characters associated with the receiving key-up or key-down event.
Notes: These characters are derived from a keyboard mapping that associates various key combinations with Unicode characters. Raises an NSInternalInconsistencyException if sent to any other kind of event object.

This method returns an empty string for dead keys, such as Option-e. However, for a key combination such as Option-Shift-e this method returns the standard accent (”’”).
(Read only property)

35.24.32 charactersIgnoringModifiers as string

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the characters generated by the receiving key event as if no modifier key (except for Shift) applies.
Notes: Raises an NSInternalInconsistencyException if sent to a nonkey event.

This method returns the non-modifier key character pressed for dead keys, such as Option-e. For example, Option-e (no shift key) returns an "e" for this method, whereas the characters method returns an empty string.

This method is useful for determining "basic" key values in a hardware-independent manner, enabling such features as keyboard equivalents defined in terms of modifier keys plus character keys. For example, to determine if the user typed Alt-S, you don't have to know whether Alt-S generates a German double ess, an integral sign, or a section symbol. You simply examine the string returned by this method along with the event's modifier flags, checking for "s" and NSAlternateKeyMask.
(Read only property)

35.24.33 clickCount as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the number of mouse clicks associated with the receiver, which represents a mouse-down or mouse-up event.
Notes: Raises an NSInternalInconsistencyException if sent to a nonmouse event.

Returns 0 for a mouse-up event if a time threshold has passed since the corresponding mouse-down event. This is because if this time threshold passes before the mouse button is released, it is no longer considered a mouse click, but a mouse-down event followed by a mouse-up event.

The return value of this method is meaningless for events other than mouse-down or mouse-up events.
(Read only property)

35.24.34 data1 as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns additional data associated with the receiver.
Notes: The value returned by this method is dependent on the event type, and is defined by the originator of the event. Raises an NSInternalInconsistencyException if sent to an event not of type NSAppKitDefined, NSSystemDefined, NSApplicationDefined, or NSPeriodic.

NSPeriodic events don't use this attribute.
(Read only property)

35.24.35 data2 as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns additional data associated with the receiver.
Notes: The value returned by this method is dependent on the event type, and is defined by the originator of the event. Raises an NSInternalInconsistencyException if sent to an event not of type NSAppKitDefined, NSSystemDefined, NSApplicationDefined, or NSPeriodic.

NSPeriodic events don't use this attribute.
(Read only property)

35.24.36 deltaX as Double

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the x-coordinate change for a scroll wheel, mouse-move, or mouse-drag event.
Notes: (Read only property)

35.24.37 deltaY as Double

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the y-coordinate change for a scroll wheel, mouse-move, or mouse-drag event.
Notes: The behavior of this method may seem counter-intuitive: as the mouse moves up the screen, the value is negative; and as it moves down the screen, the value is positive. The reason for this behavior is that NSEvent computes this delta value in device space, which is flipped, but both the screen and the window's base coordinate system are not flipped.
(Read only property)

35.24.38 deltaZ as Double

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the z-coordinate change for a scroll wheel, mouse-move, or mouse-drag event.
Notes: (Read only property)

35.24.39 description as string

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop only.

Function: Returns the description for this object.
Notes: (Read only property)

35.24.40 deviceID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a special identifier that is used to match tablet-pointer events with the tablet-proximity event represented by the receiver.
Notes: All tablet-pointer events generated in the period between the device entering and leaving tablet proximity have the same device ID. This message is valid only for mouse events with subtype NSTabletPointEventSubtype or NSTabletProximityEventSubtype, and for NSTabletPoint and NSTabletProximity events.
Available in Mac OS X v10.4 and later.
(Read only property)

35.24.41 eventNumber as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the counter value of the latest mouse or tracking-rectangle event object; every system-generated mouse and tracking-rectangle event increments this counter.
Notes: Raises an NSInternalInconsistencyException if sent to any other type of event object.
(Read only property)

35.24.42 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop & iOS.

Function: The handle to the internal used NSEvent class.
Notes: (Read and Write property)

35.24.43 hasPreciseScrollingDeltas as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether there are precise scrolling deltas available.
Notes: Returns true if precise scrolling deltas are available; false otherwise.

This method is valid for NSScrollWheel events. A generic scroll wheel issues rather coarse scroll deltas. Some mice and trackpads provide much more precise delta. This method determines how the values of the scrollingDeltaX and scrollingDeltaY should be interpreted.
Available in OS X v10.7 and later.
(Read only property)

35.24.44 isARepeat as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns true if the receiving key event is a repeat caused by the user holding the key down, false if the key event is new.
Notes: Raises an NSInternalInconsistencyException if sent to an NSFlagsChanged event or other nonkey event.
(Read only property)

35.24.45 isDirectionInvertedFromDevice as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether the user has changed the device inversion.
Notes: This method valid for NSEventScrollWheel and NSEventTypeSwipe events. The user may choose to change the scrolling behavior such that it feels like they are moving the content instead of the scroll bar.

To accomplish this, deltaX and deltaY and scrollingDeltaX and scrollingDeltaY values are automatically inverted for NSEventScrollWheel events according to the user's preferences.

The direction of fluid swipes matches the direction of scrolling and as such for NSEventTypeSwipe events gestureAmount is inverted. However, for some uses of NSEventScrollWheel and NSEventTypeSwipe events, the behavior should not respect the user preference. This method allows you to determine when the event has been inverted and compensate by multiplying -1 if needed.

Available in OS X v10.7 and later.
(Read only property)

35.24.46 isEnteringProximity as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns true to indicate that a pointing device is entering the proximity of its tablet and false when it is leaving it.
Notes: This method is valid for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events.
Available in Mac OS X v10.4 and later.
(Read only property)

35.24.47 keyCode as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the virtual key code for the keyboard key associated with the receiving key event.
Notes: The virtual key code. The returned value is hardware-independent. The value returned is the same as the value returned in the kEventParamKeyCode when using Carbon Events.

Raises an NSInternalInconsistencyException if sent to a non-key event.
(Read only property)

35.24.48 locationInWindow as NSPointMBS

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's location in the base coordinate system of the associated window.
Notes: For nonmouse events the return value of this method is undefined.

With NSMouseMoved and possibly other events, the receiver can have a nil window (that is, window returns nil). In this case, locationInWindow returns the event location in screen coordinates.
(Read only property)

35.24.49 magnification as Double

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the change in magnification.
Notes: The change in magnification that should be added to the current scaling of an item to achieve the new scale factor.
This message is valid for events of type NSEventTypeMagnify.
Available in Mac OS X v10.6 and later.

(Read only property)

35.24.50 modifierFlags as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop & iOS.

Function: Returns an integer bit field indicating the modifier keys in effect for the receiver.
Notes: You can examine individual flag settings using the C bitwise AND operator with the predefined key masks. The lower 16 bits of the modifier flags are reserved for device-dependent bits.
(Read only property)

35.24.51 pointingDeviceID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the pointing device currently in proximity with the tablet.
Notes: This index is significant for multimode (or Dual Tracking) tablets that support multiple concurrent pointing devices; the index is incremented for each pointing device that comes into proximity. Otherwise, zero is always returned. The receiver of this message should be a mouse event object with subtype NSTabletProximityEventSubtype or an event of type NSTabletProximity.

Available in Mac OS X v10.4 and later.
(Read only property)

35.24.52 pointingDeviceSerialNumber as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the vendor-assigned serial number of a pointing device of a certain type.
Notes: Devices of different types, such as a puck and a pen, may have the same serial number. The receiver of this message should be a mouse event object with subtype NSTabletProximityEventSubtype or an event of type NSTabletProximity.

Available in Mac OS X v10.4 and later.
(Read only property)

35.24.53 pointingDeviceType as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a NSPointingDeviceType constant indicating the kind of pointing device associated with the receiver.
Notes: For example, the device could be a pen, eraser, or cursor pointing device. This method is valid for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events. See "Constants" for descriptions of valid NSPointingDeviceType constants.

Available in Mac OS X v10.4 and later.
(Read only property)

35.24.54 pressure as Double

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns a value from 0.0 through 1.0 indicating the pressure applied to the input device (used for appropriate devices).
Notes: For devices that aren't pressure-sensitive, the value is either 0.0 or 1.0. Raises an NSInternalInconsistencyException if sent to a nonmouse event.

For tablet pointing devices that are in proximity, the pressure value is 0.0 if they are not actually touching the tablet. As the device is pressed into the tablet, the value is increased.
(Read only property)

35.24.55 rotation as Double

MBS MacBase Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop only.

Function: Returns the rotation in degrees of the tablet pointing device associated with the receiver.
Notes: Many devices do not support rotation, in which case the returned value is 0.0. This method is valid only for mouse events with subtype NSTabletPointEventSubtype and for NSTabletPoint events.

Available in Mac OS X v10.4 and later.
(Read only property)

35.24.56 scrollingDeltaX as Double

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the scroll wheel horizontal delta.
Notes: This is the preferred method for accessing NSScrollWheel delta values. When hasPreciseScrollingDeltas returns false, your application may which to modify this value.

Available in OS X v10.7 and later.
(Read only property)

35.24.57 scrollingDeltaY as Double

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the scroll wheel vertical delta.
Notes: This is the preferred method for accessing NSScrollWheel delta values. When hasPreciseScrollingDeltas returns false, multiply the value returned by this method by the line or row height. Otherwise scroll by the returned amount.

Available in OS X v10.7 and later.
(Read only property)

35.24.58 stage as Integer

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The stage of pressure events.
Notes: This message is valid for NSEventTypePressure events.
Pressure gesture events go through multiple stages.
(Read only property)

35.24.59 stageTransition as Double

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The stage transition for pressure events.
Notes: This message is valid for NSEventTypePressure events. Positive stageTransition describes approaching the next stage of the pressure gesture. Negative stageTransition describes approaching release of the current stage.
(Read only property)

35.24.60 subtype as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the subtype of the receiving event object.
Notes: Raises an NSInternalInconsistencyException if sent to an event not of type NSAppKitDefined,

NSSystemDefined, NSApplicationDefined, or NSPeriodic.

NSPeriodic events don't use this attribute.

This method is also valid for mouse events on Mac OS X v10.4 and later. See the predefined mouse and tablet subtypes.
(Read only property)

35.24.61 systemTabletID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the tablet device connected to the system.
Notes: If multiple tablets are connected to the system, the system-tablet ID is incremented for each subsequent one. If there is only one tablet device, its system-tablet ID is zero. The receiver of this message should be a mouse event object with subtype NSTabletProximityEventSubtype or an event of type NSTabletProximity.

Available in Mac OS X v10.4 and later.
(Read only property)

35.24.62 tabletID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the USB model identifier of the tablet device associated with the receiver.
Notes: This method is valid for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events.
Available in Mac OS X v10.4 and later.
(Read only property)

35.24.63 tangentialPressure as Double

MBS MacBase Plugin, Plugin Version: 8.7, Platform: macOS, Targets: Desktop only.

Function: Reports the tangential pressure on the device that generated the event represented by the receiver.
Notes: The value returned can range from -1.0 to 1.0. Tangential pressure is also known as barrel pressure. Only some pointing devices support tangential pressure. This method is valid for mouse events with subtype NSTabletPointEventSubtype and for NSTabletPoint events.

Available in Mac OS X v10.4 and later.
(Read only property)

35.24.64 tilt as NSPointMBS

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Reports the scaled tilt values of the pointing device that generated the event represented by the receiver.
Notes: The value returned can range from -1.0 to 1.0 for both axes. An x-coordinate value that is negative indicates a tilt to the left and a positive value indicates a tilt to the right; a y-coordinate value that is negative indicates a tilt to the top and a positive value indicates a tilt to the bottom. If the device is perfectly perpendicular to the table surface, the values are 0.0 for both axes. This method is valid for mouse events with subtype NSTabletPointEventSubtype and for NSTabletPoint events.

Available in Mac OS X v10.4 and later.
(Read only property)

35.24.65 timestamp as Double

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the time the receiver occurred in seconds since system startup.
Notes: (Read only property)

35.24.66 trackingNumber as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the identifier of a mouse-tracking event.
Notes: This method returns either an NSTrackingArea object or a NSTrackingRectTag constant depending on whether the event was generated from an NSTrackingArea object or a call to addTrackingRect:owner:user-Data:assumeInside:. Valid mouse-tracking methods are of types NSMouseEntered, NSMouseExited, and NSCursorUpdate. This method raises an NSInternalInconsistencyException if sent to any other type of event.

The NSTrackingArea class is new with Mac OS X version 10.5
(Read only property)

35.24.67 type as Integer

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop & iOS.

Function: The type of the receiving event.
Notes: The type must be one of the following:

NSLeftMouseDown
NSLeftMouseUp
NSRightMouseDown
NSRightMouseUp
NSOtherMouseDown
NSOtherMouseUp
NSMouseMoved
NSLeftMouseDragged
NSRightMouseDragged
NSOtherMouseDragged
NSMouseEntered
NSMouseExited
NSKeyDown
NSKeyUp
NSFlagsChanged
NSAppKitDefined
NSSystemDefined
NSApplicationDefined
NSPeriodic
NSCursorUpdate
NSScrollWheel
(Read only property)

35.24.68 uniqueID as UInt64

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the unique identifier of the pointing device that generated the event represented by the receiver.
Notes: Also known as tool ID, this is a unique number recorded in the chip inside every pointing device. The unique ID makes it possible to assign a specific pointing device to a specific tablet. You can also use it to "sign" documents or to restrict access to document layers to a specific pointing device. This method is valid for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events.
Available in Mac OS X v10.4 and later.
(Read only property)

35.24.69 vendorID as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the vendor identifier of the tablet associated with the receiver.
Notes: The tablet is typically a USB device. This method is valid only for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events.
Available in Mac OS X v10.4 and later.
(Read only property)

35.24.70 vendorPointingDeviceType as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a coded bit field whose set bits indicate the type of pointing device (within a vendor selection) associated with the receiver.
Notes: See the vendor documentation for an interpretation of significant bits. This method is valid only for mouse events with subtype NSTabletProximityEventSubtype and for NSTabletProximity events.
Available in Mac OS X v10.4 and later.
(Read only property)

35.24.71 window as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the window object associated with the receiver.
Notes: A periodic event, however, has no window; in this case the return value is undefined.
(Read only property)

35.24.72 windowNumber as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the identifier for the window device associated with the receiver.
Notes: A periodic event, however, has no window; in this case the return value is undefined.
(Read only property)

35.24.73 Constants

Constants

Constant	Value	Description
NSAlphaShiftKeyMask	&h10000	One of the constants representing device-independent bits fo ifier flags. Set if Caps Lock key is pressed.
NSAlternateKeyMask	&h80000	One of the constants representing device-independent bits fo ifier flags. Set if Option or Alternate key is pressed.
NSAnyEventMask	&hFFFFFFFF	One of the constants for masks for the events. Pass them to the NSCell method sendActionOn to specify should send its action message.
NSAppKitDefined	13	One of the event types.
NSAppKitDefinedMask	&h2000	One of the constants for masks for the events. Pass them to the NSCell method sendActionOn to specify should send its action message.
NSApplicationActivatedEventType	1	One of the constants representing the types of events defined b Kit. The application has been activated.
NSApplicationDeactivatedEventType	2	One of the constants representing the types of events defined b Kit. The application has been deactivated.
NSApplicationDefined	15	One of the event types.
NSApplicationDefinedMask	&h8000	One of the constants for masks for the events. Pass them to the NSCell method sendActionOn to specify should send its action message.
NSAWTEventType	16	One of the constants representing the types of events defined b Kit. An event type used to support Java applications.
NSBeginFunctionKey	&hF72A	One of the constants representing Unicode characters (0xF7 are reserved for function keys on the keyboard. Begin key. Not on most Macintosh keyboards.
NSBreakFunctionKey	&hF732	One of the constants representing Unicode characters (0xF7 are reserved for function keys on the keyboard. Break key. Not on most Macintosh keyboards.
NSClearDisplayFunctionKey	&hF73A	One of the constants representing Unicode characters (0xF7 are reserved for function keys on the keyboard. Clear Display key. Not on most Macintosh keyboards.
NSClearLineFunctionKey	&hF739	One of the constants representing Unicode characters (0xF7 are reserved for function keys on the keyboard. Clear/Num Lock key.
NSCommandKeyMask	&h100000	One of the constants representing device-independent bits fo ifier flags. Set if Command key is pressed.
NSControlKeyMask	&h40000	One of the constants representing device-independent bits fo ifier flags. Set if Control key is pressed.
NSCursorPointingDevice	2	One of the constants represent pointing-device types for N events or mouse events with subtype NSTabletProximityEve The pointingDeviceType method returns one of these consta Represents a cursor (or puck-like) pointing device. Available in Mac OS X v10.4 and later.
NSCursorUpdate	17	One of the event types.
NSCursorUpdateMask	&h20000	One of the constants for masks for the events. Pass them to the NSCell method sendActionOn to specify should send its action message.
NSDeleteCharFunctionKey	&hF73E	One of the constants representing Unicode characters (0xF7 are reserved for function keys on the keyboard. Delete Character key. Not on most Macintosh keyboards.
NSDeleteFunctionKey	&hF728	One of the constants representing Unicode characters (0xF7 are reserved for function keys on the keyboard.

Event Types

Constant	Value	Description
NSEventTypeBeginGesture	19	An event that represents a gesture beginning. Available in Mac OS X v10.6 and later.
NSEventTypeEndGesture	20	An event that represents some type of gesture such as NSEventTypeMagnify, NSEventTypeSwipe, NSEventTypeRotate, NSEventTypeBeginGesture, or NSEventTypeEndGesture. Available in Mac OS X v10.6 and later.
NSEventTypeGesture	29	An event that represents some type of gesture such as NSEventTypeMagnify, NSEventTypeSwipe, NSEventTypeRotate, NSEventTypeBeginGesture, or NSEventTypeEndGesture. Available in Mac OS X v10.6 and later.
NSEventTypeMagnify	30	An event representing a pinch open or pinch close gesture. Available in Mac OS X v10.6 and later.
NSEventTypeMouseCancelled	40	The mouse event was cancelled. For macOS 26 or newer.
NSEventTypePressure	34	A force touch pressure event.
NSEventTypeQuickLook	33	The quicklook event.
NSEventTypeRotate	18	An event representing a rotation gesture. Available in Mac OS X v10.6 and later.
NSEventTypeSmartMagnify	32	The smart magnify event.
NSEventTypeSwipe	31	An event representing a swipe gesture. Available in Mac OS X v10.6 and later.

35.25 class NSEventMonitorMBS

35.25.1 class NSEventMonitorMBS

MBS MacFrameworks Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The class for watching events in Cocoa.
Example:

```
// watch key presses in the application
// MyEventMonitor is a subclass of NSEventMonitorMBS with the LocalEvent event implemented.
// Monitor is a property of the app: Monitor As MyEventMonitor

Monitor = New MyEventMonitor
If Not Monitor.addLocalMonitorForEventsMatchingMask(NSEventMBS.NSKeyDownMask) Then
MessageBox "Failed to install monitor."
End If

// in MyEventMonitor:
Function LocalEvent(e As NSEventMBS) As NSEventMBS Handles LocalEvent
System.DebugLog "Key " + e.keyCode.ToString + ": " + e.characters
Return e // pass the event on, return Nil to swallow it
End Function
```

Notes: For Mac OS X 10.5 compatibility, please use CarbonMonitorEventsMBS class.
Blog Entries

- MBS Real Studio Plugins, version 12.4pr9

35.25.2 Methods

35.25.3 addGlobalMonitorForEventsMatchingMask(mask as UInt64) as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Installs an event monitor that receives copies of events posted to other applications.
Notes: mask: An event mask specifying which events you wish to monitor. See NSEventMBS constants for possible values.

Events are delivered asynchronously to your app and you can only observe the event; you cannot modify or otherwise prevent the event from being delivered to its original target application.

Key-related events may only be monitored if accessibility is enabled or if your application is trusted for accessibility access (see AXIsProcessTrusted).

Note that your handler will not be called for events that are sent to your own application.

Special Considerations
In OS X v 10.6, event monitors are only able to monitor the following event types:

NSLeftMouseDragged
NSRightMouseDragged
NSOtherMouseDragged
NSLeftMouseUp
NSRightMouseUp
NSOtherMouseUp
NSLeftMouseDown
NSRightMouseDown
NSOtherMouseDown
NSMouseMoved
NSFlagsChanged
NSScrollWheel
NSTabletPoint
NSTabletProximity
NSKeyDown (Key repeats are determined by sending the event an isARepeat message.)

Available in OS X v10.6 and later.

35.25.4 addLocalMonitorForEventsMatchingMask(mask as UInt64) as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Installs an event monitor that receives copies of events posted to this application before they are dispatched.
Notes: mask: An event mask specifying which events you wish to monitor. See NSEventMBS constants for possible values.

Calls the LocalEvent event. You can return the event unmodified, create and return a new NSEventMBS object, or return nil to stop the dispatching of the event.

Your handler will not be called for events that are consumed by nested event-tracking loops such as control tracking, menu tracking, or window dragging; only events that are dispatched through the applications sendEvent method will be passed to your handler.

Note: The monitor Block is called for all future events that match mask.

Special Considerations

In OS X v 10.6, event monitors are only able to monitor the following event types:

NSFlagsChanged
NSLeftMouseDragged
NSRightMouseDragged
NSOtherMouseDragged
NSLeftMouseUp
NSRightMouseUp
NSOtherMouseUp
NSLeftMouseDown
NSRightMouseDown
NSOtherMouseDown
NSMouseMoved
NSFlagsChanged
NSScrollWheel
NSTabletPoint
NSTabletProximity
NSKeyDown (Key repeats are determined by sending the event an isARepeat message.)

Available in OS X v10.6 and later.

35.25.5 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether event monitoring is available.
Notes: Returns true on Mac OS X 10.6 and newer.

35.25.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: Initializes the object.

35.25.7 Destructor

MBS MacFrameworks Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.
Notes: Remove all event monitors you added.

35.25.8 Properties

35.25.9 Count as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns number of event monitors you added.
Notes: (Read only property)

35.25.10 Events

35.25.11 GlobalEvent(e as NSEventMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: This event is called for global system events.
Notes: It is passed the event to monitor. You are unable to change the event, merely observe it.

Events are delivered asynchronously to your app and you can only observe the event; you cannot modify or otherwise prevent the event from being delivered to its original target application.

35.25.12 LocalEvent(e as NSEventMBS) as NSEventMBS

MBS MacFrameworks Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: This event is called for local application events.
Notes: You can return the event unmodified, create and return a new NSEventMBS object, or return nil to stop the dispatching of the event.

35.26 class NSExceptionHandlerMBS

35.26.1 class NSExceptionHandlerMBS

MBS Main Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The class for a global handler to catch unhandled cocoa exceptions.
Notes: Previous plugin versions tried to show a dialog to inform you. Now you can intercept that.
If code is in this event, we do not show the dialog from the plugin.

See also WinExceptionMBS, SignalHandlerMBS and GlobalExceptionHandlerMBS classes.
Blog Entries

- Xojo Tips and Tricks

- MBS Xojo / Real Studio Plugins, version 13.2pr3

35.26.2 Methods

35.26.3 Disable

MBS Main Plugin, Plugin Version: 17.0, Platform: macOS, Targets: All.

Function: Disables the global exception handler.

35.26.4 Enable

MBS Main Plugin, Plugin Version: 17.0, Platform: macOS, Targets: All.

Function: Enables the global exception handler.
Notes: By default the MBS Plugin automatically enables it when you use Cocoa classes.

35.26.5 Events

35.26.6 CaughtException(e as NSExceptionMBS, IsMainThread as boolean)

MBS Main Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: An exception was caught.
Notes: If IsMainThread is true, you can show a dialog/window. But if it's false, you may be in trouble on a worker thread and showing a dialog can cause more trouble.

35.27 class NSExceptionMBS

35.27.1 class NSExceptionMBS

MBS Main Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The Cocoa exception class.
Example:

```
Var m1 as new NSMenuMBS
Var m2 as new NSMenuMBS
Var n as new NSMenuItemMBS

n.CreateMenuItem

m1.addItem n
m2.addItem n // raises an exception as a menuitem can't be in two menus.

Exception e as NSExceptionMBS
MessageBox e.Message

// e.reason: "Item to be inserted into menu already is in another menu"
// e.name: "NSInternalInconsistencyException"
// e.message: "A Cocoa NSInternalInconsistencyException was not handled: Item to be inserted into menu already is in another menu"
```

Notes: The plugin installs exception handling code. If you use the NSExceptionMBS class somewhere in your code, the NSException plugin part will be included and a NSExceptionMBS object will be
Subclass of the RuntimeException class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

35.27.2 Methods

35.27.3 callStackSymbols as string()

MBS Main Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns an array containing the current call symbols.
Notes: This method returns an array of strings describing the call stack backtrace at the moment the exception was first raised. The format of each string is non-negotiable and is determined by the backtrace symbols API. (like BacktraceMBS function)

Available in OS X v10.6 and later. On older versions this array is empty.

35.27.4 Constructor

MBS Main Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The private constructor.

35.27.5 RaiseException(name as string, reason as string, userInfo as dictionary)

MBS Main Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Raises an exception.
Notes: The plugin does not catch it right away here, so this is a way to pass back an exception to the Cocoa frameworks.

35.27.6 Properties

35.27.7 Name as string

MBS Main Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The name of the exception. (Its type)
Notes: (Read only property)

35.27.8 Reason as string

MBS Main Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Reason the exception was raised.
Notes: (Read only property)

35.27.9 UserInfo as Dictionary

MBS Main Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns a Dictionary object containing application-specific data pertaining to the receiver.
Notes: Returns nil if no application-specific data exists. As an example, if a method's return value caused the exception to be raised, the return value might be available to the exception handler through this method. (Read only property)

35.27.10 Constants

Constants

Constant	Value	Description
NSDestinationInvalidException	"NSDestinationInvalidException"	One of the exception names.
NSGenericException	"NSGenericException"	One of the exception names.
NSInternalInconsistencyException	"NSInternalInconsistencyException"	One of the exception names.
NSInvalidArgumentException	"NSInvalidArgumentException"	One of the exception names.
NSInvalidReceivePortException	"NSInvalidReceivePortException"	One of the exception names.
NSInvalidSendPortException	"NSInvalidSendPortException"	One of the exception names.
NSMallocException	"NSMallocException"	One of the exception names.
NSObjectInaccessibleException	"NSObjectInaccessibleException"	One of the exception names.
NSObjectNotAvailableException	"NSObjectNotAvailableException"	One of the exception names.
NSPortReceiveException	"NSPortReceiveException"	One of the exception names.
NSPortSendException	"NSPortSendException"	One of the exception names.
NSPortTimeoutException	"NSPortTimeoutException"	One of the exception names.
NSRangeException	"NSRangeException"	One of the exception names.

35.28 class NSFontDescriptorMBS

35.28.1 class NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: The Cocoa class for a font descriptor.
Example:

```
// find a bold font in the Helvetica family with a font descriptor
Var base As NSFontMBS = NSFontMBS.fontWithName("Helvetica", 24)
If base = Nil Then Return

Var descriptor As NSFontDescriptorMBS = base.fontDescriptor.fontDescriptorWithSymbolicTraits(NSFont-
DescriptorMBS.NSFontBoldTrait)
Var boldFont As NSFontMBS = NSFontMBS.fontWithDescriptor(descriptor, 24.0)

If boldFont <>Nil Then
MessageBox boldFont.fontName
End If
```

Notes: NSFontDescriptor objects provide a mechanism to describe a font with a dictionary of attributes. This font descriptor can be used later to create or modify an NSFont object. Mac OS X v10.4 and later provides a font matching capability, so that you can partially describe a font by creating a font descriptor with, for example, just a family name. You can then find all the available fonts on the system with a matching family name using matchingFontDescriptorsWithMandatoryKeys.

There are several ways to create a new NSFontDescriptor object. You can use the Constructor, fontDescriptorWithFontAttributes or fontDescriptorWithName. to create a font descriptor based on either your custom attributes dictionary or on a specific font's name and size. Alternatively you can use one of the fontDescriptor,Ä¶ instance methods (such as fontDescriptorWithFace) to create a modified version of an existing descriptor. The latter methods are useful if you have an existing descriptor and simply want to change one aspect.

All attributes in the attributes dictionary are optional.

35.28.2 Methods

35.28.3 Constructor(AttributesDic as Dictionary)

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Initializes and returns a new font descriptor with the specified attributes.
Notes: attributes: The attributes for the new font descriptor. If nil, the font descriptor's attribute dictionary will be empty.

35.28.4 copy as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

35.28.5 CTFontDescription as Variant

MBS MacBase Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: Converts a NSFontDescriptorMBS to CTFontDescriptorMBS object.
Example:

```
Var f As NSFontDescriptorMBS

f = NSFontDescriptorMBS.fontDescriptorWithName("Helvetica", 12.0)

Var c As CTFontDescriptorMBS

c = f.CTFontDescription

MessageBox c.Name
```

35.28.6 fontAttributes as Dictionary

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns the receiver's dictionary of attributes.

35.28.7 fontDescriptorByAddingAttributes(AttributesDic as Dictionary) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a new font descriptor that is the same as the receiver but with the specified attributes taking precedence over the existing ones.

35.28.8 fontDescriptorWithCTFontDescriptor(CTFontDescriptor as Variant) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: Converts a CTFontDescriptorMBS to NSFontDescriptorMBS object.
Example:

```
Var c As CTFontDescriptorMBS

c = CTFontDescriptorMBS.CreateWithNameAndSize("Helvetica", 12)

Var f As NSFontDescriptorMBS

f = NSFontDescriptorMBS.fontDescriptorWithCTFontDescriptor(c)

MessageBox f.postscriptName+" "+c.FontSize.ToString
```

Notes: If you pass a CTFontDescriptorMBS, we create a new NSFontDescriptorMBS wrapping the CTFontDescriptor.
If you pass a NSFontDescriptorMBS, we return it to you.
If you pass nil or anything else, we return nil.

35.28.9 fontDescriptorWithFace(newFace as string) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a new font descriptor that is the same as the receiver but with the specified face.
Notes: newFace: The new font face.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

35.28.10 fontDescriptorWithFamily(newFamily as string) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a new font descriptor whose attributes are the same as the receiver but from the specified family.
Example:

```
Var n,f As NSFontDescriptorMBS

f = NSFontDescriptorMBS.fontDescriptorWithName("Helvetica", 12.0)
n = f.fontDescriptorWithFamily("Monaco")

// shows Monaco 12
MessageBox n.postscriptName+" "+n.pointSize.ToString
```

Notes: newFamily: The new font family.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

35.28.11 fontDescriptorWithFontAttributes(AttributesDic as Dictionary) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a font descriptor with a dictionary of attributes.
Example:

```
// ask for monospace font trait
Var traitsAttributes As New Dictionary
traitsAttributes.Value(NSFontDescriptorMBS.NSFontSymbolicTrait) = NSFontDescriptorMBS.NSFontMonoSpaceTrait

// ask for traits
Var fontAttributes As New Dictionary
fontAttributes.Value(NSFontDescriptorMBS.NSFontTraitsAttribute) = traitsAttributes

// now make a font descriptor for this
Var fd As NSFontDescriptorMBS = NSFontDescriptorMBS.fontDescriptorWithFontAttributes(fontAttributes)

// and ask font manager for matching fonts
Var fontManager As New NSFontManagerMBS
Var fonts() As String = fontManager.availableFontNamesMatchingFontDescriptor(fd)
```

// finds e.g. AndaleMono, CourierNewPSMT, CourierNewPS-ItalicMT, CourierNewPS-BoldMT, CourierNewPS-BoldItalicMT,
// FZLTXHB–B51-0, FZLTZHB–B51-0, FZLTTHB–B51-0, Menlo-Regular, Menlo-Italic, Menlo-Bold, Menlo-BoldItalic,
// Monaco, Osaka-Mono, JCsmPC, PTMono-Regular, PTMono-Bold

Notes: attributes: The attributes for the font descriptor. If nil, the font descriptor's dictionary will be empty.

Returns the new font descriptor.

35.28.12 fontDescriptorWithMatrix(matrix as Variant) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a new font descriptor that is the same as the receiver but with the specified matrix.
Notes: matrix: The new font matrix. Must be a NSAffineTransformMBS object.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

35.28.13 fontDescriptorWithName(fontName as string, size as Double) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a font descriptor with the NSFontNameAttribute and NSFontSizeAttribute dictionary attributes set to the given values.
Notes: fontName: The value for NSFontNameAttribute.
size: The value for NSFontSizeAttribute.

Returns the new font descriptor.
Available in Mac OS X v10.3 and later.

35.28.14 fontDescriptorWithNameMatrix(fontName as string, matrix as Variant) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a font descriptor with the NSFontNameAttribute and NSFontMatrixAttribute dictionary attributes set to the given values.

Notes: fontName: The value for NSFontNameAttribute.
matrix: The value for NSFontMatrixAttribute. Must be a NSAffineTransformMBS object or nil!

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

35.28.15 fontDescriptorWithSize(newPointSize as Double) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a new font descriptor that is the same as the receiver but with the specified point size.
Notes: newPointSize: The new point size.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

35.28.16 fontDescriptorWithSymbolicTraits(SymbolicTraits as Integer) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a new font descriptor that is the same as the receiver but with the specified symbolic traits taking precedence over the existing ones.
Example:

```
// get a bold font
Var n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(13)
Var f as NSFontDescriptorMBS = n.fontDescriptor
Var w as Integer = f.symbolicTraits

// find similar font without bold
f = f.fontDescriptorWithSymbolicTraits( BitwiseAnd(w, Bitwise.OnesComplement(f.NSFontBoldTrait)))

// now check it
Var d as Dictionary = f.fontAttributes
w = f.symbolicTraits

if BitwiseAnd(w, f.NSFontBoldTrait) <>0 then
MessageBox "bold"
else
MessageBox "not bold"
end if
```

Notes: symbolicTraits: The new symbolic traits.

Returns the new font descriptor.
Available in Mac OS X v10.4 and later.

35.28.17 matchingFontDescriptorsWithMandatoryKeys as NSFontDescriptorMBS()

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns all the fonts available on the system whose specified attributes match those of the receiver.
Notes: mandatoryKeys: Optional, keys that must be identical to be matched. Can be nil.

Returns the matching font descriptors.

For example, suppose there are two versions of a given font installed that differ in the number of glyphs covered (the new version has more glyphs). If you explicitly specify NSFontNameAttribute as the only mandatory key, then a font descriptor that specifies a font name and character set by default matches both versions, since the character set attribute is not used for matching. If you specify that font name and character set keys are mandatory, the returned array contains only the font that matches both keys.

Available in Mac OS X v10.4 and later.
See also:

- 35.28.18 matchingFontDescriptorsWithMandatoryKeys(mandatoryKeys() as string) as NSFontDescriptorMBS() 6388

35.28.18 matchingFontDescriptorsWithMandatoryKeys(mandatoryKeys() as string) as NSFontDescriptorMBS()

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns all the fonts available on the system whose specified attributes match those of the receiver.
Notes: mandatoryKeys: Optional, keys that must be identical to be matched. Can be nil.

Returns the matching font descriptors.

For example, suppose there are two versions of a given font installed that differ in the number of glyphs covered (the new version has more glyphs). If you explicitly specify NSFontNameAttribute as the only

mandatory key, then a font descriptor that specifies a font name and character set by default matches both versions, since the character set attribute is not used for matching. If you specify that font name and character set keys are mandatory, the returned array contains only the font that matches both keys.

Available in Mac OS X v10.4 and later.
See also:

- 35.28.17 matchingFontDescriptorsWithMandatoryKeys as NSFontDescriptorMBS() 6388

35.28.19 matchingFontDescriptorWithMandatoryKeys as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a normalized font descriptor whose specified attributes match those of the receiver.
Notes: mandatoryKeys: Optional, keys that must be identical to be matched. Can be nil.

Returns the matching font descriptor.
The returned font descriptor is the first element returned from matchingFontDescriptorsWithMandatoryKeys.
See also:

- 35.28.20 matchingFontDescriptorWithMandatoryKeys(mandatoryKeys() as string) as NSFontDescriptorMBS 6389

35.28.20 matchingFontDescriptorWithMandatoryKeys(mandatoryKeys() as string) as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a normalized font descriptor whose specified attributes match those of the receiver.
Notes: mandatoryKeys: Optional, keys that must be identical to be matched. Can be nil.

Returns the matching font descriptor.
The returned font descriptor is the first element returned from matchingFontDescriptorsWithMandatoryKeys.
See also:

- 35.28.19 matchingFontDescriptorWithMandatoryKeys as NSFontDescriptorMBS 6389

35.28.21 matrix as Variant

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns the current transform matrix of the receiver.
Notes: Must be a NSAffineTransformMBS object or nil!

35.28.22 NSFontCascadeListAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: An array with sub-descriptors.
The default value is the system default cascading list for user's locale.
Available in Mac OS X v10.4 and later.

35.28.23 NSFontCharacterSetAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: An NSCharacterSetMBS instance that represents the set of Unicode characters covered by the font.
The default value is supplied by the font.
Available in Mac OS X v10.4 and later.

35.28.24 NSFontColorAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: An optional memoryblock that specifies the font color.
(Deprecated. Use NSForegroundColorAttributeName instead.)
Available in Mac OS X v10.3 and later.
Deprecated in Mac OS X v10.4.

35.28.25 NSFontFaceAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: An optional string that specifies the font face.

35.28.26 NSFontFamilyAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: An optional string that specifies the font family.

35.28.27 NSFontFeatureSelectorIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the keys for font descriptor attributes.
Notes: A number specifying a font feature selector such as common ligature off, traditional character shape, and so on. See "Font Features" in ATSUI Programming Guide for predefined feature selectors.
Available in Mac OS X v10.5 and later.

35.28.28 NSFontFeatureTypeIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the keys for font descriptor attributes.
Notes: A number specifying a font feature type such as ligature, character shape, and so on. See "Font Features" in ATSUI Programming Guide for predefined feature types.
Available in Mac OS X v10.5 and later.

35.28.29 NSFontFixedAdvanceAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: A number containing a float value that overrides the glyph advancement specified by the font.
The default value is 0.0.

35.28.30 NSFontMatrixAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: An NSAffineTransformMBS instance that specifies the font's transformation matrix.
The default value is the identity matrix.
Available in Mac OS X v10.4 and later.

35.28.31 NSFontNameAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: An optional string that specifies the font name.

35.28.32 NSFontSizeAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: An optional string, containing a float value, that specifies the font size.

35.28.33 NSFontSlantTrait as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the keys to retrieve information about a font descriptor from its trait dictionary.
Notes: The relative slant angle value as a number.
The valid value range is from -1.0 to 1.0. The value of 0.0 corresponds to 0 degree clockwise rotation from the vertical and 1.0 corresponds to 30 degrees clockwise rotation.
Available in Mac OS X v10.4 and later.

35.28.34 NSFontSymbolicTrait as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the keys to retrieve information about a font descriptor from its trait dictionary.
Notes: The symbolic traits value as a number.
Available in Mac OS X v10.4 and later.

35.28.35 NSFontTraitsAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: A Dictionary instance instance fully describing font traits.
The default value is supplied by the font. See ”Font traits dictionary keys” for dictionary keys.
Available in Mac OS X v10.4 and later.

35.28.36 NSFontVariationAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: A dictionary instance that describes the font's variation axis.
The default value is supplied by the font. See "Font variation axis dictionary keys" for dictionary keys.
Available in Mac OS X v10.4 and later.

35.28.37 NSFontVariationAxisDefaultValueKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the keys to retrieve information about a font descriptor from its variation axis dictionary.
Notes: The default axis value as a number.
Available in Mac OS X v10.4 and later.

35.28.38 NSFontVariationAxisIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the keys to retrieve information about a font descriptor from its variation axis dictionary.
Notes: The axis identifier value as a number.
Available in Mac OS X v10.4 and later.

35.28.39 NSFontVariationAxisMaximumValueKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the keys to retrieve information about a font descriptor from its variation axis dictionary.
Notes: The maximum axis value as a number.
Available in Mac OS X v10.4 and later.

35.28.40 NSFontVariationAxisMinimumValueKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the keys to retrieve information about a font descriptor from its variation axis dictionary.
Notes: The minimum axis value as a number.
Available in Mac OS X v10.4 and later.

35.28.41 NSFontVariationAxisNameKey as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the keys to retrieve information about a font descriptor from its variation axis dictionary.
Notes: The localized variation axis name.
Available in Mac OS X v10.4 and later.

35.28.42 NSFontVisibleNameAttribute as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the attribute keys.
Notes: An optional string that specifies the font's visible name.

35.28.43 NSFontWeightTrait as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the keys to retrieve information about a font descriptor from its trait dictionary.
Notes: The normalized weight value as a number.
The valid value range is from -1.0 to 1.0. The value of 0.0 corresponds to the regular or medium font weight.
Available in Mac OS X v10.4 and later.

35.28.44 NSFontWidthTrait as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: One of the keys to retrieve information about a font descriptor from its trait dictionary.
Notes: The relative inter-glyph spacing value as a number.
The valid value range is from -1.0 to 1.0. The value of 0.0 corresponds to the regular glyph spacing.
Available in Mac OS X v10.4 and later.

35.28.45 pointSize as Double

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns the point size of the receiver.
Example:

```
Var f as NSFontMBS = NSFontMBS.fontWithName("Arial", 12)
Var d as NSFontDescriptorMBS = f.fontDescriptor
```

```
MessageBox str(d.pointSize)
```

35.28.46 postscriptName as string

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns the PostScript name of the receiver.
Example:

```
Var f as NSFontMBS = NSFontMBS.fontWithName("Arial", 12)
Var d as NSFontDescriptorMBS = f.fontDescriptor
MessageBox d.postscriptName
```

35.28.47 symbolicTraits as Integer

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a bit mask that describes the traits of the receiver.
Example:

```
Var n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(13)
Var f as NSFontDescriptorMBS = n.fontDescriptor
Var w as Integer = f.symbolicTraits

if BitwiseAnd(w, f.NSFontBoldTrait) <>0 then
MessageBox "bold"
else
MessageBox "not bold"
end if
```

Notes: Typeface information is specified by the lower 16 bits of system trait value.

The font family class constants classify certain stylistic qualities of the font. These values correspond closely to the font class values in the OpenType OS/2 table. The class values are bundled in the upper four bits of the NSFontSymbolicTraits and can be accessed via NSFontFamilyClassMask. For more information about the specific meaning of each identifier, refer to the OpenType specification.

35.28.48 variantForKey(key as string) as Variant

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns the font attribute specified by the given key.

35.28.49 Properties

35.28.50 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: The internal reference.
Notes: (Read and Write property)

35.28.51 Constants

Constants

Constant	Value	Description
NSFontFamilyClassMask	&hF0000000	The font family class mask used to access NSFontFamilyClass values. Available in Mac OS X v10.4 and later. This constant is used to access NSFontFamilyClass values in the upper four bits of NSFontSymbolicTraits.

Typeface Constants

Constant	Value	Description
NSFontBoldTrait	2	The font's typestyle is boldface. Available in Mac OS X v10.4 and later.
NSFontCondensedTrait	64	The font's typestyle is condensed. Expanded and condensed traits are mutually exclusive. Available in Mac OS X v10.4 and later.
NSFontExpandedTrait	32	The font's typestyle is expanded. Expanded and condensed traits are mutually exclusive. Available in Mac OS X v10.4 and later.
NSFontItalicTrait	1	The font's typestyle is italic. Available in Mac OS X v10.4 and later.
NSFontMonoSpaceTrait	1024	The font uses fixed-pitch glyphs if available. The font may have multiple glyph advances (many CJK glyphs contain two spaces). Available in Mac OS X v10.4 and later.
NSFontUIOptimizedTrait	4096	The font synthesizes appropriate attributes for user interface rendering, such as control titles, if necessary. Available in Mac OS X v10.4 and later.
NSFontVerticalTrait	2048	The font uses vertical glyph variants and metrics. Available in Mac OS X v10.4 and later.

Font Family Class Constants

Constant	Value	Description
NSFontClarendonSerifsClass	&h40000000	The font's style is a variation of the Oldstyle Serifs and the Transitional S Available in Mac OS X v10.4 and later.
NSFontFreeformSerifsClass	&h70000000	The font's style includes serifs, but it expresses a design freedom that doe generally fit within the other serif design classifications. Available in Mac OS X v10.4 and later.
NSFontModernSerifsClass	&h30000000	The font's style is based on the Latin printing style of the 20th century. Available in Mac OS X v10.4 and later.
NSFontOldStyleSerifsClass	&h10000000	The font's style is based on the Latin printing style of the 15th to 17th cen Available in Mac OS X v10.4 and later.
NSFontOrnamentalsClass	&h90000000	The font's style includes highly decorated or stylized character shapes su those typically used in headlines. Available in Mac OS X v10.4 and later.
NSFontSansSerifClass	&h80000000	The font's style includes most basic letter forms (excluding Scripts and O mentals) that do not have serifs on the strokes. Available in Mac OS X v10.4 and later.
NSFontScriptsClass	&hA0000000	The font's style is among those typefaces designed to simulate handwritin Available in Mac OS X v10.4 and later.
NSFontSlabSerifsClass	&h50000000	The font's style is characterized by serifs with a square transition betwee strokes and the serifs (no brackets). Available in Mac OS X v10.4 and later.
NSFontSymbolicClass	&hC0000000	The font's style is generally design independent, making it suitable for sp characters (icons, dingbats, technical symbols, and so on) that may be equally well with any font. Available in Mac OS X v10.4 and later.
NSFontTransitionalSerifsClass	&h20000000	The font's style is based on the Latin printing style of the 18th to 19th cen Available in Mac OS X v10.4 and later.
NSFontUnknownClass	0	The font has no design classification. Available in Mac OS X v10.4 and later.

35.29 class NSFontManagerMBS

35.29.1 class NSFontManagerMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: NSFontManager is the center of activity for the font conversion system.
Example:

```
// pick some font
Var n1 as NSFontMBS = nsfontmbs.fontWithName("Book Antiqua bold", 12)
Var fm as new NSFontManagerMBS

// remove all font traits
Var n2 as NSFontMBS = fm.convertFontToNotHaveTrait(n1, fm.traitsOfFont(n1))

// show name of base font
MessageBox n2.fontName
```

Notes: It records the currently selected font, updates the Font panel and Font menu to reflect the selected font, initiates font changes, and converts fonts in response to requests from text-bearing objects. In a more prosaic role, NSFontManager can be queried for the fonts available to the application and for the particular attributes of a font, such as whether it's condensed or extended.

As of Mac OS X version 10.3, font collections are managed by NSFontManager.

35.29.2 Methods

35.29.3 addCollection(collectionName as String, Options as Integer = 0) as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: Desktop only.

Function: Adds a specified font collection to the font manager with a given set of options.
Notes: collectionName: The collection to add.
Options: Pass NSFontCollectionApplicationOnlyMask to make the collection available only to the application.
Return true if the font collection was successfully added; otherwise, false.

35.29.4 addFontDescriptorsToCollection(descriptors() as NSFontDescriptorMBS, collectionName as String)

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: Desktop only.

Function: Adds an array of font descriptors to the specified font collection.
Example:

```
Var fontManager as NSFontManagerMBS = NSFontManagerMBS.sharedFontManager

Var collectionNames() as string = fontManager.collectionNames
Var collectionName as string = collectionNames(collectionNames.LastIndex) // get last one

Var fonts() as NSFontDescriptorMBS = fontManager.fontDescriptorsInCollection(collectionName)

// add Helvetica to this collection

Var font as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 12)
Var fontDescriptor as NSFontDescriptorMBS = font.fontDescriptor

fontManager.addFontDescriptorsToCollection(array(fontDescriptor), collectionName)

Var fonts2() as NSFontDescriptorMBS = fontManager.fontDescriptorsInCollection(collectionName)

// fonts2 should have one more entry than fonts
Break
```

Notes: descriptors: The font descriptors to add.
collectionName: The font collection to which descriptors are added.

35.29.5 availableFontFamilies as string()

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the names of the font families available in the system.
Example:

```
Var n as new NSFontManagerMBS
Var names() as string = n.availableFontFamilies
```

MessageBox Join(names,EndOfLine)

Notes: These fonts are in various system font directories.

35.29.6 availableFontNamesMatchingFontDescriptor(descriptor as NSFontDescriptorMBS) as String()

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: Desktop only.

Function: Returns the names of the fonts that match the attributes in the given font descriptor.
Example:

```
// ask for monospace font trait
Var traitsAttributes As New Dictionary
traitsAttributes.Value(NSFontDescriptorMBS.NSFontSymbolicTrait) = NSFontDescriptorMBS.NSFontMonoSpaceTrait

// ask for traits
Var fontAttributes As New Dictionary
fontAttributes.Value(NSFontDescriptorMBS.NSFontTraitsAttribute) = traitsAttributes

// now make a font descriptor for this
Var fd As NSFontDescriptorMBS = NSFontDescriptorMBS.fontDescriptorWithFontAttributes(fontAttributes)

// and ask font manager for matching fonts
Var fontManager As New NSFontManagerMBS
Var fonts() As String = fontManager.availableFontNamesMatchingFontDescriptor(fd)

// finds e.g. AndaleMono, CourierNewPSMT, CourierNewPS-ItalicMT, CourierNewPS-BoldMT, CourierNewPS-BoldItalicMT,
// FZLTXHB–B51-0, FZLTZHB–B51-0, FZLTTHB–B51-0, Menlo-Regular, Menlo-Italic, Menlo-Bold, Menlo-BoldItalic,
// Monaco, Osaka-Mono, JCsmPC, PTMono-Regular, PTMono-Bold
```

35.29.7 availableFontNamesWithTraits(traits as Integer) as string()

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Returns the names of the fonts available in the system whose traits are described exactly by the given font trait mask (not the NSFont objects themselves).
Example:

```
Var n as new NSFontManagerMBS
Var names() as string = n.availableFontNamesWithTraits(n.NSBoldFontMask)
```

MessageBox str(names.Count)+" fonts: "+Join(names,", ")

Notes: traits: The font traits for which to return font names. You specify the desired traits by combining the font trait mask values described in Constants using the bitwiseor operator.

Returns the names of the corresponding fonts.

These fonts are in various system font directories.

If fontTraitMask is 0, this method returns all fonts that are neither italic nor bold. This result is the same one you'd get if fontTraitMask were NSUnitalicFontMask | NSUnboldFontMask.

35.29.8 availableFonts as string()

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the names of the fonts available in the system (not the NSFont objects themselves).
Example:

```
Var n as new NSFontManagerMBS
Var names() as string = n.availableFonts

MessageBox Join(names,EndOfLine)
```

Notes: These fonts are in various system font directories.

35.29.9 availableMembersOfFontFamily(FontFamily as string) as Variant()

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns an array with one entry for each available member of a font family.
Example:

```
Var n as new NSFontManagerMBS
Var members() as Variant = n.availableMembersOfFontFamily("Times")

for each m as Variant in members
Var member() as Variant = m

MessageBox "Postscript name: "+member(0)+EndOfLine+"Suffix: "+member(1)+EndOfLine+"Font weight:
"+member(2)+EndOfLine+"Font trait: "+member(3)
```

next

Notes: family: The name of a font family, like one that availableFontFamilies returns.

Returns the available members of family.

Each entry of the returned variant array is another variant array with four members, as follows:

0. The PostScript font name, as a string.
1. The part of the font name used in the font panel that's not the font name, as a string. This value is not localized—for example, "Roman", "Italic", or "Bold".
2. The font's weight, as a double.
3. The font's traits, as a double.

The members of the family are arranged in the font panel order (narrowest to widest, lightest to boldest, plain to italic).

35.29.10 collectionNames as string()

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the names of the currently loaded font collections.
Example:

```
Var n as new NSFontManagerMBS
Var names() as string = n.collectionNames

MessageBox Join(names,EndOfLine)
```

Notes: The names of the current font collections.

35.29.11 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Initializes the object with the shared instance of the font manager for the application, creating it if necessary.

35.29.12 convertAttributes(dic as dictionary) as dictionary

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Converts attributes in response to an object initiating an attribute change, typically the Font panel or Font menu.

35.29.13 convertFont(font as NSFontMBS) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Converts the given font according to the object that initiated a font change, typically the Font panel or Font menu.

35.29.14 convertFontToFace(font as NSFontMBS, face as string) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Returns a font whose traits are as similar as possible to those of the given font except for the typeface, which is changed to the given typeface.
Example:

```
Var fontManager as new NSFontManagerMBS
// you have a font
Var font as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 12)

// change font face
font = fontManager.convertFontToFace(font, "Helvetica-BoldOblique")

MessageBox font.fontName // shows Helvetica-BoldOblique
```

Notes: Font: The font whose traits are matched.
face: The new typeface; a fully specified family-face name, such as Helvetica-BoldOblique or Times-Roman.

Returns a font with matching traits and the given typeface, or aFont if it can't be converted.

This method attempts to match the weight and posture of aFont as closely as possible. Italic is mapped to Oblique, for example. Weights are mapped based on an approximate numeric scale of 0 to 15.

35.29.15 convertFontToFamily(font as NSFontMBS, family as string) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Returns a font whose traits are as similar as possible to those of the given font except for the font family, which is changed to the given family.
Example:

```
Var fontManager as new NSFontManagerMBS
// you have a font
Var font as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 12)

// change font family
font = fontManager.convertFontToFamily(font, "Arial")

MessageBox font.fontName // shows ArialMT
```

Notes: Font: The font whose traits are matched.
family: The new font famliy; a generic font name, such as Helvetica or Times.

Returns a font with matching traits and the given family, or aFont if it can't be converted.

This method attempts to match the weight and posture of aFont as closely as possible. Italic is mapped to Oblique, for example. Weights are mapped based on an approximate numeric scale of 0 to 15.

35.29.16 convertFontToHaveTrait(font as NSFontMBS, trait as Integer) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Returns a font whose traits are the same as those of the given font, except that the traits are changed to include the single specified trait.
Example:

```
Var n as new NSFontManagerMBS
Var f as NSFontMBS = NSFontMBS.fontWithName("Times", 12.0)
Var g as NSFontMBS = n.convertFontToHaveTrait(f, n.NSBoldFontMask)

MessageBox g.fontName // Times-Bold
```

Notes: Font: The font whose traits are matched.
Trait: The new trait; may be any one of the traits described in Constants. Using NSUnboldFontMask or NSUnitalicFontMask removes the bold or italic trait, respectively.

Returns a font with matching traits including the given trait, or font if it can't be converted.
Using NSUnboldFontMask or NSUnitalicFontMask removes the bold or italic trait, respectively.

35.29.17 convertFontToNotHaveTrait(font as NSFontMBS, trait as Integer) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Returns an NSFont object with the same traits as the given font, except for the traits in the given font trait mask, which are removed.
Example:

```
Var n as new NSFontManagerMBS
Var f as NSFontMBS = NSFontMBS.fontWithName("Times-Bold", 12.0)
Var g as NSFontMBS = n.convertFontToHaveTrait(f, n.NSUnBoldFontMask)

MessageBox g.fontName // Times-Roman
```

Notes: Font: The font whose traits are matched.
trait: The mask for the traits to remove, created using the bitwiseOr operator to combine the traits described in Constants. Using NSUnboldFontMask or NSUnitalicFontMask removes the bold or italic trait, respectively.
Returns a font with matching traits minus the given traits, or font if it can't be converted.

35.29.18 convertFontToSize(font as NSFontMBS, size as Double) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Returns an NSFont object whose traits are the same as those of the given font, except for the size, which is changed to the given size.
Example:

```
Var fontManager as new NSFontManagerMBS
// you have a font
Var font as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 12)

// change font size
font = fontManager.convertFontToSize(font, 20)

MessageBox str(font.pointSize)
```

Notes: Font: The font whose traits are matched.
size: The new font size.

Returns a font with matching traits except in the new size, or aFont if it can't be converted.

35.29.19 convertFontTraits(traits as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Converts font traits to a new traits mask value.
Notes: traits: The current font traits.

Returns the new traits mask value to be used by convertFont:.

This method is intended to be invoked to query the font traits while the action message (usually changeFont:) is being invoked when the current font action is either NSAddTraitFontAction or NSRemoveTraitFontAction.

Available in Mac OS X v10.5 and later.

35.29.20 convertWeightOfFont(font as NSFontMBS, up as boolean) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Returns an NSFont object whose weight is greater or lesser than that of the given font, if possible.
Example:

```
Var n as new NSFontManagerMBS
Var f as NSFontMBS = NSFontMBS.fontWithName("Times", 12.0)
Var g as NSFontMBS = n.convertWeightOfFont(f, true)

MessageBox g.fontName // Times-Bold
```

Notes: up: If true, a heavier font is returned; if it's false, a lighter font is returned.
Font: The font whose weight is increased or decreased.

Returns a font with matching traits except for the new weight, or font if it can't be converted.

35.29.21 fontDescriptorsInCollection(collectionName as String) as NSFontDescriptorMBS()

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: Desktop only.

Function: Returns an array of the font descriptors in the collection specified by the given collection name.

Example:

```
Var fontManager as NSFontManagerMBS = NSFontManagerMBS.sharedFontManager
Var collectionNames() as string = fontManager.collectionNames
Var collectionName as string = collectionNames(collectionNames.LastIndex) // get last one
Var fonts() as NSFontDescriptorMBS = fontManager.fontDescriptorsInCollection(collectionName)
Break
```

35.29.22 fontHasTraits(fontName as string, Traits as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the given font has all the specified traits.
Example:

```
Var n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(12)
Var m as new NSFontManagerMBS

Var isBold as Boolean = m.fontHasTraits(n.fontName, m.NSBoldFontMask)
Var isItalic as Boolean = m.fontHasTraits(n.fontName, m.NSItalicFontMask)

MessageBox "is bold: "+str(isBold)+_
EndOfLine+"is italic: "+str(isItalic)
```

Notes: typeface: The name of the font.
fontTraitMask: The font traits to test, specified by combining the font trait mask values described in Constants using the bitwiseOR operation.

Returns true if the font named typeface has all the traits specified in fontTraitMask; false if it doesn't.

Using NSUnboldFontMask returns true if the font is not bold, false otherwise. Using NSUnitalicFontMask returns true if the font is not italic, false otherwise.

35.29.23 isMultiple as boolean

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the last font selection recorded has multiple fonts.
Notes: Returns true if the last font selection recorded has multiple fonts; false if it's a single font.

35.29.24 orderFrontFontPanel

MBS MacCocoa Plugin, Plugin Version: 16.4, Platform: macOS, Targets: Desktop only.

Function: This action method opens the Font panel by sending it an orderFront message, creating the Font panel if necessary.

35.29.25 orderFrontStylesPanel

MBS MacCocoa Plugin, Plugin Version: 16.4, Platform: macOS, Targets: Desktop only.

Function: This action method opens the Font styles panel.

35.29.26 removeCollection(collectionName as String) as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: Desktop only.

Function: Removes the specified font collection.
Notes: Returns true on success and false on failure.

35.29.27 removeFontDescriptorFromCollection(descriptor as NSFontDescriptorMBS, collectionName as String)

MBS MacCocoa Plugin, Plugin Version: 17.3, Platform: macOS, Targets: Desktop only.

Function: Removes the specified font descriptor from the specified collection.
Notes: descriptor: The font descriptor to remove.
collection: The font collection from which to remove the descriptor.

35.29.28 selectedFont as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Returns the last font recorded.

35.29.29 setSelectedAttributes(dic as dictionary, isMultiple as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Informs the paragraph and character formatting panels when text in a selection has changed attributes.
Notes: dic: The new attributes.
isMultiple: If true, informs the panel that multiple fonts or attributes are enclosed within the selection.

This method is used primarily by NSTextView.
Available in Mac OS X v10.3 and later.

35.29.30 setSelectedFont(font as NSFontMBS, isMultiple as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Records the given font as the currently selected font and updates the Font panel to reflect this.
Notes: font: The font to set as selected.
isMultiple: If true, the Font panel indicates that more than one font is contained in the selection; if false, it does not.

An object that manipulates fonts should invoke this method whenever it becomes first responder and whenever its selection changes. It shouldn't invoke this method in the process of handling a changeFont message, as this causes the font manager to lose the information necessary to effect the change. After all fonts have been converted, the font manager itself records the new selected font.

35.29.31 sharedFontManager as NSFontManagerMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Returns the shared instance of the font manager for the application, creating it if necessary.

35.29.32 traitsOfFont(font as NSFontMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Returns the traits of the given font.
Example:

```
Var n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(12)
Var m as new NSFontManagerMBS

// shows 2 which is m.NSBoldFontMask
MessageBox str(m.traitsOfFont(n))
```

Notes: Font: The font whose traits are returned.
Returns the font traits, returned as a mask created by combining values listed in Constants with the bitwiseOR operation.

35.29.33 weightOfFont(font as NSFontMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Returns a rough numeric measure the weight of the given font.
Example:

```
Var n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(12)
Var m as new NSFontManagerMBS

MessageBox str(m.weightOfFont(n))
```

Notes: Font: The font whose weight is returned.

A rough numeric measure the weight of the given font, where 0 indicates the lightest possible weight, 5 indicates a normal or book weight, and 9 or more indicates a bold or heavier weight.

35.29.34 Properties

35.29.35 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

35.29.36 Enabled as boolean

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Whether the font conversion system's user interface items (the Font panel and Font menu items) are enabled.
Notes: True if the font conversion system's user interface items (the Font panel and Font menu items) are enabled; false if they're not.
(Read and Write computed property)

35.29.37 Constants

Constants

Constant	Value	Description
NSAddTraitFontAction	2	One of the constants for use with modifyFont method. Converts the font to have an additional trait using convertFontto
NSBoldFontMask	2	One of the constants for use with mask of traits assigned to a fo A mask that specifies a bold font.
NSCompressedFontMask	&h00000200	One of the constants for use with mask of traits assigned to a fo A mask that specifies a compressed font.
NSCondensedFontMask	&h00000040	One of the constants for use with mask of traits assigned to a fo A mask that specifies a condensed font.
NSExpandedFontMask	&h00000020	One of the constants for use with mask of traits assigned to a fo A mask that specifies an expanded font.
NSFixedPitchFontMask	&h00000400	One of the constants for use with mask of traits assigned to a fo A mask that specifies a fixed pitch font.
NSFontCollectionApplicationOnlyMask	1	One of the constants for options accepted by addCollection. akes the collection available only to the application. This opti implemented.
NSHeavierFontAction	5	One of the constants for use with modifyFont method. Converts the font to a heavier weight using convertWeightofFont
NSItalicFontMask	1	One of the constants for use with mask of traits assigned to a fo A mask that specifies an italic font.
NSLighterFontAction	6	One of the constants for use with modifyFont method. Converts the font to a lighter weight using convertWeightofFont.
NSNarrowFontMask	&h00000010	One of the constants for use with mask of traits assigned to a fo A mask that specifies a narrow font.
NSNoFontChangeAction	0	One of the constants for use with modifyFont method. No action; the font is returned unchanged.
NSNonStandardCharacterSetFontMask	8	One of the constants for use with mask of traits assigned to a fo A mask that specifies a font that uses a non-standard character
NSPosterFontMask	&h00000100	One of the constants for use with mask of traits assigned to a fo A mask that specifies a poster-style font.
NSRemoveTraitFontAction	7	One of the constants for use with modifyFont method. Converts the font to remove a trait using convertFonttoNotHave
NSSizeDownFontAction	4	One of the constants for use with modifyFont method. Converts the font to a smaller size using convertFonttoSize.
NSSizeUpFontAction	3	One of the constants for use with modifyFont method. Converts the font to a larger size using convertFonttoSize.
NSSmallCapsFontMask	&h00000080	One of the constants for use with mask of traits assigned to a fo A mask that specifies a small-caps font.
NSUnboldFontMask	4	One of the constants for use with mask of traits assigned to a fo A mask that specifies a font that is not bold.
NSUnitalicFontMask	&h01000000	One of the constants for use with mask of traits assigned to a fo A mask that specifies a font that is not italic.
NSViaPanelFontAction	1	One of the constants for use with modifyFont method. Converts the font according to the NSFontPanel method panelC

35.30 class NSFontMBS

35.30.1 class NSFontMBS

MBS MacBase Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: A class for a font in the Cocoa world.
Example:

```
// get some fonts and show their names and sizes
Var lines() As String

Var system As NSFontMBS = NSFontMBS.systemFontOfSize(NSFontMBS.systemFontSize)
lines.Add "System: " + system.displayName + " " + system.pointSize.ToString

Var bold As NSFontMBS = NSFontMBS.boldSystemFontOfSize(14)
lines.Add "Bold: " + bold.fontName

Var helvetica As NSFontMBS = NSFontMBS.fontWithName("Helvetica", 18)
If helvetica <>Nil Then
lines.Add "Family: " + helvetica.familyName
End If

MessageBox String.FromArray(lines, EndOfLine)
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

35.30.2 Methods

35.30.3 advancementForGlyph(aGlyph as Integer) as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the nominal spacing for the given glyph—the distance the current point moves after showing the glyph—accounting for the receiver's size.
Notes: This spacing is given according to the glyph's movement direction, which is either strictly horizontal or strictly vertical.

35.30.4 boldSystemFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: All.

Function: Returns the Aqua system font used for standard interface items that are rendered in boldface type in the specified size.
Example:

```
Var n as NSFontMBS = NSFontMBS.boldSystemFontOfSize(12)

MessageBox n.description
// shows: "LucidaGrande-Bold 12.00 pt. P [ ] (0x1c082c0) fobj=0x1c09d30, spc=3.96"
```

Notes: If fontSize is 0 or negative, returns the boldface system font at the default size.

35.30.5 boundingRectForGlyph(aGlyph as Integer) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bounding rectangle for the specified glyph, scaled to the receiver's size.
Notes: Japanese fonts encoded with the scheme "EUC12-NJE-CFEncoding" do not have individual metrics or bounding boxes available for the glyphs above 127. For those glyphs, this method returns the bounding rectangle for the font instead.

35.30.6 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

35.30.7 controlContentFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the font used for the content of controls in the specified size.
Example:

```
Var n as NSFontMBS = NSFontMBS.controlContentFontOfSize(12)

MessageBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x16017750) fobj=0x160175c0, spc=3.80"
```

Notes: For example, in a table, the user's input uses the control content font, and the table's header uses another font. If fontSize is 0 or negative, returns the control content font at the default size.

35.30.8 file as folderitem

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the folderitem for this font.
Notes: One file may give several font faces.

35.30.9 fontDescriptor as NSFontDescriptorMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns the receiver's font descriptor.
Notes: A font descriptor object that describes the receiver.

The font descriptor contains a mutable dictionary of optional attributes for creating an NSFont object. See documentation on NSFontDescriptor for more information.

35.30.10 fontWithDescriptor(fontDescriptor as NSFontDescriptorMBS, fontSize as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a font object for the specified font descriptor and font size.

Notes: fontDescriptor: A font descriptor object.
fontSize: The size in points to which the font is scaled.

Returns a font object for the specified descriptor and size.

In most cases, you can simply use fontWithName to create standard scaled fonts.
Available in Mac OS X v10.4 and later.
See also:

- 35.30.11 fontWithDescriptor(fontDescriptor as NSFontDescriptorMBS, TextTransform as Variant) as NSFontMBS 6416

35.30.11 fontWithDescriptor(fontDescriptor as NSFontDescriptorMBS, TextTransform as Variant) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a font object for the specified font descriptor and text transform.
Notes: fontDescriptor: The font descriptor object describing the font to return.
textTransform: An affine transformation applied to the font. Must be a NSAffineTransformMBS object or nil!

Returns a font object for the specified name and transform.

In most cases, you can simply use fontWithName to create standard scaled fonts. If textTransform is non-nil, it has precedence over NSFontMatrixAttribute in fontDescriptor.

Available in Mac OS X v10.4 and later.
See also:

- 35.30.10 fontWithDescriptor(fontDescriptor as NSFontDescriptorMBS, fontSize as Double) as NSFontMBS 6415

35.30.12 fontWithName(fontName as string, fontSize as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: All.

Function: Creates a font object for the specified font name and font size.
Example:

```
Var n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)

MessageBox n.description
// shows: "Monaco 12.00 pt. P [ ] (0x1805020) fobj=0x168114b0, spc=7.20"
```

Notes: The fontName is a fully specified family-face name, such as Helvetica-BoldOblique or Times-Roman. The fontSize is equivalent to using a font matrix of [fontSize 0 0 fontSize 0 0] . If you use a fontSize of 0.0, this method uses the default User Font size.

Fonts created with this method automatically flip themselves in flipped views. This method is the preferred means for creating fonts.

35.30.13 glyphWithName(name as string) as UInt32

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the named encoded glyph, or –1 if the receiver contains no such glyph.
Notes: Returns –1 if the glyph named glyphName isn't encoded.
Glyph names in fonts do not always accurately identify the glyph. If possible, look up the appropriate glyph on your own.

35.30.14 labelFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the Aqua font used for standard interface labels in the specified size.
Example:

```
Var n as NSFontMBS = NSFontMBS.labelFontOfSize(12)

MessageBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1829350) fobj=0x18293f0, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns the label font with the default size.

35.30.15 labelFontSize as Double

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: All.

Function: Returns the size of the standard label font.
Example:

```
MessageBox str(NSFontMBS.labelFontSize) // shows 10
```

35.30.16 menuBarFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the font used for menu bar items, in the specified size.
Example:

```
Var n as NSFontMBS = NSFontMBS.menuBarFontOfSize(12)

MessageBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x17e00c00) fobj=0x17e00ca0, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns the menu bar font with the default size.
Available in Mac OS X v10.3 and later.

35.30.17 menuFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the font used for menu items, in the specified size.
Example:

```
Var n as NSFontMBS = NSFontMBS.menuFontOfSize(12)

MessageBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1da6d80) fobj=0x1da6e20, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns the menu items font with the default size.

35.30.18 messageFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the font used for standard interface items, such as button labels, menu items, and so on, in the specified size.
Example:

```
Var n as NSFontMBS = NSFontMBS.messageFontOfSize(12)

MessageBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1c11520) fobj=0x1c11790, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns this font at the default size. This method is equivalent to systemFontOfSize().

35.30.19 monospacedDigitSystemFontOfSize(fontSize as double, weight as double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 22.4, Platform: macOS, Targets: All.

Function: Returns a version of the standard system font that contains monospaced digit glyphs.
Notes: fontSize: The desired font size specified in points. If you specify 0.0 or a negative number for this parameter, the method returns the system font at the default size.
weight: The desired weight of font lines, specified as one of the constants in NSFontWeight.

Returns a font object containing the system font with monospace digits at the specified size and weight.

The font returned by this method has monospaced digit glyphs. Glyphs for other characters and symbols may be wider or narrower than the monospaced characters. To ensure the font uses fixed spacing for all characters, apply the NSFontFixedAdvanceAttribute attribute to the any strings you render.

35.30.20 monospacedSystemFontOfSize(fontSize as double, weight as double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 22.4, Platform: macOS, Targets: All.

Function: Returns a monospace version of the system font with the specified size and weight.
Notes: fontSize: The desired font size specified in points. If you specify 0.0 or a negative number for this parameter, the method returns the system font at the default size.
weight: The desired weight of font lines, specified as one of the constants in NSFontWeight.

Returns a font object containing a monospace version of the system font at the specified size and weight.

Use the returned font for interface items that require monospaced glyphs. The returned font includes monospaced glyphs for the Latin characters and the symbols commonly found in source code. Glyphs for other symbols are usually wider or narrower than the monospaced characters. To ensure the font uses fixed spacing for all characters, apply the NSFontFixedAdvanceAttribute attribute to the any strings you render.

35.30.21 paletteFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the font used for palette window title bars, in the specified size.
Example:

```
Var n as NSFontMBS = NSFontMBS.paletteFontOfSize(12)

MessageBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x18800c00) fobj=0x18800ca0, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns the palette title font at the default size.

35.30.22 screenFontWithRenderingMode(renderingMode as Integer) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a bitmapped screen font, when sent to a font object representing a scalable PostScript font, with the specified rendering mode, matching the receiver in typeface and matrix (or size), or nil if such a font can't be found.
Notes: For valid rendering modes, see NSFontRenderingMode.
Screen fonts are for direct use with the window server only. Never use them with Application Kit objects, such as in setFont: methods. Internally, the Application Kit automatically uses the corresponding screen font for a font object as long as the view is not rotated or scaled.
Available in Mac OS X v10.4 and later.

35.30.23 setUserFixedPitchFont(font as NSFontMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the font used by default for documents and other text under the user's control, when that font should be fixed-pitch, to the specified font.
Notes: Specifying font as nil causes the default to be removed from the application domain.

35.30.24 setUserFont(font as NSFontMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the font used by default for documents and other text under the user's control to the specified font.
Notes: Specifying font as nil causes the default to be removed from the application domain.

35.30.25 smallSystemFontSize as Double

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: All.

Function: Returns the size of the standard small system font.
Example:

```
MessageBox str(NSFontMBS.smallSystemFontSize) // shows 11
```

35.30.26 systemFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: All.

Function: Returns the Aqua system font used for standard interface items, such as button labels, menu items, and so on, in the specified size.
Example:

```
Var n as NSFontMBS = NSFontMBS.systemFontOfSize(12)

MessageBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x17e009d0) fobj=0x17e00ca0, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns the system font at the default size.

35.30.27 systemFontSize as Double

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: All.

Function: Returns the size of the standard system font.
Example:

```
MessageBox str(NSFontMBS.systemFontSize) // shows 13
```

35.30.28 systemFontSizeForControlSize(controlSize as Integer) as Double

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the font size used for the specified control size.
Example:

```
MessageBox str(NSFontMBS.systemFontSizeForControlSize(0)) // 13
MessageBox str(NSFontMBS.systemFontSizeForControlSize(1)) // 11
```

Notes: If controlSize does not correspond to a valid NSControlSize, returns the size of the standard system font.
Available in Mac OS X v10.3 and later.

35.30.29 titleBarFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the font used for window title bars, in the specified size.
Example:

```
Var n as NSFontMBS = NSFontMBS.titleBarFontOfSize(12)

MessageBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1a31b20) fobj=0x1a31bc0, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns the title bar font at the default size. This method is equivalent to boldSystemFontOfSize.

35.30.30 toolTipsFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the font used for tool tips labels, in the specified size.
Example:

```
Var n as NSFontMBS = NSFontMBS.toolTipsFontOfSize(12)

MessageBox n.description
// shows: "LucidaGrande 12.00 pt. P [ ] (0x1828db0) fobj=0x1828e50, spc=3.80"
```

Notes: If fontSize is 0 or negative, returns the tool tips font at the default size.

35.30.31 userFixedPitchFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the font used by default for documents and other text under the user's control (that is, text whose font the user can normally change), when that font should be fixed-pitch, in the specified size.
Example:

```
Var n as NSFontMBS = NSFontMBS.userFixedPitchFontOfSize(12)

MessageBox n.description
// shows: "Monaco 12.00 pt. P [ ] (0x1ad13a0) fobj=0x1ac2bd0, spc=7.20"
```

Notes: If fontSize is 0 or negative, returns the fixed-pitch font at the default size.

The system does not guarantee that all the glyphs in a fixed-pitch font are the same width. For example, certain Japanese fonts are dual-pitch, and other fonts may have nonspacing marks that can affect the display of other glyphs.

35.30.32 userFontOfSize(size as Double) as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the font used by default for documents and other text under the user's control (that is, text whose font the user can normally change), in the specified size.
Example:

```
Var n as NSFontMBS = NSFontMBS.userFontOfSize(12)

MessageBox n.description
// shows: "Helvetica 12.00 pt. P [ ] (0x19019b0) fobj=0x181fd00, spc=3.33"
```

Notes: If fontSize is 0 or negative, returns the user font at the default size.

35.30.33 Properties

35.30.34 ascender as Double

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: All.

Function: Returns the top y-coordinate, offset from the baseline, of the receiver's longest ascender.
Notes: (Read only property)

35.30.35 boundingRectForFont as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's bounding rectangle, scaled to the font's size.
Notes: The bounding rectangle is the union of the bounding rectangles of every glyph in the font.
(Read only property)

35.30.36 capHeight as Double

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: All.

Function: Returns the receiver's cap height.
Notes: (Read only property)

35.30.37 coveredCharacterSet as Variant

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSCharacterSet object containing all of the nominal characters renderable by the receiver, which is all of the entries mapped in the receiver's ‚Äòcmap' table.
Example:

```
// get the Symbol font
Var n as NSFontMBS = NSFontMBS.fontWithName("Symbol",10)

// what characters are defined for this font?
Var c as NSCharacterSetMBS = n.coveredCharacterSet

// display a string with all the characters
MessageBox c.StringValue
```

Notes: Value is a NSCharacterSetMBS object. Returned as Variant to reduce plugin dependencies.
The number of glyphs supported by a given font is often larger than the number of characters contained in the character set returned by this method.
(Read only property)

35.30.38 descender as Double

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: All.

Function: Returns the bottom y coordinate, offset from the baseline, of the receiver's longest descender.
Notes: Thus, if the longest descender extends 2 points below the baseline, descender will return –2.
(Read only property)

35.30.39 description as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: The description of the font.
Example:

```
Var n as NSFontMBS = NSFontMBS.systemFontOfSize(12)
MessageBox n.description
```

Notes: (Read only property)

35.30.40 displayName as string

MBS MacBase Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The (localized) display name of the font.
Example:

```
Var n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)

MessageBox n.displayName // shows "Monaco"
```

Notes: (Read only property)

35.30.41 familyName as string

MBS MacBase Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The family name of the font.
Example:

```
Var n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)

MessageBox n.familyName // shows "Monaco"
```

Notes: (Read only property)

35.30.42 fontName as string

MBS MacBase Plugin, Plugin Version: 8.0, Platform: macOS, Targets: All.

Function: The name of the font.
Example:

```
Var n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)

MessageBox n.fontName // shows "Monaco"
```

Notes: (Read only property)

35.30.43 Handle as Integer

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: The internal reference to the NSFont object.
Notes: (Read and Write property)

35.30.44 isFixedPitch as boolean

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether all glyphs in the receiver have the same advancement.
Notes: Returns true if all glyphs in the receiver have the same advancement; false if any advancements differ.

Some Japanese fonts encoded with the scheme "EUC12-NJE-CFEncoding" return that they have the same advancement, but actually encode glyphs with one of two advancements, for historical compatibility. You may need to handle such fonts specially for some applications.
(Read only property)

35.30.45 italicAngle as Double

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's italic angle, the amount that the font is slanted in degrees counterclockwise from the vertical, as read from its AFM file.
Notes: Because the slant is measured counterclockwise, English italic fonts typically return a negative value.
(Read only property)

35.30.46 leading as Double

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: All.

Function: Returns the receiver's leading.
Notes: Available in Mac OS X v10.4 and later.
(Read only property)

35.30.47 maximumAdvancement as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the greatest advancement of any of the receiver's glyphs.
Notes: This advancement is always either strictly horizontal or strictly vertical.
(Read only property)

35.30.48 mostCompatibleStringEncoding as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the string encoding that works best with the receiver, where there are the fewest possible unmatched characters in the string encoding and glyphs in the font.
Notes: You can use NSString,Äòs dataUsingEncoding method to convert the string to this encoding.
If this method returns NSASCIIStringEncoding, it could not determine the correct encoding and assumed that the font can render only ASCII characters.
This method works heuristically using well-known font encodings, so for nonstandard encodings it may not in fact return the optimal string encoding.
(Read only property)

35.30.49 numberOfGlyphs as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of glyphs in the receiver.
Example:

```
Var n as NSFontMBS = NSFontMBS.fontWithName("Monaco", 12)

MessageBox str(n.numberOfGlyphs) // 1678
```

Notes: Glyphs are numbered starting at 0.
(Read only property)

35.30.50 pointSize as Double

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: All.

Function: Returns the receiver's point size, or the effective vertical point size for a font with a nonstandard matrix.
Notes: (Read only property)

35.30.51 printerFont as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the scalable PostScript font corresponding to itself.
Notes: When sent to a font object representing a scalable PostScript font, returns self. When sent to a font object representing a bitmapped screen font, returns its corresponding scalable PostScript font.
(Read only property)

35.30.52 renderingMode as Integer

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the rendering mode of the receiver.
Notes: Available in Mac OS X v10.4 and later.
(Read only property)

35.30.53 screenFont as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bitmapped screen font corresponding to itself.
Notes: When sent to a font object representing a scalable PostScript font, returns a bitmapped screen font matching the receiver in typeface and matrix (or size), or nil if such a font can't be found. When sent to a font object representing a bitmapped screen font, returns nil.

Screen fonts are for direct use with the window server only. Never use them with Application Kit objects, such as in setFont: methods. Internally, the Application Kit automatically uses the corresponding screen font for a font object as long as the view is not rotated or scaled.
(Read only property)

35.30.54 textTransform as Variant

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the current transformation matrix for the receiver.
Notes: Available in Mac OS X v10.4 and later.

Returns NSAffineTransformMBS. Returned as Variant to reduce plugin dependencies.
(Read only property)

35.30.55 underlinePosition as Double

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the baseline offset that should be used when drawing underlines with the receiver, as determined by the font's AFM file.
Notes: This value is usually negative, which must be considered when drawing in a flipped coordinate system.
(Read only property)

35.30.56 underlineThickness as Double

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the thickness that should be used when drawing underlines with the receiver, as determined by the font's AFM file.
Notes: (Read only property)

35.30.57 xHeight as Double

MBS MacBase Plugin, Plugin Version: 9.3, Platform: macOS, Targets: All.

Function: Returns the x-height of the font.
Notes: (Read only property)

35.30.58 Constants

Constants

Constant	Value	Description
NSControlGlyph	&hFFFFFF	One of the constants define reserved glyph codes NSGlyphGenerator generates NSControlGlyph fo General Category C* and U200B (ZERO WIDT
NSFontAntialiasedIntegerAdvancementsRenderingMode	3	One of the constants specify the font rendering r Specifies antialiased, integer advancements rende Available in Mac OS X v10.4 and later.
NSFontAntialiasedRenderingMode	1	One of the constants specify the font rendering r Specifies antialiased, floating-point advancements with printerFont). Available in Mac OS X v10.4 and later.
NSFontDefaultRenderingMode	0	One of the constants specify the font rendering r Determines the actual mode based on the user p Available in Mac OS X v10.4 and later.
NSFontIntegerAdvancementsRenderingMode	2	One of the constants specify the font rendering r Specifies integer advancements rendering mode. Available in Mac OS X v10.4 and later.
NSNativeShortGlyphPacking	5	A constant for glyph packing. The native format for Mac OS X. ocoa stores all text data as Unicode. The text glyph IDs and places them in 1-, 2-, or 4-byte s text. To render text, you must convert the storag understands. The following constants describe t text rendering engine can use. They are used t for making a multibyte (or single-byte) array of g preter, such as the window server, which expects (that is, "packed glyphs") instead of a pure NSG glyphPacking. With Quartz, the engine always e byte short array, so NSNativeShortGlyphPackin in use.
NSNullGlyph	0	One of the constants define reserved glyph codes A null glyph.

35.31 class NSFontPanelMBS

35.31.1 class NSFontPanelMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: The NSFontPanel class implements the Font panel—a user interface object that displays a list of available fonts, letting the user preview them and change the font used to display text.
Example:

NSFontPanelMBS.sharedFontPanel.Show

Notes: The actual changes are made through conversion messages sent to the shared NSFontManager instance. There's only one Font panel for each application.
Subclass of the NSPanelMBS class.
Blog Entries

- RTF functions in MBS Plugins
- MBS Real Studio Plugins, version 12.5pr6

35.31.2 Methods

35.31.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: The Constructor.

35.31.4 convertAttributes(old as dictionary) as dictionary

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Converts attributes in response to an object initiating an attribute change, typically the Font panel.
Notes: Call this function only in the changeAttributes event.

35.31.5 convertFont(oldFont as NSFontMBS) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Converts the given font according to the object that initiated a font change, typically the Font panel.

Notes: Call this function only in the ChangeFont event.

35.31.6 Destructor

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: The destructor.

35.31.7 panelConvertFont(font as NSFontMBS) as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Converts the specified font using the settings in the receiver, with the aid of the shared NSFontManager if necessary.
Notes: Font: The font to be converted.

Returns the converted font, or aFont itself if it can't be converted.

For example, if aFont is Helvetica Oblique 12.0 point and the user has selected the Times font family (and nothing else) in the Font panel, the font returned is Times Italic 12.0 point.

35.31.8 reloadDefaultFontFamilies

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Triggers a reload to the default state, so that the delegate is called.
Notes: This reloading provides the delegate opportunity to scrutinize the default list of fonts to be displayed in the panel.

35.31.9 setPanelFont(font as NSFontMBS, isMultiple as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Sets the selected font in the receiver to the specified font.
Notes: Font: The font to be selected.
flag: If false, selects the specified font; otherwise selects no font and displays a message in the preview area indicating that multiple fonts are selected.

You normally don't use this method directly; instead, you send setSelectedFont to the shared NSFontManager, which in turn invokes this method.

35.31.10 sharedFontPanel as NSFontPanelMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Returns the single NSFontPanel instance for the application, creating it if necessary.
Example:

NSFontPanelMBS.sharedFontPanel.Show

35.31.11 sharedFontPanelExists as boolean

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Returns true if the shared Font panel has been created, false if it hasn't.

35.31.12 worksWhenModal as boolean

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the receiver allows fonts to be changed in modal windows and panels.

35.31.13 Properties

35.31.14 accessoryView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: The accessory view.
Notes: Establishes the specified view as the receiver's accessory view, allowing you to add custom controls to your application's Font panel without having to create a subclass.
(Read and Write computed property)

35.31.15 Enabled as boolean

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver's Set button is enabled.
Notes: The receiver continues to reflect the font of the selection for cooperating text objects regardless of this setting.

(Read and Write computed property)

35.31.16 Events

35.31.17 changeAttributes

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: The event called whenever attributes in the font panel changed.
Notes: Use convertAttributes to know what changed.

35.31.18 changeFont

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop only.

Function: The event called whenever the font in the font panel changed.
Notes: Use ConvertFont to know what changed.

35.31.19 validModesForFontPanel as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Returns the mode mask corresponding to the expected font panel mode.
Notes: The mode masks are defined in constants.
By default the plugin returns NSFontPanelAllModesMask.

35.31.20 Constants

Mode Constants

Constant	Value	Description
NSFontPanelAllEffectsModeMask	&hFFF00	Display all the effects user interface items.
NSFontPanelAllModesMask	&hFFFFFFFF	Display all the available adornments.
NSFontPanelCollectionModeMask	4	Display the font collections column.
NSFontPanelDocumentColorEffectModeMask	2048	Display the document color button.
NSFontPanelFaceModeMask	1	Display the typeface column.
NSFontPanelShadowEffectModeMask	4096	Display the shadow effects button.
NSFontPanelSizeModeMask	2	Display the font size column.
NSFontPanelStandardModesMask	&hFFFF	Display the standard default font panel—that is, includin face, and size columns.
NSFontPanelStrikethroughEffectModeMask	512	Display the strike-through popup menu.
NSFontPanelTextColorEffectModeMask	1024	Display the text color button.
NSFontPanelUnderlineEffectModeMask	256	Display the underline popup menu.

35.32 class NSHapticFeedbackManagerMBS

35.32.1 class NSHapticFeedbackManagerMBS

MBS MacBase Plugin, Plugin Version: 26.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: An object that provides access to the haptic feedback management attributes on a system with a Force Touch trackpad.
Example:

Var manager As NSHapticFeedbackManagerMBS
manager = NSHapticFeedbackManagerMBS.defaultPerformer
manager.performFeedbackPattern(NSHapticFeedbackManagerMBS.PatternGeneric, NSHapticFeedbackManagerMBS.PerformanceTimeNow)

Blog Entries

- MBS Xojo Plugins, version 26.5pr3

35.32.2 Methods

35.32.3 Constructor

MBS MacBase Plugin, Plugin Version: 26.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes with the current performer.
Notes: The most appropriate feedback performer for the current input device, accessibility settings and user preferences. Note: This device may change during the life of your application. Always request the defaultPerformer when you need perform feedback.

35.32.4 defaultPerformer as NSHapticFeedbackManagerMBS

MBS MacBase Plugin, Plugin Version: 26.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries the current performer.
Notes: The most appropriate feedback performer for the current input device, accessibility settings and user preferences. Note: This device may change during the life of your application. Always request the defaultPerformer when you need perform feedback.

35.32.5 performFeedbackPattern(pattern as Integer, performanceTime as Integer)

MBS MacBase Plugin, Plugin Version: 26.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initiates a specific pattern of haptic feedback to the user.

35.32.6 Properties

35.32.7 ClassName as String

MBS MacBase Plugin, Plugin Version: 26.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal class name of the framework class used.
Notes: (Read only property)

35.32.8 Handle as Integer

MBS MacBase Plugin, Plugin Version: 26.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

35.32.9 Constants

Pattern

Constant	Value	Description
PatternAlignment	1	Alignment of any type: guides, best fit, etc...
PatternGeneric	0	when none of the other options apply.
PatternLevelChange	2	Changes in discrete pressure zones. Used by NSMultiLevelAcceleratorButtons.

Performance Time

Constant	Value	Description
PerformanceTimeDefault	0	Currently, NSHapticFeedbackPerformanceTimeDrawCompleted
PerformanceTimeDrawCompleted	2	Synchronize when the next cocoa screen drawing and layer rendering pass com plete
PerformanceTimeNow	1	Perform immediately. Do not synchronize

35.33 class NSHelpManagerMBS

35.33.1 class NSHelpManagerMBS

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The NSHelpManager class provides an approach to displaying online help.
Example:

```
// open the help book of the app at a specific page
// the app bundle needs a registered help book (CFBundleHelpBookName in Info.plist)
Var help As New NSHelpManagerMBS
help.openHelpAnchor("preferences", "MyApp Help")

// or search the help book
// help.findString("export", "MyApp Help")
```

Notes: An application contains one NSHelpManager object.
Blog Entries

- MBS Xojo Plugins, version 20.5pr8
- MBS Xojo Plugins, version 19.3pr2
- MBS Plugins 11.1 Release notes
- MBS REALbasic Plugins, version 11.1pr5

35.33.2 Methods

35.33.3 Constructor

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Creates an NSHelpManagerMBS object in Xojo which points to the shared NSHelpManager object.

35.33.4 findString(query as string, book as string)

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Performs a search for the specified string in the specified book.
Notes: query: String to search for.
book: Localized help book to search. When "", all installed help books are searched.

35.33.5 isContextHelpModeActive as boolean

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Indicates whether context-sensitive help mode is active.
Notes: Returns true when the application is in context-sensitive help mode, false otherwise.

In context-sensitive help mode, when a user clicks a user interface item, help for that item is displayed in a small window just below the cursor.

35.33.6 NSContextHelpModeDidActivateNotification as string

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification names to be used with NSNotificationObserverMBS class.
Notes: Posted when the application enters context-sensitive help mode. This typically happens when the user holds down the Help key.
The notification object is the help manager. This notification does not contain a userInfo dictionary.

35.33.7 NSContextHelpModeDidDeactivateNotification as string

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification names to be used with NSNotificationObserverMBS class.
Notes: Posted when the application exits context-sensitive help mode. This happens when the user clicks the mouse button while the cursor is anywhere on the screen after displaying a context-sensitive help topic.
The notification object is the help manager. This notification does not contain a userInfo dictionary.

35.33.8 openHelpAnchor(anchor as string, book as string)

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Finds and displays the text at the given anchor location in the given book.
Notes: anchor: Location of the desired text.
book: Help book containing the anchor. When "", all installed help books are searched.

35.33.9 registerBooksInBundle(bundle as NSBundleMBS) as boolean

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Registers one or more help books in the given bundle.
Notes: bundle: The bundle for additional help books. Books in the main bundle are automatically registered.

Returns true if registration is successful, false if if the bundle doesn't contain any help books or if registration fails.

You use registerBooksInBundle to register help books in, for example, a plug-in bundle. The Info.plist in the bundle should contain a help book directory path, which specifies one or more folders containing help books.

The main bundle is automatically registered by openHelpAnchor and findString.

35.33.10 setContextHelpModeActive(active as boolean)

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Specifies whether context-sensitive help mode is active.
Notes: active: True turns on context-sensitive help, false turns it off.

You never send this message directly; instead, the NSApplication method activateContextHelpMode activates context-sensitive help mode, and the first mouse click after displaying the context-sensitive help window deactivates it.

When the application enters context-sensitive help mode, the help manager posts an NSContextHelpModeDidActivateNotification to the default notification center. When the application returns to normal operation, the help manager posts an NSContextHelpModeDidDeactivateNotification.

35.33.11 Properties

35.33.12 Handle as Integer

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The internal object reference to the NSHelpManager object.
Notes: (Read and Write property)

35.34 class NSIndexSetMBS

35.34.1 class NSIndexSetMBS

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The NSIndexSet class represents an immutable collection of unique unsigned integers, known as indexes because of the way they are used.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MessageBox str(n.firstIndex)+" "+str(n.lastIndex)
```

Notes: This collection is referred to as a index set.

You use index sets in your code to store indexes into some other data structure. For example, given an array, you could use an index set to identify a subset of objects in that array.

Each index value can appear only once in the index set. This is an important concept to understand and is why you would not use index sets to store an arbitrary collection of integer values. To illustrate how this works, if you created an NSIndexSet object with the values 4, 5, 2, and 5, the resulting set would only have the values 4, 5, and 2 in it. Because index values are always maintained in sorted order, the actual order of the values when you created the set would be 2, 4, and then 5.

In most cases, using an index set is more efficient than storing a collection of individual integers. Internally, the NSIndexSet class represents indexes using ranges. For maximum performance and efficiency, overlapping ranges in an index set are automatically coalesced—that is, ranges merge rather than overlap. Thus, the more contiguous the indexes in the set, the fewer ranges are required to specify those indexes.

You must not subclass the NSIndexSet class.

The mutable subclass of NSIndexSet is NSMutableIndexSet.
Blog Entries

- MBS Real Studio Plugins, version 13.0pr7

35.34.2 Methods

35.34.3 Constructor

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Initializes an allocated NSIndexSet object.

Example:

```
Var x as new NSIndexSetMBS
```

See also:

- 35.34.4 Constructor(index as Integer) 6442
- 35.34.5 Constructor(indexes as NSIndexSetMBS) 6442
- 35.34.6 Constructor(StartIndex as Integer, Length as Integer) 6443

35.34.4 Constructor(index as Integer)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Initializes an allocated NSIndexSet object with an index.
Example:

```
Var n as new NSIndexSetMBS(5)
MessageBox str(n.firstIndex)+" "+str(n.lastIndex)
```

See also:

- 35.34.3 Constructor 6441
- 35.34.5 Constructor(indexes as NSIndexSetMBS) 6442
- 35.34.6 Constructor(StartIndex as Integer, Length as Integer) 6443

35.34.5 Constructor(indexes as NSIndexSetMBS)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Initializes an allocated NSIndexSet object with an index set.
Example:

```
Var n as new NSIndexSetMBS(5)
Var x as new NSIndexSetMBS(n)
MessageBox str(x.firstIndex)
```

See also:

- 35.34.3 Constructor 6441
- 35.34.4 Constructor(index as Integer) 6442
- 35.34.6 Constructor(StartIndex as Integer, Length as Integer) 6443

35.34.6 Constructor(StartIndex as Integer, Length as Integer)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Initializes an allocated NSIndexSet object with an index range.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
```

Notes: This method raises an NSRangeException when indexRange would add an index that exceeds the maximum allowed value for unsigned integers.
See also:

- 35.34.3 Constructor 6441
- 35.34.4 Constructor(index as Integer) 6442
- 35.34.5 Constructor(indexes as NSIndexSetMBS) 6442

35.34.7 containsIndex(index as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Indicates whether the receiver contains a specific index.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10

if n.containsIndex(6) then
MessageBox "OK"
else
MessageBox "Error."
end if

if n.containsIndex(11) then
MessageBox "Error."
else
MessageBox "OK"
end if
```

Notes: Returns true when the receiver contains index, false otherwise.

35.34.8 containsIndexes(indexes as NSIndexSetMBS) as boolean

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Indicates whether the receiver contains a superset of the indexes in another index set.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
Var m as new NSIndexSetMBS(6,2)

if n.containsIndexes(m) then
MessageBox "OK"
else
MessageBox "Error."
end if
```

Notes: True when the receiver contains a superset of the indexes in indexSet, false otherwise.

35.34.9 containsIndexesInRange(StartIndex as Integer, Length as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Indicates whether the receiver contains the indexes represented by an index range.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
if n.containsIndexesInRange(6,2) then
MessageBox "OK"
else
MessageBox "Error."
end if
```

Notes: Returns true when the receiver contains the indexes in indexRange, false otherwise.

35.34.10 copy as NSIndexSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a copy of the Cocoa and RB object.

35.34.11 count as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Returns the number of indexes in the receiver.

Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MessageBox str(n.count) // shows 6
```

35.34.12 countOfIndexesInRange(StartIndex as Integer, Length as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Returns the number of indexes in the receiver that are members of a given range.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MessageBox str(n.countOfIndexesInRange(1,8)) // shows 4
```

Notes: Available in Mac OS X v10.5 and later.

35.34.13 firstIndex as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Returns either the first index in the receiver or the not-found indicator.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MessageBox str(n.firstIndex)+" "+str(n.lastIndex)
```

Notes: First index in the receiver or NSNotFound (&h7fffffff) when the receiver is empty.

35.34.14 indexGreaterThanIndex(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Returns either the closest index in the receiver that is greater than a specific index or the not-found indicator.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MessageBox str(n.indexGreaterThanIndex(1)) // shows(5)
```

Notes: Returns the losest index in the receiver greater than index; NSNotFound (&h7FFFFFFF) when the receiver contains no qualifying index.

35.34.15 indexGreaterThanOrEqualToIndex(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Returns either the closest index in the receiver that is greater than or equal to a specific index or the not-found indicator.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MessageBox str(n.indexGreaterThanOrEqualToIndex(1)) // shows(5)
```

Notes: Returns closest index in the receiver greater than or equal to index; NSNotFound (&h7FFFFFFF) when the receiver contains no qualifying index.

35.34.16 indexLessThanIndex(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Returns either the closest index in the receiver that is less than a specific index or the not-found indicator.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MessageBox str(n.indexLessThanIndex(20)) // shows 10
MessageBox str(n.indexLessThanIndex(1)) // shows 2147483647 for not found
```

Notes: Returns closest index in the receiver less than index; NSNotFound (&h7FFFFFFF) when the receiver contains no qualifying index.

35.34.17 indexLessThanOrEqualToIndex(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Returns either the closest index in the receiver that is less than or equal to a specific index or the not-found indicator.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MessageBox str(n.indexLessThanOrEqualToIndex(20)) // shows 10
```

Notes: Returns closest index in the receiver less than or equal to index; NSNotFound (&h7FFFFFFF) when

the receiver contains no qualifying index.

35.34.18 indexSet as NSIndexSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates an empty index set.
Example:

```
Var n as NSIndexSetMBS = NSIndexSetMBS.indexSet
MessageBox str(n.count) // 0 ->empty
```

Notes: Available in Mac OS X v10.3 and later.

35.34.19 indexSetWithIndex(index as Integer) as NSIndexSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates an index set with an index.
Example:

```
Var n as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndex(3)
MessageBox str(n.count) // 1
```

Notes: Available in Mac OS X v10.3 and later.

35.34.20 indexSetWithIndexesInRange(StartIndex as Integer, Length as Integer) as NSIndexSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates an index set with an index range.
Example:

```
Var n as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndexesInRange(3,2)
MessageBox str(n.count) // 2 and contains 3,4
```

Notes: Available in Mac OS X v10.3 and later.

35.34.21 intersectsIndexesInRange(StartIndex as Integer, Length as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Indicates whether the receiver contains any of the indexes in a range.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10

if n.intersectsIndexesInRange(1,4) then
MessageBox "Error"
else
MessageBox "OK"
end if

if n.intersectsIndexesInRange(1,6) then
MessageBox "OK"
else
MessageBox "Error"
end if
```

35.34.22 isEqualToIndexSet(other as NSIndexSetMBS) as boolean

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Indicates whether the indexes in the receiver are the same indeces contained in another index set.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
Var m as NSIndexSetMBS = n.mutableCopy

if m.isEqualToIndexSet(n) then
MessageBox "OK"
else
MessageBox "Failed."
end if
```

35.34.23 lastIndex as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Returns either the last index in the receiver or the not-found indicator.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MessageBox str(n.firstIndex)+" "+str(n.lastIndex)
```

Notes: Returns Last index in the receiver or NSNotFound (&h7FFFFFFF) when the receiver is empty.

35.34.24 mutableCopy as NSMutableIndexSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates an editable copy of the indexset.
Example:

```
Var n as new NSIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
Var m as NSMutableIndexSetMBS = n.mutableCopy

m.addIndex 20

MessageBox str(n.lastIndex)+" "+str(m.lastIndex)
```

35.34.25 Operator_Convert as string

MBS MacBase Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Converts an indexset to string for display.
Example:

```
Var n as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndexesInRange(10,40)
MessageBox n
```

Notes: This is for having str() function and MessageBox work with NSIndexSetMBS class.
If more than 20 values, you get only 20 values followed with dots and last value on the end.

35.34.26 Values as Integer()

MBS MacBase Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns all values in array.
Example:

```
Var n1 as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndexesInRange(10,10)
Var n2 as NSIndexSetMBS = NSIndexSetMBS.indexSetWithIndexesInRange(30,5)
Var n3 as new NSMutableIndexSetMBS
n3.addIndexes n1
```

```
n3.addIndexes n2
Var count1 as Integer = n1.count // 10
Var count2 as Integer = n2.count // 5
Var count3 as Integer = n3.count // 15
Var values1() as Integer = n1.Values
Var values2() as Integer = n2.Values
Var values3() as Integer = n3.Values
break // look in debugger
```

35.34.27 Properties

35.34.28 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The internal reference for the NSIndexSex.
Notes: (Read and Write property)

35.35 class NSInputStreamMBS

35.35.1 class NSInputStreamMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: A stream that provides read-only stream functionality.
Example:

```
// read a file in chunks of 64 KB
Var path As String = SpecialFolder.Desktop.Child("test.mp4").NativePath
Var stream As NSInputStreamMBS = NSInputStreamMBS.inputStreamWithFileAtPath(path)
stream.Open

Var total As Integer
While stream.hasBytesAvailable
Var chunk As MemoryBlock = stream.Read(64 * 1024)
If chunk = Nil Or chunk.Size = 0 Then Exit
total = total + chunk.Size
// process the chunk here
Wend

stream.Close
MessageBox total.ToString + " bytes read"
```

Notes: Subclass of the NSStreamMBS class.
Blog Entries

- MBS Xojo Plugins, version 18.2pr2

35.35.2 Methods

35.35.3 Constructor(filePath as string)

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSInputStream object that reads data from the file at a given path.
Notes: The stream must be opened before it can be used.

35.35.4 inputStreamWithData(data as Memoryblock) as NSInputStreamMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Creates and returns an initialized NSInputStream object for reading from a given NSData object.
Notes: data: The data object from which to read. The contents of data are copied.

Returns an initialized NSInputStream object for reading from data. If data is not an NSData object, this method returns nil.

The stream must be opened before it can be used.

35.35.5 inputStreamWithFileAtPath(path as string) as NSInputStreamMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSInputStream object that reads data from the file at a given path.
Notes: path: The path to the file.

Returns an initialized NSInputStream object that reads data from the file at path.

The stream must be opened before it can be used.

35.35.6 inputStreamWithURL(URL as string) as NSInputStreamMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Creates and returns an initialized NSInputStream object that reads data from the file at a given URL.
Notes: url: The URL to the file.

Returns an initialized NSInputStream object that reads data from the URL at url.

The stream must be opened before it can be used.

35.35.7 LookAHead as MemoryBlock

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Returns copy of read buffer.
Notes: Allows looking into data before reading it.

35.35.8 Read(maxLength as Integer) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Reads up to a given number of bytes into a given buffer.

35.35.9 Properties

35.35.10 hasBytesAvailable as Boolean

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the receiver has bytes available to read.
Notes: True if the receiver has bytes available to read, otherwise false. May also return true if a read must be attempted in order to determine the availability of bytes.
(Read only property)

35.36 class NSKeyedArchiverMBS

35.36.1 class NSKeyedArchiverMBS

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The plugin class for archiving objects.
Example:

```
// make archiver
Var a as new NSKeyedArchiverMBS

// add a string
a.encodeString "Hello World", "Greeting"

// finish
a.finishEncoding

// query data
Var m as MemoryBlock = a.archiverData

// start unarchiver
Var u as new NSKeyedUnarchiverMBS(m)

// query and display a value
Var s as string = u.decodeString("Greeting")
MessageBox s
```

Notes: NSKeyedArchiver, a concrete subclass of NSCoder, provides a way to encode objects (and scalar values) into an architecture-independent format that can be stored in a file. When you archive a set of objects, the class information and instance variables for each object are written to the archive. NSKeyedArchiver's companion class, NSKeyedUnarchiver, decodes the data in an archive and creates a set of objects equivalent to the original set.

A keyed archive differs from a non-keyed archive in that all the objects and values encoded into the archive are given names, or keys. When decoding a non-keyed archive, values have to be decoded in the same order in which they were encoded. When decoding a keyed archive, because values are requested by name, values can be decoded out of sequence or not at all. Keyed archives, therefore, provide better support for forward and backward compatibility.

The keys given to encoded values must be unique only within the scope of the current object being encoded. A keyed archive is hierarchical, so the keys used by object A to encode its instance variables do not conflict with the keys used by object B, even if A and B are instances of the same class. Within a single object, however, the keys used by a subclass can conflict with keys used in its superclasses.
Subclass of the NSCoderMBS class.

- MBS Xojo / Real Studio Plugins, version 13.2pr1

35.36.2 Methods

35.36.3 archiverData as memoryblock

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the archived data.

35.36.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Returns the receiver, initialized for encoding an archive.
See also:

- 35.36.5 Constructor(RequiringSecureCoding as Boolean) 6455

35.36.5 Constructor(RequiringSecureCoding as Boolean)

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Creates an archiver to encode data, and optionally disables secure coding.
Example:

```
Var ckRecord As New CKRecordMBS("MyType")

// archive
Var coder As NSKeyedArchiverMBS = New NSKeyedArchiverMBS(True)
ckRecord.encodeSystemFieldsWithCoder(coder)
coder.finishEncoding()

Var encodedRecordValue As String = coder.archiverData

// unarchive
Var unarchiver As New NSKeyedUnarchiverMBS(encodedRecordValue)
Var decodedRecord As CKRecordMBS = New CKRecordMBS(unarchiver)

MessageBox "OK "+decodedRecord.recordType

Exception n As NSExceptionMBS
MessageBox n.message
```

Notes: requiresSecureCoding: A Boolean value indicating whether all encoded objects must conform to NSSecureCoding.

To prevent the possibility of encoding an object that NSKeyedUnarchiver can,Äôt decode, set requiresSecureCoding to true whenever possible. This ensures that all encoded objects conform to NSSecureCoding.

Requires macOS 10.13.
See also:

- 35.36.4 Constructor 6455

35.36.6 finishEncoding

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Instructs the receiver to construct the final data stream.
Notes: No more values can be encoded after this method is called. You must call this method when finished.

35.36.7 Properties

35.36.8 outputFormat as Integer

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Sets or queries the format in which the receiver encodes its data.
Example:

```
// make archiver
Var a as new NSKeyedArchiverMBS
a.outputFormat = a.kCFPropertyListXMLFormat_v1_0

// add a string
a.encodeString "Hello World", "Greeting"

// finish
a.finishEncoding

// query data and show
Var m as MemoryBlock = a.archiverData
Var s as string = DefineEncoding(m, encodings.UTF8)
MessageBox s
```

Notes: (Read and Write computed property)

35.36.9 Constants

Constants

Constant	Value	Description
kCFPropertyListBinaryFormat_v1_0	200	One of the possible formats. Specifies the binary property list format.
kCFPropertyListXMLFormat_v1_0	100	One of the possible formats. Specifies the XML property list format.

35.37 class NSKeyedUnarchiverMBS

35.37.1 class NSKeyedUnarchiverMBS

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: The plugin class for unarchiving objects.
Example:

```
// make archiver
Var a as new NSKeyedArchiverMBS

// add a string
a.encodeString "Hello World", "Greeting"

// finish
a.finishEncoding

// query data
Var m as MemoryBlock = a.archiverData

// start unarchiver
Var u as new NSKeyedUnarchiverMBS(m)

// query and display a value
Var s as string = u.decodeString("Greeting")
MessageBox s
```

Notes: NSKeyedUnarchiver, a concrete subclass of NSCoder, defines methods for decoding a set of named objects (and scalar values) from a keyed archive. Such archives are produced by instances of the NSKeyedArchiver class.

A keyed archive is encoded as a hierarchy of objects. Each object in the hierarchy serves as a namespace into which other objects are encoded. The objects available for decoding are restricted to those that were encoded within the immediate scope of a particular object. Objects encoded elsewhere in the hierarchy, whether higher than, lower than, or parallel to this particular object, are not accessible. In this way, the keys used by a particular object to encode its instance variables need to be unique only within the scope of that object.

If you invoke one of the decode... methods of this class using a key that does not exist in the archive, a non-positive value is returned. This value varies by decoded type. For example, if a key does not exist in an archive, decodeBoolForKey returns false, decodeIntForKey returns 0, and decodeObjectForKey returns nil.

NSKeyedUnarchiver supports limited type coercion. A value encoded as any type of integer, whether a standard int or an explicit 32-bit or 64-bit integer, can be decoded using any of the integer decode methods.

Likewise, a value encoded as a float or double can be decoded as either a float or a double value. If an encoded value is too large to fit within the coerced type, the decoding method raises an NSRangeException. Further, when trying to coerce a value to an incompatible type, for example decoding an int as a float, the decoding method raises an NSInvalidUnarchiveOperationException.
Subclass of the NSCoderMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr1

35.37.2 Methods

35.37.3 Constructor(data as memoryblock)

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Initializes the receiver for decoding an archive previously encoded by NSKeyedArchiverMBS.
Notes: When you finish decoding data, you should invoke finishDecoding.
This method raises an NSExceptionMBS if data is not a valid archive.

35.37.4 finishDecoding

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Tells the receiver that you are finished decoding objects.
Notes: Invoking this method allows the receiver to notify its delegate and to perform any final operations on the archive. Once this method is invoked, the receiver cannot decode any further values.

35.38 class NSKeyValueObserverMBS

35.38.1 class NSKeyValueObserverMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The Plugin class to use a key value observer.
Example:

```
// get notified when the frame of the window changes
// MyObserver is a subclass of NSKeyValueObserverMBS with the observedValueForKeyPathChanged event implemented.
// Observer is a property of the window: Observer As MyObserver
Observer = New MyObserver(Self.NSWindowMBS.Handle)
Observer.addObserver("frame", NSKeyValueObserverMBS.kOptionNew)

// in MyObserver:
Function observedValueForKeyPathChanged(keyPath As String, target As Variant, change As Dictionary, context As Variant, ChangeNSDictionaryRef As Integer) As Boolean Handles observedValueForKeyPathChanged
System.DebugLog keyPath + " changed"
Return True
End Function
```

Notes: The NSKeyValueObserving (KVO) informal protocol defines a mechanism that allows objects to be notified of changes to the specified properties of other objects.

You can observe any object properties including simple attributes, to-one relationships, and to-many relationships. Observers of to-many relationships are informed of the type of change made —as well as which objects are involved in the change.

NSObject provides an implementation of the NSKeyValueObserving protocol that provides an automatic observing capability for all objects. You can further refine notifications by disabling automatic observer notifications and implementing manual notifications using the methods in this protocol.

This class implements an observer with event for use in Xojo.

- MBS Xojo Plugins, version 25.2pr5

- MBS Real Studio Plugins, version 13.1pr13

35.38.2 Methods

35.38.3 addObserver(keyPath as string, options as Integer = 5, context as Variant = nil)

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Registers observer to receive KVO notifications for the specified key-path relative to the receiver.
Notes: keyPath: The key path, relative to the receiver, of the property to observe. This value must not be nil.
options: A combination of the option constants that specifies what is included in observation notifications.
context: Arbitrary data that is passed to anObserver in observeValueForKeyPath.

This class holds a strong references to context and a weak reference to target.
Available in OS X v10.3 and later.

35.38.4 Constructor(TargetHandle as Integer)

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The constructor.
Notes: Please pass the handle of the target Cocoa object.
Like NSWindowMBS.handle or CALayerMBS.

35.38.5 Destructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The destructor.

35.38.6 NSKeyValueChangeIndexesKey as string

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: One of the keys for the dictionary passed to observedValueForKeyPathChanged event.
Notes: If the value of the NSKeyValueChangeKindKey entry is NSKeyValueChangeInsertion, NSKeyValueChangeRemoval, or NSKeyValueChangeReplacement, the value of this key is an NSIndexSetMBS object that contains the indexes of the inserted, removed, or replaced objects.
Available in OS X v10.3 and later.

35.38.7 NSKeyValueChangeKindKey as string

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: One of the keys for the dictionary passed to observedValueForKeyPathChanged event.

35.38.8 NSKeyValueChangeNewKey as string

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: One of the keys for the dictionary passed to observedValueForKeyPathChanged event.
Notes: If the value of the NSKeyValueChangeKindKey entry is NSKeyValueChangeSetting, and NSKeyValueObservingOptionNew was specified when the observer was registered, the value of this key is the new value for the attribute.
For NSKeyValueChangeInsertion or NSKeyValueChangeReplacement, if NSKeyValueObservingOptionNew was specified when the observer was registered, the value for this key is an NSArray instance that contains the objects that have been inserted or replaced other objects, respectively.
Available in OS X v10.3 and later.

35.38.9 NSKeyValueChangeNotificationIsPriorKey as string

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: One of the keys for the dictionary passed to observedValueForKeyPathChanged event.
Notes: If the option NSKeyValueObservingOptionPrior was specified when the observer was registered this notification is sent prior to a change.
The change dictionary contains an NSKeyValueChangeNotificationIsPriorKey entry whose value is a boolean.
Available in OS X v10.5 and later.

35.38.10 NSKeyValueChangeOldKey as string

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: One of the keys for the dictionary passed to observedValueForKeyPathChanged event.
Notes: If the value of the NSKeyValueChangeKindKey entry is NSKeyValueChangeSetting, and NSKeyValueObservingOptionOld was specified when the observer was registered, the value of this key is the value before the attribute was changed.
For NSKeyValueChangeRemoval or NSKeyValueChangeReplacement, if NSKeyValueObservingOptionOld was specified when the observer was registered, the value is an NSArray instance that contains the objects that have been removed or have been replaced by other objects, respectively.
Available in OS X v10.3 and later.

35.38.11 removeObserver(keyPath as string, context as Variant = nil)

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Stops a given object from receiving change notifications for the property specified by a given key-path relative to the receiver and a context.
Notes: keyPath: A key-path, relative to the receiver, for which observer is registered to receive KVO change notifications.
context: Arbitrary data that more specifically identifies the observer to be removed.

Examining the value in context you are able to determine precisely which addObserver method was used to create the observation relationship. When the same observer is registered for the same key-path multiple times, but with different context pointers, an application can determine specifically which object to stop observing.

The context object is only used in OS X v10.7 and later.

35.38.12 Properties

35.38.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

35.38.14 Events

35.38.15 observedValueForKeyPathChanged(keyPath as string, target as Variant, change as dictionary, context as Variant, ChangeNSDictionaryRef as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: This event is called when the value at the specified key path relative to the given object has changed.
Notes: keyPath: The key path, relative to object, to the value that has changed.
object: The source object of the key path keyPath.
change: A dictionary that describes the changes that have been made to the value of the property at the key path keyPath relative to object. Entries are described in Keys used by the change dictionary.
context: The value that was provided when the receiver was registered to receive key-value observation notifications.

The receiver must be registered as an observer for the specified keyPath and object.
ChangeNSDictionaryRef provides for debugging the reference to the original NSDictionary object.

35.38.16 Constants

Change Kind Constants.

Constant	Value	Description
kChangeInsertion	2	Indicates that an object has been inserted into the to-many relationship that is being observed.
kChangeRemoval	3	Indicates that an object has been removed from the to-many relationship that is being observed.
kChangeReplacement	4	Indicates that an object has been replaced in the to-many relationship that is being observed.
kChangeSetting	1	Indicates that the value of the observed key path was set to a new value. This change can occur when observing an attribute of an object, as well as properties that specify to-one and to-many relationships.

Option Constants

Constant	Value	Description
kOptionInitial	4	If specified, a notification should be sent to the observer immediately, before the observer registration method even returns. The change dictionary in the notification will always contain an NSKeyValueChangeNewKey entry if kOptionNew is also specified but will never contain an NSKeyValueChangeOldKey entry. (In an initial notification the current value of the observed property may be old, but it's new to the observer.) You can use this option instead of explicitly invoking, at the same time, code that is also invoked by the observer's observedValueForKeyPathChanged method. When this option is used with addObserver a notification will be sent for each indexed object to which the observer is being added. Available in OS X v10.5 and later.
kOptionNew	1	Indicates that the change dictionary should provide the new attribute value, if applicable. Available in OS X v10.3 and later.
kOptionOld	2	Indicates that the change dictionary should contain the old attribute value, if applicable. Available in OS X v10.3 and later.
kOptionPrior	8	Whether separate notifications should be sent to the observer before and after each change, instead of a single notification after the change. The change dictionary in a notification sent before a change always contains an NSKeyValueChangeNotificationIsPriorKey entry whose value is true, but never contains an NSKeyValueChangeNewKey entry. When this option is specified the change dictionary in a notification sent after a change contains the same entries that it would contain if this option were not specified. You can use this option when the observer's own key-value observing-compliance requires it to invoke one of the -willChange... methods for one of its own properties, and the value of that property depends on the value of the observed object's property. (In that situation it's too late to easily invoke -willChange... properly in response to receiving an observedValueForKeyPathChanged message after the change.) Available in OS X v10.5 and later.

35.39 class NSLayoutManagerMBS

35.39.1 class NSLayoutManagerMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: An NSLayoutManager object coordinates the layout and display of characters held in an NSTextStorage object.
Example:

```
// This example needs a window with TextArea1.
// show invisible characters and measure the height of the text in a text area
Var textView As NSTextViewMBS = TextArea1.NSTextViewMBS
Var layout As NSLayoutManagerMBS = textView.layoutManager
layout.showsInvisibleCharacters = True // spaces, tabs and returns

Var used As NSRectMBS = layout.usedRectForTextContainer(textView.textContainer)
MessageBox "Text needs " + Format(used.Height, "0") + " points height"
```

Notes: It maps Unicode character codes to glyphs, sets the glyphs in a series of NSTextContainer objects, and displays them in a series of NSTextView objects. In addition to its core function of laying out text, an NSLayoutManager object coordinates its NSTextView objects, provides services to those text views to support NSRulerView instances for editing paragraph styles, and handles the layout and display of text attributes not inherent in glyphs (such as underline or strikethrough). You can create a subclass of NSLayoutManager to handle additional text attributes, whether inherent or not.

Text Antialiasing
NSLayoutManager provides the threshold for text antialiasing. It looks at the AppleAntiAliasingThreshold default value. If the font size is smaller than or equal to this threshold size, the text is rendered aliased by NSLayoutManager. You can change the threshold value from the Appearance pane of System Preferences.

Thread Safety of NSLayoutManager
Generally speaking, a given layout manager (and associated objects) should not be used in more than one block, operation, or thread at a time. Most layout managers are used on the main thread, since it is the main thread on which their text views are displayed, and since background layout occurs on the main thread. If it is intended that a layout manager should be used on a background thread, first make sure that text views associated with that layout manager (if any) are not displayed while the layout manager is being used on the background thread, and, second, turn off background layout for that layout manager while it is being used on the background thread.

Noncontiguous Layout
Noncontiguous layout is an optional layout manager behavior new in Mac OS X v10.5. Previously, both glyph generation and layout were always performed, in order, from the beginning to the end of the document. When noncontiguous layout is turned on, however, the layout manager gains the option of performing glyph generation or layout for one portion of the document without having done so for previous sections. This can

provide significant performance improvements for large documents.

Noncontiguous layout is not turned on automatically because direct clients of NSLayoutManager typically have relied on the previous behavior—for example, by forcing layout for a given glyph range, and then assuming that previous glyphs would therefore be laid out. Clients who use NSLayoutManager only indirectly—for example, those who use NSTextView without directly calling the underlying layout manager—can usually turn on noncontiguous layout without difficulty. Clients using NSLayoutManager directly need to examine their usage before turning on noncontiguous layout.

To turn on noncontiguous layout, use AllowsNonContiguousLayout. In addition, see the other methods in "Managing Noncontiguous Layout," many of which enable you to ensure that glyph generation and layout are performed for specified portions of the text. The behavior of a number of other layout manager methods is affected by the state of noncontiguous layout, as noted in the discussion sections of those method descriptions.

So far the plugin implements a small subset of the functions in NSLayoutManager. If you miss a function, please email us and we can check whether we can add it for you.

35.39.2 Methods

35.39.3 addTextContainer(container as NSTextContainerMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Appends the given text container to the series of text containers where the receiver arranges text.
Notes: container: The text container to append.

Invalidates glyphs and layout as needed, but doesn't perform glyph generation or layout.

35.39.4 characterIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS, byref partialFraction as Double) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the character falling under the given point, expressed in the given container's coordinate system.
Notes: point: The point to test.
container: The text container within which the point is tested.
partialFraction: A fraction of the distance from the insertion point, logically before the given character to the next one.

Returns the index of the character falling under point.

Analogous to glyphIndexForPoint:inTextContainer, but expressed in character index terms. The method returns the index of the character falling under point, expressed in coordinate system of container; if no character is under the point, the nearest character is returned, where nearest is defined according to the requirements of selection by mouse. However, this is not simply equivalent to taking the result of the corresponding glyph index method and converting it to a character index, because in some cases a single glyph represents more than one selectable character, for example an fi ligature glyph. In that case, there is an insertion point within the glyph, and this method returns one character or the other, depending on whether the specified point lies to the left or the right of that insertion point.

In general, this method returns only character indexes for which there is an insertion point. The partialFraction is a fraction of the distance from the insertion point, logically before the given character to the next one, which may be either to the right or to the left depending on directionality.

Available in OS X v10.6 and later.

35.39.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Creates new NSLayoutManager object.

35.39.6 glyphIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: This method is a primitive for glyphIndexForPoint. You should always call the main method, not the primitives.

See also:

- 35.39.7 glyphIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS, byref partialFraction as Double) as Integer 6469

35.39.7 glyphIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS, byref partialFraction as Double) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the glyph falling under the given point, expressed in the given container's coordinate system.
Notes: point: The point for which to return the glyph, in coordinates of container.
container: The container in which the returned glyph is laid out.
partialFraction: On output, the fraction of the distance between the location of the glyph returned and the location of the next glyph.

Returns the index of the glyph falling under the given point, expressed in the given container's coordinate system.

If no glyph is under point, the nearest glyph is returned, where nearest is defined according to the requirements of selection by mouse. Clients who wish to determine whether the point actually lies within the bounds of the glyph returned should follow this with a call to boundingRectForGlyphRange and test whether the point falls in the rectangle returned by that method. If partialFraction is non-NULL, it returns by reference the fraction of the distance between the location of the glyph returned and the location of the next glyph.

For purposes such as dragging out a selection or placing the insertion point, a partial percentage less than or equal to 0.5 indicates that point should be considered as falling before the glyph index returned; a partial percentage greater than 0.5 indicates that it should be considered as falling after the glyph index returned. If the nearest glyph doesn't lie under point at all (for example, if point is beyond the beginning or end of a line), this ratio is 0 or 1.

If the glyph stream contains the glyphs "A" and "b", with the width of "A" being 13 points, and the user clicks at a location 8 points into "A", partialFraction is 8/13, or 0.615. In this case, the point given should be considered as falling between "A" and "b" for purposes such as dragging out a selection or placing the insertion point.

Performs glyph generation and layout if needed.

As part of its implementation, this method calls fractionOfDistanceThroughGlyphForPoint and glyphIndexForPoint. To change this method's behavior, override those two methods instead of this one.
See also:

- 35.39.6 glyphIndexForPoint(point as NSPointMBS, container as NSTextContainerMBS) as Integer 6468

35.39.8 glyphRangeForTextContainer(container as NSTextContainerMBS) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the range of glyphs laid out within the given text container.
Notes: This is a less efficient method than the similar textContainerForGlyphAtIndex.
Performs glyph generation and layout if needed.

35.39.9 lineFragmentRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle for the line fragment in which the given glyph is laid out and (optionally), by reference, the whole range of glyphs that are in that fragment.
Notes: glyphIndex: The glyph for which to return the line fragment rectangle.
effectiveGlyphRange: On output, the range for all glyphs in the line fragment.

Returns the line fragment in which the given glyph is laid out.

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, for all of the text up to and including that line fragment.

Line fragment rectangles are always in container coordinates.

Overriding this method is not recommended. If the line fragment rectangle needs to be modified, that should be done at the typesetter level or by calling setLineFragmentRect:forGlyphRange.
See also:

- 35.39.10 lineFragmentRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS, withoutAdditionalLayout as boolean) as NSRectMBS 6470

35.39.10 lineFragmentRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS, withoutAdditionalLayout as boolean) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the line fragment rectangle containing the glyph at the given glyph index.
Notes: glyphIndex: The glyph for which to return the line fragment rectangle.
effectiveGlyphRange: On output, the range for all glyphs in the line fragment.
withoutAdditionalLayout: If true, glyph generation and layout are not performed, so this option should not

be used unless layout is known to be complete for the range in question, or unless noncontiguous layout is enabled; if false, both are performed as needed.

Returns the line fragment in which the given glyph is laid out.

This method is primarily for use from within NSTypesetter, after layout is complete for the range in question, but before the layout manager's call to NSTypesetter has returned. In that case glyph and layout holes have not yet been recalculated, so the layout manager does not yet know that layout is complete for that range, and this variant must be used.

Overriding this method is not recommended. If the line fragment rectangle needs to be modified, that should be done at the typesetter level or by calling setLineFragmentRect.
See also:

- 35.39.9 lineFragmentRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS) as NSRectMBS 6470

35.39.11 lineFragmentUsedRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the usage rectangle for the line fragment in which the given glyph is laid and (optionally) by reference the whole range of glyphs that are in that fragment.
Notes: glyphIndex: The glyph for which to return the line fragment used rectangle.
effectiveGlyphRange: On output, the range for all glyphs in the line fragment.

Returns the used rectangle for the line fragment in which the given glyph is laid out.

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment.

Line fragment used rectangles are always in container coordinates.

Overriding this method is not recommended. If the line fragment used rectangle needs to be modified, that should be done at the typesetter level or by calling setLineFragmentRect.
See also:

- 35.39.12 lineFragmentUsedRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS, withoutAdditionalLayout as boolean) as NSRectMBS 6472

35.39.12 lineFragmentUsedRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS, withoutAdditionalLayout as boolean) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the usage rectangle for the line fragment in which the given glyph is laid and (optionally) by reference the whole range of glyphs that are in that fragment.
Notes: glyphIndex: The glyph for which to return the line fragment used rectangle.
effectiveGlyphRange: On output, the range for all glyphs in the line fragment.
withoutAdditionalLayout: If true, glyph generation and layout are not performed, so this option should not be used unless layout is known to be complete for the range in question, or unless noncontiguous layout is enabled; if false, both are performed as needed.

Returns the used rectangle for the line fragment in which the given glyph is laid out.

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment.

Line fragment used rectangles are always in container coordinates.

Overriding this method is not recommended. If the line fragment used rectangle needs to be modified, that should be done at the typesetter level or by calling setLineFragmentRect.
See also:

- 35.39.11 lineFragmentUsedRectForGlyphAtIndex(glyphIndex as Integer, byref effectiveRange as NSRangeMBS) as NSRectMBS 6471

35.39.13 locationForGlyphAtIndex(glyphIndex as Integer) as NSPointMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the location for the given glyph within its line fragment.
Notes: glyphIndex: The glyph whose location is returned.

Returns the location of the given glyph.

If the given glyph does not have an explicit location set for it (for example, if it is part of (but not first in) a sequence of nominally spaced characters), the location is calculated by glyph advancements from the location of the most recent preceding glyph with a location set.

Glyph locations are relative to their line fragment rectangle's origin. The line fragment rectangle in turn is defined in the coordinate system of the text container where it resides.

This method causes glyph generation and layout for the line fragment containing the specified glyph, or if noncontiguous layout is not enabled, up to and including that line fragment.

35.39.14 rangeOfNominallySpacedGlyphsContainingIndex(glyphIndex as Integer) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the range for the glyphs around the given glyph that can be displayed using only their advancements from the font, without pairwise kerning or other adjustments to spacing.
Notes: glyphIndex: Index of the glyph to test.

Returns the range of nominally spaced glyphs.

The range returned begins with the first glyph, counting back from glyphIndex, that has a location set, and it continues up to, but does not include, the next glyph that has a location set.

Performs glyph generation and layout if needed.

35.39.15 rectArrayForCharacterRange(charRange as NSRangeMBS, selCharRange as NSRangeMBS, container as NSTextContainerMBS, byref rectCount as Integer) as NSRectMBS()

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns an array of rectangles and, by reference, the number of such rectangles, that define the region in the given container enclosing the given character range.
Notes: charRange: The character range for which to return rectangles.
selCharRange: Selected characters within charRange, which can affect the size of the rectangles; it must be equal to or contain charRange. If the caller is interested in this more from an enclosing point of view rather than a selection point of view, pass { NSNotFound, 0 } as the selected range.
container: The text container in which the text is laid out.
rectCount: The number of rectangles returned.

Returns the array of rectangles enclosing the given range.

These rectangles can be used to draw the text background or highlight for the given range of characters. If a selected range is given in selCharRange, the rectangles returned are correct for drawing the selection. Selection rectangles are generally more complicated than enclosing rectangles and supplying a selected range

is the clue this method uses to determine whether to go to the trouble of doing this special work.

The number of rectangles returned isn't necessarily the number of lines enclosing the specified range. Contiguous lines can share an enclosing rectangle, and lines broken into several fragments have a separate enclosing rectangle for each fragment.

These rectangles don't necessarily enclose glyphs that draw outside their line fragment rectangles; use boundingRectForGlyphRange to determine the area that contains all drawing performed for a range of glyphs.

Performs glyph generation and layout if needed.

35.39.16 rectArrayForGlyphRange(glyphRange as NSRangeMBS, selGlyphRange as NSRangeMBS, container as NSTextContainerMBS, byref rectCount as Integer) as NSRectMBS()

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns an array of rectangles and, by reference, the number of such rectangles, that define the region in the given container enclosing the given glyph range.
Notes: glyphRange: The glyph range for which to return rectangles.
selGlyphRange: Selected glyphs within glyphRange, which can affect the size of the rectangles; it must be equal to or contain glyphRange. If the caller is interested in this more from an enclosing point of view rather than a selection point of view, pass { NSNotFound, 0 } as the selected range.
container: The text container in which the text is laid out.
rectCount: The number of rectangles returned.

Returns the array of rectangles enclosing the given range.

These rectangles can be used to draw the text background or highlight for the given range of characters. If a selected range is given in selGlyphRange, the rectangles returned are correct for drawing the selection. Selection rectangles are generally more complicated than enclosing rectangles and supplying a selected range is the clue this method uses to determine whether to go to the trouble of doing this special work.

The number of rectangles returned isn't necessarily the number of lines enclosing the specified range. Contiguous lines can share an enclosing rectangle, and lines broken into several fragments have a separate enclosing rectangle for each fragment.

The purpose of this method is to calculate line rectangles for drawing the text background and highlighting. These rectangles don't necessarily enclose glyphs that draw outside their line fragment rectangles; use boundingRectForGlyphRange to determine the area that contains all drawing performed for a range of glyphs.

Performs glyph generation and layout if needed.

35.39.17 removeTextContainerAtIndex(index as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Removes the text container at the given index and invalidates the layout as needed.
Notes: index: The index of the text container to remove.

This method invalidates glyph information as needed.

35.39.18 replaceGlyphAtIndex(glyphIndex as Integer, newGlyph as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Replaces the glyph at the given index with a new glyph.
Notes: glyphIndex: Index of the glyph to replace.
newGlyph: The new glyph.

Doesn't alter the glyph-to-character mapping or invalidate layout information. The character index of the glyph is assumed to remain the same (although it can, of course, be set explicitly if needed).

This method is for use by the glyph-generation mechanism and doesn't perform any invalidation or generation of the glyphs or layout. This method should be invoked only during glyph generation and typesetting, in almost all cases only by the glyph generator or typesetter. For example, a custom glyph generator or typesetter might invoke it.

35.39.19 replaceTextStorage(newTextStorage as NSTextStorageMBS)

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Replaces the NSTextStorage object for the group of text-system objects containing the receiver with the given text storage object.
Notes: All NSLayoutManager objects sharing the original NSTextStorage object then share the new one. This method makes all the adjustments necessary to keep these relationships intact, unlike setting textStorage property.

35.39.20 setCharacterIndex(charIndex as Integer, glyphIndex as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Sets the index of the character corresponding to the glyph at the given glyph index.
Notes: charIndex: The index to set.
glyphIndex: The glyph corresponding to the character whose index is set. The glyph must already be present.

This method is for use by the glyph-generation mechanism and doesn't perform any invalidation or generation of the glyphs or layout. This method should be invoked only during glyph generation and typesetting, in almost all cases only by the glyph generator or typesetter. For example, a custom glyph generator or typesetter might invoke it.

35.39.21 setExtraLineFragmentRect(fragmentRect as NSRectMBS, usedRect as NSRectMBS, TextContainer as NSTextContainerMBS)

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Sets the bounds and container for the extra line fragment.
Notes: fragmentRect: The rectangle to set.
usedRect: Indicates where the insertion point is drawn.
TextContainer: The text container where the rectangle is to be laid out.

The extra line fragment is used when the text backing ends with a hard line break or when the text backing is totally empty, to define the extra line which needs to be displayed at the end of the text. If the text backing is not empty and does not end with a hard line break, this should be set to NSRectMBS.Zero and nil.

Line fragment rectangles and line fragment used rectangles are always in container coordinates.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

35.39.22 setLineFragmentRect(fragmentRect as NSRectMBS, glyphRange as NSRangeMBS, usedRect as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Associates the given line fragment bounds with the given range of glyphs.
Notes: fragmentRect: The rectangle of the line fragment.
glyphRange: The range of glyphs to be associated with fragmentRect.
usedRect: The portion of fragmentRect that actually contains glyphs or other marks that are drawn (including the text container,Äôs line fragment padding. Must be equal to or contained within fragmentRect.

The typesetter must specify the text container first with setTextContainer, and it sets the exact positions of the glyphs afterwards with setLocation.

In the course of layout, all glyphs should end up being included in a range passed to this method, but only glyphs that start a new line fragment should be at the start of such ranges.

Line fragment rectangles and line fragment used rectangles are always in container coordinates.

This method is used by the layout mechanism and should be invoked only during typesetting, in almost all cases only by the typesetter. For example, a custom typesetter might invoke it.

35.39.23 usedRectForTextContainer(container as NSTextContainerMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Returns the bounding rectangle for the glyphs laid out in the given text container.
Notes: Returns the text container's currently used area, which determines the size that the view would need to be in order to display all the glyphs that are currently laid out in the container. This causes neither glyph generation nor layout.
Used rectangles are always in container coordinates.

35.39.24 Properties

35.39.25 allowsNonContiguousLayout as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Whether noncontiguous layout is enabled.
Notes: Setting to true allows but does not require the layout manager to use noncontiguous layout, and the layout manager may in fact not do so, depending on its configuration.
(Read and Write property)

35.39.26 attributedString as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Returns the text storage object from which the NSGlyphGenerator object procures characters for glyph generation.
Notes: This method is part of the NSGlyphStorage protocol, for use by the glyph generator. For NSLay-

outManager the attributed string is equivalent to the text storage.
Available in Mac OS X v10.5 and later.
(Read only property)

35.39.27 backgroundLayoutEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver generates glyphs and lays them out when the application's run loop is idle.
Notes: If true, background layout is enabled; if false, the receiver performs glyph generation and layout only when necessary.
(Read and Write property)

35.39.28 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The font for the invisible character drawing.
Notes: Use nil font for using the font of the current text.
This method is only available if the NSLayoutManagerMBS object has been created with new NSLayoutManagerMBS, so the plugin can use the special NSLayoutManager subclass with support for invisible character drawing.
(Read and Write property)

35.39.29 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

35.39.30 hasNonContiguousLayout as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Whether the layout manager currently has any areas of noncontiguous layout.
Notes: There may be times at which there is no noncontiguous layout, such as when layout is complete; this method enables the layout manager to report that to clients.
(Read only property)

35.39.31 hyphenationFactor as Double

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The threshold controlling when hyphenation is done.
Notes: factor: The hyphenation factor, ranging from 0.0 to 1.0. By default, the value is 0.0, meaning hyphenation is off. A factor of 1.0 causes hyphenation to be attempted always.

Whenever (width of the real contents of the line) / (the line fragment width) is below factor, hyphenation is attempted when laying out the line. Hyphenation slows down text layout and increases memory usage, so it should be used sparingly.

May be overridden on a per-paragraph basis by the NSParagraphStyle method hyphenationFactor.
(Read and Write property)

35.39.32 showInvisibleCharacters as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Whether to show invisible characters.
Notes: This method is only available if the NSLayoutManagerMBS object has been created with new NSLayoutManagerMBS, so the plugin can use the special NSLayoutManager subclass with support for invisible character drawing. (from MBS Plugin)
(Read and Write property)

35.39.33 showsControlCharacters as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Whether to substitute visible glyphs for control characters in layout.
Example:

```
// This example needs a window with TextArea1.
if TargetCocoa then

Var t as NSTextViewMBS = TextArea1.NSTextViewMBS
Var l as NSLayoutManagerMBS = t.layoutManager

l.showsControlCharacters = true

else
// not supported
break
end if
```

Notes: If true, the receiver substitutes visible glyphs for control characters if the font and script support it; if false, it doesn't. The default is false.
(Read and Write property)

35.39.34 showsInvisibleCharacters as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Whether to substitute visible glyphs for whitespace and other typically invisible characters in layout.
Example:

```
// This example needs a window with TextArea1.
if TargetCocoa then

Var t as NSTextViewMBS = TextArea1.NSTextViewMBS
Var l as NSLayoutManagerMBS = t.layoutManager

l.showsInvisibleCharacters = true

else
// not supported
break
end if
```

Notes: If true, the receiver substitutes visible glyphs for invisible characters if the font and script support it; if false, it doesn't. The default is false. (from Apple framework)
(Read and Write property)

35.39.35 textColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The text color for drawing invisible characters.
Notes: This method is only available if the NSLayoutManagerMBS object has been created with new NSLayoutManagerMBS, so the plugin can use the special NSLayoutManager subclass with support for invisible character drawing.
(Read and Write property)

35.39.36 textStorage as NSTextStorageMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The text storage.
Notes: (Read and Write property)

35.39.37 usesFontLeading as Boolean

MBS MacCocoa Plugin, Plugin Version: 16.4, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the receiver uses the leading provided in the font.
Notes: (Read and Write property)

35.39.38 usesScreenFonts as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Whether screen fonts to calculate layout and display text.
Notes: If true, the receiver uses screen fonts; if false, it doesn't.
(Read and Write property)

35.39.39 InvisibleCharMapping(character as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Sets/gets character mapping for invisible character.
Example:

```
Var l as new NSLayoutManagerMBS
// ...
// set tab to map to plus sign
l.InvisibleCharMapping(9) = "+"
// set space to map to star sign
l.InvisibleCharMapping(asc(" ")) = "*"
```

Notes: By default characters are set for endofline, tab and spaces.
Set showInvisibleCharacters to true and put here all the characters you need.
(Read and Write computed property)

35.40 class NSLevelIndicatorMBS

35.40.1 class NSLevelIndicatorMBS

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: NSLevelIndicatorMBS is a subclass of NSControlMBS that displays a value on a linear scale.
Example:

```
// add a level indicator showing 7 of 10 with warning and critical levels
Var level As New NSLevelIndicatorMBS(20, 20, 200, 20)
level.levelIndicatorStyle = NSLevelIndicatorMBS.NSDiscreteCapacityLevelIndicatorStyle
level.minValue = 0
level.maxValue = 10
level.warningValue = 6
level.criticalValue = 8
level.doubleValue = 7

Self.NSWindowMBS.contentView.addSubview level
```

Notes: Level indicators provide a visual representation of a level or amount of something, using discrete values. While similar to NSSlider, it provides a more customized visual feedback to the user. Level indicators do not have a "knob" indicating the current setting or allowing the user to adjust settings. The supported indicator styles include:

- A capacity style level indicator. The continuous mode for this style is often used to indicate conditions such as how much data is on hard disk. The discrete mode is similar to audio level indicators in audio playback applications. You can specify both a warning value and a critical value that provides additional visual feedback to the user.
- A ranking style level indicator. This is similar to the star ranking displays provided in iTunes and iPhoto. You can also specify your own ranking image.
- A relevancy style level indicator. This style is used to display the relevancy of a search result, for example in Mail.

NSLevelIndicator uses an NSLevelIndicatorCell to implement much of the control's functionality. NSLevelIndicator provides cover methods for most of NSLevelIndicatorCell's methods, which invoke the corresponding cell method.
Subclass of the NSControlMBS class.

35.40.2 Methods

35.40.3 Constructor

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new level indicator with size 100/100 and position 0/0
Example:

```
Var t as new NSLevelIndicatorMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.40.4 Constructor(Handle as Integer) 6483
- 35.40.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6483

35.40.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSLevelIndicator handle.
Example:

```
Var t as new NSLevelIndicatorMBS(0, 0, 100, 100)
Var v as new NSLevelIndicatorMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSLevelIndicator and the plugin retains this handle.
See also:

- 35.40.3 Constructor 6483
- 35.40.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6483

35.40.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new level indicator with the given size and position.
Example:

```
Var x as new NSLevelIndicatorMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.40.3 Constructor 6483
- 35.40.4 Constructor(Handle as Integer) 6483

35.40.6 rectOfTickMarkAtIndex(index as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Returns the bounding rectangle of the tick mark identified by index (the minimum-value tick mark is at index 0).
Notes: If no tick mark is associated with index, the method raises a NSExceptionMBS.

35.40.7 tickMarkValueAtIndex(index as Integer) as Double

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's value represented by the tick mark at index (the minimum-value tick mark has an index of 0).

35.40.8 Properties

35.40.9 criticalValue as Double

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The critical value.
Notes: (Read and Write computed property)

35.40.10 levelIndicatorStyle as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Set style of the indicator.
Notes: (Read and Write computed property)

35.40.11 maxValue as Double

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The maximum value the level indicator can represent.
Notes: (Read and Write computed property)

35.40.12 minValue as Double

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The minimum value.
Notes: (Read and Write computed property)

35.40.13 numberOfMajorTickMarks as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The number of major tick marks displayed.
Notes: The count must be less than or equal to the number of tick marks returned by numberOfTickMarks. For example, if the number of tick marks is 11 and you specify 3 major tick marks, the resulting level indicator will display 3 major tickmarks alternating with 8 minor tick marks.
(Read and Write computed property)

35.40.14 numberOfTickMarks as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The number of tick marks displayed by the receiver (which include those assigned to the minimum and maximum values) to count.
Notes: By default, this value is 0, and no tick marks appear. The number of tick marks assigned to a slider, along with the slider's minimum and maximum values, determines the values associated with the tick marks.
(Read and Write computed property)

35.40.15 tickMarkPosition as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Where tick marks appear relative to the indicator.
Notes: This method has no effect if no tick marks have been assigned (that is, numberOfTickMarks returns 0).
(Read and Write computed property)

35.40.16 warningValue as Double

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The warning value.
Notes: (Read and Write computed property)

35.40.17 Constants

Style Constants

Constant	Value	Description
NSContinuousCapacityLevelIndicatorStyle	1	A style that is often used to indicate conditions such as how much a hard disk.
NSDiscreteCapacityLevelIndicatorStyle	2	A style similar to audio level indicators in iTunes.
NSRatingLevelIndicatorStyle	3	A style similar to the star ranking displays provided in iTunes and i
NSRelevancyLevelIndicatorStyle	0	A style similar to the rank column displayed when searching in Mail

Tick mark Constants

Constant	Value	Description
NSTickMarkAbove	1	Tick marks above (for horizontal sliders).
NSTickMarkBelow	0	Tick marks below (for horizontal sliders); the default for horizontal sliders.
NSTickMarkLeft	0	Tick marks to the left (for vertical sliders); the default. for vertical sliders
NSTickMarkRight	1	Tick marks to the right (for vertical sliders).

35.41 class NSMutableCharacterSetMBS

35.41.1 class NSMutableCharacterSetMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The NSMutableCharacterSet class declares the programmatic interface to objects that manage a modifiable set of Unicode characters.
Example:

```
// build a character set for valid file name characters and split a text with it
Var allowed As New NSMutableCharacterSetMBS
allowed.addCharactersInString "abcdefghijklmnopqrstuvwxyzABCDEFGHIJKLMNOPQRSTUVWXYZ0123456789-
_."
allowed.invert // now everything else

Var parts() As String = allowed.componentsSeparatedByCharactersInSet("My Report: 2025/06 (final).pdf")
MessageBox String.FromArray(parts, "_")
```

Notes: You can add or remove characters from a mutable character set as numeric values in NSRange structures or as character values in strings, combine character sets by union or intersection, and invert a character set.

Mutable character sets are less efficient to use than immutable character sets. If you don't need to change a character set after creating it, create an immutable copy with copy and use that.

NSMutableCharacterSet defines no primitive methods. Subclasses must implement all methods declared by this class in addition to the primitives of NSCharacterSet. They must also implement mutableCopy.
Subclass of the NSCharacterSetMBS class.

Xojo Developer Magazine

- 7.6, page 8: News

35.41.2 Methods

35.41.3 addCharactersInRange(aRange as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Adds to the receiver the characters whose Unicode values are in a given range.
Example:

```
Var m as new NSMutableCharacterSetMBS
Var r as new NSRangeMBS(65,3)
m.addCharactersInRange r
MessageBox m // shows "ABC"
```

Notes: aRange: The range of characters to add.

aRange.location is the value of the first character to add; aRange.location + aRange.length–1 is the value of the last. If aRange.length is 0, this method has no effect.

35.41.4 addCharactersInString(aString as string)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Adds to the receiver the characters in a given string.
Example:

```
Var m as new NSMutableCharacterSetMBS
m.addCharactersInString "Hello"
MessageBox m // shows "Helo"
```

Notes: This method has no effect if aString is empty.

35.41.5 Constructor

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates an empty mutable character set.

35.41.6 formIntersectionWithCharacterSet(otherset as NSMutableCharacterSetMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Modifies the receiver so it contains only characters that exist in both the receiver and otherSet.

35.41.7 formUnionWithCharacterSet(otherset as NSMutableCharacterSetMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Modifies the receiver so it contains all characters that exist in either the receiver or otherSet.

35.41.8 invert

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Replaces all the characters in the receiver with all the characters it didn't previously contain.
Notes: Inverting a mutable character set, whether by invert or by invertedSet, is much less efficient than inverting an immutable character set with invertedSet.

35.41.9 removeCharactersInRange(aRange as NSRangeMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Removes from the receiver the characters whose Unicode values are in a given range.
Example:

```
Var m as new NSMutableCharacterSetMBS
Var r as new NSRangeMBS(65,3)
m.addCharactersInRange new NSRangeMBS(65,6)
m.removeCharactersInRange r
MessageBox m // shows "DEF"
```

Notes: aRange: The range of characters to remove.

aRange.location is the value of the first character to remove; aRange.location + aRange.length–1 is the value of the last. If aRange.length is 0, this method has no effect.

35.41.10 removeCharactersInString(aString as string)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Removes from the receiver the characters in a given string.
Example:

```
Var m as new NSMutableCharacterSetMBS
m.addCharactersInString "Hello"
m.removeCharactersInString "World"
MessageBox m // shows "He"
```

Notes: This method has no effect if aString is empty.

35.42 class NSMutableIndexSetMBS

35.42.1 class NSMutableIndexSetMBS

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The NSMutableIndexSet class represents a mutable collection of unique unsigned integers, known as indexes because of the way they are used.
Example:

```
Var n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MessageBox str(n.firstIndex)+" "+str(n.lastIndex)
```

Notes: This collection is referred to as a mutable index set.

The values in a mutable index set are always sorted, so the order in which values are added is irrelevant.

You must not subclass the NSMutableIndexSet class.
Subclass of the NSIndexSetMBS class.

35.42.2 Methods

35.42.3 addIndex(index as Integer)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Adds an index to the receiver.
Example:

```
Var n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.addIndex 12
MessageBox str(n.count)
```

35.42.4 addIndexes(indexes as NSIndexSetMBS)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Adds the indexes in an index set to the receiver.
Example:

```
Var n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
Var x as new NSIndexSetMBS(12,5)
n.addIndexes x
```

MessageBox str(n.count)

35.42.5 addIndexesInRange(StartIndex as Integer, Length as Integer)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Adds the indexes in an index range to the receiver.
Example:

```
Var n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.addIndexesInRange 12,5
MessageBox str(n.count)
```

Notes: Index range to add. Must include only indexes representable as unsigned integers.

This method raises an NSRangeException when indexRange would add an index that exceeds the maximum allowed value for unsigned integers.

35.42.6 Constructor

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Initializes an allocated NSMutableIndexSet object.
Example:

```
Var x as new NSMutableIndexSetMBS
```

See also:

- 35.42.7 Constructor(index as Integer) 6491
- 35.42.8 Constructor(indexes as NSIndexSetMBS) 6492
- 35.42.9 Constructor(StartIndex as Integer, Length as Integer) 6492

35.42.7 Constructor(index as Integer)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Initializes an allocated NSMutableIndexSet object with an index.
Example:

```
Var n as new NSMutableIndexSetMBS(5)
MessageBox str(n.firstIndex)+" "+str(n.lastIndex)
```

See also:

- 35.42.6 Constructor 6491
- 35.42.8 Constructor(indexes as NSIndexSetMBS) 6492
- 35.42.9 Constructor(StartIndex as Integer, Length as Integer) 6492

35.42.8 Constructor(indexes as NSIndexSetMBS)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Initializes an allocated NSIndexSet object with an index set.
Example:

```
Var n as new NSMutableIndexSetMBS(5)
Var x as new NSMutableIndexSetMBS(n)
MessageBox str(x.firstIndex)
```

See also:

- 35.42.6 Constructor 6491
- 35.42.7 Constructor(index as Integer) 6491
- 35.42.9 Constructor(StartIndex as Integer, Length as Integer) 6492

35.42.9 Constructor(StartIndex as Integer, Length as Integer)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Initializes an allocated NSIndexSet object with an index range.
Example:

```
Var n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
```

Notes: This method raises an NSRangeException when indexRange would add an index that exceeds the maximum allowed value for unsigned integers.
See also:

- 35.42.6 Constructor 6491
- 35.42.7 Constructor(index as Integer) 6491
- 35.42.8 Constructor(indexes as NSIndexSetMBS) 6492

35.42.10 removeAllIndexes

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Removes the receiver's indexes.
Example:

```
Var n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.removeAllIndexes
MessageBox str(n.count)
```

35.42.11 removeIndex(index as Integer)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Removes an index from the receiver.
Example:

```
Var n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
MessageBox str(n.count)
n.removeIndex 8
MessageBox str(n.count)
```

35.42.12 removeIndexes(indexes as NSIndexSetMBS)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Removes the indexes in an index set from the receiver.
Example:

```
Var n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
Var x as new NSIndexSetMBS(5,2)
n.removeIndexes x
MessageBox str(n.firstIndex)+" "+str(n.lastIndex)
```

35.42.13 removeIndexesInRange(StartIndex as Integer, Length as Integer)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Removes the indexes in an index range from the receiver.
Example:

```
Var n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.removeIndexesInRange 5,2
```

```
MessageBox str(n.firstIndex)+" "+str(n.lastIndex)
```

35.42.14 shiftIndexes(StartingAtIndex as Integer, delta as Integer)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Shifts a group of indexes to the left or the right within the receiver.
Example:

```
Var n as new NSMutableIndexSetMBS(5,6) // 5, 6, 7, 8, 9, 10
n.shiftIndexes 7,3
MessageBox str(n.firstIndex)+" "+str(n.lastIndex)
```

Notes: startIndex: Head of the group of indexes to shift.
delta: Amount and direction of the shift. Positive integers shift the indexes to the right. Negative integers shift the indexes to the left.

The group of indexes shifted is made up by startIndex and the indexes that follow it in the receiver.

A left shift deletes the indexes in the range (startIndex-delta,delta) from the receiver.

A right shift inserts empty space in the range (indexStart,delta) in the receiver.

35.43 class NSMutableURLRequestMBS

35.43.1 class NSMutableURLRequestMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The Cocoa class for a mutable URL Request.
Example:

```
// send a JSON POST request with NSURLSession
Var request As New NSMutableURLRequestMBS("https://www.example.com/api/test")
request.setHTTPMethod "POST"
request.setValue "application/json", "Content-Type"
request.setTimeoutInterval 30
request.setHTTPBody """ { ""name"": ""test"" } """

// Task is a property of the window: Task As NSURLSessionDataTaskMBS
Task = NSURLSessionMBS.sharedSession.dataTaskWithRequest(request, AddressOf RequestCompleted)
Task.resume

// a method in the window:
Sub RequestCompleted(data As MemoryBlock, response As NSURLResponseMBS, error As NSErrorMBS,
tag As Variant)
If error <>Nil Then
System.DebugLog error.localizedDescription
ElseIf data <>Nil Then
System.DebugLog data.StringValue(0, data.Size)
End If
End Sub
```

Notes: NSMutableURLRequest is a subclass of NSURLRequest provided to aid developers who may find it more convenient to mutate a single request object for a series of URL load requests instead of creating an immutable NSURLRequest for each load.

This programming model is supported by the following contract between NSMutableURLRequest and NSURLConnection: NSURLConnection makes a deep copy of each NSMutableURLRequest object passed to one of its initializers.
Subclass of the NSURLRequestMBS class.

35.43.2 Methods

35.43.3 addValue(value as string, field as string)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Adds an HTTP header to the receiver's HTTP header dictionary.
Example:

```
Var m as new NSMutableURLRequestMBS("http://test.test")

m.addValue "Hello", "test"
m.addValue "World", "test"

MessageBox m.valueForHTTPHeaderField("test")
```

Notes: value: The value for the header field.
field: The name of the header field. In keeping with the HTTP RFC, HTTP header field names are case-insensitive

This method provides the ability to add values to header fields incrementally. If a value was previously set for the specified field, the supplied value is appended to the existing value using the appropriate field delimiter. In the case of HTTP, this is a comma.

35.43.4 Constructor(url as string)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates an NSURLRequest with the given URL.
Example:

```
Var m as new NSMutableURLRequestMBS("http://test.test")

MessageBox m.URL
```

Notes: Default values are used for cache policy (NSURLRequestUseProtocolCachePolicy) and timeout interval (60 seconds).

On success, handle property is not zero.
See also:

- 35.43.5 Constructor(url as string, cachePolicy as Integer, timeoutInterval as Double) 6497

35.43.5 Constructor(url as string, cachePolicy as Integer, timeoutInterval as Double)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates an NSURLRequest with the given URL.
See also:

- 35.43.4 Constructor(url as string) 6496

35.43.6 setAllHTTPHeaderFields(headerFields as Dictionary)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Replaces the receiver's header fields with the passed values.
Notes: headerFields: A dictionary with the new header fields. HTTP header fields must be string values; therefore, each object and key in the headerFields dictionary must be a String. If either the key or value for a key-value pair is not a string, the key-value pair is skipped.

35.43.7 setAttribution(Attribution as Integer)

MBS MacBase Plugin, Plugin Version: 21.5, Platform: macOS, Targets: All.

Function: Sets the NSURLRequestAttribution to associate with this request.
Notes: Defaults to NSURLRequestAttributionDeveloper.

35.43.8 setCachePolicy(policy as Integer)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Sets the cache policy of the receiver.
Notes: policy: The new cache policy.

Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

These constants are used to specify interaction with the cached responses.
NSURLRequestUseProtocolCachePolicy = 0,
NSURLRequestReloadIgnoringLocalCacheData = 1,
NSURLRequestReloadIgnoringLocalAndRemoteCacheData = 4,
NSURLRequestReturnCacheDataElseLoad = 2,
NSURLRequestReturnCacheDataDontLoad = 3,
NSURLRequestReloadRevalidatingCacheData = 5

35.43.9 setHTTPBody(data as MemoryBlock)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sets the request body of the receiver to the specified data.
Notes: data: The new request body for the receiver. This is sent as the message body of the request, as in an HTTP POST request.

35.43.10 setHTTPMethod(HTTPMethod as string)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sets the receiver's HTTP request method.
Example:

```
Var m as new NSMutableURLRequestMBS("http://test.test")
m.setHTTPMethod "PUT"
MessageBox m.HTTPMethod
```

Notes: HTTPMethod: The new HTTP request method. The default HTTP method is "GET".

35.43.11 setHTTPShouldHandleCookies(should as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sets whether the receiver should use the default cookie handling for the request.
Example:

```
// This example needs a window with HTMLViewer1.
Var r as NSURLRequestMBS = NSURLRequestMBS.requestWithURL("http://www.apple.de")
Var m as NSMutableURLRequestMBS = r.mutableCopy
m.setHTTPShouldHandleCookies(false)
HTMLViewer1.LoadRequest m
```

Notes: handleCookies: True if the receiver should use the default cookie handling for the request, false otherwise. The default is true.

35.43.12 setHTTPShouldUsePipelining(shouldUsePipelining as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sets whether the request should not wait for the previous response before transmitting.
Notes: True if the receiver should transmit before the previous response is received. False to wait for the previous response before transmitting.

Calling this method with a true value does not guarantee HTTP pipelining behavior. HTTP 1.1 allows the client to send multiple requests to the server without waiting for a response.
Though HTTP 1.1 requires support for pipelining, some servers report themselves as being HTTP 1.1 but do not support pipelining. To maintain compatibility with these servers, requests may have to wait for the previous response before transmitting.

Available on Mac OS X 10.7 or newer.

35.43.13 setMainDocumentURL(url as string)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Sets the main document URL for the receiver.
Example:

```
Var m as new NSMutableURLRequestMBS("http://test.test/test.jpg")
m.setMainDocumentURL "http://test.test/"
MessageBox m.mainDocumentURL
```

Notes: url: The new main document URL. Can be nil.

The caller should set the main document URL to an appropriate main document, if known. For example, when loading a web page the URL of the HTML document for the top-level frame would be appropriate. This URL will be used for the "only from same domain as main document" cookie accept policy.
Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

35.43.14 setNetworkServiceType(networkServiceType as Integer)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sets the NSURLRequestNetworkServiceType to associate with this request.
Notes: networkServiceType: The service type to associate with the request.
This method is used to provide the network layers with a hint as to the purpose of the request. Most clients should not need to use this method. See NSURLNetworkServiceType* constants.
Available in Mac OS X 10.7 or newer.

35.43.15 setTimeoutInterval(seconds as Double)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Sets the receiver's timeout interval, in seconds.
Notes: seconds: The timeout interval, in seconds. If during a connection attempt the request remains idle for longer than the timeout interval, the request is considered to have timed out. The default timeout interval is 60 seconds.

Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

35.43.16 setURL(url as string)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Sets the URL of the receiver.
Notes: Available in Mac OS X v10.2 with Safari 1.0 installed.
Available in Mac OS X v10.2.7 and later.

35.43.17 setValue(value as string, field as string)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sets the specified HTTP header field.
Example:

```
Var m as new NSMutableURLRequestMBS("http://test.test")
m.setValue("just a test", "test")
MessageBox m.valueForHTTPHeaderField("test")
```

Notes: value: The new value for the header field. Any existing value for the field is replaced by the new value.
field: The name of the header field to set. In keeping with the HTTP RFC, HTTP header field names are case-insensitive.

35.43.18 Properties

35.43.19 allowsCellularAccess as Boolean

MBS MacBase Plugin, Plugin Version: 26.0, Platform: macOS, Targets: All.

Function: Sets whether a connection created with this request is allowed to use the built in cellular radios (if present).
Notes: False if the receiver should not be allowed to use the built in cellular radios to satisfy the request, true otherwise. The default is true.
(Read and Write property)

35.43.20 allowsConstrainedNetworkAccess as Boolean

MBS MacBase Plugin, Plugin Version: 26.0, Platform: macOS, Targets: All.

Function: Sets whether a connection created with this request is allowed to use network interfaces which have been marked as constrained.
Notes: False if the receiver should not be allowed to use an interface marked as constrained to satisfy the request, true otherwise.
(Read and Write property)

35.43.21 allowsExpensiveNetworkAccess as Boolean

MBS MacBase Plugin, Plugin Version: 26.0, Platform: macOS, Targets: All.

Function: Sets whether a connection created with this request is allowed to use network interfaces which have been marked as expensive.
Notes: False if the receiver should not be allowed to use an interface marked as expensive to satisfy the request, true otherwise.
(Read and Write property)

35.43.22 allowsUltraConstrainedNetworkAccess as Boolean

MBS MacBase Plugin, Plugin Version: 26.0, Platform: macOS, Targets: All.

Function: Sets whether a connection created with this request is allowed to use network interfaces which have been marked as ultra constrained.
Notes: False if the receiver should not be allowed to use an interface marked as ultra constrained to satisfy the request, true otherwise.

Available in macOS/iOS 26.1 or later.

(Read and Write property)

35.44 class NSOutputStreamMBS

35.44.1 class NSOutputStreamMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: A stream that provides write-only stream functionality.
Example:

```
// write data in pieces to a file
Var path As String = SpecialFolder.Desktop.Child("log.txt").NativePath
Var stream As NSOutputStreamMBS = NSOutputStreamMBS.outputStreamToFileAtPath(path, True) //
True = append
stream.Open

For i As Integer = 1 To 10
Var line As String = "Line " + i.ToString + EndOfLine
Call stream.write(line)
Next

stream.Close

// or collect the data in memory
Var memory As NSOutputStreamMBS = NSOutputStreamMBS.outputStreamToMemory
memory.Open
Call memory.write("Hello")
Var data As MemoryBlock = memory.OutputData
memory.Close
MessageBox data.Size.ToString + " bytes in memory"
```

Notes: Subclass of the NSStreamMBS class.
Blog Entries

- MBS Xojo Plugins, version 18.2pr2

35.44.2 Methods

35.44.3 Constructor

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Creates and returns an initialized output stream that will write stream data to memory.
Notes: Returns an initialized output stream that will write stream data to memory.

The stream must be opened before it can be used.

You retrieve the contents of the memory stream by OutputData property.
See also:

- 35.44.4 Constructor(filePath as string, append as boolean) 6504

35.44.4 Constructor(filePath as string, append as boolean)

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Creates and returns an initialized output stream for writing to a specified file.
Notes: path: The path to the file the output stream will write to.
append: True if newly written data should be appended to any existing file contents, otherwise false.

Returns an initialized output stream that can write to path.

The stream must be opened before it can be used.
See also:

- 35.44.3 Constructor 6503

35.44.5 OutputData as MemoryBlock

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The output of the memory stream.

35.44.6 outputStreamToFileAtPath(filePath as string, append as boolean) as NSOutputStreamMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Creates and returns an initialized output stream for writing to a specified file.
Notes: path: The path to the file the output stream will write to.
append: True if newly written data should be appended to any existing file contents, otherwise false.

Returns an initialized output stream that can write to path.

The stream must be opened before it can be used.

35.44.7 outputStreamToMemory as NSOutputStreamMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Creates and returns an initialized output stream that will write stream data to memory.
Notes: Returns an initialized output stream that will write stream data to memory.

The stream must be opened before it can be used.

You retrieve the contents of the memory stream by OutputData property.

35.44.8 outputStreamWithURL(fileURL as string, append as boolean) as NSOutputStreamMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Creates and returns an initialized output stream for writing to a specified URL.
Notes: fileURL: The URL to the file the output stream will write to.
append: True if newly written data should be appended to any existing file contents, otherwise false.

Returns an initialized output stream that can write to url.

The stream must be opened before it can be used.

35.44.9 write(data as MemoryBlock) as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Writes the contents of a provided data buffer to the receiver.
Notes: Returns a number indicating the outcome of the operation:
A positive number indicates the number of bytes written.
0 indicates that a fixed-length stream and has reached its capacity.
-1 means that the operation failed; more information about the error can be obtained with streamError.

35.44.10 Properties

35.44.11 hasSpaceAvailable as Boolean

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: A boolean value that indicates whether the receiver can be written to.
Notes: True if the receiver can be written to or if a write must be attempted in order to determine if space is available, false otherwise.
(Read only property)

35.45 class NSPanelMBS

35.45.1 class NSPanelMBS

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: The NSPanel class implements a special kind of window (known as a panel), typically performing an auxiliary function.
Example:

static n as NSPanelMBS

Var style as Integer = NSPanelMBS.NSClosableWindowMask + NSPanelMBS.NSTitledWindowMask + NSPanelMBS.NSUtilityWindowMask + NSPanelMBS.NSHUDWindowMask + NSPanelMBS.NSResizableWindowMask

n = new NSPanelMBS(100,100,200,200, style, NSPanelMBS.NSWindowBackingLocationDefault, false)

n.Title = "Hello World"
n.Show

Notes: Subclass of the NSWindowMBS class.
Blog Entries

- MBS Real Studio Plugins, version 12.5pr8
- HUD Windows in REALbasic
- MonkeyBread Software Releases the MBS Plugins 8.2

35.45.2 Methods

35.45.3 Constructor(x as Double, y as Double, w as Double, h as Double, styleMask as Integer, BackingStoreType as Integer, deferCreation as boolean)

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The constructor to create a new Cocoa Windows.
Example:

static n as NSPanelMBS

Var style as Integer = NSPanelMBS.NSClosableWindowMask + NSPanelMBS.NSTitledWindowMask + NSPanelMBS.NSUtilityWindowMask + NSPanelMBS.NSHUDWindowMask + NSPanelMBS.NSResizableWindowMask

```
n = new NSPanelMBS(100,100,200,200, style, NSPanelMBS.NSWindowBackingLocationDefault, false)

n.Title = "Hello World"
n.Show
```

Notes: x,y,w,h:
Location and size of the window's content area in screen coordinates. Note that the window server limits window position coordinates to ¬±16,000 and sizes to 10,000.

styleMask:
The window's style. Either it can be NSBorderlessWindowMask, or it can contain any of the options described in the constants, combined using the bitwiseOR function. Borderless windows display none of the usual peripheral elements and are generally useful only for display or caching purposes; you should normally not need to create them. Also, note that a window's style mask should include NSTitledWindowMask if it includes any of the others.

bufferingType:
Specifies how the drawing done in the window is buffered by the window device, and possible values are described in "Constants."

deferCreation:
Specifies whether the window server creates a window device for the window immediately. When true, the window server defers creating the window device until the window is moved onscreen. All display messages sent to the window or its views are postponed until the window is created, just before it's moved onscreen.

Initialized NSWindow object.

This method is the designated initializer for the NSWindow class.

Deferring the creation of the window improves launch time and minimizes the virtual memory load on the window server.

The new window creates a view to be its default content view. You can replace it with your own object by using the ContentView property.

35.45.4 RunAlertPanel(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Runs an alert panel.

35.45.5 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as DesktopWindow) as integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Run an alert panel.
See also:

- 35.45.6 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer 6509
- 35.45.7 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer 6509

35.45.6 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Run an alert panel.
See also:

- 35.45.5 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as DesktopWindow) as integer 6509
- 35.45.7 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer 6509

35.45.7 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Run an alert panel.
See also:

- 35.45.5 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as DesktopWindow) as integer 6509
- 35.45.6 RunAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer 6509

35.45.8 RunCriticalAlertPanel(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Runs a critical alert panel.

35.45.9 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as DesktopWindow) as integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Runs a critical alert panel.
See also:

- 35.45.10 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer 6510
- 35.45.11 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer 6510

35.45.10 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Runs a critical alert panel.
See also:

- 35.45.9 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as DesktopWindow) as integer 6510
- 35.45.11 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer 6510

35.45.11 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Runs a critical alert panel.
See also:

- 35.45.9 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as DesktopWindow) as integer 6510
- 35.45.10 RunCriticalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer 6510

35.45.12 RunInformationalAlertPanel(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Run an informational alert panel.

35.45.13 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as DesktopWindow) as integer

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Run an informational alert panel.
See also:

- 35.45.14 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer 6511
- 35.45.15 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer 6512

35.45.14 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Run an informational alert panel.
See also:

- 35.45.13 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as DesktopWindow) as integer 6511

35.45.15 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as window) as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Run an informational alert panel.
See also:

- 35.45.13 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as DesktopWindow) as integer 6511
- 35.45.14 RunInformationalAlertPanelRelativeToWindow(title as string, message as string, defaultButton as string, alternateButton as string, otherButton as string, docWindow as NSWindowMBS) as Integer 6511

35.45.16 Properties

35.45.17 becomesKeyOnlyIfNeeded as boolean

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: whether the panel becomes the key window only when needed.
Notes: By default, this attribute is set to false, indicating that the panel becomes key as other windows do. (Read and Write computed property)

35.45.18 isFloatingPanel as boolean

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Whether the panel is a floating panel.
Notes: True when the receiver is a floating panel, false otherwise.

By default, panels do not float above other windows. It's appropriate for an panel to float above other windows only if all of the following conditions are true:

- It is small enough not to obscure whatever is behind it.

- It is oriented more to the mouse than to the keyboard—that is, if it doesn't become the key window or becomes so only when needed.

- It needs to remain visible while the user works in the application's normal windows—for example, if the user must frequently move the cursor back and forth between a normal window and the panel (such as a tool palette), or if the panel gives information relevant to the user's actions in a normal window.

- It hides when the application is deactivated (the default behavior for panels).

(Read and Write computed property)

35.45.19 worksWhenModal as boolean

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver receives keyboard and mouse events even when some other window is being run modally.
Notes: True when the receiver receives keyboard and mouse events even when some other window is being run modally, false otherwise.

By default, this attribute is set to false, indicating a panel's ineligibility for events during a modal loop or session.
(Read and Write computed property)

35.45.20 Constants

Constants

Constant	Value	Description
NSAlertAlternateReturn	0	One of the possible return values for the alert panels. The user pressed the alternate button.
NSAlertDefaultReturn	1	One of the possible return values for the alert panels. The user pressed the default button.
NSAlertErrorReturn	-2	One of the possible return values for the alert panels. The alert cannot identify the reason it was closed; it may have been closed by an external source or by a button other than those listed above.
NSAlertOtherReturn	-1	One of the possible return values for the alert panels. The user pressed a second alternate button.
NSCancelButton	0	One of the constants for the modal panel return values. The Cancel button.
NSDocModalWindowMask	64	One of the constants you can use to specify the style when creating a window. The panel is created as a modal sheet.
NSHUDWindowMask	8192	One of the constants you can use to specify the style when creating a window.
NSNonactivatingPanelMask	128	One of the constants you can use to specify the style when creating a window. The panel can receive keyboard input without activating the owning application.
NSOKButton	1	One of the constants for the modal panel return values. The OK button.
NSUtilityWindowMask	16	One of the constants you can use to specify the style when creating a window. The panel is created as a floating window.

35.46 class NSPointMBS

35.46.1 class NSPointMBS

MBS Main Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: A Xojo class for the point structure in Cocoa.
Example:

```
Var n as NSPointMBS = NSMakePointMBS(500,600)
MessageBox n.String
```

Blog Entries

- Intercept Menus with MBS Xojo Plugins

- MBS REALbasic plug-in 9.6

35.46.2 Methods

35.46.3 Constructor

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates an empty point.
Example:

```
Var p as new NSPointMBS
MessageBox p // shows { 0 ,0 }
```

See also:

- 35.46.4 Constructor(p as Ptr) 6515
- 35.46.5 Constructor(s as string) 6516
- 35.46.6 Constructor(x as Double, y as Double) 6516

35.46.4 Constructor(p as Ptr)

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Creates a new instance using data at the pointer.
Notes: Make sure the pointer is valid and has the right data and size.
See also:

- 35.46.3 Constructor 6515
- 35.46.5 Constructor(s as string) 6516
- 35.46.6 Constructor(x as Double, y as Double) 6516

35.46.5 Constructor(s as string)

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a new NSPoint object using the given string.
Example:

```
Var p as new NSPointMBS(" { 3,4 } ")
MessageBox p // shows { 3 ,4 }
```

See also:

- 35.46.3 Constructor 6515
- 35.46.4 Constructor(p as Ptr) 6515
- 35.46.6 Constructor(x as Double, y as Double) 6516

35.46.6 Constructor(x as Double, y as Double)

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a new NSPoint object using the given values.
See also:

- 35.46.3 Constructor 6515
- 35.46.4 Constructor(p as Ptr) 6515
- 35.46.5 Constructor(s as string) 6516

35.46.7 Equal(other as NSPointMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Whether two points are equal.

35.46.8 Operator_Convert as String

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Converts the object to string.
Example:

```
Var p as new NSPointMBS(1,2)

MessageBox p // shows { 1 ,2 }
```

35.46.9 String as String

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the string representation of this point.
Example:

```
Var p as new NSPointMBS(1,2)

MessageBox p.String // shows { 1,2 }
```

35.46.10 Zero as NSPointMBS

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Returns a point with all values being zero.

35.46.11 Properties

35.46.12 Handle as Ptr

MBS Main Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: The pointer to the internal data structure.
Notes: May be useful for passing to declares requiring a NSPoint*.
Size of structure is 8 bytes for 32-bit (two singles) and 16 bytes for 64-bit (two doubles).
(Read only property)

35.46.13 X as Double

MBS Main Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The horizontal coordinate.
Notes: (Read and Write property)

35.46.14 Y as Double

MBS Main Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The vertical coordinate.
Notes: (Read and Write property)

35.47 class NSPopoverMBS

35.47.1 class NSPopoverMBS

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The Xojo class for a pop-over.
Example:

```
// This example needs a window with Button1.
// show a popover with a label below a button
// Popover is a property of the window: Popover As NSPopoverMBS
Var label As New NSTextFieldMBS(20, 20, 200, 22)
label.stringValue = "Hello from the popover"
label.Editable = False
label.Bordered = False
label.drawsBackground = False

Var content As New NSViewMBS(0, 0, 240, 62)
content.addSubview label

Var controller As New NSViewControllerMBS
controller.view = content

Popover = New NSPopoverMBS
Popover.contentViewController = controller
Popover.behavior = NSPopoverMBS.NSPopoverBehaviorTransient
Popover.animates = True

Var v As NSViewMBS = Button1.NSViewMBS
Popover.showRelativeToRect(v.bounds, v, NSPopoverMBS.MinYEdge)
```

Notes: A popover is a unit of content that is positioned relative to some other content on the screen. An anchor is used to express the relation between these two units of content. Each popover has an appearance that specifies its visual characteristics, as well as a behavior that determines which user interactions will cause the popover to close. A transient popover is closed in response to most user interactions, whereas a semi-transient popovers is closed when the user interacts with the window containing the popover's positioning view. Popovers with application-defined behavior are not usually closed on the developer's behalf. AppKit automatically positions each popover relative to its positioning view and moves the popover whenever its positioning view moves. A positioning rectangle within the positioning view can be specified for additional granularity. Popovers can be detached to become a separate window when they are dragged by implementing the appropriate delegate method.

Please also check the documentation from Apple for the NSPopover class.
Available in Mac OS X v10.7 and later.

35.47.2 Methods

35.47.3 available as boolean

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Whether pop-overs are available.
Example:

MessageBox "NSPopover available: "+str(NSPopoverMBS.available)

Notes: Returns true on Mac OS X 10.7.

35.47.4 Close

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Forces the popover to close without calling events.
Notes: Any popovers nested within the popovers will also receive a close message. When a window is closed in response to the close message being sent, all of its popovers will be closed. The popover will animate out when closed (unless the animates property is set to false).

35.47.5 Constructor

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new popover.

35.47.6 Destructor

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The destructor.

35.47.7 isShown as boolean

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Whether popover is visible.
Notes: True if the popover is being shown, false otherwise. The popover is considered to be shown from the point when showRelativeToRect is invoked until the popover is closed in response to an invocation of either close or performClose.

35.47.8 NSPopoverCloseReasonDetachToWindow as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the constant for the close reason.
Notes: Specifies that the popover has been closed because it is being detached to a window; a possible value for NSPopoverCloseReasonKey.

35.47.9 NSPopoverCloseReasonKey as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the close notification parameter dictionary.
Notes: Specifies the close reason. Currently used only as the userInfo key for the NSPopoverWillCloseNotification.

35.47.10 NSPopoverCloseReasonStandard as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the constant for the close reason.
Notes: Specifies that the popover is being closed in a standard way; a possible value for NSPopoverCloseReasonKey.

35.47.11 NSPopoverDidCloseNotification as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the notification names you can use with NSNotificationObserverMBS class.
Notes: Sent after the popover has finished animating offscreen. This notification has the same user info keys as NSPopoverWillCloseNotification.

35.47.12 NSPopoverDidShowNotification as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the notification names you can use with NSNotificationObserverMBS class.
Notes: Sent after the popover has finished animating onscreen.

35.47.13 NSPopoverWillCloseNotification as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the notification names you can use with NSNotificationObserverMBS class.
Notes: Sent before the popover is closed. The userInfo key NSPopoverCloseReasonKey specifies the reason for closing. It can currently be either NSPopoverCloseReasonStandard or NSPopoverCloseReasonDetachToWindow, although more reasons for closing may be added in the future.

35.47.14 NSPopoverWillShowNotification as string

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the notification names you can use with NSNotificationObserverMBS class.
Notes: Sent before the popover is shown.

35.47.15 performClose

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Attempts to close the popover.
Notes: The popover will not be closed if popoverShouldClose event returns false. The operation will fail if it is displaying a nested popover, or if it has a child window. A window will attempt to close its popovers when it receives a performClose message. The popover will animate out when closed (unless the animates property is set to false).

35.47.16 showRelativeToRect(positioningRect as NSRectMBS, view as NSViewMBS, edge as Integer)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Shows the popover positioned relative to positioningRect of positioningView (see the description of positioningRect).
Notes: The common case is to pass positioningView.bounds for positioningRect, in which case the popover will be placed adjacent to the positioningView and there is no need to update positioningRect (AppKit will detect the bounds of the positioning view was specified and automatically update the positioningView). preferredEdge is a hint to AppKit about the desired placement of the anchor of the popover towards the positioningRect, and is with respect to the isFlipped state of the positioningView. Also, if positioningRect is an empty rect, the view.bounds will automatically be used. The current (but not guaranteed) behavior is that AppKit will place the anchor towards the preferredEdge of the positioningRect unless such a placement would cause the popover not to fit on the screen of positioningView. If the anchor cannot be placed towards the preferredEdge, AppKit will (in the current implementation) attempt to place the anchor on the opposite side of the positioningRect. If that cannot be done, AppKit will attempt to place the anchor on a remaining sides of the popover, and failing that will center the popover on the screen, causing it to (at least temporarily) lose its anchor. The popover will animate onscreen and eventually animate offscreen when it is closed (unless the property animates is set to false). This method will throw a NSInvalidArgumentException if view is nil or if view is not in a window, or if the popover's behavior is NSPopoverBehaviorSemitransient and the popover's positioningView is in a popover or child window. It will throw a NSInternalInconsistencyException if the popover's content view controller (or the view controller's view) is nil. If the popover is already being shown, this method will update to be associated with the new view and positioningRect passed. If the positioning view is not visible, this method does nothing.

35.47.17 Properties

35.47.18 Handle as Integer

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The internal reference to the NSPopover object.
Notes: (Read and Write property)

35.47.19 Tag as Variant

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The tag.
Notes: You can use this property for whatever you like.
e.g. to keep the reference to the NSViewControllerMBS object.
(Read and Write property)

35.47.20 animates as boolean

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Should the popover be animated when it shows, closes, or appears to transition to a detachable window.
Notes: This property also controls whether the popover animates when the content view or content size changes. AppKit does not guarantee which behaviors will be animated or that this property will be respected; it is regarded as a hint. The default value is true.
(Read and Write computed property)

35.47.21 behavior as Integer

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The behavior of the popover.
Notes: The default behavior is NSPopoverBehaviorApplicationDefined. See the declaration of NSPopoverBehavior* constants for more information about popover behaviors.
(Read and Write computed property)

35.47.22 contentSize as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The content size of the popover.
Notes: The popover's content size is set to match the size of the content view when the content view controller is set. Changes to the content size of the popover will animate while the popover is shown (provided animates is true).
(Read and Write computed property)

35.47.23 contentViewController as NSViewControllerMBS

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The view controller that manages the content of the popover.
Notes: Please use with NSViewControllerMBS class.
The default value is nil. You must set the content view controller of the popover to a non-nil value before the popover is shown. Changes to the popover's content view controller while the popover is shown will animate (provided animates is true).
(Read and Write computed property)

35.47.24 positioningRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The positioning rectangle.
Notes: Popovers are positioned relative to a positioning view and are automatically moved when the location or size of the positioning view changes. Sometimes it is desirable to position popovers relative to a rectangle within the positioning view. In this case, you must update the positioningRect binding whenever this rectangle changes, or use the positioningRect binding so AppKit can re-position the popover when appropriate.
(Read and Write computed property)

35.47.25 Events

35.47.26 detachableWindowForPopover as NSWindowMBS

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Detaches the popover creating a window containing the content.
Notes: You return a window instance to which the popover should be detached.

You should not remove the popover's content view as part of your implementation of this method.

The popover and the detachable window may be shown at the same time and therefore cannot share a content view (or a content view controller).

If the popover and the detachable window should have the same content, you should define the content with a separate view and use a view controller to instantiate separate copies of the content for the popover and the detachable window.

The popover will animate to appear as though it morphs into the detachable window (unless the popover animates property is set to false. The exact animation used is not guaranteed.

If you do not implement this event or it returns nil, the default behavior is that the popup is not detached.

35.47.27 popoverDidClose(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the popover did close.
Notes: Invoked on the delegate when the NSPopoverDidCloseNotification notification is sent.

35.47.28 popoverDidDetach

MBS MacControls Plugin, Plugin Version: 22.4, Platform: macOS, Targets: Desktop only.

Function: Indicates that a popover has been released while it's in an implicitly detached state.
Notes: This event is not called when the popover's detached window is returned by detachableWindowFor-Popover.

35.47.29 popoverDidShow(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the popover has been shown.
Notes: Invoked on the delegate when the NSPopoverDidShowNotification notification is sent.

35.47.30 popoverShouldClose as boolean

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Allows a delegate to override a close request.
Notes: Return true if the popover should close, false otherwise.

The popover invokes this method on its delegate whenever it is about to close. This gives you a chance to override the close.

If you do not implement this method the default behavior is that the popover will close.

35.47.31 popoverShouldDetach as boolean

MBS MacControls Plugin, Plugin Version: 22.4, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether a popover should detach from its positioning view and become a separate window.
Notes: If you don't implement this event, it returns false by default. If you return true from this event, but you don't implement detachableWindowForPopover or you implement it to return nil, a detachable window is created with the popover,Äôs contentViewController.

An automatically created window has the same appearance as the detached popover. For example, if the popover's contentViewController has a title, it will be bound to and displayed as the title of the detached window. When a popover is released in a detached state, it calls popoverDidDetach event. When a detached popover is closed, calls to popoverShouldClose, popoverWillClose, and popoverDidClose, in addition to the

related notifications, specify the reason NSPopoverCloseReasonStandard.

35.47.32 popoverWillClose(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the popover is about to close.
Notes: Invoked on the delegate when the NSPopoverWillCloseNotification notification is sent.

35.47.33 popoverWillShow(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the popover will show.
Notes: Invoked on the delegate when the NSPopoverWillShowNotification notification is sent.

35.47.34 Constants

Edge constants

Constant	Value	Description
MaxXEdge	2	right
MaxYEdge	3	top (Cocoa coordinates have 0 on bottom of screen)
MinXEdge	0	left
MinYEdge	1	bottom (Cocoa coordinates have 0 on bottom of screen)

Behavior modes

Constant	Value	Description
NSPopoverBehaviorApplicationDefined	0	Your application assumes responsibility for closing the popover. AppK still close the popover in a limited number of circumstances. For instance Kit will attempt to close the popover when the window of its positionin is closed. The exact interactions in which AppKit will close the popov not guaranteed. You may consider implementing -cancel: to close the p when the escape key is pressed.
NSPopoverBehaviorSemitransient	2	AppKit will close the popover when the user interacts with user interfa ments in the window containing the popover's positioning view. Semi-tra popovers cannot be shown relative to views in other popovers, nor can t shown relative to views in child windows. The exact interactions that semi-transient popovers to close are not specified.
NSPopoverBehaviorTransient	1	AppKit will close the popover when the user interacts with a user in element outside the popover. Note that interacting with menus or pane become key only when needed will not cause a transient popover to clos exact interactions that will cause transient popovers to close are not sp

35.48 class NSRangeMBS

35.48.1 class NSRangeMBS

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: This is the Cocoa class for a Range.
Example:

```
// work with text ranges as used by Cocoa text functions
Var r1 As New NSRangeMBS(5, 10) // characters 5 to 14
Var r2 As New NSRangeMBS(12, 10) // characters 12 to 21

Var i As NSRangeMBS = r1.Intersection(r2)
Var u As NSRangeMBS = r1.Union(r2)

MessageBox "Intersection: " + i.String + EndOfLine + _
"Union: " + u.String + EndOfLine + _
"End of r1: " + r1.MaxRange.ToString + EndOfLine + _
"7 in r1: " + r1.LocationInRange(7).ToString
```

35.48.2 Methods

35.48.3 Constructor

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates an empty range.
Example:

```
Var r as new NSRangeMBS
MessageBox r // { 0, 0 }
```

See also:

35.48.6 Constructor(s as string)

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a new NSRange object using the given string.
Example:

```
Var r as new NSRangeMBS(" { 3, 4 } ")
MessageBox r // { 3, 4 }
```

See also:

35.48.7 Equal(other as NSRangeMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Whether two ranges are equal.

35.48.8 Intersection(other as NSRangeMBS) as NSRangeMBS

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the intersection of the two ranges.

35.48.9 LocationInRange(location as UInt32) as boolean

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Whether the location is in the range.

35.48.10 Operator_Convert as String

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Converts the object to string.
Example:

```
Var r as new NSRangeMBS(" { 3, 4 } ")
MessageBox r // { 3, 4 }
```

35.48.11 String as String

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the string representation of this range.
Example:

```
Var r as new NSRangeMBS(" { 3, 4 } ")
MessageBox r.String // { 3, 4 }
```

35.48.12 Union(other as NSRangeMBS) as NSRangeMBS

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates the union of two ranges.

35.48.13 Properties

35.48.14 Handle as Ptr

MBS Main Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: The pointer to the internal data structure.
Notes: May be useful for passing to declares requiring a NSRange*.
(Read only property)

35.48.15 Length as UInt32

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The length of the range.
Example:

```
Var r as new NSRangeMBS(" { 3, 4 } ")
MessageBox str(R.Length) // 4
```

Notes: (Read and Write property)

35.48.16 Location as UInt32

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The position of the range.
Notes: (Read and Write property)

35.48.17 MaxRange as UInt32

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The maximum value of the range.
Notes: Same as location+length.
(Read only property)

35.49 class NSRectMBS

35.49.1 class NSRectMBS

MBS Main Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: A Xojo class for the rect structure in Cocoa.
Example:

```
Var n as NSRectMBS = NSMakeRectMBS(100,200,500,600)
MessageBox n.String
```

35.49.2 Methods

35.49.3 Constructor

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates an empty rectangle.
Example:

```
Var p as new NSRectMBS
MessageBox p // shows { { 0 ,0 } , { 0 ,0 } }
```

See also:

- 35.49.4 Constructor(p as Ptr) 6535
- 35.49.5 Constructor(s as string) 6535
- 35.49.6 Constructor(X as Double, Y as Double, W as Double, H as Double) 6535

35.49.4 Constructor(p as Ptr)

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Creates a new instance using data at the pointer.
Notes: Make sure the pointer is valid and has the right data and size.
See also:

- 35.49.3 Constructor 6534
- 35.49.5 Constructor(s as string) 6535
- 35.49.6 Constructor(X as Double, Y as Double, W as Double, H as Double) 6535

35.49.5 Constructor(s as string)

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a new NSRect object using the given string.
Example:

```
Var p as new NSRectMBS(" { { 1,2 } , { 3,4 } } ")
MessageBox p // shows { { 1, 2 } , { 3, 4 } }
```

See also:

- 35.49.3 Constructor 6534
- 35.49.4 Constructor(p as Ptr) 6535
- 35.49.6 Constructor(X as Double, Y as Double, W as Double, H as Double) 6535

35.49.6 Constructor(X as Double, Y as Double, W as Double, H as Double)

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a new NSRect object using the given values.
See also:

- 35.49.3 Constructor 6534
- 35.49.4 Constructor(p as Ptr) 6535
- 35.49.5 Constructor(s as string) 6535

35.49.7 Contains(other as NSPointMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Whether the rectangle contains the given point.
See also:

- 35.49.8 Contains(other as NSRectMBS) as boolean 6536

35.49.8 Contains(other as NSRectMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Whether the rectangle contains the given rectangle.
See also:

- 35.49.7 Contains(other as NSPointMBS) as boolean 6536

35.49.9 Equal(other as NSRectMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Whether two rectangles are equal.

35.49.10 Inset(dx as Double, dy as Double) as NSRectMBS

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Insets the rectangle by the given delta.
Example:

```
Var p as new NSRectMBS(1.1,2.2,3.3,4.4)
Var r as NSRectMBS = p.Inset(2,3)
MessageBox r.String // shows { { 3.1, 5.2 } , { -0.7, -1.6 } }
```

35.49.11 Integral as NSRectMBS

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the integral of the rectangle.
Example:

```
Var p as new NSRectMBS(1.1,2.2,3.3,4.4)
Var r as NSRectMBS = p.Integral
```

```
MessageBox r.String // shows { { 1, 2 } , { 4, 5 } }
```

35.49.12 Intersection(other as NSRectMBS) as NSRectMBS

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the intersection of two rectangles.

35.49.13 Intersects(other as NSRectMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the intersection of the rectangle with the other rectangle.

35.49.14 Operator_Convert as String

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Converts the object to string.
Example:

```
Var p as new NSRectMBS(1,2,3,4)
MessageBox p // shows { { 1, 2 } , { 3, 4 } }
```

35.49.15 String as String

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the string representation of this point.
Example:

```
Var p as new NSRectMBS(1,2,3,4)
MessageBox p.String // shows { { 1, 2 } , { 3, 4 } }
```

35.49.16 Union(other as NSRectMBS) as NSRectMBS

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the union of two rectangles.

35.49.17 Zero as NSRectMBS

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Returns a rect with all values being zero.

35.49.18 Properties

35.49.19 Handle as Ptr

MBS Main Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: The pointer to the internal data structure.
Notes: May be useful for passing to declares requiring a NSRect*.
Size of structure is 16 bytes for 32-bit (four singles) and 32 bytes for 64-bit (four doubles).
(Read only property)

35.49.20 Height as Double

MBS Main Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The height of this rectangle.
Notes: (Read and Write property)

35.49.21 IsEmpty as boolean

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Whether the rectangle is empty.
Notes: (Read only property)

35.49.22 MaxX as Double

MBS Main Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns maximum x coordinate.
Notes: return x + width.
(Read only property)

35.49.23 MaxY as Double

MBS Main Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns maximum y coordinate.
Notes: return y + height.
(Read only property)

35.49.24 MidX as Double

MBS Main Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns center x coordinate.
Notes: (Read only property)

35.49.25 MidY as Double

MBS Main Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns center y coordinate.
Notes: (Read only property)

35.49.26 MinX as Double

MBS Main Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns x coordinate.
Notes: (Read only property)

35.49.27 MinY as Double

MBS Main Plugin, Plugin Version: 17.3, Platform: macOS, Targets: All.

Function: Returns y coordinate.
Notes: (Read only property)

35.49.28 Origin as NSPointMBS

MBS Main Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The origin of the rectangle.
Notes: (Read and Write property)

35.49.29 Size as NSSizeMBS

MBS Main Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The size of the rectangle.
Notes: (Read and Write property)

35.49.30 Width as Double

MBS Main Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The width of this rectangle.
Notes: (Read and Write property)

35.49.31 X as Double

MBS Main Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The horizontal coordinate.
Notes: (Read and Write property)

35.49.32 Y as Double

MBS Main Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The vertical coordinate.
Notes: (Read and Write property)

35.50 class NSResponderMBS

35.50.1 class NSResponderMBS

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: NSResponder is an abstract class that forms the basis of event and command processing in the Application Kit.
Example:

```
// This example needs a window with TextField1.
// focus a text field through Cocoa and walk up the responder chain
Var win As NSWindowMBS = Self.NSWindowMBS
Call win.makeFirstResponder(TextField1.NSViewMBS)

Var lines() As String
Var r As NSResponderMBS = win.firstResponder
While r <>Nil
If r IsA NSViewMBS Then
lines.Add NSViewMBS(r).className
Else
lines.Add "responder " + Hex(r.Handle)
End If
r = r.nextResponder
Wend
System.DebugLog "Responder chain: " + String.FromArray(lines, " >")
```

Notes: See the Cocoa documentation for more details.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

35.50.2 Methods

35.50.3 beginGestureWithEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has begun a touch gesture.
Notes: The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.

35.50.4 cancelOperation

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to cancel the current operation.
Notes: This method is bound to the Escape and Command-. (period) keys. The key window first searches the view hierarchy for a view whose key equivalent is Escape or Command-., whichever was entered. If none of these views handles the key equivalent, the window sends a default action message of cancelOperation: to the first responder and from there the message travels up the responder chain.

If no responder in the responder chain implements cancelOperation:, the key window searches the view hierarchy for a view whose key equivalent is Escape (note that this may be redundant if the original key equivalent was Escape). If no such responder is found, then a cancel: action message is sent to the first responder in the responder chain that implements it.

NSResponder declares but does not implement this method.

35.50.5 capitalizeWord

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to capitalize the word or words surrounding the insertion point or selection, expanding the selection if necessary.
Notes: If either end of the selection partially covers a word, that entire word is made lowercase. The sender argument is typically the object that invoked this method. NSResponder declares but doesn't implement this method.

35.50.6 centerSelectionInVisibleArea

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to scroll the selection, whatever it is, inside its visible area.

Notes: NSResponder declares but doesn't implement this method.

35.50.7 changeCaseOfLetter

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to change the case of a letter or letters in the selection, perhaps by opening a panel with capitalization options or by cycling through possible case combinations.
Notes: NSResponder declares but doesn't implement this method.

35.50.8 complete

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to complete an operation in progress or a partially constructed element.
Notes: This method can be interpreted, for example, as a request to attempt expansion of a partial word, such as for expanding a glossary shortcut, or to close a graphics item being drawn. NSResponder declares but doesn't implement this method.

35.50.9 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

35.50.10 cursorUpdate(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the mouse cursor has moved into a cursor rectangle.
Notes: Override this method to set the cursor image. The default implementation uses cursor rectangles, if cursor rectangles are currently valid. If they are not, it calls super to send the message up the responder chain.

If the responder implements this method, but decides not to handle a particular event, it should invoke the superclass implementation of this method.
Available in Mac OS X v10.5 and later.

35.50.11 deleteBackward

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to delete the selection, if there is one, or a single element backward from the insertion point (a letter or character in text, for example).
Notes: NSResponder declares but doesn't implement this method.

35.50.12 deleteBackwardByDecomposingPreviousCharacter

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to delete the selection, if there is one, or a single character backward from the insertion point.
Notes: If the previous character is canonically decomposable, this method should try to delete only the last character in the grapheme cluster (for example, deleting "a"+ "'" results in "a"). NSResponder declares but does not implement this method.

35.50.13 deleteForward

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to delete the selection, if there is one, or a single element forward from the insertion point (a letter or character in text, for example).
Notes: NSResponder declares but doesn't implement this method.

35.50.14 deleteToBeginningOfLine

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the beginning of a line (typically of text).
Notes: Also places the deleted text into the kill buffer. NSResponder declares but doesn't implement this method.

35.50.15 deleteToBeginningOfParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the beginning of a paragraph of text.
Notes: Also places the deleted text into the kill buffer. NSResponder declares but doesn't implement this

method.

35.50.16 deleteToEndOfLine

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the end of a line (typically of text).
Notes: Also places the deleted text into the kill buffer. NSResponder declares but doesn't implement this method.

35.50.17 deleteToEndOfParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to delete the selection, if there is one, or all text from the insertion point to the end of a paragraph of text.
Notes: Also places the deleted text into the kill buffer. NSResponder declares but doesn't implement this method.

35.50.18 deleteToMark

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to delete the selection, if there is one, or all items from the insertion point to a previously placed mark, including the selection itself if not empty.
Notes: Also places the deleted text into the kill buffer. NSResponder declares but doesn't implement this method.

35.50.19 deleteWordBackward

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to delete the selection, if there is one, or a single word backward from the insertion point.
Notes: NSResponder declares but doesn't implement this method.

35.50.20 deleteWordForward

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to delete the selection, if there is one, or a single word forward from the insertion point.
Notes: NSResponder declares but doesn't implement this method.

35.50.21 endGestureWithEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has ended a touch gesture.
Notes: Available in Mac OS X v10.6 and later.

35.50.22 flagsChanged(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has pressed or released a modifier key (Shift, Control, and so on).
Notes: The default implementation simply passes this message to the next responder.

35.50.23 flushBufferedKeyEvents

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Overridden by subclasses to clear any unprocessed key events.

35.50.24 helpRequested(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Displays context-sensitive help for the receiver if such exists; otherwise passes this message to the next responder.
Notes: NSWindow invokes this method automatically when the user clicks for help—while processing theEvent. Subclasses need not override this method, and application code shouldn't directly invoke it.

35.50.25 indent

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to indent the selection or the insertion point if there is no selection.
Notes: NSResponder declares but doesn't implement this method.

35.50.26 insertBacktab

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to handle a backward tab.
Notes: A field editor might respond to this method by selecting the field before it, while a regular text object either doesn't respond to or ignores such a message. NSResponder declares but doesn't implement this method.

35.50.27 insertContainerBreak

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to insert a container break (typically a page break) at the insertion point or selection, deleting the selection if there is one.
Notes: NSResponder declares but doesn't implement this method. NSTextView implements it to insert an NSFormFeedCharacter character (0x000c).

35.50.28 insertDoubleQuoteIgnoringSubstitution

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to insert a double quote character at the insertion point without interference by automatic quote correction.
Notes: NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

35.50.29 insertLineBreak

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to insert a line break (as distinguished from a paragraph break) at the insertion point or selection, deleting the selection if there is one.
Notes: NSResponder declares but doesn't implement this method. NSTextView implements it to insert an

NSLineSeparatorCharacter character (0x2028).

35.50.30 insertNewline

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to insert a newline character at the insertion point or selection, deleting the selection if there is one, or to end editing if the receiver is a text field or other field editor.
Notes: NSResponder declares but doesn't implement this method.

35.50.31 insertNewlineIgnoringFieldEditor

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to insert a line-break character at the insertion point or selection, deleting the selection if there is one.
Notes: Unlike insertNewline:, this method always inserts a line-break character and doesn't cause the receiver to end editing. NSResponder declares but doesn't implement this method.

35.50.32 insertParagraphSeparator

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to insert a paragraph separator at the insertion point or selection, deleting the selection if there is one.
Notes: NSResponder declares but doesn't implement this method.

35.50.33 insertSingleQuoteIgnoringSubstitution

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to insert a single quote character at the insertion point without interference by automatic quote correction.
Notes: NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

35.50.34 insertTab

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to insert a tab character at the insertion point or selection, deleting the selection if there is one, or to end editing if the receiver is a text field or other field editor.
Notes: NSResponder declares but doesn't implement this method.

35.50.35 insertTabIgnoringFieldEditor

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to insert a tab character at the insertion point or selection, deleting the selection if there is one.
Notes: Unlike insertTab:, this method always inserts a tab character and doesn't cause the receiver to end editing. NSResponder declares but doesn't implement this method.

35.50.36 insertText(text as string)

MBS MacBase Plugin, Plugin Version: 25.4, Platform: macOS, Targets: Desktop only.

Function: Inserts the text you specify.
Example:

```
// insert some text into a search field's text editor

Var currentEditor As NSTextMBS = NSSearchFieldControlMBS1.View.currentEditor
If currentEditor <>Nil Then
// we are in edit mode
currentEditor.insertText "Hello"
End If
```

Notes: text: The string to insert in the responder.

35.50.37 keyDown(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has pressed a key.
Notes: The receiver can interpret theEvent itself, or pass it to the system input manager using interpretKeyEvents. The default implementation simply passes this message to the next responder.

35.50.38 keyUp(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has released a key.
Notes: The default implementation simply passes this message to the next responder.

35.50.39 lowercaseWord

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to make lowercase every letter in the word or words surrounding the insertion point or selection, expanding the selection if necessary.
Notes: If either end of the selection partially covers a word, that entire word is made lowercase. NSResponder declares, but doesn't implement this method.

35.50.40 magnifyWithEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has begun a pinch gesture.
Notes: The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.

35.50.41 makeBaseWritingDirectionLeftToRight

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the paragraph base writing direction to be left to right.
Notes: Sets the NSAttributedString key NSWritingDirectionAttributeName to NSWritingDirectionLeftToRight.

This action method is intended to be used both as the target of a menu item and for key bindings. The base writing direction methods should be the target of three menu items in a submenu, under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

35.50.42 makeBaseWritingDirectionNatural

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the paragraph base writing direction to be natural.
Notes: Natural directionality is determined from the text in accordance with the Unicode bi-di algorithm. For more information see NSParagraphStyle.

Sets the NSAttributedStringkey NSWritingDirectionAttributeName to NSTextWritingDirectionEmbedding.

This action method is intended to be used both as the target of a menu item and for key bindings. The base writing direction methods should be the target of three menu items in a submenu, under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

35.50.43 makeBaseWritingDirectionRightToLeft

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the paragraph base writing direction to be right to left.
Notes: Sets the NSAttributedString key NSWritingDirectionAttributeName to NSWritingDirectionRight-ToLeft.

This action method is intended to be used both as the target of a menu item and for key bindings. The base writing direction methods should be the target of three menu items in a submenu, under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

35.50.44 makeTextWritingDirectionLeftToRight

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the character level attributed string direction attribute for left to right text.
Notes: Sets the NSAttributedString NSWritingDirectionAttributeName to NSWritingDirectionLeftToRight.

This action method is intended to be used both as the target of a menu item and for key bindings. The text writing directions should be the target of three similar menu items in a submenu under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

35.50.45 makeTextWritingDirectionNatural

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Removes the character-level writing direction attribute.
Notes: Removes the NSWritingDirectionAttributeName from an NSAttributedString.

This action method is intended to be used both as the target of a menu item and for key bindings. The text writing directions should be the target of three similar menu items in a submenu under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

35.50.46 makeTextWritingDirectionRightToLeft

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the character-level writing direction attribute to a single right-to-left embedding.
Notes: Sets the NSAttributedString key NSWritingDirectionAttributeName to NSWritingDirectionRightToLeft.

This action method is intended to be used both as the target of a menu item and for key bindings. The text writing directions should be the target of three similar menu items in a submenu under the Edit menu.

Default key bindings will also be provided for this method but will only be enabled for users of Hebrew or Arabic, or those who have otherwise enabled a suitable preference.

Available in Mac OS X v10.6 and later.

35.50.47 mouseDown(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has pressed the left mouse button.
Notes: The default implementation simply passes this message to the next responder.

35.50.48 mouseDragged(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has moved the mouse with the left button pressed.
Notes: The default implementation simply passes this message to the next responder.

35.50.49 mouseEntered(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the cursor has entered a tracking rectangle.
Notes: The default implementation simply passes this message to the next responder.
Available in Mac OS X v10.0 and later.

35.50.50 mouseExited(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the cursor has exited a tracking rectangle.
Notes: The default implementation simply passes this message to the next responder.

35.50.51 mouseMoved(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the mouse has moved.
Notes: The default implementation simply passes this message to the next responder.

35.50.52 mouseUp(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has released the left mouse button.
Notes: The default implementation simply passes this message to the next responder.

35.50.53 moveBackward

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point one element or character backward.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed at the beginning of the former selection. NSResponder declares but doesn't implement this method.

35.50.54 moveBackwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to expand or reduce either end of the selection backward by one element or character.
Notes: If the end being modified is the backward end, this method expands the selection; if the end being modified is the forward end, it reduces the selection. The first moveBackwardAndModifySelection: or moveForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the backward end becoming the mobile one if invoked first. By default, moveLeftAndModifySelection: is bound to the left arrow key.

NSResponder declares but doesn't implement this method.

35.50.55 moveDown

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point one element or character down.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed below the beginning of the former selection. NSResponder declares but doesn't implement this method.

35.50.56 moveDownAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to expand or reduce the top or bottom end of the selection downward by one element, character, or line (whichever is appropriate for text direction).

Notes: If the end being modified is the bottom, this method expands the selection; if the end being modified is the top, it reduces the selection. The first moveDownAndModifySelection: or moveUpAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the bottom end becoming the mobile one if invoked first.

NSResponder declares but doesn't implement this method.

35.50.57 moveForward

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point one element or character forward.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed at the end of the former selection. NSResponder declares but doesn't implement this method.

35.50.58 moveForwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to expand or reduce either end of the selection forward by one element or character.
Notes: If the end being modified is the backward end, this method reduces the selection; if the end being modified is the forward end, it expands the selection. The first moveBackwardAndModifySelection: or moveForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first. By default, moveRightAndModifySelection: is bound to the right arrow key.

NSResponder declares but doesn't implement this method.

35.50.59 moveLeft

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point one element or character to the left.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed at the left end of the former selection. NSResponder declares but doesn't implement this method.

35.50.60 moveLeftAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to expand or reduce either end of the selection to the left (display order) by one element or character.
Notes: If the end being modified is the left end, this method expands the selection; if the end being modified is the right end, it reduces the selection. The first moveLeftAndModifySelection: or moveRightAndModify-Selection: method in a series determines the end being modified by always expanding. Hence, this method results in the left end becoming the mobile one if invoked first. By default, this method is bound to the left arrow key.

NSResponder declares but doesn't implement this method.

The essential difference between this method and the corresponding moveBackwardAndModifySelection: is that the latter method moves in logical order, which can differ in bidirectional text, whereas this method moves in display order.

35.50.61 moveParagraphBackwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point to the beginning of the previous paragraph, expanding or reducing the current selection.
Notes: If the cursor is already at the beginning of a paragraph, the selection moves backward to the beginning of the previous paragraph.
NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

35.50.62 moveParagraphForwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point to the beginning of the next paragraph, expanding or reducing the current selection.
Notes: If the cursor is already at the end of a paragraph, the selection moves forward to the end of the next paragraph.

NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

35.50.63 moveRight

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point one element or character to the right.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed at the right end of the former selection. NSResponder declares but doesn't implement this method.

35.50.64 moveRightAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to expand or reduce either end of the selection to the right (display order) by one element or character.
Notes: If the end being modified is the left end, this method reduces the selection; if the end being modified is the right end, it expands the selection. The first moveLeftAndModifySelection: or moveRightAndModify-Selection: method in a series determines the end being modified by always expanding. Hence, this method results in the right end becoming the mobile one if invoked first. By default, this method is bound to the right arrow key.

NSResponder declares but doesn't implement this method.

The essential difference between this method and the corresponding moveForwardAndModifySelection: is that the latter method moves in logical order, which can differ in bidirectional text, whereas this method moves in display order.

35.50.65 moveToBeginningOfDocument

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection to the first element of the document or the insertion point to the beginning.
Notes: NSResponder declares but doesn't implement this method.

35.50.66 moveToBeginningOfDocumentAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point to the beginning of the document, expanding or reducing the current selection.

Notes: Available in Mac OS X v10.6 and later.

35.50.67 moveToBeginningOfLine

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection to the first element of the selected line or the insertion point to the beginning of the line.
Notes: NSResponder declares but doesn't implement this method.

35.50.68 moveToBeginningOfLineAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point to the beginning of the line, expanding or reducing the current selection.
Notes: NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

35.50.69 moveToBeginningOfParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the insertion point to the beginning of the selected paragraph.
Notes: NSResponder declares but doesn't implement this method.

35.50.70 moveToBeginningOfParagraphAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point to the beginning of the current paragraph, expanding or reducing the current selection.
Notes: NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

35.50.71 moveToEndOfDocument

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection to the last element of the document or the insertion point to the end.
Notes: NSResponder declares but doesn't implement this method.

35.50.72 moveToEndOfDocumentAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point to the end of the document, expanding or reducing the current selection.
Notes: Available in Mac OS X v10.6 and later.

35.50.73 moveToEndOfLine

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection to the last element of the selected line or the insertion point to the end of the line.
Notes: NSResponder declares but doesn't implement this method.

35.50.74 moveToEndOfLineAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection to the last element of the selected line or the insertion point to the end of the line.
Notes: NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.0 and later.

35.50.75 moveToEndOfParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the insertion point to the end of the selected paragraph.
Notes: NSResponder declares but doesn't implement this method.

35.50.76 moveToEndOfParagraphAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point to the end of the line, expanding or reducing the current selection.
Notes: NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

35.50.77 moveToLeftEndOfLine

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point to the left end of the line.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed at left end of the line. NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

35.50.78 moveToLeftEndOfLineAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point to the left end of the line, expanding or contracting the selection as required.
Notes: Available in Mac OS X v10.6 and later.

35.50.79 moveToRightEndOfLine

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point to the right end of the line.
Notes: Available in Mac OS X v10.6 and later.

35.50.80 moveToRightEndOfLineAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point to the right end of the line, expanding or contracting the selection as required.
Notes: Available in Mac OS X v10.6 and later.

35.50.81 moveUp

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point one element or character up.
Notes: In text, if there is a selection it should be deselected, and the insertion point should be placed above the beginning of the former selection. NSResponder declares but doesn't implement this method.

35.50.82 moveUpAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to expand or reduce the top or bottom end of the selection upward by one element, character, or line (whichever is appropriate for text direction).
Notes: If the end being modified is the bottom, this method reduces the selection; if the end being modified is the top, it expands the selection. The first moveDownAndModifySelection: or moveUpAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the top end becoming the mobile one if invoked first.

NSResponder declares but doesn't implement this method.

35.50.83 moveWordBackward

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point one word backward.
Notes: If there is a selection it should be deselected, and the insertion point should be placed at the end of the first word preceding the former selection. NSResponder declares but doesn't implement this method.

35.50.84 moveWordBackwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to expand or reduce either end of the selection backward by one whole word.
Notes: If the end being modified is the backward end, this method expands the selection; if the end being modified is the forward end, it reduces the selection. The first moveWordBackwardAndModifySelection: or moveWordForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the backward end becoming the mobile one if invoked first.

NSResponder declares but doesn't implement this method.

35.50.85 moveWordForward

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point one word forward, in logical order.
Notes: If there is a selection it should be deselected, and the insertion point should be placed at the beginning of the first word following the former selection. NSResponder declares but doesn't implement this method.

35.50.86 moveWordForwardAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to expand or reduce either end of the selection forward by one whole word.
Notes: If the end being modified is the backward end, this method reduces the selection; if the end being modified is the forward end, it expands the selection. The first moveWordBackwardAndModifySelection: or moveWordForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first. NSResponder declares but doesn't implement this method.

35.50.87 moveWordLeft

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point one word to the left, in display order.
Notes: If there is a selection it should be deselected, and the insertion point should be placed at the end of the first word to the left of the former selection. NSResponder declares but doesn't implement this method.

The main difference between this method and the corresponding moveWordBackward: method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

35.50.88 moveWordLeftAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to expand or reduce either end of the selection left by one whole word in display order.
Notes: If the end being modified is the left end, this method expands the selection; if the end being modified

is the right end, it reduces the selection. The first moveWordLeftAndModifySelection: or moveWordRightAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the left end becoming the mobile one if invoked first.

NSResponder declares but doesn't implement this method.

The main difference between this method and the corresponding moveWordBackwardAndModifySelection: method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

35.50.89 moveWordRight

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to move the selection or insertion point one word right.
Notes: If there is a selection it should be deselected, and the insertion point should be placed at the beginning of the first word to the right of the former selection. NSResponder declares but doesn't implement this method.

The main difference between this method and the corresponding moveWordForward: method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

35.50.90 moveWordRightAndModifySelection

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to expand or reduce either end of the selection to the right by one whole word.
Notes: If the end being modified is the backward end, this method reduces the selection; if the end being modified is the forward end, it expands the selection. The first moveWordBackwardAndModifySelection: or moveWordForwardAndModifySelection: method in a series determines the end being modified by always expanding. Hence, this method results in the forward end becoming the mobile one if invoked first. NSResponder declares but doesn't implement this method.

The main difference between this method and the corresponding moveWordForwardAndModifySelection: method is that the latter moves in logical order, which is important in bidirectional text, whereas this method moves in display order.

35.50.91 otherMouseDown(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has pressed a mouse button other than the left or right one.
Notes: The default implementation simply passes this message to the next responder.
Available in Mac OS X v10.1 and later.

35.50.92 otherMouseDragged(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.
Notes: The default implementation simply passes this message to the next responder.
Available in Mac OS X v10.1 and later.

35.50.93 otherMouseUp(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has released a mouse button other than the left or right button.
Notes: The default implementation simply passes this message to the next responder.

35.50.94 pageDown

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to scroll the receiver down (or back) one page in its scroll view, also moving the insertion point to the top of the newly displayed page.
Notes: NSResponder declares but doesn't implement this method.

35.50.95 pageDownAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to scroll the receiver down (or back) one page in its scroll view, also moving the insertion point to the top of the newly displayed page. The selection is expanded or contracted as required.
Notes: NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

35.50.96 pageUp

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to scroll the receiver up (or forward) one page in its scroll view, also moving the insertion point to the top of the newly displayed page.
Notes: NSResponder declares but doesn't implement this method.

35.50.97 pageUpAndModifySelection

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to scroll the receiver up (or forward) one page in its scroll view, also moving the insertion point to the top of the newly displayed page. The selection is expanded or contracted as necessary.
Notes: NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

35.50.98 performMnemonic(theString as string) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Overridden by subclasses to handle a mnemonic.
Notes: If the character code or codes in theString match the receiver's mnemonic, the receiver should perform the mnemonic and return true. The default implementation does nothing and returns false. Mnemonics are not supported in Mac OS X.

35.50.99 presentError(e as NSErrorMBS) as boolean

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop & iOS.

Function: Presents an error alert to the user as an application-modal dialog.
Notes: e: An object containing information about an error.

The alert displays information found in the NSError object e; this information can include error description, recovery suggestion, failure reason, and button titles (all localized). The method returns true if error recovery succeeded and false otherwise. For error recovery to be attempted, an recovery-attempter object (that is, an object conforming to the NSErrorRecoveryAttempting informal protocol) must be associated with e.

The default implementation of this method sends willPresentError to self. By doing this, NSResponder gives subclasses an opportunity to customize error presentation. It then forwards the message, passing any customized error object, to the next responder; if there is no next responder, it passes the error object to

NSApp, which displays a document-modal error alert. When the user dismisses the alert, any recovery attempter associated with the error object is given a chance to recover from the error. See the class description for the precise route up the responder chain (plus document and controller objects) this message might travel.

Available in OS X v10.4 and later.

35.50.100 rightMouseDown(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has pressed the right mouse button.
Notes: The default implementation simply passes this message to the next responder.

35.50.101 rightMouseDragged(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has moved the mouse with the right button pressed.
Notes: The default implementation simply passes this message to the next responder.

35.50.102 rightMouseUp(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has released the right mouse button.
Notes: The default implementation simply passes this message to the next responder.

35.50.103 rotateWithEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has begun a rotation gesture.
Notes: The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.

35.50.104 scrollLineDown

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to scroll the receiver one line down in its scroll view, without changing the selection.
Notes: NSResponder declares but doesn't implement this method.

35.50.105 scrollLineUp

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to scroll the receiver one line up in its scroll view, without changing the selection.
Notes: NSResponder declares but doesn't implement this method.

35.50.106 scrollPageDown

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to scroll the receiver one page down in its scroll view, without changing the selection.
Notes: NSResponder declares but doesn't implement this method.

35.50.107 scrollPageUp

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to scroll the receiver one page up in its scroll view, without changing the selection.
Notes: NSResponder declares but doesn't implement this method.

35.50.108 scrollToBeginningOfDocument

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to scroll the receiver to the beginning of the document, without changing the selection.
Notes: NSResponder declares but doesn't implement this method.
Available in Mac OS X v10.6 and later.

35.50.109 scrollToEndOfDocument

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to scroll the receiver to the end of the document, without changing the selection.
Notes: NSResponder declares but doesn't implement this method.

Available in Mac OS X v10.6 and later.

35.50.110 scrollWheel(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the mouse's scroll wheel has moved.
Notes: The default implementation simply passes this message to the next responder.
Available in Mac OS X v10.0 and later.

35.50.111 selectAll

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to select all selectable elements.
Notes: NSResponder declares but doesn't implement this method.

35.50.112 selectLine

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to select all elements in the line or lines containing the selection or insertion point.

Notes: NSResponder declares but doesn't implement this method.

35.50.113 selectParagraph

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to select all paragraphs containing the selection or insertion point.
Notes: NSResponder declares but doesn't implement this method.

35.50.114 selectToMark

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to select all items from the insertion point or selection to a previously placed mark, including the selection itself if not empty.
Notes: NSResponder declares but doesn't implement this method.

35.50.115 selectWord

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to extend the selection to the nearest word boundaries outside it (up to, but not including, word delimiters).
Notes: NSResponder declares but doesn't implement this method.

35.50.116 setMark

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to set a mark at the insertion point or selection, which is used by deleteToMark and selectToMark.
Notes: NSResponder declares but doesn't implement this method.

35.50.117 showContextHelp

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to invoke the help system, displaying information relevant to the receiver and its current state.

35.50.118 showWritingTools

MBS MacBase Plugin, Plugin Version: 24.5, Platform: macOS, Targets: All.

Function: Shows writing tools.
Example:

```
// This example needs a window with TextArea1.
var n as NSTextViewMBS = TextArea1.NSTextViewMBS
n.showWritingTools
```

Notes: For Apple Intelligence.
Requires macOS 15.2 or iOS 18.2.

35.50.119 swapWithMark

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Swaps the mark and the selection or insertion point, so that what was marked is now the selection or insertion point, and what was the insertion point or selection is now the mark.
Notes: NSResponder declares but doesn't implement this method.

35.50.120 swipeWithEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that the user has begun a rotation gesture.
Notes: The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.

35.50.121 tabletPoint(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that a tablet-point event has occurred.
Notes: Tablet events are represented by NSEvent objects of type NSTabletPoint. They describe the current state of a transducer (that is, a pointing device) that is in proximity to its tablet, reflecting changes such as location, pressure, tilt, and rotation. See the NSEvent reference for the methods that allow you to extract this and other information from theEvent. The default implementation of NSResponder passes the message to the next responder.
Available in Mac OS X v10.4 or later.

35.50.122 tabletProximity(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Informs the receiver that a tablet-proximity event has occurred.
Notes: Tablet events are represented by NSEvent objects of type NSTabletProximity. Tablet devices generate proximity events when the transducer (pointing device) nears a tablet and when it moves away from a tablet. From an event object of this type you can extract information about the kind of device and its capabilities, as well as the relation of this tablet-proximity event to various tablet-point events; see the NSEvent reference for details. The default implementation passes the message to the next responder.
Available in Mac OS X v10.4 or later.

35.50.123 transpose

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Transposes the characters to either side of the insertion point and advances the insertion point past both of them. Does nothing to a selected range of text.
Notes: NSResponder declares but doesn't implement this method.

35.50.124 transposeWords

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Transposes the words to either side of the insertion point and advances the insertion point past both of them. Does nothing to a selected range of text.
Notes: NSResponder declares but doesn't implement this method.

35.50.125 undoManager as NSUndoManagerMBS

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The undo manager for this item.
Notes: Subclasses may implement this property.

35.50.126 uppercaseWord

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Implemented by subclasses to make uppercase every letter in the word or words surrounding the insertion point or selection, expanding the selection if necessary.

Notes: If either end of the selection partially covers a word, that entire word is made uppercase. NSResponder declares but doesn't implement this method.

35.50.127 yank

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Replaces the insertion point or selection with text from the kill buffer.
Notes: If invoked sequentially, cycles through the kill buffer in reverse order. See "Standard Action Methods for Selecting and Editing" for more information on the kill buffer. NSResponder declares but doesn't implement this method.

35.50.128 Properties

35.50.129 Handle as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop & iOS.

Function: The internal handle of this Responder.
Notes: (Read and Write property)

35.50.130 menu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The receiver's menu.
Notes: (On useful for NSApplication class on Mac)
(Read and Write computed property)

35.50.131 nextResponder as NSResponderMBS

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: The next responder in the responder chain.
Notes: (Read and Write computed property)

35.51 class NSRunLoopMBS

35.51.1 class NSRunLoopMBS

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The NSRunLoop class declares the programmatic interface to objects that manage input sources.
Example:

```
// let the main run loop process events for one second while waiting for an asynchronous Cocoa function
Var runLoop As NSRunLoopMBS = NSRunLoopMBS.currentRunLoop

Var endTime As Double = System.Microseconds + 1000000
While System.Microseconds <endTime
Call runLoop.runMode(NSRunLoopMBS.NSDefaultRunLoopMode, 0.1)
Wend
```

Notes: An NSRunLoop object processes input for sources such as mouse and keyboard events from the window system, NSPort objects, and NSConnection objects. An NSRunLoop object also processes NSTimer events.

Your application cannot either create or explicitly manage NSRunLoop objects. Each NSThread object, including the application's main thread, has an NSRunLoop object automatically created for it as needed. If you need to access the current thread's run loop, you do so with the class method currentRunLoop.

Note that from the perspective of NSRunloop, NSTimer objects are not "input"—they are a special type, and one of the things that means is that they do not cause the run loop to return when they fire.

Warning:
The NSRunLoop class is generally not considered to be thread-safe and its methods should only be called within the context of the current thread. You should never try to call the methods of an NSRunLoop object running in a different thread, as doing so might cause unexpected results.
Blog Entries

35.51.2 Methods

35.51.3 AddDummyPort

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Adds a dummy port as event source.

Notes: Run loops don't loop unless there is an event source, so you can add a dummy one here.

35.51.4 allModes as string()

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns array with all mode strings.

35.51.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Creates a new object using current run loop.

35.51.6 currentRunLoop as NSRunLoopMBS

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Returns the NSRunLoop object for the current thread.
Notes: If a run loop does not yet exist for the thread, one is created and returned.

35.51.7 mainRunLoop as NSRunLoopMBS

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Returns the run loop of the main thread.
Notes: An object representing the main thread's run loop.
Available in OS X v10.5.

35.51.8 NSDefaultRunLoopMode as string

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: One of the runloop mode.
Notes: The mode to deal with input sources other than NSConnection objects.
This is the most commonly used run-loop mode.

35.51.9 NSRunLoopCommonModes as string

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: One of the runloop mode.
Notes: Objects added to a run loop using this value as the mode are monitored by all run loop modes that have been declared as a member of the set of "common" modes; see the description of CFRunLoopAddCommonMode for details.
Available in OS X v10.5 and later.

35.51.10 run

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Puts the receiver into a permanent loop, during which time it processes data from all attached input sources.
Notes: If no input sources or timers are attached to the run loop, this method exits immediately; otherwise, it runs the receiver in the NSDefaultRunLoopMode by repeatedly invoking runMode:beforeDate:. In other words, this method effectively begins an infinite loop that processes data from the run loop's input sources and timers.

Manually removing all known input sources and timers from the run loop is not a guarantee that the run loop will exit. OS X can install and remove additional input sources as needed to process requests targeted at the receiver's thread. Those sources could therefore prevent the run loop from exiting.

If you want the run loop to terminate, you shouldn't use this method. Instead, use one of the other run methods and also check other arbitrary conditions of your own, in a loop.
See also:

- 35.51.11 run(Seconds as Double) 6575

35.51.11 run(Seconds as Double)

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Runs the runloop for the given number of seconds.
See also:

- 35.51.10 run 6575

35.51.12 runMode(Mode as string, Seconds as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Runs the runloop for the given number of seconds in the given mode.

35.51.13 runModeUntilDate(Mode as string, limitDate as date) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Runs the loop once, blocking for input in the specified mode until a given date.
Notes: mode: The mode in which to run. You may specify custom modes or use one of the modes listed in "Run Loop Modes."
limitDate: The date until which to block.

Returns true if the run loop ran and processed an input source or if the specified timeout value was reached; otherwise, false if the run loop could not be started.

If no input sources or timers are attached to the run loop, this method exits immediately and returns false; otherwise, it returns after either the first input source is processed or limitDate is reached. Manually removing all known input sources and timers from the run loop does not guarantee that the run loop will exit immediately. OS X may install and remove additional input sources as needed to process requests targeted at the receiver's thread. Those sources could therefore prevent the run loop from exiting.

Note: A timer is not considered an input source and may fire multiple times while waiting for this method to return
See also:

- 35.51.14 runModeUntilDate(Mode as string, limitDate as dateTime) as boolean 6576

35.51.14 runModeUntilDate(Mode as string, limitDate as dateTime) as boolean

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Runs the loop once, blocking for input in the specified mode until a given date.
Notes: mode: The mode in which to run. You may specify custom modes or use one of the modes listed in "Run Loop Modes."
limitDate: The date until which to block.

Returns true if the run loop ran and processed an input source or if the specified timeout value was reached; otherwise, false if the run loop could not be started.

If no input sources or timers are attached to the run loop, this method exits immediately and returns false; otherwise, it returns after either the first input source is processed or limitDate is reached. Manually removing all known input sources and timers from the run loop does not guarantee that the run loop will exit immediately. OS X may install and remove additional input sources as needed to process requests targeted

at the receiver's thread. Those sources could therefore prevent the run loop from exiting.

Note: A timer is not considered an input source and may fire multiple times while waiting for this method to return
See also:

- 35.51.13 runModeUntilDate(Mode as string, limitDate as date) as boolean 6576

35.51.15 runOnce

MBS MacCocoa Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: Run the runloop once.
Notes: Great to process events now in a timer in web or console projects.

35.51.16 runUntilDate(limitDate as date)

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Runs the loop until the specified date, during which time it processes data from all attached input sources.
Notes: limitDate: The date up until which to run.

If no input sources or timers are attached to the run loop, this method exits immediately; otherwise, it runs the receiver in the NSDefaultRunLoopMode by repeatedly invoking runMode until the specified expiration date.

Manually removing all known input sources and timers from the run loop is not a guarantee that the run loop will exit. OS X can install and remove additional input sources as needed to process requests targeted at the receiver's thread. Those sources could therefore prevent the run loop from exiting.
See also:

- 35.51.17 runUntilDate(limitDate as dateTime) 6577

35.51.17 runUntilDate(limitDate as dateTime)

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Runs the loop until the specified date, during which time it processes data from all attached input sources.
Notes: limitDate: The date up until which to run.

If no input sources or timers are attached to the run loop, this method exits immediately; otherwise, it runs the receiver in the NSDefaultRunLoopMode by repeatedly invoking runMode until the specified expiration date.

Manually removing all known input sources and timers from the run loop is not a guarantee that the run loop will exit. OS X can install and remove additional input sources as needed to process requests targeted at the receiver's thread. Those sources could therefore prevent the run loop from exiting.
See also:

- 35.51.16 runUntilDate(limitDate as date) 6577

35.51.18 Properties

35.51.19 currentMode as String

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Returns the receiver's current input mode.
Notes: The receiver's current input mode. This method returns the current input mode only while the receiver is running; otherwise, it returns nil.
(Read only property)

35.51.20 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The internal object handle.
Notes: (Read and Write property)

35.52 class NSSavePanelObserverMBS

35.52.1 class NSSavePanelObserverMBS

MBS MacCocoa Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop only.

Function: Intercepts save and open dialogs on macOS to provide events to customize.
Notes: You can only have one instance of this class at a time.
First time you create an object, we initialize the necessary feature.

See also WinFileDialogObserverMBS class for Windows.
Blog Entries

35.52.2 Properties

35.52.3 Enabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop only.

Function: Whether the feature is enabled.
Notes: If value is false, no events will be called.
(Read and Write property)

35.52.4 Events

35.52.5 DidShowPanel(panel as NSSavePanelMBS, Result as Integer)

MBS MacCocoa Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop only.

Function: Event called after panel showed.
Notes: You can read results from whatever modification you made.

35.52.6 WillShowPanel(panel as NSSavePanelMBS)

MBS MacCocoa Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop only.

Function: Event called before panel shows.
Notes: You can do customization just before the dialog shows.

35.53 class NSScreenMBS

35.53.1 class NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: An NSScreen object describes the attributes of a computer's monitor, or screen.
Example:

```
Var mainScreen As NSScreenMBS = NSScreenMBS.mainScreen

MessageBox mainScreen.localizedName
```

Notes: An application may use an NSScreen object to retrieve information about a screen and use this information to decide what to display upon that screen. For example, an application may use the deepestScreen method to find out which of the available screens can best represent color and then may choose to display all of its windows on that screen.

The application object should be created before you use the methods in this class, so that the application object can make the necessary connection to the window system. You can make sure the application object exists by invoking the sharedApplication method of NSApplication. If you created your application with Xcode, the application object is automatically created for you during initialization.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

35.53.2 Methods

35.53.3 backingAlignedRect(r as NSRectMBS, options as UInt64) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Converts a rectangle in global screen coordinates to a pixel aligned rectangle.
Notes: r: The input rectangle in global screen coordinates.
options: Specifies the alignment options. See NSAlignmentOptions for possible values.
Returns a a pixel aligned rectangle on the target screen from the given input rectangle in global screen coordinates.

This method uses NSIntegralRectWithOptions() to produce the pixel aligned rectangle.
Available in Mac OS X v10.7 and later.

35.53.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop & iOS.

Function: The private constructor.

35.53.5 convertRectFromBacking(r as NSRectMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Converts the rectangle from the device pixel aligned coordinates system of a screen.
Notes: r: The rectangle.

Returns the rectangle converted from the device pixel aligned coordinates system of the screen.
Available in Mac OS X v10.7 and later.

35.53.6 convertRectToBacking(r as NSRectMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Converts the rectangle to the device pixel aligned coordinates system of a screen.
Notes: r: The rectangle.

Returns the rectangle converted to the device pixel aligned coordinates system of the screen.
Available in Mac OS X v10.7 and later.

35.53.7 NSScreenColorSpaceDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: The notification name for the notification sent when the screen colorspace changed.
Notes: The notification object is the NSScreen whose colorSpace has changed. This notification does not contain a userInfo dictionary.
Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.
Available in Mac OS X v10.6 and later.

35.53.8 screens as NSScreenMBS()

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns an array of NSScreen objects representing all of the screens available on the system.
Notes: Returns an array of the NSScreen objects available on the current system or nil if the screen information could not be obtained from the window system.

The screen at index 0 in the returned array corresponds to the primary screen of the user's system. This is the screen that contains the menu bar and whose origin is at the point (0, 0). In the case of mirroring, the first screen is the largest drawable display; if all screens are the same size, it is the screen with the highest pixel depth. This primary screen may not be the same as the one returned by the mainScreen method, which returns the screen with the active window.

The array should not be cached. Screens can be added, removed, or dynamically reconfigured at any time. When the display configuration is changed, the default notification center sends a NSApplicationDidChangeScreenParametersNotification notification.

35.53.9 supportedWindowDepths as Integer()

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a zero-terminated array of the window depths supported by the receiver.

35.53.10 Properties

35.53.11 backingScaleFactor as Double

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the backing store pixel scale factor for the screen.
Example:

MessageBox str(NSScreenMBS.mainScreen.backingScaleFactor)

Notes: Returns the scale factor representing the number of backing store pixels corresponding to each linear unit in screen space on this NSScreen.
This method is provided for rare cases when the explicit scale factor is needed. Please use the NSView class's convert backing methods whenever possible.
Available in Mac OS X v10.7 and later.

For apps which are not enabled for retina support, the function returns 1. So you only see 2 here if app is Cocoa, display is retina and info.plist has the NSHighResolutionCapable key.
(Read only property)

35.53.12 CGDirectDisplayID as Integer

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The CGDirectDisplayID for this screen.
Notes: This will return kCGNullDirectDisplay if there isn,Äôt one.

For macOS 26 or newer.
(Read only property)

35.53.13 colorSpace as Variant

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the colorSpace of the screen.
Example:

```
Var s as NSScreenMBS = NSScreenMBS.mainScreen
Var c as NSColorSpaceMBS = s.colorSpace
MessageBox c.localizedName
```

Notes: Available in Mac OS X v10.6 and later.

Value is a NSColorSpaceMBS but declared as Variant to reduce plugin interdependencies.
(Read only property)

35.53.14 deepestScreen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns an NSScreen object representing the screen that can best represent color.
Notes: This method always returns an object, even if there is only one screen and it is not a color screen.
(Read only property)

35.53.15 depth as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's current bit depth and colorspace information.
Notes: Returns the window depth information. This value cannot be used directly. You must pass it to a function such as NSBitsPerPixelFromDepth or NSColorSpaceFromDepth to obtain a concrete value for the desired information.
(Read only property)

35.53.16 deviceDescription as dictionary

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the device dictionary for the screen.
Example:

```
Var dic As Dictionary = NSScreenMBS.mainScreen.deviceDescription

Break // see content in debugger
```

Notes: A dictionary containing the attributes of the receiver's screen.
(Read only property)

35.53.17 firstScreen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the NSScreen object for the first screen.
Example:

```
MessageBox NSScreenMBS.firstScreen.localizedName
```

Notes: Returns nil if no display is present.
(Read only property)

35.53.18 frame as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the dimensions and location of the receiver.
Example:

```
Var screens() As NSScreenMBS = NSScreenMBS.screens

// show frame for each screen
For Each Screen As NSScreenMBS In screens
MessageBox Screen.frame.String
Next
```

Notes: The full screen rectangle at the current resolution. This rectangle includes any space currently occupied by the menu bar and dock.
(Read only property)

35.53.19 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The internal reference to the NSScreen object.
Notes: (Read and Write property)

35.53.20 localizedName as String

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop & iOS.

Function: The localized name of the screen.
Example:

```
MessageBox NSScreenMBS.firstScreen.localizedName
```

Notes: Either uses on MacOS 10.15 the value Apple frameworks provides.
Or returns name from plugin, either "Main Screen" or "Screen " plus index, so second screen is "Screen 2".
(Read only property)

35.53.21 mainScreen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the NSScreen object containing the window with the keyboard focus.
Example:

```
Var mainScreen As NSScreenMBS = NSScreenMBS.mainScreen

MessageBox mainScreen.localizedName
```

Notes: The main screen is not necessarily the same screen that contains the menu bar or has its origin at (0, 0). The main screen refers to the screen containing the window that is currently receiving keyboard events. It is the main screen because it is the one with which the user is most likely interacting.

The screen containing the menu bar is always the first object (index 0) in the array returned by the screens method.
(Read only property)

35.53.22 screensHaveSeparateSpaces as Boolean

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether each screen can have its own set of spaces.
Notes: This method reflects whether the ‚ÄúDisplays have separate Spaces‚Äù option is enabled in Mission Control system preference. You might use the return value to determine how to present your app when in fullscreen mode.
(Read only property)

35.53.23 secondScreen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the NSScreen object for the second screen.
Notes: Returns nil if no second display is present.
(Read only property)

35.53.24 touchCapabilities as Integer

MBS MacBase Plugin, Plugin Version: 26.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this screen has touch capability.

Notes: for macOS 27.0 or later.
(Read only property)

35.53.25 userSpaceScaleFactor as Double

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the scaling factor from user space to device space on the screen represented by the receiver.
Example:

```
MessageBox str(NSScreenMBS.mainScreen.userSpaceScaleFactor)
```

Notes: Returns the scaling factor, measured in pixels per point, where a point is always equal to 1/72 of an inch. For example, a scaling factor of 2.0 indicates the display has a resolution 2 pixels per point or 144 pixels-per-inch.

Available in Mac OS X v10.4 and later.
(Read only property)

35.53.26 visibleFrame as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the current location and dimensions of the visible screen.
Example:

```
Var screens() As NSScreenMBS = NSScreenMBS.screens

// shows coordinates for each screen.
For Each Screen As NSScreenMBS In screens
MessageBox Screen.visibleFrame.String
Next
```

Notes: The returned rectangle is always based on the current user-interface settings and does not include the area currently occupied by the dock and menu bar. Because it is based on the current user -interface settings, the returned rectangle can change between calls and should not be cached.

Note: Even when dock hiding is enabled, the rectangle returned by this method may be smaller than the full screen. The system uses a small boundary area to determine when it should display the dock.
(Read only property)

35.53.27 Constants

Touch Capabilities

Constant	Value	Description
TouchCapabilitiesMultiTouch	1	Mac with touch screen
TouchCapabilitiesNone	0	Not a touch screen

35.54 class NSServiceProviderMBS

35.54.1 class NSServiceProviderMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The class to do service handlers in Cocoa applications.
Example:

```
// offer a service in the Services menu of other apps
// The service must also be declared in the NSServices section of the Info.plist with NSMessage = ServiceInvoked.
// MyServiceProvider is a subclass of NSServiceProviderMBS with the ServiceInvoked event implemented.
// Provider is a property of the app: Provider As MyServiceProvider
Provider = New MyServiceProvider
NSApplicationMBS.sharedApplication.servicesProvider = Provider

// in MyServiceProvider:
Sub ServiceInvoked(pboard As NSPasteboardMBS, userData As String, ByRef error As String) Handles ServiceInvoked
// userData tells which of your services was chosen
Var text As String = pboard.stringForType(NSPasteboardMBS.NSPasteboardTypeString)
If text = "" Then
error = "No text selected."
Else
System.DebugLog "Service " + userData + " called with: " + text
End If
End Sub
```

Notes: This class must be subclassed to implement services.
Use ServiceInvoked as the name of the selector when declaring service (NSMessage parameter).
Use NSUserData parameter to distinguish between all the services you offer.
This class implements NSServiceProvider for Xojo and Xojo for Cocoa applications. For Carbon, please use CarbonApplicationEventsMBS events.

35.54.2 Methods

35.54.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The constructor.

35.54.4 Destructor

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The destructor.

35.54.5 Properties

35.54.6 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Internal object reference.
Notes: (Read and Write property)

35.54.7 Events

35.54.8 readSelectionFromPasteboard(pboard as NSPasteboardMBS) as Boolean

MBS MacCocoa Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Reads data from the pasteboard.
Notes: pboard: The pasteboard containing the data to read.

Return true if your implementation was able to read the pasteboard data successfully; otherwise, false.

35.54.9 ServiceInvoked(pboard as NSPasteboardMBS, userData as string, byref error as string)

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: This event is called when a service should perform.
Notes: Use ServiceInvoked as the name of the selector when declaring service (NSMessage parameter).
Use NSUserData parameter to distinguish between all the services you offer.

35.54.10 validRequestor(sendType as String, returnType as String) as Boolean

MBS MacCocoa Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the receiver can send and receive the specified pasteboard types.
Notes: sendType: The pasteboard type the app needs to send.
returnType: The pasteboard type the app needs to receive.

Return true if your class can send and receive the specified types or false if the receiver knows of no object that can send and receive data of that type.

35.54.11 writeSelectionToPasteboard(pboard as NSPasteboardMBS, types() as String) as Boolean

MBS MacCocoa Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Write the current selection to the specified pasteboard under each given type.
Notes: pboard: The pasteboard to write to.
types: An array of strings describing the types of data to write.

Return true if the data for any single type was successfully written, false otherwise.

35.55 class NSSizeMBS

35.55.1 class NSSizeMBS

MBS Main Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: A Xojo class for the size structure in Cocoa.
Example:

```
Var n as NSSizeMBS = NSMakeSizeMBS(500,600)
MessageBox n.String
```

Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.1pr1
- Apply fonts to font PopupMenu
- MBS REALbasic plug-in 9.6

35.55.2 Methods

35.55.3 Constructor

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates an empty size.
Example:

```
Var p as new NSSizeMBS
MessageBox p // shows { 0 ,0 }
```

See also:

- 35.55.4 Constructor(p as Ptr) 6593
- 35.55.5 Constructor(s as string) 6594
- 35.55.6 Constructor(Width as Double, Height as Double) 6594

35.55.4 Constructor(p as Ptr)

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Creates a new instance using data at the pointer.
Notes: Make sure the pointer is valid and has the right data and size.
See also:

- 35.55.3 Constructor 6593
- 35.55.5 Constructor(s as string) 6594
- 35.55.6 Constructor(Width as Double, Height as Double) 6594

35.55.5 Constructor(s as string)

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a new NSSize object using the given string.
Example:

```
Var p as new NSSizeMBS(" { 1,2 } ")
MessageBox p // shows { 1, 2 }
```

See also:

- 35.55.3 Constructor 6593
- 35.55.4 Constructor(p as Ptr) 6593
- 35.55.6 Constructor(Width as Double, Height as Double) 6594

35.55.6 Constructor(Width as Double, Height as Double)

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a new NSSize object using the given values.
See also:

- 35.55.3 Constructor 6593
- 35.55.4 Constructor(p as Ptr) 6593
- 35.55.5 Constructor(s as string) 6594

35.55.7 Equal(other as NSSizeMBS) as boolean

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Whether two sizes are equal.

35.55.8 Operator_Convert as String

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Converts the object to string.
Example:

```
Var p as new NSSizeMBS(1,2)
MessageBox p // shows { 1, 2 }
```

35.55.9 String as String

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the string representation of this size object.
Example:

```
Var p as new NSSizeMBS(1,2)
MessageBox p.String // shows { 1, 2 }
```

35.55.10 Zero as NSSizeMBS

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Returns a size with all values being zero.

35.55.11 Properties

35.55.12 Handle as Ptr

MBS Main Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: The pointer to the internal data structure.
Notes: May be useful for passing to declares requiring a NSSize*.
Size of structure is 8 bytes for 32-bit (two singles) and 16 bytes for 64-bit (two doubles).
(Read only property)

35.55.13 Height as Double

MBS Main Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The height of this size.
Notes: (Read and Write property)

35.55.14 Width as Double

MBS Main Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The width of this size.
Notes: (Read and Write property)

35.56 class NSSoundDelegateMBS

35.56.1 class NSSoundDelegateMBS

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for the delegate to receive events from NSSoundMBS objects.

35.56.2 Events

35.56.3 SoundFinished(s as NSSoundMBS, didFinishPlaying as boolean)

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: This delegate method is called when an NSSoundMBS instance has completed playback of its sound data.
Notes: s: The NSSound that has completed playback of its sound data.

didFinishPlaying: True when playback was successful; false otherwise.

The parameter s is not the NSSoundMBS object you used before but a new one. But it has the same handle value as the one where you called play, so you can still compare which one was affected.

35.57 class NSSoundMBS

35.57.1 class NSSoundMBS

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The NSSound class provides a simple interface for loading and playing audio files.
Example:

```
// play a system sound and a sound file
// keep a reference while playing, e.g. in a property: Player As NSSoundMBS
Player = NSSoundMBS.soundNamed("Submarine")
Call Player.play

// play a file
Var file As FolderItem = SpecialFolder.Music.Child("test.aiff")
Player = New NSSoundMBS(file, True)
Player.volume = 0.5
If Player.play Then
System.DebugLog "Playing, duration " + Player.duration.ToString + " seconds"
End If
```

Notes: This class supports the same audio encodings and file formats that are supported by Core Audio and QuickTime.

To use this class, initialize a new instance with the desired file or audio data. You can configure assorted aspects of the audio playback, including the volume and whether the sound loops before you play it. Depending on the type of the audio data, this class may use either Core Audio or QuickTime to handle the actual playback. (Typically, it uses Core Audio to play files in the AIFF, WAVE, NeXT, SD2, AU, and MP3 formats and may use it for other formats in the future as well.) Playback occurs asynchronously so that your application can continue doing work.

You should retain NSSound objects before initiating playback or make sure you have a strong reference to them in a garbage-collected environment. Upon deallocation, a sound object stops playback of the sound (as needed) so that it can free up the corresponding audio resources. If you want to deallocate a sound object immediately after playback, assign a delegate and use the sound:didFinishPlaying: method to deallocate it.

If you want to play the system beep sound, use the NSBeep function.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.3pr1
- MBS REALbasic plug-ins version 9.5
- MBS REALbasic plug-ins version 9.4

35.57.2 Methods

35.57.3 availableSounds as string()

MBS MacBase Plugin, Plugin Version: 9.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of the available sounds.
Example:

```
Var sounds(-1) as string = NSSoundMBs.availableSounds

// play first sound
Var n as NSSoundMBS = NSSoundMBS.soundNamed(sounds(0))

call n.play

// show list of sounds
MessageBox Join(sounds,EndOfLine)
```

Notes: You can use the names in this array for the soundNamed function.

35.57.4 canInitWithPasteboard as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the receiver can create an instance of itself from the data in a pasteboard.
Notes: true when the receiver can handle the data represented by pasteboard; false otherwise.

The soundUnfilteredPasteboardTypes method is used to find out whether the class can handle the data in pasteboard.

35.57.5 channelMapping as Integer()

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Provides the receiver,Äôs channel map.
Notes: A channel map correlates a sound,Äôs channels to the output-device,Äôs channels. For example, a two-channel sound being played on a five-channel device should have a channel map to optimize the sound-playing experience. The default map, correlates the first sound channel to the first output channel, the second sound channel to the second output channel, and so on.

Available in OS X v10.5 and later. Deprecated in OS X v10.9.

35.57.6 Constructor

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes the receiver with data from a pasteboard.
Notes: NSSound expects the data to have a proper magic number, sound header, and data for the formats it supports.
See also:

- 35.57.7 Constructor(data as MemoryBlock) 6600
- 35.57.8 Constructor(file as folderitem, ByReference as boolean) 6600
- 35.57.9 Constructor(url as string, ByReference as boolean) 6601

35.57.7 Constructor(data as MemoryBlock)

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes the receiver with a given audio data.
Notes: data: Audio data with which the receiver is to be initialized. The data must have a proper magic number, sound header, and data for the formats the NSSound class supports.
See also:

- 35.57.6 Constructor 6600
- 35.57.8 Constructor(file as folderitem, ByReference as boolean) 6600
- 35.57.9 Constructor(url as string, ByReference as boolean) 6601

35.57.8 Constructor(file as folderitem, ByReference as boolean)

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes the receiver with the audio data located at a given file.
Example:

```
Var s as NSSoundMBS
Var f as FolderItem

f=SpecialFolder.Desktop.Child("test.mp3")

s=new NSSoundMBS(f,true)

call s.play
```

Notes: file: Path to the sound file.
ByReference: When true only the name of the sound is stored with the NSSound instance when archived

using encodeWithCoder:; otherwise the audio data is archived along with the instance. (not used in Xojo)
See also:

- 35.57.6 Constructor 6600
- 35.57.7 Constructor(data as MemoryBlock) 6600
- 35.57.9 Constructor(url as string, ByReference as boolean) 6601

35.57.9 Constructor(url as string, ByReference as boolean)

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes the receiver with the audio data located at a given URL.
Notes: url: URL to the sound file with which the receiver is to be initialized.
ByReference: When true only the name of the sound is stored with the NSSound instance when archived using encodeWithCoder:; otherwise the audio data is archived along with the instance. (not used in Xojo)
See also:

- 35.57.6 Constructor 6600
- 35.57.7 Constructor(data as MemoryBlock) 6600
- 35.57.8 Constructor(file as folderitem, ByReference as boolean) 6600

35.57.10 duration as Double

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Provides the duration of the receiver in seconds.
Notes: Available in Mac OS X v10.5 and later.

35.57.11 isPlaying as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the receiver is playing its audio data.
Notes: True when the receiver is playing its audio data, false otherwise.

35.57.12 name as string

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the name assigned to the receiver.
Notes: Name assigned to the receiver; "" when no name has been assigned.

35.57.13 NSSoundPboardType as string

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The NSSound class defines this common pasteboard data type.

35.57.14 pause as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Pauses audio playback.
Notes: True when playback is paused successfully, false when playback is already paused or when an error occurred.

35.57.15 play as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initiates audio playback.
Notes: True when playback is initiated, false when playback is already in progress or when an error occurred.

This method initiates playback asynchronously and returns control to your application. Therefore, your application can continue doing work while the audio is playing.

35.57.16 resume as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Resumes audio playback.
Notes: True when playback is resumed, false when playback is in progress or when an error occurred.

Assumes the receiver has been previously paused by sending it pause.

35.57.17 setChannelMapping(mapping() as Integer)

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Specifies the receiver,Äôs channel map.
Notes: Mapping: Audio-channel—to—device–channel mappings for the receiver.

Available in OS X v10.5 and later. Deprecated in OS X v10.9.

35.57.18 setDelegate(DelegateHandler as NSSoundDelegateMBS)

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Set the receiver's delegate.
Notes: You can assign one delegate to several sounds.
But the delegate object is not referenced, so keep it alive with your own reference, so RB won't destroy it too early.

35.57.19 setName(name as string) as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Registers the receiver under a given name.
Notes: Returns True when successful; false otherwise.

If the receiver is already registered under another name, this method first unregisters the prior name.

35.57.20 soundNamed(name as string) as NSSoundMBS

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the NSSound instance associated with a given name.
Example:

```
Var s as NSSoundMBS

s=NSSoundMBS.soundNamed("Submarine")

call s.play
```

Notes: NSSound instance initialized with the sound data identified by soundName.

The returned object can be one of the following:

One that's been assigned a name with setName.

One of the named system sounds provided by the Application Kit framework If there's no known NSSound

object with soundName, this method tries to create one by searching for sound files in the application's main bundle (see NSBundle for a description of how the bundle's contents are searched). If no sound file can be located in the application main bundle, the following directories are searched in order:
textasciitilde /Library/Sounds, /Library/Sounds, /Network/Library/Sounds or /System/Library/Sounds.

If no data can be found for soundName, no object is created, and nil is returned.

The preferred way to locate a sound is to pass a name without the file extension. See the class description for a list of the supported sound file extensions.

35.57.21 soundUnfilteredFileTypes as string()

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Provides the list of file types the NSSound class understands.
Notes: Returns array of strings representing the file types the NSSound class understands.
The returned array may be passed directly to the runModalForTypes method of the NSOpenPanel class.
Available in OS X v10.0 and later. Deprecated in OS X v10.5.

35.57.22 soundUnfilteredPasteboardTypes as string()

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Provides a list of the pasteboard types that the NSSound class can accept.
Notes: Array of pasteboard types that the NSSound class can accept.
Available in OS X v10.0 and later. Deprecated in OS X v10.5.

35.57.23 soundUnfilteredTypes as string()

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Provides the file types the NSSound class understands.
Notes: Returns array of UTIs identifying the file types the NSSound class understands.

Available in OS X v10.5 and later.

35.57.24 soundWithContentsOfFile(file as folderitem, ByReference as boolean) as NSSoundMBS

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a NSSound object with the audio data located at a given file.
Example:

```
Var s as NSSoundMBS
Var f as FolderItem

f=SpecialFolder.Desktop.Child("test.mp3")

s=NSSoundMBS.soundWithContentsOfFile(f,true)

call s.play

// sound continues to play even after NSSoundMBS object is destroyed.
```

Notes: file: Path to the sound file.
ByReference: When true only the name of the sound is stored with the NSSound instance when archived using encodeWithCoder:; otherwise the audio data is archived along with the instance. (not used in Xojo)

35.57.25 soundWithContentsOfURL(url as string, ByReference as boolean) as NSSoundMBS

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a NSSoundMBS object with the audio data located at a given URL.
Notes: url: URL to the sound file with which the receiver is to be initialized.
ByReference: When true only the name of the sound is stored with the NSSound instance when archived using encodeWithCoder:; otherwise the audio data is archived along with the instance. (not used in Xojo)

35.57.26 soundWithData(data as MemoryBlock) as NSSoundMBS

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a NSSoundMBS object with a given audio data.
Notes: data: Audio data with which the receiver is to be initialized. The data must have a proper magic number, sound header, and data for the formats the NSSound class supports.

35.57.27 soundWithPasteboard as NSSoundMBS

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a NSSoundMBS object with data from a pasteboard.
Notes: NSSound expects the data to have a proper magic number, sound header, and data for the formats it supports.

35.57.28 stop as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Concludes audio playback.
Notes: True when playback is concluded successfully or if it's paused, false otherwise.

35.57.29 writeToPasteboard

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Writes the receiver's data to a pasteboard.

35.57.30 Properties

35.57.31 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference to the NSSound object.
Notes: (Read and Write property)

35.57.32 currentTime as Double

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Provides the receiver's playback progress in seconds.
Notes: Receiver's playback progress in seconds.

Sounds start with currentTime == 0 and end with currentTime == ([<sound>duration] - 1).

Available in Mac OS X v10.5 and later.
This property is not archived, copied, or stored on the pasteboard.
(Read and Write computed property)

35.57.33 loops as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates whether the receiver restarts playback when it reaches the end of its content.
Notes: True when the receiver restarts playback when it finishes, false otherwise.
Default: false

Available in Mac OS X v10.5 and later.

When loops is true, the delegate does not call the SoundFinished event on the end of its content and restarts playback.
(Read and Write computed property)

35.57.34 playbackDeviceIdentifier as string

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Identifies the receiver's output device.
Notes: Returns an unique identifier of a sound output device.
Available in Mac OS X v10.5 and later.
(Read and Write computed property)

35.57.35 volume as Double

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Provides the volume of the receiver.
Notes: This method does not affect the systemwide volume.
Available in Mac OS X v10.5 and later.

0.0 is not sound and 1.0 is full sound.
(Read and Write computed property)

35.58 class NSStreamMBS

35.58.1 class NSStreamMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: An abstract class representing a stream.
Example:

```
// read a file in chunks with a Cocoa input stream
Var stream As NSInputStreamMBS = NSInputStreamMBS.inputStreamWithFileAtPath(SpecialFolder.Desktop.Child("test.txt").NativePath)
If stream = Nil Then Return
stream.Open

Var total As Integer
While stream.hasBytesAvailable
Var chunk As MemoryBlock = stream.Read(4096)
If chunk = Nil Or chunk.Size = 0 Then Exit
total = total + chunk.Size
Wend
If stream.Error <>Nil Then System.DebugLog stream.Error.localizedDescription
stream.Close
MessageBox total.ToString + " bytes read"
```

Notes: This class's interface is common to all Cocoa stream classes, including its concrete subclasses NSInputStream and NSOutputStream.
NSStream objects provide an easy way to read and write data to and from a variety of media in a device-independent way. You can create stream objects for data located in memory, in a file, or on a network (using sockets), and you can use stream objects without loading all of the data into memory at once.
By default, NSStream instances that are not file-based are non-seekable, one-way streams (although custom seekable subclasses are possible). Once the data has been provided or consumed, the data cannot be retrieved from the stream.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 18.2pr2

35.58.2 Methods

35.58.3 Close

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Closes the receiver.
Notes: Closing the stream terminates the flow of bytes and releases system resources that were reserved for

the stream when it was opened. If the stream has been scheduled on a run loop, closing the stream implicitly removes the stream from the run loop. A stream that is closed can still be queried for its properties.

35.58.4 Constructor

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The private constructor.

35.58.5 Open

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Opens the receiving stream.
Notes: A stream must be created before it can be opened. Once opened, a stream cannot be closed and reopened.

35.58.6 SetPosition(pos as Int64) as boolean

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Sets position in a stream.
Notes: Returns true on success or false on failure.

35.58.7 Properties

35.58.8 Error as NSErrorMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Returns an NSError object representing the stream error.
Notes: An NSError object representing the stream error, or nil if no error has been encountered.
(Read only property)

35.58.9 Handle as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

35.58.10 position as Int64

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Queries position in file stream.
Notes: (Read only property)

35.58.11 Status as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Returns the receiver,Äôs status.
Notes: See kStatus* constants.
(Read only property)

35.58.12 Constants

Status Constants

Constant	Value	Description
kStatusAtEnd	5	There is no more data to read, or no more data can be written to the stream. When this status is returned, the stream is in a ,Äúnon-blocking,Äù mode and no data are available.
kStatusClosed	6	The stream is closed (close has been called on it).
kStatusError	7	The remote end of the connection can,Äôt be contacted, or the connection has been severed for some other reason.
kStatusNotOpen	0	The stream is not open for reading or writing. This status is returned before the underlying call to open a stream but after it,Äôs been created.
kStatusOpen	2	The stream is open, but no reading or writing is occurring.
kStatusOpening	1	The stream is in the process of being opened for reading or for writing. For network streams, this status might include the time after the stream was opened, but while network DNS resolution is happening.
kStatusReading	3	Data is being read from the stream. This status would be returned if code on another thread were to call Status on the stream while a read() was in progress.
kStatusWriting	4	Data is being written to the stream. This status would be returned if code on another thread were to call Status on the stream while a write() was in progress.

35.59 class NSTimerMBS

35.59.1 class NSTimerMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platforms: macOS, iOS, Targets: All.

Function: The cocoa timer class.
Example:

```
Var n as new NSTimerMBS(5, true)
```

Notes: You use the NSTimer class to create timer objects or, more simply, timers. A timer waits until a certain time interval has elapsed and then fires, calling the action event. For example, you could create an NSTimer object that calls the action event, telling it to update itself after a certain time interval.

A timer is not a real-time mechanism; it fires only when one of the run loop modes to which the timer has been added is running and able to check if the timer's firing time has passed. Because of the various input sources a typical run loop manages, the effective resolution of the time interval for a timer is limited to on the order of 50-100 milliseconds. If a timer's firing time occurs during a long callout or while the run loop is in a mode that is not monitoring the timer, the timer does not fire until the next time the run loop checks the timer. Therefore, the actual time at which the timer fires potentially can be a significant period of time after the scheduled firing time.

Repeating Versus Non-Repeating Timers
You specify whether a timer is repeating or non-repeating at creation time. A non-repeating timer fires once and then invalidates itself automatically, thereby preventing the timer from firing again. By contrast, a repeating timer fires and then reschedules itself on the same run loop.

A repeating timer always schedules itself based on the scheduled firing time, as opposed to the actual firing time. For example, if a timer is scheduled to fire at a particular time and every 5 seconds after that, the scheduled firing time will always fall on the original 5 second time intervals, even if the actual firing time gets delayed. If the firing time is delayed so far that it passes one or more of the scheduled firing times, the timer is fired only once for that time period; the timer is then rescheduled, after firing, for the next scheduled firing time in the future.

Scheduling Timers in Run Loops
A timer object can be registered in only one run loop at a time, although it can be added to multiple run loop modes within that run loop. There are three ways to create a timer:

Use the Constructor to create the timer and schedule it on the current run loop in the default mode.

Once scheduled, the timer fires at the specified interval until it is invalidated. A non-repeating timer invalidates itself immediately after it fires. However, for a repeating timer, you must invalidate the timer object yourself by calling its invalidate method. Calling this method requests the removal of the timer from the

current run loop; as a result, you should always call the invalidate method from the same thread on which the timer was installed. Invalidating the timer immediately disables it so that it no longer affects the run loop. The run loop then removes and releases the timer, either just before the invalidate method returns or at some later point. Once invalidated, timer objects cannot be reused.

Please don't create a lot of TimerMBS objects in your application. Have a few. If you need a lot, maybe just have one to lookup in a table what to do and call the right method. If you run dozens of timers, the precision of each of them gets worse as they all fire and delay each other's events.

35.59.2 Methods

35.59.3 Constructor(fireDate as date, timeInterval as Double, repeats as boolean)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a new NSTimer.
Example:

```
Var d as new date
d.hour = d.hour + 1 // start in one hour

Var n as new NSTimerMBS(d, 5, true)
```

Notes: fireDate: The time at which the timer should first fire.

timeInterval: For a repeating timer, this parameter contains the number of seconds between firings of the timer. If seconds is less than or equal to 0.0, this method chooses the nonnegative value of 0.1 milliseconds instead.
repeats: If true, the timer will repeatedly reschedule itself until invalidated. If false, the timer will be invalidated after it fires.

The time is initialized such that, when added to a run loop, it will fire at date and then, if repeats is true, every seconds after that.
See also:

- 35.59.4 Constructor(fireDate as date, timeInterval as Double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string) 6613
- 35.59.5 Constructor(fireDate as dateTime, timeInterval as double, repeats as boolean) 6613
- 35.59.6 Constructor(fireDate as dateTime, timeInterval as double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string) 6614
- 35.59.7 Constructor(timeInterval as Double, repeats as boolean) 6615

35.59.4 Constructor(fireDate as date, timeInterval as Double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string)

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a new NSTimer.
Notes: fireDate: The time at which the timer should first fire.

timeInterval: For a repeating timer, this parameter contains the number of seconds between firings of the timer. If seconds is less than or equal to 0.0, this method chooses the nonnegative value of 0.1 milliseconds instead.
repeats: If true, the timer will repeatedly reschedule itself until invalidated. If false, the timer will be invalidated after it fires.

The time is initialized such that, when added to a run loop, it will fire at date and then, if repeats is true, every seconds after that.

Schedules the timer to run on the given runloop in the given mode.
See also:

- 35.59.3 Constructor(fireDate as date, timeInterval as Double, repeats as boolean) 6612
- 35.59.5 Constructor(fireDate as dateTime, timeInterval as double, repeats as boolean) 6613
- 35.59.6 Constructor(fireDate as dateTime, timeInterval as double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string) 6614
- 35.59.7 Constructor(timeInterval as Double, repeats as boolean) 6615

35.59.5 Constructor(fireDate as dateTime, timeInterval as double, repeats as boolean)

MBS MacCocoa Plugin, Plugin Version: 20.5, Platforms: macOS, iOS, Targets: All.

Function: Creates and returns a new NSTimer object and schedules it on the current run loop in the default mode.

Notes: timeInterval: The number of seconds between firings of the timer. If seconds is less than or equal to 0.0, this method chooses the nonnegative value of 0.1 milliseconds instead.
repeats: If true, the timer will repeatedly reschedule itself until invalidated. If false, the timer will be invalidated after it fires.

After seconds seconds have elapsed, the timer fires, calling the Action event.

- 35.59.7 Constructor(timeInterval as Double, repeats as boolean) 6615

35.59.6 Constructor(fireDate as dateTime, timeInterval as double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string)

MBS MacCocoa Plugin, Plugin Version: 20.5, Platforms: macOS, iOS, Targets: All.

Function: Initializes a new NSTimer.
Notes: fireDate: The time at which the timer should first fire.

timeInterval: For a repeating timer, this parameter contains the number of seconds between firings of the timer. If seconds is less than or equal to 0.0, this method chooses the nonnegative value of 0.1 milliseconds instead.
repeats: If true, the timer will repeatedly reschedule itself until invalidated. If false, the timer will be invalidated after it fires.

The time is initialized such that, when added to a run loop, it will fire at date and then, if repeats is true, every seconds after that.

Schedules the timer to run on the given runloop in the given mode.
See also:

- 35.59.4 Constructor(fireDate as date, timeInterval as Double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string) 6613
- 35.59.5 Constructor(fireDate as dateTime, timeInterval as double, repeats as boolean) 6613
- 35.59.7 Constructor(timeInterval as Double, repeats as boolean) 6615

35.59.7 Constructor(timeInterval as Double, repeats as boolean)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platforms: macOS, iOS, Targets: All.

Function: Creates and returns a new NSTimer object and schedules it on the current run loop in the default mode.
Example:

```
Var n as new NSTimerMBS(5, true)
MessageBox str(n.timeInterval)
```

Notes: timeInterval: The number of seconds between firings of the timer. If seconds is less than or equal to 0.0, this method chooses the nonnegative value of 0.1 milliseconds instead.
repeats: If true, the timer will repeatedly reschedule itself until invalidated. If false, the timer will be invalidated after it fires.

After seconds seconds have elapsed, the timer fires, calling the Action event.
See also:

- 35.59.3 Constructor(fireDate as date, timeInterval as Double, repeats as boolean) 6612
- 35.59.4 Constructor(fireDate as date, timeInterval as Double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string) 6613
- 35.59.5 Constructor(fireDate as dateTime, timeInterval as double, repeats as boolean) 6613
- 35.59.6 Constructor(fireDate as dateTime, timeInterval as double, repeats as boolean, runloop as NSRunLoopMBS, runloopMode as string) 6614

35.59.8 fire

MBS MacCocoa Plugin, Plugin Version: 10.0, Platforms: macOS, iOS, Targets: All.

Function: Causes the receiver's message to be sent to its target.
Notes: You can use this method to fire a repeating timer without interrupting its regular firing schedule. If the timer is non-repeating, it is automatically invalidated after firing, even if its scheduled fire date has not arrived.

35.59.9 invalidate

MBS MacCocoa Plugin, Plugin Version: 10.0, Platforms: macOS, iOS, Targets: All.

Function: Stops the receiver from ever firing again and requests its removal from its run loop.
Example:

```
Var n as new NSTimerMBS(5, true)
```

```
// later

n.invalidate
```

Notes: The destructor calls invalide automatically for you.

This method is the only way to remove a timer from an NSRunLoop object. The NSRunLoop object removes and releases the timer, either just before the invalidate method returns or at some later point.

You must send this message from the thread on which the timer was installed. If you send this message from another thread, the input source associated with the timer may not be removed from its run loop, which could prevent the thread from exiting properly.

35.59.10 Timer(t as timer) as NSTimerMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Platforms: macOS, iOS, Targets: All.

Function: Creates a NSTimerMBS object referencing the given timer object.
Example:

```
Var n as NSTimerMBS = NSTimerMBS.timer(timer1)
n.tolerance = 0.1
```

Notes: Only for Cocoa 32bit currently.
Works fine in Xojo 2012 and Xojo 2014r1 in Cocoa target.

35.59.11 Properties

35.59.12 fireDate as date

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date at which the receiver will fire.
Example:

```
Var d as new date
d.hour = d.hour + 1 // start in one hour

Var n as new NSTimerMBS(d, 5, true)
MessageBox n.fireDate.ShortDate+" "+n.fireDate.ShortTime
```

Notes: The date at which the receiver will fire. If the timer is no longer valid, this method returns the last

date at which the timer fired.

Use the isValid method to verify that the timer is valid.

You typically use this method to adjust the firing time of a repeating timer. Although resetting a timer's next firing time is a relatively expensive operation, it may be more efficient in some situations. For example, you could use it in situations where you want to repeat an action multiple times in the future, but at irregular time intervals. Adjusting the firing time of a single timer would likely incur less expense than creating multiple timer objects, scheduling each one on a run loop, and then destroying them.

You should not call this method on a timer that has been invalidated, which includes non-repeating timers that have already fired. You could potentially call this method on a non-repeating timer that had not yet fired, although you should always do so from the thread to which the timer is attached to avoid potential race conditions.
(Read and Write property)

35.59.13 fireDateTime as DateTime

MBS MacCocoa Plugin, Plugin Version: 20.5, Platforms: macOS, iOS, Targets: All.

Function: The date at which the receiver will fire.
Notes: (Read and Write property)

35.59.14 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platforms: macOS, iOS, Targets: All.

Function: The internal reference to the NSTimer object.
Example:

```
Var n as new NSTimerMBS(5, true)
MessageBox str(n.Handle)
```

Notes: (Read and Write property)

35.59.15 isValid as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Platforms: macOS, iOS, Targets: All.

Function: Returns a Boolean value that indicates whether the receiver is currently valid.
Example:

```
Var n as new NSTimerMBS(5, true)
MessageBox str(n.isValid)
```

Notes: True if the receiver is still capable of firing or false if the timer has been invalidated and is no longer capable of firing.
(Read only property)

35.59.16 tag as Variant

MBS MacCocoa Plugin, Plugin Version: 10.0, Platforms: macOS, iOS, Targets: All.

Function: A value you can use in your app however you like.
Example:

```
Var n as new NSTimerMBS(5, true)
n.tag = Window1 // some value you may later use
```

Notes: (Read and Write property)

35.59.17 timeInterval as Double

MBS MacCocoa Plugin, Plugin Version: 10.0, Platforms: macOS, iOS, Targets: All.

Function: The receiver's time interval.
Example:

```
Var n as new NSTimerMBS(5, true)
MessageBox str(n.timeInterval)
```

Notes: The receiver's time interval. If the receiver is a non-repeating timer, returns 0 (even if a time interval was set).
(Read only property)

35.59.18 tolerance as Double

MBS MacCocoa Plugin, Plugin Version: 13.5, Platforms: macOS, iOS, Targets: All.

Function: The tolerance for this timer.
Notes: Requires Mac OS X 10.9.

Setting a tolerance for a timer allows it to fire later than the scheduled fire date, improving the ability of

the system to optimize for increased power savings and responsiveness. The timer may fire at any time between its scheduled fire date and the scheduled fire date plus the tolerance. The timer will not fire before the scheduled fire date. For repeating timers, the next fire date is calculated from the original fire date regardless of tolerance applied at individual fire times, to avoid drift. The default value is zero, which means no additional tolerance is applied. The system reserves the right to apply a small amount of tolerance to certain timers regardless of the value of this property.

As the user of the timer, you will have the best idea of what an appropriate tolerance for a timer may be. A general rule of thumb, though, is to set the tolerance to at least 10% of the interval, for a repeating timer. Even a small amount of tolerance will have a significant positive impact on the power usage of your application. The system may put a maximum value of the tolerance.
(Read and Write property)

35.59.19 Events

35.59.20 Action

MBS MacCocoa Plugin, Plugin Version: 10.0, Platforms: macOS, iOS, Targets: All.

Function: The event called when the timer fires.

35.60 class NSTimeZoneMBS

35.60.1 class NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: NSTimeZone is an abstract class that defines the behavior of time zone objects.
Example:

```
// show the local time zone and the current offset of some other cities
Var local As NSTimeZoneMBS = NSTimeZoneMBS.localTimeZone
Var lines() As String
lines.Add "Local: " + local.name + " (" + local.abbreviation + "), daylight saving: " + local.isDaylight-
SavingTime.ToString

For Each name As String In Array("America/New_York", "Asia/Tokyo", "Australia/Sydney")
Var tz As NSTimeZoneMBS = NSTimeZoneMBS.timeZoneWithName(name)
lines.Add name + ": GMT" + If(tz.SecondsFromGMT >= 0, "+", "") + Format(tz.SecondsFromGMT /
3600, "0.#") + " " + tz.abbreviation
Next
lines.Add NSTimeZoneMBS.knownTimeZoneNames.Count.ToString + " known time zones"
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Time zone objects represent geopolitical regions. Consequently, these objects have names for these regions. Time zone objects also represent a temporal offset, either plus or minus, from Greenwich Mean Time (GMT) and an abbreviation (such as PST for Pacific Standard Time).

NSTimeZone provides several class methods to get time zone objects: timeZoneWithName, timeZoneWith-Abbreviation, and timeZoneForSecondsFromGMT. The class also permits you to set the default time zone within your application (setDefaultTimeZone). You can access this default time zone at any time with the defaultTimeZone class method, and with the localTimeZone class method, you can get a relative time zone object that decodes itself to become the default time zone for any locale in which it finds itself.

Cocoa does not provide any API to change the time zone of the computer, or of other applications.

Some NSCalendarDate methods return date objects that are automatically bound to time zone objects. These date objects use the functionality of NSTimeZone to adjust dates for the proper locale. Unless you specify otherwise, objects returned from NSCalendarDate are bound to the default time zone for the current locale.

Note that, strictly, time zone database entries such as "America/Los_Angeles" are IDs not names. An example of a time zone name is "Pacific Daylight Time". Although many NSTimeZone method names include the word "name", they refer to IDs.

- MBS Real Studio Plugins, version 12.3pr11

35.60.2 Methods

35.60.3 Constructor

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Creates a new timezone.
See also:

- 35.60.4 Constructor(name as string) 6621

35.60.4 Constructor(name as string)

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Creates a time zone initialized with a given ID.
Example:

```
Var t as NSTimeZoneMBS = new NSTimeZoneMBS("Europe/Berlin")
MessageBox t.name
```

Notes: If name is a known ID, this method calls initWithName:data: with the appropriate data object.

In Mac OS X v10.4 and earlier providing nil for the parameter would have caused a crash. In Mac OS X v10.5 and later, this now raises an invalid argument exception.
See also:

- 35.60.3 Constructor 6621

35.60.5 copy as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Creates a copy of the timezone object.
Example:

```
Var t as NSTimeZoneMBS = NSTimeZoneMBS.systemTimeZone
Var c as NSTimeZoneMBS = t.copy
```

MessageBox c.name

35.60.6 defaultTimeZone as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the default time zone for the current application.
Example:

MessageBox NSTimeZoneMBS.defaultTimeZone.name

Notes: The default time zone for the current application. If no default time zone has been set, this method invokes systemTimeZone and returns the system time zone.

Discussion
The default time zone is the one that the application is running with, which you can change (so you can make the application run as if it were in a different time zone).

If you get the default time zone and hold onto the returned object, it does not change if a subsequent invocation of setDefaultTimeZone changes the default time zone—you still have the specific time zone you originally got. Contrast this behavior with the object returned by localTimeZone.

35.60.7 isEqualToTimeZone(timeZone as NSTimeZoneMBS) as boolean

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the receiver has the same name and data as another given time zone.
Example:

```
if NSTimeZoneMBS.systemTimeZone.isEqualToTimeZone(NSTimeZoneMBS.localTimeZone) then
MessageBox "equal"
else
MessageBox "not equal"
end if
```

Notes: TimeZone: The time zone to compare with the receiver.
Returns true if TimeZone and the receiver have the same name and data, otherwise false.

35.60.8 knownTimeZoneNames as string()

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns an array of strings listing the IDs of all the time zones known to the system.
Example:

MessageBox join(NSTimeZoneMBS.knownTimeZoneNames, EndOfLine)

35.60.9 localTimeZone as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns an object that forwards all messages to the default time zone for the current application.
Example:

MessageBox NSTimeZoneMBS.localTimeZone.name

Notes: An object that forwards all messages to the default time zone for the current application.

Discussion
The local time zone represents the current state of the default time zone at all times. If you get the default time zone (using defaultTimeZone) and hold onto the returned object, it does not change if a subsequent invocation of setDefaultTimeZone changes the default time zone—you still have the specific time zone you originally got. The local time zone adds a level of indirection, it acts as if it were the current default time zone whenever you invoke a method on it.

35.60.10 Print

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Writes the time zone to debug output.
Example:

NSTimeZoneMBS.localTimeZone.print

Notes: This may help for debugging and you see output in console app.

35.60.11 systemTimeZone as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the time zone currently used by the system.
Example:

MessageBox NSTimeZoneMBS.systemTimeZone.name

Notes: The time zone currently used by the system. If the current time zone cannot be determined, returns the GMT time zone.

Special Considerations
If you get the system time zone, it is cached by the application and does not change if the user subsequently changes the system time zone. The next time you invoke systemTimeZone, you get back the same time zone you originally got. You have to invoke resetSystemTimeZone to clear the cached object.

35.60.12 timeZoneForSecondsFromGMT(seconds as Integer) as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 17.5, Platform: macOS, Targets: All.

Function: Creates time zone object based on a delta from GMT.
Notes: Time zones created with this never have daylight savings and the offset is constant no matter the date; the name and abbreviation do NOT follow the POSIX convention (of minutes-west).

35.60.13 timeZoneWithName(name as string) as NSTimeZoneMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns the time zone object identified by a given ID.
Example:

```
Var t as NSTimeZoneMBS = NSTimeZoneMBS.timeZoneWithName("Europe/Berlin")
MessageBox t.name
```

Notes: Name: The ID for the time zone.

Returns the time zone in the information directory with a name matching name.
Returns nil if there is no match for the name.

35.60.14 Properties

35.60.15 abbreviation as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the abbreviation for the receiver.
Example:

MessageBox NSTimeZoneMBS.localTimeZone.Abbreviation

Notes: The abbreviation for the receiver, such as "EDT" (Eastern Daylight Time).
Invokes abbreviationForDate with the current date as the argument.
(Read only property)

35.60.16 DaylightSavingTimeOffset as Double

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns the current daylight saving time offset of the receiver.
Example:

MessageBox str(NSTimeZoneMBS.localTimeZone.DaylightSavingTimeOffset)

Notes: Available in OS X v10.5 and later.
(Read only property)

35.60.17 description as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the description of the receiver.
Example:

MessageBox NSTimeZoneMBS.localTimeZone.Description

Notes: The description of the receiver, including the name, abbreviation, offset from GMT, and whether or not daylight savings time is currently in effect.
(Read only property)

35.60.18 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

35.60.19 isDaylightSavingTime as Boolean

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the receiver is currently using daylight saving time.
Example:

MessageBox str(NSTimeZoneMBS.localTimeZone.isDaylightSavingTime)

Notes: Returns true if the receiver is currently using daylight savings time, otherwise false.
(Read only property)

35.60.20 name as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the geopolitical region ID that identifies the receiver.
Example:

MessageBox NSTimeZoneMBS.localTimeZone.Name

Notes: (Read only property)

35.60.21 SecondsFromGMT as Double

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns the current difference in seconds between the receiver and Greenwich Mean Time.
Example:

MessageBox str(NSTimeZoneMBS.localTimeZone.SecondsFromGMT)

Notes: The current difference in seconds between the receiver and Greenwich Mean Time.
(Read only property)

35.60.22 abbreviationDictionary as Dictionary

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns a dictionary holding the mappings of time zone abbreviations to time zone names.
Notes: Note that more than one time zone may have the same abbreviation—for example, US/Pacific and Canada/Pacific both use the abbreviation "PST." In these cases, abbreviationDictionary chooses a single

name to map the abbreviation to.
(Read and Write computed property)

35.61 class NSTokenFieldMBS

35.61.1 class NSTokenFieldMBS

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: NSTokenField is a subclass of NSTextField that provides tokenized editing similar to the address field in the Mail application.
Example:

```
// add a token field with some tokens to the window
Var tokens As New NSTokenFieldMBS(20, 20, 300, 24)
tokens.tokenStyle = NSTokenFieldMBS.NSRoundedTokenStyle

Var values() As Variant
values.Add "Red"
values.Add "Green"
values.Add "Blue"
tokens.setObjects values

Self.NSWindowMBS.contentView.addSubview tokens

// later read them back
For Each v As Variant In tokens.objects
System.DebugLog v.StringValue
Next
```

Notes: NSTokenField uses an NSTokenFieldCell to implement much of the control's functionality. NSTokenField provides cover methods for most methods of NSTokenFieldCell, which invoke the corresponding cell method.

In MBS Plugin the objects must be strings or numbers. With plugin version 12.5, you can also use normal Xojo objects.

In OS X v10.4, NSTokenField trims whitespace around tokens but it does not trim whitespace in OS X versions 10.5.0 and 10.5.1. In OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and not implementing the representedObjectForEditingString event. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

Please note: Due to the way the plugin is implemented the Action, textShouldEndEditing and textShouldBeginEditing events do nothing, so please use tokenFieldAction, tokenFieldTextShouldEndEditing and tokenFieldTextShouldBeginEditing.
Subclass of the NSTextFieldMBS class.

- MBS Real Studio Plugins, version 12.5pr1

35.61.2 Methods

35.61.3 Constructor

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with size 100/100 and position 0/0
Example:

```
Var t as new NSTokenFieldMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.61.4 Constructor(Handle as Integer) 6629
- 35.61.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6629

35.61.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSControl handle.
Example:

```
Var t as new NSTokenFieldMBS(0, 0, 100, 100)
Var v as new NSTokenFieldMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSControl and the plugin retains this handle.
See also:

- 35.61.3 Constructor 6629
- 35.61.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6629

35.61.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with the given size and position.
Example:

```
Var x as new NSTokenFieldMBS(0, 0, 100, 20)
```

Notes: On success the handle property is not zero.
See also:

- 35.61.3 Constructor 6629
- 35.61.4 Constructor(Handle as Integer) 6629

35.61.6 defaultCompletionDelay as Double

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Returns the default completion delay.
Notes: The default completion delay is 0.

35.61.7 defaultTokenizingCharacterSet as NSCharacterSetMBS

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Returns the default tokenizing character set.
Notes: The default tokenizing character set is ",".

35.61.8 objects as Variant()

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Queries list of represented objects.

35.61.9 setObjects(objects() as Variant)

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Sets current objects.

35.61.10 Properties

35.61.11 completionDelay as Double

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The completion delay.
Notes: (Read and Write computed property)

35.61.12 tokenizingCharacterSet as NSCharacterSetMBS

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The tokenizing character set.
Notes: (Read and Write computed property)

35.61.13 tokenStyle as Integer

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The token style.
Notes: (Read and Write computed property)

35.61.14 Events

35.61.15 completionsForSubstring(substring as string, tokenIndex as Integer, byref selectedIndex as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide an array of appropriate completions for the contents of the receiver.
Notes: substring: The partial string that is to be completed.
tokenIndex: The index of the token being edited.
selectedIndex: Optionally, you can return by-reference an index into the returned array that specifies which of the completions should be initially selected. If none are to be selected, return by reference -1.

Returns an array of strings that are possible completions.
If the delegate does not implement this method, no completions are provided.

35.61.16 displayStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide a string to be displayed as a proxy for the given represented object.
Notes: representedObject: A represented object of the token field.

Returns the string to be used as a proxy for representedObject. If you return nil or do not implement this method, then representedObject is displayed as the string.

35.61.17 editingStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide a string to be edited as a proxy for a represented object.
Notes: representedObject: A represented object of the token field.

Returns a string that's an editable proxy of the represented object, or nil if the token should not be editable.

35.61.18 hasMenuForRepresentedObject(representedObject as Variant) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to specify whether the given represented object provides a menu.
Notes: representedObject: A represented object of the token field.

Returns true if the represented object has a menu, false otherwise.
By default tokens in a token field have no menus.

35.61.19 menuForRepresentedObject(representedObject as Variant) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide a menu for the specified represented object.
Notes: representedObject: A represented object of the token field.

Returns the menu associated with the represented object.

By default tokens in a token field do not return menus.

35.61.20 readFromPasteboard(pboard as NSPasteboardMBS) as Variant()

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to return an array of objects representing the data read from the specified pasteboard.
Notes: pboard: The pasteboard from which to read the represented objects.

Returns an array of represented objects created from the pasteboard data.

35.61.21 representedObjectForEditingString(editingString as string) as Variant

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide a represented object for the given editing string.
Notes: editingString: The edited string representation of a represented object.

Returns a represented object that is displayed rather than the editing string.

Note: In OS X v10.4, NSTokenField trims whitespace around tokens but it does not trim whitespace in OS X versions 10.5.0 and 10.5.1. In OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and not implementing the this method. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

35.61.22 shouldAddObjects(tokens() as Variant, index as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Allows to validate the tokens to be added to the receiver at a particular location.
Notes: tokens: An array of tokens to be inserted in the receiver at index.
index: The index of the receiver in which the array of tokens to be validated (tokens) will be inserted.

Returns an array of validated tokens.

The event can return the array unchanged or return a modified array of tokens. To reject the add completely, return an empty array. Returning nil causes an error.

35.61.23 styleForRepresentedObject(representedObject as Variant) as Integer

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to return the token style for editing the specified represented object.
Notes: representedObject: A represented object of the token field.

Returns the style that should be used to display the representedObject. Possible values are shown in NSTokenStyle Values.

If the event implements this method and returns an NSTokenStyle that differs from the style set by setTokenStyle:, the value the event returns is preferred.

If you don't implement this method, the token field's tokenStyle is used.

35.61.24 tokenFieldAction

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The control's action was triggered.
Notes: For a button if it was pressed.

35.61.25 tokenFieldTextShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing.

35.61.26 tokenFieldTextShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow text editing.

35.61.27 writeRepresentedObjects(objects() as Variant, pboard as NSPasteboardMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Sent so the delegate can write represented objects to the pasteboard corresponding to a given array of display strings.
Notes: objects: An array of represented objects associated with the token field.
pboard: The pasteboard to which to write the represented objects.

Return true if you writes the represented objects to the pasteboard, false otherwise. If false, the token field writes the display strings to the NSStringPboardType pasteboard.

35.61.28 Constants

Token Styles

Constant	Value	Description
NSDefaultTokenStyle	0	Style best used for keyword type tokens. Available in OS X v10.4 and later.
NSPlainTextTokenStyle	1	Style to use for data you want represented as plain-text and without any token background. Available in OS X v10.4 and later.
NSRoundedTokenStyle	2	Style best used for address type tokens. Available in OS X v10.4 and later.

35.62 class NSTouchMBS

35.62.1 class NSTouchMBS

MBS MacBase Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: An object representing the location, size, movement, and force of a touch occurring on the screen.
Notes: You access touch objects through UIEvent objects passed into responder objects for event handling. A touch object includes accessors for:

- The view or window in which the touch occurred
- The location of the touch within the view or window
- The approximate radius of the touch
- The force of the touch (on devices that support 3D Touch or Apple Pencil)

A touch object also contains a timestamp indicating when the touch occurred, an integer representing the number of times the user tapped the screen, and the phase of the touch in the form of a constant that describes whether the touch began, moved, or ended, or whether the system canceled the touch.

To learn how to work with swipes, read Handling Swipe and Drag Gestures in Event Handling Guide for UIKit Apps.

A touch object persists throughout a multi-touch sequence. You may store a reference to a touch while handling a multi-touch sequence, as long as you release that reference when the sequence ends. If you need to store information about a touch outside of a multi-touch sequence, copy that information from the touch.

Using NSTouch on macOS and UITouch on iOS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

35.62.2 Methods

35.62.3 Constructor

MBS MacBase Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The private constructor.

35.62.4 locationInView(View as NSViewMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns the current location of the touch in the coordinate system of the given view.
Notes: view: The view object in whose coordinate system you want the touch located. A custom view that is handling the touch may specify self to get the touch location in its own coordinate system. Pass nil to get the touch location in the window,Äôs coordinates.

Returns a point specifying the location of the receiver in view.

This method returns the current location of a UITouch object in the coordinate system of the specified view. Because the touch object might have been forwarded to a view from another view, this method performs any necessary conversion of the touch location to the coordinate system of the specified view.

35.62.5 previousLocationInView(View as NSViewMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns the previous location of the touch in the coordinate system of the given view.
Notes: view: The view object in whose coordinate system you want the touch located. A custom view that is handling the touch may specify self to get the touch location in its own coordinate system. Pass nil to get the touch location in the window,Äôs coordinates.

This method returns the previous location of a UITouch object in the coordinate system of the specified view. Because the touch object might have been forwarded to a view from another view, this method performs any necessary conversion of the touch location to the coordinate system of the specified view.

35.62.6 Properties

35.62.7 deviceSize as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: The range of the touch device in points, such as 72 ppi.
Notes: The lower-left corner of the surface is considered (0,0).
(Read only property)

35.62.8 force as Double

MBS MacBase Plugin, Plugin Version: 23.5, Platform: iOS, Targets: iOS only.

Function: The force of the touch, where a value of 1.0 represents the force of an average touch (predetermined by the system, not user-specific).
Notes: This property is available on devices that support 3D Touch or Apple Pencil. To check at runtime if a device supports 3D Touch, read the value of the forceTouchCapability property on the trait collection for any object in your app with a trait environment.
The force reported by Apple Pencil is measured along the axis of the pencil. If you want a force perpendicular to the device, you need to calculate this value using the altitudeAngle value.
The force reported by Apple Pencil is estimated at first, and may not always be updated. To determine if an update is expected, consult estimatedPropertiesExpectingUpdates and look for a UITouchPropertyForce flag. In this scenario, estimationUpdateIndex contains a non-nil value, which you can correlate with the original touch when the update occurs. When there are no expected force updates, the entire touch sequence usually won't have updates, so it may be appropriate to apply a custom, tool-specific force curve to the touch sequence.
(Read only property)

35.62.9 Handle as Integer

MBS MacBase Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The internal object reference.
Notes: (Read and Write property)

35.62.10 identity as MemoryBlock

MBS MacBase Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: The changes to a particular touch during its lifetime.
Notes: While touch identities may be re-used, they are unique during the life of the touch, even when

multiple devices are present.

As of current macOS releases, this value is a 16 byte value, which MBS Plugin provides back as MemoryBlock.
(Read only property)

35.62.11 majorRadius as Double

MBS MacBase Plugin, Plugin Version: 23.5, Platform: iOS, Targets: iOS only.

Function: The radius (in points) of the touch.
Notes: Use the value in this property to determine the size of the touch that was reported by the hardware. This value is an approximation of the size and can vary by the amount specified in the majorRadiusTolerance property.
(Read only property)

35.62.12 majorRadiusTolerance as Double

MBS MacBase Plugin, Plugin Version: 23.5, Platform: iOS, Targets: iOS only.

Function: The tolerance (in points) of the touch,Äôs radius.
Notes: This value determines the accuracy of the value in the majorRadius property. Add this value to the radius to get the maximum touch radius. Subtract the value to get the minimum touch radius.
(Read only property)

35.62.13 maximumPossibleForce as Double

MBS MacBase Plugin, Plugin Version: 23.5, Platform: iOS, Targets: iOS only.

Function: The maximum possible force for a touch.
Notes: The value of this property is sufficiently high to provide a wide dynamic range for values of the force property.
This property is available on devices that support 3D Touch or Apple Pencil. To check at runtime if a device supports 3D Touch, read the value of the forceTouchCapability property on the trait collection for any object in your app with a trait environment.
(Read only property)

35.62.14 normalizedPosition as NSPointMBS

MBS MacBase Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: The normalized position of the touch.
Notes: The normalized position is a scaled value between (0.0) and (1.0,1.0), where (0.0,0.0) is the lower-left position on the touch device.
(Read only property)

35.62.15 phase as Integer

MBS MacBase Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The phase of the touch.
Notes: The property value is a constant that indicates whether the touch began, moved, ended, or was canceled. For descriptions of the possible values of this property, see UITouchPhase.
(Read only property)

35.62.16 resting as Boolean

MBS MacBase Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: The indicator for a resting touch.
Notes: Resting touches occur when a user simply rests their thumb on the trackpad device.
(Read only property)

35.62.17 tapCount as Integer

MBS MacBase Plugin, Plugin Version: 23.5, Platform: iOS, Targets: iOS only.

Function: The number of times the finger was tapped for this given touch.
Notes: The value of this property is an integer containing the number of taps that occurred for this touch within a predefined period of time. Use this property to evaluate whether the user single-tapped, double-tapped, or even triple-tapped a particular view or window.
(Read only property)

35.62.18 timestamp as Double

MBS MacBase Plugin, Plugin Version: 23.5, Platform: iOS, Targets: iOS only.

Function: The time when the touch occurred or when it was last mutated.
Notes: The value of this property is the time, in seconds since system startup, that the touch originated or was last changed. You can store the value of this property and compare it to the timestamp in subsequent UITouch objects to determine the duration of the touch and, if it is being swiped, the speed of movement. For a definition of the time since system startup, see the description of the systemUptime method of the

NSProcessInfo class.
(Read only property)

35.62.19 type as Integer

MBS MacBase Plugin, Plugin Version: 23.5, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The type of the touch.
Notes: Type constants on macOS and iOS are different. Please check Apple's documentation.
(Read only property)

35.62.20 view as NSViewMBS

MBS MacBase Plugin, Plugin Version: 23.5, Platform: iOS, Targets: iOS only.

Function: The view to which touches are being delivered, if any.
Notes: The value of this property is the view object to which touches are being delivered, which is not necessarily the view the touch is currently in. For example, when a gesture recognizer recognizes the touch, this property is nil because no view is receiving the touch.
(Read only property)

35.62.21 window as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 23.5, Platform: iOS, Targets: iOS only.

Function: The window in which the touch initially occurred.
Notes: The value of the property is the window in which the touch originally occurred. This window might not be the same window that currently contains the touch.
(Read only property)

35.62.22 Constants

Touch Types

Constant	Value	Description
TouchTypeDirect	0	A touch resulting from direct contact with the screen.
TouchTypeIndirect	1	A touch that doesn,Äôt result from contact with the screen. Indirect touches are generated by touch input devices that are separate from the screen. For example, the trackpad of an Apple TV remote generates indirect touches.
TouchTypeIndirectPointer	3	A touch resulting from a button-based, indirect input device that describes the input sequence from button press to button release.
TouchTypePencil	2	A touch from Apple Pencil. A pencil touch occurs when Apple Pencil interacts with the device,Äôs screen.
TouchTypeStylus	2	A touch from a stylus.

35.63 class NSUserDefaultsMBS

35.63.1 class NSUserDefaultsMBS

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The Cocoa class to handle preferences.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setStringValue "test", "Hello World"
MessageBox u.stringForKey("test")
```

Notes: The NSUserDefaults class provides a programmatic interface for interacting with the defaults system. The defaults system allows an application to customize its behavior to match a user's preferences. For example, you can allow users to determine what units of measurement your application displays or how often documents are automatically saved. Applications record such preferences by assigning values to a set of parameters in a user's defaults database. The parameters are referred to as defaults since they're commonly used to determine an application's default state at startup or the way it acts by default.

At runtime, you use an NSUserDefaults object to read the defaults that your application uses from a user's defaults database. NSUserDefaults caches the information to avoid having to open the user's defaults database each time you need a default value. The synchronize method, which is automatically invoked at periodic intervals, keeps the in-memory cache in sync with a user's defaults database.

The NSUserDefaults class provides convenience methods for accessing common types such as floats, doubles, integers, Booleans, and URLs. A default object must be a property list, that is, an instance of (or for collections a combination of instances of): NSData, NSString, NSNumber, NSDate, NSArray, or NSDictionary. If you want to store any other type of object, you should typically archive it to create an instance of NSData.

Values returned from NSUserDefaults are immutable, even if you set a mutable object as the value. For example, if you set a mutable string as the value for "MyStringDefault", the string you later retrieve using stringForKey will be immutable.

A defaults database is created automatically for each user. The NSUserDefaults class does not currently support per-host preferences. To do this, you must use the CFPreferencesMBS class. However, NSUserDefaults correctly reads per-host preferences, so you can safely mix CFPreferencesMBS code with NSUserDefaultsMBS code.

If your application supports managed environments, you can use an NSUserDefaults object to determine which preferences are managed by an administrator for the benefit of the user. Managed environments correspond to computer labs or classrooms where an administrator or teacher may want to configure the systems in a particular way. In these situations, the teacher can establish a set of default preferences and force those preferences on users. If a preference is managed in this manner, applications should prevent users

from editing that preference by disabling any appropriate controls.

The NSUserDefaults class is thread-safe.

35.63.2 Methods

35.63.3 addSuiteNamed(suiteName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Inserts the specified domain name into the receiver's search list.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.addSuiteNamed "testsuite"
```

Notes: suiteName: The domain name to insert. This domain is inserted after the application domain.

The suiteName domain is similar to a bundle identifier string, but is not tied to a particular application or bundle. A suite can be used to hold preferences that are shared between multiple applications.

35.63.4 arrayForKey(key as string) as Variant()

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns the array associated with the specified key.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
Var t(-1) as Variant
t.Add "Hello"
t.Add "World"

u.setArrayValue "test", t

Var a(-1) as Variant = u.ArrayForKey("test")

for each v as Variant in a
```

MessageBox v
next

Notes: The array associated with the specified key, or an empty array if the key does not exist or its value is not an array.

35.63.5 Constructor

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Creates a new user defaults object initialized with the defaults for the current user account.
Example:

```
Var u as new NSUserDefaultsMBS
u.setURLValue "test", "http://www.apple.de/"
MessageBox u.URLForKey("test")
```

Notes: This method does not put anything in the search list.
See also:

- 35.63.6 Constructor(username as string) 6645

35.63.6 Constructor(username as string)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Creates an NSUserDefaultsMBS object initialized with the defaults for the specified user account.
Notes: username: The name of the user account.

Returns an initialized NSUserDefaultsMBS object whose argument and registration domains are already set up. If the current user does not have access to the specified user account, the object is invalid.

This method does not put anything in the search list. Invoke it only if you've allocated your own NSUserDefaults instance instead of using the shared one.

You do not normally use this method to initialize an instance of NSUserDefaults. Applications used by a superuser might use this method to update the defaults databases for a number of users. The user who started the application must have appropriate access (read, write, or both) to the defaults database of the new user, or this method returns nil.
See also:

- 35.63.5 Constructor 6645

35.63.7 dictionaryRepresentation as dictionary

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns a dictionary that contains a union of all key-value pairs in the domains in the search list.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
Var d as Dictionary = u.dictionaryRepresentation

break // "Look here in the dictionary in the debugger."
```

Notes: Returns a dictionary containing the keys. The keys are names of defaults and the value corresponding to each key is a property list object as Variant.

As with variantForKey, key-value pairs in domains that are earlier in the search list take precedence. The combined result does not preserve information about which domain each entry came from.

35.63.8 NSArgumentDomain as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: One of the constants to specify the domain.
Notes: The domain consisting of defaults parsed from the application's arguments. These are one or more pairs of the form -default value included in the command-line invocation of the application.

35.63.9 NSGlobalDomain as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: One of the constants to specify the domain.
Notes: The domain consisting of defaults meant to be seen by all applications.

35.63.10 NSRegistrationDomain as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: One of the constants to specify the domain.
Notes: The domain consisting of a set of temporary defaults whose values can be set by the application to ensure that searches will always be successful.

35.63.11 NSUserDefaultsDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The notification name for a did change notification.
Notes: Use with the NSNotification* objects.

35.63.12 objectIsForcedForKey(key as string) as boolean

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the specified key is managed by an administrator.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
MessageBox str(u.objectIsForcedForKey("test"))
```

Notes: key: The key whose status you want to check.

Returns true if the value of the specified key is managed by an administrator, otherwise false.

This method assumes that the key is a preference associated with the current user and application. For managed keys, the application should disable any user interface that allows the user to modify the value of key.

Available in Mac OS X v10.2 and later.
See also:

- 35.63.13 objectIsForcedForKey(key as string, domain as string) as boolean 6647

35.63.13 objectIsForcedForKey(key as string, domain as string) as boolean

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the key in the specified domain is managed by an administrator.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
MessageBox str(u.objectIsForcedForKey("test", u.NSGlobalDomain))
```

Notes: key: The key whose status you want to check.
domain: The domain of the key.

Returns true if the key is managed by an administrator in the specified domain, otherwise false.

This method assumes that the key is a preference associated with the current user. For managed keys, the application should disable any user interface that allows the user to modify the value of key.

Available in Mac OS X v10.2 and later.
See also:

- 35.63.12 objectIsForcedForKey(key as string) as boolean 6647

35.63.14 persistentDomainForName(domainName as string) as dictionary

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns a dictionary containing the keys and values in the specified persistent domain.
Notes: Returns a dictionary containing the keys. The keys are names of defaults and the value corresponding to each key is a property list object (NSData, NSString, NSNumber, NSDate, NSArray, or NSDictionary).

35.63.15 persistentDomainNames as string()

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns an array of the current persistent domain names.
Notes: You can get the keys and values for each domain by passing the returned domain names to the persistentDomainForName method.

35.63.16 registerDefaults(dic as dictionary)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Adds the contents the specified dictionary to the registration domain.
Notes: dic: The dictionary of keys and values you want to register.

If there is no registration domain, one is created using the specified dictionary, and NSRegistrationDomain is added to the end of the search list.

The contents of the registration domain are not written to disk; you need to call this method each time your application starts. You can place a plist file in the application's Resources directory and call registerDefaults with the contents that you read in from that file.

35.63.17 removeObjectForKey(defaultName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Removes the value of the specified default key in the standard application domain.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setBoolValue("test", true)
u.removeObjectForKey "test"
MessageBox str(u.boolForKey("test")) // shows false as key does not exist
```

Notes: defaultName: The key whose value you want to remove.

Removing a default has no effect on the value returned by the variantForKey method if the same key exists in a domain that precedes the standard application domain in the search list.

35.63.18 removePersistentDomainForName(domainName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Removes the contents of the specified persistent domain from the user's defaults.
Notes: domainName: The domain whose keys and values you want. This value should be equal to your application's bundle identifier.

When a persistent domain is changed, an NSUserDefaultsDidChangeNotification is posted.

35.63.19 removeSuiteNamed(suiteName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Removes the specified domain name from the receiver's search list.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.removeSuiteNamed "testsuite"
```

Notes: suiteName: The domain name to remove.

35.63.20 removeVolatileDomainForName(domainName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Removes the specified volatile domain from the user's defaults.
Notes: domainName: The volatile domain you want to remove.

35.63.21 resetStandardUserDefaults

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Synchronizes any changes made to the shared user defaults object and releases it from memory.
Example:

```
NSUserDefaultsMBS.resetStandardUserDefaults
```

Notes: A subsequent invocation of standardUserDefaults creates a new shared user defaults object with the standard search list.

35.63.22 setArrayValue(key as string, values() as Variant)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the value of the specified default key to the specified array.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
Var t(-1) as Variant
t.Add "Hello"
t.Add "World"

u.setArrayValue "test", t

Var a(-1) as Variant = u.ArrayForKey("test")

for each v as Variant in a
MessageBox v
next
```

35.63.23 setBoolValue(key as string, value as boolean)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the value of the specified default key to the specified Boolean value.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setBoolValue("test", true)
MessageBox str(u.boolForKey("test"))
```

35.63.24 setDataValue(key as string, value as memoryblock)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the value of the specified default key to the specified binary string.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults

u.setDataValue("test", "Hello √§√√º")

MessageBox u.dataForKey("test") // shows no umlauts as encoding is away in binary string
```

Notes: setStringValue is for text with encoding and setDataValue is for strings containing binary data.

35.63.25 setDictionaryValue(key as string, value as dictionary)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the value of the specified default key to the specified dictionary.
Example:

```
Var u as new NSUserDefaultsMBS
Var d as new Dictionary

d.Value("First")="Hello"
d.Value("Second")=1234.5678
u.setDictionaryValue "test", d

Var e as Dictionary = u.dictionaryForKey("test")
for each key as Variant in e.keys
Var value as Variant = e.Value(key)
MessageBox key+": "+value
next
```

35.63.26 setDoubleValue(key as string, value as Double)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the value of the specified default key to the double value.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setDoubleValue("test", 5)
MessageBox str(u.DoubleForKey("test"))
```

Notes: Available in Mac OS X v10.5 and later. On Mac OS X 10.4 the plugin will call setFloatValue for you to avoid an exception.

35.63.27 setFileValue(key as string, value as folderitem)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the value of the specified default key to the specified URL.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
Var f as FolderItem = SpecialFolder.Desktop

// write
u.setFileValue "test", f

// read
MessageBox u.fileForKey("test").NativePath
```

Notes: Available in Mac OS X v10.6 and later.

35.63.28 setFloatValue(key as string, value as single)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the value of the specified default key to the specified floating-point value.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setFloatValue("test", 5)
MessageBox str(u.FloatForKey("test"))
```

35.63.29 setIntegerValue(key as string, value as Integer)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the value of the specified default key to the specified integer value.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setIntegerValue("test", 5)
MessageBox str(u.integerForKey("test"))
```

35.63.30 setPersistentDomain(domain as dictionary, domainName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the dictionary for the specified persistent domain.
Notes: domain: The dictionary of keys and values you want to assign to the domain.
domainName: The domain whose keys and values you want to set. This value should be equal to your application's bundle identifier.

When a persistent domain is changed, an NSUserDefaultsDidChangeNotification is posted.

35.63.31 setStringArrayValue(key as string, values() as string)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the value of the specified default key to the specified string array.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
Var t(-1) as string = array("Hello","World")

u.setStringArrayValue "test", t

Var a(-1) as string = u.stringArrayForKey("test")

MessageBox Join(a) // shows "Hello World"
```

35.63.32 setStringValue(key as string, value as string)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the value of the specified default key to the specified text string.

Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults

u.setStringValue "test", "Hello √§√√º"

MessageBox u.stringForKey("test")
```

Notes: setStringValue is for text with encoding and setDataValue is for strings containing binary data.

35.63.33 setURLValue(key as string, value as string)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the value of the specified default key to the specified URL.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setURLValue "test", "http://www.apple.de/"
MessageBox u.URLForKey("test")
```

Notes: Available in Mac OS X v10.6 and later.

35.63.34 setVariantValue(key as string, value as Variant)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the value of the specified default key in the standard application domain.
Example:

```
Var u as new NSUserDefaultsMBS
u.setVariantValue "test", "Hello World"
MessageBox u.variantForKey("test")
```

Notes: The value parameter can be only property list objects: String, Number, Date, an Array of variant, or Dictionary. For Arrays and Dictionaries, their contents must be property list objects.

Setting a default has no effect on the value returned by the objectForKey: method if the same key exists in a domain that precedes the application domain in the search list.

35.63.35 setVolatileDomain(domain as dictionary, domainName as string)

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Sets the dictionary for the specified volatile domain.
Notes: domain: The dictionary of keys and values you want to assign to the domain.
domainName: The domain whose keys and values you want to set.

This method raises an NSInvalidArgumentException if a volatile domain with the specified name already exists.

35.63.36 standardUserDefaults as NSUserDefaultsMBS

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns the shared defaults object.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
```

Notes: If the shared defaults object does not exist yet, it is created with a search list containing the names of the following domains, in this order:

NSArgumentDomain, consisting of defaults parsed from the application's arguments. A domain identified by the application's bundle identifier
NSGlobalDomain, consisting of defaults meant to be seen by all applications. Separate domains for each of the user's preferred languages
NSRegistrationDomain, a set of temporary defaults whose values can be set by the application to ensure that searches will always be successful

The defaults are initialized for the current user. Subsequent modifications to the standard search list remain in effect even when this method is invoked again—the search list is guaranteed to be standard only the first time this method is invoked. The shared instance is provided as a convenience—you can create custom instances using the Constructor.

35.63.37 stringArrayForKey(key as string) as string()

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns the array of strings associated with the specified key.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
```

```
Var t(-1) as string = array("Hello","World")

u.setStringArrayValue "test", t

Var a(-1) as string = u.stringArrayForKey("test")

MessageBox Join(a) // shows "Hello World"
```

Notes: Returns an array with strings. The array is empty if the value for the key is not an array.

35.63.38 synchronize as boolean

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Writes any modifications to the persistent domains to disk and updates all unmodified persistent domains to what is on disk.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults

// do something

if u.synchronize then
MessageBox "Saved preferences."
else
MessageBox "Failed to save preferences."
end if
```

Notes: Returns true if the data was saved successfully to disk, otherwise false.

Because this method is automatically invoked at periodic intervals, use this method only if you cannot wait for the automatic synchronization (for example, if your application is about to exit) or if you want to update the user defaults to what is on disk even though you have not made any changes.

35.63.39 volatileDomainForName(domainName as string) as dictionary

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns the dictionary for the specified volatile domain.
Notes: Returns the dictionary of keys and values belonging to the domain. The keys in the dictionary are names of defaults, and the value corresponding to each key is a property list object (String, Number, Date, Array, or Dictionary).

35.63.40 volatileDomainNames as string()

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns an array of the current volatile domain names.
Notes: You can get the contents of each domain by passing the returned domain names to the volatileDomainForName method.

35.63.41 Properties

35.63.42 boolForKey(key as string) as boolean

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The Boolean value associated with the specified key.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.boolForKey("test") = true
MessageBox str(u.boolForKey("test"))
```

Notes: If a boolean value is associated with defaultName in the user defaults, that value is returned. Otherwise, false is returned.
(Read and Write computed property)

35.63.43 dataForKey(key as string) as memoryblock

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The data string associated with the specified key.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults

u.dataForKey("test")="Hello √§√√º"

MessageBox u.dataForKey("test") // shows no umlauts as encoding is away in binary string
```

Notes: Returns the memoryblock or nil if there is no value for this key.

dataForKey is for any string and does not store encoding. stringForKey does store encoding and works only for text strings.
(Read and Write computed property)

35.63.44 dictionaryForKey(key as string) as dictionary

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The dictionary object associated with the specified key.
Example:

```
Var u as new NSUserDefaultsMBS
Var d as new Dictionary

d.Value("First")="Hello"
d.Value("Second")=1234.5678
u.setDictionaryValue "test", d

Var e as Dictionary = u.dictionaryForKey("test")
for each key as Variant in e.keys
Var value as Variant = e.Value(key)
MessageBox key+": "+value
next
```

Notes: Returns dictionary object associated with the specified key, or nil if the key does not exist or its value is not an dictionary.
(Read and Write computed property)

35.63.45 doubleForKey(key as string) as Double

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The double value associated with the specified key.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.doubleForKey("test") = 5
MessageBox str(u.doubleForKey("test"))
```

Notes: Returns the double value associated with the specified key. If the key does not exist, this method returns 0.
Available in Mac OS X v10.5 and later. On Mac OS X 10.4 the plugin will call floatForKey for you to avoid an exception.
(Read and Write computed property)

35.63.46 fileForKey(key as string) as folderitem

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The NSURL instance associated with the specified key.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
Var f as FolderItem = SpecialFolder.Desktop

// write
u.fileForKey("test")=f

// read
MessageBox u.fileForKey("test").NativePath
```

Notes: Available in Mac OS X v10.6 and later.
(Read and Write computed property)

35.63.47 floatForKey(key as string) as single

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The floating-point value associated with the specified key.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.floatForKey("test") = 5
MessageBox str(u.floatForKey("test"))
```

Notes: Returns the floating-point value associated with the specified key. If the key does not exist, this method returns 0.
(Read and Write computed property)

35.63.48 integerForKey(key as string) as Integer

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The integer value associated with the specified key.
Example:

```
Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.IntegerForKey("test") = 5
MessageBox str(u.integerForKey("test"))
```

Notes: The integer value associated with the specified key. If the specified key does not exist, this method returns 0.
(Read and Write computed property)

35.63.49 stringForKey(key as string) as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The string associated with the specified key.
Example:

Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults

u.setStringValue "test", "Hello √§√√º"

MessageBox u.stringForKey("test")

Notes: Returns the string or "" if there is no value for this key.

dataForKey is for any string and does not store encoding. stringForKey does store encoding and works only for text strings.
(Read and Write computed property)

35.63.50 URLForKey(key as string) as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The NSURL instance associated with the specified key.
Example:

Var u as NSUserDefaultsMBS = NSUserDefaultsMBS.standardUserDefaults
u.setURLValue "test", "http://www.apple.de/"
MessageBox u.URLForKey("test")

Notes: Available in Mac OS X v10.6 and later.
(Read and Write computed property)

35.63.51 variantForKey(key as string) as Variant

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The object associated with the first occurrence of the specified default.
Example:

Var u as new NSUserDefaultsMBS

```
u.setVariantValue "test", "Hello World"
MessageBox u.variantForKey("test")
```

Notes: This method searches the domains included in the search list in the order they are listed.
(Read and Write computed property)

35.64 class NSUUIDMBS

35.64.1 class NSUUIDMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: An object representing a universally unique value that bridges to UUID; use NSUUID when you need reference semantics or other Foundation-specific behavior.
Example:

```
// create a new UUID and parse an existing one
Var id As NSUUIDMBS = NSUUIDMBS.UUID
System.DebugLog "New UUID: " + id.UUIDString

Var other As New NSUUIDMBS("E621E1F8-C36C-495A-93FC-0C247A3E6E5F")
MessageBox "Same: " + id.isEqual(other).ToString + ", bytes: " + other.data.Size.ToString
```

Notes: UUIDs (Universally Unique Identifiers), also known as GUIDs (Globally Unique Identifiers) or IIDs (Interface Identifiers), are 128-bit values. UUIDs created by NSUUID conform to RFC 4122 version 4 and are created with random bytes.
The standard format for UUIDs represented in ASCII is a string punctuated by hyphens, for example 68753A44-4D6F-1226-9C60-0050E4C00067. The hex representation looks, as you might expect, like a list of numerical values preceded by 0x. For example, 0xD7, 0x36, 0x95, 0x0A, 0x4D, 0x6E, 0x12, 0x26, 0x80, 0x3A, 0x00, 0x50, 0xE4, 0xC0, 0x00, 0x67. Because a UUID is expressed simply as an array of bytes, there are no endianness considerations for different platforms.

- MBS Xojo Plugins, version 18.2pr2

35.64.2 Methods

35.64.3 Available as boolean

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on macOS 10.8 or newer.

35.64.4 Constructor

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Initializes a new UUID with RFC 4122 version 4 random bytes.
See also:

- 35.64.5 Constructor(UUID as MemoryBlock) 6663
- 35.64.6 Constructor(UUID as String) 6663

35.64.5 Constructor(UUID as MemoryBlock)

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Initializes a new UUID with the given bytes.
See also:

- 35.64.4 Constructor 6662
- 35.64.6 Constructor(UUID as String) 6663

35.64.6 Constructor(UUID as String)

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Initializes a new UUID with the formatted string.
See also:

- 35.64.4 Constructor 6662
- 35.64.5 Constructor(UUID as MemoryBlock) 6663

35.64.7 copy as NSUUIDMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Copies the UUID.

35.64.8 isEqual(other as NSUUIDMBS) as boolean

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Compares two UUIDs.
Example:

```
Var u1 as new NSUUIDMBS
Var s1 as string = u1.UUIDString

// make new object with same UUID
Var u2 as NSUUIDMBS = new NSUUIDMBS(s1)
Var s2 as string = u2.UUIDString
```

```
// other uuid
Var o as new NSUUIDMBS
Var so as string = o.UUIDString

Var e1 as Boolean = u1.isEqual(u2)
Var e2 as Boolean = u1.isEqual(o)

Break
```

Notes: Returns true if both are equal.

35.64.9 Operator_Compare(other as NSUUIDMBS) as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Compares two UUIDs.
Example:

```
Var u1 as new NSUUIDMBS
Var s1 as string = u1.UUIDString

// make new object with same UUID
Var u2 as NSUUIDMBS = new NSUUIDMBS(s1)
Var s2 as string = u2.UUIDString

// other uuid
Var o as new NSUUIDMBS
Var so as string = o.UUIDString

if u1 = u2 then
MessageBox "u1 and u2 are equal."
else
MessageBox "u1 and u2 are not equal. Problem?"
end if

if u1 = o then
MessageBox "u1 and o are equal. Problem?"
else
MessageBox "u1 and o are not equal."
end if
```

35.64.10 UUID as NSUUIDMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Create and returns a new UUID with RFC 4122 version 4 random bytes.

35.64.11 Properties

35.64.12 data as MemoryBlock

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Queries copy of the bytes as memory block.
Notes: (Read only property)

35.64.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

35.64.14 UUIDString as String

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: The UUID as a string.
Notes: (Read only property)

35.65 class NSViewControllerMBS

35.65.1 class NSViewControllerMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The plugin class for a NSViewController.
Example:

```
// show a view in a new window by using a view controller
Var label As New NSTextFieldMBS(20, 20, 260, 22)
label.stringValue = "Content of the view controller"
label.Editable = False
label.Bordered = False
label.drawsBackground = False

Var content As New NSViewMBS(0, 0, 300, 62)
content.addSubview label

Var controller As New NSViewControllerMBS
controller.view = content
controller.title = "My View"

// WindowFromController is a property of the window: WindowFromController As NSWindowMBS
WindowFromController = NSViewControllerMBS.windowWithContentViewController(controller)
WindowFromController.makeKeyAndOrderFront
```

Notes: Available in Mac OS X v10.5 and later.
Subclass of the NSResponderMBS class.

35.65.2 Methods

35.65.3 available as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this class is available.
Example:

MessageBox str(NSViewControllerMBS.available)

Notes: Returns true on Mac OS X 10.5 or newer.

35.65.4 Constructor

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor creating a new view controller.

35.65.5 contentViewController(window as NSWindowMBS) as NSViewControllerMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Queries content view's content view controller for the window.
Notes: Returns nil if the window has no controller.

The main content view controller for the window.

The value of this property provides the content view of the window. Setting this value removes the existing value of contentView and makes the contentViewController.view the main content view for the window. By default, the value of this property is nil.

35.65.6 dismissViewController(ViewController as NSViewControllerMBS)

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Dismisses a presented view controller, using the same animator that presented it.
Notes: In macOS, this is the universal way to dismiss a view controller, no matter how it was presented.

35.65.7 loadView

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Explicitly load the view now.
Notes: This method connects an instantiated view from a nib file to the view property of the view controller. This method is called by the system, and is exposed in this class so you can override it to add behavior immediately before or after nib loading.
Do not call this method. If you require this method to be called, access the view property.

Do not invoke this method from other objects unless you take care to avoid redundant invocations. The default implementation of the loadView method handles redundant invocations correctly, but a view controller subclass might not. To be safe, other objects should instead access a view controller,Äôs view property.

The loadView method first obtains the values of the view controller,Äôs nibName and nibBundle properties. It then employs the NSNib class to instantiate the specified nib file via the instantiateWithOwner:topLevelObjects: method, providing the view controller object as the owner parameter.

For this method to work correctly, you need to have specified the file,Äôs owner of the nib file, in Interface Builder, to be NSViewController. You also need to have correctly connected the view outlet of the file's owner to the intended view in the nib file. Then, at runtime, the nib loading machinery sets the value of the view controller,Äôs view property to the nib file,Äôs instantiated view.

Prior to OS X v10.10, the loadView method did not provide well-defined behavior if the nibName property,Äôs value was nil. In macOS 10.10 and later, however, you get correct behavior without specifying a nib name as long as the nib file,Äôs name is the same as that of the view controller. For example, if you have a view controller subclass called MyViewController and a nib file with the same name, you can employ the convenient initialization pattern [[MyViewController alloc] init] .

35.65.8 presentViewControllerAsModalWindow(ViewController as NSViewControllerMBS)

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Presents another view controller as a modal window, also known as an alert.
Notes: To dismiss the modal window, call the dismissViewController: method on self (the presenting view controller).

35.65.9 presentViewControllerAsPopover(ViewController as NSViewControllerMBS, RelativeToRect as NSRectMBS, positioningView as NSViewMBS, preferredEdge as Integer, behavior as Integer)

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Presents another view controller as a popover.
Notes: viewController: The other view controller to present as a popover.
RelativeToRect: The content size of the popover.
positioningView: The view relative to which the popover should be positioned. Must not be nil, or else the view controller raises an NSInvalidArgumentException exception.
preferredEdge: The edge of positioningView that the popover should prefer to be anchored to.
behavior: The popover,Äôs closing behavior. See the NSPopoverBehavior enumeration.

To dismiss the popover, call the dismissViewController: method on self (the presenting view controller).

35.65.10 presentViewControllerAsSheet(ViewController as NSViewControllerMBS)

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Presents a new sheet window with the given view controller.
Notes: The presented view controller is the delegate and the content view controller of its sheet.
To dismiss the sheet, call the dismissViewController: method on self (the presenting view controller).

35.65.11 windowWithContentViewController(ViewController as NSViewControllerMBS) as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a titled window that contains the specified content view controller.
Notes: ViewController: The view controller that provides the main content view for the window. The window,Äôs contentView property is set to contentViewController.view.

Returns a window with the content view controller set to the passed-in view controller object.

This method creates a basic window object that is titled, closable, resizable, and miniaturizable. By default, the window's title is automatically bound to the title of contentViewController. You can control the size of the window by using Auto Layout and applying size constraints to the view or its subviews. The initial size of the window is set to the initial size of contentView (that is, the size of contentViewController.view). The newly created window has releasedWhenClosed set to NO, and it must be explicitly retained to keep the window instance alive.

35.65.12 Properties

35.65.13 className as string

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop & iOS.

Function: The name of this NSViewController class.
Notes: (Read only property)

35.65.14 classPath as string

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop & iOS.

Function: The path of this NSViewController class.
Notes: Useful for debugging to know what super classes the view controller has.
(Read only property)

35.65.15 Identifier as String

MBS MacBase Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop & iOS.

Function: A string that identifies this user interface item.
Notes: It should be set to a unique value on NSViews when they are intended to be used inside a view-based NSTableView. Identifiers should be unique per-window. For programmatically created user interface items, you would typically set this value in code after creating a view but before adding it to a window. You may also want to set an identifier on a window, after creating it programmatically, to identify the window easily when it is reopened. You should not change the identifier after a view is added to a window. Identifiers beginning with an underscore are reserved for the system. In framework classes that implement this protocol, the accessor methods are not intended to be overridden.

To help avoid collision of identifiers, it is recommended that identifiers use the same prefix as is used for the framework or application. For example, identifiers for standard AppKit interface items, such as the open panel, will begin with "NS".

The slash '/', backslash '\', and colon ':' characters are reserved and should not be used in identifiers.
(Read and Write property)

35.65.16 representedObject as Variant

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop & iOS.

Function: The object whose value is presented in the receiver,Äôs primary view.

Notes: (Read and Write property)

35.65.17 Title as string

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The localized title of the receiver's view.
Notes: NSViewController does not use the title property directly. This property is here because so many anticipated uses of this class will involve letting the user choose among multiple named views using a pull-down menu or some other user interface.
(Read and Write property)

35.65.18 view as NSViewMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: The view belonging to this view controller.
Notes: (Read and Write property)

35.65.19 viewLoaded as Boolean

MBS MacBase Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop & iOS.

Function: Whether view is already loaded.
Notes: (Read only property)

35.65.20 Constants

Edge Constants

Constant	Value	Description
NSMaxXEdge	2	the maximum X edge. Typically right side.
NSMaxYEdge	3	The maximum Y edge. Topically the top edge of a window.
NSMinXEdge	0	the minimum X edge. Typically left side.
NSMinYEdge	1	Minimum Y. As coordinates are upside down in the Cocoa world, this is the bottom edge of a window.

Behavior modes

Constant	Value	Description
PopoverBehaviorApplicationDefined	0	Your application assumes responsibility for closing the popover. AppKit still close the popover in a limited number of circumstances. For instance, A Kit will attempt to close the popover when the window of its positioningV is closed. The exact interactions in which AppKit will close the popover not guaranteed. You may consider implementing -cancel: to close the popo when the escape key is pressed.
PopoverBehaviorSemitransient	2	AppKit will close the popover when the user interacts with user interface ments in the window containing the popover's positioning view. Semi-trans popovers cannot be shown relative to views in other popovers, nor can they shown relative to views in child windows. The exact interactions that ca semi-transient popovers to close are not specified.
PopoverBehaviorTransient	1	AppKit will close the popover when the user interacts with a user interf element outside the popover. Note that interacting with menus or panels t become key only when needed will not cause a transient popover to close. exact interactions that will cause transient popovers to close are not specif

35.66 class NSViewMBS

35.66.1 class NSViewMBS

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop & iOS.

Function: The Cocoa class for a view.
Example:

```
// This example needs a window with Button1.
// change the look of a control through its Cocoa view
Var v As NSViewMBS = Button1.NSViewMBS
v.toolTip = "Click to save"
v.alphaValue = 0.7 // a bit transparent
v.setFrameOrigin(20, 20)

Var lines() As String
For Each child As NSViewMBS In Self.NSWindowMBS.contentView.subviews
lines.Add child.className
Next
System.DebugLog "Views in window: " + String.FromArray(lines, ", ")
```

Notes: To draw into a NSView, use either CustomNSViewMBS class with drawRect event or NSGraphicsMBS class.
Subclass of the NSResponderMBS class.

35.66.2 Methods

35.66.3 addSubview(subview as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop & iOS.

Function: Adds a view to the subviews so it's displayed above its siblings.
Example:

```
// create a button
Var n as new NSButtonMBS(100, 100, 50, 24)

n.bezelStyle = n.NSRoundedBezelStyle
n.Title = "Test"

// add directly to window's content view
Window1.NSWindowMBS.contentView.addSubview n
```

See also:

- 35.66.4 addSubview(subview as NSViewMBS, positioned as Integer, relativeToView as NSViewMBS) 6674

35.66.4 addSubview(subview as NSViewMBS, positioned as Integer, relativeToView as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Inserts a view among the receiver's subviews so it's displayed immediately above or below another view.
Example:

```
// create a button
Var n as new NSButtonMBS(100, 100, 50, 24)

n.bezelStyle = n.NSRoundedBezelStyle
n.Title = "Test"

// add directly to window's super view, below the content view
// so it is behind all RB controls
Window1.NSWindowMBS.contentView.superview.addSubview n, NSWindowMBS.NSWindowBelow, Window1.NSWindowMBS.contentView
```

Notes: subView: The view object to add to the receiver as a subview.
positioned: A constant specifying the position of the aView relative to otherView. Valid values are NSWindowAbove or NSWindowBelow.
relativeToView: The other view subView is to be positioned relative to. If relativeToView is nil (or isn't a subview of the receiver), subView is added above or below all of its new siblings.

This method also sets the receiver as the next responder of aView.
See also:

- 35.66.3 addSubview(subview as NSViewMBS) 6674

35.66.5 addToolTipRect(rect as NSRectMBS, tooltip as NSViewTooltipMBS)

MBS MacBase Plugin, Plugin Version: 18.0, Platform: macOS, Targets: Desktop only.

Function: Creates a tooltip for a defined area the view and returns a tag that identifies the tooltip rectangle.
Notes: Rect: A rectangle defining the region of the view to associate the tooltip with.
tooltip: The object to provide text.

Please keep reference of tooltip object as the tooltip is removed by it's destructor.

35.66.6 adjustScroll(rect as NSRectMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Overridden by subclasses to modify a given rectangle, returning the altered rectangle.
Notes: rect: A rectangle that defines a region of the view.

NSClipView invokes this method to allow its document view to adjust its position during scrolling. For example, a custom view object that displays a table of data can adjust the origin of newVisible so rows or columns aren,Äôt cut off by the edge of the enclosing NSClipView. The NSView implementation simply returns newVisible.

NSClipView only invokes this method during automatic or user controlled scrolling. Its scrollToPoint: method doesn,Äôt invoke this method, so you can still force a scroll to an arbitrary point.

In Xojo, you can't overwrite this, but use it to adjust a rectangle by the view.

35.66.7 ancestorSharedWithView(view as NSViewMBS) as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The closest ancestor shared by the receiver and a given view.
Notes: The closest ancestor or nil if there's no such object. Returns self if aView is identical to the receiver.

35.66.8 animator as NSViewMBS

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the proxy object for this view which animates.
Example:

```
Var v as NSViewMBS // your NSViewMBS object

v.alphaValue = 0.5 // switch alpha directly
v.animator.alphaValue = 0.5 // switch alpha animated
```

35.66.9 autoscroll(e as NSEventMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Scrolls the view,Äôs closest ancestor NSClipView object proportionally to the distance of an event that occurs outside of it.
Notes: e: An event object whose location should be expressed in the window,Äôs base coordinate system (which it normally is), not the receiving view's.

Returns true if any scrolling is performed; otherwise returns false.

View objects that track mouse-dragged events can use this method to scroll automatically when the cursor is dragged outside of the NSClipView object. Repeated invocations of this method (with an appropriate delay) result in continual scrolling, even when the mouse doesn,Äôt move.

35.66.10 backgroundFilters as variant()

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: An array of Core Image filters to apply to the view,Äôs background.
Notes: This property contains an array of CIFilterMBS objects. This array represents the background filters stored in the backgroundFilters property of the view,Äôs layer. If the view does not have a layer, setting the value of this property has no effect.
The default value of this property is an empty array.

We use variant here to reduce plugin dependencies. Please use with array of variants containing CIFilterMBS.

35.66.11 beginDraggingSessionWithItems(items() as Variant, e as NSEventMBS, source as NSViewMBS) as Variant

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Initiates a dragging session with a group of dragging items.
Notes: items: The dragging items (array of variant containing NSDraggingItemMBS objects). The frame property of each NSDraggingItem must be in the view's coordinate system.
event: The mouse-down event object from which to initiate the drag operation. In particular, its mouse location is used for the offset of the icon being dragged.
source: An object that serves as the controller of the dragging operation. It must conform to the NSDraggingSource informal protocol and is typically the receiver itself or its NSWindow object.

Returns the dragging session for the drag (NSDraggingSessionMBS object). Returned as Variant to reduce plugin dependencies.

A basic drag starts by calling beginDraggingSessionWithItems.

The caller can take the returned NSDraggingSession and continue to modify its properties such as slidesBackOnCancelOrFail. When the drag actually starts, the source is sent a draggingSessionWillBeginAtPoint message followed by multiple draggingSessionMovedToPoint messages as the user drags.

Once the drag is ended or cancelled, the source receives a draggingSessionEndedAtPoint:operation and the drag is complete.

Available in OS X v10.7 and later.

35.66.12 Constructor

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: Creates a new control with size 100/100 and position 0/0
Notes: On success the handle property is not zero.
See also:

- 35.66.13 Constructor(Handle as Integer) 6677
- 35.66.14 Constructor(left as Double, top as Double, width as Double, height as Double) 6678

35.66.13 Constructor(Handle as Integer)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop & iOS.

Function: Creates an object based on the given NSView handle.
Example:

```
Var t as new NSTextViewMBS(0, 0, 100, 100)
Var v as new NSTextViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSView and the plugin retains this handle.
See also:

- 35.66.12 Constructor 6677
- 35.66.14 Constructor(left as Double, top as Double, width as Double, height as Double) 6678

35.66.14 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor to create a new NSView.
Notes: On success handle is set.

For a toolbar, please get the view directly: self.NSToolbarMBS.toolbarView.
See also:

- 35.66.12 Constructor 6677
- 35.66.13 Constructor(Handle as Integer) 6677

35.66.15 contentFilters as variant()

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: An array of Core Image filters to apply to the contents of the view and its sublayers.
Notes: This property contains an array of CIFilterMBS objects. This array represents the filters stored in the filters property of the view,Äôs layer. If the view does not have a layer, setting the value of this property has no effect.
The default value of this property is an empty array.

We use variant here to reduce plugin dependencies. Please use with array of variants containing CIFilterMBS.

35.66.16 convertPointFromView(point as NSPointMBS, View as NSViewMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Converts a point from the coordinate system of a given view to that of the receiver.
Notes: point: A point specifying a location in the coordinate system of aView.
View: The view with aPoint in its coordinate system. If View is nil, this method instead converts from window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the point converted to the coordinate system of the receiver.

35.66.17 convertPointToView(point as NSPointMBS, View as NSViewMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Converts a point from the receiver's coordinate system to that of a given view.
Notes: point: A point specifying a location in the coordinate system of the receiver.
View: The view into whose coordinate system point is to be converted. If View is nil, this method instead converts to window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the point converted to the coordinate system of View.

35.66.18 convertRectFromView(rect as NSRectMBS, View as NSViewMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Converts a rectangle from the coordinate system of another view to that of the receiver.
Notes: rect: The rectangle in aView's coordinate system.
view: The view with aRect in its coordinate system. If view is nil, this method instead converts from window base coordinates. Otherwise, both view and the receiver must belong to the same NSWindow object.

Returns the converted rectangle.

35.66.19 convertRectToView(rect as NSRectMBS, View as NSViewMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Converts a rectangle from the receiver's coordinate system to that of another view.
Notes: rect: A rectangle in the receiver's coordinate system.
View: The view that is the target of the conversion operation. If View is nil, this method instead converts from window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the converted rectangle.

35.66.20 convertSizeFromView(Size as NSSizeMBS, View as NSViewMBS) as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Converts a size from another view's coordinate system to that of the receiver.
Notes: Size: The size (width and height) in aView's coordinate system.
View: The view with Size in its coordinate system. If View is nil, this method instead converts from window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the converted size, as an NSSize structure.

35.66.21 convertSizeToView(Size as NSSizeMBS, View as NSViewMBS) as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Converts a size from the receiver's coordinate system to that of another view.
Notes: Size: The size (width and height) in the receiver's coordinate system.
View: The view that is the target of the conversion operation. If View is nil, this method instead converts from window base coordinates. Otherwise, both View and the receiver must belong to the same NSWindow object.

Returns the converted size, as an NSSize structure.

35.66.22 dataWithEPSInsideRect(left as Double, top as Double, width as Double, height as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 8.5, Platform: macOS, Targets: Desktop only.

Function: Returns EPS data that draws the region of the receiver within a specified rectangle.
Example:

```
Var n as new NSProgressIndicatorMBS
n.sizeToFit

Var data as string = n.dataWithEPSInsideRect(0, 0, n.frameWidth, n.frameHeight)
Var f as FolderItem = SpecialFolder.Desktop.Child("test.ps")
Var b as BinaryStream = f.CreateBinaryFile("")

b.Write data
f.Launch
```

35.66.23 dataWithPDFInsideRect(left as Double, top as Double, width as Double, height as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 8.5, Platform: macOS, Targets: Desktop only.

Function: Returns PDF data that draws the region of the receiver within a specified rectangle.
Example:

```
Var n as new NSProgressIndicatorMBS
n.sizeToFit

Var data as string = n.dataWithPDFInsideRect(0, 0, n.frameWidth, n.frameHeight)
Var f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
Var b as BinaryStream = f.CreateBinaryFile("")

b.Write data
f.Launch
```

See also:

- 35.66.24 dataWithPDFInsideRect(r as NSRectMBS) as Memoryblock 6681

35.66.24 dataWithPDFInsideRect(r as NSRectMBS) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Returns PDF data that draws the region of the receiver within a specified rectangle.
See also:

- 35.66.23 dataWithPDFInsideRect(left as Double, top as Double, width as Double, height as Double) as Memoryblock 6681

35.66.25 dragImage(image as NSImageMBS, viewLocation as NSPointMBS, offset as NSSizeMBS, NSEvent as NSEventMBS, pboard as NSPasteboardMBS, source as NSViewMBS, slideFlag as boolean)

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Initiates a dragging operation from the receiver, allowing the user to drag arbitrary data with a specified icon into any application that has window or view objects that accept dragged data.
Notes: Image: The NSImage object to be dragged.
viewLocation: The location of the image's lower-left corner, in the receiver's coordinate system. It determines the placement of the dragged image under the cursor. When determining the image location you should use the mouse down coordinate, provided in theEvent, rather than the current mouse location.
offset: This parameter is ignored.
NSEvent: The left mouse-down event that triggered the dragging operation (see discussion below).
pboard: The pasteboard that holds the data to be transferred to the destination (see discussion below).
source: An object that serves as the controller of the dragging operation. It must conform to the NSDraggingSource protocol and is typically the receiver itself or its NSWindow object.
slideBack: A Boolean that determines whether the drag image should slide back if it's rejected. The image slides back to imageLoc if slideBack is true and the image isn't accepted by the dragging destination. If false the image doesn't slide back.

This method must be invoked only within an implementation of the mouseDown or mouseDragged methods. Before invoking this method, you must place the data to be transferred on pboard. To do this, get the drag pasteboard object (NSDragPboard), declare the types of the data, and then put the data on the pasteboard.

35.66.26 drawFocusRingMask

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Draws the focus ring mask for the view.
Notes: This method provides the shape of the focus ring mask by drawing the focus ring mask. An implementation of this method should draw in the view's interior (bounds) coordinate space, that the focus ring style has been set (it will be set it to NSFocusRingOnly to capture the focus ring itself), and that the fill and stroke colors have been set to an arbitrary fully opaque color.

Subclasses that find the default behavior insufficient should only draw the focus ring shape.

The NSView implementation of this method simply fills self.bounds.
Available in Mac OS X v10.7 and later.

35.66.27 enclosingMenuItem as Variant

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns the menu item containing the receiver or any of its superviews in the view hierarchy.
Notes: Value is a NSMenuItemMBS. We use variant to reduce dependency to other plugins.

Returns the menu item containing the receiver or any of its superviews in the view hierarchy, or nil if the receiver's view hierarchy is not in a menu item

Available in Mac OS X v10.5 and later.

35.66.28 enclosingScrollView as Variant

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Returns the nearest ancestor NSScrollView object containing the receiver (not including the receiver itself); otherwise returns nil.
Notes: Value is a NSScrollViewMBS. We use variant to reduce dependency to other plugins.

35.66.29 focusRingMaskBounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Returns the focus ring mask bounds.
Notes: Returns a rectangle containing the mask in the view's interior (bounds) coordinate space.

The mask bounds allows the focus ring's overall size and position to be determined before it is drawn.
Subclasses must override this method if they require the display of a focus ring.
The NSView implementation of this method simply returns NSRectMBS.Zero.

Note: The information provided by focusRingMaskBounds will enable Accessibility to identify selected subelements for zoom tracking, so it is important that this method provide a reasonably tight bounding box and that noteFocusRingMaskChanged is invoked as described.

35.66.30 hitTest(x as double, y as double) as NSViewMBS

MBS MacBase Plugin, Plugin Version: 24.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Returns the farthest descendant of the view in the view hierarchy (including itself) that contains a specified point, or nil if that point lies completely outside the view.

Notes: x/y: A point that is in the coordinate system of the view,Äôs superview, not of the view itself.

This method is used primarily by an NSWindowMBS object to determine which view should receive a mouse-down event. You,Äôd rarely need to invoke this method, but you might want to override it to have a view object hide mouse-down events from its subviews. This method ignores hidden views.

35.66.31 isDescendantOf(view as NSViewMBS) as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: True if the receiver is a subview of a given view or if it's identical to that view; otherwise, it returns false.

35.66.32 makeBackingLayer as Variant

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates the view's backing layer.
Notes: Value is a CALayerMBS. We use variant to reduce dependency to other plugins.
Available in OS X v10.6 and later.

35.66.33 nextValidKeyView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Returns the closest view object in the key view loop that follows the receiver and accepts first responder status.
Notes: This method ignores hidden views when it determines the next valid key view.
Returns nil on any error.

35.66.34 noteFocusRingMaskChanged

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Invoked to notify the view that the focus ring mask requires updating.
Notes: It is important to note that it is only necessary for developers to invoke this method when some internal state change of their application, that the Application Kit can't determine, affects the shape of the focus ring mask.

It is assumed that if the view is marked as needing display, or is resized, its focus ring shape is likely to

have changed, and there is no need for clients to explicitly send this message in such cases, they are handled automatically.

If, however, a view is showing a focus ring around some part of its content (an NSImage, perhaps), and that content changes, the client must provide notification by invoking this method so that focusRingMaskBounds and drawFocusRingMask will be invoked to redraw the focus ring.
Available in Mac OS X v10.7 and later.

35.66.35 NSViewBoundsDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names to use with the NSView class.
Notes: Posted whenever the NSView's bounds rectangle changes independently of the frame rectangle, if the NSView is configured using setPostsBoundsChangedNotifications to post such notifications.

The notification object is the NSView object whose bounds rectangle has changed. This notification does not contain a userInfo dictionary.

The following methods can result in notification posting

- setBounds
- setBoundsOrigin
- setBoundsRotation
- setBoundsSize
- translateOriginToPoint
- scaleUnitSquareToSize
- rotateByAngle

Note that the bounds rectangle resizes automatically to track the frame rectangle. Because the primary change is that of the frame rectangle, however, setFrame and setFrameSize don't result in a bounds-changed notification.

35.66.36 NSViewDidUpdateTrackingAreasNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names to use with the NSView class.
Notes: Posted whenever an NSView object recalculates its tracking areas. It is sent after the view receives updateTrackingAreas.

Available in Mac OS X v10.5 and later.

35.66.37 NSViewFocusDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names to use with the NSView class.
Notes: Sent when focus changed. Object for this notification is the view.

35.66.38 NSViewFrameDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names to use with the NSView class.
Notes: Posted whenever the view's frame rectangle changes, if the view is configured using setPostsFrameChangedNotifications to post such notifications.

The notification object is the NSView object whose frame rectangle has changed. This notification does not contain a userInfo dictionary.

The following methods can result in notification posting:

- setFrame
- setFrameOrigin
- setFrameRotation
- setFrameSize

35.66.39 NSViewGlobalFrameDidChangeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: One of the notification names to use with the NSView class.
Notes: Posted whenever an NSView object that has attached surfaces (that is, NSOpenGLContext objects) moves to a different screen, or other cases where the NSOpenGLContext object needs to be updated. The notification object is the surface's view. This notification does not contain a userInfo dictionary.

35.66.40 pageFooter as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns a default footer string that includes the current page number and page count.
Notes: A printable view class can override this method to substitute its own content in place of the default value. You should not need to call this method directly. The printing system calls it once per page during printing.

Footers are generated only if the user defaults contain the key NSPrintHeaderAndFooter with the value true.

35.66.41 pageHeader as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns a default header string that includes the print job title and date.
Notes: Typically, the print job title is the same as the window title. A printable view class can override this method to substitute its own content in place of the default value. You should not need to call this method directly. The printing system calls it once per page during printing.

Headers are generated only if the user defaults contain the key NSPrintHeaderAndFooter with the value true.

35.66.42 previousKeyView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Returns the view object preceding the receiver in the key view loop.
Notes: This view should, if possible, be made first responder when the user navigates backward from the receiver using keyboard interface control.
Returns nil on any error.

35.66.43 previousValidKeyView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Returns the closest view object in the key view loop that precedes the receiver and accepts first responder status.
Notes: This method ignores hidden views when it determines the previous valid key view.
Returns nil on any error.

35.66.44 print

MBS MacBase Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: This action method opens the Print panel, and if the user chooses an option other than canceling, prints the receiver and all its subviews to the device specified in the Print panel.

35.66.45 registeredDraggedTypes as string()

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Returns the array of pasteboard drag types that the view can accep
Example:

```
// This example needs a window with ListBox1.
// we register some types
ListBox1.AcceptPictureDrop
ListBox1.AcceptTextDrop

// and query them:
MessageBox Join(ListBox1.NSViewMBS.registeredDraggedTypes, EndOfLine)

' shows:
'NeXT TIFF v4.0 pasteboard type
'com.apple.traditional-mac-plain-text
'NSStringPboardType
```

Notes: This method returns the types registered by calling registerForDraggedTypes:. Each element of the array is a uniform type identifier. The returned elements are in no particular order, but the array is guaranteed not to contain duplicate entries.

35.66.46 registerForDraggedTypes(Types() as string)

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Registers the pasteboard types that the receiver will accept as the destination of an image-dragging session.
Notes: Types: An array of uniform type identifiers. See Types for Standard Data (Mac OS X 10.6 and later) for descriptions of the pasteboard type identifiers.

Registering an NSView object for dragged types automatically makes it a candidate destination object for a dragging session. As such, it must properly implement some or all of the NSDraggingDestination protocol methods. As a convenience, NSView provides default implementations of these methods. See the NSDraggingDestination protocol specification for details.

Xojo with Cocoa target implements the methods listed above. So this method is useful to change the allowed types for the case the framework has a bug.

35.66.47 removeAllToolTips

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop only.

Function: Removes all tool tips assigned to the receiver.

35.66.48 removeFromSuperview

MBS MacBase Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop & iOS.

Function: Unlinks the view from its superview and its window, removes it from the responder chain, and invalidates its cursor rectangles.

35.66.49 removeFromSuperviewWithoutNeedingDisplay

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Unlinks the receiver from its superview and its window and removes it from the responder chain, but does not invalidate its cursor rectangles to cause redrawing.
Notes: The receiver is also released; if you plan to reuse it, be sure to retain it before sending this message and to release it as appropriate when adding it as a subview of another view.

Unlike its counterpart, removeFromSuperview, this method can be safely invoked during display.

35.66.50 RenderImage(subviews as boolean = false, flipped as boolean = false) as variant

MBS MacBase Plugin, Plugin Version: 8.5, Platform: macOS, Targets: Desktop only.

Function: Renders a picture of the view.
Example:

```
Var n as new NSProgressIndicatorMBS
n.sizeToFit

Var image as NSImageMBS = n.RenderImage
```

```
Var pic as Picture = image.CopyPicture

Backdrop = pic
```

Notes: May return nil on any error.
Returns a NSImageMBS. We use variant to reduce dependency to other plugins.

Added flipped parameter for version 20.3.
Flipped was true for older versions.

35.66.51 replaceSubview(oldView as NSViewMBS, newView as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Replaces one of the receiver's subviews with another view.
Notes: oldView: The view to be replaced by newView. May not be nil.
newView: The view to replace oldView. May not be nil.

This method does nothing if oldView is not a subview of the receiver.
Neither oldView nor newView may be nil, and the behavior is undefined if either of these parameters is nil.

35.66.52 rotateByAngle(angle as Double)

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Rotates the receiver's bounds rectangle by a specified degree value around the origin of the coordinate system, (0.0, 0.0).
Notes: angle: A float value specifying the angle of rotation, in degrees.

See the BoundsRotation property description for more information. This method neither redisplays the receiver nor marks it as needing display. You must do this yourself with display or NeedsDisplay.

This method posts an NSViewBoundsDidChangeNotification to the default notification center if the receiver is configured to do so.

35.66.53 scaleUnitSquareToSize(size as NSSizeMBS)

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: Desktop only.

Function: Scales the receiver's coordinate system so that the unit square scales to the specified dimensions.

Notes: For example, a newUnitSize of (0.5, 1.0) causes the receiver's horizontal coordinates to be halved, in turn doubling the width of its bounds rectangle. Note that scaling is performed from the origin of the coordinate system, (0.0, 0.0), not the origin of the bounds rectangle; as a result, both the origin and size of the bounds rectangle are changed. The frame rectangle remains unchanged.

This method neither redisplays the receiver nor marks it as needing display. You must do this yourself with display or setNeedsDisplay.

This method posts an NSViewBoundsDidChangeNotification to the default notification center if the receiver is configured to do so.

35.66.54 Screenshot as Picture

MBS MacBase Plugin, Plugin Version: 22.2, Platform: macOS, Targets: Desktop only.

Function: Renders the view into a picture.
Notes: Like ScreenshotWindowMBS, but only for the view you are interested in, e.g. a map.
Returns nil on failure like out of memory.

35.66.55 scrollPoint(x as double, y as double)

MBS MacBase Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Scrolls the view,Äôs closest ancestor NSClipView object so a point in the view lies at the origin of the clip view's bounds rectangle.
Example:

```
// scroll to bottom
'ScrollView.documentView.scrollPoint 0, 0

// scroll to top
ScrollView.documentView.scrollPoint 0, ScrollView.documentView.frame.Height-ScrollView.frame.Height
```

Notes: x/y: The point in the view to scroll to.

35.66.56 scrollRectToVisible(rect as NSRectMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Scrolls the view,Äôs closest ancestor NSClipView object the minimum distance needed so a specified region of the view becomes visible in the clip view.
Notes: The rectangle to be made visible in the clip view.

Returns true if any scrolling is performed; otherwise returns false.

35.66.57 setBackgroundFilters(Filters() as variant)

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: Sets an array of Core Image filters to apply to the view,Äôs background.
Notes: This property contains an array of CIFilterMBS objects. This array represents the background filters stored in the backgroundFilters property of the view,Äôs layer. If the view does not have a layer, setting the value of this property has no effect.
The default value of this property is an empty array.

We use variant here to reduce plugin dependencies. Please use with array of variants containing CIFilterMBS.

35.66.58 setBoundsOrigin(origin as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the bounds origin.
See also:

- 35.66.59 setBoundsOrigin(x as Double, y as Double) 6692

35.66.59 setBoundsOrigin(x as Double, y as Double)

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the bounds origin.
See also:

- 35.66.58 setBoundsOrigin(origin as NSPointMBS) 6692

35.66.60 setBoundsSize(size as NSSizeMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the bounds size of the nsview.
See also:

- 35.66.61 setBoundsSize(width as Double, height as Double) 6693

35.66.61 setBoundsSize(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the bounds size of the nsview.
See also:

- 35.66.60 setBoundsSize(size as NSSizeMBS) 6692

35.66.62 setContentFilters(Filters() as variant)

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: Sets an array of Core Image filters to apply to the contents of the view and its sublayers.
Notes: This property contains an array of CIFilterMBS objects. This array represents the filters stored in the filters property of the view,Äôs layer. If the view does not have a layer, setting the value of this property has no effect.
The default value of this property is an empty array.

We use variant here to reduce plugin dependencies. Please use with array of variants containing CIFilterMBS.

35.66.63 setFocus

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Convenience function to set the focus to this view.
Notes: Calls internally makeFirstResponder on NSWindow.

35.66.64 setFrameOrigin(origin as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sets the frame origin.
See also:

- 35.66.65 setFrameOrigin(x as Double, y as Double) 6693

35.66.65 setFrameOrigin(x as Double, y as Double)

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Sets the frame origin.
See also:

- 35.66.64 setFrameOrigin(origin as NSPointMBS) 6693

35.66.66 setFrameSize(size as NSSizeMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Sets the frame size.
See also:

- 35.66.67 setFrameSize(width as Double, height as Double) 6694

35.66.67 setFrameSize(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Sets the frame size.
See also:

- 35.66.66 setFrameSize(size as NSSizeMBS) 6694

35.66.68 subviews(recursive as boolean = false) as NSViewMBS()

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The immediate subviews.
Notes: The order of the subviews may be considered as being back-to-front, but this does not imply invalidation and drawing behavior. The order is based on the order of the receiver's subviews as specified in the nib file from which they were unarchived or the programmatic interface for modifying the receiver's subview list. This ordering is also the reverse of the order in which hit-testing is done.

If recursive is true, we include all subviews of all subviews. (new in 14.2)

35.66.69 unregisterDraggedTypes

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Unregisters the receiver as a possible destination in a dragging session.

35.66.70 Properties

35.66.71 acceptsTouchEvents as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether the view will accept touch events.
Notes: Available in Mac OS X v10.6 and later.
(Read and Write property)

35.66.72 allowsVibrancy as Boolean

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: allowsVibrancy is queried when a vibrant appearance is used on a view hierarchy.
Notes: When allowsVibrancy returns YES, the view will have an appropriate measure taken to ensure it is vibrant on top of its given material.
Specific subclasses, such as NSControl, will answer this question based on the artwork they draw for a given appearance.
(Read only property)

35.66.73 alphaValue as Double

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: the opacity of the view.
Example:

```
// This example needs a window with CheckBox1.
// makes a checkbox half transparent on Cocoa target:
CheckBox1.NSViewMBS.alphaValue = 0.5
```

Notes: This method returns the value of the opacity property of the view's layer. Possible values are between 0.0 (transparent) and 1.0 (opaque). The default is 1.0.

Sending this message to a view that is not managing a Core Animation layer causes an exception.
(Read and Write property)

35.66.74 autoresizesSubviews as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: True if the receiver automatically resizes its subviews using resizeSubviewsWithOldSize whenever its frame size changes, false otherwise.
Notes: (Read and Write property)

35.66.75 autoresizingMask as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: The receiver's autoresizing mask, which determines how it's resized by the resizeWithOldSuperviewSize method.
Notes: If the autoresizing mask is equal to NSViewNotSizable (that is, if none of the options are set), then the receiver doesn't resize at all in resizeWithOldSuperviewSize.

NSViewNotSizable = 0	The receiver cannot be resized.
NSViewMinXMargin = 1	The left margin between the receiver and its superview is flexible.
NSViewWidthSizable = 2	The receiver's width is flexible.
NSViewMaxXMargin = 4	The right margin between the receiver and its superview is flexible.
NSViewMinYMargin = 8	The bottom margin between the receiver and its superview is flexible.
NSViewHeightSizable = 16	The receiver's height is flexible.
NSViewMaxYMargin = 32	The top margin between the receiver and its superview is flexible.

(Read and Write property)

35.66.76 bounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the receiver's bounds rectangle, which expresses its location and size in its own coordinate system.
Example:

```
Var n as new NSProgressIndicatorMBS
n.sizeToFit

MessageBox n.bounds.String
```

Notes: The bounds rectangle may be rotated; use the boundsRotation method to check this.
(Read and Write property)

35.66.77 boundsRotation as Double

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The angle, in degrees, of the view's bounds rectangle relative to its frame rectangle.
Notes: (Read and Write property)

35.66.78 canBecomeKeyView as boolean

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.
(Read only property)

35.66.79 canDraw as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns true if drawing commands will produce any result, false otherwise.
Notes: Use this method when invoking a draw method directly along with lockFocus and unlockFocus, bypassing the display... methods (which test drawing ability and perform locking for you). If this method returns false, you shouldn't invoke lockFocus or perform any drawing.

A view object can draw on-screen if it is not hidden, it is attached to a view hierarchy in a window (NSWindow), and the window has a corresponding window device. A view object can draw during printing if it is a descendant of the view being printed.

To draw into a NSView, use either CustomNSViewMBS class with drawRect event or NSGraphicsMBS class.
(Read only property)

35.66.80 canDrawConcurrently as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether the view's drawRect: method can be invoked on a background thread.
Notes: Available in Mac OS X v10.6 and later.
(Read and Write property)

35.66.81 className as string

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop & iOS.

Function: The name of this NSView class.
Example:

```
// shows RBNSButton
MessageBox CheckBox1.NSViewMBS.className
```

Notes: (Read only property)

35.66.82 classPath as string

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop & iOS.

Function: The path of this NSView class.
Example:

```
// This example needs a window with TextArea1.
MessageBox TextArea1.NSViewMBS.classPath
// shows "RBNSScrollView:NSScrollView:NSView:NSResponder:NSObject"
```

Notes: Useful for debugging to know what super classes the view has.
(Read only property)

35.66.83 clipsToBounds as Boolean

MBS MacBase Plugin, Plugin Version: 23.4, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: A Boolean value that determines whether subviews are confined to the bounds of the view.
Notes: Setting this value to true causes subviews to be clipped to the bounds of the view. If set to false, subviews whose frames extend beyond the visible bounds of the view aren,Äôt clipped.
The default value is false. Some subclasses of UIView, like UIScrollView, override the default value to true.
(Read and Write property)

35.66.84 focusRingType as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The type of focus ring to be drawn around the receiver.
Notes: This method only sets the desired focus ring type and does not cause the view to draw the actual focus ring. You are responsible for drawing the focus ring in your view's drawRect method whenever your

view is made the first responder.

possible values:

NSFocusRingTypeDefault	0
NSFocusRingTypeNone	1
NSFocusRingTypeExterior	2

(Read and Write property)

35.66.85 frame as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the frame size and position of the view.
Example:

```
Var n as new NSProgressIndicatorMBS
n.sizeToFit

MessageBox n.frame.String
```

Notes: (Read and Write property)

35.66.86 frameCenterRotation as Double

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's rotation about the layer's position.
Notes: If the application has altered the layer's anchorPoint property, the behavior is undefined. Sending this message to a view that is not managing a Core Animation layer causes an exception.

Available in Mac OS X v10.5 and later.
(Read and Write property)

35.66.87 frameHeight as Double

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop & iOS.

Function: The height of the view frame.
Example:

```
Var n as new NSProgressIndicatorMBS
MessageBox str(n.frameHeight)
```

Notes: This is a convenience property which calls the frame function to get the current rectangle, changes the value and sets the frame to the new rectangle.
(Read and Write property)

35.66.88 frameLeft as Double

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop & iOS.

Function: The left position of the view frame.
Example:

```
Var n as new NSProgressIndicatorMBS
MessageBox str(n.frameLeft)
```

Notes: This is a convenience property which calls the frame function to get the current rectangle, changes the value and sets the frame to the new rectangle.
(Read and Write property)

35.66.89 frameRotation as Double

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The angle, in degrees, of the view's frame relative to its superview's coordinate system.
Notes: Var n as new NSProgressIndicatorMBS
n.frameRotation=10
MessageBox str(n.frameRotation)
(Read and Write property)

35.66.90 frameTop as Double

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop & iOS.

Function: The top position of the view frame.
Example:

```
Var n as new NSProgressIndicatorMBS
MessageBox str(n.frameTop)
```

Notes: This is a convenience property which calls the frame function to get the current rectangle, changes the value and sets the frame to the new rectangle.
(Read and Write property)

35.66.91 frameWidth as Double

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop & iOS.

Function: The width of the view frame.
Example:

```
Var n as new NSProgressIndicatorMBS
MessageBox str(n.frameWidth)
```

Notes: This is a convenience property which calls the frame function to get the current rectangle, changes the value and sets the frame to the new rectangle.
(Read and Write property)

35.66.92 identifier as string

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: A string that identifies this user interface item.
Notes: It should be set to a unique value on NSViews when they are intended to be used inside a view-based NSTableView. Identifiers should be unique per-window. For programmatically created user interface items, you would typically set this value in code after creating a control but before adding it to a window. You may also want to set an identifier on a window, after creating it programmatically, to identify the window easily when it is reopened. You should not change the identifier after a control is added to a window. Identifiers beginning with an underscore are reserved for the system. In framework classes that implement this protocol, the accessor methods are not intended to be overridden.

To help avoid collision of identifiers, it is recommended that identifiers use the same prefix as is used for the framework or application. For example, identifiers for standard AppKit interface items, such as the open panel, will begin with "NS".

The slash '/', backslash '\', and colon ':' characters are reserved and should not be used in identifiers.
(Read and Write property)

35.66.93 isFlipped as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: True if the nsview uses flipped drawing coordinates or false if it uses native coordinates.
Notes: (Read only property)

35.66.94 isHidden as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the receiver is marked as hidden.
Notes: (Read and Write property)

35.66.95 isHiddenOrHasHiddenAncestor as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: True if the nsview is marked as hidden or has an ancestor in the view hierarchy that is marked as hidden; returns false otherwise.
Notes: (Read only property)

35.66.96 isOpaque as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop & iOS.

Function: Overridden by subclasses to return true if the view is opaque, false otherwise.
Notes: (Read only property)

35.66.97 isRotatedFromBase as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: True if the nsview or any of its ancestors has ever set a FrameRotation or BoundsRotation properties; otherwise returns false.
Notes: (Read only property)

35.66.98 isRotatedOrScaledFromBase as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: True if the nsview or any of its ancestors has ever had a nonzero frame or bounds rotation, or has been scaled from the window's base coordinate system; otherwise returns false.
Notes: The intent of this information is to optimize drawing and coordinate calculation, not necessarily to reflect the exact state of the receiver's coordinate system, so it may not reflect the actual rotation or scaling. For example, if an NSView object is rotated to 45 degrees and later back to 0, this method still returns true.
(Read only property)

35.66.99 layer as Variant

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns or sets the Core Animation layer that the receiver uses as its backing store.
Notes: Value is a CALayerMBS. We use variant to reduce dependency to other plugins.

Available in OS X v10.5 and later.
(Read and Write property)

35.66.100 layerUsesCoreImageFilters as Boolean

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the view,Äôs layer uses Core Image filters and needs in-process rendering.
Notes: If your view uses a custom layer and you assigned Core Image to that layer directly, you must set this property to YES to let AppKit know of that fact. In macOS 10.9 and later, AppKit prefers to render layer trees out-of-process but cannot do so if any layers have Core Image filters attached to them. Specifying true for property lets AppKit know that it must move rendering of the layer hierarchy back into your app,Äôs process. If the value of this property is false, adding a filter to the view,Äôs layer triggers an exception.

You do not need to modify this property if you assigned the filters using the backgroundFilters, compositingFilter, or contentFilters properties of the view. Those methods automatically let AppKit know that it needs to render the layer hierarchy in-process. Set it only if you set the filters on the layer directly.
(Read and Write property)

35.66.101 needsDisplay as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: whether the view needs to be displayed.
Notes: (Read and Write property)

35.66.102 nextKeyView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The view object following the receiver in the key view loop.
Notes: Returns the view object following the receiver in the key view loop, or nil if there is none.
On setting inserts a specified view object after the receiver in the key view loop of the receiver's window.
This view should, if possible, be made first responder when the user navigates forward from the receiver using keyboard interface control.
Returns nil on any error.
(Read and Write property)

35.66.103 opaqueAncestor as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's closest opaque ancestor (including the receiver itself).
Notes: (Read only property)

35.66.104 prefersCompactControlSizeMetrics as boolean

MBS MacBase Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: Whether to prefer compact control size.
Notes: When this property is true, any NSControls in the view or its descendants will be sized with compact metrics compatible with macOS 15 and earlier. Defaults to false

For macOS 26 or newer.
(Read and Write property)

35.66.105 RetainCount as Integer

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop & iOS.

Function: The retain count for the NSView object.
Notes: Useful for debugging. Should always be >0.
(Read only property)

35.66.106 superview as NSViewMBS

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the receiver's superview, or nil if it has none.
Notes: (Read only property)

35.66.107 toolTip as string

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The tooltip text for this view.
Example:

```
Var n as new NSProgressIndicatorMBS
n.toolTip = "Hello"
MessageBox n.toolTip
```

Notes: (Read and Write property)

35.66.108 userInteractionEnabled as Boolean

MBS MacBase Plugin, Plugin Version: 21.4, Platform: macOS, Targets: iOS only.

Function: A Boolean value that determines whether user events are ignored and removed from the event queue.
Notes: When set to false, touch, press, keyboard, and focus events intended for the view are ignored and removed from the event queue. When set to YES, events are delivered to the view normally. The default value of this property is true.

During an animation, user interactions are temporarily disabled for all views involved in the animation, regardless of the value in this property. You can disable this behavior by specifying the UIViewAnimationOptionAllowUserInteraction option when configuring the animation.
(Read and Write property)

35.66.109 visibleRect as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the portion of the receiver not clipped by its superviews.
Notes: Visibility for this method is defined quite simply and doesn't account for whether other NSView objects (or windows) overlap the receiver or whether the receiver has a window at all. This method returns an empty rectangle if the receiver is effectively hidden.

During a printing operation the visible rectangle is further clipped to the page being imaged.
(Read only property)

35.66.110 wantsDefaultClipping as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns whether the Application Kit's default clipping provided to drawRect implementations is in effect.
Notes: Subclasses may override this method to return false if they want to suppress the default clipping. They may want to do this in situations where drawing performance is critical to avoid the cost of setting up, enforcing, and cleaning up the clip path

A view that overrides this method to refuse the default clipping must either set up whatever clipping it requires or constrain its drawing exactly to the list of rectangles returned by getRectsBeingDrawn. Failing to do so could result in corruption of other drawing in the view's window.
(Read only property)

35.66.111 wantsLayer as Boolean

MBS MacBase Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver and its subviews use a Core Animation layer as a backing store.
Notes: True if the view and its subviews should use a Core Animation layer as its backing store, otherwise false.

Requires Mac OS X 10.5.
(Read and Write property)

35.66.112 wantsRestingTouches as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether the view wants resting touches.
Notes: A resting touch occurs when a user rests their thumb on a device (for example, the glass trackpad of a MacBook).

By default, these touches are not delivered and are not included in the event's set of touches. Touches may transition in and out of resting at any time. Unless the view wants restingTouches, began / ended events are simulated as touches transition from resting to active and vice versa.

In general resting touches should be ignored.

Available in Mac OS X v10.6 and later.
(Read and Write property)

35.66.113 window as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the receiver's window object, or nil if it has none.
Notes: (Read only property)

35.66.114 compositingFilter as variant

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop only.

Function: The Core Image filter used to composite the view,Äôs contents with its background.
Notes: This property contains the compositing filter stored in the compositingFilter property of the view,Äôs

layer. If the view does not have a layer, setting the value of this property has no effect.
The default value of this property is nil, which causes content to be rendered without any special compositing effects.

We use variant here to reduce plugin dependencies. Please use with variant containing CIFilterMBS.
(Read and Write computed property)

35.66.115 Constants

Constants

Constant	Value	Description
NSBezelBorder	2	One of the constants to specify the type of a view's border. A concave border that makes the view look sunken.
NSFocusRingTypeDefault	0	One of the constants for the focusringtype property. The default focus ring type for NSView or NSCell.
NSFocusRingTypeExterior	2	One of the constants for the focusringtype property. The standard Aqua focus ring.
NSFocusRingTypeNone	1	One of the constants for the focusringtype property. No focus ring. If you set the focus ring type to this value, NS will not draw any focus ring.
NSGrooveBorder	3	One of the constants to specify the type of a view's border. A thin border that looks etched around the image.
NSLineBorder	1	One of the constants to specify the type of a view's border. A black line border around the view.
NSNoBorder	0	One of the constants to specify the type of a view's border. No border.
NSViewHeightSizable	16	One of the constants for the autoresizingMask property. The receiver's height is flexible.
NSViewLayerContentsRedrawBeforeViewResize	3	One of the view layer content redraw policy constants.
NSViewLayerContentsRedrawDuringViewResize	2	One of the view layer content redraw policy constants.
NSViewLayerContentsRedrawNever	0	One of the view layer content redraw policy constants.
NSViewLayerContentsRedrawOnSetNeedsDisplay	1	One of the view layer content redraw policy constants.
NSViewMaxXMargin	4	One of the constants for the autoresizingMask property. The right margin between the receiver and its superview is fl
NSViewMaxYMargin	32	One of the constants for the autoresizingMask property. The top margin between the receiver and its superview is flex
NSViewMinXMargin	1	One of the constants for the autoresizingMask property. The left margin between the receiver and its superview is flex
NSViewMinYMargin	8	One of the constants for the autoresizingMask property. The bottom margin between the receiver and its superview is
NSViewNotSizable	0	One of the constants for the autoresizingMask property. The receiver cannot be resized.
NSViewWidthSizable	2	One of the constants for the autoresizingMask property. The receiver's width is flexible.

Window Order Constants

Constant	Value	Description
NSWindowAbove	1	Moves the window above the indicated window.
NSWindowBelow	-1	Moves the window below the indicated window.
NSWindowOut	0	Moves the window off the screen.

35.67 class NSViewTooltipMBS

35.67.1 class NSViewTooltipMBS

MBS MacBase Plugin, Plugin Version: 18.0, Platform: macOS, Targets: Desktop only.

Function: The class for a dynamical NSView tooltip.
Notes: Can be used for customized helptags with event to return current text.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 18.0
- MBS Xojo Plugins, version 18.0pr7

Xojo Developer Magazine

- 16.2, page 9: News

35.67.2 Methods

35.67.3 Constructor

MBS MacBase Plugin, Plugin Version: 18.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.

35.67.4 Properties

35.67.5 Text as String

MBS MacBase Plugin, Plugin Version: 18.0, Platform: macOS, Targets: Desktop only.

Function: The text for the tooltip.
Notes: If event is not implemented, we use this default text.
(Read and Write property)

35.67.6 Events

35.67.7 stringForToolTip(point as NSPointMBS) as string

MBS MacBase Plugin, Plugin Version: 18.0, Platform: macOS, Targets: Desktop only.

Function: Queries string for tooltip at position.
Notes: The point allows you to customize the tooltip for the location.
Please return the text to display.

35.68 class NSVisualEffectViewMBS

35.68.1 class NSVisualEffectViewMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The class to use visual effect view.
Example:

```
// put a translucent sidebar background behind the left part of the window
Var effect As New NSVisualEffectViewMBS(0, 0, 200, Self.Height)
effect.material = NSVisualEffectViewMBS.NSVisualEffectMaterialSidebar
effect.blendingMode = NSVisualEffectViewMBS.NSVisualEffectBlendingModeBehindWindow
effect.state = NSVisualEffectViewMBS.NSVisualEffectStateFollowsWindowActiveState

// add it below the other controls of the window
Self.NSWindowMBS.contentView.addSubview effect, NSViewMBS.NSWindowBelow, Nil
```

Notes: The NSVisualEffectView is the basis for all visual effects, including "vibrant" appearances. You can optionally set the appearance to NSAppearanceMBS.appearanceNamed(NSAppearanceNameVibrantDark) (or Light) to get the desired light or dark appearance. Combine this with an appropriate light or dark material to get the desired vibrant look. Combining NSAppearanceNameVibrantDark with a light material will look bad, and should not be done.

Requires Mac OS X 10.10 or newer.

Please review Apple's documentation on this for details.
Subclass of the NSViewMBS class.
Blog Entries

- MBS Xojo Plugins, version 21.2pr1
- New for Mac OS X 10.10 in MBS Xojo Plugins

35.68.2 Methods

35.68.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Whether this class is available.
Notes: Only available on Mac OS X 10.10 or later.

35.68.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new NSVisualEffectViewMBS object.
See also:

- 35.68.5 Constructor(Handle as Integer) 6713
- 35.68.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6713

35.68.5 Constructor(Handle as Integer)

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSVisualEffectView handle.
Example:

```
Var t as new NSVisualEffectViewMBS(0, 0, 100, 100)
Var v as new NSVisualEffectViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSVisualEffectView and the plugin retains this handle.
See also:

- 35.68.4 Constructor 6713
- 35.68.6 Constructor(left as Double, top as Double, width as Double, height as Double) 6713

35.68.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new NSVisualEffectViewMBS object.
See also:

- 35.68.4 Constructor 6713
- 35.68.5 Constructor(Handle as Integer) 6713

35.68.7 Properties

35.68.8 blendingMode as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: How this backdrop view blurs its contents.
Notes: It can either blend with the contents behind the window (NSVisualEffectBlendingModeBehind-Window – the default), or within the current window (NSVisualEffectBlendingModeWithinWindow). The blending mode for the material NSVisualEffectMaterialTitlebar can only be NSVisualEffectBlendingMode-WithinWindow.

The blendingMode NSVisualEffectBlendingModeWithinWindow requires WantsLayer = true to be done on the parent view that you desire to blend with.
(Read and Write property)

35.68.9 Emphasized as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.2, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether to emphasize the look of the material.
Notes: Some materials change their appearance when they are emphasized. For example, the first responder view conveys its status.
The default value of this property is false.

Available in MacOS 10.12 or newer.
(Read and Write property)

35.68.10 interiorBackgroundStyle as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The interior background style.
Notes: Returns "Light" or "Dark" depending on the material selected.
(Read only property)

35.68.11 maskImage as NSImageMBS

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The mask image masks this view.
Notes: (Read and Write property)

35.68.12 material as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The material used.
Notes: The default value is NSVisualEffectMaterialAppearanceBased; the material is updated to be the correct material based on the appearance set on this view.
(Read and Write property)

35.68.13 state as Integer

MBS MacFrameworks Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The current state.
Notes: The state defaults to NSVisualEffectStateFollowsWindowActiveState.
(Read and Write property)

35.68.14 Constants

Background Styles

Constant	Value	Description
NSBackgroundStyleDark	1	Dark
NSBackgroundStyleLight	0	Light

Blending Modes

Constant	Value	Description
NSVisualEffectBlendingModeBehindWindow	0	Blends and blurs with the contents behind the window (such as th other windows). These can overlap, and the view lower in the h "win".
NSVisualEffectBlendingModeWithinWindow	1	Blends and blurs with contents behind the view in the current wind now, these cannot overlap each other. This mode REQUIRES la with view.wantsLayer = true.

Materials

Constant	Value	Description
NSVisualEffectMaterialAppearanceBased	0	When NSVisualEffectMaterialAppearanceBased is set, the determined by the current effectiveAppearance that is on the
NSVisualEffectMaterialContentBackground	18	The material for the background of opaque content. You might use this material as the background for content table view, or collection view. This material supports Desktop Tinting in Dark Mode. With the system modifies the material's color dynamically by incor the color from the underlying desktop image.
NSVisualEffectMaterialDark	2	Dark
NSVisualEffectMaterialFullScreenUI	15	The material for the background of a full-screen modal interf
NSVisualEffectMaterialHeaderView	10	The material for in-line header or footer views.
NSVisualEffectMaterialHUDWindow	13	The material for the background of heads-up display (HUD)
NSVisualEffectMaterialLight	1	Light
NSVisualEffectMaterialMenu	5	The material for menus.
NSVisualEffectMaterialPopover	6	The material for the background of popover windows.
NSVisualEffectMaterialSelection	4	The material used to indicate a selection.
NSVisualEffectMaterialSheet	11	The material for the background of sheet windows.
NSVisualEffectMaterialSidebar	7	The material for the background of window sidebars.
NSVisualEffectMaterialTitlebar	3	The material for a window,Äôs titlebar.
NSVisualEffectMaterialToolTip	17	The material for the background of a tool tip.
NSVisualEffectMaterialUnderPageBackground	22	The material for the area behind the pages of a document. This material supports Desktop Tinting in Dark Mode. With the system modifies the material's color dynamically by incor the color from the underlying desktop image.
NSVisualEffectMaterialUnderWindowBackground	21	The material to show under a window's background. Use this material on a visual effect view with a blendingM EffectBlendingModeBehindWindow to create a sense of pee back of the window. This effect creates an illusion that the b window has peeled away to reveal what,Äôs under it.
NSVisualEffectMaterialWindowBackground	12	The material for the background of opaque windows. This material supports Desktop Tinting in Dark Mode. With the system modifies the material's color dynamically by incor the color from the underlying desktop image.

States

Constant	Value	Description
NSVisualEffectStateActive	1	The backdrop is explicitly active, always.
NSVisualEffectStateFollowsWindowActiveState	0	The backdrop automatically appears active when the window inactive when it is not active.
NSVisualEffectStateInactive	2	The backdrop is explicitly inactive.

35.69 class NSWindowControllerMBS

35.69.1 class NSWindowControllerMBS

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: An NSWindowController object manages a window, usually a window stored in a nib file.
Example:

```
// let macOS remember position and size of a window between launches
// ControllerForWindow is a property of the window: ControllerForWindow As NSWindowControllerMBS
ControllerForWindow = New NSWindowControllerMBS(Self.NSWindowMBS)
ControllerForWindow.shouldCascadeWindows = False
ControllerForWindow.windowFrameAutosaveName = "MainWindow"
```

Notes: Please read Apple's documentation for details:
https://developer.apple.com/library/mac/documentation/Cocoa/Reference/ApplicationKit/Classes/NSWindowController_Class/Reference/Reference.html
Subclass of the NSResponderMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr6

35.69.2 Methods

35.69.3 close

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Closes the window if it was loaded.
Notes: Because this method closes the window without asking the user for confirmation, you usually do not invoke it when the Close menu command is chosen. Instead invoke NSWindow's performClose on the receiver's window.

35.69.4 Constructor(win as NSWindowMBS)

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Returns a window controller initialized with a given window.
Notes: window: The window object to manage; can be nil.
Returns a newly initialized window controller.
This method is the designated initializer for NSWindowController.

This initializer is useful when a window has been loaded but no window controller is assigned. The default

initialization turns on cascading, sets the shouldCloseDocument flag to NO, and sets the window frame autosave name to an empty string. As a side effect, the created window controller is added as an observer of the NSWindowWillCloseNotifications posted by that window object (which is handled by a private method). If you make the window controller a delegate of the window, you can implement NSWindow's windowShouldClose delegate method.
See also:

- 35.69.5 Constructor(windowNibName as string) 6718

35.69.5 Constructor(windowNibName as string)

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Returns a window controller initialized with a nib file.
Notes: windowNibName: The name of the nib file (minus the ".nib" extension) that archives the receiver's window; cannot be empty.

Sets the owner of the nib file to the receiver. The default initialization turns on cascading, sets the shouldCloseDocument flag to false, and sets the autosave name for the window's frame to an empty string.
See also:

- 35.69.4 Constructor(win as NSWindowMBS) 6717

35.69.6 showWindow

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Displays the window associated with the receiver.
Notes: If the window is an NSPanel object and has its becomesKeyOnlyIfNeeded flag set to true, the window is displayed in front of all other windows but is not made key; otherwise it is displayed in front and is made key. This method is useful for menu actions.

35.69.7 synchronizeWindowTitleWithDocumentName

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Synchronizes the displayed window title and the represented filename with the information in the associated document.
Notes: Does nothing if the window controller has no associated document or loaded window. This method queries the window controller's document to get the document's display name and full filename path, then calls windowTitleForDocumentDisplayName to get the display name to show in the window title.

35.69.8 Properties

35.69.9 className as string

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The name of this NSWindowController class.
Notes: (Read only property)

35.69.10 classPath as string

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The path of this NSWindowController class.
Notes: Useful for debugging to know what super classes the window controller has.
(Read only property)

35.69.11 shouldCascadeWindows as boolean

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver should necessarily close the associated document when the window it manages is closed.
Notes: True if the receiver necessarily closes the associated document when the window it manages is closed, false otherwise.
If false, the document is closed only when the last remaining window of the document is closed.
The default is false.
(Read and Write property)

35.69.12 shouldCloseDocument as boolean

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver should necessarily close the associated document when the window it manages is closed.
Notes: True if the receiver necessarily closes the associated document when the window it manages is closed, false otherwise.
If false, the document is closed only when the last remaining window of the document is closed.
The default is false.
(Read and Write property)

35.69.13 window as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The window owned by the controller.
Notes: If the window has not yet been loaded, this method attempts to load the window's nib file using loadWindow. Before it loads the window, it invokes windowWillLoad, and if the window controller has a document, it invokes the document's corresponding method windowControllerWillLoadNib (if implemented). After loading the window, this method invokes windowDidLoad and, if there is a document, the NSDocument method windowControllerDidLoadNib (if implemented).
(Read and Write property)

35.69.14 windowFrameAutosaveName as string

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The name under which the frame rectangle of the window owned by the receiver is stored in the defaults database.
Notes: By default, name is an empty string, causing no information to be stored in the defaults database.
(Read and Write property)

35.69.15 windowNibName as string

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Returns the name of the nib file that stores the window associated with the receiver.
Notes: (Read only property)

35.69.16 windowNibPath as string

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Returns the full path of the nib file that stores the window associated with the receiver.
Notes: The full path of the nib file that stores the window associated with the receiver; "" if it cannot be located.
(Read only property)

35.70 class NSWindowDelegateMBS

35.70.1 class NSWindowDelegateMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: A Xojo class for a cocoa windows delegate.
Example:

```
// keep the window frame (including title bar) at a 16:9 aspect ratio while the user resizes it
// MyWindowDelegate is a subclass of NSWindowDelegateMBS with the windowWillResize event implemented.
// WindowDelegate is a property of the window: WindowDelegate As MyWindowDelegate
WindowDelegate = New MyWindowDelegate(Self)

// in MyWindowDelegate:
Function windowWillResize(win As NSWindowMBS, newFrameSize As NSSizeMBS, newSize As NSSizeMBS)
As NSSizeMBS Handles windowWillResize
// newFrameSize is the size the user wants, return the size to use
Return NSMakeSizeMBS(newFrameSize.Width, newFrameSize.Width * 9 / 16)
End Function
```

Notes: The NSWindowDelegate protocol defines the methods that a delegate of NSWindow should implement. All methods in this protocol are optional.

By implementing these methods, the delegate may respond to window resizing, moving, exposing, minimizing, and a number of other window events.

35.70.2 Methods

35.70.3 Constructor(win as DesktopWindow)

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Initializes the delegate class pointing to the Xojo window.
Notes: This class does not keep a reference to the window, so you can keep this delegate as a property of

the window without a memory leak.

The original delegate from Xojo is preserved and all messages are forwarded to it. Also when this object is destroyed, the old delegate is restored.
See also:

- 35.70.4 Constructor(win as NSWindowMBS) 6722
- 35.70.5 Constructor(win as window) 6722

35.70.4 Constructor(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Initializes the delegate class pointing to the Cocoa window.
Notes: The original delegate on the window is preserved and all messages are forwarded to it. Also when this object is destroyed, the old delegate is restored.
See also:

- 35.70.3 Constructor(win as DesktopWindow) 6721
- 35.70.5 Constructor(win as window) 6722

35.70.5 Constructor(win as window)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Initializes the delegate class pointing to the Xojo window.
Notes: This class does not keep a reference to the window, so you can keep this delegate as a property of the window without a memory leak.

The original delegate from Xojo is preserved and all messages are forwarded to it. Also when this object is destroyed, the old delegate is restored.
See also:

- 35.70.3 Constructor(win as DesktopWindow) 6721
- 35.70.4 Constructor(win as NSWindowMBS) 6722

35.70.6 InstallRestoreEvents

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Activates plugin code to catch events restoreStateWithCoder and encodeRestorableStateWithCoder.

35.70.7 Events

35.70.8 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

35.70.9 customWindowsToEnterFullScreenForWindow(win as NSWindowMBS) as NSWindowMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the window is about to enter full screen mode.
Notes: win: The window to enter to full screen mode.

Return an array of windows involved in the animation to fullscreen for window; otherwise nil.

This method lets a window delegate to customize the animation by providing a custom window or windows containing layers or other effects. If you do not want to perform custom animation, you can omit the implementation of this method, or it can return nil.

Available in Mac OS X v10.7 and later.

35.70.10 customWindowsToExitFullScreenForWindow(win as NSWindowMBS) as NSWindowMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The system has started its animation out of fullscreen, including transitioning back to the desktop space.
Notes: win: The window to exit fullscreen.

Return true if the window wants to run a custom animation; otherwise false if the default NSWindow animation should be used.

This method lets the window delegate customize the animation when the window is about to exit fullscreen. If an you do not want to perform custom animation, you can omit the implementation of this method, or it can return nil.

Available in Mac OS X v10.7 and later.

35.70.11 didDecodeRestorableState(win as NSWindowMBS, state as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate the window is has extracted its restorable state from a given archiver.
Notes: win: The window extracting its restorable state from an archive.
state: The coder extracting the archive.

This method is invoked during the window's restoreStateWithCoder method.

Available in Mac OS X v10.7 and later.

35.70.12 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

35.70.13 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

35.70.14 draggingExited(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

35.70.15 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

35.70.16 encodeRestorableStateWithCoder(win as NSWindowMBS, coder as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Method called to save the restorable state.
Notes: The receiver is passed an NSCoderMBS that supports keyed encoding (but not decoding), and should encode its restorable state. If you override this method, you should call through to super. You should not otherwise invoke this method. If you encode an object that implements the NSUserInterfaceItemIdentification protocol, the object itself is not archived; only its identifier is stored. Thus, for example, a window may efficiently store its firstResponder as restorable state.

Called only if you called InstallRestoreEvents at least ones.

35.70.17 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

35.70.18 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes: sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

35.70.19 restoreStateWithCoder(win as NSWindowMBS, coder as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Method called to restore state.
Notes: The receiver is passed an NSCoder that supports keyed decoding (but not encoding). The receiver should decode any previously stored state. If you override this method, you should call through to super. You should not otherwise invoke this method.
Called only if you called InstallRestoreEvents at least ones.

35.70.20 shouldDragDocumentWithEvent(win as NSWindowMBS, evnt as NSEventMBS, dragImageLocation as NSPointMBS, pasteboard as Variant) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Asks the delegate whether a user can drag the document icon from the window's title bar.

Notes: win: The window containing the document icon the user wants to drag.
evnt: The left-mouse down event that triggered the dragging operation.
dragImageLocation: The location at which the user started the dragging operation.
pasteboard: The pasteboard containing the contents of the document, which the delegate can modify. This is a NSPasteboardMBS object.

Return true to allow the drag to proceed; false to prevent it. Before turning no the delegate can implement its own dragging behavior as described below.

Implementing this method allows an application to customize the process of dragging the window's document icon.implement its own dragging process, the delegate can perform the dragging operation and return false.

The delegate can prohibit the drag by returning false. Before returning false, the delegate may implement its own dragging behavior.

Available in Mac OS X v10.5 and later.

35.70.21 shouldPopUpDocumentPathMenu(win as NSWindowMBS, menu as NSMenuMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Asks the delegate whether the window displays the title pop-up menu in response to a Command-click or Control-click on its title.
Notes: win: The window whose title the user Command-clicked or Control-clicked.
menu: The menu the window will display, if allowed. By default, its items are the path components of the file represented by window.

Returns true to allow the display of the title pop-up menu; false to prevent it.

Available in Mac OS X v10.5 and later.

35.70.22 startCustomAnimationToEnterFullScreenWithDuration(win as NSWindowMBS, duration as Double)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the window is about to enter fullscreen mode.
Notes: win: The window to enter to full screen mode.
duration: The duration of the presentation change.

This method is called to start the window animation into fullscreen, including transitioning to a new space. You can implement this method to perform custom animation with the given duration to be in sync with the system animation.

Special Considerations
This method is called only if customWindowsToEnterFullScreenForWindow returned non-nil.

Available in Mac OS X v10.7 and later.

35.70.23 startCustomAnimationToExitFullScreenWithDuration(win as NSWindowMBS, duration as Double)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Informs the delegate that the window is about to enter fullscreen mode.
Notes: win: The window to exit to fullscreen.
duration: The duration of the presentation change.

Special Considerations
This method is called only if customWindowsToExitFullScreenForWindow returned non-nil.

Available in Mac OS X v10.7 and later.

35.70.24 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging images should be changed.
Notes: sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

35.70.25 wantsPeriodicDraggingUpdates as boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes: Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

35.70.26 willEncodeRestorableState(win as NSWindowMBS, state as NSCoderMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate the window is about to add its restorable state to a given archiver.
Notes: win: The window adding its restorable state to an archive.
state: The coder creating the archive.

This method is invoked during the window's encodeRestorableStateWithCoder method.

Available in Mac OS X v10.7 and later.

35.70.27 willPositionSheet(win as NSWindowMBS, sheet as NSWindowMBS, rect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window is about to show a sheet at the specified location, giving it the opportunity to return a custom location for the attachment of the sheet to the window.
Notes: win: The window containing the sheet to be animated.
sheet: The sheet to be shown.
rect: The default sheet location, just under the title bar of the window, aligned with the left and right edges of the window.

Return the custom location specified.

This method is also invoked whenever the user resizes window while sheet is attached.

This method is useful in many situations. If your window has a toolbar, for example, you can specify a loca-

tion for the sheet that is just below it. If you want the sheet associated with a certain control or view, you could position the sheet so that it appears to originate from the object (through animation) or is positioned next to it.

Neither the rect parameter nor the returned NSRect value define the boundary of the sheet. They indicate where the top-left edge of the sheet is attached to the window. The origin is expressed in window coordinates; the default origin.y value is the height of the content view and the default origin.x value is 0. The size.width value indicates the width and behavior of the initial animation; if size.width is narrower than the sheet, the sheet genies out from the specified location, and if size.width is wider than the sheet, the sheet slides out. You cannot affect the size of the sheet through the size.width and size.height fields. It is recommended that you specify zero for the size.height value as this field may have additional meaning in a future release.

Available in Mac OS X v10.3 and later.

35.70.28 willResizeForVersionBrowser(win as NSWindowMBS, maxPreferredFrameSize as NSSizeMBS, maxAllowedFrameSize as NSSizeMBS) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate the window will resize for presentation during version browsing.
Notes: win: The window being presented in a version browser.
maxPreferredSize: The maximum size the version browser would prefer the window to be.
maxAllowedSize: The maximum allowed size for the window (the full screen frame minus the margins required to ensure the Versions controls are still visible).

Returns the size that the window should be.

Windows entering the version browser will be resized to the size returned by this method. If either dimension of the returned size is larger than the maxPreferredFrameSize, the window will also be scaled down to ensure it fits properly in the version browser.

If this method is not implemented, the version browser will use windowWillUseStandardFrame to determine the resulting window frame size.

Available in Mac OS X v10.7 and later.

35.70.29 willUseFullScreenContentSize(win as NSWindowMBS, proposedSize as NSSizeMBS) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the delegate to modify the fullscreen content size.
Notes: win: The window to enter to full screen mode.
proposedSize: The proposed window size.

Returns the window size to actually use when displaying content size.

Available in Mac OS X v10.7 and later.

35.70.30 willUseFullScreenPresentationOptions(win as NSWindowMBS, proposedOptions as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns the presentation options the window will use when transitioning to fullscreen.
Notes: win: The window to enter to full screen mode.
proposedOptions: The proposed options. See NSApplicationPresentationOptions for the possible values.

Return the options the window should use when transitioning to fullscreen. These may be the same as the proposedOptions or may be modified.

Available in Mac OS X v10.7 and later.

35.70.31 windowDidBecomeKey(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Informs the delegate that the window has become the key window.
Notes: notification: A notification named NSWindowDidBecomeKeyNotification.

You can retrieve the window object in question by sending object to notification.

Available in Mac OS X v10.0 and later.

35.70.32 windowDidBecomeMain(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Informs the delegate that the window has become main.
Notes: notification: A notification named NSWindowDidBecomeMainNotification.

You can retrieve the window object in question by sending object to notification.

Available in Mac OS X v10.0 and later.

35.70.33 windowDidChangeScreen(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window has changed screens.
Notes: notification: A notification named NSWindowDidChangeScreenNotification.

You can retrieve the NSWindow object in question by sending object to notification.

Available in Mac OS X v10.0 and later.

35.70.34 windowDidChangeScreenProfile(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window has changed screen display profiles.
Notes: notification: A notification named NSWindowDidChangeScreenProfileNotification.

You can retrieve the NSWindow object in question by sending object to notification.

Available in Mac OS X v10.4 and later.

35.70.35 windowDidDeminiaturize(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window has been deminimized.
Notes: notification: A notification named NSWindowDidDeminiaturizeNotification

You can retrieve the NSWindow object in question by sending object to notification.

Available in Mac OS X v10.0 and later.

35.70.36 windowDidEndLiveResize(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Informs the delegate that a live resize operation on the window has ended.
Notes: notification: A notification named NSWindowDidEndLiveResizeNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.6 and later.

35.70.37 windowDidEndSheet(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window has closed a sheet.
Notes: notification: A notification named NSWindowDidEndSheetNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.1 and later.

35.70.38 windowDidEnterFullScreen(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The window just entered fullscreen mode.
Notes: notification: A notification named NSWindowDidEnterFullScreenNotification.
Available in Mac OS X v10.7 and later.

35.70.39 windowDidEnterVersionBrowser(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate the window just entered version browsing.
Notes: notification: An NSWindowDidEnterVersionBrowserNotification notification.

Available in Mac OS X v10.7 and later.

35.70.40 windowDidExitFullScreen(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The window is about to enter fullscreen mode.
Notes: notification: A notification named NSWindowDidExitFullScreenNotification.
Available in Mac OS X v10.7 and later.

35.70.41 windowDidExitVersionBrowser(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate the window is about to leave version browsing.
Notes: notification: An NSWindowDidExitVersionBrowserNotification notification.
Available in Mac OS X v10.7 and later.

35.70.42 windowDidExpose(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window has been exposed.
Notes: notification: A notification named NSWindowDidExposeNotification.
You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

35.70.43 windowDidFailToEnterFullScreen(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Invoked if the window failed to enter fullscreen.
Notes: win: The window that failed to enter to full screen mode.

In some cases, the transition to enter fullscreen will fail, due to being in the midst of handling some other animation or user gesture. This method indicates that there was an error, and you should clean up any work you may have done to prepare to enter fullscreen.

This message is sent whether or not the delegate indicated a custom animation by returning non-nil from customWindowsToEnterFullScreenForWindow.

Available in Mac OS X v10.7 and later.

35.70.44 windowDidFailToExitFullScreen(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Invoked if the window failed to exit fullscreen.
Notes: win: The window that failed to exit to fullscreen.

In some cases, the transition to exit fullscreen will fail, due to being in the midst of handling some other animation or user gesture. This method indicates that there was an error, and you should clean up any work you may have done to prepare to enter fullscreen.

This message is sent whether or not the delegate indicated a custom animation by returning non-nil from customWindowsToExitFullScreenForWindow.

Available in Mac OS X v10.7 and later.

35.70.45 windowDidMiniaturize(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window has been minimized.
Notes: notification: A notification named NSWindowDidMiniaturizeNotification.

You can retrieve the NSWindow object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

35.70.46 windowDidMove(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window has moved.
Notes: notification: A notification named NSWindowDidMoveNotification.

You can retrieve the NSWindow object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

35.70.47 windowDidResignKey(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Informs the delegate that the window has resigned key window status.
Notes: notification: A notification named NSWindowDidResignKeyNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

35.70.48 windowDidResignMain(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Informs the delegate that the window has resigned main window status.
Notes: notification: A notification named NSWindowDidResignMainNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

35.70.49 windowDidResize(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Informs the delegate that the window has been resized.
Notes: notification: A notification named NSWindowDidResizeNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

35.70.50 windowDidUpdate(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window received an update message.
Notes: notification: A notification named NSWindowDidUpdateNotification

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

35.70.51 windowShouldClose as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the user has attempted to close a window or the window has received a performClose message.
Notes: Return true to allow sender to be closed; otherwise, false.

This method may not always be called during window closing. Specifically, this method is not called when a user quits an application.

Available in Mac OS X v10.0 and later.

35.70.52 windowShouldZoom(win as NSWindowMBS, newFrame as NSRectMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Asks the delegate whether the specified window should zoom to the specified frame.
Notes: win: The window being zoomed.
newFrame: The rectangle to which the specified window is being zoomed.

Return true to allow window's frame to become newFrame; otherwise, false.

Available in Mac OS X v10.0 and later.

35.70.53 windowWillBeginSheet(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate that the window is about to open a sheet.
Notes: notification: A notification named NSWindowWillBeginSheetNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.1 and later.

35.70.54 windowWillClose(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window is about to close.
Notes: notification: A notification named NSWindowWillCloseNotification.

You can retrieve the NSWindow object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

35.70.55 windowWillEnterFullScreen(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The window is about to enter fullscreen mode.
Notes: notification: A notification named NSWindowWillEnterFullScreenNotification.

Available in Mac OS X v10.7 and later.

35.70.56 windowWillEnterVersionBrowser(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate the window is about to enter version browsing.
Notes: notification: An NSWindowWillEnterVersionBrowserNotification notification.
Available in Mac OS X v10.7 and later.

35.70.57 windowWillExitFullScreen(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The window is about to exit fullscreen mode.
Notes: notification: A notification named NSWindowWillExitFullScreenNotification.
Available in Mac OS X v10.7 and later.

35.70.58 windowWillExitVersionBrowser(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate the window just left version browsing.
Notes: notification: An NSWindowWillExitVersionBrowserNotification notification.
Available in Mac OS X v10.7 and later.

35.70.59 windowWillMiniaturize(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window is about to be minimized.
Notes: notification: A notification named NSWindowWillMiniaturizeNotification.
You can retrieve the NSWindow object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

35.70.60 windowWillMove(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window is about to move.
Notes: notification: A notification named NSWindowWillMoveNotification.
You can retrieve the NSWindow object in question by sending object to notification.
Available in Mac OS X v10.0 and later.

35.70.61 windowWillResize(win as NSWindowMBS, newFrameSize as NSSizeMBS, newSize as NSSizeMBS) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window is being resized (whether by the user or through one of the setFrame... methods other than setFrame:display:).
Notes: The plugin first passes the event to Xojo runtime. In the newSize parameter you get the result from the runtime. Now you can decide. If you return nil, the newSize value is used.

win: The window being resized.
frameSize: The size to which the specified window is being resized.
newSize: The size Xojo wants to use.

Return a custom size to which the specified window will be resized.

The frameSize contains the size (in screen coordinates) sender will be resized to. To resize to a different size, simply return the desired size from this method; to avoid resizing, return the current size. sender's minimum and maximum size constraints have already been applied when this method is invoked.

While the user is resizing a window, the delegate is sent a series of windowWillResize messages as the window's outline is dragged. The window's outline is displayed at the constrained size as set by this method.

Available in Mac OS X v10.0 and later.

35.70.62 windowWillReturnUndoManager(win as NSWindowMBS) as NSUndoManagerMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that the window's undo manager has been requested. Returns the appropriate undo manager for the window.
Notes: win: The window whose undo manager is being requested.

Return the appropriate undo manager for the specified window.

If this method is not implemented by the delegate, the window creates an NSUndoManager for window.

Available in Mac OS X v10.0 and later.

35.70.63 windowWillStartLiveResize(notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Informs the delegate that the window is about to be live resized.
Notes: notification: A notification named NSWindowWillStartLiveResizeNotification.

You can retrieve the window object in question by sending object to notification.
Available in Mac OS X v10.6 and later.

35.70.64 windowWillUseStandardFrame(win as NSWindowMBS, newFrame as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Invoked by NSWindow's zoom: method while determining the frame a window may be zoomed to.
Notes: win: The window whose frame size is being determined.
newFrame: The size of the current screen, which is the screen containing the largest part of the window's current frame, possibly reduced on the top, bottom, left, or right, depending on the current interface style. The frame is reduced on the top to leave room for the menu bar.

Return the specified window's standard frame.

The standard frame for a window should supply the size and location that are ”best” for the type of information shown in the window, taking into account the available display or displays. For example, the best width for a window that displays a word-processing document is the width of a page or the width of the display, whichever is smaller. The best height can be determined similarly. On return from this method, the zoom: method modifies the returned standard frame, if necessary, to fit on the current screen.

Available in Mac OS X v10.0 and later.

35.71 class NSWindowMBS

35.71.1 class NSWindowMBS

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: The Cocoa class for a window.
Example:

```
// add gray layer over Xojo window. Or hide it on second call, show on third call, etc...

If view = Nil Then
// view is property in window/module

Var win As NSWindowMBS = Self.NSWindowMBS

view = New NSViewMBS(0, 0, Width, Height)

win.contentView.AddSubView(view)

view.wantsLayer = True
view.autoresizesSubviews = True
view.autoresizingMask = view.NSViewWidthSizable + view.NSViewHeightSizable

Var layer As CALayerMBS = view.layer
layer.backgroundColor = CGColorMBS.CreateDeviceGray(0.3, 0.5)

Else

// show or hide
view.isHidden = Not view.isHidden

End If
```

Notes: Subclass of the NSResponderMBS class.

35.71.2 Methods

35.71.3 addChildWindow(win as DesktopWindow, order as integer)

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Adds a given window as a child window of the window.
Notes: win: The child window to order.
order: Either NSWindowAbove: childWindow is ordered immediately in front of the window, or NSWindowBelow: childWindow is ordered immediately behind the window.

After the childWindow is added as a child of the window, it is maintained in relative position indicated by order mode for subsequent ordering operations involving either window. While this attachment is active, moving childWindow will not cause the window to move (as in sliding a drawer in or out), but moving the window will cause childWindow to move.

Note that you should not create cycles between parent and child windows. For example, you should not add window B as child of window A, then add window A as a child of window B.

- 35.71.4 addChildWindow(win as NSWindowMBS, order as Integer) 6744
- 35.71.5 addChildWindow(win as window, order as Integer) 6745

35.71.4 addChildWindow(win as NSWindowMBS, order as Integer)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Adds a given window as a child window of the window.
Notes: win: The child window to order.
order: Either NSWindowAbove: childWindow is ordered immediately in front of the window, or NSWindowBelow: childWindow is ordered immediately behind the window.

After the childWindow is added as a child of the window, it is maintained in relative position indicated by order mode for subsequent ordering operations involving either window. While this attachment is active,

moving childWindow will not cause the window to move (as in sliding a drawer in or out), but moving the window will cause childWindow to move.

Note that you should not create cycles between parent and child windows. For example, you should not add window B as child of window A, then add window A as a child of window B.
See also:

- 35.71.3 addChildWindow(win as DesktopWindow, order as integer) 6744
- 35.71.5 addChildWindow(win as window, order as Integer) 6745

35.71.5 addChildWindow(win as window, order as Integer)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Adds a given window as a child window of the window.
Notes: win: The child window to order.
order: Either NSWindowAbove: childWindow is ordered immediately in front of the window, or NSWindowBelow: childWindow is ordered immediately behind the window.

After the childWindow is added as a child of the window, it is maintained in relative position indicated by order mode for subsequent ordering operations involving either window. While this attachment is active, moving childWindow will not cause the window to move (as in sliding a drawer in or out), but moving the window will cause childWindow to move.

Note that you should not create cycles between parent and child windows. For example, you should not add window B as child of window A, then add window A as a child of window B.
See also:

- 35.71.3 addChildWindow(win as DesktopWindow, order as integer) 6744
- 35.71.4 addChildWindow(win as NSWindowMBS, order as Integer) 6744

35.71.6 addTabbedWindow(win as NSWindowMBS, ordered as Integer)

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop & iOS.

Function: Allows creating a group of tabbed windows, or adding a new window to an existing tabbed window group.
Example:

```
// Window2 is a window of the example project.
Var n as NSWindowMBS = Window1.NSWindowMBS

n.addTabbedWindow(Window2, n.NSWindowAbove)
```

Notes: The 'window' will be added to the receiver's tabbed window group, or create a group if needed. The tabbingIdentifier for the entire group should be the same for all the windows, otherwise an exception will be thrown. Use the ordered parameter with "NSWindowAbove" and "NSWindowBelow" to place the new window before or after the receiver's tab. Passing "NSWindowOut" will thrown an exception. Currently this method is not animatable, but that may change in the future.
Raises an exception when used on OS X 10.11 and older.

35.71.7 animator as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the proxy object for this window which animates.
Example:

```
Var v as NSWindowMBS // your NSWindowMBS object

v.alphaValue = 0.5 // switch alpha directly
v.animator.alphaValue = 0.5 // switch alpha animated
```

35.71.8 areCursorRectsEnabled as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the window's cursor rectangles are enabled.
Notes: Available in Mac OS X v10.0 and later.

35.71.9 attachedSheet as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the sheet attached to the window.
Notes: The sheet attached to the window; nil when the window doesn't have a sheet attached.

Available in Mac OS X v10.1 and later.

35.71.10 autorecalculatesContentBorderThicknessForEdge(edge as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window calculates the thickness of a given border automatically.
Notes: edge: Border whose thickness autorecalculation status to set:

NSMaxYEdge: Top border.
NSMinYEdge: Bottom border.

Returns true when the window auto-recalculates the given border's thickness; otherwise, false.

Requires Mac OS X 10.5.

35.71.11 becomeKeyWindow

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Invoked automatically to inform the window that it has become the key window; never invoke this method directly.
Notes: This method reestablishes the window's first responder, sends the becomeKeyWindow message to that object if it responds, and posts an NSWindowDidBecomeKeyNotification to the default notification center.

35.71.12 becomeMainWindow

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Invoked automatically to inform the window that it has become the main window; never invoke this method directly.

35.71.13 cacheImageInRect(r as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Stores the window's raster image from a given rectangle expressed in the window's base coordinate system.
Notes: This method allows the window to perform temporary drawing, such as a band around the selection as the user drags the mouse, and to quickly restore the previous image by invoking restoreCachedImage and flushWindowIfNeeded. The next time the window displays, it discards its cached image rectangles. You can also explicitly use discardCachedImage to free the memory occupied by cached image rectangles. aRect is made integral before caching the image to avoid antialiasing artifacts.

Only the last cached rectangle is remembered and can be restored.

35.71.14 Center

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the window's location to the center of the screen.
Notes: The window is placed exactly in the center horizontally and somewhat above center vertically. Such a placement carries a certain visual immediacy and importance. This method doesn't put the receiver on-screen, however; use makeKeyAndOrderFront (show) to do that.

You typically use this method to place a window—most likely an alert dialog—where the user can't miss it. This method is invoked automatically when a panel is placed on the screen by the runModalForWindow method of the NSApplication class.

35.71.15 childWindows as NSWindowMBS()

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns an array of the window's attached child windows.

35.71.16 ClearFocus

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: Clears the focus.
Notes: Moves the focus back to the window.

35.71.17 Close

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: Closes the window.

35.71.18 Constructor(w as DesktopWindow)

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Creates a NSWindow for the given Xojo window.
Example:

```
Var w as new NSWindowMBS(Window1)
```

MessageBox w.Title

See also:

- 35.71.19 Constructor(w as window) 6749
- 35.71.20 Constructor(x as Double, y as Double, w as Double, h as Double, styleMask as Integer, BackingStoreType as Integer = 0, deferCreation as boolean = false, canBecomeKeyWindow as boolean = false) 6749

35.71.19 Constructor(w as window)

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop only.

Function: Creates a NSWindow for the given Xojo window.
Example:

Var w as new NSWindowMBS(Window1)

MessageBox w.Title

Notes: In plugin version 9.4 and newer this works only with Cocoa windows.
In plugin version 9.7 and newer you can use it also for Carbon windows.
See also:

- 35.71.18 Constructor(w as DesktopWindow) 6748
- 35.71.20 Constructor(x as Double, y as Double, w as Double, h as Double, styleMask as Integer, BackingStoreType as Integer = 0, deferCreation as boolean = false, canBecomeKeyWindow as boolean = false) 6749

35.71.20 Constructor(x as Double, y as Double, w as Double, h as Double, styleMask as Integer, BackingStoreType as Integer = 0, deferCreation as boolean = false, canBecomeKeyWindow as boolean = false)

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: The constructor to create a new Cocoa Windows.
Notes: x,y,w,h:
Location and size of the window's content area in screen coordinates. Note that the window server limits window position coordinates to ¬±16,000 and sizes to 10,000.

styleMask:
The window's style. Either it can be NSBorderlessWindowMask, or it can contain any of the options described in the constants, combined using the bitwiseOR function. Borderless windows display none of the

usual peripheral elements and are generally useful only for display or caching purposes; you should normally not need to create them. Also, note that a window's style mask should include NSTitledWindowMask if it includes any of the others.

bufferingType:
Specifies how the drawing done in the window is buffered by the window device, and possible values are described in "Constants."

deferCreation:
Specifies whether the window server creates a window device for the window immediately. When true, the window server defers creating the window device until the window is moved onscreen. All display messages sent to the window or its views are postponed until the window is created, just before it's moved onscreen.

Initialized NSWindow object.

This method is the designated initializer for the NSWindow class.

Deferring the creation of the window improves launch time and minimizes the virtual memory load on the window server.

The new window creates a view to be its default content view. You can replace it with your own object by using the ContentView property.

Parameter canBecomeKeyWindow (in 11.3 plugin) controls whether we use a special NSWindow subclass which returns true for the canBecomeKeyWindow function. This way you can create windows which can take key focus.
See also:

- 35.71.18 Constructor(w as DesktopWindow) 6748
- 35.71.19 Constructor(w as window) 6749

35.71.21 contentBorderThicknessForEdge(edge as Integer) as Double

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates the thickness of a given border of the window.
Notes: edge: The border whose thickness to get:

NSMaxYEdge: Top border.
NSMinYEdge: Bottom border.

Requires Mac OS X 10.5.

35.71.22 contentRectForFrameRect(windowFrame as NSRectMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the window's content rectangle with a given frame rectangle.
Example:

```
Var w as NSWindowMBS = Window1.NSWindowMBS
Var fr as NSRectMBS = w.frame
Var cr as NSRectMBS = w.contentRectForFrameRect(fr)

MessageBox "Title height: "+str(fr.Height-cr.Height)
```

Notes: windowFrame: The frame rectangle for the window expressed in screen coordinates.

Returns the window's content rectangle, expressed in screen coordinates, with windowFrame.

The window uses its current style mask in computing the content rectangle. See Window Style Mask constants for a list of style mask values. The main advantage of this instance-method counterpart to contentRectForFrameRect (With styleMask) is that it allows you to take toolbars into account when converting between content and frame rectangles. (The toolbar is not included in the content rectangle.)
See also:

- 35.71.23 contentRectForFrameRect(windowFrame as NSRectMBS, styleMask as UInt32) as NSRectMBS 6751

35.71.23 contentRectForFrameRect(windowFrame as NSRectMBS, styleMask as UInt32) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the content rectangle used by a window with a given frame rectangle and window style.
Notes: windowFrame: The frame rectangle for the window expressed in screen coordinates.
windowStyle: The window style for the window. See constants for a list of style mask values.

Returns the content rectangle, expressed in screen coordinates, used by the window with windowFrame and windowStyle.
When a NSWindowMBS instance is available, you should use contentRectForFrameRect instead of this method.
See also:

- 35.71.22 contentRectForFrameRect(windowFrame as NSRectMBS) as NSRectMBS 6751

35.71.24 convertBaseToScreen(p as NSPointMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a given point from the window's base coordinate system to the screen coordinate system.

35.71.25 convertScreenToBase(p as NSPointMBS) as NSPointMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Converts a given point from the screen coordinate system to the window's base coordinate system.

35.71.26 dataWithEPSInsideRect(r as NSRectMBS) as Memoryblock

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns EPS data that draws the region of the window within a given rectangle.
Notes: This data can be placed on a pasteboard, written to a file, or used to create an NSImage object.

35.71.27 dataWithPDFInsideRect(r as NSRectMBS) as Memoryblock

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns PDF data that draws the region of the window within a given rectangle.
Notes: This data can be placed on a pasteboard, written to a file, or used to create an NSImage object.

35.71.28 deminiaturize

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: This action method deminimizes the receiver.
Notes: Invoke this method to programmatically deminimize a minimized window in the Dock.

35.71.29 disableCursorRects

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Disables all cursor rectangle management within the window.
Notes: Use this method when you need to do some special cursor manipulation and you don't want the

Application Kit interfering.

35.71.30 disableFlushWindow

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Disables the flushWindow method for the window.
Notes: If the window is buffered, disabling flushWindow prevents drawing from being automatically flushed by the NSView display... methods from the window's backing store to the screen. This method permits several views to be drawn before the results are shown to the user.

Flushing should be disabled only temporarily, while the window's display is being updated. Each disableFlushWindow message must be paired with a subsequent enableFlushWindow message. Invocations of these methods can be nested; flushing isn't reenabled until the last (unnested) enableFlushWindow message is sent.

35.71.31 disableScreenUpdatesUntilFlush

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Disables the window's screen updates until the window is flushed.
Notes: This method can be invoked to synchronize hardware surface flushes with the window's flushes. The window immediately disables screen updates using the NSDisableScreenUpdates function and reenables screen updates when the window flushes. Sending this message multiple times during a window update cycle has no effect.

Available in Mac OS X v10.4 and later.

35.71.32 disableSnapshotRestoration

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop & iOS.

Function: Disable snapshot restoration.
Notes: While snapshot restoration is disabled, the window will not be snapshotted for restorable state.
Available in OS X v10.7 and later.

35.71.33 discardCachedImage

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Discards all of the window's cached image rectangles.

Notes: An NSWindow object automatically discards its cached image rectangles when it displays.

35.71.34 discardCursorRects

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Invalidates all cursor rectangles in the window.
Notes: This method is invoked by resetCursorRects to clear out existing cursor rectangles before resetting them. You shouldn't invoke it in the code you write, but you might want to override it to change its behavior.

35.71.35 display

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Passes a display message down the window's view hierarchy, thus redrawing all views within the window, including the frame view that draws the border, title bar, and other peripheral elements.
Notes: You rarely need to invoke this method. NSWindow objects normally record which of their views need display and display them automatically on each pass through the event loop.

35.71.36 displayIfNeeded

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Passes a displayIfNeeded message down the window's view hierarchy, thus redrawing all views that need to be displayed, including the frame view that draws the border, title bar, and other peripheral elements.
Notes: This method is useful when you want to modify some number of views and then display only the ones that were modified.

You rarely need to invoke this method. NSWindow objects normally record which of their views need display and display them automatically on each pass through the event loop.

35.71.37 dockTile as Variant

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop & iOS.

Function: Provides the application's Dock tile.
Notes: Available in Mac OS X v10.5 and later.

Returns NSDockTileMBS object for the dock tile.

35.71.38 dragImage(image as NSImageMBS, viewLocation as NSPointMBS, offset as NSSizeMBS, NSEvent as NSEventMBS, pboard as NSPasteboardMBS, source as NSViewMBS, slideFlag as boolean)

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Begins a dragging session.
Notes: image: The object to be dragged.
imageLocation: Location of the image's bottom-left corner in the window's coordinate system. It determines the placement of the dragged image under the pointer.
offset: The pointer's location relative to the mouse-down location. Not used in OS X v10.4 and later.
NSEvent: The left-mouse down event that triggered the dragging operation.
pasteboard: The pasteboard that holds the data to be transferred to the destination.
source: The object serving as the controller of the dragging operation. It must conform to the NSDraggingSource protocol.
slideBack: Specifies whether the drag image should slide back to imageLocation if it's rejected by the drag destination. Pass true to specify slide back behavior or false to specify that it should not.

This method should be invoked only from within a view's implementation of the mouseDown or mouseDragged methods (which overrides the version defined in NSResponder class). Essentially the same as the NSView method of the same name, except that imageLocation is given in the NSWindow object's base coordinate system.

35.71.39 enableCursorRects

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Reenables cursor rectangle management within the window after a disableCursorRects message.

35.71.40 enableFlushWindow

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Reenables the flushWindow method for the window after it was disabled through a previous disableFlushWindow message.

35.71.41 enableSnapshotRestoration

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop & iOS.

Function: Enable snapshot restoration.
Notes: While snapshot restoration is enabled, the window will be snapshotted for restorable state.
Available in OS X v10.7 and later.

35.71.42 endEditingFor(anObject as object = nil)

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop & iOS.

Function: Forces the field editor to give up its first responder status and prepares it for its next assignment.
Notes: anObject: The object that is using the window's field editor.

If the field editor is the first responder, it's made to resign that status even if its resignFirstResponder method returns false. This registration forces the field editor to send a textDidEndEditing message to its delegate. The field editor is then removed from the view hierarchy, its delegate is set to nil, and it's emptied of any text it may contain.

This method is typically invoked by the object using the field editor when it's finished. Other objects normally change the first responder by simply using makeFirstResponder, which allows a field editor or other object to retain its first responder status if, for example, the user has entered an invalid value. The endEditingFor: method should be used only as a last resort if the field editor refuses to resign first responder status. Even in this case, you should always allow the field editor a chance to validate its text and take whatever other action it needs first. You can do this by first trying to make the NSWindow object the first responder.

35.71.43 fieldEditor(createFlag as boolean = True, forObject as object = nil) as Variant

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the window's field editor, creating it if requested.
Notes: Returns NSTextMBS object. Returned as Variant to reduce plugin dependencies.

createWhenNeeded: If true, creates a field editor if one doesn't exist; if false, does not create a field editor. A freshly created NSWindow object doesn't have a field editor. After a field editor has been created for a window, the createWhenNeeded argument is ignored. By passing false for createWhenNeeded and testing the return value, however, you can predicate an action on the existence of the field editor.
forObject: A text-displaying object for which the delegate (in windowWillReturnFieldEditor) assigns a custom field editor. Pass nil to get the default field editor, which can be the NSWindow field editor or a custom field editor returned by the delegate.

Returns the field editor for the designated object (anObject) or, if anObject is nil, the default field editor. Returns nil if createFlag is false and if the field editor doesn't exist.

The field editor is a single NSTextView object that is shared among all the controls in a window for light text-editing needs. It is automatically instantiated when needed, and it can be used however your application sees fit. Typically, the field editor is used by simple text-bearing objects—for example, an NSTextField object uses its window's field editor to display and manipulate text. The field editor can be shared by any number of objects, and so its state may be constantly changing. Therefore, it shouldn't be used to display text that demands sophisticated layout (for this you should create a dedicated NSTextView object).

The field editor may be in use by some view object, so be sure to properly dissociate it from that object before actually using it yourself (the appropriate way to do this is illustrated in the description of endEditingFor:). Once you retrieve the field editor, you can insert it in the view hierarchy, set a delegate to interpret text events, and have it perform whatever editing is needed. Then, when it sends a textDidEndEditing message to the delegate, you can get its text to display or store and remove the field editor using endEditingFor.

The window's delegate can substitute a custom field editor in place of the window's field editor by implementing windowWillReturnFieldEditor. The custom field editor can become the default editor (common to all text-displaying objects) or specific to a particular text-displaying object (anObject). The window sends this message to its delegate with itself and anObject as the arguments; if the delegate returns a non-nil value, the window returns that object instead of its field editor in fieldEditor. However, note the following:

If the window's delegate is identical to anObject, windowWillReturnFieldEditor isn't sent to the delegate. The object returned by the delegate method, though it may become first responder, does not become the window's default field editor. Other objects continue to use the window's default field editor.

35.71.44 firstResponder as NSResponderMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The window's first responder.
Notes: The first responder is usually the first object in a responder chain to receive an event or action message. In most cases, the first responder is a view object in that the user selects or activates with the mouse or keyboard.

You can use the firstResponder method in custom subclasses of responder classes (NSWindow, NSApplication, NSView, and subclasses) to determine if an instance of the subclass is currently the first responder. You can also use it to help locate a text field that currently has first-responder status. For more on this subject, see Event Handling Basics (on developer.apple.com).

35.71.45 flushWindow

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Flushes the window's offscreen buffer to the screen if the window is buffered and flushing is enabled.
Notes: Does nothing for other display devices, such as a printer. This method is automatically invoked by the NSWindow display and displayIfNeeded methods and the corresponding NSView display and displayIfNeeded methods.

35.71.46 flushWindowIfNeeded

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Flushes the window's offscreen buffer to the screen if flushing is enabled and if the last flushWindow message had no effect because flushing was disabled.
Notes: To avoid unnecessary flushing, use this method rather than flushWindow to flush an NSWindow object after flushing has been reenabled.

35.71.47 frameRectForContentRect(windowContent as NSRectMBS) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the window's frame rectangle with a given content rectangle.
Notes: windowContent: The content rectangle for the window expressed in screen coordinates.

Returns the window's frame rectangle, expressed in screen coordinates, with windowContent.

The window uses its current style mask in computing the frame rectangle. See "Window Style Masks" for a list of style mask values. The major advantage of this instance-method counterpart to frameRectForContentRect (with styleMask) is that it allows you to take toolbars into account when converting between content and frame rectangles. (The toolbar is included in the frame rectangle but not the content rectangle.)
See also:

- 35.71.48 frameRectForContentRect(windowContentRect as NSRectMBS, styleMask as UInt32) as NSRectMBS 6758

35.71.48 frameRectForContentRect(windowContentRect as NSRectMBS, styleMask as UInt32) as NSRectMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the frame rectangle used by a window with a given content rectangle and window style.
Notes: windowContentRect: The content rectangle for a window expressed in screen coordinates.
windowStyle: The window style for the window. See Window Style Mask constants for a list of style mask values.

Returns the frame rectangle, expressed in screen coordinates, used by the window with windowContentRect and windowStyle.
When a NSWindowMBS instance is available, you should use frameRectForContentRect instead of this method.
See also:

- 35.71.47 frameRectForContentRect(windowContent as NSRectMBS) as NSRectMBS 6758

35.71.49 GetFrame(byref left as Double, byref top as Double, byref width as Double, byref height as Double)

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: Asks for the current window dimensions.
Notes: The point 0/0 is on the left bottom position.

35.71.50 gState as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the window's graphics state object.
Notes: This graphics state is used by default for all NSView objects in the window's view hierarchy, but individual views can be made to use their own with the NSView method allocateGState.

35.71.51 Hide

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: Hides the window.

35.71.52 inLiveResize as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window is being resized by the user.
Notes: Available in Mac OS X v10.6 and later.

35.71.53 invalidateCursorRectsForView(View as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Marks as invalid the cursor rectangles of a given NSView object in the window's view hierarchy, so they'll be set up again when the window becomes key (or immediately if the window is key).

35.71.54 invalidateRestorableState

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop & iOS.

Function: Method that you may call to indicate that the restorable state is invalid.
Notes: At some point in the future, encodeRestorableStateWithCoder: will be called to encode the restorable state. You should not override this method.

35.71.55 invalidateShadow

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Invalidates the window shadow so that it is recomputed based on the current window shape.

35.71.56 keyDown(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Handles a given keyboard event that may need to be interpreted as changing the key view or triggering a keyboard equivalent.
Notes: event: The keyboard event to process.

35.71.57 makeFirstResponder(r as NSResponderMBS) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Attempts to make a given responder the first responder for the window.
Example:

```
Var MySearchField as NSViewMBS // your control to move focus to
Var w as new NSWindowMBS(Window1)
call w.makeFirstResponder(MySearchField)
```

Notes: responder: The responder to set as the window's first responder. nil makes the window its first

responder.

Returns true when the operation is successful; otherwise, false.

If responder isn't already the first responder, this method first sends a resignFirstResponder message to the object that is the first responder. If that object refuses to resign, it remains the first responder, and this method immediately returns false. If the current first responder resigns, this method sends a becomeFirstResponder message to responder. If responder does not accept first responder status, the NSWindow object becomes first responder; in this case, the method returns true even if responder refuses first responder status.

If responder is nil, this method still sends resignFirstResponder to the current first responder. If the current first responder refuses to resign, it remains the first responder and this method immediately returns false. If the current first responder returns true from resignFirstResponder, the window is made its own first responder and this method returns true.

The Application Kit framework uses this method to alter the first responder in response to mouse-down events; you can also use it to explicitly set the first responder from within your program. The responder object is typically an NSView object in the window's view hierarchy. If this method is called explicitly, first send acceptsFirstResponder to responder, and do not call makeFirstResponder if acceptsFirstResponder returns false.

Use setInitialFirstResponder to the set the first responder to be used when the window is brought onscreen for the first time.

35.71.58 makeKeyAndOrderFront

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: Moves the window to the front of the screen list, within its level, and makes it the key window; that is, it shows the window.
Notes: More or less the same as Xojo's show command on the window class.

35.71.59 makeKeyWindow

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Makes the window the key window.

35.71.60 makeMainWindow

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Makes the window the main window.

35.71.61 mergeAllWindows

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop & iOS.

Function: Merges all windows into one window.
Example:

```
Var n as NSWindowMBS = Window1.NSWindowMBS
n.mergeAllWindows
```

Notes: Raises an exception when used on OS X 10.11 and older.

35.71.62 minFrameWidthWithTitle(WindowTitle as string, styleMask as UInt32) as Double

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the minimum width a window's frame rectangle must have for it to display a title, with a given window style.
Example:

```
// shows 84.77588
MessageBox str(NSWindowMBS.minFrameWidthWithTitle("Hello World",0))
```

Notes: windowTitle: The title for the window.
windowStyle: The window style for the window. See Window Style Mask constants for a list of style mask values.

The minimum width of the window's frame, using windowStyle, in order to display windowTitle.

35.71.63 miniaturize

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: This action method removes the receiver from the screen list and displays the minimized window in the Dock.

35.71.64 moveTabToNewWindow

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop & iOS.

Function: Moves current tab to a new window.
Example:

```
Var n as NSWindowMBS = Window1.NSWindowMBS
n.moveTabToNewWindow
```

Notes: Raises an exception when used on OS X 10.11 and older.

35.71.65 NSDockWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the standard window levels in Mac OS X.
Notes: The level for the doc. (Deprecated. There is no replacement.)

35.71.66 NSFloatingWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the standard window levels in Mac OS X.
Notes: Useful for floating palettes.

35.71.67 NSMainMenuWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the standard window levels in Mac OS X.
Notes: Reserved for the application's main menu.

35.71.68 NSModalPanelWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the standard window levels in Mac OS X.
Notes: The level for a modal panel.

35.71.69 NSNormalWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the standard window levels in Mac OS X.
Notes: The default level for NSWindow objects.

35.71.70 NSPopUpMenuWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the standard window levels in Mac OS X.
Notes: The level for a pop-up menu.

35.71.71 NSScreenSaverWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the standard window levels in Mac OS X.
Notes: The level for a screen saver.

35.71.72 NSStatusWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the standard window levels in Mac OS X.
Notes: The level for a status window.

35.71.73 NSSubmenuWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the standard window levels in Mac OS X.
Notes: Reserved for submenus. Synonymous with NSTornOffMenuWindowLevel, which is preferred.

35.71.74 NSTornOffMenuWindowLevel as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the standard window levels in Mac OS X.
Notes: The level for a torn-off menu. Synonymous with NSSubmenuWindowLevel.

35.71.75 NSWindowDidBecomeKeyNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object becomes the key window.

The notification object is the NSWindow object that has become key. This notification does not contain a userInfo dictionary.

35.71.76 NSWindowDidBecomeMainNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object becomes the main window.

The notification object is the NSWindow object that has become main. This notification does not contain a userInfo dictionary.

35.71.77 NSWindowDidChangeScreenNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever a portion of an NSWindow object's frame moves onto or off of a screen.

The notification object is the NSWindow object that has changed screens. This notification does not contain a userInfo dictionary.

This notification is not sent in Mac OS X versions earlier than 10.4.

35.71.78 NSWindowDidChangeScreenProfileNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever the display profile for the screen containing the window changes.

This notification is sent only if the window returns true from displaysWhenScreenProfileChanges. This notification may be sent when a majority of the window is moved to a different screen (whose profile is also different from the previous screen) or when the ColorSync profile for the current screen changes.

The notification object is the NSWindow object whose profile changed. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.4 and later.

35.71.79 NSWindowDidDeminiaturizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object is deminimized.

The notification object is the NSWindow object that has been deminimized. This notification does not contain a userInfo dictionary.

35.71.80 NSWindowDidEndLiveResizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted after the user resizes a window.

This notification is sent only once for a series of window resize operations.

The notification object is the NSWindow object that was resized. This notification does not contain a user-Info dictionary.

Available in Mac OS X v10.6 and later.

35.71.81 NSWindowDidEndSheetNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object closes an attached sheet.

The notification object is the NSWindow object that contained the sheet. This notification does not contain a userInfo dictionary.

35.71.82 NSWindowDidEnterFullScreenNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted when the window entered full screen mode.
The notification object is the NSWindow object entered full screen mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

35.71.83 NSWindowDidEnterVersionBrowserNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted when the window will exit full screen mode.
The notification object is the NSWindow object that will exit full screen mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

35.71.84 NSWindowDidExitFullScreenNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted when the window will exit full screen mode.
The notification object is the NSWindow object that will exit full screen mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

35.71.85 NSWindowDidExitVersionBrowserNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted when the window did exit version browser mode.
The notification object is the NSWindow object that did exit version browser mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

35.71.86 NSWindowDidExposeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever a portion of a nonretained NSWindow object is exposed, whether by being ordered in front of other windows or by other windows being removed from in front of it.

The notification object is the NSWindow object that has been exposed. The userInfo dictionary contains the following information:

Key	Value
NSExposedRect	The rectangle that has been exposed (NSRect).

35.71.87 NSWindowDidMiniaturizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object is minimized.

The notification object is the NSWindow object that has been minimized. This notification does not contain a userInfo dictionary.

35.71.88 NSWindowDidMoveNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object is moved.

The notification object is the NSWindow object that has moved. This notification does not contain a user-Info dictionary.

Note: This notification is sent when the window that moved didn't also change size. See NSWindowDidResizeNotification for more information.

35.71.89 NSWindowDidResignKeyNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object resigns its status as key window.

The notification object is the NSWindow object that has resigned its key window status. This notification does not contain a userInfo dictionary.

35.71.90 NSWindowDidResignMainNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object resigns its status as main window.

The notification object is the NSWindow object that has resigned its main window status. This notification does not contain a userInfo dictionary.

35.71.91 NSWindowDidResizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object's size changes.

The notification object is the NSWindow object whose size has changed. This notification does not contain a userInfo dictionary.

35.71.92 NSWindowDidUpdateNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object receives an update message.

The notification object is the NSWindow object that received the update message. This notification does not contain a userInfo dictionary.

35.71.93 NSWindowWillBeginSheetNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object is about to open a sheet.

The notification object is the NSWindow object that is about to open the sheet. This notification does not contain a userInfo dictionary.

35.71.94 NSWindowWillCloseNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object is about to close.

The notification object is the NSWindow object that is about to close. This notification does not contain a userInfo dictionary.

35.71.95 NSWindowWillEnterFullScreenNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted when the window will enter full screen mode.

The notification object is the NSWindow object will enter full screen mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

35.71.96 NSWindowWillEnterVersionBrowserNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted when the window will enter version browser mode.
The notification object is the NSWindow object that will enter version browser mode. This notification does not contain a userInfo dictionary.
Available in Mac OS X v10.7 and later.

35.71.97 NSWindowWillExitFullScreenNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted when the window will exit full screen mode.
The notification object is the NSWindow object that will exit full screen mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

35.71.98 NSWindowWillExitVersionBrowserNotification as string

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted when the window will exit version browser mode.
The notification object is the NSWindow object that will exit version browser mode. This notification does not contain a userInfo dictionary.

Available in Mac OS X v10.7 and later.

35.71.99 NSWindowWillMiniaturizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object is about to be minimized.

The notification object is the NSWindow object that is about to be minimized. This notification does not contain a userInfo dictionary.

35.71.100 NSWindowWillMoveNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted whenever an NSWindow object is about to move.

The notification object is the NSWindow object that is about to move. This notification does not contain a userInfo dictionary.

35.71.101 NSWindowWillStartLiveResizeNotification as string

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop & iOS.

Function: One of the notification strings you can use with the NSNotification* classes.
Notes: Posted before the user resizes a window.
This notification is sent only once for a series of window resize operations.
The notification object is the NSWindow object that is about to be live resized. This notification does not contain a userInfo dictionary.
Available in Mac OS X v10.6 and later.

35.71.102 orderBack

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Moves the window to the back of its level in the screen list, without changing either the key window or the main window.

35.71.103 orderFront

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Moves the window to the front of its level in the screen list, without changing either the key window or the main window.

35.71.104 orderFrontRegardless

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Moves the window to the front of its level, even if its application isn't active, without changing either the key window or the main window.
Notes: Normally an NSWindow object can't be moved in front of the key window unless it and the key window are in the same application. You should rarely need to invoke this method; it's designed to be used when applications are cooperating in such a way that an active application (with the key window) is using another application to display data.

Available in Mac OS X v10.0 and later.

35.71.105 orderOut

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: Removes the window from the screen list, which hides the window.
Notes: More or less the same as Xojo's hide command on the window class.

If the window is the key or main window, the NSWindow object immediately behind it is made key or main in its place. Calling the orderOut method causes the window to be removed from the screen, but does not cause it to be released. See the close method for information on when a window is released.

The default animation based on the window type will be used when the window is ordered out unless it has been modified by the setAnimationBehavior method.

35.71.106 PerformClose

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: This action method simulates the user clicking the close button by momentarily highlighting the button and then closing the window.
Notes: Same as if the user clicks the close button.

So if the button is disabled or closing is not permitted by the window, it will do nothing.

35.71.107 performMiniaturize

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: This action method simulates the user clicking the minimize button by momentarily highlighting the button, then minimizing the window.
Notes: If the receiver doesn't have a minimize button or can't be minimized for some reason, the system emits the alert sound.

35.71.108 performWindowDragWithEvent(event as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 20.3, Platform: macOS, Targets: Desktop & iOS.

Function: Starts a drag based on the specified mouse-down event.
Notes: event: The original mouse-down event received by the application or a view. If you don't have a NSEvent object, please pass the one from NSApplicationMBS.currentEvent here.

Your application (or a view) can call this method after receiving and examining a mouse-down event. Upon examination of the event, a view may allow that portion of the window to start a window drag and can hand off the work to the Window Server process by calling this method. Doing so allows the window to participate in space switching and other system features.
This method returns right away, and a mouse-up event may not get sent.

35.71.109 performZoom

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: This action method simulates the user clicking the zoom box by momentarily highlighting the button and then zooming the window.
Notes: If the receiver doesn't have a zoom box or can't be zoomed for some reason, the computer beeps.

35.71.110 print

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: This action method runs the Print panel, and if the user chooses an option other than canceling, prints the window (its frame view and all subviews).

35.71.111 registerForDraggedTypes(Types() as string)

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop & iOS.

Function: Registers a give set of pasteboard types as the pasteboard types the window will accept as the destination of an image-dragging session.
Notes: Types: An array of the pasteboard types the window will accept as the destination of an image-dragging session.

Registering an NSWindow object for dragged types automatically makes it a candidate destination object for a dragging session. NSWindow has a default implementation for many of the methods in the NSDraggingDestination informal protocol. The default implementation forwards each message to the delegate if the delegate responds to the selector of the message. The messages forwarded this way are draggingEntered:, draggingUpdated:, draggingExited:, prepareForDragOperation:, performDragOperation:, and concludeDragOperation:.

Xojo with Cocoa target implements the methods listed above. So this method is useful to change the allowed types for the case the framework has a bug.

35.71.112 removeChildWindow(win as NSWindowMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Detaches a given child window from the window.
Notes: win: The child window to detach.
See also:

- 35.71.113 removeChildWindow(win as window) 6775

35.71.113 removeChildWindow(win as window)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Detaches a given child window from the window.
Notes: win: The child window to detach.
See also:

- 35.71.112 removeChildWindow(win as NSWindowMBS) 6775

35.71.114 removeFrameUsingName(name as string)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop & iOS.

Function: Removes the frame data stored under a given name from the application's user defaults.

35.71.115 resetCursorRects

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Clears the window's cursor rectangles and the cursor rectangles of the NSView objects in its view hierarchy.
Notes: Invokes discardCursorRects to clear the window's cursor rectangles, then sends resetCursorRects to every NSView object in the window's view hierarchy.

This method is typically invoked by the NSApplication object when it detects that the key window's cursor rectangles are invalid. In program code, it's more efficient to invoke invalidateCursorRectsForView.

35.71.116 resignKeyWindow

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Invoked automatically when the window resigns key window status; never invoke this method directly.
Notes: This method sends resignKeyWindow to the window's first responder, sends windowDidResignKey to the window's delegate, and posts an NSWindowDidResignKeyNotification to the default notification center.

35.71.117 resignMainWindow

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Invoked automatically when the window resigns main window status; never invoke this method directly.
Notes: This method sends windowDidResignMain to the window's delegate and posts an NSWindowDidResignMainNotification to the default notification center.

35.71.118 resizeFlags as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the flags field of the event record for the mouse-down event that initiated the resizing session.
Notes: A mask indicating which of the modifier keys was held down when the mouse-down event occurred.

The flags are listed in NSEvent object's modifierFlags method description.

This method is valid only while the window is being resized

You can use this method to constrain the direction or amount of resizing. Because of its limited validity, this method should only be invoked from within an implementation of the delegate method windowWillResize.

35.71.119 restoreCachedImage

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Splices the window's cached image rectangles, if any, back into its raster image (and buffer if it has one), undoing the effect of any drawing performed within those areas since they were established using cacheImageInRect.
Notes: You must invoke flushWindow after this method to guarantee proper redisplay. An NSWindow object automatically discards its cached image rectangles when it displays.

35.71.120 runToolbarCustomizationPalette

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: The action method for the "Customize Toolbar..." menu item.

35.71.121 saveFrameUsingName(s as String)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop & iOS.

Function: Saves the window's frame rectangle in the user defaults system under a given name.
Notes: With the companion method setFrameUsingName, you can save and reset an NSWindow object's frame over various launches of an application. The default is owned by the application and stored under the name "NSWindow Frame frameName". See NSUserDefaults for more information.

35.71.122 selectKeyViewFollowingView(view as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Makes key the view that follows the given view.
Notes: Sends the nextValidKeyView message to referenceView and, if that message returns an NSView object, invokes makeFirstResponder with the returned object.

35.71.123 selectKeyViewPrecedingView(view as NSViewMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Makes key the view that follows the given view.
Notes: Sends the nextValidKeyView message to referenceView and, if that message returns an NSView object, invokes makeFirstResponder with the returned object.

35.71.124 selectNextKeyView

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: This action method searches for a candidate next key view and, if it finds one, invokes makeFirstResponder to establish it as the first responder.
Notes: The candidate is one of the following (searched for in this order):

- The current first responder's next valid key view, as returned by the nextValidKeyView method of NSView
- The object designated as the window's initial first responder (using setInitialFirstResponder) if it returns true to an acceptsFirstResponder message
- Otherwise, the initial first responder's next valid key view, which may end up being nil

35.71.125 selectNextTab

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop & iOS.

Function: Selects next tab.
Example:

```
Var n as NSWindowMBS = Window1.NSWindowMBS
n.selectNextTab
```

Notes: Raises an exception when used on OS X 10.11 and older.

35.71.126 selectPreviousKeyView

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: This action method searches for a candidate previous key view and, if it finds one, invokes makeFirstResponder to establish it as the first responder.
Notes: The candidate is one of the following (searched for in this order):

- The current first responder's previous valid key view, as returned by the previousValidKeyView method of NSView
- The object designated as the window's initial first responder (using setInitialFirstResponder) if it returns true to an acceptsFirstResponder message
- Otherwise, the initial first responder's previous valid key view, which may end up being nil

35.71.127 selectPreviousTab

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop & iOS.

Function: Selects previous tab.
Example:

```
Var n as NSWindowMBS = Window1.NSWindowMBS
n.selectPreviousTab
```

Notes: Raises an exception when used on OS X 10.11 and older.

35.71.128 sendEvent(e as NSEventMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: This action method dispatches mouse and keyboard events sent to the window by the NSApplication object.
Notes: Never invoke this method directly. A right mouse-down event in a window of an inactive application is not delivered to the corresponding NSWindow object. It is instead delivered to the NSApplication object through a sendEvent: message with a window number of 0.

35.71.129 setAutorecalculatesContentBorderThickness(flag as boolean, edge as Integer)

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies whether the window calculates the thickness of a given border automatically.
Notes: flag: If true, the window calculates the thickness of the edge automatically; if false, it does not.

edge: The border whose thickness auto-recalculation status to set:

NSMaxYEdge: Top border.
NSMinYEdge: Bottom border.

Special Considerations
Turning off a border's auto-recalculation status sets its border thickness to 0.0.

In a non-textured window calling setAutorecalculatesContentBorderThickness passing NSMaxYEdge will raise an exception. It is only valid to set the content border thickness of the top edge in a textured window.

Requires Mac OS X 10.5.

35.71.130 setBottomCornerRounded(flag as boolean)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the bottom corner to be round.
Notes: This is an undocumented function in the NSWindow class.

35.71.131 setContentBorderThickness(thickness as Double, edge as Integer)

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the thickness of a given border of the window.
Example:

```
Var w as NSWindowMBS = Window1.NSWindowMBS

w.setContentBorderThickness(30, w.NSMinYEdge) // bottom 30 pixel
w.setContentBorderThickness(20, w.NSMaxYEdge) // top 30 pixel. Window must be metal for this
```

Notes: thickness: The thickness for edge, in points.
edge: The border whose thickness to set:

NSMaxYEdge: Top border.
NSMinYEdge: Bottom border.

In a non-textured window calling setContentBorderThickness passing NSMaxYEdge will raise an exception. It is only valid to set the content border thickness of the top edge in a textured window.

The contentBorder does not include the titlebar or toolbar, so a textured window that just wants the gradient in the titlebar and toolbar should have a contentBorderThickness of 0 for NSMaxYEdge.

Requires Mac OS X 10.5.

35.71.132 setContentSize(size as NSSizeMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the size of the window's content view to a given size, which is expressed in the window's base coordinate system.
Notes: This size in turn alters the size of the NSWindow object itself. Note that the window server limits window sizes to 10,000; if necessary, be sure to limit aSize relative to the frame rectangle.

35.71.133 setFrame(frameRect as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the origin and size of the window's frame rectangle according to a given frame rectangle, thereby setting its position and size onscreen.
Notes: frameRect: The frame rectangle for the window, including the title bar.

Note that the window server limits window position coordinates to ¬±16,000 and sizes to 10,000.
See also:

- 35.71.134 setFrame(frameRect as NSRectMBS, display as boolean) 6781
- 35.71.135 setFrame(frameRect as NSRectMBS, display as boolean, animated as boolean) 6782
- 35.71.136 SetFrame(left as Double, top as Double, width as Double, height as Double) 6782

35.71.134 setFrame(frameRect as NSRectMBS, display as boolean)

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the origin and size of the window's frame rectangle according to a given frame rectangle, thereby setting its position and size onscreen.
Notes: The point 0/0 is on the bottom left position of the main screen.
display: Specifies whether the window redraws the views that need to be displayed. When true the window sends a displayIfNeeded message down its view hierarchy, thus redrawing all views.
See also:

- 35.71.133 setFrame(frameRect as NSRectMBS) 6781
- 35.71.135 setFrame(frameRect as NSRectMBS, display as boolean, animated as boolean) 6782
- 35.71.136 SetFrame(left as Double, top as Double, width as Double, height as Double) 6782

35.71.135 setFrame(frameRect as NSRectMBS, display as boolean, animated as boolean)

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the origin and size of the window's frame rectangle, with optional animation, according to a given frame rectangle, thereby setting its position and size onscreen.
Notes: The point 0/0 is on the bottom left position of the main screen.
If animated is true, the change is animated.
See also:

- 35.71.133 setFrame(frameRect as NSRectMBS) 6781
- 35.71.134 setFrame(frameRect as NSRectMBS, display as boolean) 6781
- 35.71.136 SetFrame(left as Double, top as Double, width as Double, height as Double) 6782

35.71.136 SetFrame(left as Double, top as Double, width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the origin and size of the window's frame rectangle according to a given frame rectangle, thereby setting its position and size onscreen.
Notes: The point 0/0 is on the bottom left position of the main screen.
See also:

- 35.71.133 setFrame(frameRect as NSRectMBS) 6781
- 35.71.134 setFrame(frameRect as NSRectMBS, display as boolean) 6781
- 35.71.135 setFrame(frameRect as NSRectMBS, display as boolean, animated as boolean) 6782

35.71.137 setFrameAutosaveName(name as String) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the name used to automatically save the window's frame rectangle in the defaults system to a given name.
Notes: Returns true when the frame name is set successfully; false when frameName is being used as an autosave name by another NSWindow object in the application (in which case the window's old name remains in effect).

If frameName isn't the empty string (""), the window's frame is saved as a user default (as described in saveFrameUsingName) each time the frame changes.

When the window has an autosave name, its frame data is written whenever the frame rectangle changes.

If there is a frame rectangle previously stored for frameName in the user defaults, the window's frame is set to this frame rectangle. That is, when you call this method with a previously used frameName, the window picks up the previously saved setting. For example, if you call setFrameAutosaveName for a window that is already onscreen, this method could cause the window to move to a different screen location. For this reason, it is generally better to call this method before the window is visible on screen.

Keep in mind that a window controller may change the window's position when it displays it if window cascading is turned on. To preclude the window controller from changing a window's position from the one saved in the defaults system, you must send setShouldCascadeWindows(false) to the window controller.

35.71.138 setFrameFromString(s as String)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the window's frame rectangle from a given string representation.
Notes: If the window is not resizable, this method will not resize the window. The frame is constrained according to the window's minimum and maximum size settings. This method can cause a windowWillResize event.

35.71.139 setFrameOrigin(point as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Positions the bottom-left corner of the window's frame rectangle at a given point in screen coordinates.
Notes: Note that the window server limits window position coordinates to ¬±16,000.

35.71.140 setFrameTopLeftPoint(point as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Positions the top-left corner of the window's frame rectangle at a given point in screen coordinates.
Notes: Note that the window server limits window position coordinates to ¬±16,000; if necessary, adjust aPoint relative to the window's lower-left corner to account for this limit.

35.71.141 setFrameUsingName(name as String, force as boolean = false) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop & iOS.

Function: Sets the window's frame rectangle by reading the rectangle data stored under a given name from the defaults system.
Notes: Returns true when frameName is read and the frame is set successfully; otherwise, false.

The frame is constrained according to the window's minimum and maximum size settings. This method causes a windowWillResize event.

35.71.142 setRestorationClass

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the class to use to acquire a matching window object during subsequent launches.
Notes: The plugin provides a class to restore windows. See NSWindowRestoreHandlerMBS class.

The restoration class of a window is responsible for recreating not just the window but any other objects needed to manage the window. Therefore, the restoration class must be able to create (or find existing instances of) all of these objects at launch time in your application.

If you mark your windows as restorable, you must associate a restoration class with them.
Available in OS X v10.7 and later.

35.71.143 setTitleWithRepresentedFile(filename as folderitem)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Sets a given path as the window's title, formatting it as a file-system path, and records this path as the window's associated filename using setRepresentedFilename.

35.71.144 setTitleWithRepresentedFilename(filename as string)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Sets a given path as the window's title, formatting it as a file-system path, and records this path as the window's associated filename using setRepresentedFilename.

35.71.145 Show

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: Shows the window.

35.71.146 standardWindowButton(button as Integer) as Variant

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the window button of a given window button kind in the window's view hierarchy.
Example:

```
// another way to disable close button on Cocoa
Var n as NSButtonMBS = Window1.NSWindowMBS.standardWindowButton(NSWindowMBS.NSWindow-
CloseButton)
n.isEnabled = false

// or move to the right
Var r as NSRectMBS = n.frame
n.frame = NSMakeRectMBS(r.x+100, r.y, r.Width, r.Height)
```

Notes: button: The kind of standard window button to return.

Returns Window button in the window's view hierarchy of the kind identified by windowButtonKind; nil when such button is not in the window's view hierarchy.

Declared as Variant for reduced plugin dependencies.
Button constants: NSWindowCloseButton, NSWindowDocumentIconButton, NSWindowMiniaturizeButton, NSWindowToolbarButton and NSWindowZoomButton.
See also:

- 35.71.147 standardWindowButton(button as Integer, StyleMask as Integer) as Variant 6785

35.71.147 standardWindowButton(button as Integer, StyleMask as Integer) as Variant

MBS MacBase Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a new instance of a given standard window button, sized appropriately for a given window style.
Notes: button: The kind of standard window button to return.
StyleMask: The window style for which windowButtonKind is to be sized. See "Window Style Masks" for the list of allowable values.

Returns the new window button of the kind identified by windowButtonKind; nil when no such button kind exists.

The caller is responsible for adding the button to the view hierarchy and for setting the target to be the window.

Declared as Variant for reduced plugin dependencies.
Button constants: NSWindowCloseButton, NSWindowDocumentIconButton, NSWindowMiniaturizeButton, NSWindowToolbarButton and NSWindowZoomButton
See also:

- 35.71.146 standardWindowButton(button as Integer) as Variant 6785

35.71.148 stringWithSavedFrame as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop & iOS.

Function: Returns a string representation of the window's frame rectangle.
Notes: A string representation of the window's frame rectangle in a format that can be used with a later setFrameFromString method.

35.71.149 tabbedWindows as NSWindowMBS()

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the entire group (stack) of windows that are all visually shown together in one virtual tabbed window and associated with this particular window.
Example:

```
Var n as NSWindowMBS = Window1.NSWindowMBS
Var windows() as NSWindowMBS = n.tabbedWindows
break // check in debugger
```

Notes: Operations can then be done on each window, as necessary. For instance, iterating over each window in the group and calling performClose: will close the entire stack. The result will be nil when the window is not tabbed at all (not showing a tab bar), and non-nil with at least one object when the tab bar is shown. The order of items in the array is the same order as the tabs visually shown (leading to trailing).
Raises an exception when used on OS X 10.11 and older.

35.71.150 toggleFullScreen

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Toggles fullscreen mode for this window.
Example:

```
Var w as new NSWindowMBS(Window1)

// set window to have fullscreen
w.collectionBehavior = BitwiseOr(w.collectionBehavior, NSWindowMBS.NSWindowCollectionBehaviorFullScreen-
Primary)

// and switch to fullscreen
w.toggleFullScreen
```

Notes: Available on Mac OS X 10.7 or later.
If an application supports fullscreen, it should add a menu item to the View menu with toggleFullScreen as the action.
This method does not much if you don't mark a window to be the primary fullscreen window.

35.71.151 toggleTabBar

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop & iOS.

Function: Toggles tab bar.
Example:

```
Var n as NSWindowMBS = Window1.NSWindowMBS
n.toggleTabBar
```

Notes: Raises an exception when used on OS X 10.11 and older.

35.71.152 toggleToolbarShown

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The action method for the "Hide Toolbar" menu item (which alternates with "Show Toolbar").

35.71.153 toolbarview as NSViewMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop & iOS.

Function: Convenience function to find the toolbar view on the window.
Example:

```
Var v as NSViewMBS = Window1.NSWindowMBS.toolbarview
Var m as NSMenuMBS = v.Menu
Var i as NSMenuItemMBS = m.Item(0)
MessageBox i.title
```

Notes: Returns nil if there is no toolbar view.

35.71.154 unregisterDraggedTypes

MBS MacBase Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop & iOS.

Function: Unregisters the window as a possible destination for dragging operations.

35.71.155 update

MBS MacBase Plugin, Plugin Version: 8.3, Platform: macOS, Targets: Desktop & iOS.

Function: Updates the window.
Notes: The NSWindow implementation of this method does nothing more than post an NSWindowDidUpdateNotification notification to the default notification center. A subclass can override this method to perform specialized operations, but it should send an update message to super just before returning. For example, the NSMenu class implements this method to disable and enable menu commands.

An NSWindow object is automatically sent an update message on every pass through the event loop and before it's displayed onscreen. You can manually cause an update message to be sent to all visible NSWindow objects through the NSApplication updateWindows method.

35.71.156 useOptimizedDrawing(value as boolean)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies whether the window is to optimize focusing and drawing when displaying its views.
Notes: value: If true, the window will optimize focusing and drawing for its views; if false, it will not, in which case, the window does not preserve the Z-ordering of overlapping views when an object explicitly sends lockFocus to a view and draws directly to it, instead of using the AppKit standard display mechanism.

The optimizations may prevent sibling subviews from being displayed in the correct order—which matters only if the subviews overlap. You should always set optimizedDrawing to true when there are no overlapping

subviews within the window. The default is false.

35.71.157 WindowHandle as Integer

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: The Window handle.
Notes: Can be used with the CarbonWindowsEventsMBS class.
(for events like open and close)

35.71.158 windowNumberAtPoint(x as Double, y as Double, belowWindowWithWindowNumber as Integer = 0) as Integer

MBS MacBase Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the number of the frontmost window that would be hit by a mouseDown at the screen location point.
Notes: belowWindowWithWindowNumber can be specified to exclude a given window along with all windows above it, and may belong to any application. If no windows are to be excluded, specify 0 for belowWindowWithWindowNumber. The windowNumber returned may correspond to a window in another application.
Requires Mac OS X 10.6 or newer.

35.71.159 windowNumbersWithOptions(options as Integer = 0) as Integer()

MBS MacBase Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop & iOS.

Function: Returns an array of integers containing windowNumbers for all visible windows satisfying options.
Example:

```
Var windowNumbers1() as Integer
Var windowNumbers2() as Integer
Var windowNumbers3() as Integer

// To get an array of windowNumbers visible on the current space and belonging to the calling application:
windowNumbers1 = NSWindowMBS.windowNumbersWithOptions(0)
// To get an array of windowNumbers visible on any space and belonging to any application:
windowNumbers2 = NSWindowMBS.windowNumbersWithOptions(NSWindowMBS.NSWindowNumberListAllApplications+NSWindowMBS.NSWindowNumberListAllSpaces)
// To get an array of windowNumbers visible on any space and belonging to the calling application:
windowNumbers3 = NSWindowMBS.windowNumbersWithOptions(NSWindowMBS.NSWindowNumberListAllSpaces)
```

Notes: In no options are specified, only visible windows belonging to the calling application and on the active space are included. If options include NSWindowNumberListAllApplications, visible windows belonging to all applications are included. If options include NSWindowNumberListAllSpaces, visible windows on all spaces are included.

35.71.160 zoom

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: This action method toggles the size and location of the window between its standard state (provided by the application as the "best" size to display the window's data) and its user state (a new size and location the user may have set by moving or resizing the window).

35.71.161 Properties

35.71.162 acceptsMouseMovedEvents as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the receiver is to accept mouse-moved events.
Notes: True to have the receiver accept mouse-moved events (and to distribute them to its responders); false to not accept such events.
(Read and Write property)

35.71.163 allowsAutomaticWindowTabbing as Boolean

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop & iOS.

Function: Allows automatic window tabbing when the value is true.
Example:

```
// disable automatic tabbing
NSWindowMBS.allowsAutomaticWindowTabbing = false
```

Notes: By default, this will be set to true, but applications can explicitly opt out of all automatic tabbing by setting it to false, and can still adopted explicit window tabbing, if desired.
Raises an exception when used on OS X 10.11 and older.
(Read and Write property)

35.71.164 allowsConcurrentViewDrawing as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Whether threading of view drawing is enabled for this window.
Notes: Whether threading of view drawing should be enabled for this window. Defaults to true. When this is set to true, AppKit's view system is allowed to perform drawRect activity for the window's views on threads other than the main thread, for views that have canDrawConcurrently = true. When this is set to false, the window's views will be drawn serially as on 10.5 and earlier, even though some of the views may have canDrawConcurrently = true.

Available on Mac OS X 10.6.
(Read and Write property)

35.71.165 allowsToolTipsWhenApplicationIsInactive as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Whether this window displays tooltips even when the application is in the background.
Notes: Default is false. Set to true to allow a window to display tooltips even when the application is in the background. Note that, enabling tooltips in an inactive application will cause the app to do work any time the mouse passes over the window. This can degrade system performance.
(Read and Write property)

35.71.166 alphaValue as Double

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: The receiver's alpha value.
Example:

```
if TargetCocoa then
Var w as new NSWindowMBS(Window1)
w.alphaValue=0.5
else
MessageBox "this sample requires Xojo Cocoa Target"
end if
```

Notes: (Read and Write property)

35.71.167 animationBehavior as Integer

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop & iOS.

Function: Provides for per-window control over automatic orderFront/orderOut animation behaviors added in 10.7.
Example:

```
Var w as new NSWindowMBS(Window1)

w.animationBehavior = NSWindowMBS.NSWindowAnimationBehaviorDocumentWindow

Title = str(W.animationBehavior)
```

Notes: Can be set to NSWindowAnimationBehaviorNone to disable Appkit's automatic animations for a given window, or to one of the other non-Default NSWindowAnimationBehavior values to override AppKit's automatic inference of appropriate animation behavior based on the window's apparent type.
Available on Mac OS X 10.7 or later.
(Read and Write property)

35.71.168 aspectRatio as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The window's aspect ratio, which constrains the size of its frame rectangle to integral multiples of this ratio when the user resizes it.
Notes: (Read and Write property)

35.71.169 Autodisplay as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the window automatically displays views that need to be displayed.
Notes: Automatic display typically occurs on each pass through the event loop.

Available in Mac OS X v10.0 and later.
(Read and Write property)

35.71.170 backgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop & iOS.

Function: The window background color.
Notes: (Read and Write property)

35.71.171 backingLocation as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates the window's backing store location.
Notes: The location of the window's backing store. See "Constants" for possible values.
Available in Mac OS X v10.5 and later.
(Read only property)

35.71.172 backingScaleFactor as Double

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the backing scale factor.
Notes: Returns 2.0 for high resolution scaled display modes, and 1.0 for all other cases.

There are some scenarios where an application that is resolution-aware may want to reason on its own about the display environment it is running in.

It is important to note that this number returned by this method does not represent anything concrete, such as pixel density or physical size, since it can vary based on the configured display mode. For example, the display may be in a mirrored configuration that is still high resolution scaled, resulting in pixel geometry that may not match the native resolution of the display device.

Note: For almost all common cases, developers should avoid using the backingScaleFactor as an input to layout or drawing calculations. Developers should instead use the backing coordinate space conversion methods instead, as the resulting code will more likely work consistently and correctly under both low and high resolution operation.

For apps which are not enabled for retina support, the function returns 1. So you only see 2 here if app is Cocoa, display is retina and info.plist has the NSHighResolutionCapable key.
(Read only property)

35.71.173 backingType as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The window's backing store type.
Notes: Use constants like this:

Name	Value	Description
NSBackingStoreRetained	= 0	The window uses a buffer, but draws directly to the screen where possible and to the buffer for obscured portions. You should not use this mode. It combines the limitations of NSBackingStoreNonretained with the memory use of NSBackingStoreBuffered. The original NeXTSTEP implementation was an interesting compromise that worked well with fast memory mapped framebuffers on the CPU bus—something that hasn't been in general use since around 1994. These tend to have performance problems. In Mac OS X 10.5 and later, requests for retained windows will result in the window system creating a buffered window, as that better matches actual use. Available in Mac OS X v10.0 and later.
NSBackingStoreNonretained	= 1	The window draws directly to the screen without using any buffer. You should not use this mode. It exists primarily for use in the original Classic Blue Box. It does not support Quartz drawing, alpha blending, or opacity. Moreover, it does not support hardware acceleration, and interferes with system-wide display acceleration. If you use this mode, your application must manage visibility region clipping itself, and manage repainting on visibility changes. Available in Mac OS X v10.0 and later.
NSBackingStoreBuffered	= 2	The window renders all drawing into a display buffer and then flushes it to the screen. You should use this mode. It supports hardware acceleration, Quartz drawing, and takes advantage of the GPU when possible. It also supports alpha channel drawing, opacity controls, using the compositor. Available in Mac OS X v10.0 and later.

(Read and Write property)

35.71.174 canBecomeKeyWindow as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window can become the key window.
Notes: Attempts to make the window the key window are abandoned if this method returns false. The NSWindow implementation returns true if the window has a title bar or a resize bar, or false otherwise.
(Read only property)

35.71.175 canBecomeMainWindow as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window can become the application's main window.
Notes: Attempts to make the window the main window are abandoned if this method returns false. The NSWindow implementation returns true if the window is visible, is not an NSPanel object, and has a title

bar or a resize mechanism. Otherwise it returns false.
(Read only property)

35.71.176 canBecomeVisibleWithoutLogin as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window can be displayed at the login window.
Notes: Default: false.
Available in Mac OS X v10.5 and later.
(Read and Write property)

35.71.177 canHide as boolean

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies whether the window can be hidden when its application becomes hidden (during execution of the NSApplication hide method).
Notes: (Read and Write property)

35.71.178 canStoreColor as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window has a depth limit that allows it to store color values.
Notes: (Read only property)

35.71.179 className as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: The name of this NSWindow class.
Notes: (Read only property)

35.71.180 classPath as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: The path of this NSView class.
Notes: Useful for debugging to know what super classes the window has.

(Read only property)

35.71.181 collectionBehavior as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Identifies the window's behavior in window collections.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

35.71.182 colorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The window's color space.
Notes: Available in Mac OS X v10.6 and later.
(Read and Write property)

35.71.183 contentAspectRatio as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The aspect ratio (height in relation to width) of the window's content view, constraining the dimensions of its content rectangle to integral multiples of that ratio when the user resizes it.
Notes: Available in Mac OS X v10.3 and later
(Read and Write property)

35.71.184 contentLayoutRect as NSRectMBS

MBS MacBase Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop & iOS.

Function: The area inside the window that is for non-obscured content, in window coordinates.
Notes: Typically, the area represented by this property is the same as the frame of the contentView. However, for windows with NSFullSizeContentViewWindowMask set, there needs to be a way to determine the portion that is not under the toolbar. The contentLayoutRect property contains the portion of the layout that is not obscured under the toolbar.
(Read only property)

35.71.185 contentMaxSize as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum size of the window's content view.
Notes: Available in Mac OS X v10.3 and later.
(Read and Write property)

35.71.186 contentMinSize as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum size of the window's content view.
Notes: Available in Mac OS X v10.3 and later.
(Read and Write property)

35.71.187 contentResizeIncrements as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The window's content-view resizing increments.
Notes: Available in Mac OS X v10.3 and later.
(Read and Write property)

35.71.188 contentView as NSViewMBS

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: The receiver's content view, the highest accessible NSView object in the receiver's view hierarchy.
Notes: (Read and Write property)

35.71.189 currentEvent as NSEventMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the event currently being processed by the application, by invoking NSApplication's currentEvent method.
Notes: Returns the event being processed by the application.
(Read only property)

35.71.190 deepestScreen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the deepest screen the window is on (it may be split over several screens).
Notes: The deepest screen the window is on; nil when the window is offscreen.
(Read only property)

35.71.191 depthLimit as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the depth limit of the window.
Notes: The value returned can be examined with the Application Kit functions NSPlanarFromDepth, NSColorSpaceFromDepth, NSBitsPerSampleFromDepth, and NSBitsPerPixelFromDepth.
(Read and Write property)

35.71.192 displaysWhenScreenProfileChanges as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window context should be updated when the screen profile changes or when the window moves to a different screen.
Notes: Returns true when the window context should be updated when the screen profile changes or when the window moves to a different screen; otherwise, false.

The default value is false.

Available in Mac OS X v10.4 and later.
(Read and Write property)

35.71.193 frame as NSRectMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The window's frame rectangle.
Notes: (Read only property)

35.71.194 hasDynamicDepthLimit as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window's depth limit can change to match the depth of the screen it's on.
Notes: True when the window has a dynamic depth limit; otherwise, false.
(Read and Write property)

35.71.195 hasShadow as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the receiver has a shadow.
Notes: True when the receiver has a shadow, false when it doesn't.
(Read and Write property)

35.71.196 Height as Double

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: The height of the color panel in pixel.
Notes: (Read and Write property)

35.71.197 hidesOnDeactivate as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the receiver is removed from the screen when its application becomes inactive.
Notes: True when the receiver is removed from the screen when its application is deactivated; false if it remains onscreen.

The default for NSWindow is false; the default for NSPanel is true.
(Read and Write property)

35.71.198 identifier as string

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop & iOS.

Function: A string that identifies this user interface item.
Example:

```
Var w as new NSWindowMBS(Window1)

w.identifier = "window1"
MessageBox w.identifier
```

Notes: It should be set to a unique value on NSViews when they are intended to be used inside a view-based NSTableView. Identifiers should be unique per-window. For programmatically created user interface items, you would typically set this value in code after creating a control but before adding it to a window. You may also want to set an identifier on a window, after creating it programmatically, to identify the window easily when it is reopened. You should not change the identifier after a control is added to a window. Identifiers beginning with an underscore are reserved for the system. In framework classes that implement this protocol, the accessor methods are not intended to be overridden.

To help avoid collision of identifiers, it is recommended that identifiers use the same prefix as is used for the framework or application. For example, identifiers for standard AppKit interface items, such as the open panel, will begin with "NS".

The slash '/', backslash '\', and colon ':' characters are reserved and should not be used in identifiers.
(Read and Write property)

35.71.199 ignoresMouseEvents as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the receiver is transparent to mouse events.
Notes: True when the receiver is transparent to mouse events, otherwise false.
(Read and Write property)

35.71.200 initialFirstResponder as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The view that's made first responder the first time the window is placed onscreen.
Notes: (Read and Write property)

35.71.201 isDocumentEdited as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the receiver's document has been edited.
Notes: True when the receiver's document has been edited; false otherwise.

Initially, by default, NSWindow objects are in the "not edited" state.
(Read and Write property)

35.71.202 isExcludedFromWindowsMenu as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the receiver's title is omitted from the application's Windows menu.
Notes: True to specify that the receiver is to be omitted from the application's Windows menu; false to specify otherwise.
(Read and Write property)

35.71.203 isFlushWindowDisabled as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window's flushing ability is disabled.
Notes: (Read only property)

35.71.204 isKeyWindow as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window is the key window for the application.
Notes: (Read only property)

35.71.205 isMainWindow as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window is the application's main window.
Notes: (Read only property)

35.71.206 isMiniaturized as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the receiver is minimized.
Notes: A minimized window is removed from the screen and replaced by a image, icon, or button that represents it, called the counterpart.
(Read only property)

35.71.207 isMovableByWindowBackground as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the receiver is movable by clicking and dragging anywhere in its background.
Notes: True when the window is movable by clicking and dragging anywhere in its background, otherwise false.

A window with a style mask of NSTexturedBackgroundWindowMask is movable by background by default. Sheets and drawers cannot be movable by window background.

Available in Mac OS X v10.2 and later.
Works in Xojo 2011r3, but not in 2011r4.
(Read and Write property)

35.71.208 isOnActiveSpace as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window is on the currently active space.
Notes: For visible windows, this method indicates whether the window is currently visible on the active space. For offscreen windows, it indicates whether ordering the window onscreen would cause it to be on the active space.
Available in Mac OS X v10.6 and later.
(Read only property)

35.71.209 isOneShot as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window device the window manages is freed when it's removed from the screen list.
Notes: (Read and Write property)

35.71.210 isOpaque as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the receiver is opaque.
Notes: True when the receiver is opaque; false otherwise.
(Read and Write property)

35.71.211 isSheet as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window has ever run as a modal sheet.
Notes: Sheets are created using the NSPanel subclass.
Available in Mac OS X v10.1 and later.
(Read only property)

35.71.212 isZoomed as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: A Boolean value that indicates whether the receiver is in a zoomed state.
Notes: (Read only property)

35.71.213 Left as Double

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: The horizontal position of the color panel in pixel.
Notes: (Read and Write property)

35.71.214 Level as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: The window level of the receiver.
Example:

```
Var n as NSWindowMBS = Window1.NSWindowMBS
n.Level = n.NSFloatingWindowLevel
```

Notes: (Read and Write property)

35.71.215 maxSize as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The maximum size to which the window's frame (including its title bar) can be sized.
Notes: The maximum size to which the window's frame (including its title bar) can be sized either by the user or by the setFrame... methods other than setFrame.
(Read and Write property)

35.71.216 miniwindowImage as Variant

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: The custom miniaturized window image of the receiver.
Notes: The miniaturized window image is the image displayed in the Dock when the window is minimized. If you did not assign a custom image to the window, this method returns nil.

Value is declares as Variant to minimize plugin dependencies, but should be NSImageMBS.
(Read and Write property)

35.71.217 miniwindowTitle as String

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: The title displayed in the receiver's minimized window.
Notes: (Read and Write property)

35.71.218 minSize as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The minimum size to which the window's frame (including its title bar) can be sized.
Notes: The minimum size to which the window's frame (including its title bar) can be sized either by the user or by the setFrame... methods other than setFrame.
(Read and Write property)

35.71.219 Movable as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the window can be moved by clicking in its title bar or background.
Notes: setMovableByWindowBackground, called with the argument true, is ignored by a window that returns false from isMovable. If a window returns false, that means it can only be dragged between spaces in F8 mode, and its relative screen position is always preserved. Note that a resizable window may still be resized, and the window frame may be changed programmatically. A non-movable window will not be moved or resized by the system in response to a display reconfiguration. Applications may choose to enable application-controlled window dragging after disabling user-initiating dragging by handling the mouseDown/mouseDragged/mouseUp sequence in sendEvent in an NSWindow subclass.
Available in Mac OS X v10.6 and later.
(Read and Write property)

35.71.220 parentWindow as NSWindowMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The parent window to which the window is attached as a child.
Notes: Available in Mac OS X v10.2 and later.
(Read and Write property)

35.71.221 preferredBackingLocation as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The preferred location for the window's backing store.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

35.71.222 preservesContentDuringLiveResize as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the window tries to optimize user-initiated resize operations by preserving the content of views that have not changed.
Notes: Returns true if the window tries to optimize live resize operations by preserving the content of views that have not moved; otherwise, false.

Discussion
When live-resize optimization is active, the window redraws only those views that moved (or do not support this optimization) during a live resize operation.

See preservesContentDuringLiveResize in NSView for additional information on how to support this optimization.

Available in Mac OS X v10.4 and later.
(Read and Write property)

35.71.223 preventsApplicationTerminationWhenModal as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the window prevents application termination when modal.
Notes: Available in Mac OS X v10.6 and later.
(Read and Write property)

35.71.224 representedFile as folderitem

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The pathname of the file the window represents.
Notes: (Read and Write property)

35.71.225 representedFilename as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The pathname of the file the window represents.
Notes: (Read and Write property)

35.71.226 representedURL as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The URL of the file the window represents.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var n as new NSWindowMBS(Window1)
n.representedURL = f.URLPath

MessageBox n.representedURL
```

Notes: The URL for the file the window represents.

When the URL specifies a path, the window shows an icon in its title bar, as described in Table 1.

Title bar document icon display:

Filepath	Document icon
Empty	None.
Specifies a nonexistent file	Generic.
Specifies an existent file	Specific for the file's type.

You can customize the file icon in the tile bar with the following code:

```
window.standardWindowButton(NSWindowDocumentIconButton).Image=theImage
```

When the URL identifies an existing file, the window's title offers a pop-up menu showing the path components of the URL. (The user displays this menu by Command-clicking the title.) The behavior and contents of this menu can be controlled with shouldPopUpDocumentPathMenu.

Available in Mac OS X v10.5 and later.
(Read and Write property)

35.71.227 resizeIncrements as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The window's resizing increments.
Notes: (Read and Write property)

35.71.228 Restorable as boolean

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies whether the window configuration is preserved between application launches.
Notes: value: Specify true if you want the window to be preserved or false if you do not want it preserved.

Windows should be preserved between launch cycles to maintain interface continuity for the user. During subsequent launch cycles, the system tries to recreate the window and restore its configuration to the preserved state. Configuration data is updated as needed and saved automatically by the system.

If you enable preservation for a given window, you should also specify a restoration class for the window using the setRestorationClass method.
Available in OS X v10.7 and later.
(Read and Write property)

35.71.229 screen as NSScreenMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the screen the window is on.
Notes: The screen where most of the window is on; nil when the window is offscreen.

When the window is partly on one screen and partly on another, the screen where most of it lies is returned.
(Read only property)

35.71.230 sharingType as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: The level of access other processes have to the window's content.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

35.71.231 showsResizeIndicator as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the receiver's resize indicator is visible
Notes: True to show it, false to hide it.
This method does not affect whether the receiver is resizable.
(Read and Write property)

35.71.232 showsToolbarButton as boolean

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the receiver shows the toolbar control button.
Notes: True to display the toolbar control button; false to hide the button.

If the window does not have a toolbar, this method has no effect.
(Read and Write property)

35.71.233 styleMask as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: The receiver's style mask, indicating what kinds of control items it displays.
Example:

```
Var p as new IKPictureTakerMBS
p.styleMask = BitwiseAnd(p.styleMask, &hFD) // disable close button
```

Notes: See the information about the style mask in constants below. An NSWindow object's style is set when the object is initialized. Once set, it can't be changed.

constants:

(Read and Write property)

NSBorderlessWindowMask = 0	The window displays none of the usual peripheral elements. Useful only for display or caching purposes.
NSTitledWindowMask = 1	The window displays a title bar.
NSClosableWindowMask = 2	The window displays a close button.
NSMiniaturizableWindowMask = 4	The window displays a minimize button.
NSResizableWindowMask = 8	The window displays a resize control.
NSTexturedBackgroundWindowMask = 256	The window displays with a metal-textured background. Additionally, the window may be moved by clicking and dragging anywhere in the window background. A bordered window with this mask gets rounded bottom corners.

35.71.234 SubTitle as String

MBS MacBase Plugin, Plugin Version: 20.3, Platform: macOS, Targets: Desktop & iOS.

Function: Secondary text that may be displayed adjacent to or below the primary title depending on the configuration of the window.
Notes: A value of empty string will remove the subtitle from the window layout.
(Read and Write property)

35.71.235 tabbingIdentifier as String

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop & iOS.

Function: Windows with the same tabbingIdentifier will have the ability to be tabbed together when a window is being shown.
Example:

```
Var n as NSWindowMBS = Window1.NSWindowMBS
n.tabbingIdentifier = "test"
MessageBox n.tabbingIdentifier
```

Notes: This allows aggregation of similiar windows. By default, the tabbingIdentifier will be generated based on inherit window properties, such as the window class name, the delegate class name, the window controller class name, and some additional state. Windows can be explicilty made to group together by using the same tabbingIdentifier.
Raises an exception when used on OS X 10.11 and older.
(Read and Write property)

35.71.236 tabbingMode as Integer

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop & iOS.

Function: Get and set the tabbing mode for this window.
Example:

```
Var n as NSWindowMBS = Window1.NSWindowMBS
n.tabbingMode = n.NSWindowTabbingModeDisallowed
MessageBox str(n.tabbingMode) // shows 2
```

Notes: This should be set before a window is shown. The default value is NSWindowTabbingModeAutomatic. When the value is NSWindowTabbingModeAutomatic, the system will look at the userTabbingPreference and automatically tab windows together based on the tabbingIdentifier, when it is appropriate to do so.
Raises an exception when used on OS X 10.11 and older.
(Read and Write property)

35.71.237 Title as String

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: The title of the color panel window.
Example:

```
if TargetCocoa then
Var w as new NSWindowMBS(Window1)

MessageBox w.title

else
MessageBox "this sample requires Xojo Cocoa Target"
end if
```

Notes: (Read and Write property)

35.71.238 titlebarAppearsTransparent as Boolean

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop & iOS.

Function: Whether titlebar appears transparent.
Notes: When True, the titlebar doesn't draw its background, allowing all buttons to show through, and "click through" to happen. In general, this is only useful when NSFullSizeContentViewWindowMask is set.

Available on Mac OS X 10.10 and newer.
(Read and Write property)

35.71.239 titlebarSeparatorStyle as Integer

MBS MacBase Plugin, Plugin Version: 20.3, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies the style of separator displayed between the window's titlebar and content.
Notes: The default value is NSTitlebarSeparatorStyleAutomatic. Changing this value will override any preference made by NSSplitViewItem.
(Read and Write property)

35.71.240 titleVisibility as Integer

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop & iOS.

Function: The title visibility.
Notes: Can be NSWindowTitleVisible, NSWindowTitleHidden or NSWindowTitleHiddenWhenActive.
Available on Mac OS X 10.10 and newer.
(Read and Write property)

35.71.241 toolbar as Variant

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop & iOS.

Function: The window's toolbar.
Notes: Value is a NSToolbarMBS object.
Returned as Variant to reduce plugin dependencies.
(Read and Write property)

35.71.242 toolbarStyle as Integer

MBS MacBase Plugin, Plugin Version: 20.3, Platform: macOS, Targets: Desktop & iOS.

Function: Specifies how the titlebar area of the window should appear when the window displays an NSToolbar.
Example:

```
Var w as NSWindowMBS = Window1.NSWindowMBS
w.toolbarStyle = NSWindowMBS.NSWindowToolbarStyleUnified
```

Notes: (Read and Write property)

35.71.243 Top as Double

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: The vertical position of the color panel in pixel.
Notes: In the Cocoa world this is the distance from the bottom of the screen.
(Read and Write property)

35.71.244 userTabbingPreference as Integer

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop & iOS.

Function: Returns the user's tabbing preference as set in System Preferences.
Example:

MessageBox str(NSWindowMBS.userTabbingPreference)

Notes: This value should be queried anytime a new window is made to see if the user wants to automatically show it in tabs.

Can be NSWindowUserTabbingPreferenceManual, NSWindowUserTabbingPreferenceAlways or NSWindowUserTabbingPreferenceInFullScreen.
Raises an exception when used on OS X 10.11 and older.
(Read only property)

35.71.245 viewsNeedDisplay as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether any of the window's views need to be displayed.
Notes: (Read and Write property)

35.71.246 Visible as boolean

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the color panel is currently visible.
Notes: Setting to false calls Hide and setting to true calls show.
(Read only property)

35.71.247 Width as Double

MBS MacBase Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop & iOS.

Function: The width of the color panel in pixel.
Notes: (Read and Write property)

35.71.248 windowController as NSWindowControllerMBS

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The window's window controller.
Notes: (Read and Write property)

35.71.249 windowNumber as Integer

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop & iOS.

Function: Provides the window number of the receiver's window device.
Example:

```
if TargetCocoa then
Var w as new NSWindowMBS(Window1)

MessageBox str(w.windowNumber)

else
MessageBox "this sample requires Xojo Cocoa Target"
end if
```

Notes: (Read only property)

35.71.250 worksWhenModal as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop & iOS.

Function: Indicates whether the window is able to receive keyboard and mouse events even when some other window is being run modally.
Notes: True if the window is able to receive keyboard and mouse events even when some other window is being run modally; otherwise, false.

The NSWindow implementation of this method returns false. Only subclasses of NSPanel should override

this default.
(Read only property)

35.71.251 frameAutosaveName as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop & iOS.

Function: The name used to automatically save the window's frame rectangle data in the defaults system.
Notes: (Read and Write computed property)

35.71.252 Constants

Constants

Constant	Value	Description
NSBorderlessWindowMask	0	One of the constants you can use to specify the style when c The window displays none of the usual peripheral elements display or caching purposes.
NSClosableWindowMask	2	One of the constants you can use to specify the style when c The window displays a close button.
NSDirectSelection	0	One of the constants specify the direction a window is current the key view using keyViewSelectionDirection. The window isn't traversing the key view loop.
NSFullScreenWindowMask	16384	One of the constants you can use to specify the style when c When set, the window will appear full screen. This mask toggled when toggleFullScreen: is called.
NSFullSizeContentViewWindowMask	32768	One of the constants you can use to specify the style when c If set, the contentView will consume the full size of the w combined with other window style masks, but is only respe with a titlebar. Utilizing this mask opts-in to layer-backing. Utilize the cont auto-layout contentLayoutGuide to layout views underneath bar area.
NSMiniaturizableWindowMask	4	One of the constants you can use to specify the style when c The window displays a minimize button.
NSResizableWindowMask	8	One of the constants you can use to specify the style when c The window displays a resize control.
NSSelectingNext	1	One of the constants specify the direction a window is current the key view using keyViewSelectionDirection. The window is proceeding to the next valid key view.
NSSelectingPrevious	2	One of the constants specify the direction a window is current the key view using keyViewSelectionDirection. The window is proceeding to the previous valid key view.
NSTexturedBackgroundWindowMask	256	One of the constants you can use to specify the style when c The window displays with a metal-textured background. window may be moved by clicking and dragging anywhere in ground. A bordered window with this mask gets rounded bo
NSTitledWindowMask	1	One of the constants you can use to specify the style when c The window displays a title bar.
NSUnifiedTitleAndToolbarWindowMask	4096	One of the constants you can use to specify the style when c
NSUnscaledWindowMask	2048	One of the constants you can use to specify the style when c
NSWindowBackingLocationDefault	0	One of the constant to specify the window backing store loca Determined by the operating system. Available in Mac OS X v10.5 and later.
NSWindowBackingLocationMainMemory	2	One of the constant to specify the window backing store loca Physical memory. Available in Mac OS X v10.5 and later.
NSWindowBackingLocationVideoMemory	1	One of the constant to specify the window backing store loca Video memory. Available in Mac OS X v10.5 and later.
NSWindowCloseButton	0	One constants providing a way to access standard title bar b The close button.
NSWindowCollectionBehaviorCanJoinAllSpaces	1	One of the constants for window collection behaviors relatec Spaces. The window appears in all spaces. The menu bar behaves th Available in Mac OS X v10.5 and later.
NSWindowCollectionBehaviorDefault	0	One of the constants for window collection behaviors relatec Spaces. The window can be associated to one space at a time. Available in Mac OS X v10.5 and later.
NSWindowCollectionBehaviorFullScreenAuxiliary	256	One of the constants for window collection behaviors. Windows with this collection behavior can be shown with the f
NSWindowCollectionBehaviorFullScreenPrimary	128	One of the constants for window collection behaviors.

Edge Constants

Constant	Value	Description
NSMaxXEdge	2	the maximum X edge. Typically right side.
NSMaxYEdge	3	The maximum Y edge. Topically the top edge of a window.
NSMinXEdge	0	the minimum X edge. Typically left side.
NSMinYEdge	1	Minimum Y. As coordinates are upside down in the Cocoa world, this is the bottom edge of a window.

Titlebar Separator Styles

Constant	Value	Description
NSTitlebarSeparatorStyleAutomatic	0	The titlebar separator style is determined by the window,Äôs configuratio
NSTitlebarSeparatorStyleLine	2	The titlebar separator is a line.
NSTitlebarSeparatorStyleNone	1	There,Äôs no titlebar separator.
NSTitlebarSeparatorStyleShadow	3	The titlebar separator is a shadow.

Window Order Constants

Constant	Value	Description
NSWindowAbove	1	Moves the window above the indicated window.
NSWindowBelow	-1	Moves the window below the indicated window.
NSWindowOut	0	Moves the window off the screen.

Animation Behavior Constants.

Constant	Value	Description
NSWindowAnimationBehaviorAlertPanel	5	Default behavior for alert window.
NSWindowAnimationBehaviorDefault	0	let AppKit infer animation behavior for this window
NSWindowAnimationBehaviorDocumentWindow	3	Default behavior for document window.
NSWindowAnimationBehaviorNone	2	suppress inferred animations (don't animate)
NSWindowAnimationBehaviorUtilityWindow	4	Default behavior for utility window.

Tabbing Modes

Constant	Value	Description
NSWindowTabbingModeAutomatic	0	The system automatically prefers to tab this window when appropriate.
NSWindowTabbingModeDisallowed	2	The window explicitly should not prefer to tab when shown
NSWindowTabbingModePreferred	1	The window explicitly should prefer to tab when shown.

Title Visibility

Constant	Value	Description
NSWindowTitleHidden	1	The always hidden mode hides the title and moves the toolbar up into the ar previously occupied by the title.
NSWindowTitleHiddenWhenActive	2	This mode hides the title when the window is active, and shows it when inacti It does not adjust toolbars.
NSWindowTitleVisible	0	The default mode has a normal window title and titlebar buttons.

Toolbar Styles

Constant	Value	Description
NSWindowToolbarStyleAutomatic	0	The system displays the toolbar based on the window,Äôs given configu
NSWindowToolbarStyleExpanded	1	The toolbar appears below the window title.
NSWindowToolbarStylePreference	2	The toolbar appears below the window title and items in the toolbar a tered and have increased margins.
NSWindowToolbarStyleUnified	3	The toolbar, when visible, appears inline with the window title.
NSWindowToolbarStyleUnifiedCompact	4	The toolbar appears inline and with the window title and with smaller r when visible.

User Tabbing Preferences

Constant	Value	Description
NSWindowUserTabbingPreferenceAlways	1	
NSWindowUserTabbingPreferenceInFullScreen	2	
NSWindowUserTabbingPreferenceManual	0	

35.72 class NSWindowRestoreHandlerMBS

35.72.1 class NSWindowRestoreHandlerMBS

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The class implementing the event to be called for window restoration.
Example:

```
// recreate windows when macOS restores the app state after a restart
// MyRestoreHandler is a subclass of NSWindowRestoreHandlerMBS with the RestoreWindow event implemented.
// RestoreHandler is a property of the app: RestoreHandler As MyRestoreHandler
RestoreHandler = New MyRestoreHandler

// in MyRestoreHandler:
Sub RestoreWindow(identifier As String, state As Variant) Handles RestoreWindow
// identifier is the name you gave the window with NSWindowMBS.identifier
Var w As New DesktopWindow // use your window class here
Me.SetRestoredWindow w
End Sub
```

Blog Entries

35.72.2 Methods

35.72.3 Constructor

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The constructor.

35.72.4 Destructor

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The destructor.

35.72.5 SetError(error as NSErrorMBS)

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Sets the error to pass back from event.

35.72.6 SetRestoredWindow(win as DesktopWindow)

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Sets the window to pass back from event.
See also:

- 35.72.7 SetRestoredWindow(win as NSWindowMBS) 6820
- 35.72.8 SetRestoredWindow(win as window) 6820

35.72.7 SetRestoredWindow(win as NSWindowMBS)

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Sets the window to pass back from event.
See also:

- 35.72.6 SetRestoredWindow(win as DesktopWindow) 6820
- 35.72.8 SetRestoredWindow(win as window) 6820

35.72.8 SetRestoredWindow(win as window)

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Sets the window to pass back from event.
See also:

- 35.72.6 SetRestoredWindow(win as DesktopWindow) 6820
- 35.72.7 SetRestoredWindow(win as NSWindowMBS) 6820

35.72.9 Events

35.72.10 RestoreWindow(identifier as string, state as Variant)

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The following event is sent to request that a window be restored.
Notes: State is a NSCoderMBS object.

If the receiver knows how to restore the identified window, it should invoke the completion handler with the window, possibly creating it. It is acceptable to invoke the completion handler with a pre-existing window, though you should not pass the same window to more than one completion handler. If the receiver cannot restore the identified window (for example, the window referenced a document that has been deleted), it should invoke the completion handler with a nil window. In Mac OS X 10.7, the error parameter is ignored.

The receiver is passed the identifier of the window, which allows the receiver to quickly check for known windows. For example, you might give your preferences window an identifier of "preferences" in the nib, and then check for that identifier in your implementation. The receiver is also passed the NSCoder containing the combined restorable state of the window, its delegate, the window controller, and any document. The receiver may decode information previously stored in the coder to determine what window to restore.

Please call SetRestoredWindow or SetError to pass back status to system. It is not necessary or recommended for implementations of this method to order restored windows onscreen (for example, the window may have been minimized, in which case it will not be ordered onscreen).

Please call SetError and SetRestoredWindow to provide result to system.

35.73 class NSWorkspaceAuthorizationMBS

35.73.1 class NSWorkspaceAuthorizationMBS

MBS MacCocoa Plugin, Plugin Version: 19.3, Platform: macOS, Targets: All.

Function: The authorization granted to the app by the user.
Notes: To enable your app to prompt the user for these file permissions, you must have a Privileged File Operation entitlement. If you have an app on the Mac App Store or plan to submit your app for review, you can request this entitlement (see https://developer.apple.com/go/?id=workspace-authorization).

see also
https://developer.apple.com/documentation/appkit/nsworkspaceauthorization
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

35.73.2 Methods

35.73.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 19.3, Platform: macOS, Targets: All.

Function: The private constructor.

35.73.4 Properties

35.73.5 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 19.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

35.73.6 Constants

Authorization types

Constant	Value	Description
NSWorkspaceAuthorizationTypeCreateSymbolicLink	0	Authorization for the app to create a symbolic link.
NSWorkspaceAuthorizationTypeReplaceFile	2	Authorization for the app to perform an atomic file write w target file's permissions.
NSWorkspaceAuthorizationTypeSetAttributes	1	Authorization for the app to change specific file attributes

35.74 class NSWorkspaceMBS

35.74.1 class NSWorkspaceMBS

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: An NSWorkspace object responds to application requests to perform a variety of services.
Example:

```
// get icon image
Var n as NSImageMBS = NSWorkspaceMBS.iconForFile(SpecialFolder.desktop)
// set the size we want
n.setSize 512,512
// make a copy as picture
Backdrop = n.CopyPictureWithMask
```

Notes:

- Opening, manipulating, and obtaining information about files and devices
- Tracking changes to the file system, devices, and the user database
- Launching applications

35.74.2 Methods

35.74.3 absolutePathForAppBundleWithIdentifier(bundleIdentifier as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the absolute file-system path of an application bundle.
Notes: bundleIdentifier: The bundle identifier string. This value corresponds to the value in the CFBundleIdentifier key of the application's Info.plist file. For example, the bundle identifier of the TextEdit application is com.apple.TextEdit.

Returns the file system path to the application bundle identified by bundleIdentifier, or "" if the bundle cannot be found.

35.74.4 activateFileViewerSelectingFiles(Files() as folderitem)

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Activates the Finder, and opens one or more windows selecting the specified files.
Example:

```
Var file as FolderItem = SpecialFolder.Pictures.Child("mbs.jpg") // some file

Var w as new NSWorkspaceMBS
Var files() as FolderItem

files.Add file

// show in Finder
w.activateFileViewerSelectingFiles(files)
```

Notes: Available in Mac OS X v10.6 and later.

35.74.5 activateFileViewerSelectingURLs(URLs() as string)

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Activates the Finder, and opens one or more windows selecting the specified files.
Notes: Available in Mac OS X v10.6 and later.

35.74.6 ApplicationsToOpenFile(File as FolderItem) as FolderItem()

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of files to all available applications that can open the file.
Example:

```
Var test As FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var files() As FolderItem = NSWorkspaceMBS.ApplicationsToOpenFile(test)
Var list() As String

For Each file As FolderItem In files
list.Add file.NativePath
Next

MessageBox Join(list, EndOfLine)
```

Notes: Returns an array of files to available apps that can open the specified url. Returns an empty array if no app can open the file, or if the file doesn,Äôt exist.

The system sorts the resulting array according to each app,Äôs suitability to open the URL. The returned array lists the best match first.

35.74.7 ApplicationsToOpenURL(url as string) as FolderItem()

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of URLs to all available applications that can open the URL.
Example:

```
Var files() As FolderItem = NSWorkspaceMBS.ApplicationsToOpenURL("http://test")
Var list() As String

For Each file As FolderItem In files
list.Add file.NativePath
Next

MessageBox Join(list, EndOfLine)
```

Notes: Returns an array of URLs to available apps that can open the specified url. Returns an empty array if no app can open the URL, or if the file URL doesn,Äôt exist.

The system sorts the resulting array according to each app,Äôs suitability to open the URL. The returned array lists the best match first.

35.74.8 ApplicationsWithBundleIdentifier(bundleIdentifier as string) as FolderItem()

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of FolderItems to all available applications that can open the specified bundle identifier.
Example:

```
// find all copies of Xojo
Var files() As FolderItem = NSWorkspaceMBS.ApplicationsWithBundleIdentifier("com.xojo.xojo")
Var list() As String

For Each file As FolderItem In files
list.Add file.NativePath
Next

MessageBox Join(list, EndOfLine)
```

Notes: Returns an array of URLs to available apps that can open the specified bundleIdentifier.

Returns an empty array if no app associates with the bundle identifier.

The system sorts the resulting array accounts according to each app,Äôs suitability to launch. The returned array lists the best match first.

35.74.9 ApplicationToOpenFile(File as FolderItem) as FolderItem

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the URL to the default app to open the specified file.
Example:

```
var test as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var file As FolderItem = NSWorkspaceMBS.ApplicationToOpenFile(test)
MessageBox file.NativePath
```

Notes: Returns the FolderItem of the default app that would open the specified url. Returns nil if no app can open the FolderItem, or if the file does not exist.

This method is the programmatic equivalent of double-clicking a document in the Finder.
You can safely call this method from any thread of your app.

35.74.10 ApplicationToOpenURL(url as String) as FolderItem

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the URL to the default app to open the specified URL.
Example:

```
Var file As FolderItem = NSWorkspaceMBS.ApplicationToOpenURL("http://test")
MessageBox file.NativePath
```

Notes: Returns the URL of the default app that would open the specified url. Returns nil if no app can open the URL, or if the file URL does not exist.

This method is the programmatic equivalent of double-clicking a document in the Finder.
You can safely call this method from any thread of your app.

35.74.11 ApplicationWithBundleIdentifier(bundleIdentifier as String) as FolderItem

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the FolderItem to the default app with the specified bundle identifier.
Example:

```
// find preferred Xojo
Var file As FolderItem = NSWorkspaceMBS.ApplicationWithBundleIdentifier("com.xojo.xojo")
MessageBox file.NativePath
```

Notes: Returns the URL of the app, or nil if no app has the bundle identifier.

This method uses various heuristics in case multiple apps have the same bundle ID.
You can safely call this method from any thread of your app.

35.74.12 desktopImageOptionsForScreen(screen as NSScreenMBS) as dictionary

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the desktop image options for the given screen.
Example:

```
Var w as new NSWorkspaceMBS
Var m as NSScreenMBS = NSScreenMBS.mainScreen
Var dic as Dictionary = w.desktopImageOptionsForScreen(m)
```

```
break // check in debugger
```

Notes: screen: The screen for which to get the desktop image options.

Returns a dictionary containing key-value pairs. Keys can be NSWorkspaceDesktopImageScalingKey, NSWorkspaceDesktopImageAllowClippingKey or NSWorkspaceDesktopImageFillColorKey.
Available in Mac OS X v10.6 and later.

35.74.13 desktopImageURLForScreen(screen as NSScreenMBS) as folderitem

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the folderitem for the desktop image for the given screen.
Example:

```
Var w as new NSWorkspaceMBS
Var m as NSScreenMBS = NSScreenMBS.mainScreen
Var file as FolderItem = w.desktopImageURLForScreen(m)

MessageBox file.NativePath
```

Notes: screen: The screen for which to get the desktop image.
Returns the desktop image.
Available in Mac OS X v10.6 and later.

35.74.14 duplicateFiles(files() as FolderItem, tag as variant = nil)

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Duplicates the specified files asynchronously in the same manner as the Finder.
Notes: files: An array of FolderItem objects representing the files to duplicate. This parameter must not be nil.

Calls duplicateCompleted later when done.

This method may cause a progress indicator, or other user interface element, to be shown by the Finder.

In macOS 10.6, this method requires the app to run its main run loop in a common mode. You can safely call this method from any thread of your app.

35.74.15 fileLabelColors as NSColorMBS()

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the corresponding array of file label colors for the file labels.
Example:

```
Var w as new NSWorkspaceMBS
Var labels() as string = w.fileLabels
Var colors() as NSColorMBS = w.fileLabelColors
Var lines() as string

Var u as Integer = Colors.LastIndex
for i as Integer = 0 to u
Var co as NSColorMBS = colors(i)

lines.Add labels(i)+": "+str(co.colorValue)
next

MessageBox Join(lines,EndOfLine)
```

Notes: This array has the same number of elements as fileLabels, and the color at a given index corresponds to the label at the same index.

You can listen for notifications named NSWorkspaceDidChangeFileLabelsNotification to be notified when file labels change which may result in changes to the order of the fileLabelColors.

Available in Mac OS X v10.6 and later.

35.74.16 fileLabels as string()

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the array of file labels as strings.
Example:

```
Var w as new NSWorkspaceMBS
Var labels() as string = w.fileLabels

MessageBox Join(labels, EndOfLine)
```

Notes: You can listen for notifications named NSWorkspaceDidChangeFileLabelsNotification to be notified when file labels change.
Available in Mac OS X v10.6 and later.

35.74.17 findApplications

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Examines all applications and updates the records of registered services and file types.
Example:

```
NSWorkspaceMBS.findApplications
```

35.74.18 frontmostApplication as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets the frontmost application, which is the application that will receive key events.
Example:

```
Var w as new NSWorkspaceMBS
Var n as NSRunningApplicationMBS = w.frontmostApplication

MessageBox n.localizedName
```

Notes: Requires Mac OS X 10.7.

35.74.19 fullPathForApplication(appname as string) as folderitem

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the full path for the specified application.
Example:

```
MessageBox NSWorkspaceMBS.fullPathForApplication("textedit").ShellPath
// shows /Applications/TextEdit.app
```

Notes: The full path for the application, or nil if the specified application was not found.

35.74.20 hideOtherApplications

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Hides all applications other than the sender.
Example:

```
NSWorkspaceMBS.hideOtherApplications
```

Notes: The user can hide all applications except the current one by Command-Option-clicking on an application's Dock icon.

35.74.21 iconForContentType(contentType as string) as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an image containing the icon for the specified content type.
Example:

```
// query picture based on content type
Var image As NSImageMBS = NSWorkspaceMBS.iconForContentType("public.jpeg")

// make bigger
image.setSize 128,128

// now get picture to show
Backdrop = image.CopyPictureWithAlpha
```

Notes: contentType: An object representing a uniform type of content.

Returns the icon associated with the content type.

This method returns a default icon if the operation fails.

35.74.22 iconForFile(file as folderitem) as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an image containing the icon for the specified file.
Example:

```
Var f as FolderItem
f=SpecialFolder.Desktop.Child("test.txt")

Var n as NSImageMBS = NSWorkspaceMBS.iconForFile(f)
n.size = new NSSizeMBS(512,512)
Backdrop=n.CopyPictureWithMask
```

Notes: The returned image has an initial size of 32 pixels by 32 pixels.
Returns nil on any error.

35.74.23 iconForFiles(files() as folderitem) as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an image containing the icon for the specified files.
Example:

```
Var w as new NSWorkspaceMBS
Var files() as FolderItem

Var folder as FolderItem = SpecialFolder.Pictures

// one file
files.Add folder.TrueItem(2)
Canvas1.Backdrop = w.iconForFiles(files).CopyPictureWithMask

// two files
files.Add folder.TrueItem(3)
Canvas2.Backdrop = w.iconForFiles(files).CopyPictureWithMask

// three files
files.Add folder.TrueItem(4)
Canvas3.Backdrop = w.iconForFiles(files).CopyPictureWithMask
```

Notes: files: An array of folderitems, each of which contains the full path to a file.

Returns the icon associated with the group of files.

If fullPaths specifies one file, that file's icon is returned. If fullPaths specifies more than one file, an icon representing the multiple selection is returned.

35.74.24 iconForFileType(filetype as string) as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an image containing the icon for files of the specified type.
Example:

```
const SizeWanted = 512
const typeWanted = "txt"

Var n as NSImageMBS = NSWorkspaceMBS.iconForFileType(typeWanted)
// set size we want
n.setSize SizeWanted*2, SizeWanted*2
```

```
// make picture
Var p as Picture = n.CopyPictureWithMask

// set DPI
p.VerticalResolution = 144
p.HorizontalResolution = 144
```

Notes: filetype: The file type, which may be either a filename extension or an encoded HFS file type.

The returned image has an initial size of 32 pixels by 32 pixels.
Returns nil on any error.

Running this in a thread can lead to crashes.

35.74.25 isFilePackageAtPath(item as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Determines whether the specified path is a file package.
Example:

```
Var w as new NSWorkspaceMBS
Var file as FolderItem = SpecialFolder.Applications.Child("iTunes.app")

// shows true for iTunes
MessageBox str(w.isFilePackageAtPath(file))
```

Notes: Returns true if the path identifies a file package; otherwise, false if the path does not exist, is not a directory, or is not a file package.

35.74.26 launchApplication(appname as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Launches the specified application.
Example:

```
if NSWorkspaceMBS.launchApplication("Textedit") then
MessageBox "Ok"
else
MessageBox "failed"
end if
```

Notes: Returns true if the application was successfully launched or was already running; otherwise, false.

The appName parameter need not be specified with a full path and, in the case of an application wrapper, may be specified with or without the .app extension, as described in "Use of .app Extension".
See also:

- 35.74.27 launchApplication(appname as string, showicon as boolean, autolaunch as boolean) as boolean 6835

35.74.27 launchApplication(appname as string, showicon as boolean, autolaunch as boolean) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Launches the specified application using additional options.
Example:

```
if NSWorkspaceMBS.launchApplication("Textedit",false,false) then
MessageBox "Ok"
else
MessageBox "failed"
end if
```

Notes: appName: The name of the application to open.
showIcon: If false, the application's icon is not placed on the screen. (The icon still exists, though.)
autolaunch: If true, the autolaunch default is set as though the specified application were autolaunched at startup.

This method is provided to enable daemon-like applications that lack a normal user interface. Its use is not generally encouraged.
Returns true if the application is successfully launched or already running, and false if it can't be launched.
See also:

- 35.74.26 launchApplication(appname as string) as boolean 6834

35.74.28 launchApplicationAtFile(file as folderitem, options as UInt32 = 0, configuration as dictionary = nil) as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Launches the app at the specified file location.
Notes: file: The application folderitem.
options: Options to use when launching the application. see NSWorkspaceLaunch* constants.
configuration: A dictionary containing the configuration options. Possible key-value pairs are described NSWorkspaceLaunchConfiguration* functions.

error: The error is returned here.

Returns reference to newly started application.

Available in Mac OS X v10.6 and later.
See also:

- 35.74.29 launchApplicationAtFile(file as folderitem, options as UInt32, configuration as dictionary, byref error as NSErrorMBS) as NSRunningApplicationMBS 6836

35.74.29 launchApplicationAtFile(file as folderitem, options as UInt32, configuration as dictionary, byref error as NSErrorMBS) as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Launches the app at the specified file location.
Example:

```
Var w as new NSWorkspaceMBS
Var file as FolderItem = SpecialFolder.Applications.Child("Address Book.app")

Var error as NSErrorMBS
Var configuration as new Dictionary
Var options as Integer

// today we start 32 bit version
configuration.Value(w.NSWorkspaceLaunchConfigurationArchitecture) = w.NSBundleExecutableArchitectureI386

// and hide all others
options = w.NSWorkspaceLaunchAndHideOthers

Var r as NSRunningApplicationMBS = w.launchApplicationAtFile(file, options, configuration, error)

if r = nil then
MessageBox "Error: "+error.LocalizedDescription
else
MessageBox "Started: "+r.localizedName
end if
```

Notes: file: The application folderitem.
options: Options to use when launching the application. see NSWorkspaceLaunch* constants.
configuration: A dictionary containing the configuration options. Possible key-value pairs are described NSWorkspaceLaunchConfiguration* functions.

error: The error is returned here.

Returns reference to newly started application.

Available in Mac OS X v10.6 and later.
See also:

- 35.74.28 launchApplicationAtFile(file as folderitem, options as UInt32 = 0, configuration as dictionary = nil) as NSRunningApplicationMBS 6835

35.74.30 launchApplicationAtURL(URL as string, options as UInt32 = 0, configuration as dictionary = nil) as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Launches the app at the specified URL.
Notes: url: The application URL.
options: Options to use when launching the application. see NSWorkspaceLaunch* constants.
configuration: A dictionary containing the configuration options. Possible key-value pairs are described NSWorkspaceLaunchConfiguration* functions.
error: The error is returned here.

Returns reference to newly started application.

Available in Mac OS X v10.6 and later.
See also:

- 35.74.31 launchApplicationAtURL(URL as string, options as UInt32, configuration as dictionary, byref error as NSErrorMBS) as NSRunningApplicationMBS 6837

35.74.31 launchApplicationAtURL(URL as string, options as UInt32, configuration as dictionary, byref error as NSErrorMBS) as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Launches the app at the specified URL.
Notes: url: The application URL.
options: Options to use when launching the application. see NSWorkspaceLaunch* constants.
configuration: A dictionary containing the configuration options. Possible key-value pairs are described NSWorkspaceLaunchConfiguration* functions.
error: The error is returned here.

Returns reference to newly started application.

Available in Mac OS X v10.6 and later.
See also:

- 35.74.30 launchApplicationAtURL(URL as string, options as UInt32 = 0, configuration as dictionary = nil) as NSRunningApplicationMBS 6837

35.74.32 launchAppWithBundleIdentifier(bundleIdentifier as string, options as Integer = &h00030000, AppleEventDescriptor as Variant = nil) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Launches the application corresponding to the specified bundleIdentifier.
Notes: bundleIdentifier: A bundle identifier string. This value corresponds to the value in the CFBundleIdentifier key of the application's Info.plist file. For example, the bundle identifier of the TextEdit application is com.apple.TextEdit.
options: Options to use when launching the application. Values for this parameter are described in constants.
descriptor: Additional options specified in an AppleEvent-style descriptor. For example, you could use this parameter to specify additional documents to open when the application is launched.

Returns true if the application was found and launched; otherwise, false.

35.74.33 localizedDescriptionForType(typeName as string) as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the localized description for the specified Uniform Type Identifier.
Example:

```
MessageBox NSWorkspaceMBS.localizedDescriptionForType("public.jpeg")
// "JPEG-Bild" in German
```

Notes: The localized description is suitable for displaying to the user.
Available in Mac OS X v10.5 and later.

35.74.34 menuBarOwningApplication as NSRunningApplicationMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets the menu bar owning application, which is the application that currently owns and draws

the menu bar.
Example:

```
Var w as new NSWorkspaceMBS
Var n as NSRunningApplicationMBS = w.menuBarOwningApplication

MessageBox n.localizedName
```

Notes: Requires Mac OS X 10.7.

35.74.35 mountedLocalVolumePaths as string()

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the mount points of all local volumes, not just the removable ones returned by mountedRemovableMedia.
Example:

```
Var w as new NSWorkspaceMBS
Var paths() as string = w.mountedLocalVolumePaths

MessageBox Join(paths, EndOfLine)
```

Notes: Returns an array of strings, each of which contains the full pathname of the mount point for any local volumes.

35.74.36 mountedRemovableMedia as string()

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the full pathnames of all currently mounted removable disks.
Example:

```
Var w as new NSWorkspaceMBS
Var paths() as string = w.mountedRemovableMedia

MessageBox Join(paths, EndOfLine)
```

Notes: Returns an array of strings, each of which contains the full pathname of a mounted removable disk.

If the computer provides an interrupt or other notification when the user inserts a disk into a drive, the Finder will mount the disk immediately. However, if no notification is given, the Finder won't be aware that a disk needs to be mounted. On such systems, an application should invoke either mountNewRemovableMe-

dia or checkForRemovableMedia before invoking mountedRemovableMedia. Either of these methods cause the Finder to poll the drives to see if a disk is present. If a disk has been inserted but not yet mounted, these methods will cause the Finder to mount it.

The Disk button in an Open or Save panel invokes mountedRemovableMedia and mountNewRemovableMedia as part of its operation, so most applications won't need to invoke these methods directly.

35.74.37 noteFileSystemChanged

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Informs the NSWorkspace object that the file system has changed.
Notes: The NSWorkspace object then gets the status of all the files and directories it is interested in and updates itself appropriately. This method is used by many objects that write or delete files.

The NSDocument and NSSavePanel objects use this method when saving a file. If you create a file directly, you should call noteFileSystemChanged so that the Finder can update the folder if it is open.

Available in Mac OS X v10.0 and later. Deprecated in Mac OS X v10.6.
See also:

- 35.74.38 noteFileSystemChanged(path as folderitem) 6840

35.74.38 noteFileSystemChanged(path as folderitem)

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Informs the NSWorkspace object that the file system changed at the specified path.
Notes: The NSWorkspace object then gets the status of all the files and directories it is interested in and updates itself appropriately. This method is used by many objects that write or delete files.
See also:

- 35.74.37 noteFileSystemChanged 6840

35.74.39 notificationCenter as NSNotificationCenterMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the notification center for workspace notifications.

35.74.40 NSWorkspaceActiveSpaceDidChangeNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when a Spaces change has occurred.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.
Available in Mac OS X v10.6 and later.

35.74.41 NSWorkspaceApplicationKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: This constant is supplied in the userInfo dictionary of various notifications.
Notes: The value corresponding to this key is an instance of NSRunningApplication that reflects the affected application.
Available in Mac OS X v10.6 and later.

35.74.42 NSWorkspaceCompressOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the file operation modes.
Notes: Compress file. This operation always returns an error.

35.74.43 NSWorkspaceCopyOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the file operation modes.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test")
Var tag as Integer
Var files(-1) as string
Var b as Boolean
Var source,dest as FolderItem

// copies a file from one folder to another folder

source=f.Parent
files.Add f.name
dest=SpecialFolder.Pictures
```

b=NSWorkspaceMBS.performFileOperation(NSWorkspaceMBS.NSWorkspaceCopyOperation, source, dest, files, tag)

```
if b then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Copy file to destination.

35.74.44 NSWorkspaceDecompressOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the file operation modes.
Notes: Decompress file. This operation always returns an error.

35.74.45 NSWorkspaceDecryptOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the file operation modes.
Notes: Decrypt file. This operation always returns an error.

35.74.46 NSWorkspaceDesktopImageAllowClippingKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the options dictionary used with SetDesktopImageURL.
Notes: The value is a boolean, which affects the interpretation of Proportional scaling types. A false value will make the image fully visible, but there may be empty space on the sides or top and bottom. A true value will cause the image to fill the entire screen, but the image may be clipped. If this is not specified, false is assumed. Non-proportional scaling types ignore this value.
Available in Mac OS X v10.6 and later.

35.74.47 NSWorkspaceDesktopImageFillColorKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the options dictionary used with SetDesktopImageURL.
Notes: The value is an NSColor, which is used to fill any empty space around the image. If not specified, a default value is used. Currently, only colors that use or can be converted to use NSCalibratedRGBColorSpace are supported, and any alpha value is ignored.
Available in Mac OS X v10.6 and later.

35.74.48 NSWorkspaceDesktopImageScalingKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the options dictionary used with SetDesktopImageURL.
Notes: The value is an Number containing an NSImageScaling constant as declared in NSCell. If this is not specified, NSImageScaleProportionallyUpOrDown=3 is used. NSImageScaleProportionallyDown=0 is not currently supported.
Available in Mac OS X v10.6 and later.

35.74.49 NSWorkspaceDestroyOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the file operation modes.
Notes: Destroy file.

35.74.50 NSWorkspaceDidActivateApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when the Finder is about to activate an application.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.
Available in Mac OS X v10.6 and later.

35.74.51 NSWorkspaceDidChangeFileLabelsNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when the Finder file labels or colors change.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo

dictionary.
Available in Mac OS X v10.6 and later.

35.74.52 NSWorkspaceDidDeactivateApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when the Finder deactivated an application.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.
Available in Mac OS X v10.6 and later.

35.74.53 NSWorkspaceDidHideApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when the Finder hid an application.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.
Available in Mac OS X v10.6 and later.

35.74.54 NSWorkspaceDidLaunchApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when a new application has started up.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.

35.74.55 NSWorkspaceDidMountNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when a new device has been mounted.

The notification object is the shared NSWorkspace instance.

In Mac OS X v10.5 and earlier the userInfo dictionary contains a key @"NSDevicePath" that returns the path where the device was mounted, as a string.
Available in Mac OS X v10.0 and later.

35.74.56 NSWorkspaceDidPerformFileOperationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when a file operation has been performed in the receiving application.
The notification object is the shared NSWorkspace instance. The userInfo dictionary contains a key "NSOperationNumber" with a number containing an integer indicating the type of file operation
Available in Mac OS X v10.0 and later.

35.74.57 NSWorkspaceDidRenameVolumeNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when a volume changes its name and/or mount path. These typically change simultaneously, in which case only one notification is posted.
The notification object is the shared NSWorkspace instance.
Available in Mac OS X v10.6 and later.

35.74.58 NSWorkspaceDidTerminateApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when an application finishes executing.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.

Available in Mac OS X v10.0 and later.

35.74.59 NSWorkspaceDidUnhideApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when the Finder unhid an application.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.
Available in Mac OS X v10.6 and later.

35.74.60 NSWorkspaceDidUnmountNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when the Finder did unmount a device.
This notification is delivered even if a volume was forcibly and immediately made unavailable, such as when a drive is simply unplugged.

The notification object is the shared NSWorkspace instance. The userInfo dictionary contains a key "NSDevicePath" that returns the path where the device was mounted, as a string.
Available in Mac OS X v10.0 and later.

35.74.61 NSWorkspaceDidWakeNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when the machine wakes from sleep.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.
Available in Mac OS X v10.3 and later.

35.74.62 NSWorkspaceDuplicateOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the file operation modes.
Notes: Duplicate file in source directory.

35.74.63 NSWorkspaceEncryptOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the file operation modes.
Notes: Encrypt file. This operation always returns an error.

35.74.64 NSWorkspaceLaunchConfigurationAppleEvent as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the configuration dictionary for launchApplication* methods.
Notes: The value is the first NSAppleEventDescriptor to send to the new application. If an instance of the application is already running, this is sent to that application.
Available in Mac OS X v10.6 and later.

35.74.65 NSWorkspaceLaunchConfigurationArchitecture as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the configuration dictionary for launchApplication* methods.
Notes: The value is a number containing an Mach-O Architecture constant. Ignored if a new instance of the application is not launched.
Available in Mac OS X v10.6 and later.
See NSBundleExecutableArchitecture* constants.

35.74.66 NSWorkspaceLaunchConfigurationArguments as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the configuration dictionary for launchApplication* methods.
Notes: The value is an NSArray of NSStrings, passed to the new application in the argv parameter. Ignored if a new instance of the application is not launched.
Available in Mac OS X v10.6 and later.

35.74.67 NSWorkspaceLaunchConfigurationEnvironment as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the configuration dictionary for launchApplication* methods.
Notes: The value is an dictionary, mapping Strings to Strings, containing environment variables to set for the new app. Ignored if a new instance of the application is not launched.

Available in Mac OS X v10.6 and later.

35.74.68 NSWorkspaceLinkOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the file operation modes.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test")
Var tag as Integer
Var files(-1) as string
Var b as Boolean
Var source,dest as FolderItem

// creates a hard link to a file in a folder

source=f.Parent
files.Add f.name
dest=SpecialFolder.Pictures

b=NSWorkspaceMBS.performFileOperation(NSWorkspaceMBS.NSWorkspaceLinkOperation, source, dest,
files, tag)

if b then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Create hard link to file in destination.

35.74.69 NSWorkspaceMoveOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the file operation modes.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test")
Var tag as Integer
Var files(-1) as string
Var b as Boolean
Var source,dest as FolderItem
```

```
// moves a file from one folder to another folder

source=f.Parent
files.Add f.name
dest=SpecialFolder.Pictures

b=NSWorkspaceMBS.performFileOperation(NSWorkspaceMBS.NSWorkspaceMoveOperation, source, dest,
files, tag)

if b then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Move file to destination.

35.74.70 NSWorkspaceRecycleOperation as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the file operation modes.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test")
Var tag as Integer
Var files(-1) as string
Var b as Boolean
Var source,dest as FolderItem

source=f.Parent

files.Add f.name

b=NSWorkspaceMBS.performFileOperation(NSWorkspaceMBS.NSWorkspaceRecycleOperation, source, dest,
files, tag)

if b then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Move file to trash. The file is moved to the trash folder on the volume containing the file using the same semantics as NSWorkspaceMoveOperation. If a file with the same name currently exists in the trash

folder, the new file is renamed. If no trash folder exists on the volume containing the file, the operation fails.

35.74.71 NSWorkspaceScreensDidSleepNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when the machine's screen goes to sleep.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

Few applications are likely to be interested in this notification, but they may be useful for certain hardware-based drawing decisions, for example when using OpenGL.

Available in Mac OS X v10.6 and later.

35.74.72 NSWorkspaceScreensDidWakeNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when the machine's screens wake.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

Few applications are likely to be interested in this notification, but they may be useful for certain hardware-based drawing decisions, for example when using OpenGL.

Available in Mac OS X v10.6 and later.

35.74.73 NSWorkspaceSessionDidBecomeActiveNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted after a user session is switched in. This allows an application to re-enable some processing when a switched out session gets switched back in, for example.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

Available in Mac OS X v10.3 and later.

35.74.74 NSWorkspaceSessionDidResignActiveNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted before a user session is switched out. This allows an application to disable some processing when its user session is switched out, and re-enable when that session gets switched back in, for example. The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

If an application is launched in an inactive session, NSWorkspaceSessionDidResignActiveNotification is sent after NSApplicationWillFinishLaunchingNotification and before sending NSApplicationDidFinishLaunching-Notification.

Available in Mac OS X v10.3 and later.

35.74.75 NSWorkspaceVolumeLocalizedNameKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the userinfo dictionary for the NSWorkspaceDidRenameVolumeNotification notification.
Notes: String containing the user-visible name of the volume.
Available in Mac OS X v10.6 and later.

35.74.76 NSWorkspaceVolumeOldLocalizedNameKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the userinfo dictionary for the NSWorkspaceDidRenameVolumeNotification notification.
Notes: String containing the old user-visible name of the volume
Available in Mac OS X v10.6 and later.

35.74.77 NSWorkspaceVolumeOldURLKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the userinfo dictionary for the NSWorkspaceDidRenameVolumeNotification notification.
Notes: URL containing the old mount path of the volume
Available in Mac OS X v10.6 and later.

35.74.78 NSWorkspaceVolumeURLKey as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the userinfo dictionary for the NSWorkspaceDidRenameVolumeNotification notification.
Notes: URL containing the mount path of the volume.
Available in Mac OS X v10.6 and later.

35.74.79 NSWorkspaceWillLaunchApplicationNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when the Finder is about to launch an application.
The notification object is the shared NSWorkspace instance. In Mac OS X v10.6 and later the userInfo dictionary contains the NSWorkspaceApplicationKey key with a corresponding instance of NSRunningApplication that represents the affected application.

Available in Mac OS X v10.0 and later.

35.74.80 NSWorkspaceWillPowerOffNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when the user has requested a logout or that the machine be powered off.
The notification object is the shared NSWorkspace instance. This notification does not contain a userInfo dictionary.
Available in Mac OS X v10.0 and later.

35.74.81 NSWorkspaceWillSleepNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted before the machine goes to sleep. An observer of this message can delay sleep for up to 30 seconds while handling this notification.
The notification object is the shared NSWorkspace instance. The notification does not contain a userInfo dictionary.

Available in Mac OS X v10.3 and later.

35.74.82 NSWorkspaceWillUnmountNotification as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names.
Notes: Posted when the Finder is about to unmount a device.
This notification will not be delivered if a volume was forcibly and immediately made unavailable, such as when a FireWire drive is simply unplugged, because there is no chance to deliver it before the volume becomes unavailable.

The notification object is the shared NSWorkspace instance. The userInfo dictionary contains a key "NSDevicePath" that returns the path where the device was mounted, as a string.
Available in Mac OS X v10.0 and later.

35.74.83 openApplicationFile(Application as FolderItem, configuration as NSWorkspaceOpe ConfigurationMBS, tag as variant = nil)

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Launches the app at the specified URL and asynchronously reports back on the app,Äôs status.
Notes: application: A FolderItem specifying the location of the app in the file system.
configuration: The options that indicate how you want to launch the app.

Calls OpenCompleted event later.

35.74.84 openApplicationURL(ApplicationURL as String, configuration as NSWorkspaceOp ConfigurationMBS, tag as variant = nil)

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Launches the app at the specified URL and asynchronously reports back on the app,Äôs status.
Notes: applicationURL: A URL specifying the location of the app in the file system.

configuration: The options that indicate how you want to launch the app.

Calls OpenCompleted event later.

35.74.85 openFile(file as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Opens the specified file specified using the default application associated with its type.
Example:

```
Var f as FolderItem

f=SpecialFolder.Desktop.Child("test.txt")

if NSWorkspaceMBS.openFile(f) then
MessageBox "Ok"
else
MessageBox "failed"
end if
```

Notes: Returns true if the file was successfully opened; otherwise, false.
The sending application is deactivated before the request is sent.

- 35.74.86 openFile(File as FolderItem, Application as FolderItem, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6854
- 35.74.87 openFile(file as folderitem, appname as string) as boolean 6855
- 35.74.88 openFile(file as folderitem, appname as string, Deactivate as boolean) as boolean 6856
- 35.74.89 openFile(File as FolderItem, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6856

35.74.86 openFile(File as FolderItem, Application as FolderItem, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil)

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Opens a file asynchronously using the provided options.
Notes: File: The file to open.
application: A folderitem specifying the location of the app in the file system.
configuration: The options that indicate how you want to open the URL.

Calls OpenCompleted event later.

You may call this method safely from any thread of your app.

- 35.74.85 openFile(file as folderitem) as boolean 6854
- 35.74.87 openFile(file as folderitem, appname as string) as boolean 6855
- 35.74.88 openFile(file as folderitem, appname as string, Deactivate as boolean) as boolean 6856
- 35.74.89 openFile(File as FolderItem, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6856

35.74.87 openFile(file as folderitem, appname as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Opens a file using the specified application.
Example:

```
Var f as FolderItem
f=SpecialFolder.Desktop.Child("test.txt")

if NSWorkspaceMBS.openFile(f,"BBEdit") then
MessageBox "Ok"
else
MessageBox "failed"
end if
```

Notes: Returns true if the file was successfully opened; otherwise, false.

The appName parameter need not be specified with a full path and, in the case of an application wrapper, may be specified with or without the .app extension, as described in "Use of .app Extension". The sending application is deactivated before the request is sent.
See also:

- 35.74.85 openFile(file as folderitem) as boolean 6854
- 35.74.86 openFile(File as FolderItem, Application as FolderItem, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6854
- 35.74.88 openFile(file as folderitem, appname as string, Deactivate as boolean) as boolean 6856
- 35.74.89 openFile(File as FolderItem, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6856

35.74.88 openFile(file as folderitem, appname as string, Deactivate as boolean) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Opens the specified file and optionally deactivates the sending application.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.file")

if NSWorkspaceMBS.openFile(f,"BBEdit",true) then
MessageBox "Ok"
else
MessageBox "failed"
end if
```

Notes: appName: The name of the application to use when opening the file.

flag: If true, the sending application is deactivated before the request is sent, allowing the opening application to become the active application.

Returns true if the file was successfully opened; otherwise, false.

The appName parameter need not be specified with a full path and, in the case of an application wrapper, may be specified with or without the .app extension, as described in "Use of .app Extension". If appName is nil, the default application for the file's type is used.

- 35.74.86 openFile(File as FolderItem, Application as FolderItem, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6854
- 35.74.87 openFile(file as folderitem, appname as string) as boolean 6855
- 35.74.89 openFile(File as FolderItem, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6856

35.74.89 openFile(File as FolderItem, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil)

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Opens a file asynchronously using the provided options.
Example:

```
Var test As FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var workspace As New NSWorkspaceMBS
Var config As New NSWorkspaceOpenConfigurationMBS
config.architecture = config.CPUTypeX86_64
config.hidesOthers = True
config.promptsUserIfNeeded = true

workspace.openFile test, config
```

Notes: File: The file to open.
configuration: The options that indicate how you want to open the URL.

Calls OpenCompleted event later.

You may call this method safely from any thread of your app.
See also:

- 35.74.85 openFile(file as folderitem) as boolean 6854
- 35.74.86 openFile(File as FolderItem, Application as FolderItem, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6854
- 35.74.87 openFile(file as folderitem, appname as string) as boolean 6855
- 35.74.88 openFile(file as folderitem, appname as string, Deactivate as boolean) as boolean 6856

35.74.90 openURL(url as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Opens the location at the specified URL.
Example:

```
if NSWorkspaceMBS.openURL("http://www.apple.com") then
MessageBox "Ok"
else
MessageBox "failed"
end if
```

Notes: Returns true if the location was successfully opened; otherwise, false.
See also:

- 35.74.91 openURL(URL as String, ApplicationURL as String, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6858
- 35.74.92 openURL(url as string, bundleIdentifier as string, options as Integer = &h00030000, AppleEventDescriptor as Variant = nil) as Boolean 6858

- 35.74.93 openURL(URL as String, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6859

35.74.91 openURL(URL as String, ApplicationURL as String, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil)

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Opens a URL asynchronously using the provided options.
Notes: url: The URL to open.
applicationURL: A URL specifying the location of the app in the file system.
configuration: The options that indicate how you want to open the URL.

Calls OpenCompleted event later.

You may call this method safely from any thread of your app.
See also:

- 35.74.90 openURL(url as string) as boolean 6857
- 35.74.92 openURL(url as string, bundleIdentifier as string, options as Integer = &h00030000, AppleEventDescriptor as Variant = nil) as Boolean 6858
- 35.74.93 openURL(URL as String, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6859

35.74.92 openURL(url as string, bundleIdentifier as string, options as Integer = &h00030000, AppleEventDescriptor as Variant = nil) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Opens one or more files from an array of URLs.
Notes: url: A URL for the application to open.
bundleIdentifier: A bundle identifier string or "" to use the default system bindings. This value corresponds to the value in the CFBundleIdentifier key of the application's Info.plist file. For example, the bundle identifier of the TextEdit application is com.apple.TextEdit.
options: Options to use when launching the application. Values for this parameter are described in constants.
descriptor: Additional options specified in an AppleEvent-style descriptor. For example, you could use this parameter to specify additional documents to open when the application is launched.

Returns true if the application was found and launched; otherwise, false.
See also:

- 35.74.90 openURL(url as string) as boolean 6857

- 35.74.91 openURL(URL as String, ApplicationURL as String, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6858
- 35.74.93 openURL(URL as String, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6859

35.74.93 openURL(URL as String, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil)

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Opens a URL asynchronously using the provided options.
Notes: url: The URL to open.
configuration: The options that indicate how you want to open the URL.

Calls OpenCompleted event later.

You may call this method safely from any thread of your app.
See also:

- 35.74.90 openURL(url as string) as boolean 6857
- 35.74.91 openURL(URL as String, ApplicationURL as String, configuration as NSWorkspaceOpenConfigurationMBS, tag as variant = nil) 6858
- 35.74.92 openURL(url as string, bundleIdentifier as string, options as Integer = &h00030000, AppleEventDescriptor as Variant = nil) as Boolean 6858

35.74.94 performFileOperation(operation as string, source as folderitem, destination as folderitem, files() as string, byref tag as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Performs a file operation on a set of files in a particular directory.
Notes: operation: The file operation to perform. The possible values for this parameter are described in "Constants."

source: The full path to the directory containing the files on which to operate.

destination: The full path to the destination directory of the operation.

files: An array of folderitems specifying the names of the files and directories to be manipulated. Each string must not contain any path information other than the name of the file or directory. In other words, all of the files and directories must be located in the source directory and not in one if its subdirectories.

tag: On input, a integer variable; on return, this variable contains a negative integer if the operation fails, 0 if he operation was performed synchronously and succeeded, or a positive integer if the operation was performed asynchronously. If the value is a positive integer, the value is a tag that identifies the requested file operation.

Return Value: True if the operation succeeded; otherwise, false.

Discussion:
Some operations—such as moving, copying, and linking files—require a destination directory to be specified. If not, destination should be the empty string (""). Before this method returns, it posts an NSWorkspaceDidPerformFileOperationNotification to the NSWorkspace object's notification center.

35.74.95 preferredFilenameExtensionForType(typeName as string) as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the preferred filename extension for the specified Uniform Type Identifier.
Example:

```
MessageBox NSWorkspaceMBS.preferredFilenameExtensionForType("public.jpeg")
// "jpeg" in German
```

Notes: The appropriate filename extension for typeName, or "" if no extension could be determined.

35.74.96 recycleFiles(files() as FolderItem, tag as variant = nil)

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Moves the specified URLs to the trash in the same manner as the Finder.
Notes: files: An array of FolderItem objects representing the files to move to the trash. This parameter must not be nil.

Calls recycleCompleted later when done.

This method may cause a progress indicator, or other user interface element, to be shown by the Finder.

In macOS 10.6, this method requires the app to run the main run loop in a common mode to facilitate the display of any user interface elements. You can safely call this method from any thread of your app.

35.74.97 requestAuthorization(type as integer, tag as variant = nil)

MBS MacCocoa Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop only.

Function: Requests authorization to perform a privileged file operation.
Notes: type: The type of file operation to perform.

Calls requestAuthorizationCompleted event later.
Tag value is passed through as is to event.

Requires the application to be code-signed.

35.74.98 selectFile(file as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Selects the file in the Finder.
Example:

```
Var f as FolderItem

f=SpecialFolder.Desktop.Child("test.txt")

if NSWorkspaceMBS.selectFile(f) then
MessageBox "Ok"
else
MessageBox "failed"
end if
```

Notes: Returns true on success.

For Windows, please use WinOpenFolderAndSelectItemsMBS function.

35.74.99 setDesktopImageURL(file as folderitem, screen as NSScreenMBS, options as dictionary, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Sets the desktop image for the given screen to the image at the specified URL.
Notes: file: The image file. The file must not be nil.
screen: The screen to set the desktop image on.
options: The options dictionary may contain any of the Desktop Image Dictionary Keys (NSWorkspaceDesktopImageScalingKey, NSWorkspaceDesktopImageAllowClippingKey or NSWorkspaceDesktopImageFillCol-

orKey), which control how the image is scaled on the screen.
error: A error that is returned by-reference if setting the image fails.

Returns true if the image was set as the desktop, otherwise false. If false is returned, the error parameter provides additional information.

You should not present a user interface for picking the options. Instead, choose appropriate defaults and allow the user to adjust them in the System Preference Pane.

Available in Mac OS X v10.6 and later.

35.74.100 setIcon(image as NSImageMBS, file as folderitem, flags as Integer = 0) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the icon for the file or directory at the specified path.
Example:

```
Var f as FolderItem
Var p as Picture
Var img as NSImageMBS

f=SpecialFolder.Desktop.Child("test.txt")

p=New Picture(128,128,32)
p.Graphics.ForeColor=rgb(0,128,0)
p.Graphics.fillrect 0,0,128,128
p.Graphics.ForeColor=rgb(255,0,0)
p.Graphics.filloval 0,0,128,128

img=new NSImageMBS(p)

if NSWorkspaceMBS.setIcon(img,f,0) then
MessageBox "Ok. Icon may not be visible directly. Maybe you make a copy of the file to see it directly?"
else
MessageBox "failed"
end if
```

Notes: image: The image to use as the icon for the file or directory.
file: The full path of the file or directory.
flags: The icon representations to generate from the image. You specify this value by combining the appropriate NSWorkspaceIconCreationOptions constants, listed in Constants, using the C bitwise OR operator. Specify 0 if you want to generate icons in all available icon representation formats.

Returns true if the icon was set; otherwise, false.

The image can be an arbitrary image, with or without transparency. This image is automatically scaled (as needed) to generate the icon representations. The file or folder must exist and be writable by the user.

It is recommended that applications include the NSExclude10_4ElementsIconCreationOption option for compatibility with pre-Mac OS X v10.3 Finder. Icons that include the high resolution elements prevent custom icons from being displayed on earlier systems.

Before setting icon, make sure you close all Binarystream, Textoutputstream or other classes which may have the file open.
See also:

- 35.74.101 setIcon(image as NSImageMBS, path as string, flags as Integer = 0) as boolean 6863

35.74.101 setIcon(image as NSImageMBS, path as string, flags as Integer = 0) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the icon for the file or directory at the specified path.
Notes: image: The image to use as the icon for the file or directory.
path: The full path of the file or directory.
flags: The icon representations to generate from the image. You specify this value by combining the appropriate NSWorkspaceIconCreationOptions constants, listed in Constants, using the C bitwise OR operator. Specify 0 if you want to generate icons in all available icon representation formats.

Returns true if the icon was set; otherwise, false.

The image can be an arbitrary image, with or without transparency. This image is automatically scaled (as needed) to generate the icon representations. The file or folder must exist and be writable by the user.

It is recommended that applications include the NSExclude10_4ElementsIconCreationOption option for compatibility with pre-Mac OS X v10.3 Finder. Icons that include the high resolution elements prevent custom icons from being displayed on earlier systems.

Before setting icon, make sure you close all Binarystream, Textoutputstream or other classes which may have the file open.
See also:

- 35.74.100 setIcon(image as NSImageMBS, file as folderitem, flags as Integer = 0) as boolean 6862

35.74.102 showSearchResultsForQueryString(queryString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays a Spotlight search results window in Finder for the specified query string.
Notes: Returns true if the communication with Finder was successful, otherwise false.

Finder becomes the active application, if possible. The user can further refine the search via the Finder user interface.

Available in Mac OS X v10.6 and later.

35.74.103 typeOfFile(File as folderitem, byref error as NSErrorMBS) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the uniform type identifier of the specified file, if it can be determined.
Notes: file: The absolute path of the file.
Error: If the Uniform Type Identifier of the file at absolutePath can't be determined, outError contains an NSError object that describes why.

Returns a string containing the uniform type identifier of the file at absoluteFilePath. If no UTI can be determined the return value is "".

If the file at the specified path is a symbolic link, the type of the symbolic link is returned.
See also:

- 35.74.104 typeOfFile(Path as string, byref error as NSErrorMBS) as string 6865

35.74.104 typeOfFile(Path as string, byref error as NSErrorMBS) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the uniform type identifier of the specified file, if it can be determined.
Notes: file: The absolute path of the file.
Error: If the Uniform Type Identifier of the file at absolutePath can't be determined, outError contains an NSError object that describes why.

Returns a string containing the uniform type identifier of the file at absoluteFilePath. If no UTI can be determined the return value is "".

If the file at the specified path is a symbolic link, the type of the symbolic link is returned.
See also:

- 35.74.103 typeOfFile(File as folderitem, byref error as NSErrorMBS) as string 6865

35.74.105 unmountAndEjectDevice(item as folderitem, byref e as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Unmounts and ejects the device at the specified path.
Example:

```
Var w as new NSWorkspaceMBS
Var disk as FolderItem = Volume(VolumeCount-1)
```

```
MessageBox disk.Name

Var e as NSErrorMBS
if w.unmountAndEjectDevice(disk, e) then
MessageBox "OK"
else
MessageBox "Error: "+e.localizedDescription
end if
```

Notes: Returns true if the volume was unmounted and ejected successfully, otherwise false, for example, if the volume is not ejectable.
error: If the operation fails, this error contains more information about the failure.

35.74.106 URLForApplicationToOpenURL(url as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the URL to the default application that would be used to open the given URL.
Notes: url: The URL of the file to open.

Returns the URL of the default application that would open the specified url. Returns "" if no application is able to open the url, or if the file url does not exist.

This is the programmatic equivalent of double clicking a document in the Finder.

35.74.107 URLForApplicationWithBundleIdentifier(bundleIdentifier as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the URL for the application with the specified identifier.
Notes: bundleIdentifier: A bundle identifier specifying an application.

Returns the URL of the application, or "" if no application has the bundle identifier.
This uses various (currently unspecified) heuristics in case multiple apps have the same bundle ID.

35.74.108 Properties

35.74.109 accessibilityDisplayShouldDifferentiateWithoutColor as Boolean

MBS MacCocoa Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the current accessibility display option for differentiate without color.
Notes: If this is true, UI should not convey information using color alone and instead should use shapes or glyphs to convey information. You may listen for NSWorkspaceAccessibilityDisplayOptionsDidChangeNotification to be notified when this changes.
(Read only property)

35.74.110 accessibilityDisplayShouldIncreaseContrast as Boolean

MBS MacCocoa Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A Boolean value that indicates whether the app should present a high contrast user interface.
Notes: When this method returns true, present a high contrast UI. For example, use a less subtle color palette or bolder lines.
(Read only property)

35.74.111 accessibilityDisplayShouldInvertColors as Boolean

MBS MacCocoa Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the current accessibility display option for invert colors.
Notes: If this property's value is true then the display will be inverted. In these cases it may be needed for UI drawing to be adjusted to in order to display optimally when inverted. You may listen for NSWorkspaceAccessibilityDisplayOptionsDidChangeNotification to be notified when this changes.

Available on MacOS 10.12 or newer.
(Read only property)

35.74.112 accessibilityDisplayShouldReduceMotion as Boolean

MBS MacCocoa Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the current accessibility display option for reduce motion.
Notes: If this property's value is true, UI should avoid large animations, especially those that simulate the third dimension. You may listen for NSWorkspaceAccessibilityDisplayOptionsDidChangeNotification to be notified when this changes.
Available on MacOS 10.12 or newer.

(Read only property)

35.74.113 accessibilityDisplayShouldReduceTransparency as Boolean

MBS MacCocoa Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get the current accessibility display option for reduce transparency.
Notes: If this property's value is true, UI (mainly window) backgrounds should not be semi-transparent; they should be opaque. You may listen for NSWorkspaceAccessibilityDisplayOptionsDidChangeNotification to be notified when this changes.
(Read only property)

35.74.114 isSwitchControlEnabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates if Switch Control is currently running.
Notes: (Read only property)

35.74.115 isVoiceOverEnabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates if VoiceOver is currently running.
Notes: (Read only property)

35.74.116 Events

35.74.117 duplicateCompleted(files() as FolderItem, Mapping as Dictionary, error as NSErrorMBS, tag as Variant)

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called when duplicateFiles completed.
Notes: files: An array of FolderItem objects representing the files to duplicate.

Mapping: A dictionary parameter whose keys and values are FolderItem objects. Each key is a FolderItem from the files parameter. The value of each key is a FolderItem representing the location of the duplicated file. If this method could not duplicate a file, the corresponding FolderItem is not included in the dictionary.

error: If the operation succeeded for every file, this parameter is nil. If the operation failed for one or more files, the parameter contains an error object describing the overall result of the operation in a manner suitable for presentation to the user.

35.74.118 openCompleted(item as Variant, application as Variant, configuration as NSWorkspaceOpenConfigurationMBS, runningApp as NSRunningApplicationMBS, error as NSErrorMBS, tag as Variant)

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event is called asynchronously when one of the open async methods finishes.
Notes: We provide the folderitem or URL in item.
If you asked to open an application, we provide the URL or folderitem here.

runningApp: On success, this parameter contains a reference to the launched app. If the app wasn,Äôt launched, this parameter is nil.
error: On failure, this parameter contains an NSErrorMBS object indicating the reason for the failure. If the app launched successfully, this parameter is nil.

35.74.119 recycleCompleted(files() as FolderItem, Mapping as Dictionary, error as NSErrorMBS, tag as Variant)

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event called when recycleFiles completed.
Notes: files: An array of FolderItem objects representing the files to move to the trash.

Mapping: A dictionary that maps the file,Äôs original location to its location in the trash. Each key is a FolderItem from the files parameter. The value of each key is a FolderItem representing the location of the file in the trash. If this method could not move a file to the trash, the corresponding FolderItem is not included in the dictionary.

error: If the operation succeeded for every file, this parameter is nil. If the operation failed for one or more files, the parameter contains an error object describing the overall result of the operation in a manner suitable for presentation to the user.

35.74.120 requestAuthorizationCompleted(type as Integer, authorization as NSWorkspaceAuthorizationMBS, error as NSErrorMBS, tag as variant)

MBS MacCocoa Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The request for authorization completed.
Notes: type: The type of file operation requested.
authorization: The authorization granted for this app. Use it when creating a new NSFileManagerMBS with fileManagerWithAuthorization function.
error: nil if the app is authorized; otherwise, a pointer to the authorization error.

The completion event to call when the authorization request is completed.

35.74.121 Constants

Constants

Constant	Value	Description
NSExclude10_4ElementsIconCreationOption	4	One of the possible constants you can use with SetIc
NSExcludeQuickDrawElementsIconCreationOption	2	One of the possible constants you can use with SetIc
NSWorkspaceLaunchAndHide	&h00100000	One of the constants for the launch functions.
NSWorkspaceLaunchAndHideOthers	&h00200000	One of the constants for the launch functions.
NSWorkspaceLaunchAndPrint	2	One of the constants for the launch functions.
NSWorkspaceLaunchAsync	&h00010000	One of the constants for the launch functions.
NSWorkspaceLaunchDefault	&h00010000	One of the constants for the launch functions.
NSWorkspaceLaunchInhibitingBackgroundOnly	&h00000080	One of the constants for the launch functions.
NSWorkspaceLaunchNewInstance	&h00080000	One of the constants for the launch functions.
NSWorkspaceLaunchWithErrorPresentation	&h00000040	One of the constants for the launch functions.
NSWorkspaceLaunchWithoutActivation	&h00000200	One of the constants for the launch functions.
NSWorkspaceLaunchWithoutAddingToRecents	&h00000100	One of the constants for the launch functions.

Architectures

Constant	Value	Description
NSBundleExecutableArchitectureARM64	&h0100000c	Specifies the 64-bit ARM architecture.
NSBundleExecutableArchitectureI386	&h00000007	Intel 32 bit.
NSBundleExecutableArchitecturePPC	&h00000012	PPC 32 bit.
NSBundleExecutableArchitecturePPC64	&h01000012	PPC 64 bit.
NSBundleExecutableArchitectureX86_64	&h01000007	Intel 64 bit.

Authorization Types

Constant	Value	Description
NSWorkspaceAuthorizationTypeCreateSymbolicLink	0	Authorization for the app to create a symoblic link.
NSWorkspaceAuthorizationTypeReplaceFile	2	Authorization for the app to perform an atomic file write w target file's permissions.
NSWorkspaceAuthorizationTypeSetAttributes	1	Authorization for the app to change specific file attributes

35.75 class NSWorkspaceOpenConfigurationMBS

35.75.1 class NSWorkspaceOpenConfigurationMBS

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: The configuration options for opening URLs or launching apps.
Example:

```
// open a file with a given application in the background
// MyWorkspace is a subclass of NSWorkspaceMBS with the openCompleted event implemented.
// Workspace is a property of the window: Workspace As MyWorkspace
Var config As New NSWorkspaceOpenConfigurationMBS
config.activates = False // keep our app in front
config.addsToRecentItems = False

Var file As FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var app As FolderItem = SpecialFolder.Applications.Child("TextEdit.app")

Workspace = New MyWorkspace
Workspace.openFile file, app, config

// in MyWorkspace:
Sub openCompleted(item As Variant, application As Variant, configuration As NSWorkspaceOpenConfigurationMBS, runningApp As NSRunningApplicationMBS, error As NSErrorMBS, tag As Variant) Handles openCompleted
If error <>Nil Then
System.DebugLog "Failed: " + error.localizedDescription
End If
End Sub
```

Notes: Create an NSWorkspaceOpenConfigurationMBS object before launching an app or opening a URL using the shared NSWorkspaceMBS object. Use the properties of this object to customize the behavior of the launched app or the handling of the URLs. For example, you might tell the app to hide itself immediately after launch.

35.75.2 Methods

35.75.3 arguments as string()

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The set of command-line arguments to pass to a new app instance at launch time.
Notes: The default value of this property is an empty array. When launching a new instance of an app, use this property to specify any additional launch arguments. The system inserts the app,Äôs path as the first element in the array.
If the calling process is sandboxed, the system ignores the value of this property.

35.75.4 configuration as NSWorkspaceOpenConfigurationMBS

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: Creates and returns a new workspace configuration object containing default values.

35.75.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: The constructor.

35.75.6 copy as NSWorkspaceOpenConfigurationMBS

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: Creates a copy of this configuration.

35.75.7 setArguments(arguments() as string)

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the set of command-line arguments to pass to a new app instance at launch time.
Notes: The default value of this property is an empty array. When launching a new instance of an app, use this property to specify any additional launch arguments. The system inserts the app,Äôs path as the first element in the array.
If the calling process is sandboxed, the system ignores the value of this property.

35.75.8 Properties

35.75.9 activates as Boolean

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the system activates the app and brings it to the foreground.
Notes: The default value of this property is true, which causes the system to bring the app to the foreground.
(Read and Write property)

35.75.10 addsToRecentItems as Boolean

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether to add the app or documents to the Recent Items menu.
Notes: The default value of this property is true, which causes AppKit to add the items to the Recent Items menu.
(Read and Write property)

35.75.11 allowsRunningApplicationSubstitution as Boolean

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether to use a running instance of an application even if it,Äôs at a different URL.
Notes: If an instance of an application is already running and is capable of opening the provided URLs, but the running instance is at a different URL, use the running application.

This property defaults to true. Set this to false if you let the user select between specific versions of an application, or let them choose a particular installation.
(Read and Write property)

35.75.12 appleEvent as Variant

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: The first Apple event to send to the new app.
Notes: The default value of this property is nil, which causes the system to send a default Apple event, as needed. The system sends the event only if an instance of the app is already running.

This is an NSAppleEventDescriptorMBS object. But to avoid dependencies, we use a variant here.

(Read and Write property)

35.75.13 architecture as Integer

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: The architecture version of the app to launch.
Example:

```
Var c As New NSWorkspaceOpenConfigurationMBS

// run Apple Silicon
c.architecture = c.CPUTypeARM64
```

Notes: The default value of this property is CPUTypeAny, which causes the system to launch the app,Äôs preferred architecture. You may specify a different value to force the system to launch that architecture.
(Read and Write property)

35.75.14 createsNewApplicationInstance as Boolean

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether you want the system to launch a new instance of the app.
Notes: When the value of this property is true, the system always launches a new version of the app, even if an existing copy is already running. The default value of this property is false, which causes the system to open the already running app when present.
(Read and Write property)

35.75.15 environment as Dictionary

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: The set of environment variables to set in a new app instance.
Notes: The default value of this property is an empty dictionary. When launching a new instance of an app, use this property to specify the key/value pairs for any environment variables.

If the calling process is sandboxed, the system ignores the value of this property.
(Read and Write property)

35.75.16 ForPrinting as Boolean

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether you want to print the contents of documents and URLs instead of opening them.
Notes: The default value of this property is false, which causes the app to open documents and URLs. Set the value to true if you want the app to print the items instead.
(Read and Write property)

35.75.17 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

35.75.18 hides as Boolean

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether you want the app to hide itself after it launches.
Notes: The default value of this property is false, which leaves the app in its default state after launch. Setting the property to true causes the app to hide itself.
(Read and Write property)

35.75.19 hidesOthers as Boolean

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether you want to hide all apps except the one that launched.
Notes: The default value of this property is false, which leaves the visibility of other apps unchanged. Setting the property to true hides all apps except the one that launched.
(Read and Write property)

35.75.20 promptsUserIfNeeded as Boolean

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether to display errors, authentication requests, or other UI elements to the user.
Notes: When the value of this property is true, the system presents a user interface to request or display

relevant information. The system waits until the user dismisses the UI before calling any relevant completion handlers. The default value of this property is true.
(Read and Write property)

35.75.21 requiresUniversalLinks as Boolean

MBS MacCocoa Plugin, Plugin Version: 26.1, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether you require the URL to have an associated universal link.
Notes: The default value of this property is false, which tells the app to open any URL you provide. Set the value to true when you want the app to open only valid universal links.
The app must be specifically configured to open universal links, and attempts to open such links fail with an appropriate error if the app isn,Äôt properly configured. Attempts may also fail with an error if the user disabled support for opening links with the specified app.
(Read and Write property)

35.75.22 Constants

CPU Types

Constant	Value	Description
CPUTypeAny	-1	Any CPU
CPUTypeARM	12	32-bit ARM
CPUTypeARM64	&h0100000C	64-bit ARM
CPUTypeX86	7	32-bit Intel
CPUTypeX86_64	&h01000007	64-bit Intel

Chapter 36

Cocoa Collection View

36.1 control DesktopNSCollectionViewControlMBS

36.1.1 control DesktopNSCollectionViewControlMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control to host a NSCollectionView within Xojo.
Notes: Requires macOS 10.11 or newer!

36.1.2 Methods

36.1.3 performBatchUpdates(tag as variant)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Encapsulates multiple insert, delete, reload, and move operations into a single animated operation.
Notes: Use this method to make multiple changes to the collection view in one single animated operation. Normally, when you insert, delete, reload, or move items, the collection view animates each change separately. Making those same changes inside the updates block causes them to be animated at the same time. This method updates the current layout information as needed before and after performing the operations in the updates block.

The order in which you make calls to insert, delete, or otherwise modify the collection view is ignored. When executing your updates block, this method gathers information about the operations you requested without performing those operations. After it gathers that information, the method reorders the operations and performs all deletion operations first, followed by all insertion operations and then all move operations. (Reloading an item is treated as a delete operation followed by an insert operation at the same location.) As a result, the indexes you specify for each set of operations must reflect the changes made by any preceding operations.

You may call this method from inside your performBatchUpdatesWork or performBatchUpdatesCompleted events.

This method calls performBatchUpdatesWork event, where you can perform the work and later performBatchUpdatesCompleted event when finished.

36.1.4 Properties

36.1.5 ScrollView as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The scroll view used around the collection view.
Notes: (Read only property)

36.1.6 View as NSCollectionViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The reference to the NSCollectionView object.
Notes: (Read only property)

36.1.7 Events

36.1.8 acceptDrop(draggingInfo as NSDraggingInfoMBS, indexPath as NSIndexPathMBS, dropOperation as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Incorporates the dropped content into the collection view.
Notes: draggingInfo: The information about the drag operation.
indexPath: The index path at which the drop occurred. Use this location as the insertion point for the content.
dropOperation: The type of drop operation to perform.

Return true if the drop operation should be accepted or false if it should be rejected.

The collection view calls this event when the user releases the mouse button while it is over a valid drop target. This event is called after the validateDrop method validates that dropping the content at the specified location is possible. You must implement this event to accept the dropped content and incorporate it into the collection view.

In your implementation, use the information in the draggingInfo parameter to retrieve the data, update your data source object, and insert the appropriate items into the collection view. The dropped data is stored in the draggingPasteboard property of the dragging information object.

If the animatesToDestination property of the dragging information is true, update the image and frame for each dragged item to its new location in the collection view.

36.1.9 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

36.1.10 cancelPrefetchingForItems(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Notifies your 'prefetchDataSource' that items at the specified 'indexPaths', for which the CollectionView previously sent prefetchItems evnet, are no longer expected to be displayed.
Notes: This is a good opportunity to cancel any pending resource fetches you've initiated for the items, if possible and worthwhile. This is only sent for items that don't end up being displayed; CollectionView doesn't cancel prefetching for items that it actually instantiates and shows.

36.1.11 canDragItems(indexPaths() as NSIndexPathMBS, NSEvent as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean indicating whether a drag operation involving the specified items can begin.
Notes: indexPaths: The index paths of the items about to be dragged.
event: The mouse-down event that began the drag operation.

Return true if the drag operation can begin or false if it cannot.

If you do not implement this event, the collection view assumes a return value of true.

36.1.12 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

36.1.13 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

36.1.14 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

36.1.15 didChangeItems(indexPaths() as NSIndexPathMBS, highlightState as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks the delegate to approve the pending highlighting of the specified items.
Notes: indexPaths: The array of NSIndexPathMBS objects corresponding to the items being highlighted.
highlightState: The new highlight state for the items.

Returns the array of NSIndexPath objects corresponding to the items that you want to receive the specified highlight. If you do not want any items to receive the specified highlight state, return an empty set.

Use this method to approve or modify the set of items targeted to receive the specified highlight state. During interactive selection or dragging, the collection view calls this method when actions occur that would affect the highlight state of items. Your implementation of the method can return the proposed set of index paths as-is or modify the set and disallow the highlighting of some or all of the items. Removing items from the set suppresses the corresponding actions, such as selecting the item or showing its eligibility as a drop target.

If you do not implement this method, the collection view updates the highlight state for the items specified by the indexPaths parameter.

36.1.16 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

36.1.17 didDeselectItems(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate object that one or more items were deselected.
Notes: indexPaths: The array of NSIndexPathMBS objects corresponding to the items that were deselected.

After the user successfully deselects one or more items, the collection view calls this method to let you know that the items are no longer selected. Use this method to respond to the selection change and to make any necessary adjustments to your content or the collection view.
This method is not called when you set the selection programmatically using the methods of the NSCollectionViewMBS class.

36.1.18 didEndDisplayingItem(item as NSCollectionViewItemMBS, indexPath as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate that the specified item was removed from the collection view.
Notes: item: The item that was removed.
indexPath: The index path of the item.

The collection view calls this method after removing an item from its content. You can use this method to track the removal of items and perform related tasks.

36.1.19 didEndDisplayingSupplementaryView(view as NSViewMBS, elementKind as String, indexPath as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate that the specified supplementary view was removed from the collection view.
Notes: view: The supplementary view that was removed.

elementKind: The type of the supplementary view. Layouts are responsible for defining the types of supplementary views they support.
indexPath: The index path associated with the supplementary view.

The collection view calls this method after removing a supplementary view from its content. You can use this method to track the removal of views and perform related tasks.

36.1.20 didSelectItems(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate object that one or more items were selected.
Notes: collectionView: The collection view notifying you of the selection change.
indexPaths: The array of NSIndexPathMBS objects corresponding to the items that are now selected.

After the user successfully selects one or more items, the collection view calls this method to let you know that the selection has been made. Use this method to respond to the selection change and to make any necessary adjustments to your content or the collection view.
This method is not called when you set the selection programmatically using the methods of the NSCollectionViewMBS class.

36.1.21 draggingImageForItems(indexPaths() as NSIndexPathMBS, NSEvent as NSEventMBS, byref dragImageOffset as NSPointMBS) as NSImageMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a drag image to represent the specified items during a drag.
Notes: indexPaths: The index paths of the items being dragged.
NSEvent: The mouse-down event that began the drag operation. You can use the mouse location when determining what value to return in the dragImageOffset parameter.
dragImageOffset: The offset value to use when positioning the image. On input, the point is NSZeroPoint, which centers the returned image under the mouse. Your method can return a different point that repositions the drag image by the specified offset values.

Return the image to use for the dragged items.

Your implementation of this event should create an appropriate image to use during the drag operation. The collection view places the center of your image at the current mouse location. Update the value in the dragImageOffset parameter to shift the position of your image by the specified amount.
If you do not implement this event, the collection view uses the drag image returned by the draggingImageForItemsAtIndexPaths method instead.

36.1.22 draggingSessionEnded(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, dragOperation as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Notifies your delegate that a drag session ended.
Notes: session: The dragging session that ended.
screenPoint: The end point (in screen coordinates) for the drag operation.
operation: The operation that was performed. Use this value to determine how the operation ended. For example, for content that was dragged to the trash, the operation type would be NSDragOperationDelete (32).

You can use this method to perform tasks related to the ending of a drag session.

36.1.23 draggingSessionWillBegin(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Notifies your delegate that a drag session is about to begin.
Notes: session: The dragging session that is about to begin.
screenPoint: The starting point (in screen coordinates) for the drag operation. (in Cocoa coordinate system with bottom = zero)
indexPaths: The index paths of the items being dragged.

You can use this method to modify the dragging session or to perform other tasks related to the beginning of a drag session.

36.1.24 FocusLost

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

36.1.25 FocusReceived

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

36.1.26 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

36.1.27 insetForSectionAtIndex(layout as NSCollectionViewLayoutMBS, section as Integer) as NSEdgeInsetsMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks you for the margins to apply to content in the specified section.
Notes: collectionViewLayout: The layout object requesting the information.
section: The index of the section whose margins are needed.

Return the margins to apply to items in the specified section.

Implement this method when you want to provide margins for sections in the flow layout. Your implementation can return the same margins for all sections or it can return different margins for different sections. You can also adjust the margins of each section dynamically each time you update the layout. If you do not implement this method, the margins are obtained from the properties of the flow layout object.

The insets you return reflect the spacing between the items and the header and footer views of the section. They also reflect the spacing at the edges of a single row or column. For more information about how insets are applied, see the description of the sectionInset property.

36.1.28 ItemApplyLayoutAttributes(item as NSCollectionViewItemMBS, layoutAttributes as NSCollectionViewLayoutAttributesMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Applies the specified layout attributes to the element.
Notes: In your custom elements, you can use this method to apply the specified attributes to your content. For example, if your element object is a view controller, you would override this method and use it to apply the attributes to the root view object. When using your element with a layout object that supports custom attributes, you would also use this method to apply those custom attributes.

36.1.29 ItemDidTransition(item as NSCollectionViewItemMBS, oldLayout as NSCollectionViewLayoutMBS, newLayout as NSCollectionViewLayoutMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the element that the layout object of the collection view changed.
Notes: oldLayout: The collection view,Äôs previous layout object.
newLayout: The current layout object associated with the collection view.

The default implementation of this method does nothing. Subclasses can override it and use it to finalize any behaviors associated with the change in layouts.

In OS X 10.11, this method is never called.

36.1.30 itemForRepresentedObject(indexPath as NSIndexPathMBS) as NSCollectionViewItemMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks your data source object to provide the item at the specified location in the collection view.
Notes: indexPath: The index path that specifies the location of the item. This index path contains both the section index and the item index within that section.

Returns a configured item object. You must not return nil from this method.

All data source objects must implement this method. Your implementation is responsible for creating, configuring, and returning the appropriate item object based on the specified index path. You do this by calling the makeItem() method of the collection view to retrieve an empty item object of the appropriate type. After receiving the item object, update its properties with the data from your app,Äôs data structures and return it.
You do not need to set the frame of an item,Äôs view from this method. The collection view gets the

item,Äôs location and other layout-related attributes from the layout object during a separate step.

36.1.31 ItemPreferredLayoutAttributesFittingAttributes(item as NSCollectionViewItemMBS, layoutAttributes as NSCollectionViewLayoutAttributesMBS) as NSCollectionViewLayoutAttributesMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks your element if it wants to modify any layout attributes before they are applied.
Notes: layoutAttributes: The attributes provided by the layout object. These attributes represent the values that the layout object intends to apply to the element.

Return the final attributes to apply to the element.

The default implementation of this method returns the same attributes that are in the layoutAttributes parameter. You can override this method in subclasses and use it to return a different set of attributes. If you override this method, call super first to give the system the opportunity to make changes, then modify the returned attributes.

36.1.32 ItemPrepareForReuse(item as NSCollectionViewItemMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Performs any necessary cleanup to prepare the element for use again.
Notes: The recycling of content is an important technique for improving performance of a collection view. Instead of creating all views from scratch, the collection view recycles views and view controllers that move offscreen. When your app subsequently calls the makeItem or makeSupplementaryViewOfKind method, the collection view retrieves a recycled object from the appropriate storage, calls this method, and then returns the object to your app.

Implement this method when you need to delete old data or when you want to restore your recycled views to a standard initial state prior to their reuse. For example, you might use this method to restore the size of a view to some standard size or reset the alpha to 1.0 to ensure that the view is fully opaque. Do not use this method to configure the view with new data. Restoring your views to a default state in this method simplifies the configuration code you must write in your data source object later.

36.1.33 ItemWillTransition(item as NSCollectionViewItemMBS, oldLayout as NSCollectionViewLayoutMBS, newLayout as NSCollectionViewLayoutMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the element that the layout object of the collection view is about to change.
Notes: oldLayout: The current layout object used by the collection view.
newLayout: The new layout object that is about to be used by the collection view.

The default implementation of this method does nothing. Subclasses can override it and use it to prepare for the change in layouts.

Special Considerations
In OS X 10.11, this method is never called.

36.1.34 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

36.1.35 minimumInteritemSpacingForSectionAtIndex(layout as NSCollectionViewLayoutMBS, section as Integer) as double

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks you for the spacing between successive items of a single row or column.
Notes: collectionViewLayout: The layout object requesting the information.
section: The index of the section whose inter-item spacing is needed.

Return the minimum space (in points) to apply between successive items in a single row or column.

Implement this method when you want to provide custom inter-item spacing for sections in the flow layout. Your implementation can return the same spacing for all sections or it can return different spacing for different sections. You can also adjust the inter-item spacing of each section dynamically each time you update the layout. If you do not implement this method, the inter-item spacing is obtained from the properties of the flow layout object.

For a vertically scrolling layout, this value represents the minimum spacing between items in the same row. For a horizontally scrolling layout, this value represents the minimum spacing between items in the same column. The layout object uses this spacing only to compute how many items can fit in a single row or column. The actual spacing may be increased after the number of items has been determined. For more information about how inter-item spacing is applied, see the description of the minimumInteritemSpacing property.

36.1.36 minimumLineSpacingForSectionAtIndex(layout as NSCollectionViewLayoutMBS, section as Integer) as double

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks you for the spacing between successive rows or columns of a section.
Notes: collectionViewLayout: The layout object requesting the information.
section: The index of the section whose line spacing is needed.

Returns the minimum space (in points) to apply between successive lines in a section.

Implement this method when you want to provide custom line spacing for sections in the flow layout. Your implementation can return the same line spacing for all sections or it can return different line spacing for different sections. You can also adjust the line spacing of each section dynamically each time you update the layout. If you do not implement this method, the line spacing is obtained from the properties of the flow layout object.

For a vertically scrolling layout, this value represents the minimum spacing between successive rows. For a horizontally scrolling layout, this value represents the minimum spacing between successive columns. This spacing is not applied to the space between the header and the first line or between the last line and the footer. For more information about how line spacing is applied, see the description of the minimumLineSpacing property.

36.1.37 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

36.1.38 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

36.1.39 MouseUp(x As Integer, y As Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

36.1.40 namesOfPromisedFilesDroppedAtDestination(dropURL as String, indexPaths() as NSIndexPathMBS) as String()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the names of the promised files that you created for a drag operation.
Notes: dropURL: The URL at which to create the promised files.
indexPaths: The index paths of the dragged items.

Return an array of strings containing the filenames you created, or intend to create, at the specified URL.

At the start of a drag operation, your app must provide the data that constitutes the items being dragged. If you specify a file promise, instead of the data itself, use this method to specify the names of the files you promised. If the files already exist, move them to the directory specified by the dropURL parameter. If you must create the files first, use this method to specify the names of the files you intend to provide and begin creating those files asynchronously on a background thread.

The filenames you return are made available from the namesOfPromisedFilesDroppedAtDestination method of the NSDraggingInfo object passed around during the drag operation.

36.1.41 numberOfItemsInSection(section as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks your data source object to provide the number of items in the specified section.
Notes: All data source objects must implement this event. Your implementation should quickly return the number of items in the specified section.
Make sure the number of items you return is accurate. The itemForRepresentedObject event must be able to provide a visual representation for each item in the section.

36.1.42 numberOfSections as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks your data source object to provide the total number of sections.
Notes: Implement this method when the organization of your data requires more than one section. If you do not implement this method, the collection view creates only one section.

36.1.43 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

36.1.44 pasteboardWriterForItem(indexPath as NSIndexPathMBS) as NSPasteboardItemMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Provides the pasteboard writer for the item at the specified index path.
Notes: collectionView: The collection view making the request.
indexPath: The index path of the item requiring a pasteboard writer.

Returns the pasteboard writer object to use for managing the item data. Return nil to prevent the collection view from dragging the item.

You must implement this method or the collectionView:writeItemsAtIndexPaths method to support drag operations. The collection view calls this method in preference over the writeItemsAtIndexPaths method if both are implemented. If your app supports multi-image drag and drop, you must implement this method.

The collection view calls this method for each item involved in the drag operation after it has determined that a drag should begin but before the drag operation has started. Your implementation of this method

should create and return the pasteboard writer—an object conforming to the NSPasteboardWriting protocol—to use for providing the item,Äôs data. Using the object you provide, the collection view creates an NSDraggingItem object for you and configures its draggingFrame and imageComponents properties for you using information from the item at the specified index path.
If you implement this method, the collection view does not call the draggingImageForItemsAtIndexPaths of your delegate or the draggingImageForItemsAtIndexPaths method of NSCollectionView.

36.1.45 performBatchUpdatesCompleted(tag as variant, finished as boolean)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A event to execute when the changes made in the performBatchUpdatesWork events have finished animating.
Notes: finished: A Boolean value indicating whether the animations completed successfully. The value of this parameter is true if the animations ran to completion or false if they were interrupted.

36.1.46 performBatchUpdatesWork(tag as variant)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event that performs the needed inset, delete, reload, or move operations.

36.1.47 prefetchItems(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Notifies your 'prefetchDataSource' that items at the specified 'indexPaths' are likely to be instantiated and displayed soon.
Notes: The CollectionView sends this as early as possible, to give your 'prefetchDataSource' the opportunity to begin acquiring any resources such as thumbnail images or metadata that you might need in order to prepare the item's content for display. The given 'indexPaths' are sorted by the order in which they are likely to be needed.

36.1.48 referenceSizeForFooterInSection(layout as NSCollectionViewLayoutMBS, section as Integer) as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks you for the size of the footer view in the specified section.
Notes: collectionViewLayout: The layout object requesting the information.

section: The index of the section whose footer size is requested.

The size of the footer. Return NSZeroSize if you do not want a footer added to the section.

If you implement this method, the flow layout object calls it to obtain the size of the footer in each section and uses that information to set the size of the corresponding views. If you do not implement this method, the footer size is obtained from the properties of the flow layout object.

The flow layout object uses only one of the returned size values. For a vertically scrolling layout, the layout object uses the height value. For a horizontally scrolling layout, the layout object uses the width value. The other value is sized appropriately to match the opposing dimension of the collection view itself. Set the size of the footer to 0 to prevent it from being displayed.

36.1.49 referenceSizeForHeaderInSection(layout as NSCollectionViewLayoutMBS, section as Integer) as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks you for the size of the header view in the specified section.
Notes: collectionViewLayout: The layout object requesting the information.
section: The index of the section whose header size is requested.

Returns the size of the header. Return NSZeroSize if you do not want a header added to the section.

If you implement this method, the flow layout object calls it to obtain the size of the header in each section and uses that information to set the size of the corresponding views. If you do not implement this method, the header size is obtained from the properties of the flow layout object.

The flow layout object uses only one of the returned size values. For a vertically scrolling layout, the layout object uses the height value. For a horizontally scrolling layout, the layout object uses the width value. The other value is sized appropriately to match the opposing dimension of the collection view itself. Set the size of the header to 0 to prevent it from being displayed.

36.1.50 ScaleFactorChanged(NewFactor as double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

36.1.51 shouldChangeItems(indexPaths() as NSIndexPathMBS, highlightState as Integer) as NSIndexPathMBS()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks the delegate to approve the pending highlighting of the specified items.
Notes: indexPaths: The set of NSIndexPathMBS objects corresponding to the items being highlighted.
highlightState: The new highlight state for the items.

Return the set of NSIndexPath objects corresponding to the items that you want to receive the specified highlight. If you do not want any items to receive the specified highlight state, return an empty set.

Use this method to approve or modify the set of items targeted to receive the specified highlight state. During interactive selection or dragging, the collection view calls this method when actions occur that would affect the highlight state of items. Your implementation of the method can return the proposed set of index paths as-is or modify the set and disallow the highlighting of some or all of the items. Removing items from the set suppresses the corresponding actions, such as selecting the item or showing its eligibility as a drop target.
If you do not implement this method, the collection view updates the highlight state for the items specified by the indexPaths parameter.

36.1.52 shouldDeselectItems(indexPaths() as NSIndexPathMBS) as NSIndexPathMBS()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks the delegate object to approve the pending deselection of items.
Notes: indexPaths: The array of NSIndexPathMBS objects corresponding to the items deselected by the user.

Return the array of NSIndexPathMBS objects corresponding to the items that you want to be deselected. If you do not want any items deselected, return an empty set.

Use this method to approve or modify the items that the user tries to deselect. During interactive selection, the collection view calls this method whenever the user deselects items. Your implementation of the method can return the proposed set of index paths as-is or modify the set before returning it. You might modify the set to disallow the deselection of specific items.

This method is not called when you set the selection programmatically using the methods of the NSCollectionViewMBS class. If you do not implement this method, the collection view deselects the items specified by the indexPaths parameter.

36.1.53 shouldSelectItems(indexPaths() as NSIndexPathMBS) as NSIndexPathMBS()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks the delegate to approve the pending selection of items.
Notes: indexPaths: The array of NSIndexPathMBS objects corresponding to the items selected by the user.

Returns the array of NSIndexPathMBS objects corresponding to the items that you want to be selected. If you do not want any items selected, return an empty array.

Use this method to approve or modify the items that the user tries to select. During interactive selection, the collection view calls this method whenever the user selects new items. Your implementation of the method can return the proposed set of index paths as-is or modify the set before returning it. You might modify the set to disallow the selection of specific items or specific combinations of items.

This method is not called when you set the selection programmatically using the methods of the NSCollectionViewMBS class. If you do not implement this method, the collection view selects the items specified by the indexPaths parameter.

36.1.54 sizeForItemAtIndexPath(layout as NSCollectionViewLayoutMBS, indexPath as NSIndexPathMBS) as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks you for the size of the specified item.
Notes: collectionViewLayout: The layout object requesting the information.
indexPath: The index path of the item.

Return the size of the item. The width and height values must both be greater than 0. Items must also not exceed the available space in the collection view.

Implement this method when you want to provide the size of items in the flow layout. Your implementation can return the same size for all items or it can return different sizes for items. You can also adjust the size of items dynamically each time you update the layout. If you do not implement this method, the size of items is obtained from the properties of the flow layout object.

The size value you return from this method must allow the item to be displayed fully by the collection view. In the scrolling direction, items can be larger than the collection view because the remaining content can always be scrolled into view, but in the nonscrolling directions, items should always be smaller than the collection view itself. For example, the width of an item in a vertically scrolling collection view must not exceed the width of the collection view minus any section insets. The flow layout does not crop an item,Äôs bounds to make it fit into the available space.

36.1.55 transitionLayout(fromLayout as NSCollectionViewLayoutMBS, toLayout as NSCollectionViewLayoutMBS) as NSCollectionViewTransitionLayoutMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the transition layout object to use when performing an animated change between different layouts.
Notes: fromLayout: The current layout object of the collection view. This is the starting point for the transition.
toLayout: The new layout for the collection view.

Return the collection view transition layout object to use to perform the transition.

When changing layouts for a collection view, you can use this method to customize the transition layout object used to make the change. A transition layout object lets you customize the behavior of collection view elements when transitioning from one layout to the next. Normally, transitioning between layouts causes the assorted items and views to animate from their current locations directly to their new locations. By returning a custom transition object, you could have those elements follow a nonlinear path, use a different timing algorithm, or move items in response to touch events.

If you do not implement this method in your delegate object, the collection view uses a standard UICollectionViewTransitionLayout object for the transition.

Special Considerations
In OS X 10.11, this method is never called by the collection view.

36.1.56 updateDraggingItemsForDrag(draggingInfo as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks your delegate to update the dragging items during a drag operation.
Notes: draggingInfo: The current information for the drag operation. Use this object to iterate over the dragging items.

You can use this method to update the current drag items while a drag is in progress. Updating the drag items is optional, but you might use this method to change the image for an item. For example, you might change the image when the mouse hovers over a particular part of the collection view. Use the enumerateDraggingItems method of the draggingInfo parameter to iterate over the drag items and update them as appropriate.

36.1.57 validateDrop(draggingInfo as NSDraggingInfoMBS, byref proposedIndexPath as NSIndexPathMBS, byref dropOperation as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Validates whether a drop operation is possible at the specified location.
Notes: draggingInfo: The information about the drag operation.
proposedDropIndexPath: The index path at which the drop would occur. This parameter is passed by-reference and can be modified to change the proposed index path.
proposedDropOperation: The type of drop operation being proposed. This parameter is passed by-reference and can be modified to change the drop operation type.

Returns a value that indicates which dragging operation to perform. Return NSDragOperationNone to disallow a drop at the proposed location.

Although implementation of this method is optional, you must implement it to support drops onto the associated collection view. You must also call the collection view,Äôs registerForDraggedTypes method to register the types of drops it supports. If you do not perform both of these actions, the collection view does not accept drops.

When an interactive drag operation occurs, the collection view calls this method to determine whether the current mouse location is a valid place to drop the content. This method may be called many times during the course of the drag operation. Your implementation should look at the proposed location and return a constant that reflects how the drop would be handled.
While validating the drop location, you can suggest a better drop location by updating the values in the proposedDropIndexPath and proposedDropOperation parameters. For example, you might suggest dropping the content before the specified item instead of on it. The collection view sets the proposedDropOperation parameter to DropOn when the mouse is closer to the middle of an item than to its edges; otherwise, it sets the parameter to DropBefore.

36.1.58 viewForSupplementaryElement(kind as String, indexPath as NSIndexPathMBS) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks your data source object to provide the supplementary view at the specified location in a section of the collection view.
Notes: kind: The kind of supplementary view to provide. The value of this string is defined by the current layout object associated with the collection view. Layouts may define additional views to add visual content that is unrelated to specific items.
indexPath: The index path that identifies the section in which to place the supplementary view.

Returns a configured view object. You must not return nil from this method.

Implement this method if the collection view,Äôs layout object supports supplementary views. Your implementation is responsible for creating, configuring, and returning an appropriate view. You do this by calling the makeSupplementaryViewOfKind method of the collection view to retrieve an unconfigured view of the appropriate type. After receiving the view, update its properties and content using your app,Äôs data structures and return it.
You do not need to set the location of supplementary views inside the collection view,Äôs bounds. The collection view gets the view,Äôs location and other layout-related attributes from the layout object during a separate step.

36.1.59 willDisplayItem(item as NSCollectionViewItemMBS, indexPath as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate that the specified item is about to be displayed by the collection view.
Notes: item: The item being added.
indexPath: The index path of the item.

The collection view calls this method before adding new items to its content. You can use this method to track the addition of items and perform related tasks.

36.1.60 willDisplaySupplementaryView(view as NSViewMBS, elementKind as String, indexPath as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate that the specified supplementary view is about to be displayed by the collection view.
Notes: view: The supplementary view being added.
elementKind: The type of the supplementary view. Layouts are responsible for defining the types of supplementary views they support.
indexPath: The index path associated with the supplementary view.

The collection view calls this method before adding new supplementary views to its content. You can use this method to track the addition of those views and perform related tasks.

36.1.61 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

36.1.62 writeItems(indexPaths() as NSIndexPathMBS, Pasteboard as NSPasteboardMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Places the data for the drag operation on the pasteboard.
Notes: indexPaths: The index paths of the items being dragged.
pasteboard: The pasteboard on which to place the drag data.

Return true if the drag operation can continue or no if you want to refuse the drag.

The collection view calls this method after it has determined that a drag should begin but before the drag operation has started. Your implementation of this method should do the following:

- Declare the pasteboard types you support using the declareTypes method of the provided pasteboard object.
- Write data to the pasteboard for each type you declare.
- Return true from this event.

36.1.63 Constants

Drop Operation

Constant	Value	Description
DropBefore	1	The drop occurs before the collection view item to which the item was dragged.
DropOn	0	The drop occurs at the collection view item to which the item was dragged.

36.2 control NSCollectionViewControlMBS

36.2.1 control NSCollectionViewControlMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The control to host a NSCollectionView within Xojo.
Notes: Requires macOS 10.11 or newer!

36.2.2 Methods

36.2.3 performBatchUpdates(tag as variant)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Encapsulates multiple insert, delete, reload, and move operations into a single animated operation.
Notes: Use this method to make multiple changes to the collection view in one single animated operation. Normally, when you insert, delete, reload, or move items, the collection view animates each change separately. Making those same changes inside the updates block causes them to be animated at the same time. This method updates the current layout information as needed before and after performing the operations in the updates block.

The order in which you make calls to insert, delete, or otherwise modify the collection view is ignored. When executing your updates block, this method gathers information about the operations you requested without performing those operations. After it gathers that information, the method reorders the operations and performs all deletion operations first, followed by all insertion operations and then all move operations. (Reloading an item is treated as a delete operation followed by an insert operation at the same location.) As a result, the indexes you specify for each set of operations must reflect the changes made by any preceding operations.

You may call this method from inside your performBatchUpdatesWork or performBatchUpdatesCompleted events.

This method calls performBatchUpdatesWork event, where you can perform the work and later performBatchUpdatesCompleted event when finished.

36.2.4 Properties

36.2.5 ScrollView as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The scroll view used around the collection view.
Notes: (Read only property)

36.2.6 View as NSCollectionViewMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The reference to the NSCollectionView object.

Notes: (Read only property)

36.2.7 Events

36.2.8 acceptDrop(draggingInfo as NSDraggingInfoMBS, indexPath as NSIndexPathMBS, dropOperation as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Incorporates the dropped content into the collection view.
Notes: draggingInfo: The information about the drag operation.
indexPath: The index path at which the drop occurred. Use this location as the insertion point for the content.
dropOperation: The type of drop operation to perform.

Return true if the drop operation should be accepted or false if it should be rejected.

The collection view calls this event when the user releases the mouse button while it is over a valid drop target. This event is called after the validateDrop method validates that dropping the content at the specified location is possible. You must implement this event to accept the dropped content and incorporate it into the collection view.

In your implementation, use the information in the draggingInfo parameter to retrieve the data, update your data source object, and insert the appropriate items into the collection view. The dropped data is stored in the draggingPasteboard property of the dragging information object.

If the animatesToDestination property of the dragging information is true, update the image and frame for each dragged item to its new location in the collection view.

36.2.9 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

36.2.10 cancelPrefetchingForItems(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Notifies your 'prefetchDataSource' that items at the specified 'indexPaths', for which the Col-

lectionView previously sent prefetchItems evnet, are no longer expected to be displayed.
Notes: This is a good opportunity to cancel any pending resource fetches you've initiated for the items, if possible and worthwhile. This is only sent for items that don't end up being displayed; CollectionView doesn't cancel prefetching for items that it actually instantiates and shows.

36.2.11 canDragItems(indexPaths() as NSIndexPathMBS, NSEvent as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean indicating whether a drag operation involving the specified items can begin.
Notes: indexPaths: The index paths of the items about to be dragged.
event: The mouse-down event that began the drag operation.

Return true if the drag operation can begin or false if it cannot.

If you do not implement this event, the collection view assumes a return value of true.

36.2.12 Close

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

36.2.13 Closing

Plugin Version: 21.0, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

36.2.14 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

36.2.15 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

36.2.16 didChangeItems(indexPaths() as NSIndexPathMBS, highlightState as Integer)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Asks the delegate to approve the pending highlighting of the specified items.
Notes: indexPaths: The array of NSIndexPathMBS objects corresponding to the items being highlighted.
highlightState: The new highlight state for the items.

Returns the array of NSIndexPath objects corresponding to the items that you want to receive the specified highlight. If you do not want any items to receive the specified highlight state, return an empty set.

Use this method to approve or modify the set of items targeted to receive the specified highlight state. During interactive selection or dragging, the collection view calls this method when actions occur that would affect the highlight state of items. Your implementation of the method can return the proposed set of index paths as-is or modify the set and disallow the highlighting of some or all of the items. Removing items from the set suppresses the corresponding actions, such as selecting the item or showing its eligibility as a drop target.

If you do not implement this method, the collection view updates the highlight state for the items specified by the indexPaths parameter.

36.2.17 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

36.2.18 didDeselectItems(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate object that one or more items were deselected.
Notes: indexPaths: The array of NSIndexPathMBS objects corresponding to the items that were deselected.

After the user successfully deselects one or more items, the collection view calls this method to let you know that the items are no longer selected. Use this method to respond to the selection change and to make any necessary adjustments to your content or the collection view.
This method is not called when you set the selection programmatically using the methods of the NSCollectionViewMBS class.

36.2.19 didEndDisplayingItem(item as NSCollectionViewItemMBS, indexPath as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate that the specified item was removed from the collection view.
Notes: item: The item that was removed.
indexPath: The index path of the item.

The collection view calls this method after removing an item from its content. You can use this method to track the removal of items and perform related tasks.

36.2.20 didEndDisplayingSupplementaryView(view as NSViewMBS, elementKind as String, indexPath as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate that the specified supplementary view was removed from the collection view.
Notes: view: The supplementary view that was removed.
elementKind: The type of the supplementary view. Layouts are responsible for defining the types of supplementary views they support.
indexPath: The index path associated with the supplementary view.

The collection view calls this method after removing a supplementary view from its content. You can use this method to track the removal of views and perform related tasks.

36.2.21 didSelectItems(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate object that one or more items were selected.
Notes: collectionView: The collection view notifying you of the selection change.
indexPaths: The array of NSIndexPathMBS objects corresponding to the items that are now selected.

After the user successfully selects one or more items, the collection view calls this method to let you know that the selection has been made. Use this method to respond to the selection change and to make any necessary adjustments to your content or the collection view.
This method is not called when you set the selection programmatically using the methods of the NSCollectionViewMBS class.

36.2.22 draggingImageForItems(indexPaths() as NSIndexPathMBS, NSEvent as NSEventMBS, byref dragImageOffset as NSPointMBS) as NSImageMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a drag image to represent the specified items during a drag.
Notes: indexPaths: The index paths of the items being dragged.
NSEvent: The mouse-down event that began the drag operation. You can use the mouse location when determining what value to return in the dragImageOffset parameter.
dragImageOffset: The offset value to use when positioning the image. On input, the point is NSZeroPoint, which centers the returned image under the mouse. Your method can return a different point that repositions the drag image by the specified offset values.

Return the image to use for the dragged items.

Your implementation of this event should create an appropriate image to use during the drag operation. The collection view places the center of your image at the current mouse location. Update the value in the dragImageOffset parameter to shift the position of your image by the specified amount.
If you do not implement this event, the collection view uses the drag image returned by the draggingImageForItemsAtIndexPaths method instead.

36.2.23 draggingSessionEnded(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, dragOperation as Integer)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Notifies your delegate that a drag session ended.
Notes: session: The dragging session that ended.

screenPoint: The end point (in screen coordinates) for the drag operation.
operation: The operation that was performed. Use this value to determine how the operation ended. For example, for content that was dragged to the trash, the operation type would be NSDragOperationDelete (32).

You can use this method to perform tasks related to the ending of a drag session.

36.2.24 draggingSessionWillBegin(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Notifies your delegate that a drag session is about to begin.
Notes: session: The dragging session that is about to begin.
screenPoint: The starting point (in screen coordinates) for the drag operation. (in Cocoa coordinate system with bottom = zero)
indexPaths: The index paths of the items being dragged.

You can use this method to modify the dragging session or to perform other tasks related to the beginning of a drag session.

36.2.25 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

36.2.26 FocusLost

Plugin Version: 21.0, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

36.2.27 FocusReceived

Plugin Version: 21.0, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

36.2.28 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

36.2.29 GotFocus

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

36.2.30 insetForSectionAtIndex(layout as NSCollectionViewLayoutMBS, section as Integer) as NSEdgeInsetsMBS

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: Asks you for the margins to apply to content in the specified section.
Notes: collectionViewLayout: The layout object requesting the information.
section: The index of the section whose margins are needed.

Return the margins to apply to items in the specified section.

Implement this method when you want to provide margins for sections in the flow layout. Your implemen-

tation can return the same margins for all sections or it can return different margins for different sections. You can also adjust the margins of each section dynamically each time you update the layout. If you do not implement this method, the margins are obtained from the properties of the flow layout object.

The insets you return reflect the spacing between the items and the header and footer views of the section. They also reflect the spacing at the edges of a single row or column. For more information about how insets are applied, see the description of the sectionInset property.

36.2.31 ItemApplyLayoutAttributes(item as NSCollectionViewItemMBS, layoutAttributes as NSCollectionViewLayoutAttributesMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Applies the specified layout attributes to the element.
Notes: In your custom elements, you can use this method to apply the specified attributes to your content. For example, if your element object is a view controller, you would override this method and use it to apply the attributes to the root view object. When using your element with a layout object that supports custom attributes, you would also use this method to apply those custom attributes.

36.2.32 ItemDidTransition(item as NSCollectionViewItemMBS, oldLayout as NSCollectionViewLayoutMBS, newLayout as NSCollectionViewLayoutMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Tells the element that the layout object of the collection view changed.
Notes: oldLayout: The collection view,Äôs previous layout object.
newLayout: The current layout object associated with the collection view.

The default implementation of this method does nothing. Subclasses can override it and use it to finalize any behaviors associated with the change in layouts.

In OS X 10.11, this method is never called.

36.2.33 itemForRepresentedObject(indexPath as NSIndexPathMBS) as NSCollectionViewItemMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Asks your data source object to provide the item at the specified location in the collection view.
Notes: indexPath: The index path that specifies the location of the item. This index path contains both

the section index and the item index within that section.

Returns a configured item object. You must not return nil from this method.

All data source objects must implement this method. Your implementation is responsible for creating, configuring, and returning the appropriate item object based on the specified index path. You do this by calling the makeItem() method of the collection view to retrieve an empty item object of the appropriate type. After receiving the item object, update its properties with the data from your app,Äôs data structures and return it.
You do not need to set the frame of an item,Äôs view from this method. The collection view gets the item,Äôs location and other layout-related attributes from the layout object during a separate step.

36.2.34 ItemPreferredLayoutAttributesFittingAttributes(item as NSCollectionViewItemMBS, layoutAttributes as NSCollectionViewLayoutAttributesMBS) as NSCollectionViewLayoutAttributesMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Asks your element if it wants to modify any layout attributes before they are applied.
Notes: layoutAttributes: The attributes provided by the layout object. These attributes represent the values that the layout object intends to apply to the element.

Return the final attributes to apply to the element.

The default implementation of this method returns the same attributes that are in the layoutAttributes parameter. You can override this method in subclasses and use it to return a different set of attributes. If you override this method, call super first to give the system the opportunity to make changes, then modify the returned attributes.

36.2.35 ItemPrepareForReuse(item as NSCollectionViewItemMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Performs any necessary cleanup to prepare the element for use again.
Notes: The recycling of content is an important technique for improving performance of a collection view. Instead of creating all views from scratch, the collection view recycles views and view controllers that move offscreen. When your app subsequently calls the makeItem or makeSupplementaryViewOfKind method, the collection view retrieves a recycled object from the appropriate storage, calls this method, and then returns the object to your app.

Implement this method when you need to delete old data or when you want to restore your recycled views

to a standard initial state prior to their reuse. For example, you might use this method to restore the size of a view to some standard size or reset the alpha to 1.0 to ensure that the view is fully opaque. Do not use this method to configure the view with new data. Restoring your views to a default state in this method simplifies the configuration code you must write in your data source object later.

36.2.36 ItemWillTransition(item as NSCollectionViewItemMBS, oldLayout as NSCollectionViewLayoutMBS, newLayout as NSCollectionViewLayoutMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Tells the element that the layout object of the collection view is about to change.
Notes: oldLayout: The current layout object used by the collection view.
newLayout: The new layout object that is about to be used by the collection view.

The default implementation of this method does nothing. Subclasses can override it and use it to prepare for the change in layouts.

Special Considerations
In OS X 10.11, this method is never called.

36.2.37 LostFocus

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

36.2.38 MenuBarSelected

Plugin Version: 21.0, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

36.2.39 minimumInteritemSpacingForSectionAtIndex(layout as NSCollectionViewLayoutMBS, section as Integer) as double

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: Asks you for the spacing between successive items of a single row or column.
Notes: collectionViewLayout: The layout object requesting the information.
section: The index of the section whose inter-item spacing is needed.

Return the minimum space (in points) to apply between successive items in a single row or column.

Implement this method when you want to provide custom inter-item spacing for sections in the flow layout. Your implementation can return the same spacing for all sections or it can return different spacing for different sections. You can also adjust the inter-item spacing of each section dynamically each time you update the layout. If you do not implement this method, the inter-item spacing is obtained from the properties of the flow layout object.

For a vertically scrolling layout, this value represents the minimum spacing between items in the same row. For a horizontally scrolling layout, this value represents the minimum spacing between items in the same column. The layout object uses this spacing only to compute how many items can fit in a single row or column. The actual spacing may be increased after the number of items has been determined. For more information about how inter-item spacing is applied, see the description of the minimumInteritemSpacing property.

36.2.40 minimumLineSpacingForSectionAtIndex(layout as NSCollectionViewLayoutMBS, section as Integer) as double

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: Asks you for the spacing between successive rows or columns of a section.
Notes: collectionViewLayout: The layout object requesting the information.
section: The index of the section whose line spacing is needed.

Returns the minimum space (in points) to apply between successive lines in a section.

Implement this method when you want to provide custom line spacing for sections in the flow layout. Your implementation can return the same line spacing for all sections or it can return different line spacing for different sections. You can also adjust the line spacing of each section dynamically each time you update the layout. If you do not implement this method, the line spacing is obtained from the properties of the flow layout object.

For a vertically scrolling layout, this value represents the minimum spacing between successive rows. For a horizontally scrolling layout, this value represents the minimum spacing between successive columns. This

spacing is not applied to the space between the header and the first line or between the last line and the footer. For more information about how line spacing is applied, see the description of the minimumLineSpacing property.

36.2.41 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

36.2.42 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

36.2.43 MouseUp(x As Integer, y As Integer)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

36.2.44 namesOfPromisedFilesDroppedAtDestination(dropURL as String, indexPaths() as NSIndexPathMBS) as String()

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the names of the promised files that you created for a drag operation.
Notes: dropURL: The URL at which to create the promised files.
indexPaths: The index paths of the dragged items.

Return an array of strings containing the filenames you created, or intend to create, at the specified URL.

At the start of a drag operation, your app must provide the data that constitutes the items being dragged. If you specify a file promise, instead of the data itself, use this method to specify the names of the files you promised. If the files already exist, move them to the directory specified by the dropURL parameter. If you must create the files first, use this method to specify the names of the files you intend to provide and begin creating those files asynchronously on a background thread.

The filenames you return are made available from the namesOfPromisedFilesDroppedAtDestination method of the NSDraggingInfo object passed around during the drag operation.

36.2.45 numberOfItemsInSection(section as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Asks your data source object to provide the number of items in the specified section.
Notes: All data source objects must implement this event. Your implementation should quickly return the number of items in the specified section.
Make sure the number of items you return is accurate. The itemForRepresentedObject event must be able to provide a visual representation for each item in the section.

36.2.46 numberOfSections as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Asks your data source object to provide the total number of sections.
Notes: Implement this method when the organization of your data requires more than one section. If you do not implement this method, the collection view creates only one section.

36.2.47 Open

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

36.2.48 Opening

Plugin Version: 21.0, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

36.2.49 pasteboardWriterForItem(indexPath as NSIndexPathMBS) as NSPasteboardItemMBS

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: Provides the pasteboard writer for the item at the specified index path.
Notes: collectionView: The collection view making the request.
indexPath: The index path of the item requiring a pasteboard writer.

Returns the pasteboard writer object to use for managing the item data. Return nil to prevent the collection view from dragging the item.

You must implement this method or the collectionView:writeItemsAtIndexPaths method to support drag operations. The collection view calls this method in preference over the writeItemsAtIndexPaths method if both are implemented. If your app supports multi-image drag and drop, you must implement this method.

The collection view calls this method for each item involved in the drag operation after it has determined that a drag should begin but before the drag operation has started. Your implementation of this method should create and return the pasteboard writer—an object conforming to the NSPasteboardWriting protocol—to use for providing the item,Äôs data. Using the object you provide, the collection view creates an NSDraggingItem object for you and configures its draggingFrame and imageComponents properties for you using information from the item at the specified index path.
If you implement this method, the collection view does not call the draggingImageForItemsAtIndexPaths of your delegate or the draggingImageForItemsAtIndexPaths method of NSCollectionView.

36.2.50 performBatchUpdatesCompleted(tag as variant, finished as boolean)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A event to execute when the changes made in the performBatchUpdatesWork events have finished animating.
Notes: finished: A Boolean value indicating whether the animations completed successfully. The value of this parameter is true if the animations ran to completion or false if they were interrupted.

36.2.51 performBatchUpdatesWork(tag as variant)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The event that performs the needed inset, delete, reload, or move operations.

36.2.52 prefetchItems(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Notifies your 'prefetchDataSource' that items at the specified 'indexPaths' are likely to be instantiated and displayed soon.
Notes: The CollectionView sends this as early as possible, to give your 'prefetchDataSource' the opportunity to begin acquiring any resources such as thumbnail images or metadata that you might need in order to prepare the item's content for display. The given 'indexPaths' are sorted by the order in which they are likely to be needed.

36.2.53 referenceSizeForFooterInSection(layout as NSCollectionViewLayoutMBS, section as Integer) as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: Asks you for the size of the footer view in the specified section.
Notes: collectionViewLayout: The layout object requesting the information.
section: The index of the section whose footer size is requested.

The size of the footer. Return NSZeroSize if you do not want a footer added to the section.

If you implement this method, the flow layout object calls it to obtain the size of the footer in each section and uses that information to set the size of the corresponding views. If you do not implement this method, the footer size is obtained from the properties of the flow layout object.

The flow layout object uses only one of the returned size values. For a vertically scrolling layout, the layout object uses the height value. For a horizontally scrolling layout, the layout object uses the width value. The other value is sized appropriately to match the opposing dimension of the collection view itself. Set the size of the footer to 0 to prevent it from being displayed.

36.2.54 referenceSizeForHeaderInSection(layout as NSCollectionViewLayoutMBS, section as Integer) as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: Asks you for the size of the header view in the specified section.
Notes: collectionViewLayout: The layout object requesting the information.
section: The index of the section whose header size is requested.

Returns the size of the header. Return NSZeroSize if you do not want a header added to the section.

If you implement this method, the flow layout object calls it to obtain the size of the header in each section and uses that information to set the size of the corresponding views. If you do not implement this method, the header size is obtained from the properties of the flow layout object.

The flow layout object uses only one of the returned size values. For a vertically scrolling layout, the layout object uses the height value. For a horizontally scrolling layout, the layout object uses the width value. The other value is sized appropriately to match the opposing dimension of the collection view itself. Set the size of the header to 0 to prevent it from being displayed.

36.2.55 ScaleFactorChanged(NewFactor as double)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

36.2.56 shouldChangeItems(indexPaths() as NSIndexPathMBS, highlightState as Integer) as NSIndexPathMBS()

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Asks the delegate to approve the pending highlighting of the specified items.
Notes: indexPaths: The set of NSIndexPathMBS objects corresponding to the items being highlighted.
highlightState: The new highlight state for the items.

Return the set of NSIndexPath objects corresponding to the items that you want to receive the specified highlight. If you do not want any items to receive the specified highlight state, return an empty set.

Use this method to approve or modify the set of items targeted to receive the specified highlight state. During interactive selection or dragging, the collection view calls this method when actions occur that would affect the highlight state of items. Your implementation of the method can return the proposed set of index paths as-is or modify the set and disallow the highlighting of some or all of the items. Removing items from the set suppresses the corresponding actions, such as selecting the item or showing its eligibility as a drop target.
If you do not implement this method, the collection view updates the highlight state for the items specified

by the indexPaths parameter.

36.2.57 shouldDeselectItems(indexPaths() as NSIndexPathMBS) as NSIndexPathMBS()

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Asks the delegate object to approve the pending deselection of items.
Notes: indexPaths: The array of NSIndexPathMBS objects corresponding to the items deselected by the user.

Return the array of NSIndexPathMBS objects corresponding to the items that you want to be deselected. If you do not want any items deselected, return an empty set.

Use this method to approve or modify the items that the user tries to deselect. During interactive selection, the collection view calls this method whenever the user deselects items. Your implementation of the method can return the proposed set of index paths as-is or modify the set before returning it. You might modify the set to disallow the deselection of specific items.

This method is not called when you set the selection programmatically using the methods of the NSCollectionViewMBS class. If you do not implement this method, the collection view deselects the items specified by the indexPaths parameter.

36.2.58 shouldSelectItems(indexPaths() as NSIndexPathMBS) as NSIndexPathMBS()

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Asks the delegate to approve the pending selection of items.
Notes: indexPaths: The array of NSIndexPathMBS objects corresponding to the items selected by the user.

Returns the array of NSIndexPathMBS objects corresponding to the items that you want to be selected. If you do not want any items selected, return an empty array.

Use this method to approve or modify the items that the user tries to select. During interactive selection, the collection view calls this method whenever the user selects new items. Your implementation of the method can return the proposed set of index paths as-is or modify the set before returning it. You might modify the set to disallow the selection of specific items or specific combinations of items.

This method is not called when you set the selection programmatically using the methods of the NSCollectionViewMBS class. If you do not implement this method, the collection view selects the items specified by the indexPaths parameter.

36.2.59 sizeForItemAtIndexPath(layout as NSCollectionViewLayoutMBS, indexPath as NSIndexPathMBS) as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: Asks you for the size of the specified item.
Notes: collectionViewLayout: The layout object requesting the information.
indexPath: The index path of the item.

Return the size of the item. The width and height values must both be greater than 0. Items must also not exceed the available space in the collection view.

Implement this method when you want to provide the size of items in the flow layout. Your implementation can return the same size for all items or it can return different sizes for items. You can also adjust the size of items dynamically each time you update the layout. If you do not implement this method, the size of items is obtained from the properties of the flow layout object.

The size value you return from this method must allow the item to be displayed fully by the collection view. In the scrolling direction, items can be larger than the collection view because the remaining content can always be scrolled into view, but in the nonscrolling directions, items should always be smaller than the collection view itself. For example, the width of an item in a vertically scrolling collection view must not exceed the width of the collection view minus any section insets. The flow layout does not crop an item,Äôs bounds to make it fit into the available space.

36.2.60 transitionLayout(fromLayout as NSCollectionViewLayoutMBS, toLayout as NSCollectionViewLayoutMBS) as NSCollectionViewTransitionLayoutMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the transition layout object to use when performing an animated change between different layouts.
Notes: fromLayout: The current layout object of the collection view. This is the starting point for the transition.
toLayout: The new layout for the collection view.

Return the collection view transition layout object to use to perform the transition.

When changing layouts for a collection view, you can use this method to customize the transition layout object used to make the change. A transition layout object lets you customize the behavior of collection view

elements when transitioning from one layout to the next. Normally, transitioning between layouts causes the assorted items and views to animate from their current locations directly to their new locations. By returning a custom transition object, you could have those elements follow a nonlinear path, use a different timing algorithm, or move items in response to touch events.

If you do not implement this method in your delegate object, the collection view uses a standard UICollectionViewTransitionLayout object for the transition.

Special Considerations
In OS X 10.11, this method is never called by the collection view.

36.2.61 updateDraggingItemsForDrag(draggingInfo as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Asks your delegate to update the dragging items during a drag operation.
Notes: draggingInfo: The current information for the drag operation. Use this object to iterate over the dragging items.

You can use this method to update the current drag items while a drag is in progress. Updating the drag items is optional, but you might use this method to change the image for an item. For example, you might change the image when the mouse hovers over a particular part of the collection view. Use the enumerateDraggingItems method of the draggingInfo parameter to iterate over the drag items and update them as appropriate.

36.2.62 validateDrop(draggingInfo as NSDraggingInfoMBS, byref proposedIndexPath as NSIndexPathMBS, byref dropOperation as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Validates whether a drop operation is possible at the specified location.
Notes: draggingInfo: The information about the drag operation.
proposedDropIndexPath: The index path at which the drop would occur. This parameter is passed by-reference and can be modified to change the proposed index path.
proposedDropOperation: The type of drop operation being proposed. This parameter is passed by-reference and can be modified to change the drop operation type.

Returns a value that indicates which dragging operation to perform. Return NSDragOperationNone to disallow a drop at the proposed location.

Although implementation of this method is optional, you must implement it to support drops onto the

associated collection view. You must also call the collection view,Äôs registerForDraggedTypes method to register the types of drops it supports. If you do not perform both of these actions, the collection view does not accept drops.

When an interactive drag operation occurs, the collection view calls this method to determine whether the current mouse location is a valid place to drop the content. This method may be called many times during the course of the drag operation. Your implementation should look at the proposed location and return a constant that reflects how the drop would be handled.
While validating the drop location, you can suggest a better drop location by updating the values in the proposedDropIndexPath and proposedDropOperation parameters. For example, you might suggest dropping the content before the specified item instead of on it. The collection view sets the proposedDropOperation parameter to DropOn when the mouse is closer to the middle of an item than to its edges; otherwise, it sets the parameter to DropBefore.

36.2.63 viewForSupplementaryElement(kind as String, indexPath as NSIndexPathMBS) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Asks your data source object to provide the supplementary view at the specified location in a section of the collection view.
Notes: kind: The kind of supplementary view to provide. The value of this string is defined by the current layout object associated with the collection view. Layouts may define additional views to add visual content that is unrelated to specific items.
indexPath: The index path that identifies the section in which to place the supplementary view.

Returns a configured view object. You must not return nil from this method.

Implement this method if the collection view,Äôs layout object supports supplementary views. Your implementation is responsible for creating, configuring, and returning an appropriate view. You do this by calling the makeSupplementaryViewOfKind method of the collection view to retrieve an unconfigured view of the appropriate type. After receiving the view, update its properties and content using your app,Äôs data structures and return it.
You do not need to set the location of supplementary views inside the collection view,Äôs bounds. The collection view gets the view,Äôs location and other layout-related attributes from the layout object during a separate step.

36.2.64 willDisplayItem(item as NSCollectionViewItemMBS, indexPath as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate that the specified item is about to be displayed by the collection view.
Notes: item: The item being added.
indexPath: The index path of the item.

The collection view calls this method before adding new items to its content. You can use this method to track the addition of items and perform related tasks.

36.2.65 willDisplaySupplementaryView(view as NSViewMBS, elementKind as String, indexPath as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate that the specified supplementary view is about to be displayed by the collection view.
Notes: view: The supplementary view being added.
elementKind: The type of the supplementary view. Layouts are responsible for defining the types of supplementary views they support.
indexPath: The index path associated with the supplementary view.

The collection view calls this method before adding new supplementary views to its content. You can use this method to track the addition of those views and perform related tasks.

36.2.66 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

36.2.67 writeItems(indexPaths() as NSIndexPathMBS, Pasteboard as NSPasteboardMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Places the data for the drag operation on the pasteboard.
Notes: indexPaths: The index paths of the items being dragged.
pasteboard: The pasteboard on which to place the drag data.

Return true if the drag operation can continue or no if you want to refuse the drag.

The collection view calls this method after it has determined that a drag should begin but before the drag operation has started. Your implementation of this method should do the following:

- Declare the pasteboard types you support using the declareTypes method of the provided pasteboard object.
- Write data to the pasteboard for each type you declare.
- Return true from this event.

36.2.68 Constants

Drop Operation

Constant	Value	Description
DropBefore	1	The drop occurs before the collection view item to which the item was dragged.
DropOn	0	The drop occurs at the collection view item to which the item was dragged.

36.3 class NSCollectionViewFlowLayoutInvalidationContextMBS

36.3.1 class NSCollectionViewFlowLayoutInvalidationContextMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: An object that identifies the portions of a flow layout object that need to be updated.
Notes: Layout objects use invalidation contexts to optimize the layout process and avoid unnecessary work. You use this class to specify whether the NSCollectionViewFlowLayout object should fetch new size information from its delegate. You can also prevent the flow layout object from updating its layout information altogether.

When you want to invalidate your flow layout object, call the NewInvalidationContext method of your layout object and instantiate the resulting class. (The implementation of that method in NSCollectionViewFlowLayout returns this class.) After instantiating this class, set the properties to appropriate values and pass the object to the invalidateLayoutWithContext method of the layout object.
Subclass of the NSCollectionViewLayoutInvalidationContextMBS class.

36.3.2 Methods

36.3.3 Constructor

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.

36.3.4 Properties

36.3.5 invalidateFlowLayoutAttributes as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the flow layout object should invalidate its current attributes.
Notes: Setting this property to NO tells the flow layout object to keep its existing layout information, effectively stopping the invalidation process. Typically, you set this property to false only if you subclass NSCollectionViewFlowLayoutMBS and update changed layout information directly.
The default value of this property is true, which causes the flow layout object to throw out its existing layout information and recompute it.
(Read and Write property)

36.3.6 invalidateFlowLayoutDelegateMetrics as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the flow layout object should fetch new size information from its delegate.
Notes: As part of the invalidation process, the flow layout object normally asks its delegate to provide size information for the items in the flow layout. This behavior is necessary when the size of the items can change because it ensures that the corresponding layout attributes are always updated. However, if you know that the size of items has not changed, you can set this property to false. Doing so causes the flow layout to use its existing size information rather than querying the delegate, which saves time.
The default value of this property is YES, which causes the flow layout object to query the delegate for new size information.
(Read and Write property)

36.4 class NSCollectionViewFlowLayoutMBS

36.4.1 class NSCollectionViewFlowLayoutMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A layout that organizes items into a flexible and configurable arrangement.
Example:

```
// This example needs a window with NSCollectionViewControlMBS1.
// arrange the items of a collection view in rows with fixed size and spacing
Var layout As New NSCollectionViewFlowLayoutMBS
layout.itemSize = NSMakeSizeMBS(120, 90)
layout.minimumInteritemSpacing = 10
layout.minimumLineSpacing = 10
layout.sectionInset = New NSEdgeInsetsMBS(10, 10, 10, 10)
layout.scrollDirection = NSCollectionViewFlowLayoutMBS.ScrollDirectionVertical
layout.headerReferenceSize = NSMakeSizeMBS(0, 30) // room for section headers

NSCollectionViewControlMBS1.View.collectionViewLayout = layout
```

Notes: In a flow layout, the first item is positioned in the top-left corner and other items are laid out either horizontally or vertically based on the scroll direction, which is configurable. Items may be the same size or different sizes, and you may use the flow layout object or the collection view,Äôs delegate object to specify the size of items and the spacing around them. The flow layout also lets you specify custom header and footer views for each section.

You can use an NSCollectionViewFlowLayoutMBS object as-is or subclass it to modify more aspects of the layout behavior. There are several ways to customize the basic layout behavior that do not require subclassing. For example, you can use a delegate object to change the size and spacing of items dynamically. Subclassing is appropriate for more advanced layout changes, such as adding supplementary views or decoration views, supporting custom layout attributes, or customizing the layout animations when inserting or deleting items.

Subclass of the NSCollectionViewLayoutMBS class.
Blog Entries

- NSCollectionView for Xojo

36.4.2 Methods

36.4.3 collapseSectionAtIndex(sectionIndex as Integer)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Collapses the section with the given index.

36.4.4 Constructor

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.

36.4.5 ElementKindSectionFooter as String

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A supplementary view that acts as a footer for a given section.

36.4.6 ElementKindSectionHeader as String

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A supplementary view that acts as a header for a given section.

36.4.7 expandSectionAtIndex(sectionIndex as Integer)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Expands the section with the given index.

36.4.8 Properties

36.4.9 estimatedItemSize as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The estimated size of items in the collection view.
Notes: Providing an estimated item size lets the collection view defer some of the calculations needed to determine the size of its content, which can improve performance. Instead of explicitly computing the size of each item, the flow layout assumes that offscreen items have the estimated size. The estimated size is used only until an actual value is calculated. The default value of this property is zero size.

If the value of this property is not NSZeroSize, the flow layout uses the estimated size you specified. If all of your items actually have the same size, use the itemSize property to set their size and set this property to NSZeroSize.
(Read and Write property)

36.4.10 footerReferenceSize as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The default size to use for section footers.
Notes: The layout object uses only the value that is appropriate for the current scrolling direction. In other words, the layout object uses only the height value when the content scrolls vertically, setting the width of the footer to the width of the collection view. Similarly, the layout object uses only the width value when the content scrolls horizontally, setting the footer,Äôs height to the height of the collection view. If the size value for the appropriate dimension is 0, the layout object omits the footer entirely.

The default value of this property is zero size.
(Read and Write property)

36.4.11 headerReferenceSize as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The default size to use for section headers.
Notes: The layout object uses only the value that is appropriate for the current scrolling direction. In other words, the layout object uses only the height value when the content scrolls vertically, setting the width of the header to the width of the collection view. Similarly, the layout object uses only the width value when the content scrolls horizontally, setting the header,Äôs height to the height of the collection view. If the size value for the appropriate dimension is 0, the layout object omits the header entirely.

The default value of this property is zero size.
(Read and Write property)

36.4.12 itemSize as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The default size to use for items.
Notes: This property contains the default size of items.

All items are set to the same size. This value applies only to items and not to supplementary views.
The default value of this property is (50.0, 50.0).
(Read and Write property)

36.4.13 minimumInteritemSpacing as Double

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The minimum spacing (in points) to use between items in the same row or column.
Notes: For a vertically scrolling layout, the value represents the minimum spacing between items in the same row. For a horizontally scrolling layout, the value represents the minimum spacing between items in the same column. The layout object uses this spacing only to compute how many items can fit in a single row or column. The actual spacing may be increased after the number of items has been determined.

The default value of this property is 10.0.
(Read and Write property)

36.4.14 minimumLineSpacing as Double

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The minimum spacing (in points) to use between rows or columns.
Notes: For a vertically scrolling layout, the value represents the minimum spacing between successive rows. For a horizontally scrolling layout, the value represents the minimum spacing between successive columns. This spacing is not applied to the space between the header view and the first line or between the last line and the footer view. Figure 1 shows how the line spacing is applied to rows of unevenly sized items, illustrating how the actual spacing between individual items may be greater than the minimum value.

The default value of this property is 10.0.
(Read and Write property)

36.4.15 scrollDirection as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The scroll direction of the layout.
Notes: The flow layout scrolls along one axis only, either horizontally or vertically. When the scroll direction is ScrollDirectionVertical, the width of the content never exceeds the width of the collection view itself but the height grows as needed to accommodate the current items. When the scroll direction is ScrollDirection-Horizontal, the height never exceeds the height of the collection view but the width grows as needed.

The default value of this property is ScrollDirectionVertical.
(Read and Write property)

36.4.16 sectionFootersPinToVisibleBounds as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Set to true to get footers that pin to the bottom while scrolling.
Notes: Enabling this feature may affect the parenting of header and footer views.
(Read and Write property)

36.4.17 sectionHeadersPinToVisibleBounds as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Set to true to get headers that pin to the top of the visible area.
Notes: Enabling this feature may affect the parenting of header and footer views.
(Read and Write property)

36.4.18 sectionInset as NSEdgeInsetsMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The margins used to lay out content in a section.
Notes: Section insets reflect the spacing at the outer edges of the section. The margins affect the positioning of the header view, the minimum space on either side of each line of items, and the distance from the last line to the footer view. The margin insets do not affect the size of the header and footer views in the nonscrolling direction.

The default insets are all set to 0.
(Read and Write property)

36.4.19 sectionAtIndexIsCollapsed(sectionIndex as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Whether the section is collapsed.
Notes: True if the specified section is currently collapsed; false if not, or if there is no such section. Defaults to false.
(Read and Write computed property)

36.4.20 Constants

Scroll Directions

Constant	Value	Description
ScrollDirectionHorizontal	1	The layout scrolls content horizontally.
ScrollDirectionVertical	0	The layout scrolls content vertically.

36.5 class NSCollectionViewGridLayoutMBS

36.5.1 class NSCollectionViewGridLayoutMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A layout that displays a single section of items in a row and column grid..
Example:

```
// This example needs a window with NSCollectionViewControlMBS1.
// show the items of a collection view in a grid with at most 4 columns
Var layout As New NSCollectionViewGridLayoutMBS
layout.maximumNumberOfColumns = 4
layout.minimumItemSize = NSMakeSizeMBS(80, 80)
layout.maximumItemSize = NSMakeSizeMBS(160, 160)
layout.minimumInteritemSpacing = 8
layout.minimumLineSpacing = 8
layout.margins = New NSEdgeInsetsMBS(10, 10, 10, 10)

NSCollectionViewControlMBS1.View.collectionViewLayout = layout
```

Notes: The NSCollectionViewGridLayoutMBS object provides the same layout behavior offered by the NSCollectionViewMBS class prior to macOS 10.11, and you can use it in cases where you want to maintain the old appearance while still taking advantage of newer collection view features.

Configuring a Collection View to Use a Grid Layout

You can configure a collection view to use a grid layout object programmatically or at design time:

- At design time, set the Layout attribute of your collection view to Grid.

Create an NSCollectionViewGridLayoutMBS object programmatically and assign it to the collection view,Äôs collectionViewLayout property.

- A grid layout displays only items and does not display supplementary views or decoration views. Use the properties of this class to configure the number of rows and columns in the grid. You can also use these properties to configure the spacing between items and the minimum sizes.

Subclass of the NSCollectionViewLayoutMBS class.

36.5.2 Methods

36.5.3 backgroundColors as NSColorMBS()

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The array of background colors to use when drawing the grid.
Notes: The NSColorMBS objects in this property are used to draw the grid,Äôs background. The appearance of the background depends on the value you specify:

- Specifying nil fills the background with the collection view,Äôs default background color.
- Specifying an empty array causes the collection view to draw no background color.
- Specifying an array with one color object fills the background with the specified color.
- Specifying an array with more than one color object causes the collection view to use the specified colors to create a checkerboard pattern. Each successive grid item is displayed with the next color in the array, cycling back to the beginning of the array when the last color is reached.

The default value of this property is nil.

36.5.4 Constructor

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.

36.5.5 setBackgroundColors(Colors() as NSColorMBS = nil)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Sets the array of background colors to use when drawing the grid.
Notes: The NSColorMBS objects in this property are used to draw the grid,Äôs background. The appearance of the background depends on the value you specify:

- Specifying nil fills the background with the collection view,Äôs default background color.
- Specifying an empty array causes the collection view to draw no background color.
- Specifying an array with one color object fills the background with the specified color.
- Specifying an array with more than one color object causes the collection view to use the specified colors to create a checkerboard pattern. Each successive grid item is displayed with the next color in the array, cycling back to the beginning of the array when the last color is reached.

The default value of this property is nil.

36.5.6 Properties

36.5.7 margins as NSEdgeInsetsMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The amount of empty space (in points) around the grid,Äôs content.
Notes: The default value of this property is zeros. Changing this property to a new value invalidates the layout.
(Read and Write property)

36.5.8 maximumItemSize as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The largest allowable size for an item,Äôs view.
Notes: Use this property to limit the maximum size of items displayed in the grid. The default value of this property is (0.0, 0.0), which imposes no maximum size for items.
(Read and Write property)

36.5.9 maximumNumberOfColumns as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The maximum number of columns to display in the collection view,Äôs visible area.
Notes: Use this value to specify the maximum number of columns that should be visible in the collection view at any given time. The grid layout object uses this value during layout to configure the position and spacing of items. The default value of this property is 0, which means that there is no maximum number of columns.
(Read and Write property)

36.5.10 maximumNumberOfRows as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The maximum number of rows to display in the collection view,Äôs visible area.
Notes: Use this value to specify the maximum number of rows to display in the collection view at any given time. The grid layout object uses this value during layout to configure the position and spacing of items. The default value of this property is 0, which means that there is no maximum number of rows.

(Read and Write property)

36.5.11 minimumInteritemSpacing as Double

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The minimum spacing (in points) to use between items in the same row or column.
Notes: For a vertically scrolling layout, the value represents the minimum spacing between items in the same row. For a horizontally scrolling layout, the value represents the minimum spacing between items in the same column. The layout object uses this spacing only to compute how many items can fit in a single row or column. The actual spacing may be increased after the number of items has been determined.
The default value of this property is 0.0.
(Read and Write property)

36.5.12 minimumItemSize as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The smallest allowable size for an item,Äôs view.
Notes: Use this property to ensure that items have a minimum size when displayed in the grid. The default value of this property is (0.0, 0.0), which imposes no minimum size for items.
(Read and Write property)

36.5.13 minimumLineSpacing as Double

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The minimum spacing (in points) to use between rows or columns.
Notes: For a vertically scrolling layout, the value represents the minimum spacing between successive rows. For a horizontally scrolling layout, the value represents the minimum spacing between successive columns. This spacing is not applied to the space between the header view and the first line or between the last line and the footer view.
The default value of this property is 0.0.
(Read and Write property)

36.5.14 Constants

Highlight States

Constant	Value	Description
HighlightAsDropTarget	3	The drop target highlight state. This type of highlight is applied when the item is the target of a drop operation on the collection view. After the drop operation completes, the highlight state returns to HighlightNone.
HighlightForDeselection	2	The deselection highlight state. During interactive selection, this state is used to indicate that the item will become deselected when interactions end. After interactions end, the highlight state returns to HighlightNone.
HighlightForSelection	1	The selected highlight state. This type of highlight is applied when an item is selected. During interactive highlighting, this state is also applied to indicate that the item will become highlighted.
HighlightNone	0	No highlight state.

36.6 class NSCollectionViewItemMBS

36.6.1 class NSCollectionViewItemMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The visual representation for a single data element in a collection view.
Example:

```
// show 20 numbered items in a collection view
// MyCollection is a subclass of DesktopNSCollectionViewControlMBS with the events implemented, placed on the window as MyCollection1.

// in MyCollection:
Function numberOfItemsInSection(section As Integer) As Integer Handles numberOfItemsInSection
Return 20
End Function

Function itemForRepresentedObject(indexPath As NSIndexPathMBS) As NSCollectionViewItemMBS Handles itemForRepresentedObject
Var item As New NSCollectionViewItemMBS
item.textField = New NSTextFieldMBS(0, 0, 100, 20)
item.textField.stringValue = "Item " + Str(indexPath.item + 1)
Return item
End Function
```

Notes: Item objects are view controllers, and you use their view hierarchies to display your content. The default implementation of this class supports the creation of a simple item that displays a single image or string. If the appearance or layout of your items is more sophisticated, you can subclass and configure the view hierarchy based on your needs.

see also
https://developer.apple.com/documentation/appkit/nscollectionviewitem
Subclass of the NSViewControllerMBS class.

36.6.2 Methods

36.6.3 Constructor

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.

36.6.4 copy as NSCollectionViewItemMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Creates a copy of the item.

36.6.5 Properties

36.6.6 collectionView as NSCollectionViewMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The collection view that owns the item.
Notes: Use this property as a convenient way to access the collection view that owns the item.
(Read only property)

36.6.7 highlightState as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The highlight state currently applied to the item.
Notes: The highlight state provides a visual indication of operations happening to items in the collection view. The highlight state normally toggles between the HighlightNone and HighlightForSelection states, but other states may be applied to indicate transient conditions. For example, the HighlightForDeselection state is applied during interactive selections when a currently selected item is about to be deselected.
(Read and Write property)

36.6.8 identifier as String

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The identifier.
Notes: (Read only property)

36.6.9 imageView as NSImageViewMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: An image view outlet that you can use to display images.
Notes: This is a convenience property for accessing an image view in your item,Äôs view hierarchy.

(Read and Write property)

36.6.10 selected as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean indicating whether the item is currently selected.
Notes: The value of this property is true when the item is selected or false when it is not.
(Read and Write property)

36.6.11 textField as NSTextFieldMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A text field outlet that you can use to display a string.
Notes: This is a convenience property for accessing a text field in your item,Äôs view hierarchy.
(Read and Write property)

36.6.12 Constants

Highlight States

Constant	Value	Description
HighlightAsDropTarget	3	The drop target highlight state. This type of highlight is applied when the item is the target of a drop operation on the collection view. After the drop operation completes, the highlight state returns to HighlightNone.
HighlightForDeselection	2	The deselection highlight state. During interactive selection, this state is used to indicate that the item will become deselected when interactions end. After interactions end, the highlight state returns to HighlightNone.
HighlightForSelection	1	The selected highlight state. This type of highlight is applied when an item is selected. During interactive highlighting, this state is also applied to indicate that the item will become highlighted.
HighlightNone	0	No highlight state.

36.7 class NSCollectionViewLayoutAttributesMBS

36.7.1 class NSCollectionViewLayoutAttributesMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: An object that contains layout-related attributes for an element in a collection view.
Example:

```
// fade in items of a collection view when they appear
// MyCollection is a subclass of DesktopNSCollectionViewControlMBS with the ItemApplyLayoutAttributes event implemented, placed on the window as MyCollection1.

// in MyCollection:
Sub ItemApplyLayoutAttributes(item As NSCollectionViewItemMBS, layoutAttributes As NSCollectionViewLayoutAttributesMBS) Handles ItemApplyLayoutAttributes
System.DebugLog "Item " + layoutAttributes.indexPath.item.ToString + ": alpha " + layoutAttributes.alpha.ToString + ", z " + layoutAttributes.zIndex.ToString
End Sub
```

Notes: During the layout, the layout object creates instances of NSCollectionViewLayoutAttributesMBS for each element displayed in the collection view. The layout attributes describe the position of an element and other information such as its alpha and position on the z axis. The collection view later applies the layout attributes to the onscreen elements.

The only time you interact with layout attribute objects is when you implement a custom layout, and the interactions are straightforward. When asked for layout attributes for a specific element, your layout object uses the methods of this class to create an appropriate instance of the class based on the type of the requested element. It then configures the properties of the object and returns it to the requester.

36.7.2 Methods

36.7.3 Constructor

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.

36.7.4 copy as NSCollectionViewLayoutAttributesMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Creates a copy of the object.

36.7.5 ElementKindInterItemGapIndicator as String

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The element kind string assigned to the attributes object when it represents an inter-item gap.

36.7.6 layoutAttributesForDecorationView(decorationViewKind as String, indexPath as NSIndexPathMBS) as NSCollectionViewLayoutAttributesMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a layout attributes object for a decoration view based on the specified information.
Notes: decorationViewKind: A string that identifies the type of the decoration view. Use this string to differentiate from among the decoration views in a given section. This parameter must contain a valid value. indexPath: The index path of the item. You can use this information to identify the item in your app,Äôs data structures.

Returns a new layout attributes object configured with the initial attributes for the decoration view.

Call this method when you need to create a layout attributes object for a decoration view in a collection view. Decoration views are a tertiary type of content that display visual adornments in your collection view interface. For example, decoration views might display custom backgrounds. This method uses the parameters to set the initial values of the indexPath and representedElementKind properties the returned object.

36.7.7 layoutAttributesForInterItemGapBefore(indexPath as NSIndexPathMBS) as NSCollectionViewLayoutAttributesMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a layout attributes object for an inter-item gap view at the specified index path.
Notes: indexPath: The index path at which to insert the gap view. The gap is placed after the item specified by the index path. This parameter must contain a valid value.

Returns a new layout attributes object configured with the initial attributes for the inter-item gap view.

Call this method when you need to create a layout attributes object for an inter-item gap view in a col-

lection view. Gap views are used during drag and drop to indicate the area where content will drop. This method uses the parameters to set the initial values of the indexPath property of the returned object. The representedElementKind property is set to ElementKindInterItemGapIndicator.

36.7.8 layoutAttributesForItem(indexPath as NSIndexPathMBS) as NSCollectionViewLayoutAttributesMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a layout attributes object for the item at the specified index path.
Notes: indexPath: The index path of the item. You can use this information to identify the item in your app,Äôs data structures. This parameter must contain a valid value.

Returns a new layout attributes object containing the initial attributes for the item.

Call this method when you need to create a layout attributes object for an item in a collection view. Items are the main type of content presented by a collection view. Items are grouped into sections, although a collection view may have only one section. This method assigns the provided index path to the indexPath property of the returned object.

36.7.9 layoutAttributesForSupplementaryView(elementKind as String, indexPath as NSIndexPathMBS) as NSCollectionViewLayoutAttributesMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a layout attributes object for a supplementary view based on the specified information.
Notes: elementKind: A string that identifies the type of the supplementary view. Use this string to differentiate from among the supplementary views in a given section. This parameter must contain a valid value. indexPath: The index path of the item. You can use this information to identify the item in your app,Äôs data structures. This parameter must contain a valid value.

Returns a new layout attributes object configured with the initial attributes for the supplementary view.

Call this method when you need to create a layout attributes object for a supplementary view in a collection view. Supplementary views are a secondary type of content that display data related to a specific section. For example, header and footer views in a grid layout implemented using supplementary views. This method uses the parameters to set the initial values of the indexPath and representedElementKind properties the returned object.

36.7.10 Properties

36.7.11 alpha as Double

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The transparency of the element.
Notes: Possible values are between 0.0 (fully transparent) and 1.0 (fully opaque). The default value is 1.0. Transparent items continue to participate in hit testing for the collection view.
(Read and Write property)

36.7.12 frame as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The frame rectangle of the element.
Notes: The frame rectangle is measured in points and specified in the collection view,Äôs coordinate system. Setting the value of this property also updates the value in the size property.
(Read and Write property)

36.7.13 Hidden as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the element is hidden.
Notes: The default value of this property is false. As an optimization, the collection view might not create the corresponding view when the value of this property is true. Because there might not be a view, hidden elements do not participate in hit testing for the collection view.
(Read and Write property)

36.7.14 indexPath as NSIndexPathMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The index path of the element.
Notes: Use the index path to locate information about the item in your app,Äôs data structures. For supplementary and decoration views, you must also use the representedElementKind property to identify the element.
(Read and Write property)

36.7.15 representedElementCategory as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The type of the element.
Notes: Use this property to distinguish whether the layout attributes apply to an item, a supplementary view, a decoration view, or another type of element presented by the collection view.
(Read only property)

36.7.16 representedElementKind as String

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The identifier for specific elements of your collection view interface.
Notes: For supplementary and decoration views, you use this string to distinguish between views in a given section. You also use this string to identify the intended purpose of the view in your collection view interface. When the value of the representedElementCategory property is ElementCategoryItem, this property is nil.
(Read only property)

36.7.17 size as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The size of the element.
Notes: Setting the value of this property also updates the value in the frame property.
(Read and Write property)

36.7.18 zIndex as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The element,Äôs position on the z axis.
Notes: Use this property to specify the front-to-back ordering of items during layout. Items with higher index values appear on top of those with lower values. Items with the same value have an undetermined order.
The default value of this property is 0.
(Read and Write property)

36.7.19 Constants

Element Categories

Constant	Value	Description
ElementCategoryDecorationView	2	The element is a decoration view. Decoration views represent visual ac ments that do not contain any data of their own.
ElementCategoryInterItemGap	3	The element is an inter-item gap. An inter-item gap element is a cus visual indicator that is displayed between items when dropping items into collection view.
ElementCategoryItem	0	The element is an item. Items represent the main content of your colle view.
ElementCategorySupplementaryView	1	The element is a supplementary view. Use supplementary views for single v that contain some data but are associated with an entire section. For exan use them to specify header or footer views for a section.

36.8 class NSCollectionViewLayoutInvalidationContextMBS

36.8.1 class NSCollectionViewLayoutInvalidationContextMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: An object that identifies the portions of your layout that need to be updated.
Notes: Invalidation contexts are a way to improve the efficiency of layout operations and must be supported explicitly by the layout object. Instead of invalidating the entire layout, you can create an invalidation layout object that specifies only the portions of the layout that changed. You then pass that invalidation context to the invalidateLayoutWithContext: method of the layout object.

Typically, you ask the layout object to create an invalidation context for you. The NSCollectionViewLayoutMBS class defines methods for creating a supported invalidation context. If you define a custom layout, you can define additional methods for creating invalidation contexts with custom information. Layout objects may also create invalidation contexts in response to specific changes. For example, layout objects automatically create invalidation contexts when you change the collection view,Äôs data source, when you insert or delete items, and when you reload the collection view,Äôs data.

36.8.2 Methods

36.8.3 Constructor

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.

36.8.4 invalidateDecorationElementsOfKind(elementKind as String, indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Marks the specified decoration views as invalid so that their layout information can be updated.
Notes: elementKind: A string that identifies the type of the decoration views. This parameter must not be nil or an empty string.
indexPaths: An array of NSIndexPathMBS objects. Each index path contains the section in which the decoration view appears.

Call this method when you want the layout object to recompute attributes for one or more decoration views. All of the views must be of the type specified by the elementKind parameter. The method adds the views you specify to the invalidatedDecorationIndexPaths property. You can call this method more than once for the specified elementKind value.

36.8.5 invalidatedItemIndexPaths as NSIndexPathMBS()

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The set of items whose layout attributes are invalid.
Notes: The set contains zero or more NSIndexPathMBS objects, each of which identifies an invalid item.

36.8.6 invalidateItemsAtIndexPaths(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Marks the specified items as invalid so that their layout information can be updated.
Notes: indexPaths: An array of NSIndexPathMBS objects. Each index path represents an item whose layout needs to be recomputed.

Call this method when you want the layout object to recompute attributes for a specific set of items. The items you provide are added to the invalidatedItemIndexPaths property. You can call this method more than once to create a merged set of items.

36.8.7 invalidateSupplementaryElementsOfKind(elementKind as String, indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Marks the specified supplementary views as invalid so that their layout information can be updated.
Notes: elementKind: A string that identifies the type of the supplementary views. This parameter must not be nil or an empty string.
indexPaths: An array of NSIndexPathMBS objects. Each index path contains the section in which the supplementary view appears.

Call this method when you want the layout object to recompute attributes for one or more supplementary views. All of the views must be of the type specified by the elementKind parameter. The method adds the views you specify to the invalidatedSupplementaryIndexPaths property. You can call this method more than once for the specified elementKind value.

36.8.8 Properties

36.8.9 contentOffsetAdjustment as NSPointMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The delta value to add to the collection view,Äôs content offset.
Notes: The content offset adjustment shifts the position of content inside the collection view by the specified amount. You use this value to make tweaks based on how you want to present your content. For example, you might use it to ensure that the first line of items is always lined up at the same position in the collection view,Äôs visible rectangle. When making adjustments, you can specify both positive and negative values.
The default value of this property is zero/zero.
(Read and Write property)

36.8.10 contentSizeAdjustment as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The delta value to add to the collection view,Äôs content size.
Notes: Use this property to update the size of the collection view,Äôs content area, as computed by the associated layout object. The default value of this property is zero/zero. Changing the value causes the collection view to add the specified height and width values to its content size. Thus, positive values grow the content area and negative values shrink it. You might add space around the content area to provide a visual buffer for your collection view content.
(Read and Write property)

36.8.11 invalidateDataSourceCounts as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the layout object should ask for new section and item counts.
Notes: The collection view sets this property in response to specific layout invalidation scenarios. For example, the collection view sets the property to true when you insert or delete items or call the collection view,Äôs reloadData method.
When this property is set to true, the layout object must query the data source for the new number of sections and items. IT should also update its layout based on the updated number of sections and items.
(Read only property)

36.8.12 invalidatedDecorationIndexPaths as Dictionary

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A dictionary containing the decoration views whose layout attributes are invalid.
Notes: The keys in this dictionary are the element kind strings of the decoration views. The value for each key is an array object containing one or more NSIndexPath objects, each of which identifies the section containing the decoration view.
(Read only property)

36.8.13 invalidatedSupplementaryIndexPaths as Dictionary

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A dictionary containing the supplementary views whose layout attributes are invalid.
Notes: The keys in this dictionary are the element kind strings of the supplementary views. The value for each key is an array object containing one or more NSIndexPath objects, each of which identifies the section containing the supplementary view.
(Read only property)

36.8.14 invalidateEverything as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether all layout data should be marked as invalid.
Notes: The collection view sets this property in response to specific layout invalidation scenarios. For example, the collection view sets the property to true when you change the current layout object, change the data source of the collection view, or call the reloadData method and subsequently request a layout invalidation context.
When this property is set to true, the layout object must throw away all previous layout information and recompute it.
(Read only property)

36.9 class NSCollectionViewLayoutMBS

36.9.1 class NSCollectionViewLayoutMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: An abstract base class that you subclass and use to generate layout information for a collection view.
Notes: The job of a layout object is to perform the calculations needed to determine the placement and appearance of items, supplementary views, and other content in the collection view. The layout object does not apply the layout attributes it generates to the views in your interface. Instead, it passes those layout attributes to the collection view, which then creates the needed views and applies the layout attributes to them.

- NSCollectionView for Xojo

36.9.2 Methods

36.9.3 Constructor

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.

36.9.4 invalidateLayout

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Invalidates all layout information and triggers a layout update.
Notes: Call this method when you make changes that require updating all of the current layout information. This method marks the layout as invalid and returns right away, so you can call this method multiple times from the same block of code without triggering multiple layout updates. During the next update cycle, the collection view requests new layout information and updates its contents accordingly.

36.9.5 invalidateLayoutWithContext(context as NSCollectionViewLayoutInvalidationContextMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Invalidates specific parts of the layout using the specified context object.
Notes: context: The context object indicating which parts of the layout need to be updated.

Call this method when you make changes that need to be reflected by the collection view, but which do not require the replacement of all of the layout information. You use this method to minimize the work performed by the layout object. Instead of optimizing everything, the specified context object indicates which parts of the layout need to be recomputed. All other layout information is left alone.
When implementing a custom layout, you can override this method and use it to process information provided by a custom invalidation context. You are not required to provide a custom invalidation context but might do so if you are able to provide additional properties that can help optimize layout updates. If you override this method, you must call super at some point in your implementation.

36.9.6 NewInvalidationContext as NSCollectionViewLayoutInvalidationContextMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new invalidation context object.

36.9.7 NewLayoutAttributes as NSCollectionViewLayoutAttributesMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new layout attributes object.

36.9.8 Properties

36.9.9 collectionView as NSCollectionViewMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The collection view object currently using this layout.
Notes: When you assign a layout object to a collection view, the collection view automatically updates this property.
(Read only property)

36.10 class NSCollectionViewMBS

36.10.1 class NSCollectionViewMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: An ordered collection of data items displayed in a customizable layout.
Example:

```
// This example needs a window with NSCollectionViewControlMBS1.
// allow selecting several items and select all
Var view As NSCollectionViewMBS = NSCollectionViewControlMBS1.View
view.allowsMultipleSelection = True
view.reloadData
view.selectAll
MessageBox view.numberOfItemsInSection(0).ToString + " items"
```

Notes: The simplest type of collection view displays its items in a grid, but you can define layouts to arrange items however you like. For example, you might create a layout where items are arranged in a circle. You can also change layouts dynamically at runtime whenever you need to present items differently.

36.10.2 Methods

36.10.3 backgroundColors as NSColorMBS()

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: An array containing the collection view,Äôs background colors.
Notes: This property contains an array of NSColorMBS objects, representing the colors to use when drawing the background grid. Specifying an empty array or nil causes the collection view to use the default colors

returned by the controlAlternatingRowBackgroundColors method.

When a background view is specified for the collection view, the colors in this property are ignored.

36.10.4 Constructor

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new NSCollectionView object.
See also:

- 36.10.5 Constructor(Handle as Integer) 6953
- 36.10.6 Constructor(left as double, top as double, width as double, height as double) 6953

36.10.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.
Notes: Pass a valid handle to a NSTextField to initialize.
See also:

- 36.10.4 Constructor 6953
- 36.10.6 Constructor(left as double, top as double, width as double, height as double) 6953

36.10.6 Constructor(left as double, top as double, width as double, height as double)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new custom NSTextField object.
See also:

- 36.10.4 Constructor 6953
- 36.10.5 Constructor(Handle as Integer) 6953

36.10.7 deleteItems(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Deletes the items at the specified index paths.
Example:

```
// remove item at index

Var index As Integer = 1

// remove from data source
MainWindow.items.RemoveAt(index)

// remove also from view
Var items() As NSIndexPathMBS
items.Add NSIndexPathMBS.indexPathForItem(index)

MainWindow.collectionView.deleteItems items
```

Notes: indexPaths: A set of NSIndexPathMBS objects, each of which includes a section and item index corresponding to the insertion point of a single item. Specifying nil for this parameter raises an exception.

After removing items from your data source object, use this method to synchronize those changes with the collection view. Calling this method lets the collection view know that it must update its internal data structures and possibly update its visual appearance. In response, the collection view asks the layout object to update the positions of the remaining objects. If the layout object indicates that there are changes to the visible items, the collection view animates the affected items into place.

When inserting or deleting multiple sections and items, you can animate all of your changes at once using the performBatchUpdates method.

36.10.8 deleteSections(sections as NSIndexSetMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Deletes the specified sections and their contained items.
Notes: sections: An index set containing the indexes of the sections that you want to delete. This parameter must not be nil.

Use this method to delete entire sections and their contained items. Always update your data source object before calling this method. Calling this method kicks off an update (and possible animations) to delete the specified sections. Specifically, the collection view asks the layout object for the final layout attributes for any deleted sections and may also ask for updated layout attributes for any remaining sections. If the layout attributes of any visible items changed, those changes are animated into place.

When inserting or deleting multiple sections and items, you can animate all of your changes at once using the performBatchUpdates method.

36.10.9 deselectAll

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Deselects all items in the collection view.
Notes: This method works only when the selectable and allowsEmptySelection properties are both true YES. If either property is set to false, this method quietly does nothing and any connected menu item is disabled.

This method consults the delegate object regarding the selection. Specifically, it calls the delegate,Äôs shouldDeselectItems method to see if the items should be selected. For any items that are selected, it calls the didDeselectItems method.

36.10.10 deselectItems(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Removes the specified items from the current selection.
Notes: indexPaths: The index paths of the items you want to deselect.

Use this method to reduce the current selection. If you want to animate the deselection of the new items, call this method on the collection view,Äôs animator proxy object instead. This method does not call any methods of the delegate object when making the selection.

36.10.11 frameForItem(Index as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the frame of the collection view item at the specified index.
Notes: index: The index of the collection view item.

Return the frame calculated by the receiver where it intends to place the subview for the NSCollectionViewItem at the given index. The rectangle is returned in the collection view,Äôs coordinate system.

You can use this method in the draggingImageForItemsAtIndexes method to determine which views are in the visible portion of the enclosing scroll view.
Overriding this method will have no effect on the collection view,Äôs subview layout.
See also:

- 36.10.12 frameForItem(Index as Integer, numberOfItems as Integer) as NSRectMBS 6956

36.10.12 frameForItem(Index as Integer, numberOfItems as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the frame of the collection view item at the specified index.
Notes: index: The index of the collection view item.

Returns the frame calculated by the receiver where it intends to place the subview for the NSCollectionViewItem at the given index. The rectangle is returned in the collection view,Äôs coordinate system.

You can use this method in the draggingImageForItemsAtIndexes method to determine which views are in the visible portion of the enclosing scroll view.
Overriding this method will have no effect on the collection view,Äôs subview layout.
See also:

- 36.10.11 frameForItem(Index as Integer) as NSRectMBS 6955

36.10.13 indexPathForItem(indexPath as NSCollectionViewItemMBS) as NSIndexPathMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index path of the specified item.
Notes: Returns the item,Äôs index path or nil if the item is not in the collection view.
See also:

- 36.10.14 indexPathForItem(x as double, y as double) as NSIndexPathMBS 6956

36.10.14 indexPathForItem(x as double, y as double) as NSIndexPathMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index path of the specified item.
Example:

```
// remove item at index

Var index As Integer = 1

// remove from data source
MainWindow.items.RemoveAt(index)

// remove also from view
Var items() As NSIndexPathMBS
items.Add NSIndexPathMBS.indexPathForItem(index)
```

MainWindow.collectionView.deleteItems items

Notes: Returns the item,Äôs index path or nil if the item is not in the collection view.
See also:

- 36.10.13 indexPathForItem(indexPath as NSCollectionViewItemMBS) as NSIndexPathMBS 6956

36.10.15 indexPathsForVisibleItems as NSIndexPathMBS()

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index paths of the currently active items.
Notes: The set of NSIndexPathMBS objects corresponding to the currently visible items.

The index paths returned by this method belong to items that are active and currently being managed by the collection view. As a result, the returned set may include index paths for items that are outside of the collection view,Äôs actual visible rectangle. For example, it may contain index paths for items that were recently visible but have since been scrolled out of view. To test whether an item is visible, check to see if its frame rectangle intersects the visibleRect of the collection view.

36.10.16 indexPathsForVisibleSupplementaryElementsOfKind(elementKind as String) as NSIndexPathMBS()

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index paths of the currently active supplementary views.
Notes: elementKind: The kind of the supplementary views you want returned. The layout object defines the kinds of supplementary views it supports. This parameter must not be nil.

Return the set of NSIndexPathMBS objects. The returned array may be empty.

The index paths returned by this method correspond to supplementary views that are active and currently being managed by the collection view. The set may include index paths for views that are outside of the collection view,Äôs actual visible rectangle. For example, it might contain index paths for views that were recently visible but have since been scrolled out of the visible rectangle. To test whether a view is actually visible, check to see if its frame rectangle intersects the visibleRect of the collection view.

36.10.17 insertItems(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Inserts new items into the collection view at the specified locations.
Notes: indexPaths: A set of NSIndexPathMBS objects, each of which includes a section and item index corresponding to the insertion point of a single item. Specifying nil for this parameter raises an exception.

After adding new items to your data source object, use this method to synchronize those changes with the collection view. Calling this method lets the collection view know that it must update its internal data structures and possibly update its visual appearance. In response, the collection view asks the layout object for information about the new objects. If the layout object indicates that the new items should appear on-screen, the collection view asks the data source to provide the appropriate content, animating that content into position as needed.

When inserting or deleting multiple sections and items, you can animate all of your changes at once using the performBatchUpdates method.

36.10.18 insertSections(sections as NSIndexSetMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Inserts new sections at the specified indexes.
Notes: sections: An index set containing the indexes at which you want to insert new sections. This parameter must not be nil.

This method tells the collection view to insert the specified sections and update itself. Always update your data source object before calling this method. Calling this method kicks off an update (and possible animations) to add the new sections. Specifically, the collection view asks the layout object for any updated layout attributes related to the new sections or any existing sections. If the layout attributes of any visible items changed, those changes are animated into place.

When inserting or deleting multiple sections and items, you can animate all of your changes at once using the performBatchUpdates method.

36.10.19 item(index as Integer) as NSCollectionViewItemMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the item associated with the specified index path.
Notes: The item for the specified index path or nil if no item is available.

For efficiency, the collection view does not create items until they are needed, and usually it creates them only when they need to be displayed onscreen. If the collection view does not currently have an item for the specified index path, because that item would be positioned offscreen, this method returns nil.
See also:

• 36.10.20 item(indexPath as NSIndexPathMBS) as NSCollectionViewItemMBS 6959

36.10.20 item(indexPath as NSIndexPathMBS) as NSCollectionViewItemMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the item associated with the specified index path.
Notes: The item for the specified index path or nil if no item is available.

For efficiency, the collection view does not create items until they are needed, and usually it creates them only when they need to be displayed onscreen. If the collection view does not currently have an item for the specified index path, because that item would be positioned offscreen, this method returns nil.
See also:

• 36.10.19 item(index as Integer) as NSCollectionViewItemMBS 6958

36.10.21 layoutAttributesForItem(indexPath as NSIndexPathMBS) as NSCollectionViewLayoutAttributesMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the layout information for the item at the specified index path.
Notes: The layout attributes of the item or nil if no item exists at the specified path.

This method updates the layout information as needed before returning the specified attributes. Always use this method to retrieve the layout attributes for items in the collection view. Do not query the layout object directly.

36.10.22 layoutAttributesForSupplementaryElementOfKind(kind as String, indexPath as NSIndexPathMBS) as NSCollectionViewLayoutAttributesMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the layout information for the supplementary view at the specified index path.
Notes: kind: The kind of the supplementary view whose attributes you want. The layout object defines the kinds of supplementary views it supports. This parameter must not be nil.
indexPath: The index path of the supplementary view. Normally, this path

Returns the layout attributes of the supplementary view or nil if no item exists at the specified path.

This method updates the layout information as needed before returning the specified attributes. Always use this method to retrieve the layout attributes for supplementary views in the collection view. Do not query

the layout object directly.

36.10.23 makeItem(indexPath as NSIndexPathMBS) as NSCollectionViewItemMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Creates or returns a reusable item object of the specified type.
Notes: indexPath: The index path specifying the location of the item. The data source object receives this information in its itemForRepresentedObjectAtIndexPath method and you should just pass it along.

36.10.24 makeSupplementaryViewOfKind(elementKind as String, indexPath as NSIndexPathMBS) as NSCollectionViewSectionHeaderViewMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Creates or returns a reusable supplementary view of the specified type.
Notes: elementKind: The kind of supplementary view to create. This value is defined by the layout object. This parameter must not be an empty string or nil.
identifier: The reuse identifier for the specified item. This is the identifier you specified when registering the supplementary view. This parameter must not be nil.
indexPath: The index path specifying the location of the supplementary view. The data source object receives this information in its viewForSupplementaryElementOfKind method and you should just pass it along.

Returns a view that adopts the NSCollectionViewElement protocol, e.g. a NSCollectionViewSectionHeaderViewMBS object.

This method looks for a recycled supplementary view of the specified type and returns it if one exists. If one does not exist, it creates it one.

36.10.25 moveItem(indexPath as NSIndexPathMBS, toIndexPath as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Moves an item from one location to another in the collection view.
Notes: indexPath: The index path of the item that you want to move. This parameter must not be nil.
newIndexPath: The index path of the item,Äôs new location. This parameter must not be nil.

After rearranging items in your data source object, use this method to synchronize those changes with the collection view. Calling this method lets the collection view know that it must update its internal data structures and possibly update its visual appearance. You can move the item to a different section or to a

new location in the same section. The collection view updates the layout as needed to account for the move, animating cells into position in response.

When inserting or deleting multiple sections and items, you can animate all of your changes at once using the performBatchUpdates method.

36.10.26 moveSection(section as Integer, toSection as Integer)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Moves a section from its current location to a new location.
Notes: section: The index of the section that you want to move.
newSection: The new index at which to insert the section.

Use this method to reorganize sections and their contained items. Always update your data source object before calling this method. Calling this method kicks off an update (and possible animations) to move the specified section to its new location. Specifically, the collection view asks the layout object for any updated layout attributes related to the new sections or any existing sections. If the layout attributes of any visible items changed, those changes are animated into place.

When inserting or deleting multiple sections and items, you can animate all of your changes at once using the performBatchUpdates method.

36.10.27 numberOfItemsInSection(section as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the number of items in the specified section.
Notes: section: The index of the section whose item count you want. This index is 0-based.

Returns the number of items in the section.

Use this method to get the number of items currently displayed by the collection view for the specified section. Do not call the methods of the data source to get this information.

36.10.28 reloadData

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Reloads all of the data for the collection view.

Notes: Call this method when the data in your data source object changes or when you want to force the collection view to update its contents. When you call this method, the collection view discards any currently visible items and views and redisplays them. For efficiency, the collection view displays only the items and supplementary views that are visible after reloading the data. If the collection view,Äôs size changes as a result of reloading the data, the collection view adjusts its scrolling offsets accordingly.
Do not call this method in the middle of animation blocks where items are being inserted or deleted. The methods used to insert and delete items automatically update the collection view,Äôs contents.

36.10.29 reloadItems(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Reloads only the specified items.
Notes: indexPaths: The index paths of the specific items that you want to reload. Specifying nil for this parameter raises an exception.

Call this method to update specific items in your collection view. You call this method when the underlying data for those items changes and you want to update the visual appearance of those items. When you call this method, the collection view discards the specified items and asks your data source to provide new ones. For efficiency, the collection view requests only the items that are visible.

36.10.30 reloadSections(sections as NSIndexSetMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Reloads the data in the specified sections of the collection view.
Notes: sections: The indexes of the sections that you want to reload. Specifying nil for this parameter raises an exception.

Call this method when the data for the specified sections changes or when you want to force the appearance of those sections to be updated. When you call this method, the collection view discards visible elements in the section along with any cached attributes for those elements. For efficiency, it then asks the layout object to provide fresh attributes for only the visible items and views and requests new views for those elements.
Do not call this method in the middle of animation blocks where items are being inserted or deleted. The methods used to insert and delete items automatically update the collection view,Äôs contents.

36.10.31 scrollToItems(indexPaths() as NSIndexPathMBS, scrollPosition as Integer)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Scrolls the collection view contents until the specified items are visible.
Example:

```
Var collectionView as NSCollectionViewMBS

Var itemPaths() As NSIndexPathMBS
itemPaths.Add NSIndexPathMBS.indexPathForItem(0)

collectionView.scrollToItems(itemPaths, NSCollectionViewMBS.NSCollectionViewScrollPositionTop)
```

Notes: indexPaths: The index paths of the items. The layout attributes of these items define the bounding box that needs to be scrolled onscreen.
scrollPosition: The options for scrolling the bounding box of the specified items into view. You may combine one vertical and one horizontal scrolling option when calling this method. Specifying more than one option for either the vertical or horizontal directions raises an exception.

To animate the scrolling operation, call this method on the collection view,Äôs animator proxy object instead.

36.10.32 selectAll

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Selects all items in the collection view, if doing so is possible.
Notes: This method works only when the selectable and allowsMultipleSelection properties are both true. If either property is set to false, this method quietly does nothing and any connected menu item is disabled.

This method consults the delegate object regarding the selection. Specifically, it calls the delegate,Äôs shouldSelectItems method to see if the items should be selected. For any items that are selected, it calls the didSelectItems method.

36.10.33 selection as NSIndexPathMBS()

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The array of index paths representing the currently selected items.
Notes: This property reflects the index paths of the currently selected items, where each index path contains a section number and an index number for the item in that section. This property is updated automatically when the user selects items interactively. You can also change the selection programmatically by assigning a new value to this property. To animate changes to the selection, call this method on the collection view,Äôs animator proxy object instead.
It is a programmer error to specify an index path that does not refer to a valid item in the data source. If you specify an invalid index path, this method raises an exception.
This property is key-value observable. Other methods that modify the selection automatically update this

property.

36.10.34 selectItems(indexPaths() as NSIndexPathMBS, scrollPosition as Integer)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Adds the specified items to the current selection and optionally scrolls the items into position.
Notes: indexPaths: The index paths of the items you want to select.
scrollPosition: The options for scrolling the newly selected items into view. You may combine one vertical and one horizontal scrolling option when calling this method. Specifying more than one option for either the vertical or horizontal directions raises an exception.

Use this method to extend the current selection. If you want to animate the selection of the new items, call this method on the collection view,Äôs animator proxy object instead. This method does not call any methods of the delegate object when making the selection.

36.10.35 setBackgroundColors(Colors() as NSColorMBS = nil)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Sets array containing the collection view,Äôs background colors.
Notes: This property contains an array of NSColorMBS objects, representing the colors to use when drawing the background grid. Specifying an empty array or nil causes the collection view to use the default colors returned by the controlAlternatingRowBackgroundColors method.

When a background view is specified for the collection view, the colors in this property are ignored.

36.10.36 setDraggingSourceOperationMask(mask as integer, local as boolean)

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: Configures the default value returned from draggingSourceOperationMaskForLocal.
Notes: mask: The types of drag operations allowed.
isLocal: If true, mask applies when the drag destination object is in the same application as the receiver; if false, mask applies when the destination object is outside the receiver's application.

By default, draggingSourceOperationMaskForLocal returns NSDragOperationEvery when isLocal is true and NSDragOperationNone when isLocal is false.

Available in Mac OS X v10.5 and later.

36.10.37 setSelection(indexPaths() as NSIndexPathMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Sets the selection.

36.10.38 supplementaryViewForElementKind(elementKind as String, indexPath as NSIndexPathMBS) as NSCollectionViewSectionHeaderViewMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns the supplementary view associated with the specified index path.
Notes: elementKind: The kind of the supplementary views you want returned. The layout object defines the kinds of supplementary views it supports. This parameter must not be nil.
indexPath: The index path whose supplementary view you want.

Returns the view for the specified index path or nil if no view is available.

For efficiency, the collection view does not create supplementary views until they are needed. Typically, views are created only when they need to be displayed onscreen. If the collection view does not currently have a supplementary view for the specified index path, because that view would be positioned offscreen, this method returns nil.

36.10.39 toggleSectionCollapse(sender as NSViewMBS)

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: Collapses the section in which the sender resides into a single horizontally scrollable row.
Notes: Please pass the button clicked as sender.

36.10.40 visibleItems as NSCollectionViewItemMBS()

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns an array of the actively managed items in the collection view.
Notes: An array of NSCollectionViewItemMBS objects. The returned array may be empty.

The items returned by this method represent the ones that are active and currently being managed by the collection view. This array may contain items that are outside of the collection view,Äôs actual visible rectangle. For example, it may contain items that were recently visible but have since been scrolled out of view. To test whether an item is actually visible, check to see if its frame rectangle intersects the visibleRect of the collection view.

36.10.41 visibleSupplementaryViewsOfKind(elementKind as String) as NSViewMBS()

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Returns an array of the actively managed supplementary views in the collection view.
Notes: elementKind: The kind of the supplementary views you want returned. The layout object defines the kinds of supplementary views it supports. This parameter must not be nil.

Returns an array of view objects. The returned array may be empty.

The views returned by this method represent the ones that are active and are currently being managed by the collection view. The array may contain supplementary views that are outside of the collection view,Äôs actual visible rectangle. For example, it might contain views that were recently visible but have since been scrolled out of the visible rectangle. To test whether a view is actually visible, check to see if its frame rectangle intersects the visibleRect of the collection view.

36.10.42 Properties

36.10.43 allowsEmptySelection as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the collection view may have no selected items.
Notes: The default value of this property is true, which allows the collection view to have no selected items. Setting this property to false causes the collection view to always leave at least one item selected.
(Read and Write property)

36.10.44 allowsMultipleSelection as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the user may select more than one item in the collection view.
Notes: The value of this property is true if the collection view supports the selection of more than one item at a time. The default value of this property is false. Changing the value from true to false reduces the

current selection to the first item in the selected group.
(Read and Write property)

36.10.45 animator as NSCollectionViewMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The animator proxy object.
Example:

```
Var collectionView as NSCollectionViewMBS // your control

Var context As NSAnimationContextMBS = NSAnimationContextMBS.currentContext
context.beginGrouping
context.allowsImplicitAnimation = True
context.duration = 0.5

Var view As Variant = collectionView.animator
Var animator As NSCollectionViewMBS = view

// scroll to top
Var itemPaths() As NSIndexPathMBS
itemPaths.Add NSIndexPathMBS.indexPathForItem(0)

animator.scrollToItems(itemPaths, NSCollectionViewMBS.NSCollectionViewScrollPositionTop)

context.endGrouping
```

Notes: You can call methods on the animator instead of the direct object. Methods with animation support will then be animated.
(Read only property)

36.10.46 backgroundView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The background view placed behind all items and supplementary views.
Notes: The view you assign to this property is positioned underneath all other content and sized automatically to match the enclosing clip view,Äôs frame. The view itself does not scroll with the rest of the collection view content. The view,Äôs layer redraw policy is also changed to NSViewLayerContentsRedrawNever.

In macOS 10.12 and later, a collection view that sets both backgroundView and backgroundColors shows backgroundColors [0] through all areas that are not opaquely covered by the backgroundView.
(Read and Write property)

36.10.47 backgroundViewScrollsWithContent as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the collection view,Äôs background view scrolls with the items and other content.
Notes: The default value of this property is false, which means that backgroundView (if it exists) fills the collection view's visible area and remains stationary when the collection view's content is scrolled. When the value of this property is YES, backgroundView matches the collection view's frame and scrolls with the collection view's items and other content.
Changing the value of this property also changes the background view,Äôs parent. When backgroundView floats behind the scrolling content, it is a sibling of the collection view,Äôs clip view. When it scrolls with the collection view,Äôs content, it is a subview of the collection view.
(Read and Write property)

36.10.48 collectionViewLayout as NSCollectionViewLayoutMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The layout object used to organize the collection view,Äôs content.
Notes: Typically, you specify the layout object at design time in Interface Builder. The layout object works with your data source object to generate the needed items and views to display. In macOS 10.11 and later, using a data source object is recommended, but you may specify nil for this property if your collection view does not use a data source object. The collection view uses the NSCollectionViewGridLayout object by default.

Assigning a new value to this property changes the layout object and causes the collection view to update its contents immediately and without animations.
(Read and Write property)

36.10.49 firstResponder as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the collection view is the first responder.
Notes: The value of this property is true when the collection view is the first responder. This property is fully key-value observing compliant.
(Read only property)

36.10.50 numberOfSections as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The number of sections in the collection view.
Notes: This property contains the number of sections reported by the data source object. If the collection view does not use a data source object, the value in this property is 1.
(Read only property)

36.10.51 selectable as Boolean

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the user may select items in the collection view.
Notes: The value of this property is true when the collection view allows the user to select items, or false when it does not. You can set selections programmatically regardless of this setting.

The default value of this property is false. Changing the value from YES to NO removes the current selection if there is one.
(Read and Write property)

36.10.52 Constants

Scroll Position

Constant	Value	Description
NSCollectionViewScrollPositionBottom	4	Scroll so that the bottom edge of the bounding box is a of the collection view,Äôs bounds. This option must not be combined with the NSCol tionTop, NSCollectionViewScrollPositionCenteredVertic ViewScrollPositionNearestHorizontalEdge options, but r other options.
NSCollectionViewScrollPositionCenteredHorizontally	16	Scroll so that the selected items,Äô bounding box is ce the collection view,Äôs bounds. This option must not be combined with the NSCollecti Left, NSCollectionViewScrollPositionRight, NSCollecti LeadingEdge, NSCollectionViewScrollPositionTrailingE ViewScrollPositionNearestVerticalEdge options, but ma other options.
NSCollectionViewScrollPositionCenteredVertically	2	Scroll so that the bounding box of the selected items is the collection view,Äôs bounds. This option must not be combined with the NSCollecti Top, NSCollectionViewScrollPositionBottom, or NSCol tionNearestHorizontalEdge options, but may be combine
NSCollectionViewScrollPositionLeadingEdge	64	Scroll so that the leading edge of the selected items,Äô bo to the leading edge of the collection view,Äôs bounds. Use this option to support both left-to-right and right- priately. This option must not be combined with the NS PositionLeft, NSCollectionViewScrollPositionCenteredH tionViewScrollPositionRight, NSCollectionViewScrollPos NSCollectionViewScrollPositionNearestVerticalEdge opti bined with other options.
NSCollectionViewScrollPositionLeft	8	Scroll so that the left edge of the selected items,Äô bou to the left edge of the collection view,Äôs bounds. This option must not be combined with the NSCollecti CenteredHorizontally, NSCollectionViewScrollPositionl ViewScrollPositionLeadingEdge, NSCollectionViewScroll or NSCollectionViewScrollPositionNearestVerticalEdge combined with other options.
NSCollectionViewScrollPositionNearestHorizontalEdge	512	Scroll so that the bounding box is adjacent to the nearest of the collection view. This option must not be combined with the NSCol tionTop, NSCollectionViewScrollPositionCenteredVertic ViewScrollPositionBottom options, but may be combine
NSCollectionViewScrollPositionNearestVerticalEdge	256	Scroll so that the bounding box is adjacent to the nea trailing) of the collection view. Use this option to support both left-to-right and right- priately. This option must not be combined with the NS PositionLeft, NSCollectionViewScrollPositionCenteredH tionViewScrollPositionRight, NSCollectionViewScrollPos NSCollectionViewScrollPositionTrailingEdge options, b with other options.
NSCollectionViewScrollPositionNone	0	Do not scroll.
NSCollectionViewScrollPositionRight	32	Scroll so that the right edge of the selected items,Äô bou to the right edge of the collection view,Äôs bounds. This option must not be combined with the NSCol tionLeft, NSCollectionViewScrollPositionCenteredHoriz ViewScrollPositionLeadingEdge, NSCollectionViewScroll or NSCollectionViewScrollPositionNearestVerticalEdge combined with other options.
NSCollectionViewScrollPositionTop	1	Scroll so that the top edge of the selected items,Äô bou to the top edge of the collection view,Äôs bounds. This option must not be combined with the NSCollecti CenteredVertically, NSCollectionViewScrollPositionBotto

36.11 class NSCollectionViewSectionHeaderViewMBS

36.11.1 class NSCollectionViewSectionHeaderViewMBS

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: A protocol that defines a button to control the collapse of a collection view,Äôs section.
Notes: A collection view can support a section that can collapse into a single horizontally scrollable row, similar to the groupings in the icon view in Finder. To ensure that the collection view can communicate with the button that controls the collapsing of a section, the section header view object connects to the button via sectionCollapseButton property.
Subclass of the NSViewMBS class.

36.11.2 Methods

36.11.3 Constructor

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new custom NSCollectionViewSectionHeaderView object.
See also:

- 36.11.4 Constructor(Handle as Integer) 6971
- 36.11.5 Constructor(left as double, top as double, width as double, height as double) 6972

36.11.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new custom NSCollectionViewSectionHeaderView object.
Notes: Pass a valid handle to a NSCollectionViewSectionHeaderView to initialize.
See also:

- 36.11.3 Constructor 6971
- 36.11.5 Constructor(left as double, top as double, width as double, height as double) 6972

36.11.5 Constructor(left as double, top as double, width as double, height as double)

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new custom NSCollectionViewSectionHeaderView object.
See also:

- 36.11.3 Constructor 6971
- 36.11.4 Constructor(Handle as Integer) 6971

36.11.6 Properties

36.11.7 sectionCollapseButton as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 21.3, Platform: macOS, Targets: Desktop only.

Function: A control that lets users collapse and open a collection view section.
Notes: For the best user experience, set this property to the button that lets users control the collapsing of a section so that the collection view can show and hide the button appropriately, based on whether the section,Äôs items can be displayed in the available space. The collection view uses its toggleSectionCollapse property to access this button.
(Read and Write property)

36.12 class NSCollectionViewTransitionLayoutMBS

36.12.1 class NSCollectionViewTransitionLayoutMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: An object that implements custom behaviors when changing from one layout to another in a collection view.
Notes: Transition layout objects are commonly used to implement interactive transitions between layouts, where the transition itself is driven by a gesture recognizer.
Subclass of the NSCollectionViewLayoutMBS class.

36.12.2 Methods

36.12.3 Constructor

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The constructor.
See also:

- 36.12.4 Constructor(currentLayout as NSCollectionViewLayoutMBS, nextLayout as NSCollectionViewLayoutMBS) 6973

36.12.4 Constructor(currentLayout as NSCollectionViewLayoutMBS, nextLayout as NSCollectionViewLayoutMBS)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Initializes and returns the transition layout object.
Notes: currentLayout: The layout object currently in use by the collection view.
newLayout: The new layout object that is about to be installed into the collection view.

This method initializes the transition layout object and saves references to the current and new layout objects. If you subclass and implement your own initialization method, you must call this method to initialize the superclass.
See also:

- 36.12.3 Constructor 6973

36.12.5 Properties

36.12.6 currentLayout as NSCollectionViewLayoutMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The collection view,Äôs current layout object.
Notes: Use this object to retrieve the initial layout attributes for elements of the collection view. If the transition is ultimately cancelled, the collection view animates its items back to the attributes provided by this object.
(Read only property)

36.12.7 nextLayout as NSCollectionViewLayoutMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The collection view,Äôs new layout object.
Notes: Use this object to retrieve the final layout attributes for elements of the collection view. If the transition completes as expected, the collection view animates its items to the attributes provided by this object.
(Read only property)

36.12.8 transitionProgress as Double

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The completion percentage of the transition.
Notes: During the transition, set the value of this property periodically and call the invalidateLayout method to force the collection view to update item positions. For example, when driving a transition using a gesture recognizer, you can set this property from the handler method of your gesture recognizer.
(Read and Write property)

36.12.9 valueForAnimatedKey(AnimatedKey as String) as Double

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: Queries or sets the value of a key whose value you use during the animation.
Notes: value: The value of the key.
key: The key that you define for your custom transition layout.

Use this method to query or update the value of a specific key that you use in your custom transition layout.

Use this method to retrieve floating-point values that relate to laying out the contents of your collection view. The key you specify is a string that you define and that has some meaning to your layout,Äôs implementation. At points during an interactive transition, you can assign new values to that key.
(Read and Write computed property)

36.13 class NSCollectionViewUpdateItemMBS

36.13.1 class NSCollectionViewUpdateItemMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: A description of a single change to make to an item in a collection view.
Notes: You do not create instances of this class directly. When updating its content, the collection view object creates them and passes them to the layout object,Äôs prepareForCollectionViewUpdates method, which can use them to prepare for the upcoming changes.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

36.13.2 Methods

36.13.3 Constructor

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

36.13.4 Properties

36.13.5 indexPathAfterUpdate as NSIndexPathMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The index path of the item after the update.
Notes: The value of this property is nil for an action of type UpdateActionDelete.
(Read only property)

36.13.6 indexPathBeforeUpdate as NSIndexPathMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The index path of the item before the update.
Notes: The value of this property is nil for an action of type UpdateActionInsert.
(Read only property)

36.13.7 updateAction as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The action being performed on the item.
Notes: For a list of relevant actions, see constants.
(Read only property)

36.13.8 Constants

Update Actions

Constant	Value	Description
UpdateActionDelete	1	Remove the action from the collection view.
UpdateActionInsert	0	Insert the item into the collection view.
UpdateActionMove	3	Move the item from its current location to a new location.
UpdateActionNone	4	Take no action on the item.
UpdateActionReload	2	Reload the item, which consists of deleting and then inserting the item.

36.14 class NSIndexPathMBS

36.14.1 class NSIndexPathMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A list of indexes that together represent the path to a specific location in a tree of nested arrays.
Example:

```
// index paths address items in collection views and outline views
Var path As NSIndexPathMBS = NSIndexPathMBS.indexPathForItem(3, 1) // item 3 in section 1
MessageBox "Section " + path.section.ToString + ", item " + path.item.ToString

// a deeper path for a tree: 0 / 2 / 5
Var tree As NSIndexPathMBS = NSIndexPathMBS.indexPathWithIndex(0).indexPathByAddingIndex(2).indexPathByAddingIndex(5)
Var parts() As String
For Each index As Integer In tree.indexes
parts.Add index.ToString
Next
MessageBox "Path: " + String.FromArray(parts, " / ") + " with length " + tree.length.ToString
```

Notes: Each index in an index path represents the index into an array of children from one node in the tree to another, deeper, node.
Blog Entries

- MBS Xojo Plugins, version 23.6pr1

36.14.2 Methods

36.14.3 compare(other as NSIndexPathMBS) as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Indicates the depth-first traversal order of the receiving index path and another index path.
Notes: Returns the depth-first traversal ordering of the receiving index path and indexPath.

NSOrderedAscending = -1: The receiving index path comes before indexPath.
NSOrderedDescending = 1: The receiving index path comes after indexPath.
NSOrderedSame = 0: The receiving index path and indexPath are the same index path.

36.14.4 Constructor(Index as Integer)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes an index path with a single node.
Notes: Returns an initialized NSIndexPath object representing a one-node index path with index.
See also:

- 36.14.5 Constructor(Indexes() as Integer) 6979

36.14.5 Constructor(Indexes() as Integer)

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes an index path with the given nodes and length.
Notes: indexes: Array of indexes to make up the index path.
See also:

- 36.14.4 Constructor(Index as Integer) 6978

36.14.6 copy as NSIndexPathMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of the object.

36.14.7 indexAtPosition(position as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Provides the value at a particular node in the index path.
Notes: position: Index value of the desired node. Node numbering starts at zero.

Returns the index value at node or NSNotFound (-1) if the node is outside the range of the index path.

36.14.8 indexes as Integer()

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries indexes.

36.14.9 indexPathByAddingIndex(index as Integer) as NSIndexPathMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an index path containing the nodes in the receiving index path plus another given index.
Notes: index: Index to append to the index path,Äôs indexes.

Returns a new index path containing the receiving index path,Äôs indexes and index.

36.14.10 indexPathByRemovingLastIndex as NSIndexPathMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an index path with the nodes in the receiving index path, excluding the last one.
Notes: Returns an empty NSIndexPath instance if the receiving index path,Äôs length is 1 or less.

In OS X v10.4 this method returns nil when the length of the receiving index path is 1 or less. On iOS and macOS 10.5 and later this method never returns nil.

36.14.11 indexPathForItem(item as Integer, section as Integer = 0) as NSIndexPathMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes an index path with the indexes of a specific item and section in a collection view.
Notes: item: An index number identifying an item in a NSCollectionViewMBS object in a section identified by the section parameter.
section: An index number identifying a section in a NSCollectionViewMBS object.

36.14.12 indexPathWithIndex(index as Integer) as NSIndexPathMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes an index path with a single node.
Notes: Returns an initialized NSIndexPath object representing a one-node index path with index.

36.14.13 indexPathWithIndexes(indexes() as Integer) as NSIndexPathMBS

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes an index path with the given nodes and length.
Notes: indexes: Array of indexes to make up the index path.

36.14.14 Properties

36.14.15 item as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: An index number identifying an item in a section of a collection view.
Notes: The section the item is in is identified by the value of section.
(Read only property)

36.14.16 length as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of nodes in the index path.
Notes: (Read only property)

36.14.17 section as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: An index number identifying a section in a table view or collection view.
Notes: (Read only property)

Chapter 37

Cocoa Controls

37.1 class BevelButton

37.1.1 class BevelButton

Plugin Version: 3.0, Platform: macOS, Targets: Desktop only.

Function: An extension of Xojo's internal control.

37.1.2 Methods

37.1.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

```
// This example needs a window with BevelButton1.
MessageBox BevelButton1.NSButtonMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

37.2 class CanvasGesturesMBS

37.2.1 class CanvasGesturesMBS

MBS MacControls Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: The class to catch canvas gesture events.
Example:

```
// This example needs a window with Canvas1.
// receive trackpad pinch and rotate gestures for a canvas
// MyCanvasGestures is a subclass of CanvasGesturesMBS with the events implemented.
// Gestures is a property of the app, one instance for all canvases: Gestures As MyCanvasGestures

Gestures = New MyCanvasGestures
Gestures.AddCanvas Canvas1

// in MyCanvasGestures:
Function magnifyWithEvent(can As Variant, e As NSEventMBS) As Boolean Handles magnifyWithEvent
System.DebugLog "magnify by " + e.magnification.ToString
Return True // handled
End Function

Function rotateWithEvent(can As Variant, e As NSEventMBS) As Boolean Handles rotateWithEvent
System.DebugLog "rotate by " + e.rotation.ToString
Return True
End Function
```

Notes: Please use one global instance of this class to catch the events for all canvases you track.

Updated class for v23.2 to work with DesktopCanvas control.

37.2.2 Methods

37.2.3 AddCanvas(c as Canvas)

MBS MacControls Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: Adds a canvas to the list of canvases to track.
Notes: Please add canvas controls in Window.Open event.
See also:

- 37.2.4 AddCanvas(c as DesktopCanvas) 6985

37.2.4 AddCanvas(c as DesktopCanvas)

MBS MacControls Plugin, Plugin Version: 23.2, Platform: macOS, Targets: Desktop only.

Function: Adds a canvas to the list of canvases to track.
Notes: Please add canvas controls in Window.Open event.
See also:

- 37.2.3 AddCanvas(c as Canvas) 6985

37.2.5 Constructor

MBS MacControls Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: The constructor.

37.2.6 Destructor

MBS MacControls Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: The destructor.

37.2.7 RemoveCanvas(c as Canvas)

MBS MacControls Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: Removes a canvas from the list.
Notes: Please remove canvas controls in Window.Close event.
The plugin tries to remove all when a window closes automatically.
See also:

- 37.2.8 RemoveCanvas(c as DesktopCanvas) 6986

37.2.8 RemoveCanvas(c as DesktopCanvas)

MBS MacControls Plugin, Plugin Version: 23.2, Platform: macOS, Targets: Desktop only.

Function: Removes a canvas from the list.
Notes: Please remove canvas controls in Window.Close event.
The plugin tries to remove all when a window closes automatically.
See also:

- 37.2.7 RemoveCanvas(c as Canvas) 6986

37.2.9 Properties

37.2.10 CanvasCount as Integer

MBS MacControls Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: Number of Canvas controls registered.
Notes: (Read only property)

37.2.11 Events

37.2.12 beginGestureWithEvent(can as Variant, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a touch gesture.
Notes: e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.

Available in Mac OS X v10.6 and later.
Return true if you handled this event.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.2.13 endGestureWithEvent(can as Variant, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has ended a touch gesture.
Notes: e: An event object representing the gesture end.

Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.2.14 magnifyWithEvent(can as Variant, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a pinch gesture.
Notes: e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.

Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.2.15 rotateWithEvent(can as Variant, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a rotation gesture.
Notes: e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.

Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.2.16 scrollWheel(can as Variant, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the mouse,Äôs scroll wheel has moved.
Notes: The default implementation simply passes this message to the next responder.

e: An event object representing the swipe gesture.

The event will be sent to the view under the touch in the key window.
Return true if you handled this event.

37.2.17 smartMagnifyWithEvent(can as Variant, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user performed a smart zoom gesture.
Notes: The smart zoom gesture is a two-finger double tap on trackpads. In response to this event, you should intelligently magnify the content.

e: An event object representing the swipe gesture.

The event will be sent to the view under the touch in the key window.
Return true if you handled this event.

37.2.18 swipeWithEvent(can as Variant, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a swipe gesture.
Notes: e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.

Available in Mac OS X v10.6 and later.
Return true if you handled this event.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.2.19 touchesBeganWithEvent(can as Variant, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that new set of touches has been recognized.
Notes: can: The Canvas or DesktopCanvas control.
e: An event object representing the beginning of a touch.

The system sends the event to the view under the touch in the key window.
This isn,Äôt always the point of contact with the touch device. A touch that transitions from resting to active may be part of a touchesBeganWithEvent set.

Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.2.20 touchesCancelledWithEvent(can as Variant, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that tracking of touches has been cancelled for any reason.
Notes: can: The Canvas or DesktopCanvas control.
e: An event object representing the cancellation of a touch event.

The event will be sent to the view under the touch in the key window.

Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.2.21 touchesEndedWithEvent(can as Variant, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Returns that a set of touches have been removed.
Notes: can: The Canvas or DesktopCanvas control.
e: An event object representing the ending of a touch event.

The system sends the event to the view under the touch in the key window.

This isn,Äôt always the point of removal with the touch device. A touch that transitions from active to resting may be part of an touchesEndedWithEvent set.

Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.2.22 touchesMovedWithEvent(can as Variant, e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that one or more touches has moved.
Notes: can: The Canvas or DesktopCanvas control.
e: An event object representing a touch movement.

The system sends the to the view under the touch in the key window.

Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.3 class Checkbox

37.3.1 class Checkbox

Plugin Version: 2.9, Platform: macOS, Targets: Desktop only.

Function: An extension of Xojo's internal control.

37.3.2 Methods

37.3.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

```
// This example needs a window with CheckBox1.
MessageBox CheckBox1.NSButtonMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

37.4 class ComboBox

37.4.1 class ComboBox

Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The built in ComboBox class in Xojo.

37.4.2 Methods

37.4.3 NSComboBoxMBS as NSComboBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSComboBoxMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

37.5 class ContainerControl

37.5.1 class ContainerControl

Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The container class in Xojo.

37.5.2 Methods

37.5.3 NSViewMBS as NSViewMBS

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Creates a NSViewMBS object for the given container.
Example:

```
// This example needs a window with ContainerControl1.
MessageBox ContainerControl1.NSViewMBS.className
```

Notes: This way you can manipulate Cocoa container controls directly.

37.6 class CustomNSScrollerMBS

37.6.1 class CustomNSScrollerMBS

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The class for a custom scroller.
Notes: Subclass of the NSScrollerMBS class.
Blog Entries

37.6.2 Methods

37.6.3 Constructor

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new custom NSScroller object.
See also:

- 37.6.4 Constructor(Handle as Integer) 6994
- 37.6.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6994

37.6.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The constructor.
See also:

- 37.6.3 Constructor 6994
- 37.6.5 Constructor(left as Double, top as Double, width as Double, height as Double) 6994

37.6.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new custom NSScroller object.
See also:

- 37.6.3 Constructor 6994
- 37.6.4 Constructor(Handle as Integer) 6994

37.6.6 Destructor

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The destructor.

37.6.7 Events

37.6.8 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes: The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

37.6.9 acceptsFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

37.6.10 becomeFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Called when the object gets focus.
Notes: Return true to accept.

37.6.11 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a touch gesture.
Notes: e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.6.12 canBecomeKeyView as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

37.6.13 Close

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom view is destroyed.

37.6.14 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

37.6.15 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

37.6.16 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

37.6.17 draggingExited(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

37.6.18 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging session has completed.
Notes: session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

37.6.19 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag moves on the screen.
Notes: session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

37.6.20 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Declares the types of operations the source allows to be performed. (required)
Notes: session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

37.6.21 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag will begin.
Notes: session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

37.6.22 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

37.6.23 drawArrow(g as NSGraphicsMBS, Arrow as Integer, highlight as boolean)

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Called when arrow need to be drawn.
Notes: Draw the scroll button indicated by arrow, which is either NSScrollerIncrementArrow (the down or right scroll button) or NSScrollerDecrementArrow (up or left).
If flag is true, the button is drawn highlighted; otherwise it's drawn normally. You should never need to invoke this method directly, but may wish to override it to customize the appearance of scroll buttons.

37.6.24 drawKnob(g as NSGraphicsMBS)

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Draw the knob.

37.6.25 drawKnobSlotInRect(g as NSGraphicsMBS, slotRect as NSRectMBS, highlight as boolean)

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Draw the knob slow in the rectangle.

37.6.26 drawParts(g as NSGraphicsMBS)

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Called when parts need to be drawn.

37.6.27 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has ended a touch gesture.
Notes: e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.6.28 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes: session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

37.6.29 isOpaque as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Whether this view is opaque.

37.6.30 keyDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.

37.6.31 keyUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.

37.6.32 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a pinch gesture.
Notes: e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.6.33 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes: theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

37.6.34 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.6.35 mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: This event is called so you can decide what happens with mouse down.
Notes: Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

37.6.36 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.

Notes: Return true if you handled this event.

37.6.37 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.6.38 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.6.39 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.6.40 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.6.41 Open

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom NSView is created.

37.6.42 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.6.43 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.6.44 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.6.45 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

37.6.46 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes: sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

37.6.47 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes: This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

37.6.48 resignFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Focus is going away.
Notes: Return true to accept.

37.6.49 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.6.50 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.6.51 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.6.52 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a rotation gesture.
Notes: e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.6.53 scrollWheel(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes: e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

37.6.54 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a swipe gesture.
Notes: e: An event object representing the swipe gesture.

The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.6.55 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging images should be changed.
Notes: sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

37.6.56 viewDidMoveToWindow

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that it has been added to a new view hierarchy.
Notes: The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

37.6.57 wantsPeriodicDraggingUpdates as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes: Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages

even if nothing changes.

37.7 class CustomNSSearchFieldMBS

37.7.1 class CustomNSSearchFieldMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The class for a custom searchfield.
Notes: Some events will not fire as Searchfield eats them itself.
Subclass of the NSSearchFieldMBS class.

37.7.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new custom NSView object.
See also:

- 37.7.3 Constructor 7009
- 37.7.4 Constructor(Handle as Integer) 7009

37.7.6 Destructor

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The destructor.

37.7.7 Events

37.7.8 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes: The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

37.7.9 acceptsFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

37.7.10 becomeFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Called when the object gets focus.
Notes: Return true to accept.

37.7.11 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a touch gesture.
Notes: e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.7.12 canBecomeKeyView as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

37.7.13 Close

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom view is destroyed.

37.7.14 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

37.7.15 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

37.7.16 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

37.7.17 draggingExited(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

37.7.18 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging session has completed.
Notes: session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

37.7.19 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag moves on the screen.
Notes: session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

37.7.20 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Declares the types of operations the source allows to be performed. (required)
Notes: session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

37.7.21 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag will begin.
Notes: session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

37.7.22 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

37.7.23 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has ended a touch gesture.
Notes: e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.7.24 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes: session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

37.7.25 isOpaque as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Whether this view is opaque.

37.7.26 keyDown(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

37.7.27 keyUp(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

37.7.28 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a pinch gesture.
Notes: e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.7.29 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes: theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

37.7.30 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.7.31 mouseDownCanMoveWindow as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: This event is called so you can decide what happens with mouse down.
Notes: Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

37.7.32 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.7.33 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.7.34 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.7.35 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.7.36 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.7.37 Open

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom NSSearchField is created.

37.7.38 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.7.39 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.7.40 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.7.41 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

37.7.42 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes: sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

37.7.43 pressureChange(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.

Notes: This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

37.7.44 resignFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Focus is going away.
Notes: Return true to accept.

37.7.45 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.7.46 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.7.47 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.7.48 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a rotation gesture.
Notes: e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.7.49 scrollWheel(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes: e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

37.7.50 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a swipe gesture.
Notes: e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.7.51 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging images should be changed.
Notes: sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

37.7.52 viewDidMoveToWindow

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that it has been added to a new view hierarchy.
Notes: The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

37.7.53 wantsPeriodicDraggingUpdates as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes: Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

37.8 class CustomNSTextFieldCellMBS

37.8.1 class CustomNSTextFieldCellMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The class to customize cells.
Notes: Subclass of the NSTextFieldCellMBS class.
Blog Entries

- MBS Xojo Plugins, version 17.2pr1

37.8.2 Methods

37.8.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The constructor.

37.8.4 superDrawWithFrame(frame as NSRectMBS, view as NSViewMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Calls drawWithFrame on super class.
Notes: This is for calling in DrawWithFrame event.

37.8.5 Events

37.8.6 cellSize(size as NSSizeMBS) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Return a custom cell size.
Notes: If not implemented, we call through to super.cellSize.
We provide super.cellSize in size parameter.

37.8.7 Clone(clonedCell as NSTextFieldCellMBS) as CustomNSTextFieldCellMBS

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Requests a clone of the object.
Notes: This event is called when the system needs a clone of the object.
Please create a new object, keep a reference and return it.

SuperClone provides the cloned object, which we use together with the xojo object you return.

37.8.8 didDrawWithFrame(cellFrame as NSRectMBS, controlView as NSViewMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Event called after drawWithFrame run.

37.8.9 drawWithFrame(cellFrame as NSRectMBS, controlView as NSViewMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Event to replace drawWithFrame.
Notes: If false is returned or not implemented, we call super.drawWithFrame.

37.8.10 fieldEditorForView(controlView as NSViewMBS) as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Returns a custom field editor for editing in the view.
Notes: ,ÄãControl,ÄãView: The view containing cells that require a custom field editor.

Returns a custom field editor. The field editor must have field,ÄãEditor set to true.

This is an override point for NSCell subclasses designed to use their own custom field editors. This message is sent to the selected cell of ,ÄãControl,ÄãView using the NSWindow method in field,ÄãEditor,Äã.

Returning non-nil from this method indicates skipping the standard field editor querying processes including window,ÄãWill,ÄãReturn,ÄãField,ÄãEditor delegation.
The default implementation returns nil.

37.8.11 imageRectForBounds(rect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event for imageRectForBounds method.

37.8.12 selectWithFrame(rect as NSRectMBS, controlView as NSViewMBS, text as NSTextMBS, theDelegate as Variant, selStart as Integer, selLength as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event for selectWithFrame method.
Notes: If you return false, we call super.selectWithFrame.

37.8.13 setUpFieldEditorAttributes(textObj as NSTextMBS, superFieldEditor as NSTextMBS) as NSTextMBS

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Sets up the field editor. You never invoke this method directly; by overriding it, however, you can customize the field editor.
Notes: When you override this method, you should generally invoke the implementation of super and return the text,ÄãObj argument. For information on field editors, see Using the Window,Äôs Field Editor.

37.8.14 titleRectForBounds(rect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event for titleRectForBounds method.
Notes: If you return nil, we call super.titleRectForBounds.

37.9 class CustomNSTextFieldMBS

37.9.1 class CustomNSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The class for a custom text field.
Notes: Some events will not fire as text field eats them itself.
Subclass of the NSTextFieldMBS class.

37.9.4 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The constructor.
Notes: Pass a valid handle to a NSTextField to initialize.
See also:

- 37.9.3 Constructor 7026
- 37.9.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7026

37.9.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new custom NSTextField object.
See also:

- 37.9.3 Constructor 7026
- 37.9.4 Constructor(Handle as Integer) 7026

37.9.6 Destructor

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The destructor.

37.9.7 Events

37.9.8 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes: The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

37.9.9 acceptsFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

37.9.10 becomeFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Called when the object gets focus.
Notes: Return true to accept.

37.9.11 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a touch gesture.
Notes: e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.9.12 canBecomeKeyView as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

37.9.13 Close

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom view is destroyed.

37.9.14 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

37.9.15 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

37.9.16 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

37.9.17 draggingExited(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

37.9.18 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging session has completed.
Notes: session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

37.9.19 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag moves on the screen.
Notes: session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

37.9.20 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Declares the types of operations the source allows to be performed. (required)
Notes: session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

37.9.21 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag will begin.
Notes: session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

37.9.22 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

37.9.23 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has ended a touch gesture.
Notes: e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.9.24 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes: session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

37.9.25 isOpaque as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Whether this view is opaque.

37.9.26 keyDown(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

37.9.27 keyUp(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.

Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

37.9.28 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a pinch gesture.
Notes: e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.9.29 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes: theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

37.9.30 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.9.31 mouseDownCanMoveWindow as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: This event is called so you can decide what happens with mouse down.
Notes: Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

37.9.32 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.9.33 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.9.34 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.9.35 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.9.36 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.9.37 Open

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom NSSearchField is created.

37.9.38 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.9.39 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.9.40 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.9.41 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

37.9.42 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes: sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

37.9.43 pressureChange(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes: This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

37.9.44 resignFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Focus is going away.
Notes: Return true to accept.

37.9.45 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.9.46 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.9.47 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.9.48 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a rotation gesture.
Notes: e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.9.49 scrollWheel(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes: e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

37.9.50 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a swipe gesture.
Notes: e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.9.51 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging images should be changed.
Notes: sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

37.9.52 viewDidMoveToWindow

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that it has been added to a new view hierarchy.
Notes: The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose

to ignore such cases if they are not of interest.

37.9.53 wantsPeriodicDraggingUpdates as boolean

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes: Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

37.10 class CustomNSTextViewMBS

37.10.1 class CustomNSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: The class for a custom text view.
Notes: Some events will not fire as text view eats them itself.
Subclass of the NSTextViewMBS class.

• 37.10.4 Constructor(Handle as Integer) 7040

37.10.6 Destructor

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: The destructor.

37.10.7 Events

37.10.8 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes: The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

37.10.9 acceptsFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

37.10.10 becomeFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Called when the object gets focus.
Notes: Return true to accept.

37.10.11 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a touch gesture.
Notes: e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.10.12 canBecomeKeyView as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

37.10.13 Close

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom view is destroyed.

37.10.14 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

37.10.15 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

37.10.16 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

37.10.17 draggingExited(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

37.10.18 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging session has completed.
Notes: session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

37.10.19 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag moves on the screen.
Notes: session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

37.10.20 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Declares the types of operations the source allows to be performed. (required)
Notes: session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

37.10.21 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag will begin.
Notes: session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

37.10.22 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

37.10.23 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has ended a touch gesture.
Notes: e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.10.24 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes: session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

37.10.25 isOpaque as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Whether this view is opaque.

37.10.26 keyDown(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

37.10.27 keyUp(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.

Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

37.10.28 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a pinch gesture.
Notes: e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.10.29 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes: theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

37.10.30 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.10.31 mouseDownCanMoveWindow as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: This event is called so you can decide what happens with mouse down.
Notes: Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

37.10.32 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.10.33 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.10.34 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.10.35 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.10.36 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.10.37 Open

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom NSSearchField is created.

37.10.38 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.10.39 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.10.40 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.10.41 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

37.10.42 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes: sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

37.10.43 pressureChange(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes: This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

37.10.44 resignFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Focus is going away.
Notes: Return true to accept.

37.10.45 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.10.46 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.10.47 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.10.48 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a rotation gesture.
Notes: e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.10.49 scrollWheel(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes: e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

37.10.50 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a swipe gesture.
Notes: e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.10.51 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging images should be changed.
Notes: sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

37.10.52 viewDidMoveToWindow

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that it has been added to a new view hierarchy.
Notes: The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose

to ignore such cases if they are not of interest.

37.10.53 wantsPeriodicDraggingUpdates as boolean

MBS MacCocoa Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop only.

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes: Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

37.11 class CustomNSTokenFieldMBS

37.11.1 class CustomNSTokenFieldMBS

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The class for a custom NSTokenField.
Notes: Subclass of the NSTokenFieldMBS class.

37.11.6 Destructor

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The destructor.

37.11.7 Events

37.11.8 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes: The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

37.11.9 acceptsFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

37.11.10 becomeFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Called when the object gets focus.
Notes: Return true to accept.

37.11.11 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a touch gesture.
Notes: e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.11.12 canBecomeKeyView as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

37.11.13 Close

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom view is destroyed.

37.11.14 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

37.11.15 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

37.11.16 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

37.11.17 draggingExited(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

37.11.18 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging session has completed.
Notes: session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

37.11.19 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag moves on the screen.
Notes: session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

37.11.20 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Declares the types of operations the source allows to be performed. (required)
Notes: session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

37.11.21 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag will begin.
Notes: session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

37.11.22 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

37.11.23 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has ended a touch gesture.
Notes: e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.11.24 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes: session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

37.11.25 isOpaque as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Whether this view is opaque.

37.11.26 keyDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

37.11.27 keyUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.

Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

37.11.28 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a pinch gesture.
Notes: e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.11.29 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes: theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

37.11.30 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.11.31 mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: This event is called so you can decide what happens with mouse down.
Notes: Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

37.11.32 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.11.33 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.11.34 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.11.35 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.11.36 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.11.37 Open

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom NSView is created.

37.11.38 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.11.39 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.11.40 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.11.41 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

37.11.42 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes: sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

37.11.43 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes: This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

37.11.44 resignFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Focus is going away.
Notes: Return true to accept.

37.11.45 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.11.46 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.11.47 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.11.48 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a rotation gesture.
Notes: e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.11.49 scrollWheel(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes: e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

37.11.50 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a swipe gesture.
Notes: e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.11.51 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging images should be changed.
Notes: sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

37.11.52 viewDidMoveToWindow

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that it has been added to a new view hierarchy.
Notes: The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose

to ignore such cases if they are not of interest.

37.11.53 wantsPeriodicDraggingUpdates as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes: Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

37.12 class CustomNSViewMBS

37.12.1 class CustomNSViewMBS

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The class for a custom NSView.
Example:

```
// add a custom view to the window that draws itself and reacts to mouse clicks
// MyView is a subclass of CustomNSViewMBS with the events implemented.
// View is a property of the window: View As MyView
View = New MyView(20, 20, 200, 100)
Self.NSWindowMBS.contentView.addSubview View

// in MyView:
Sub DrawRect(g As NSGraphicsMBS, left As Double, top As Double, width As Double, height As Double)
Handles DrawRect
g.setFillColor NSColorMBS.systemBlueColor
g.fillRect 0, 0, Me.bounds.Width, Me.bounds.Height
End Sub

Function mouseDown(e As NSEventMBS, x As Double, y As Double) As Boolean Handles mouseDown
System.DebugLog "Clicked at " + x.ToString + "/" + y.ToString
Return True
End Function
```

Notes: Subclass of the NSViewMBS class.

37.12.2 Methods

37.12.3 Constructor

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The dummy constructor doing nothing.
See also:

- 37.12.4 Constructor(Handle as Integer) 7069
- 37.12.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7069

37.12.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given CustomNSView handle.
Notes: The handle is casted to a CustomNSView and the plugin retains this handle.
See also:

- 37.12.3 Constructor 7069
- 37.12.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7069

37.12.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The constructor for a new custom NSView object.
See also:

- 37.12.3 Constructor 7069
- 37.12.4 Constructor(Handle as Integer) 7069

37.12.6 Destructor

MBS MacControls Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The destructor.

37.12.7 Events

37.12.8 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes: The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

37.12.9 acceptsFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

37.12.10 becomeFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Called when the object gets focus.
Notes: Return true to accept.

37.12.11 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a touch gesture.
Notes: e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.12.12 canBecomeKeyView as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

37.12.13 Close

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom view is destroyed.

37.12.14 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

37.12.15 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

37.12.16 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

37.12.17 draggingExited(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

37.12.18 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging session has completed.
Notes: session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.

operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

37.12.19 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag moves on the screen.
Notes: session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

37.12.20 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Declares the types of operations the source allows to be performed. (required)
Notes: session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

37.12.21 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the drag will begin.
Notes: session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

37.12.22 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

37.12.23 drawFocusRingMask(g as NSGraphicsMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Draw the focus ring mask for the view.
Notes: If false is returned, the default method from NSView class runs.

This method provides the shape of the focus ring mask by drawing the focus ring mask. An implementation of this method should draw in the view's interior (bounds) coordinate space, that the focus ring style has been set (it will be set it to NSFocusRingOnly to capture the focus ring itself), and that the fill and stroke colors have been set to an arbitrary fully opaque color.

Subclasses that find the default behavior insufficient should only draw the focus ring shape.

The NSView default implementation of this method simply fills self.bounds.
Available in Mac OS X v10.7 and later.

Please use NSGraphicsMBS class for drawing.

37.12.24 DrawRect(g as NSGraphicsMBS, left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The paint event with the rectangle which needs to be redrawn.

37.12.25 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has ended a touch gesture.
Notes: e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.12.26 focusRingMaskBounds as NSRectMBS

MBS MacControls Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Returns the focus ring mask bounds.
Notes: Return nil to run default NSView method.

Return a rectangle containing the mask in the view's interior (bounds) coordinate space.

The mask bounds allows the focus ring's overall size and position to be determined before it is drawn.
Subclasses must override this method if they require the display of a focus ring.
The NSView default implementation of this method simply returns NSRectMBS.Zero.

Note: The information provided by focusRingMaskBounds will enable Accessibility to identify selected subelements for zoom tracking, so it is important that this method provide a reasonably tight bounding box and that noteFocusRingMaskChanged is invoked as described.

37.12.27 ignoreModifierKeysForDraggingSession(session as NSDraggingSessionMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes: session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

37.12.28 isFlipped as Boolean

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The event to return a boolean value indicating whether the view uses a flipped coordinate system.
Notes: The default value of this property is false, which results in a non-flipped coordinate system. In a non-flipped coordinate system, the origin is in the lower-left corner of the view and positive y-values extend upward. In a flipped coordinate system, the origin is in the upper-left corner of the view and y-values extend downward. X-values always extend to the right.

If you want your view to use a flipped coordinate system, override this property and return true.

37.12.29 isOpaque as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether this view is opaque.

37.12.30 keyDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

37.12.31 keyUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the key events.
Notes: Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

37.12.32 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a pinch gesture.
Notes: e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.12.33 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes: theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

37.12.34 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.12.35 mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: This event is called so you can decide what happens with mouse down.
Notes: Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

37.12.36 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.12.37 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.12.38 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.12.39 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.12.40 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.12.41 Open

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The event called when the custom NSView is created.

37.12.42 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.12.43 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.12.44 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.
Third mouse button.

37.12.45 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

37.12.46 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes: sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

37.12.47 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.

Notes: This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

37.12.48 resignFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Focus is going away.
Notes: Return true to accept.

37.12.49 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.12.50 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.12.51 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: One of the mouse events.
Notes: Return true if you handled this event.

37.12.52 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a rotation gesture.
Notes: e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.12.53 scrollWheel(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes: e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

37.12.54 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has begun a swipe gesture.
Notes: e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

37.12.55 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging images should be changed.
Notes: sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

37.12.56 viewDidMoveToWindow

MBS MacControls Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that it has been added to a new view hierarchy.
Notes: The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

37.12.57 wantsPeriodicDraggingUpdates as boolean

MBS MacControls Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes: Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

37.13 class DateTimePicker

37.13.1 class DateTimePicker

Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The built-in date time picker control in Xojo.
Notes: Only for Xojo 2020r2 or newer.

37.13.2 Methods

37.13.3 NSDatePickerMBS as NSDatePickerMBS

MBS MacControls Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: Queries date picker object for the control.
Notes: Only for Xojo 2020r2 or newer.

37.14 class DesktopBevelButton

37.14.1 class DesktopBevelButton

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: An extension of Xojo's internal control.

37.14.2 Methods

37.14.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

```
// This example needs a window with BevelButton1.
MessageBox BevelButton1.NSButtonMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

37.15 class DesktopButton

37.15.1 class DesktopButton

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built in Button class in Xojo.

37.15.2 Methods

37.15.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

```
// This example needs a window with PushButton1.
MessageBox PushButton1.NSButtonMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

37.16 class DesktopCheckBox

37.16.1 class DesktopCheckBox

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: An extension of Xojo's internal control.

37.16.2 Methods

37.16.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

```
// This example needs a window with CheckBox1.
MessageBox CheckBox1.NSButtonMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

37.17 class DesktopComboBox

37.17.1 class DesktopComboBox

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built in ComboBox class in Xojo.

37.17.2 Methods

37.17.3 NSComboBoxMBS as NSComboBoxMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSComboBoxMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

37.18 class DesktopContainer

37.18.1 class DesktopContainer

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The container class in Xojo.

37.18.2 Methods

37.18.3 NSViewMBS as NSViewMBS

MBS MacBase Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSViewMBS object for the given container.
Example:

```
// This example needs a window with ContainerControl1.
MessageBox ContainerControl1.NSViewMBS.className
```

Notes: This way you can manipulate Cocoa container controls directly.

37.19 class DesktopDateTimePicker

37.19.1 class DesktopDateTimePicker

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built-in date time picker control in Xojo.
Notes: Only for Xojo 2021r3 or newer.

37.19.2 Methods

37.19.3 NSDatePickerMBS as NSDatePickerMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Queries date picker object for the control.
Notes: Only for Xojo 2020r2 or newer.

37.20 class DesktopDisclosureTriangle

37.20.1 class DesktopDisclosureTriangle

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built in DisclosureTriangle class in Xojo.

37.20.2 Methods

37.20.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

MessageBox DisclosureTriangle1.NSButtonMBS.className

Notes: This way you can manipulate Cocoa controls directly.

37.21 class DesktopGroupBox

37.21.1 class DesktopGroupBox

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built in Groupbox class in Xojo.

37.21.2 Methods

37.21.3 NSBoxMBS as NSBoxMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSBoxMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

37.22 class DesktopImageViewer

37.22.1 class DesktopImageViewer

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built in ImageWell class in Xojo.

37.22.2 Methods

37.22.3 NSImageViewMBS as NSImageViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSImageViewMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

37.23 control DesktopNSButtonControlMBS

37.23.1 control DesktopNSButtonControlMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSButton.
Notes: This control embeds a special NSButton subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.

37.23.2 Properties

37.23.3 AlternateTitle as String

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The title that the button displays when it's in its alternate state.
Notes: (Read and Write property)

37.23.4 BezelStyle as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The appearance of the border, if the view has one.
Notes: Use this constants:

(Read and Write property)

37.23.5 ButtonType as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The button type.
Notes: See also NSButtonMBS.ButtonType and the constants there like NSPushOnPushOffButton.
(Read and Write property)

NSRoundedBezelStyle	= 1
NSRegularSquareBezelStyle	= 2
NSThickSquareBezelStyle	= 3
NSThickerSquareBezelStyle	= 4
NSDisclosureBezelStyle	= 5
NSShadowlessSquareBezelStyle	= 6
NSCircularBezelStyle	= 7
NSTexturedSquareBezelStyle	= 8
NSHelpButtonBezelStyle	= 9
NSSmallSquareBezelStyle	= 10
NSTexturedRoundedBezelStyle	= 11
NSRoundRectBezelStyle	= 12
NSRecessedBezelStyle	= 13
NSRoundedDisclosureBezelStyle	= 14

37.23.6 Title as String

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The title displayed on the button when it's in its normal state.
Notes: (Read and Write property)

37.23.7 View as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.23.8 Events

37.23.9 Action

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The action event.

37.23.10 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.23.11 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.23.12 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.23.13 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.23.14 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.23.15 FocusLost

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.23.16 FocusReceived

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.23.17 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.23.18 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.23.19 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.23.20 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.23.21 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.23.22 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.23.23 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.23.24 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.24 control DesktopNSComboBoxControlMBS

37.24.1 control DesktopNSComboBoxControlMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSComboBox.
Notes: This control embeds a special NSComboBox subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.

37.24.2 Properties

37.24.3 View as NSComboBoxMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.24.4 Events

37.24.5 Action

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The action event run, when e.g. return key is pressed.

37.24.6 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.24.7 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.24.8 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.24.9 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.24.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.24.11 FocusLost

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.24.12 FocusReceived

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.24.13 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.24.14 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.24.15 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.24.16 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.24.17 MouseUp(x As Integer, y As Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.24.18 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.24.19 ScaleFactorChanged(NewFactor as double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.24.20 SelectionDidChange

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the pop-up list selection has finished changing.

37.24.21 SelectionIsChanging

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the pop-up list selection is changing.

37.24.22 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text begins an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

37.24.23 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when the text in the receiving control changes.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is

automatically registered to receive the notification. The field editor is provided as parameter for inspection.

37.24.24 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text ends an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

37.24.25 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.24.26 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.24.27 WillDismiss

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the pop-up list is about to be dismissed.

37.24.28 WillPopUp

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the pop-up list is about to be displayed.

37.24.29 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.25 control DesktopNSDatePickerControlMBS

37.25.1 control DesktopNSDatePickerControlMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control to put a Mac OS X date picker on a Xojo window.
Notes: This control embeds a special NSDatePicker subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.

37.25.2 Properties

37.25.3 AcceptTabs as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes: If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

37.25.4 View as NSDatePickerMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The reference to the underlaying NSDatePicker.
Notes: (Read only property)

37.25.5 Events

37.25.6 Action

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event is called when user clicks on a date/time and changes something.

37.25.7 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.25.8 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.25.9 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.25.10 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.25.11 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.25.12 FocusLost

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.25.13 FocusReceived

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.25.14 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.25.15 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.25.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.25.17 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.25.18 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.25.19 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.25.20 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.25.21 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.26 control DesktopNSOutlineControlMBS

37.26.1 control DesktopNSOutlineControlMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control for a NSOutlineView.
Notes: Please use NSOutlineControlMBS for hierarchical lists and NSTableControlMBS for normal lists.

37.26.2 Properties

37.26.3 AcceptTabs as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes: If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

37.26.4 allowsColumnReordering as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to rearrange columns by dragging their headers.
Notes: The default value of this property is true, which allows the user to rearrange the table view,Äôs columns. You can rearrange columns programmatically regardless of this setting.
(Read and Write property)

37.26.5 allowsColumnResizing as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to resize columns by dragging between their headers.
Notes: The default of this property is true, which allows the user to resize the table view,Äôs columns. You can resize columns programmatically regardless of this setting.
(Read and Write property)

37.26.6 allowsColumnSelection as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select columns by clicking their headers.
Notes: The default is false, which prevents the user from selecting columns (if you create the table view in Interface Builder, the default value is true). You can select columns programmatically regardless of this setting.
(Read and Write property)

37.26.7 allowsEmptySelection as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select zero columns or rows.
Notes: The default is true, which allows the user to select zero columns or rows.
(Read and Write property)

37.26.8 allowsMultipleSelection as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select more than one column or row at a time.
Notes: The default is false, which allows the user to select only one column or row at a time. You can select multiple columns or rows programmatically regardless of this setting.
(Read and Write property)

37.26.9 autohidesScrollers as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view automatically hides its scroll bars when they are not needed.
Notes: The horizontal and vertical scroll bars are hidden independently of each other. When the value of this property is YES and the content of the scroll view doesn't extend beyond the size of the clip view on a given axis, the scroller on that axis is removed to leave more room for the content.
(Read and Write property)

37.26.10 hasHorizontalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view has a horizontal scroller.
Notes: When the value of this property is true, the scroll view allocates and displays a horizontal scroller as needed. The default value of this property is false.
(Read and Write property)

37.26.11 hasVerticalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view has a vertical scroller.
Notes: When the value of this property is true, the scroll view allocates and displays a vertical scroller as needed. The default value of this property is false.
(Read and Write property)

37.26.12 ScrollView as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The scroll view used in this control.
Notes: (Read only property)

37.26.13 View as NSOutlineViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The outline view used in this control.
Notes: (Read only property)

- 37.26.94 view(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSViewMBS 7138

37.26.14 Events

37.26.15 acceptDrop(info as NSDraggingInfoMBS, item as NSOutlineViewItemMBS, index as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether a drop operation was successful.
Notes: info: An object that contains more information about this dragging operation.
item: The parent of the item over which the cursor was placed when the mouse button was released.
index: The index of the child of item over which the cursor was placed when the mouse button was released.

Return true if the drop operation was successful, otherwise false.

The data source should incorporate the data from the dragging pasteboard in the implementation of this method. You can get the data for the drop operation from info using the draggingPasteboard method.
The return value indicates success or failure of the drag operation to the system.

37.26.16 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.26.17 childOfItem(index as Integer, item as NSOutlineViewItemMBS) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the child item at the specified index of a given item.
Notes: index: The index of the child item from item to return.
item: An item in the data source.

Return the child item at index of item. If item is nil, returns the appropriate child item of the root object.

Children of a given parent item are accessed sequentially. In order for the collapsed state of the outline view to remain consistent when it is reloaded you must always return the same object for a specified child and item.

Do not call reloadData from this method.

This event is called very frequently, so it must be efficient.

37.26.18 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.26.19 ColumnDidMove(notification as NSNotificationMBS, OldColumn as Integer, NewColumn as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked whenever the user moves a column in the outline view.

37.26.20 ColumnDidResize(notification as NSNotificationMBS, tableColumn as NSTableColumnMBS, OldWidth as Double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked whenever the user resizes a column in the outline view.

37.26.21 concludeDragOperation(info as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

37.26.22 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.26.23 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.26.24 dataCell(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSCellMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the cell to use in a given column for a given item.
Notes: tableColumn: The table column for which the cell is required. This value may be nil.
item: The item for which the cell is required.

Return the cell to use in column tableColumn for item item, or nil. The cell must properly implement copyWithZone (since it may be copied by by the outline view).

You can return a different data cell for any particular combination of table column and item, or a cell that will be used for the entire row (a full-width cell). If tableColumn is non-nil, you should return a cell. Typically, you should default to returning the result from [tableColumn dataCellForRow:row] .
When each row (identified by the item) is being drawn, this method is first called with a nil value for

tableColumn. At this time, you can return a cell that is used to draw the entire row, acting like a group. If you do return a cell for the nil table column, your implementations of the other corresponding data source and delegate methods must be prepared to be invoked with a nil value for tableColumn. If do not return a cell for the nil table column, the method is called once for each column in the outline view, as usual.

37.26.25 didAddRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implemented to know when a new row view is added to the table.
Notes: rowView: The new row view.
row: The row to which the view was added.

This evemt is for NSView-based outline views. At this point, you can choose to add in extra views or modify any properties on rowView.

37.26.26 didClickTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent at the time the mouse button subsequently goes up in outlineView and tableColumn has been ‚Äúclicked‚Äù without having been dragged anywhere.

37.26.27 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.26.28 didDragTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent at the time the mouse button goes up in outlineView and tableColumn has been dragged during the time the mouse button was down.

37.26.29 didRemoveRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implemented to know when a row view is removed from the table
Notes: rowView: The row view that was removed.
row: The number of the row that was removed due to being moved offscreen, or -1 if the row was removed from the table so it is no longer valid.

The removed rowView may be reused by the table, so any additionally inserted views should be removed at this point.

37.26.30 didTile

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The tableview did tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

37.26.31 DoubleClick

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse made a double click.

37.26.32 draggingEnded(info as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.
This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

37.26.33 draggingExited(info as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.

Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

37.26.34 draggingSessionEnded(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implement this method to know when the given dragging session has ended.
Notes: session: The dragging session that ended.
screenPoint: The point onscreen at which the drag ended.
operation: A mask specifying the types of drag operations permitted by the dragging source.

You can implement this optional delegate method to know when the dragging source operation ended at a specific location, such as the trash (by checking for an operation of NSDragOperationDelete).

37.26.35 draggingSessionWillBegin(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, draggedItems() as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implement this method know when the given dragging session is about to begin and potentially modify the dragging session.
Notes: session: The dragging session that is about to begin.

screenPoint: The point onscreen at which the drag is to begin.
draggedItems: A array of items to be dragged, excluding items for which pasteboardWriterForItem returns nil.

The draggedItems array directly matches the pasteboard writer array used to begin the dragging session with the NSView method beginDraggingSessionWithItems. Hence, the order is deterministic, and can be used in acceptDrop when enumerating the NSDraggingInfo protocol's pasteboard classes.

37.26.36 FocusLost

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.26.37 FocusReceived

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.26.38 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.26.39 heightOfRowByItem(item as NSOutlineViewItemMBS) as Double

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the height in points of the row containing item.
Notes: item: The row item.

Return the height of the row.

Values returned by this method should not include intercell spacing and must be greater than 0.
Implement this event to support an outline view with varying row heights.

For large tables in particular, you should make sure that this method is efficient. NSOutlineView may cache the values this method returns, so if you would like to change a row's height make sure to invalidate the row height by calling noteHeightOfRowsWithIndexesChanged. NSOutlineView automatically invalidates its entire row height cache in reloadData and noteNumberOfRowsChanged.

If you call viewAtColumn or rowViewAtRow within your implementation of this method, an exception is thrown.

To avoid the possibility of a hang due to unexpected recursion, don,Äôt call geometry-calculating methods such as bounds, rectOfColumn, or any NSTableView method that calls tile within your implementation of this method.

37.26.40 isGroupItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean that indicates whether a given row should be drawn in the ,Äúgroup row,Äù style.
Notes: item: An item in the outline view.

Return true to indicate a particular row should have the "group row" style drawn for that row, otherwise false.

If the cell in that row is an instance of NSTextFieldCell and contains only a string value, the ,Äúgroup row,Äù style attributes are automatically applied for that cell.

37.26.41 isItemExpandable(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the a given item is expandable.
Notes: item: An item in the data source.

Returns true if item can be expanded to display its children, otherwise NO.

This method may be called quite often, so it must be efficient.

Do not call reloadData from this method.

37.26.42 ItemDidCollapse(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the did collapse notification is posted—that is, whenever the user collapses an item in the outline view.

37.26.43 ItemDidExpand(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when notification is posted—that is, whenever the user expands an item in the outline view.

37.26.44 itemForPersistentObject(PersistentObject as Variant) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked by outlineView to return the item for the archived object.
Notes: object: An archived representation of an item in outlineView's data source.

Return the unarchived item corresponding to object. If the item is an archived object, this method may return the object.

When the outline view is restoring the saved expanded items, this method is called for each expanded item, to translate the archived object to an outline view item.

You must implement this method if you are automatically saving expanded items (that is, if autosaveExpandedItems returns true).

37.26.45 ItemWillCollapse(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when notification is posted—that is, whenever the user is about to collapse an item in the outline view.

37.26.46 ItemWillExpand(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when notification is posted—that is, whenever the user is about to expand an item in the outline view.

37.26.47 LeftMouseDown(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has pressed the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.26.48 LeftMouseDragged(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has moved the mouse with the left button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.26.49 LeftMouseUp(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has released the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.26.50 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.26.51 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.26.52 mouseDownInHeaderOfTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Event sent whenever the mouse button is clicked in outlineView while the cursor is in a column header tableColumn.

37.26.53 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.26.54 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.26.55 namesOfPromisedFilesDroppedAtDestination(dropDestination as folderItem, DraggedItems() as NSOutlineViewItemMBS) as string()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns an array of filenames for the created files that the receiver promises to create.
Notes: dropDestination: The drop location where the files are created.
items: The items being dragged.

Returns an array of filenames (not full paths) for the created files that the receiver promises to create.

For more information on file promise dragging, see documentation on the NSDraggingSource protocol and namesOfPromisedFilesDroppedAtDestination.

37.26.56 nextTypeSelectMatchFromItem(startItem as NSOutlineViewItemMBS, endItem as NSOutlineViewItemMBS, searchString as String) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the first item that matches the searchString from within the range of startItem to endItem.
Notes: startItem: The first item to search.
endItem: The item before which to stop searching. It is possible for endItem to be less than startItem if the search will wrap.
searchString: The string for which to search.

Returns the first item—from within the range of startItem to endItem—that matches the searchString, or nil if there is no match.

Implement this method if you want to control how type selection works. You should include startItem as a possible match, but do not include endItem.
It is not necessary to implement this event in order to support type select.

37.26.57 numberOfChildrenOfItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the number of child items encompassed by a given item.
Notes: item: An item in the data source.

Returns the number of child items encompassed by item. If item is nil, this method should return the number of children for the top-level item.

The numberOfChildrenOfItem method is called very frequently, so it must be efficient.

Do not call reloadData from this method.

37.26.58 objectValue(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Variant

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked by outlineView to return the data object associated with the specified item.
Notes: tableColumn: A column in outlineView.
item: An item in the data source in the specified tableColumn of the view.

Returns the item is located in the specified tableColumn of the view.

Do not call reloadData from this method.

37.26.59 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.26.60 OtherMouseDown(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has pressed a mouse button other than the left or right one.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.26.61 OtherMouseDragged(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.26.62 OtherMouseUp(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has released a mouse button other than the left or right button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.26.63 pasteboardWriterForItem(item as NSOutlineViewItemMBS) as NSPasteboardItemMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implement this method to enable the table to be an NSDraggingSource that supports dragging multiple items.
Notes: item: The item for which to return a pasteboard writer.

Returns a NSPasteboardItem object.

If this method is implemented, then writeItems is not called.

37.26.64 persistentObjectForItem(item as NSOutlineViewItemMBS) as Variant

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked by outlineView to return an archived object for item.
Notes: item: The item for which to return an archived object.

Returns an archived representation of item. If the item is an archived object, this method may return the item.

When the outline view is saving the expanded items, this method is called for each expanded item, to translate the outline view item to an archived object.

You must implement this method if you are automatically saving expanded items (that is, if autosaveExpandedItems returns true).

37.26.65 RightMouseDown(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the view that the user has pressed the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.26.66 RightMouseDragged(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has moved the mouse with the right button pressed .
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.26.67 RightMouseUp(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has released the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.26.68 rowViewForItem(item as NSOutlineViewItemMBS) as NSTableRowViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implement this method to return a custom NSTableRowView for a particular item.

Notes: item: The item displayed by the returned table row view.

Return an instance or subclass of NSTableRowView. If nil is returned, a NSTableRowView instance is created and used.

This method, if implemented, is only invoked for NSView-based outline views.

37.26.69 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.26.70 SelectionDidChange(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the selection did change notification is posted—that is, immediately after the outline view,Äôs selection has changed.

37.26.71 selectionIndexesForProposedSelection(proposedSelectionIndexes as NSIndexSetMBS) as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the delegate to modify the proposed selection.
Notes: proposedSelectionIndexes: An index set containing the indexes of the proposed selection.
Return an NSIndexSet instance containing the indexes of the new selection. Return proposedSelectionIndexes if the proposed selection is acceptable, or the value of the table view,Äôs existing selection to avoid changing the selection.

This method may be called multiple times with one new index added to the existing selection to find out if a particular index can be selected when the user is extending the selection with the keyboard or mouse.

Implementation of this method is optional. If implemented, this method will be called instead of willDisplayOutlineCell.

If not implemented or returns nil, the plugin will return proposedSelectionIndexes.

37.26.72 SelectionIsChanging(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when notification is posted—that is, whenever the outline view,Äôs selection changes.

37.26.73 selectionShouldChangeInOutlineView as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the outline view should change its selection.
Notes: Return true to permit outlineView to change its selection (typically a row being edited), false to deny permission.

For example, if the user is editing a cell and enters an improper value, the delegate can prevent the user from selecting or editing any other cells until a proper value has been entered into the original cell. You can implement this method for complex validation of edited rows based on the values of any of their cells.

37.26.74 setObjectValue(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS, value as Variant)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Set the data object for a given item in a given column.
Notes: object: The new value for the item.
tableColumn: A column in outlineView.
item: An item in the data source in the specified tableColumn of the view.

The item is located in the specified tableColumn of the view.

Do not call reloadData from this method.

37.26.75 shouldCollapseAutoExpandedItemsForDeposited(deposited as Boolean, superResult as Boolean) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether auto-expanded items should return to their original collapsed state.
Notes: deposited: If true, the drop terminated successfully; if false the drop failed.

Return true if auto-expanded items should return to their original collapsed state; otherwise false.

Implement this event to provide custom behavior. If the target of a drop is not auto-expanded (by hovering long enough) the drop target still gets expanded after a successful drop unless this method returns true. The default implementation returns false after a successful drop.
This method is called in a variety of situations. For example, it is called shortly after the acceptDrop method is called and also if the drag exits the outline view (exiting the view is treated the same as a failed drop). The return value of the acceptDrop method determines the incoming value of the deposited parameter.

37.26.76 shouldCollapseItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the outline view should collapse a given item.
Notes: item: The item that should collapse.

Return true to permit outlineView to collapse item, false to deny permission.

You can implement this method to disallow collapsing of specific items. For example, if the first row of your outline view should not be collapsed, your delegate method could contain this line of code:

return rowForItem(item) <>0

37.26.77 shouldEdit(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMB as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the outline view should allow editing of a given item in a given table column.
Notes: tableColumn: The table column.
item: The item.

Returns true to permit outlineView to edit the cell specified by tableColumn and item, false to deny permission.
If this method returns true, the cell may still not be editable—for example, if you have set up a custom NSTextFieldCell as a data cell, it must return true for isEditable to allow editing.

You can implement this method to disallow editing of specific cells.

37.26.78 shouldExpandItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the outline view should expand a given item.
Notes: item: The item that should expand.

Returns true to permit outlineView to expand item, false to deny permission.
You can implement this method to disallow expanding of specific items.

37.26.79 shouldReorderColumn(columnIndex as Integer, newColumnIndex as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent to the delegate to allow or prohibit the specified column to be dragged to a new location.
Notes: columnIndex: The index of the column being dragged.
newColumnIndex: The proposed target index of the column.

Returns true if the column reordering should be allowed, otherwise false.

When a column is initially dragged by the user, the delegate is first called with a newColumnIndex value of -1. Returning false will disallow that column from being reordered at all. Returning true allows it to be reordered, and the delegate will be called again when the column reaches a new location.

The actual NSTableColumn instance can be retrieved from the tableColumns array.
If this method is not implemented, all columns are considered reorderable.

37.26.80 shouldSelectItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the outline view should select a given item.
Notes: item: The item.

Return true to permit outlineView to select item, false to deny permission.

You implement this event to disallow selection of particular items.
For better performance and finer grain control over the selection, use dataCell.

37.26.81 shouldSelectTableColumn(tableColumn as NSTableColumnMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the outline view should select a given table column.
Notes: tableColumn: The table column.

Return true to permit outlineView to select tableColumn, false to deny permission.

You can implement this method to disallow selection of specific columns.

37.26.82 shouldShowCellExpansion(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the delegate to control cell expansion for a specific column and item.
Notes: tableColumn: A table column in the outline view.
item: An item in the outline view.

Returns true to allow an expansion tooltip to appear in the column tableColumn for item item, otherwise false.

Cell expansion can occur when the mouse hovers over the specified cell and the cell contents are unable to be fully displayed within the cell. If this method returns true, the full cell contents will be shown in a special floating tool tip view, otherwise the content is truncated.

37.26.83 shouldShowOutlineCellForItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns whether the specified item should display the outline cell (the disclosure triangle).
Notes: item: An item in the outline view.

Returns true if the outline cell should be displayed, otherwise false.

Returning false causes frameOfOutlineCellAtRow to return NSZeroRect, hiding the cell. In addition, the row will not be collapsible by keyboard shortcuts.

This method is called only for expandable rows.

37.26.84 shouldTrackCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether a given cell should be tracked.
Notes: cell: The cell used to display item item in column tableColumn
tableColumn: A table column in the outline view.
item: An item in the outline view.

Returns true if the cell should be tracked for the item item in column tableColumn, otherwise false.

Normally, only selectable or selected cells can be tracked. If you implement this method, cells which are not selectable or selected can be tracked (and vice-versa). For example, this allows you to have a button cell in a table which does not change the selection, but can still be clicked on and tracked.

37.26.85 shouldTypeSelectForEvent(e as NSEventMBS, searchString as String) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether type select should proceed for a given event and search string.
Notes: e: The event that caused the message to be sent.
searchString: The string for which searching is to proceed. The search string is nil if no type select has begun.

Return true if type select should proceed, otherwise false.

Generally, this method will be called from keyDown and the event will be a key event.

37.26.86 sizeToFitWidthOfColumn(Column as Integer) as Double

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the delegate to provide custom sizing behavior when a column,Äôs resize divider is double clicked.
Notes: column: The index of the column.

Returns the width of the specified column.

By default, NSOutlineView iterates every row in the table, accesses a cell via preparedCellAtColumn, and requests the cellSize to find the appropriate largest width to use.
For accurate results and performance, it is recommended that this method is implemented when using large tables. By default, large tables use a monte carlo simulation instead of iterating every row.

37.26.87 sortDescriptorsDidChange(oldDescriptors() as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked by an outline view to notify the data source that the descriptors changed and the data may need to be resorted.
Notes: oldDescriptors: An array that contains the previous descriptors.

The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source does not itself manage them, you can get outlineView's current sort descriptors by sending it a sortDescriptors message.

37.26.88 textShouldBeginEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow.

37.26.89 textShouldEndEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow.

37.26.90 toolTipForCell(cell as NSCellMBS, byref rect as NSRectMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS, mouseLocation as NSPointMBS) as String

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: When the cursor pauses over a given cell, the value returned from this method is displayed in a tooltip.
Notes: cell: The cell for which to generate a tooltip.
rect: The proposed active area of the tooltip. To control the default active area, you can modify the rect parameter. By default, rect is computed as cell.drawingRectForBounds(cellFrame).
tc: The table column that contains cell.
item: The item for which to display a tooltip.
mouseLocation: The current mouse location in view coordinates.

If you don,Äôt want a tooltip at that location, return nil or the empty string.

37.26.91 typeSelectString(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as String

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the string that is used for type selection for a given column and item.
Notes: tableColumn: A table column in the outline view.
item: An item in the outline view.

Return the string that is used for type selection. You may want to change what is searched for based on what is displayed, or simply return nil for that row and/or column to not be searched

Implement this method if you want to control the string that is used for type selection. You may want to change what is searched for based on what is displayed, or simply return nil to specify that the given row and/or column should not be searched. By default, all cells with text in them are searched.

The default value when this delegate method is not implemented is:
outlineView.preparedCellAtColumn(tableColumn, outlineView.rowForItem(item)).stringValue
and you can return this value from the event if you wish.

37.26.92 updateDraggingItemsForDrag(draggingInfo as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implement this method to enable the table to update dragging items as they are dragged over

the view.
Notes: draggingInfo: The dragging info object.

37.26.93 validateDrop(info as NSDraggingInfoMBS, proposedItem as NSOutlineViewItemMBS, proposedChildIndex as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Used by an outline view to determine a valid drop target.
Notes: info: An object that contains more information about this dragging operation.
item: The proposed parent.
index: The proposed child location.

Returns a value that indicates which dragging operation the data source will perform.

Based on the mouse position, the outline view will suggest a proposed drop location. The data source may ‚Äúretarget‚Äù a drop if desired by calling setDropItem and returning something other than NSDragOperationNone. You may choose to retarget for various reasons (for example, for better visual feedback when inserting into a sorted position).
Implementation of this method is optional.

37.26.94 view(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implemented to return the view used to display the specified item and column.
Notes: tableColumn: The table column, or nil if the row is a group row.
item: The item displayed by the returned view.

Return the view to display the specified column and row. Returning nil is acceptable, in which case a view is not shown at that location.

This method is required if you wish to use NSView objects instead of NSCell objects for the cells within an outline view. Cells and views cannot be mixed within the same outline view.
It is recommended that the implementation of this method first call the NSTableView method makeViewWithIdentifier passing, respectively, the tableColumn parameter,Äôs identifier and self as the owner to attempt to reuse a view that is no longer visible. The frame of the view returned by this method is not important, and is automatically set by the outline view.
The view's properties should be properly set up before returning the result.
When using Cocoa bindings, this method is optional if at least one identifier has been associated with the table view at design time. If this method is not implemented, the outline view automatically calls make-

ViewWithIdentifier with the tableColumn parameter,Äôs identifier and the outline view,Äôs delegate as parameters, to attempt to reuse a previous view or automatically unarchive a prototype associated with the table view.
The autoresizingMask of the returned view is automatically set to NSViewHeightSizable to resize properly on row height changes.
See also:

- 37.26.13 View as NSOutlineViewMBS 7114

37.26.95 willDisplayCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the delegate that the cell specified by the column and item will be displayed.
Notes: cell: The cell.
tableColumn: The table column.
item: The item.

You can implement this method to modify cell to provide further setup for the cell in tableColumn and item. It is not safe to do drawing inside this method—you should only set up state for cell.

37.26.96 willDisplayOutlineCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the delegate that an outline view is about to display a cell used to draw the expansion symbol.
Notes: cell: The cell.
tableColumn: The table column.
item: The item.

Informs the event that outlineView is about to display cell—an expandable cell (a cell that has the expansion symbol)—for the column and item specified by tableColumn and item. The delegate can modify cell to alter its display attributes.
This method is not invoked when outlineView is about to display a non-expandable cell.

37.26.97 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.26.98 willTile

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The tableview will tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

37.26.99 writeItems(items() as NSOutlineViewItemMBS, pasteboard as NSPasteboardMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether a drag operation is allowed.
Notes: items: An array of the items participating in the drag.
pasteboard: The pasteboard to which to write the drag data.

Returns true if the drag operation is allowed, otherwise false.

Invoked by outlineView after it has been determined that a drag should begin, but before the drag has been started.
To refuse the drag, return false. To start a drag, return true and place the drag data onto the pboard (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the outline view once this call returns with true.

37.27 control DesktopNSPathControlControlMBS

37.27.1 control DesktopNSPathControlControlMBS

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The Xojo control to host a NSPathControl.
Notes: We know the fact, that the control wrapping the segmented control has control twice in the name. Suggestions to rename are welcome, but unlikely to happen as it would break code.

37.27.2 Properties

37.27.3 View as NSPathControlMBS

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The reference to the underlaying NSPathControlMBS.
Notes: (Read only property)

37.27.4 Events

37.27.5 Action

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when user clicks on a date/time and changes something.

37.27.6 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.27.7 Closing

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.27.8 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 24.0, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.27.9 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 24.0, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.27.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.27.11 DoubleClick

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: Called when a double click happened.
Notes: May call Action event before.

37.27.12 FocusLost

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.27.13 FocusReceived

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.27.14 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.27.15 MenuBarSelected

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.27.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.27.17 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.27.18 MouseUp(x As Integer, y As Integer)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.27.19 Opening

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.
Example:

```
Sub Open() Handles Open
// set small font
Var p As NSPathControlMBS = Me.View
p.Font = NSFontMBS.systemFontOfSize(10)

// disable focus ring
p.focusRingType = p.NSFocusRingTypeNone
End Sub
```

37.27.20 ScaleFactorChanged(NewFactor as double)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.27.21 willDisplayOpenPanel(openPanel as Variant)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: Implement this method to customize the Open panel shown by a pop-up–style path.
Notes: This method is called before the Open panel is shown but after its allowed file types are set to the cell's allowed types. At this time, you can further customize the Open panel as required. This method is called only when the style is set to NSPathStylePopUp. Implementation of this method is optional.

openPanel is a NSOpenPanelMBS object.

37.27.22 willPopUpMenu(menu as Variant)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: Implement this method to customize the menu of a pop-up–style path.
Notes: This event is called before the pop-up menu is shown. At this time, you can further customize the menu as required, adding and removing items. This method is called only when the style is set to NSPathStylePopUp. Implementation of this method is optional.

Menu is a NSMenuMBS object.

37.27.23 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.28 control DesktopNSPopUpButtonControlMBS

37.28.1 control DesktopNSPopUpButtonControlMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSPopUpButtonControl.
Notes: This control embeds a special NSPopUpButtonControl subclass.
Designed for Xojo 2021r3 and newer.

37.28.2 Properties

37.28.3 View as NSPopUpButtonMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.28.4 Events

37.28.5 Action

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The action event.

37.28.6 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.28.7 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.28.8 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.28.9 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.28.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.28.11 FocusLost

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.28.12 FocusReceived

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.28.13 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.28.14 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.28.15 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.28.16 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.28.17 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.28.18 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.28.19 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.28.20 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.29 control DesktopNSSearchFieldControlMBS

37.29.1 control DesktopNSSearchFieldControlMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSSearchField.
Notes: This control embeds a special NSSearchField subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.

Xojo Developer Magazine

- 24.4, page 10: News

37.29.2 Properties

37.29.3 View as NSSearchFieldMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.29.4 Events

37.29.5 Action

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The action event run, when e.g. return key is pressed.

37.29.6 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.29.7 cancelButtonRectForBounds(controlRect as NSRectMBS, cellRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: Modifies the bounding rectangle for the cancel button cell.
Example:

```
Function cancelButtonRectForBounds(controlRect as NSRectMBS, cellRect as NSRectMBS) Handles cancelButtonRectForBounds as NSRectMBS
// make room for our found text
cellRect.Width = cellRect.Width + 20
cellRect.X = cellRect.x - 20

return cellRect
End Function
```

Notes: controlRect: The current bounding rectangle for the cancel button.
cellRect: The default cell rectangle.

Return the updated bounding rectangle to use for the cancel button. The default value is the value passed into the rect parameter.

Subclasses can override this method to return a new bounding rectangle for the cancel button cell. You might use this method to provide a custom layout for the search field control.

37.29.8 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.29.9 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.29.10 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.29.11 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.29.12 FocusLost

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.29.13 FocusReceived

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.29.14 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.29.15 MenuBarSelected

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.29.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.29.17 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.29.18 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.29.19 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.29.20 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.29.21 searchButtonRectForBounds(controlRect as NSRectMBS, cellRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: Modifies the bounding rectangle for the search button cell.
Notes: controlRect: The current bounding rectangle for the search button.
cellRect: The default cell rectangle.

The updated bounding rectangle to use for the search button. The default value is the value passed into the rect parameter.

Subclasses can override this method to return a new bounding rectangle for the search button cell. You might use this method to provide a custom layout for the search field control.

37.29.22 searchFieldDidEndSearching

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: The event that is called when the search field has ended its search for content.

37.29.23 searchFieldDidStartSearching

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: The event that is called when the search field begins searching for content.

37.29.24 searchTextRectForBounds(controlRect as NSRectMBS, cellRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: Modifies the bounding rectangle for the search-text field cell.
Notes: controlRect: The current bounding rectangle for the search text field.
cellRect: The default cell rectangle.

Return the updated bounding rectangle to use for the search text field. The default value is the value passed into the rect parameter.

Subclasses can override this method to return a new bounding rectangle for the text-field cell object. You might use this method to provide a custom layout for the search field control.

37.29.25 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text begins an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

37.29.26 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when the text in the receiving control changes.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

37.29.27 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text ends an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

37.29.28 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.29.29 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.29.30 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.30 control DesktopNSSecureTextFieldControlMBS

37.30.1 control DesktopNSSecureTextFieldControlMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSSecureTextField.
Notes: This control embeds a special NSSecureTextField subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.

37.30.2 Properties

37.30.3 echosBullets as Boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver echoes a bullet character rather than each character typed.
Example:

```
Var t as DesktopNSSecureTextFieldControlMBS // your textfield
t.echosBullets = true
```

Notes: If true, bullets are echoed. If false, the cursor is moved for each character typed, but nothing is displayed.
(Read and Write property)

37.30.4 View as NSSecureTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.30.5 Events

37.30.6 Action

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control's action was triggered.
Notes: The text changed.

37.30.7 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.30.8 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.30.9 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.30.10 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.30.11 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.30.12 FocusLost

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.30.13 FocusReceived

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.30.14 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.30.15 MenuBarSelected

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.30.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.30.17 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.30.18 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.30.19 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.30.20 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.30.21 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text begins an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

37.30.22 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when the text in the receiving control changes.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

37.30.23 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text ends an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

37.30.24 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.30.25 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.30.26 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.31 control DesktopNSSegmentedControlControlMBS

37.31.1 control DesktopNSSegmentedControlControlMBS

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The Xojo control to host a NSSegmentedControl.
Notes: We know the fact, that the control wrapping the segmented control has control twice in the name. Suggestions to rename are welcome, but unlikely to happen as it would break code.
Blog Entries

37.31.2 Properties

37.31.3 View as NSSegmentedControlMBS

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The reference to the underlaying NSSegmentedControlMBS.
Notes: (Read only property)

37.31.4 Events

37.31.5 Action

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when user clicks on a date/time and changes something.

37.31.6 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.31.7 Closing

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.31.8 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 24.0, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.31.9 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 24.0, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.31.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.31.11 FocusLost

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.31.12 FocusReceived

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.31.13 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.31.14 MenuBarSelected

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.31.15 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.31.16 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.31.17 MouseUp(x As Integer, y As Integer)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.31.18 Opening

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.31.19 ScaleFactorChanged(NewFactor as double)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.31.20 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.32 control DesktopNSSplitViewControlMBS

37.32.1 control DesktopNSSplitViewControlMBS

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Our control to wrap a NSSplitViewMBS object.
Blog Entries

- MBS Xojo Plugins, version 23.5pr7
- News from the MBS Xojo Plugins Version 23.4
- MonkeyBread Software Releases the MBS Xojo Plugins in version 23.4
- NSSplitView Control for Xojo
- MBS Xojo Plugins, version 23.4pr5

37.32.2 Properties

37.32.3 View as NSSplitViewMBS

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The reference to the underlaying NSSplitView.
Notes: (Read only property)

37.32.4 Events

37.32.5 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.32.6 canCollapseSubview(subview as NSViewMBS) as Boolean

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to determine whether the user can collapse and expand the specified subview.
Notes: subview: The subview to collapse.

Returns true if subview collapses when the user drags a divider beyond the halfway mark between its minimum size and its edge; otherwise, false.

The subview expands when the user drags the divider beyond the halfway mark between its minimum size and its edge.

To specify the minimum size, define the constrainMaxCoordinate and constrainMinCoordinate events. A subview can collapse only if you also define constrainMinCoordinate.
A collapsed subview isn,Äôt visible, but the split view object retains it with the same size as before the collapse.
If the events are implemented, the subviews can,Äôt collapse.

37.32.7 Closing

Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.32.8 constrainMaxCoordinate(proposedMaximumPosition as double, dividerIndex as Integer) as Double

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to constrain the maximum coordinate limit of a divider when the user drags it.
Notes: proposedMax: The proposed maximum coordinate limit of the subview in the split view,Äôs flipped coordinate system.
dividerIndex: Specifies the divider the user is moving, with the first divider being 0 and increasing from top to bottom (or left to right).

Returns the maximum coordinate limit of the divider.

The delegate receives this message before the split view begins tracking the mouse to position a divider. You can further constrain the limits, but you can,Äôt extend the divider limits.
If the split bars are horizontal (views are one on top of the other), proposedMax is the bottom limit. If the split bars are vertical (views are side by side), proposedMax is the right limit. The initial value of proposedMax is the bottom (or right side) of the subview after the divider.

37.32.9 constrainMinCoordinate(proposedMinimumPosition as double, dividerIndex as Integer) as Double

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to constrain the minimum coordinate limit of a divider when the user drags it.
Notes: proposedMin: The proposed minimum coordinate limit of the subview in the split view,Äôs flipped coordinate system.
dividerIndex: Specifies the divider the user is moving, with the first divider being 0 and increasing from top to bottom (or left to right).

Returns the minimum coordinate limit of the divider.

The delegate receives this message before the split view begins tracking the cursor to position a divider. You can further constrain the limits, but you can,Äôt extend the divider limits.
If the split bars are horizontal (views are one on top of the other), proposedMin is the top limit. If the split bars are vertical (views are side by side), proposedMin is the left limit. The initial value of proposedMin is the top (or left side) of the subview before the divider.

37.32.10 constrainSplitPosition(proposedPosition as double, dividerIndex as Integer) as Double

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to constrain the divider to certain positions.
Notes: proposedPosition: The cursor,Äôs current position, and the proposed position of the divider.
dividerIndex: The index of the divider the user is moving, with the first divider being 0 and increasing from top to bottom (or left to right).

Returns the position for constraining the divider.

If the delegate implements this method, the split view calls it repeatedly as the user moves the divider.
If a subview,Äôs height must be a multiple of a certain number, use this method to return the multiple nearest to proposedPosition.

37.32.11 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 23.4, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.32.12 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.32.13 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.32.14 drawDivider(graphics as NSGraphicsMBS, Rect as NSRectMBS) as Boolean

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Draws a divider between two of the split view,Äôs subviews.
Example:

```
Function drawDivider(graphics as NSGraphicsMBS, Rect as NSRectMBS) Handles drawDivider as Boolean

// draw a red box with blue border
graphics.setFillColor NSColorMBS.redColor
graphics.setStrokeColor NSColorMBS.blueColor

Var r As New NSRectMBS(rect.X, rect.y + rect.Height/2 - 5, 10, 10)
graphics.fillRect r
graphics.strokeRect r

Return True
End Function
```

Notes: Rect: The entire divider rectangle in the split view,Äôs flipped coordinate system.

If you override this method to use a custom style for the divider, you may need to change the size of the

divider.

37.32.15 FocusLost

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.32.16 FocusReceived

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.32.17 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.32.18 MenuBarSelected

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.32.19 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.32.20 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.32.21 MouseUp(x As Integer, y As Integer)

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.32.22 Opening

Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.32.23 resizeSubviewsWithOldSize(oldSize as NSSizeMBS)

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to specify custom sizing behavior for the subviews of the split view.
Notes: oldSize: The size of the split view before the user resizes it.

If the delegate implements this method, it receives this message after the split view resizes.

Resize the subviews so that the sum of the sizes of the subviews plus the sum of the thickness of the dividers equals the size of the new frame of the NSSplitView. You can get the thickness of a divider through the dividerThickness method.

If you implement this delegate method to resize subviews on your own, the NSSplitViewMBS doesn,Äôt perform any error checking for you. However, you can invoke adjustSubviews() to perform the default sizing behavior.

37.32.24 ScaleFactorChanged(NewFactor as double)

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.32.25 shouldAdjustSizeOfSubview(view as NSViewMBS) as Boolean

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to specify whether to resize the subview.
Notes: subview: The subview to resize.

If adjustSubviews() can change the size of the subview, return true; otherwise, false. By returning false, you lock the size of the split view subview while the split view resizes.

Regardless of the value that this method returns, adjustSubviews() may change the origin of the subview. Nonresizable subviews may resize to prevent an invalid subview layout.
If a split view has no delegate, or if its delegate doesn,Äôt respond to this message, the split view behaves as if this method returns true.

37.32.26 shouldHideDivider(dividerIndex as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to determine whether the user can drag a divider or adjust it off the edge of the split view.
Notes: dividerIndex: The zero-based index of the divider.

Return true if the user can drag the divider off the edge of the split view, resulting in it not being visible.

If a split view has no delegate, or if its delegate doesn,Äôt respond to this message, the split view behaves as if it has a delegate that returns false when it receives this message.

37.32.27 splitViewDidResizeSubviews

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate when the split view resizes its subviews.
Notes: The control invokes this event after the split view resizes two of its subviews in response to the repositioning of a divider.

37.32.28 splitViewWillResizeSubviews

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate when the split view is about to resize its subviews.
Notes: The control invokes this method before the split view resizes two of its subviews in response to the repositioning of a divider.

37.32.29 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.33 control DesktopNSSwitchControlMBS

37.33.1 control DesktopNSSwitchControlMBS

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The control to host a NSSwitch as control in Xojo.
Notes: Available on macOS 10.15 or newer.

37.33.2 Properties

37.33.3 State as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The current state.
Notes: Set to true for toggle on and set to false for toggle off.
(Read and Write property)

37.33.4 View as NSSwitchMBS

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.33.5 Events

37.33.6 Action

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The action event.

37.33.7 BoundsChanged

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.33.8 Closing

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.33.9 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.33.10 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.33.11 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.33.12 FocusLost

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.33.13 FocusReceived

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.33.14 FrameChanged

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.33.15 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.33.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.33.17 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.33.18 MouseUp(x As Integer, y As Integer)

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.33.19 Opening

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.33.20 ScaleFactorChanged(NewFactor as double)

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.33.21 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.34 control DesktopNSTableControlMBS

37.34.1 control DesktopNSTableControlMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control for a NSTableView.
Notes: Please use NSOutlineControlMBS for hierarchical lists and NSTableControlMBS for normal lists.

37.34.2 Properties

37.34.3 AcceptTabs as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes: If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

37.34.4 allowsColumnReordering as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to rearrange columns by dragging their headers.
Notes: The default value of this property is true, which allows the user to rearrange the table view,Äôs columns. You can rearrange columns programmatically regardless of this setting.
(Read and Write property)

37.34.5 allowsColumnResizing as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to resize columns by dragging between their headers.
Notes: The default of this property is true, which allows the user to resize the table view,Äôs columns. You can resize columns programmatically regardless of this setting.
(Read and Write property)

37.34.6 allowsColumnSelection as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select columns by clicking their headers.
Notes: The default is false, which prevents the user from selecting columns (if you create the table view in Interface Builder, the default value is true). You can select columns programmatically regardless of this setting.
(Read and Write property)

37.34.7 allowsEmptySelection as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select zero columns or rows.
Notes: The default is true, which allows the user to select zero columns or rows.
(Read and Write property)

37.34.8 allowsMultipleSelection as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select more than one column or row at a time.
Notes: The default is false, which allows the user to select only one column or row at a time. You can select multiple columns or rows programmatically regardless of this setting.
(Read and Write property)

37.34.9 autohidesScrollers as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view automatically hides its scroll bars when they are not needed.
Notes: The horizontal and vertical scroll bars are hidden independently of each other. When the value of this property is YES and the content of the scroll view doesn't extend beyond the size of the clip view on a given axis, the scroller on that axis is removed to leave more room for the content.
(Read and Write property)

37.34.10 disableCellEvents as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether to disable cell based events.
Notes: The table view can work with cell modes and use NSCell to disable cells.
Or since OS X 10.7 it can work with NSView to display cells or rows.
This property lets you explicitly disable cells and use only views.
(Read and Write property)

37.34.11 disableViewEvents as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether to disable view based events.
Notes: The table view can work with cell modes and use NSCell to disable cells.
Or since OS X 10.7 it can work with NSView to display cells or rows.
This property lets you explicitly disable views and use only cells.
(Read and Write property)

37.34.12 hasHorizontalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view has a horizontal scroller.
Notes: When the value of this property is true, the scroll view allocates and displays a horizontal scroller as needed. The default value of this property is false.
(Read and Write property)

37.34.13 hasVerticalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view has a vertical scroller.
Notes: When the value of this property is true, the scroll view allocates and displays a vertical scroller as needed. The default value of this property is false.
(Read and Write property)

37.34.14 ScrollView as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The scroll view used in this control.
Notes: (Read only property)

37.34.15 View as NSTableViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The table view used in this control.
Notes: (Read only property)
See also:

- 37.34.82 view(tableColumn as NSTableColumnMBS, row as Integer) as NSViewMBS 7206

37.34.16 Events

37.34.17 acceptDrop(info as NSDraggingInfoMBS, row as Integer, dropOperation as Integer) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Called by TableView when the mouse button is released over a table view that previously decided to allow a drop.
Notes: info: An object that contains more information about this dragging operation.
row: The index of the proposed target row.
operation: The type of dragging operation.

Returns true if the drop operation was successful, otherwise false.

The data source should incorporate the data from the dragging pasteboard in the implementation of this method. You can use the draggingPasteboard method to get the data for the drop operation from info.
To accept a drop on the second row, row would be 2 and operation would be NSTableViewDropOn. To accept a drop below the last row, row would be TableView.numberOfRows and operation would be NSTableViewDropAbove.

37.34.18 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.34.19 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.34.20 ColumnDidMove(notification as NSNotificationMBS, oldColumn as Integer, newColumn as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event informs the delegate that a column was moved by user action in the table view.

37.34.21 ColumnDidResize(notification as NSNotificationMBS, tableColumn as NSTableColumnMBS, OldWidth as Double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event informs you that a column was resized in the table view.

37.34.22 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.34.23 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.34.24 dataCell(tableColumn as NSTableColumnMBS, row as Int64) as NSCellMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Optional return a different cells for each row.
Notes: A different data cell can be returned for any particular tableColumn and row, or a cell that will be used for the entire row (a full width cell). The returned cell should properly implement copyWithZone:, since the cell may be copied by NSTableView. If the tableColumn is non-nil, and nil is returned, then the table will use the default cell from tableColumn.dataCellForRow(Row).

When each row is being drawn, this method will first be called with a nil tableColumn. At this time, you can return a cell that will be used to draw the entire row, acting like a group. If you do return a cell for the 'nil' tableColumn, be prepared to have the other corresponding datasource and delegate methods to be called with a 'nil' tableColumn value. If don't return a cell, the method will be called once for each tableColumn in the tableView, as usual.

37.34.25 didAddRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that a row view was added at the specified row.
Notes: rowView: The row view.

row: The index of the row.

At this point, the delegate can add extra views, or modify the properties of rowView.

This method is only valid for NSView-based table views.

37.34.26 didClickTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Called if a table column was clicked on.

37.34.27 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.34.28 didDragTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent at the time the mouse button goes up in tableView and tableColumn has been dragged during the time the mouse button was down.
Notes: tableColumn: The table column.

The behavior of this method on Mac OS X v10.5 is different from prior versions. On Mac OS X v 10.5 the dragged column is sent to the subclass. In earlier versions the table column that is currently located at the dragged column's original index is sent.

37.34.29 didRemoveRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Tells the delegate that a row view was removed from the table at the specified row.
Notes: rowView: The row view.

row: The index of the row.

If row equals -1, the row is being deleted from the table and is no longer a valid row; otherwise row is a valid row that is being removed by being moved off screen.

This method is only valid for NSView-based table views.

37.34.30 didTile

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The tableview did tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

37.34.31 DoubleClick

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse made a double click.

37.34.32 draggingSessionEnded(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implement this method to determine when a dragging session has ended.
Notes: session: The dragging session.
screenPoint: The ending drag location in screen coordinates.
operation: The drag operation. See NSDragOperation for supported values.

This delegate method can be used to determine when the dragging source operation ended at a specific location, such as the trash, by checking for an operation of NSDragOperationDelete.

37.34.33 draggingSessionWillBegin(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, rowIndexes as NSIndexSetMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implement this method to determine when a dragging session will begin.
Notes: session: The dragging session.
screenPoint: The initial drag location in screen coordinates.
rowIndexes: The indexes of the rows to be dragged, excluding rows that were not dragged due to pasteboardItemForRow returning nil.

Implement this method to know when the dragging session is about to begin and to potentially modify the dragging session.
The dragged item order will directly match the pasteboard writer array used to begin the dragging session with the NSView method beginDraggingSessionWithItems. Hence, the order is deterministic, and can be used in acceptDrop when enumerating the NSDraggingInfo pasteboard classes.

37.34.34 FocusLost

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.34.35 FocusReceived

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.34.36 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.34.37 heightOfRow(row as Int64) as Double

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implement this event to support a table with varying row heights.
Notes: The height returned by this method should not include intercell spacing and must be greater than zero. Performance Considerations: For large tables in particular, you should make sure that this method is efficient. NSTableView may cache the values this method returns, but this should NOT be depended on, as all values may not be cached. To signal a row height change, call noteHeightOfRowsWithIndexesChanged. For a given row, the same row height should always be returned until noteHeightOfRowsWithIndexesChanged is called, otherwise unpredicable results will happen. NSTableView automatically invalidates its entire row height cache in reloadData, and noteNumberOfRowsChanged.

37.34.38 isGroupRow(row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the delegate to indicate that a specified row is a group row.
Notes: row: The row index.

Return true if the specified row should have the group row style drawn, false otherwise.

If the cell in row is an NSTextFieldCell and contains only a string, the group row style attributes will automatically be applied to the cell.

Group rows in view-based table views can be made to visually ‚Äòfloat' by setting the tableview method setFloatsGroupRows to true.

Note: When configured as a source list style table view, rows identified as group rows draw with a specific style unique for source lists.
Available in Mac OS X v10.5 and later.

37.34.39 LeftMouseDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has pressed the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.34.40 LeftMouseDragged(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has moved the mouse with the left button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.34.41 LeftMouseUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has released the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.34.42 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.34.43 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.34.44 mouseDownInHeaderOfTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent to the subclass whenever the mouse button is clicked in the table view's header column.
Notes: tableColumn: The table column.

37.34.45 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.34.46 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.34.47 namesOfPromisedFilesDroppedAtDestination(dropDestination as folderItem, DraggedRowsWithIndexes as NSIndexSetMBS) as string()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns an array of filenames that represent the indexSet rows for a drag to dropDestination.
Notes: dropDestination: The drop location where the files are created.
indexSet: The indexes of the items being dragged.

Returns an array of filenames (not full paths) for the created files that the receiver promises to create.

This method is called when a destination has accepted a promise drag.
For more information on file promise dragging, see documentation on the NSDraggingSource protocol and namesOfPromisedFilesDroppedAtDestination:.

37.34.48 nextTypeSelectMatchFromRow(startRow as Int64, endRow as Int64, searchString as string) as Int64

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the subclass to modify how type selection works.
Notes: startRow: The starting row of the search range.
endRow: The ending row of the search range.
searchString: A string containing the typed selection.

Return the first row in the range of startRow through endRow (excluding endRow itself) that matches selectionString. Return -1 if no match is found.

It is possible for endRow to be less than startRow if the search will wrap.
Available in Mac OS X v10.5 and later.

37.34.49 numberOfRowsInTableView as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Called when the table view needs to know the number of rows.
Notes: numberOfRowsInTableView is called very frequently, so it must be efficient.

37.34.50 objectValue(column as NSTableColumnMBS, row as Integer) as Variant

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Called when a value is required for a given cell.
Notes: Please implement your own arrays to store values.

37.34.51 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.34.52 OtherMouseDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has pressed a mouse button other than the left or right one.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.34.53 OtherMouseDragged(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.34.54 OtherMouseUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has released a mouse button other than the left or right button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.34.55 pasteboardItemForRow(row as Integer) as NSPasteboardItemMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Called to allow the table to support multiple item dragging.
Notes: row: The row.

Returns an instance of NSPasteboardItem. Returning nil excludes the row from being dragged.

This method is required for multi-image dragging.
If this method is implemented, then writeRowsWithIndexes will not be called.

This is pasteboardWriterForRow method.

37.34.56 RightMouseDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the view that the user has pressed the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.34.57 RightMouseDragged(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has moved the mouse with the right button pressed .
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.34.58 RightMouseUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has released the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.34.59 rowActionsForRow(row as Integer, edge as Integer) as NSTableViewRowActionMBS()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks the control to provide an array of row actions to be attached to the specified edge of a table row and displayed when the user swipes horizontally across the row.
Notes: row: The index of the target row.
edge: The edge (NSTableRowActionEdgeLeading or NSTableRowActionEdgeTrailing) for which row actions are requested. This is based on the direction in which the user swiped on the row. Swiping to the right results in an edge value of leading. Swiping to the left results in an edge value of trailing.

Returns an array of row actions (of class NSTableViewRowActionMBS) to be enabled on the specified edge of the table row.

Implement this method if your table row supports actions that are displayed when the user swipes horizontally across the row. For example, your table view could use this method to implement a swipe left to delete function in your table rows. When called, this method receives the table view, the index of the row

the user swiped, and an edge of type NSTableRowActionEdge. The method should return an array of any row actions of class NSTableViewRowAction that are supported for the specified edge. If no row actions are available, an empty array should be returned.
If this method isn,Äôt implemented, then the table row displays no actions when the user swipes horizontally away from the specified edge.

37.34.60 rowViewForRow(row as Integer) as NSTableRowViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks the delegate for a view to display the specified row.
Notes: row: The row index.

Return an instance or subclass of NSTableRowView. If nil is returned, an NSTableRowView instance will be created and used.

You can implement this event to return a custom NSTableRowView for row.
The reuse queue can be used in the same way as documented in tableView:view:row:. The returned view will have attributes properly set to it before it,Äôs added to the tableView.

This method is only valid for NSView-based table views.

37.34.61 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.34.62 SelectionDidChange(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event informs you that the table view's selection has changed.

37.34.63 selectionIndexesForProposedSelection(proposedSelectionIndexes as NSIndexSetMBS) as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the delegate to modify the proposed selection.
Notes: proposedSelectionIndexes: An index set containing the indexes of the proposed selection.

Return an NSIndexSet instance containing the indexes of the new selection. Return proposedSelectionIndexes if the proposed selection is acceptable, or the value of the table view's existing selection to avoid changing the selection.

This method may be called multiple times with one new index added to the existing selection to find out if a particular index can be selected when the user is extending the selection with the keyboard or mouse.

Implementation of this method is optional. If implemented, this method will be called instead of shouldSelectRow.
Available in Mac OS X v10.5 and later.

37.34.64 SelectionIsChanging(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event informs you that the table view's selection is in the process of changing (typically because the user is dragging the mouse across a number of rows).

37.34.65 selectionShouldChangeInTableView as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns whether the selection should change.
Notes: Return true to allow the table view to change its selection (typically a row being edited), false to deny selection change.

The user can select and edit different cells within the same row, but can't select another row unless the delegate approves. The subclass can implement this method for complex validation of edited rows based on the values of any of their cells.

37.34.66 setObjectValue(value as Variant, column as NSTableColumnMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Called when a cell value is saved to the datasource.

37.34.67 shouldEditTableColumn(tableColumn as NSTableColumnMBS, row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns whether the cell at the specified row and column can be edited.
Notes: TableColumn: The table column.
rowIndex: The row index.
Return true to allow editing the cell, false to deny editing.

The subclass can implement this method to disallow editing of specific cells.
Note: This method is only valid for cell-based table views.

37.34.68 shouldReorderColumn(columnIndex as Int64, newColumnIndex as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent to the subclass to allow or prohibit the specified column to be dragged to a new location.
Notes: columnIndex: The index of the column being dragged.
newColumnIndex: The proposed target index of the column.

Return true if the column reordering should be allowed, otherwise false.

When a column is initially dragged by the user, the delegate is first called with a newColumnIndex value of -1. Returning false will disallow that column from being reordered at all. Returning true allows it to be reordered, and the delegate will be called again when the column reaches a new location.

The actual NSTableColumn instance can be retrieved from the tableColumns array.

If this method is not implemented, all columns are considered reorderable.
Available in Mac OS X v10.6 and later.

37.34.69 shouldSelectRow(row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns whether the table view should allow selection of the specified row.
Notes: rowIndex: The row index.

Return true to permit selection of the row, false to deny selection.

The delegate can implement this method to disallow selection of particular rows.
For better performance and finer-grain control over the selection, use selectionIndexesForProposedSelection.

37.34.70 shouldSelectTableColumn(tableColumn as NSTableColumnMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns whether the specified table column can be selected.
Notes: TableColumn: The table column.

Return true to permit selection, otherwise false.

The subclass can implement this event to disallow selection of particular columns.

37.34.71 shouldShowCellExpansion(tableColumn as NSTableColumnMBS, row as Int64) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the subclass to control cell expansion for a specific row and column.
Notes: TableColumn: The table column.
row: The row index.

Return true if the tooltip cell should expand, false otherwise.

Cell expansion can occur when the mouse hovers over the specified cell and the cell contents are unable to be fully displayed within the cell. If this method returns true, the full cell contents will be shown in a special floating tool tip view, otherwise the content is truncated.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

37.34.72 shouldTrackCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the subclass to control the tracking behavior for a specific cell.
Notes: cell: The cell to track.
tableColumn: The table column.
row: A row in tableView.

Returns true if the cell should track, false otherwise.

Normally, only selectable or selected cells can be tracked. If you implement this method, cells which are not selectable or selected can be tracked, and vice-versa.

For example, this allows you to have an NSButtonCell in a table which does not change the selection, but can still be clicked on and tracked.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

37.34.73 shouldTypeSelectForEvent(e as NSEventMBS, searchString as string) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the subclass to control type select for a specific event.
Notes: event: The event.
searchString: The search string or nil if no type select has began.

Return true to allow type select for event, false otherwise.

Typically, this is called from the table view keyDown implementation and the event will be a key event.
Available in Mac OS X v10.5 and later.

37.34.74 sizeToFitWidthOfColumn(column as Int64) as Double

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the subclass to provide custom sizing behavior when a column's resize divider is double clicked.
Notes: column: The index of the column.

Returns the width of the specified column.

By default, NSTableView iterates every row in the table, accesses a cell via preparedCellAtColumn, and requests the cellSize to find the appropriate largest width to use.

For accurate results and performance, it is recommended that this method is implemented when using large tables. By default, large tables use a monte carlo simulation instead of iterating every row.

Available in Mac OS X v10.6 and later.

37.34.75 sortDescriptorsDidChange(oldDescriptors() as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Called by TableView to indicate that sorting may need to be done.
Notes: The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source doesn,Äôt manage them itself, you can get the current sort descriptors by calling TableView.sortDescriptors function.

37.34.76 textShouldBeginEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow.

37.34.77 textShouldEndEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow.

37.34.78 toolTipForCell(cell as NSCellMBS, r as NSRectMBS, tableColumn as NSTableColumnMBS, row as Int64, mouseLocation as NSPointMBS) as string

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a string that is displayed as a tooltip for the specified cell in the column and row.
Notes: Cell: The cell.
r: The proposed active area of the tooltip. You can modify rect to provide an alternative active area.
TableColumn: The table column.
row: The row index.
mouseLocation: The mouse location.

Return a string containing the tooltip. Return empty string if no tooltip is desired.

By default, rect is computed as cell.drawingRectForBounds(cellFrame).
Available in Mac OS X v10.4 and later.

37.34.79 typeSelectString(tableColumn as NSTableColumnMBS, row as Int64) as string

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the subclass to provide an alternate text value used for type selection for a specified row and column.
Notes: tableColumn: The table column.
row: The row index.

Returns a string that is used in type select comparison for row and tableColumn. Return "" if the row or tableColumn should not be searched.

Implement this method to change the string value that is searched for based on what is displayed. By default, all cells with text in them are searched.

If this event is not implemented the string value is the cell string value.
Implementation of this event is optional.

Available in Mac OS X v10.5 and later.

37.34.80 updateDraggingItemsForDrag(draggingInfo as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implement this method to allow the table to update dragging items as they are dragged over a view.
Notes: The dragging information.

Required for multi-image dragging. Typically this will involve invoking enumerateDraggingItemsWithOptions on the draggingInfo parameter value and setting the draggingItem object,Äôs imageComponentsProvider to a proper image based on the content.
For view-based table views, you can use the NSTableCellView method draggingImageComponents. For cell-based tables, use the NSCell method draggingImageComponentsWithFrame.

37.34.81 validateDrop(info as NSDraggingInfoMBS, proposedRow as Integer, dropOperation as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Used by aTableView to determine a valid drop target.
Notes: info: An object that contains more information about this dragging operation.
row: The index of the proposed target row.
operation: The type of dragging operation proposed.

Returns the dragging operation the data source will perform.

The data source may retarget a drop by calling setDropRow and returning something other than NSDragOperationNone. A data source might retarget for various reasons, such as to provide better visual feedback when inserting into a sorted position.
To propose a drop on the second row, row would be 2 and operation would be NSTableViewDropOn. To propose a drop below the last row, row would be TableView.numberOfRows and operation would be NSTableViewDropAbove.

37.34.82 view(tableColumn as NSTableColumnMBS, row as Integer) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks the delegate for a view to display the specified row and column.
Notes: see also
https://developer.apple.com/reference/appkit/nstableviewdelegate/1527449-tableview?language=objc
See also:

- 37.34.15 View as NSTableViewMBS 7187

37.34.83 willDisplayCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the tableview will display the specified cell at the row in the column.
Notes: Cell: The cell to be displayed.
TableColumn: The table column.
row: The row index.

The event can modify the display attributes of cell to alter the appearance of the cell.

Because cell is reused for every row in tableColumn, the event must set the display attributes both when drawing special cells and when drawing normal cells.

Note: The implementation of this method must not draw portions of the cell. It should only alter the state of the passed in cell.

37.34.84 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.34.85 willTile

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The tableview will tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

37.34.86 writeRowsWithIndexes(rowIndexes as NSIndexSetMBS, pboard as NSPasteboardMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether a drag operation is allowed.
Notes: rowIndexes: An index set of row numbers that will be participating in the drag.

pboard: The pasteboard to which to write the drag data.

Returns true if the drag operation is allowed, false otherwise.

Called by TableView after it has been determined that a drag should begin, but before the drag has been started.
To refuse the drag, return false. To start a drag, return true and place the drag data onto pboard (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the table view once this call returns with true.

37.35 control DesktopNSTextFieldControlMBS

37.35.1 control DesktopNSTextFieldControlMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSTextField.
Notes: This control embeds a special NSTextField subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.

37.35.2 Properties

37.35.3 View as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.35.4 Events

37.35.5 Action

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control's action was triggered.
Notes: The text changed.

37.35.6 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.35.7 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.35.8 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.35.9 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.35.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.35.11 FocusLost

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.35.12 FocusReceived

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.35.13 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.35.14 MenuBarSelected

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.35.15 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.35.16 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.35.17 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.35.18 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.35.19 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.35.20 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text begins an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

37.35.21 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when the text in the receiving control changes.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

37.35.22 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text ends an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

37.35.23 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.35.24 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.35.25 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.36 control DesktopNSTextViewControlMBS

37.36.1 control DesktopNSTextViewControlMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSTextView.
Notes: This control embeds a special NSTextView subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.

37.36.2 Properties

37.36.3 AcceptTabs as Boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes: If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

37.36.4 Scrollview as Variant

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The scrollview for this textview.
Notes: (Read only property)

37.36.5 View as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.36.6 Events

37.36.7 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.36.8 clickedOnLink(Link as Variant, charIndex as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Sent after the user clicks a link.
Notes: link: The link that was clicked; the value of NSLinkAttributeName.
charIndex: The character index where the click occurred, indexed within the text storage.

Return true if the click was handled; otherwise, false to allow the next responder to handle it.

The event can use this method to handle the click on the link. It is invoked by clickedOnLink().
The charIndex parameter is a character index somewhere in the range of the link attribute. If the user actually physically clicked the link, then it should be the character that was originally clicked. In some cases a link may be opened indirectly or programmatically, in which case a character index somewhere in the range of the link attribute is supplied.

37.36.9 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.36.10 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.36.11 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.36.12 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.36.13 FocusLost

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.36.14 FocusReceived

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.36.15 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.36.16 MenuBarSelected

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.36.17 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.36.18 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.36.19 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.36.20 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.36.21 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.36.22 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when a text view needs to determine if text in a specified range should be changed.
Notes: affectedCharRange: The range of characters to be replaced.
replacementString: The characters that will replace the characters in affectedCharRange; nil if only text attributes are being changed.

Return true to allow the replacement, or false to reject the change.

37.36.23 textDidBeginEditing

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the text object has begun editing (that the user has begun changing it).

37.36.24 textDidChange

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the text object has changed its characters or formatting attributes.

37.36.25 textDidEndEditing

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the text object has finished editing (that it has resigned first responder status).

37.36.26 textShouldBeginEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when a text object begins to change its text, this method requests permission to begin editing.
Notes: If the delegate returns false, the text object proceeds to make changes. If the delegate returns true, the text object abandons the editing operation. This method is also invoked when the user drags and drops a file onto the text object.

37.36.27 textShouldEndEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked from a text object's implementation of resignFirstResponder, this method requests permission to end editing.
Notes: If the delegate returns false, the text object proceeds to finish editing and resign first responder status. If the delegate returns true, the text object selects all of its text and remains the first responder.

37.36.28 textViewDidChangeSelection

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when the selection changes in the text view.

37.36.29 textViewWritingToolsDidEnd

MBS MacCocoa Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Tells you that the current writing tools session ended.
Notes: Use this method to undo any actions you took at the start of a writing tools session to modify your app,Äôs behavior. The text view calls this method after the writing session finishes. At this point, the text view contains the final text the person chose.

37.36.30 textViewWritingToolsWillBegin

MBS MacCocoa Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Tells you that an interaction with the writing tools interface is about to begin.
Notes: Use this method to take any necessary steps to prepare your app for writing tools interactions. During the course of a writing tools session, the writing tools UI suggests changes to the text view,Äôs text. It also allows the person to toggle between the original and replacement text before choosing one. To avoid issues while these changes occur, save any current data to disk and and disable features that might modify your view,Äôs text storage while the session is active. For example, disable iCloud synchronization until the session ends. Reenable those features when the session ends.

The text view calls this method when the person requests the writing tools interface, but before the interface makes any changes to your content. Because the session isn,Äôt active yet, the writingToolsActive property of the text view is NO while this method executes. The value of that property resolves to YES only after the method returns.

37.36.31 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.37 control DesktopNSTokenFieldControlMBS

37.37.1 control DesktopNSTokenFieldControlMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control to host a NSTokenField.
Blog Entries

- MBS Xojo Plugins, version 24.1pr5
- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo Plugins, version 21.4pr1
- MBS Xojo Plugins, version 21.1pr2

37.37.2 Properties

37.37.3 View as NSTokenFieldMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used for the control.
Notes: (Read only property)

37.37.4 Events

37.37.5 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.37.6 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.37.7 completionsForSubstring(substring as string, tokenIndex as Integer, byref selectedIndex as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide an array of appropriate completions for the contents of the receiver.
Notes: substring: The partial string that is to be completed.
tokenIndex: The index of the token being edited.
selectedIndex: Optionally, you can return by-reference an index into the returned array that specifies which of the completions should be initially selected. If none are to be selected, return by reference -1.

Returns an array of strings that are possible completions.

If the delegate does not implement this method, no completions are provided.
Available in OS X v10.4 and later.

37.37.8 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.37.9 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.37.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.37.11 displayStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide a string to be displayed as a proxy for the given represented object.
Notes: representedObject: A represented object of the token field.

Returns the string to be used as a proxy for representedObject. If you return nil or do not implement this method, then representedObject is displayed as the string.

37.37.12 editingStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide a string to be edited as a proxy for a represented object.
Notes: representedObject: A represented object of the token field.

Returns a string that's an editable proxy of the represented object, or nil if the token should not be editable.

37.37.13 FocusLost

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.37.14 FocusReceived

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.37.15 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.37.16 hasMenuForRepresentedObject(representedObject as Variant) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to specify whether the given represented object provides a menu.
Notes: representedObject: A represented object of the token field.

Returns true if the represented object has a menu, false otherwise.
By default tokens in a token field have no menus.

37.37.17 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.37.18 menuForRepresentedObject(representedObject as Variant) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide a menu for the specified represented object.
Notes: representedObject: A represented object of the token field.

Returns the menu associated with the represented object.
By default tokens in a token field do not return menus.

37.37.19 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.37.20 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.37.21 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.37.22 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.37.23 readFromPasteboard(pboard as NSPasteboardMBS) as Variant()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to return an array of objects representing the data read from the specified pasteboard.
Notes: pboard: The pasteboard from which to read the represented objects.

Returns an array of represented objects created from the pasteboard data.

37.37.24 representedObjectForEditingString(editingString as string) as Variant

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to provide a represented object for the given editing string.
Notes: editingString: The edited string representation of a represented object.

Returns a represented object that is displayed rather than the editing string.

Note: In OS X v10.4, NSTokenField trims whitespace around tokens but it does not trim whitespace in OS X versions 10.5.0 and 10.5.1. In OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and not implementing the this method. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

37.37.25 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.37.26 shouldAddObjects(tokens() as Variant, index as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Allows to validate the tokens to be added to the receiver at a particular location.
Notes: tokens: An array of tokens to be inserted in the receiver at index.
index: The index of the receiver in which the array of tokens to be validated (tokens) will be inserted.

Returns an array of validated tokens.

The event can return the array unchanged or return a modified array of tokens. To reject the add completely, return an empty array. Returning nil causes an error.

37.37.27 styleForRepresentedObject(representedObject as Variant) as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to return the token style for editing the specified represented object.
Notes: representedObject: A represented object of the token field.

Returns the style that should be used to display the representedObject. Possible values are shown in NSTokenStyle Values.

If the event implements this method and returns an NSTokenStyle that differs from the style set by setTokenStyle:, the value the event returns is preferred.

If you don't implement this method, the token field's tokenStyle is used.

37.37.28 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text begins an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

See TextDidEndEditing for an explanation of why you may not always get one invocation of TextDidBeginEditing for each invocation of TextDidEndEditing.

37.37.29 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when the text in the receiving control changes.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

37.37.30 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text ends an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

Warning: In some cases, such as when editing within an instance of NSOutlineView, this method may be invoked without a previous invocation of TextDidBeginEditing. You will only get the TextDidBeginEditing: notification if the user actually types something, but you can get the TextDidEndEditing notification if the user just double-clicks the field and then clicks outside the field, without typing.

37.37.31 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.37.32 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.37.33 tokenFieldAction

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control's action was triggered.
Notes: For a button if it was pressed.

37.37.34 tokenFieldTextShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing.

37.37.35 tokenFieldTextShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow text editing.

37.37.36 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.37.37 writeRepresentedObjects(objects() as Variant, pboard as NSPasteboardMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Sent so the delegate can write represented objects to the pasteboard corresponding to a given array of display strings.
Notes: objects: An array of represented objects associated with the token field.
pboard: The pasteboard to which to write the represented objects.

Return true if you writes the represented objects to the pasteboard, false otherwise. If false, the token field writes the display strings to the NSStringPboardType pasteboard.

37.38 class DesktopPopupMenu

37.38.1 class DesktopPopupMenu

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Gives access to the NSMenuMBS of the PopupMenu.

37.38.2 Methods

37.38.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

```
// This example needs a window with PopupMenu1.
MessageBox PopupMenu1.NSButtonMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

37.38.4 NSPopUpButtonMBS as NSPopUpButtonMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSPopUpButtonMBS object for the given control.
Example:

```
// This example needs a window with PopupMenu1.
// get cocoa view for the popupmenu
Var p as NSPopUpButtonMBS = PopupMenu1.NSPopUpButtonMBS

// find a menu entry
Var it as NSMenuItemMBS = p.itemAtIndex(0)

// get a picture
Var pic as Picture = LogoMBS(500)
Var img as new NSImageMBS(pic)
img.setSize 16,16

// and assign icon
it.image = img
```

Notes: This way you can manipulate Cocoa controls directly.

37.39 class DesktopProgressWheel

37.39.1 class DesktopProgressWheel

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built in ProgressWheel class in Xojo.

37.39.2 Methods

37.39.3 NSProgressIndicatorMBS as NSProgressIndicatorMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSProgressIndicatorMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

37.40 class DesktopRadioButton

37.40.1 class DesktopRadioButton

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: An extension of Xojo's internal control.

37.40.2 Methods

37.40.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

```
// This example needs a window with RadioButton1.
MessageBox RadioButton1.NSButtonMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

37.41 class DesktopRadioGroup

37.41.1 class DesktopRadioGroup

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: An extension of Xojo's internal control.

37.41.2 Methods

37.41.3 NSButtonsMBS as NSButtonMBS()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Queries the buttons within a radio button group.
Example:

```
Var buttons() As NSButtonMBS = RadioGroup1.NSButtonsMBS

For Each button As NSButtonMBS In buttons
button.alphaValue = 0.5 // half transparent
Next

Break
```

37.42 class DesktopScrollableArea

37.42.1 class DesktopScrollableArea

Plugin Version: 26.3, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a scrollable area.

37.42.2 Methods

37.42.3 NSScrollViewMBS as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 26.3, Platform: macOS, Targets: Desktop only.

Function: Finds the scroll view for the scrollable area.
Example:

```
// Window1 is a window of the example project.
Var v As NSScrollViewMBS = Window1.ScrollableArea1.NSScrollViewMBS

v.verticalScrollElasticity = NSScrollViewMBS.NSScrollElasticityAllowed
```

Notes: The DesktopScrollableArea needs to have a container assigned for content.

37.43 class DesktopScrollBar

37.43.1 class DesktopScrollBar

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built in Scrollbar class in Xojo.

37.43.2 Methods

37.43.3 NSScrollerMBS as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSScrollerMBS object for the given control.
Example:

```
// This example needs a window with ScrollBar1.
MessageBox ScrollBar1.NSScrollerMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

37.44 class DesktopSearchField

37.44.1 class DesktopSearchField

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built-in search field control in Xojo.
Notes: Only for Xojo 2020r2 or newer.

37.44.2 Methods

37.44.3 NSSearchFieldMBS as NSSearchFieldMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Queries search field object for the control.
Notes: Only for Xojo 2021r3 or newer.

37.45 class DesktopSegmentedButton

37.45.1 class DesktopSegmentedButton

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Build in Segmented Control class in Xojo.

37.45.2 Methods

37.45.3 NSSegmentedControlMBS as NSSegmentedControlMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSSegmentedControlMBS object for the given control.
Example:

```
// This example needs a window with SegmentedControl1.
SegmentedControl1.NSSegmentedControlMBS.selectedSegment = 0
```

Notes: This way you can manipulate Cocoa controls directly.

37.46 class DesktopSeparator

37.46.1 class DesktopSeparator

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built in Separator class in Xojo.

37.46.2 Methods

37.46.3 NSBoxMBS as NSBoxMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSBoxMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

37.47 class DesktopSlider

37.47.1 class DesktopSlider

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built in slider class in Xojo.

37.47.2 Methods

37.47.3 NSSliderMBS as NSSliderMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSSliderMBS object for the given control.
Example:

```
// This example needs a window with Slider1.
MessageBox Slider1.NSSliderMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

37.48 class DesktopTable

37.48.1 class DesktopTable

Plugin Version: 26.5, Platform: macOS, Targets: Desktop only.

Function: The built in table control in Xojo.

37.48.2 Methods

37.48.3 NSScrollViewMBS as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 26.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSScrollViewMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.
Requires Xojo 2026r3 or newer.

37.49 class DesktopTabPanel

37.49.1 class DesktopTabPanel

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Extends the TabPanel control inside Xojo.

37.49.2 Methods

37.49.3 NSTabViewMBS as NSTabViewMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTabViewMBS object for the given control.
Example:

```
// This example needs a window with TabPanel1.
MessageBox TabPanel1.NSTabViewMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

37.50 class DesktopTextArea

37.50.1 class DesktopTextArea

Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built in textarea control in Xojo.
Example:

```
// This example needs a window with TextArea1.
// make a PDF from a textarea in Cocoa Xojo target:

// find view
Var n as NSViewMBS = TextArea1.NSViewMBS
if n = nil then
MessageBox "Only in Cocoa!"
Return
end if

// make pdf data
Var s as string = n.dataWithPDFInsideRect(0,0,n.frame.Width, n.frame.Height)

// save
Var f as FolderItem = FolderItem.ShowSaveFileDialog("", "test.pdf")

if f<>Nil then

Var b as BinaryStream = BinaryStream.Create(f, true)

b.Write s

end if
```

Notes: Requires Xojo 2021r3 or newer.

37.50.2 Methods

37.50.3 NSScrollViewMBS as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSScrollViewMBS object for the given control.
Example:

```
// This example needs a window with TextArea1.
MessageBox TextArea1.NSScrollViewMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

37.50.4 NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextFieldMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.
Xojo uses a NSTextField for text areas without style and without multiline.

37.50.5 NSTextViewMBS as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextViewMBS object for the given control.
Example:

```
// This example needs a window with TextArea1.
// load rtfd file into textarea
Var file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
Var n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(file)
Var t as NSTextViewMBS = TextArea1.NSTextViewMBS
t.textStorage.setAttributedString(n)
```

Notes: This way you can manipulate Cocoa controls directly.
Xojo uses a NSTextField for text areas without style and without multiline.

37.50.6 SetTextThreadSafeMBS(text as string)

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets text property on main thread.
Example:

```
// This example needs a window with TextArea1.
// called im a thread:
TextArea1.SetTextThreadSafeMBS "Hello World"
```

Notes: This method is to allow you to set the text property of a label in a thread without a problem.

If called on main thread, the plugin will simply set text property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

37.50.7 WinInsertImageMBS(data as string, Width as Integer, Height as Integer)

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Inserts image to file.
Example:

```
// This example needs a window with TextArea1.
Var pic As Picture = LogoMBS(500)
Var data As String = pic.GetData(pic.SaveAsJPEG)

call TextArea1.WinInsertImageMBS(data, 500, 500)
```

Notes: Specify size in pixels and image data.
Image data works with JPEG and other data types.
Requires Windows 8 or newer.

37.50.8 WinShowFontPanelMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Shows font dialog.
Example:

```
// This example needs a window with TextArea1.
If TextArea1.WinShowFontPanelMBS Then
// update controls as font may have been changed?

End If
```

Notes: You can make changes and apply them with OK button.
Returns true when OK is selected.

37.50.9 Properties

37.50.10 RTFDataMBS as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Get or set the textview content as RTF data.
Example:

```
// This example needs a window with TextArea1 and TextArea2.
Var rtf as MemoryBlock = TextArea1.RTFDataMBS
TextArea2.RTFDataMBS = rtf
```

Notes: Works only for Cocoa and uses RTF parser/generator from Apple.

See also RTFDataMBS in StyledText, WinRTFDataMBS in TextArea and DesktopTextArea controls and RTFData in NSTextViewMBS class.
(Read and Write computed property)

37.50.11 WinAutoCorrectionMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Enables auto correction for Textarea.
Example:

```
// This example needs a window with TextArea1.
#If TargetWindows Then
TextArea1.WinAutoCorrectionMBS = True
#ElseIf TargetMacOS Then
TextArea1.NSTextViewMBS.AutomaticSpellingCorrectionEnabled = True
#EndIf
```

Notes: Only for Windows 8 and newer.
Uses current language from user.

See AutomaticSpellingCorrectionEnabled and ContinuousSpellCheckingEnabled properties in NSTextViewMBS for MacOS.
(Read and Write computed property)

37.50.12 WinAutoHorizontalScrollMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Whether to auto scroll horizontally.
Notes: Automatically scrolls text to the right by 10 characters when the user types a character at the end of the line. When the user presses the ENTER key, the control scrolls all text back to position zero.

This property controls an option of the RichEdit control used by Xojo for the Textarea control on Windows.
(Read and Write computed property)

37.50.13 WinAutoVerticalScrollMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Whether to auto scroll vertically.
Notes: Automatically scrolls text up one page when the user presses the ENTER key on the last line.

This property controls an option of the RichEdit control used by Xojo for the Textarea control on Windows.
(Read and Write computed property)

37.50.14 WinRTFDataMBS(SelectionOnly as boolean = false) as string

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Get or set the RTF data for the text area.
Example:

```
// This example needs a window with TextArea1.
Var rtfData As String

#If TargetWindows Then
rtfData = TextArea1.WinRTFDataMBS
#ElseIf TargetMacOS Then
rtfData = TextArea1.RTFDataMBS
#EndIf
```

Notes: Including images and probably faster as StyledText.RTFData.
(Read and Write computed property)

37.50.15 WinSelHasTextBackColorMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Whether a custom background color is in used for the selection.
Example:

TextArea1.WinSelHasTextBackColorMBS = false

Notes: If false, standard background color is used.
(Read and Write computed property)

37.50.16 WinSelHasTextColorMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Whether a custom text color is in used for the selection.
Example:

TextArea1.WinSelHasTextColorMBS = false

Notes: If false, standard text color is used.
(Read and Write computed property)

37.50.17 WinSelStrikeThroughMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Get or set StrikeThrough text style.
Example:

// This example needs a window with TextArea1.
TextArea1.WinSelStrikeThroughMBS = True

Notes: See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

37.50.18 WinSelSubScriptMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Get or set subscript text style.
Example:

// This example needs a window with TextArea1.
TextArea1.WinSelSubScriptMBS = True

Notes: Subscript text has a lower base line and is smaller.
See example project for how to do this for both Mac and Windows.

(Read and Write computed property)

37.50.19 WinSelSuperScriptMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Get or set superscript text style.
Example:

```
// This example needs a window with TextArea1.
TextArea1.WinSelSuperScriptMBS = True
```

Notes: Superscript text has a higher base line and is smaller.
See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

37.50.20 WinSelTextBackColorMBS as Color

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: The current background text color.
Example:

```
TextArea1.WinSelTextBackColorMBS = &cFF0000
```

Notes: If set also sets WinSelHasTextBackColorMBS to true internally.
(Read and Write computed property)

37.50.21 WinSelTextColorMBS as Color

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: The current foreground text color.
Example:

```
TextArea1.WinSelTextColorMBS = &cFF0000
```

Notes: If set also sets WinSelHasTextColorMBS to true internally.
(Read and Write computed property)

37.50.22 WinSpellcheckingMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Enables spellchecking for Textarea.
Example:

```
// This example needs a window with TextArea1.
#If TargetWindows Then
TextArea1.WinSpellcheckingMBS = True
#ElseIf TargetMacOS Then
TextArea1.NSTextViewMBS.continuousSpellCheckingEnabled = True
#EndIf
```

Notes: Only for Windows 8 and newer.
Uses current language from user.

See AutomaticSpellingCorrectionEnabled and ContinuousSpellCheckingEnabled properties in NSTextViewMBS for MacOS.
(Read and Write computed property)

37.51 class DesktopUpDownArrows

37.51.1 class DesktopUpDownArrows

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The build in control class in Xojo.

37.51.2 Methods

37.51.3 NSStepperMBS as NSStepperMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSStepperMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

37.52 class DisclosureTriangle

37.52.1 class DisclosureTriangle

Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: The built in DisclosureTriangle class in Xojo.

37.52.2 Methods

37.52.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

MessageBox DisclosureTriangle1.NSButtonMBS.className

Notes: This way you can manipulate Cocoa controls directly.

37.53 class Groupbox

37.53.1 class Groupbox

Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The built in Groupbox class in Xojo.

37.53.2 Methods

37.53.3 NSBoxMBS as NSBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSBoxMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

37.54 class ImageWell

37.54.1 class ImageWell

Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The built in ImageWell class in Xojo.

37.54.2 Methods

37.54.3 NSImageViewMBS as NSImageViewMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSImageViewMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

37.55 class KeyValueCodingMBS

37.55.1 class KeyValueCodingMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The class for key value coding and using NSSortDescriptor class.
Example:

```
// sort your own objects by a key with NSSortDescriptorMBS
// MyPerson is a subclass of KeyValueCodingMBS with the valueForKey event implemented and properties
Name As String and Age As Integer.
Var people() As KeyValueCodingMBS
Var names() As String = Array("Charlie", "Anna", "Bert")
Var ages() As Integer = Array(35, 42, 28)
For i As Integer = 0 To names.LastIndex
Var p As New MyPerson
p.Name = names(i)
p.Age = ages(i)
people.Add p
Next

Var sorting() As NSSortDescriptorMBS
sorting.Add NSSortDescriptorMBS.sortDescriptorWithKey("age", True)
Var lines() As String
For Each p As KeyValueCodingMBS In KeyValueCodingMBS.sortedArrayUsingDescriptors(people, sorting)
lines.Add MyPerson(p).Name + " " + MyPerson(p).Age.ToString
Next
MessageBox String.FromArray(lines, EndOfLine)

// in MyPerson:
Function valueForKey(key As String) As Variant Handles valueForKey
Select Case key
Case "name"
Return Me.Name
Case "age"
Return Me.Age
End Select
End Function
```

Notes: Events are only raised if called on main thread to avoid threading trouble.
Blog Entries

- MBS Xojo Plugins, version 17.1pr3

37.55.2 Methods

37.55.3 Constructor

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The constructor.

37.55.4 sortedArrayUsingDescriptor(values() as KeyValueCodingMBS, sortDescriptor as NSSortDescriptorMBS) as KeyValueCodingMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a copy of the receiving array sorted as specified by a given a sort descriptor.
Notes: sortDescriptor: The NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptor.

37.55.5 sortedArrayUsingDescriptors(values() as KeyValueCodingMBS, sortDescriptor() as NSSortDescriptorMBS) as KeyValueCodingMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a copy of the receiving array sorted as specified by a given array of sort descriptors.
Notes: sortDescriptors: An array of NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptors.

The first descriptor specifies the primary key path to be used in sorting the receiving array,Äôs contents. Any subsequent descriptors are used to further refine sorting of objects with duplicate values. See NSSortDescriptor for additional information.

37.55.6 Properties

37.55.7 Description as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The description text property.
Notes: (Read only property)
See also:

- 37.55.12 Description as String 7259

37.55.8 Handle as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The internal object handle.
Notes: (Read and Write property)

37.55.9 Tag as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The tag value.
Notes: Store anything you need, e.g. a dictionary.
(Read and Write property)

37.55.10 valueForKey(key as String) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Get/set the value for the property identified by a given key.
Notes: key: The name of one of the receiver's properties.
(Read and Write computed property)
See also:

- 37.55.15 valueForKey(key as string) as Variant 7260

37.55.11 Events

37.55.12 Description as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event when system queries description for object.
See also:

- 37.55.7 Description as String 7258

37.55.13 setValueForKey(key as string, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Sets the property of the receiver specified by a given key to a given value.
Notes: value: The value for the property identified by key.
key: The name of one of the receiver's properties.

If key identifies a to-one relationship, relate the object specified by value to the receiver, unrelating the previously related object if there was one. Given a collection object and a key that identifies a to-many relationship, relate the objects contained in the collection to the receiver, unrelating previously related objects if there were any.
The search pattern that setValueForKey uses is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
In a reference-counted environment, if the instance variable is accessed directly, value is retained.

37.55.14 setValueForUndefinedKey(key as string, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked by setValueForKey when it finds no property for a given key.
Notes: value: The value for the key identified by key.
key: A string that is not equal to the name of any of the receiver's properties.

Subclasses can override this method to handle the request in some other way. The default implementation raises an NSUndefinedKeyException.

37.55.15 valueForKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Return the value for the property identified by a given key.
Notes: key: The name of one of the receiver's properties.

Returns the value for the property identified by key.

If event is not implemented, the search pattern that valueForKey uses to find the correct value to return is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
See also:

- 37.55.10 valueForKey(key as String) as Variant 7259

37.55.16 valueForUndefinedKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked by valueForKey when it finds no property corresponding to a given key.
Notes: key: A string that is not equal to the name of any of the receiver's properties.

Subclasses can override this method to return an alternate value for undefined keys. The default implementation raises an NSUndefinedKeyException.

37.56 class NSActionCellMBS

37.56.1 class NSActionCellMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: An NSActionCell defines an active area inside a control (an instance of NSControl or one of its subclasses).
Notes: As an NSControl's active area, an NSActionCell does three things: it usually performs display of text or an icon; it provides the NSControl with a target and an action; and it handles mouse (cursor) tracking by properly highlighting its area and sending action messages to its target based on cursor movement.
Subclass of the NSCellMBS class.

Xojo Developer Magazine

- 7.6, page 8: News

37.56.2 Methods

37.56.3 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with an image.
Example:

```
Var pic as Picture = LogoMBS(500)
Var n as NSImageMBS = new NSImageMBS(pic)
Var c as new NSActionCellMBS(n)

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath
```

See also:

- 37.56.4 Constructor(text as string) 7262

37.56.4 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with a text.
Example:

```
Var c as new NSActionCellMBS("Hello")
MessageBox c.StringValue
```

See also:

- 37.56.3 Constructor(image as NSImageMBS) 7262

37.57 class NSBoxMBS

37.57.1 class NSBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The NSBox class implements simple views that can title themselves and draw a border around their content.
Example:

```
// add a custom box with a colored background and rounded corners to the window
Var box As New NSBoxMBS(20, 20, 300, 150)
box.boxType = NSBoxMBS.NSBoxCustom
box.fillColor = NSColorMBS.systemOrangeColor
box.borderColor = NSColorMBS.darkGrayColor
box.borderWidth = 2
box.cornerRadius = 10
box.title = "My Box"

Self.NSWindowMBS.contentView.addSubview box
```

Notes: These objects are known as boxes. You can use box to group, visually, some number of other views.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

- MBS REALbasic Plugins, version 10.3pr5

37.57.2 Methods

37.57.3 borderRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle in which the receiver's border is drawn.
Notes: The rectangle in which the border of the NSBox is drawn.

37.57.4 Constructor

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new box view with size 100/100 and position 0/0
Example:

```
Var x as new NSBoxMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.57.5 Constructor(Handle as Integer) 7265
- 37.57.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7265

37.57.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSView handle.
Example:

```
Var t as new NSBoxMBS(0, 0, 100, 100)
Var v as new NSBoxMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSBox and the plugin retains this handle.
See also:

- 37.57.4 Constructor 7264
- 37.57.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7265

37.57.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with the given size and position.
Example:

```
Var left,top,width,height as Integer
// define rectangle
Var x as new NSBoxMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:

- 37.57.4 Constructor 7264

• 37.57.5 Constructor(Handle as Integer) 7265

37.57.7 setFrameFromContentFrame(contentFrame as NSRectMBS)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Places the receiver so its content view lies on the specified frame.
Notes: contentFrame: The rectangle specifying the frame of the box's content view, reckoned in the coordinate system of the box's superview. The box is marked for redisplay.

37.57.8 setTitleWithMnemonic(stringWithAmpersand as string)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Sets the title of the receiver with a character denoted as an access key.
Notes: Mnemonics are not supported in Mac OS X.

By default, a box's title is "Title." The content view is not automatically resized, and the box is not marked for redisplay.

37.57.9 sizeToFit

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Resizes and moves the receiver's content view so it just encloses its subviews.
Example:

```
Var n as new NSProgressIndicatorMBS
n.sizeToFit

MessageBox n.frame.String
```

Notes: The receiver is then moved and resized to wrap around the content view. The receiver's width is constrained so its title will be fully displayed.

You should invoke this method after:

- Adding a subview (to the content view)
- Altering the size or location of such a subview
- Setting the margins around the content view

The mechanism by which the content view is moved and resized depends on whether the object responds to its own sizeToFit message: If it does respond, then that message is sent, and the content view is expected to be so modified. If the content view doesn't respond, the box moves and resizes the content view itself.

37.57.10 titleCell as NSCellMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the cell used to display the receiver's title.

37.57.11 titleRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle in which the receiver's title is drawn.
Notes: The rectangle in which the title is drawn.

37.57.12 Properties

37.57.13 borderColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the color of the receiver's border when the receiver is a custom box with a simple line border.
Notes: The receiver's border color. It must be a custom box—that is, it has a type of NSBoxCustom—and it must have a border style of NSLineBorder.

Available in Mac OS X v10.5 and later.
(Read and Write computed property)

37.57.14 borderType as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The border type to aType, which must be a valid border type.
Notes: A constant describing the type of border. Border types are defined in NSView.h. Currently, the following border types are defined: NSNoBorder, NSLineBorder, NSBezelBorder, NSGrooveBorder.

If the size of the new border is different from that of the old border, the content view is resized to absorb the difference, and the box is marked for redisplay.
(Read and Write computed property)

37.57.15 borderWidth as Double

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The border width.
Notes: Functional only when the receiver's box type (boxType) is NSBoxCustom and its border type (borderType) is NSLineBorder.

Available in Mac OS X v10.5 and later.
(Read and Write computed property)

37.57.16 boxType as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The box type.
Notes: Use the NSBox* constants.
(Read and Write computed property)

37.57.17 contentView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The receiver's content view.
Notes: On settings the NSView object is resized to fit within the box's current content area and the box is marked for redisplay.
(Read and Write computed property)

37.57.18 contentViewMargins as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The horizontal and vertical distance between the border of the receiver and its content view.
Notes: Value: The width and height of the offset between the box's border and content view. The horizontal value is applied (reckoned in the box's coordinate system) fully and equally to the left and right sides of the box. The vertical value is similarly applied to the top and bottom.

Unlike changing a box's other attributes, such as its title position or border type, changing the offsets doesn't automatically resize the content view. In general, you should send a sizeToFit message to the box after changing the size of its offsets. This message causes the content view to remain unchanged while the box is sized to fit around it.
(Read and Write computed property)

37.57.19 cornerRadius as Double

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The corner radius for the box.
Notes: Functional only when the receiver's box type (boxType) is NSBoxCustom and its border type (borderType) is NSLineBorder.
(Read and Write computed property)

37.57.20 fillColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The color of the receiver's background when the receiver is a custom box with a simple line border.
Notes: The receiver's fill color. It must be a custom box—that is, it has a type of NSBoxCustom—and it must have a border style of NSLineBorder.
Available in Mac OS X v10.5 and later.
(Read and Write computed property)

37.57.21 title as string

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The title for the box.
Notes: By default, a box's title is "Title."
(Read and Write computed property)

37.57.22 titleFont as NSFontMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The font object used to draw the receiver's title.
Notes: By default, the title is drawn using the small system font (obtained using (smallSystemFontSize as the parameter of systemFontOfSize:, both NSFont class methods). If the size of the new font is different

from that of the old font, the content view is resized to absorb the difference.
(Read and Write computed property)

37.57.23 titlePosition as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The position of the box's title.
Notes: If the new title position changes the size of the box's border area, the content view is resized to absorb the difference, and the box is marked as needing redisplay.

Use this constants: NSNoTitle, NSAboveTop, NSAtTop, NSBelowTop, NSAboveBottom, NSAtBottom and NSBelowBottom.
(Read and Write computed property)

37.57.24 Transparent as Boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver is transparent.
Notes: True makes the receiver transparent.
False makes the receiver opaque.
(Read and Write computed property)

37.57.25 Constants

Constants

Constant	Value	Description
NSAboveBottom	4	One of the constants for the title position. Title positioned above the box's bottom border.
NSAboveTop	1	One of the constants for the title position. Title positioned above the box's top border.
NSAtBottom	5	One of the constants for the title position. Title positioned within the box's bottom border.
NSAtTop	2	One of the constants for the title position. Title positioned within the box's top border.
NSBelowBottom	6	One of the constants for the title position. Title positioned below the box's bottom border.
NSBelowTop	3	One of the constants for the title position. Title positioned below the box's top border.
NSBoxCustom	4	One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box. Specifies that the appearance of the box is determined entirely by the by box-configuration methods, without automatically applying Apple human interface guidelines.
NSBoxOldStyle	3	One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box. Specifies that the box is a Mac OS X v10.2–style box.
NSBoxPrimary	0	One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box. Specifies the primary box appearance. This is the default box type.
NSBoxSecondary	1	One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box. Specifies the secondary box appearance.
NSBoxSeparator	2	One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box. Specifies the secondary box appearance.
NSNoTitle	0	One of the constants for the title position. The box has no title.

37.58 class NSButtonCellMBS

37.58.1 class NSButtonCellMBS

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The NSButtonCell class is a subclass of NSActionCell used to implement the user interfaces of push buttons, checkboxes (switches), and radio buttons.
Example:

```
// This example needs a window with Button1.
// give a button an image on the left side of the title
Var cell As NSButtonCellMBS = Button1.NSButtonMBS.cell
If cell = Nil Then Return

cell.image = NSImageMBS.imageWithSystemSymbolName("square.and.arrow.down", "Save")
cell.imagePosition = 2 // NSImageLeft
cell.showsBorderOnlyWhileMouseInside = False
```

Notes: It can also be used for any other region of a view that's designed to send a message to a target when clicked. The NSButtonMBS subclass of NSControlMBS uses a single NSButtonCellMBS.

The NSButtonCell class implements the user interface of NSButton.

Setting the integer, float, double, or object value of an NSButtonCell object results in a call to setState with the value converted to integer. In the case of setObjectValue, nil is equivalent to 0, and a non-nil object that doesn't respond to intValue sets the state to 1. Otherwise, the state is set to the object's intValue. Similarly, querying the integer, float, double, or object value of an NSButtonCell returns the current state in the requested representation. In the case of objectValue, this is an NSNumber containing true for on, false for off, and integer value -1 for the mixed state.

For more information on the behavior of NSButtonCell, see the NSButton and NSMatrix class specifications, and Button Programming Topics.
Subclass of the NSActionCellMBS class.

37.58.2 Methods

37.58.3 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with an image.
Example:

```
Var pic as Picture = LogoMBS(500)
Var n as NSImageMBS = new NSImageMBS(pic)
Var c as new NSButtonCellMBS(n)

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath
```

- 37.58.4 Constructor(text as string) 7273

37.58.4 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with a text.
Example:

```
Var c as new NSButtonCellMBS("Hello")
MessageBox c.StringValue
```

See also:

- 37.58.3 Constructor(image as NSImageMBS) 7273

37.58.5 Properties

37.58.6 alternateImage as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The image the button displays in its alternate state and, if necessary, redraws its contents.
Notes: Note that some button types don't display an alternate image.
(Read and Write property)

37.58.7 alternateTitle as String

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The title the button displays when it's in its alternate state.
Notes: Note that some button types don't display an alternate title.
(Read and Write property)

37.58.8 attributedAlternateTitle as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The string the button displays when it's in its alternate state to the given attributed string.
Notes: Note that some button types don't display an alternate title.

Graphics attributes that are set on the cell (backgroundColor, alignment, font, etc.) are overridden when corresponding properties are set for the attributed string.
(Read and Write property)

37.58.9 attributedTitle as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The string the button displays when it's in its normal state to the given attributed string and redraws the button.
Notes: The title is always shown on buttons that don't use their alternate contents when highlighting or displaying their alternate state.

Graphics attributes configured for the cell (backgroundColor, alignment, font, etc.) are overridden when corresponding properties are set for the attributed string.
(Read and Write property)

37.58.10 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The background color for the button.
Notes: (Read and Write property)

37.58.11 imageDimsWhenDisabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Whether to dim image when button is disabled.
Notes: When disabled, the image and text of an NSButtonCell are normally dimmed with gray.
Radio buttons and switches use (imageDimsWhenDisabled = false) so only their text is dimmed.
(Read and Write property)

37.58.12 imagePosition as Integer

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The position of the receiver's image relative to its title.
Notes: (Read and Write property)

37.58.13 imageScaling as Integer

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The scale factor for the receiver's image.
Notes: Available in OS X v10.5 and later.
(Read and Write property)

37.58.14 showsBorderOnlyWhileMouseInside as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Whether to show border only while mouse is inside.
Notes: (Read and Write property)

37.58.15 sound as Variant

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The sound that's played when the user presses the receiver.
Notes: The sound is played during a mouse-down event, such as NSLeftMouseDown.
Value is a NSSoundMBS object.
(Read and Write property)

37.58.16 Constants

Bezel Styles

Constant	Value	Description
BezelStyleAccessoryBar	13	A bezel style that is suitable for accessory and scope bars. This style is typically used for buttons with togglable state.
BezelStyleAccessoryBarAction	12	A bezel style that is suitable for accessory and scope bars. This style is typically used for buttons that perform an action or for pop-up buttons.
BezelStyleAutomatic	0	The appearance of this bezel style is automatically determined based on the button's contents and position within the window. This bezel style is the default for all button initializers.
BezelStyleBadge	15	A bezel style that is typically used in table rows to display information about the row, such as a count.
BezelStyleCircular	7	A button with a circular bezel suitable for a small icon or single character.
BezelStyleDisclosure	5	An unbezeled button with a disclosure triangle.
BezelStyleFlexiblePush	2	A flexible-height variant of NSBezelStylePush.
BezelStyleGlass	16	A bezel style with a glass effect. For macOS 26 or newer.
BezelStyleHelpButton	9	A circular button with a question mark providing the standard Help button appearance.
BezelStylePush	1	The standard system push button style.
BezelStylePushDisclosure	14	A bezeled variant of NSBezelStyleDisclosure.
BezelStyleSmallSquare	10	A button with squared edges and flexible height.
BezelStyleToolbar	11	A button style that is appropriate for use in a toolbar item.

37.59 control NSButtonControlMBS

37.59.1 control NSButtonControlMBS

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSButton.
Notes: This control embeds a special NSButton subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

37.59.2 Properties

37.59.3 AlternateTitle as String

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The title that the button displays when it's in its alternate state.
Notes: (Read and Write property)

37.59.4 BezelStyle as Integer

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The appearance of the border, if the view has one.
Notes: Use this constants:

(Read and Write property)

37.59.5 ButtonType as Integer

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The button type.
Notes: See also NSButtonMBS.ButtonType and the constants there like NSPushOnPushOffButton.
(Read and Write property)

NSRoundedBezelStyle	= 1
NSRegularSquareBezelStyle	= 2
NSThickSquareBezelStyle	= 3
NSThickerSquareBezelStyle	= 4
NSDisclosureBezelStyle	= 5
NSShadowlessSquareBezelStyle	= 6
NSCircularBezelStyle	= 7
NSTexturedSquareBezelStyle	= 8
NSHelpButtonBezelStyle	= 9
NSSmallSquareBezelStyle	= 10
NSTexturedRoundedBezelStyle	= 11
NSRoundRectBezelStyle	= 12
NSRecessedBezelStyle	= 13
NSRoundedDisclosureBezelStyle	= 14

37.59.6 Title as String

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The title displayed on the button when it's in its normal state.
Notes: (Read and Write property)

37.59.7 View as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.59.8 Events

37.59.9 Action

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The action event.

37.59.10 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.59.11 Close

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

37.59.12 Closing

Plugin Version: 13.2, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.59.13 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.59.14 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.59.15 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.59.16 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

37.59.17 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.59.18 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.59.19 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.59.20 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

37.59.21 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.59.22 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.59.23 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.59.24 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.59.25 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.59.26 Open

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

37.59.27 Opening

Plugin Version: 13.2, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.59.28 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.59.29 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.60 class NSButtonMBS

37.60.1 class NSButtonMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The Cocoa class for a button control.
Example:

```
// This example needs a window with Button1.
// give a Xojo button a SF Symbol image and a red bezel
Var b As NSButtonMBS = Button1.NSButtonMBS

b.image = NSImageMBS.imageWithSystemSymbolName("star.fill")
b.imagePosition = NSCellMBS.NSImageLeft
b.bezelColor = NSColorMBS.systemRedColor
b.contentTintColor = NSColorMBS.controlAccentColor
```

Notes: Subclass of the NSControlMBS class.

37.60.2 Methods

37.60.3 Constructor

MBS MacControls Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new button with size 100/100 and position 0/0
Example:

```
Var t as new NSButtonMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.60.4 Constructor(Handle as Integer) 7285
- 37.60.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7285
- 37.60.6 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0) 7286

37.60.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSButton handle.
Example:

```
Var t as new NSButtonMBS(0, 0, 100, 100)
Var v as new NSButtonMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSButton and the plugin retains this handle.
See also:

- 37.60.3 Constructor 7284
- 37.60.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7285
- 37.60.6 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0) 7286

37.60.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Creates a new button with the given size and position.
Example:

```
Var x as new NSButtonMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.60.3 Constructor 7284
- 37.60.4 Constructor(Handle as Integer) 7285
- 37.60.6 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0) 7286

37.60.6 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0)

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Creates a new button with default settings.
Notes: For macOS 10.12, we use the convenience functions from Apple.
For older systems, we use our own code.
Title is the title to use. Can be empty.
Image is the image to use. Can be nil.
Type is the type, e.g. NSMomentaryLightButton.
See also:

- 37.60.3 Constructor 7284
- 37.60.4 Constructor(Handle as Integer) 7285
- 37.60.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7285

37.60.7 setButtonType(buttonType as Integer)

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Sets how the button highlights while pressed and how it shows its state.
Notes: Use this constants:

NSMomentaryLightButton	= 0
NSPushOnPushOffButton	= 1
NSToggleButton	= 2
NSSwitchButton	= 3
NSRadioButton	= 4
NSMomentaryChangeButton	= 5
NSOnOffButton	= 6
NSMomentaryPushInButton	= 7

37.60.8 setNextState

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Sets the view to its next state.
Notes: If the button has three states, it cycles through them in this order: on, off, mixed, on, and so forth. If the button has two states, it toggles between them.

37.60.9 Properties

37.60.10 allowsMixedState as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the button allows a mixed state.
Notes: (Read and Write property)

37.60.11 alternateImage as NSImageMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The image that appears on the button when it's in its alternate state.
Notes: The image displayed by the button when it's in its alternate state, or nil if there is no alternate image. Note that some button types don't display an alternate image. Buttons don't display images by default.
(Read and Write property)

37.60.12 alternateTitle as string

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The title that the button displays when it's in its alternate state.
Notes: (Read and Write property)

37.60.13 attributedAlternateTitle as NSAttributedStringMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The title that appears on the button when it's in its alternate state to the given attributed string.
Notes: (Read and Write property)

37.60.14 attributedTitle as NSAttributedStringMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The title that the button displays in its normal state as an attributed string.
Notes: (Read and Write property)

37.60.15 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The background color.
Notes: The background color is used only when drawing borderless buttons.
(Read and Write property)

37.60.16 bezelColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The color of the button's bezel, in appearances that support it.
Notes: (Read and Write property)

37.60.17 bezelStyle as Integer

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The appearance of the border, if the view has one.
Notes: Use this constants:

(Read and Write property)

37.60.18 contentTintColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 25.1, Platform: macOS, Targets: Desktop only.

Function: A tint color to use for the template image and text content.
Example:

```
// This example needs a window with Button1.
// take a button and make it red color:
Var n As NSButtonMBS = Button1.NSButtonMBS
```

NSRoundedBezelStyle	= 1
NSRegularSquareBezelStyle	= 2
NSThickSquareBezelStyle	= 3
NSThickerSquareBezelStyle	= 4
NSDisclosureBezelStyle	= 5
NSShadowlessSquareBezelStyle	= 6
NSCircularBezelStyle	= 7
NSTexturedSquareBezelStyle	= 8
NSHelpButtonBezelStyle	= 9
NSSmallSquareBezelStyle	= 10
NSTexturedRoundedBezelStyle	= 11
NSRoundRectBezelStyle	= 12
NSRecessedBezelStyle	= 13
NSRoundedDisclosureBezelStyle	= 14

n.contentTintColor = NSColorMBS.redColor
n.isBordered = False

Notes: The contentTintColor is only applicable to borderless buttons. This color is used in combination with other theme-appropriate effects.
(Read and Write property)

37.60.19 hasDestructiveAction as Boolean

MBS MacControls Plugin, Plugin Version: 22.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that defines whether a button,Äôs action has a destructive effect.
Notes: Available on macOS 11.0 and newer.

The default value of hasDestructiveAction is false. Setting this to true allows the system to guard a destructive-action button against accidental presses, and can give the button a special appearance in certain contexts to caution against unintentional use.
(Read and Write property)

37.60.20 image as NSImageMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The view's image.
Notes: A button's image is displayed when the button is in its normal state, or all the time for a button that doesn't change its contents when highlighting or displaying its alternate state.
(Read and Write property)

37.60.21 imageDimsWhenDisabled as Boolean

MBS MacControls Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver,Äôs image appears "dim" when the button cell is disabled.
Notes: True to indicate that the button's image should dim when the button is disabled.

By default, all button types except NSSwitchButton and NSRadioButton do dim when disabled. When NSSwitchButtons and NSRadioButtons are disabled, only the associated text dims. The default setting for this condition is reasserted whenever you set ButtonType, so be sure to specify the button cell,Äôs type before you set ImageDimsWhenDisabled.
(Read and Write property)

37.60.22 imageHugsTitle as Boolean

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Whether image hugs title.
Notes: Available in macOS 10.12 and newer.
(Read and Write property)

37.60.23 imagePosition as Integer

MBS MacControls Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The position of the button's image relative to its title.
Notes: Value can be:

NSNoImage	0	The cell doesn,Äôt display an image.
NSImageOnly	1	The cell displays an image, but not a title.
NSImageLeft	2	The image is to the left of the title.
NSImageRight	3	The image is to the right of the title.
NSImageBelow	4	The image is below the title.
NSImageAbove	5	The image is above the title.
NSImageOverlaps	6	The image overlaps the title.

(Read and Write property)

37.60.24 imageScaling as Integer

MBS MacControls Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The scale factor for the receiver,Äôs image.
Notes: These constants specify a cell,Äôs image scaling behavior.

NSImageScaleProportionallyDown	0	If it is too large for the destination, scale the image down while preserving the aspect ratio.
NSImageScaleAxesIndependently	1	Scale each dimension to exactly fit destination. This setting does not preserve the aspect ratio of the image.
NSImageScaleNone	2	Do not scale the image.
NSImageScaleProportionallyUpOrDown	3	Scale the image to its maximum possible dimensions while both staying within the destination area and preserving its aspect ratio.

Available in OS X v10.5 and later.
(Read and Write property)

37.60.25 isBordered as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the button has a border.
Notes: (Read and Write property)

37.60.26 isTransparent as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the button is transparent.
Notes: (Read and Write property)

37.60.27 keyEquivalent as string

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The key-equivalent character of the view.
Notes: (Read and Write property)

37.60.28 keyEquivalentModifierMask as Integer

MBS MacControls Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: the controls's keyboard equivalent modifier mask.
Example:

```
const NSShiftKeyMask=131.072
const NSControlKeyMask=262144
const NSAlternateKeyMask=524288
const NSCommandKeyMask=1048576

Var d as NSButtonMBS // your button
d.KeyEquivalent="A"
d.KeyEquivalentModifierMask=NSShiftKeyMask+NSCommandKeyMask+NSAlternateKeyMask // command-option-shift
```

Notes: Constants for the mask:

NSAlphaShiftKeyMask = 65536
Set if Caps Lock key is pressed.
Available in Mac OS X v10.0 and later.

NSShiftKeyMask = 131072
Set if Shift key is pressed.
Available in Mac OS X v10.0 and later.

NSControlKeyMask = 262144
Set if Control key is pressed.
Available in Mac OS X v10.0 and later.

NSAlternateKeyMask = 524288
Set if Option or Alternate key is pressed.
Available in Mac OS X v10.0 and later.

NSCommandKeyMask = 1048576
Set if Command key is pressed.
Available in Mac OS X v10.0 and later.

NSNumericPadKeyMask = 2097152
Set if any key in the numeric keypad is pressed. The numeric keypad is generally on the right side of the keyboard. This is also set if any of the arrow keys are pressed (NSUpArrowFunctionKey, NSDownArrowFunctionKey, NSLeftArrowFunctionKey, and NSRightArrowFunctionKey).
Available in Mac OS X v10.0 and later.

NSHelpKeyMask = 4194304
Set if the Help key is pressed.
Available in Mac OS X v10.0 and later.

NSFunctionKeyMask = 8388608
Set if any function key is pressed. The function keys include the F keys at the top of most keyboards (F1, F2, and so on) and the navigation keys in the center of most keyboards (Help, Forward Delete, Home, End, Page Up, Page Down, and the arrow keys).
Available in Mac OS X v10.0 and later.

NSDeviceIndependentModifierFlagsMask = 16777216
Used to retrieve only the device-independent modifier flags, allowing applications to mask off the device-dependent modifier flags, including event coalescing information.
Available in Mac OS X v10.4.
(Read and Write property)

37.60.29 maxAcceleratorLevel as Integer

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Configures the maximum allowed level for an NSMultiLevelAcceleratorButton, allowed values range from [1,5] .
Notes: Defaults to 2.
Available on Mac OS X 10.10.3.
(Read and Write property)

37.60.30 showsBorderOnlyWhileMouseInside as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the view's border is displayed only when the cursor is over the button.
Notes: If isBordered returns false, the border is never displayed, regardless of what this method returns.
(Read and Write property)

37.60.31 sound as Variant

MBS MacControls Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The sound played when the user presses the button.
Notes: The sound that should be played when the user presses the button. The sound is played during a

mouse-down event, such as NSLeftMouseDown.
Value is NSSoundMBS object.
(Read and Write property)

37.60.32 SpringLoaded as Boolean

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Sends action on deep-press or extended hover while dragging.
Notes: Defaults to false.
Available on Mac OS X 10.10.3.
(Read and Write property)

37.60.33 state as Integer

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The state of the button.
Notes: This can be NSOnState (1), NSOffState (0), NSMixedState (-1).
(Read and Write property)

37.60.34 symbolConfiguration as NSImageSymbolConfigurationMBS

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: The combination of point size, weight, and scale to use when sizing and displaying symbol images.
Notes: If you don,Äôt provide a symbol configuration, the button uses its font property to size and display the symbol image.

The default value is nil.
(Read and Write property)

37.60.35 title as string

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The title displayed on the button when it's in its normal state.
Notes: (Read and Write property)

37.60.36 Constants

Constants

Constant	Value	Description
NSCircularBezelStyle	7	One of the button styles that can be specified using bezelStyle. A round button with room for a small icon or a single character. This style has both regular and small variants, but the large variant is available only in gray at this time.
NSDisclosureBezelStyle	5	One of the button styles that can be specified using bezelStyle. A bezel style for use with a disclosure triangle. To create the disclosure triangle, set the button bezel style to NSDisclosure-BezelStyle and the button type to NSOnOffButton.
NSHelpButtonBezelStyle	9	One of the button styles that can be specified using bezelStyle. A round button with a question mark providing the standard help button look.
NSInlineBezelStyle	15	One of the button styles that can be specified using bezelStyle. Inline Style.
NSMomentaryChangeButton	5	One of the button types that can be specified using ButtonType. While the button is held down, the alternate image and alternate title are displayed. The normal image and title are displayed when the button isn't pressed. This option is called "Momentary Change" in Interface Builder's Button Inspector.
NSMomentaryLightButton	0	One of the button types that can be specified using ButtonType. While the button is held down it's shown as "lit," and also "pushed in" to the screen if the button is bordered. This type of button is best for simply triggering actions, as it doesn't show its state; it always displays its normal image or title. This option is called "Momentary Light" in Interface Builder's Button Inspector.
NSMomentaryPushInButton	7	One of the button types that can be specified using ButtonType. While the button is held down it's shown as "lit." This type of button is best for simply triggering actions, as it doesn't show its state; it always displays its normal image or title. This option is called "Momentary Push In" in Interface Builder's Button Inspector.
NSOnOffButton	6	One of the button types that can be specified using ButtonType. The first click highlights the button; a second click returns it to the normal (unhighlighted) state.
NSPushOnPushOffButton	1	One of the button types that can be specified using ButtonType. The first click both highlights and causes the button to be "pushed in" if the button is bordered; a second click returns it to its normal state.
NSRadioButton	4	One of the button types that can be specified using ButtonType. This style is similar to NSSwitchButton, but it used to constrain a selection to a single element from several.
NSRecessedBezelStyle	13	One of the button styles that can be specified using bezelStyle. A bezel style that matches the recessed buttons in Mail, Finder and Safari.
NSRegularSquareBezelStyle	2	One of the button styles that can be specified using bezelStyle. A rectangular button with a 2 point border, designed for icons.
NSRoundedBezelStyle	1	One of the button styles that can be specified using bezelStyle. A rounded rectangle button, designed for text.
NSRoundedDisclosureBezelStyle	14	One of the button styles that can be specified using bezelStyle. A bezel style that matches the disclosure style used in the standard Save panel.
NSRoundRectBezelStyle	12	One of the button styles that can be specified using bezelStyle. A bezel style that matches the search buttons in Finder and Mail.
NSShadowlessSquareBezelStyle	6	One of the button styles that can be specified using bezelStyle. Similar to NSRegularSquareBezelStyle, but has no shadow so you can abut the cells without overlapping shadows. This style would be used in a tool palette, for example.
NSSmallSquareBezelStyle	10	One of the button styles that can be specified using bezelStyle. A simple square bezel style. Buttons using this style can be scaled to any size.
NSSwitchButton	3	One of the button types that can be specified using ButtonType. This style is a variant of NSToggleButton that has no border and is used to represent a checkbox.
NSTexturedRoundedBezelStyle	11	One of the button styles that can be specified using bezelStyle. A textured (metal) bezel style similar in appearance to the Finder's action

37.61 class NSCellMBS

37.61.1 class NSCellMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The NSCell class provides a mechanism for displaying text or images in an NSView object without the overhead of a full NSView subclass.
Example:

```
// This example needs a window with Button1.
// read and change settings of the cell behind a button
Var cell As NSCellMBS = Button1.NSButtonMBS.cell
If cell = Nil Then Return

cell.font = NSFontMBS.systemFontOfSize(14)
cell.title = "Save Now"
MessageBox "Cell state: " + cell.state.ToString + ", control size: " + cell.controlSize.ToString
```

Notes: It's used heavily by most of the NSControl classes to implement their internal workings.

- Nearly 2000 new Functions in the 9.6 prerelease of MBS

Xojo Developer Magazine

- 7.6, page 8: News

37.61.2 Methods

37.61.3 acceptsFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver accepts first responder status.
Notes: The default value is true if the receiver is enabled. Subclasses may override this method to return a different value.

37.61.4 calcDrawInfo(theRect as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Recalculates the cell geometry.
Notes: Objects (such as controls) that manage NSCell objects generally maintain a flag that informs them if any of their cells have been modified in such a way that the location or size of the cell should be recomputed. If so, calcSize method of NSControl is automatically invoked prior to the display of the cell, and that method invokes the calcDrawInfo method of the cell.
The default implementation of this method does nothing.

37.61.5 cellSize as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the minimum size needed to display the receiver.
Notes: Returns the size of the cell, or the size (10000, 10000) if the receiver is not a text or image cell. If the cell is an image cell but no image has been set, returns NSZeroSize.
This method takes into account of the size of the image or text within a certain offset determined by the border type of the cell.

37.61.6 cellSizeForBounds(theRect as NSRectMBS) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the minimum size needed to display the receiver, constraining it to the specified rectangle.
Notes: aRect: The size of the cell, or the size of the aRect parameter if the cell is not a text or image cell. If the cell is an image cell but no image has been set, returns an empty size.

This method takes into account of the size of the image or text within a certain offset determined by the border type of the cell. If the receiver is of text type, the text is resized to fit within aRect (as much as aRect is within the bounds of the cell).

37.61.7 compare(otherCell as NSCellMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Compares the string values of the receiver another cell, disregarding case.
Notes: otherCell: The cell to compare against the receiver. This parameter must be of type NSCell; if it is not, this method raises NSBadComparisonException.

This value must not be nil. If the value is nil, the behavior is undefined and may change in future versions of Mac OS X.

Returns NSOrderedAscending if the string value of the receiver precedes the string value of otherCell in lexical ordering, NSOrderedSame if the string values are equivalent in lexical value, and NSOrderedDescending string value of the receiver follows the string value of otherCell in lexical ordering.

37.61.8 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with an image.
Example:

```
Var pic as Picture = LogoMBS(500)
Var n as NSImageMBS = new NSImageMBS(pic)
Var c as new NSCellMBS(n)

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath
```

See also:

- 37.61.9 Constructor(text as string) 7299

37.61.9 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with a text.
Example:

```
Var c as new NSCellMBS("Hello")
MessageBox c.StringValue
```

See also:

- 37.61.8 Constructor(image as NSImageMBS) 7299

37.61.10 defaultFocusRingType as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the default type of focus ring for the receiver.
Notes: Use this constants:

NSFocusRingTypeDefault	= 0	The default focus ring type for NSView or NSCell.
NSFocusRingTypeNone	= 1	No focus ring. If you set the focus ring type to this value, NSView and NSCell will not draw any focus ring.
NSFocusRingTypeExterior	= 2	The standard Aqua focus ring.

37.61.11 defaultMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the default menu for instances of the receiver.
Notes: Returns the default menu. The NSCell implementation of this method returns nil.

37.61.12 drawingRectForBounds(theRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle within which the receiver draws itself.
Notes: theRect: The bounding rectangle of the receiver.
Returns the rectangle in which the receiver draws itself. This rectangle is slightly inset from the one in theRect.

37.61.13 highlightColorWithFrame(theRect as NSRectMBS, controlView as NSViewMBS) as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Redraws the receiver with the specified highlight setting.
Notes: theRect: The bounding rectangle of the receiver.
controlView: The control that manages the cell.

Returns the color the receiver uses when drawing the selection highlight.
You should not assume that a cell would necessarily want to draw itself with the value returned from selectedControlColor. A cell may wish to draw with different a selection highlight color depending on such things as the key state of its controlView.

37.61.14 imageRectForBounds(theRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle in which the receiver draws its image.
Notes: theRect: The bounding rectangle of the receiver.

The rectangle in which the receiver draws its image. This rectangle is slightly offset from the one in theRect.

37.61.15 isEntryAcceptable(aString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns whether a string representing a numeric or date value is formatted in a suitable way for the cell's entry type.
Notes: This method is being deprecated in favor of a new class of formatter objects. For more information, see NSFormatter. This documentation is provided only for developers who need to modify older applications

37.61.16 mnemonic as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the character in the receiver's title that appears underlined for use as a mnemonic.
Notes: A string containing the mnemonic character, or an empty string if no mnemonic character is set.

37.61.17 nextState as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's next state.
Notes: If the receiver has three states, it cycles through them in this order: on, off, mixed, on, and so forth. If the receiver has two states, it toggles between them.

37.61.18 performClick

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Simulates a single mouse click on the receiver.
Notes: This method performs the receiver's action on its target. The receiver must be enabled to perform the action. If the receiver's control view is valid, that view is used as the sender; otherwise, the value in

sender is used.

The receiver of this message must be a cell of type NSActionCell. This method raises an exception if the action message cannot be successfully sent.

37.61.19 prefersTrackingUntilMouseUp as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether tracking stops when the cursor leaves the cell.
Notes: The default implementation returns false. Subclasses may override this method to return a different value.

37.61.20 sendActionOn(mask as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the conditions on which the receiver sends action messages to its target.
Notes: mask: A bit mask containing the conditions for sending the action. The only conditions that are actually checked are associated with the NSLeftMouseDownMask, NSLeftMouseUpMask, NSLeftMouseDraggedMask, and NSPeriodicMask bits.

Returns a bit mask containing the previous settings. This bit mask uses the same values as specified in the mask parameter.

You use this method during mouse tracking when the mouse button changes state, the mouse moves, or if the cell is marked to send its action continuously while tracking. Because of this, the only bits checked in mask are NSLeftMouseDownMask, NSLeftMouseUpMask, NSLeftMouseDraggedMask, and NSPeriodicMask, which are declared in the NSEvent class reference.

You can use the setContinuous method to turn on the flag corresponding to NSPeriodicMask or NSLeftMouseDraggedMask, whichever is appropriate to the given subclass of NSCell.

37.61.21 setNextState

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Changes the state of the receiver to its next state.
Notes: If the receiver has three states, it cycles through them in this order: on, off, mixed, on, and so forth. If the receiver has two states, it toggles between them.

37.61.22 setTitleWithMnemonic(stringWithAmpersand as string)

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the title of the receiver with one character in the string denoted as an access key.
Notes: stringWithAmpersand: The new title of the cell. One character in the string should be preceded by an ampersand (&) character. The character that follows becomes the mnemonic character for the title. Mnemonics are not supported in Mac OS X.

37.61.23 titleRectForBounds(theRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle in which the receiver draws its title text.
Notes: If the receiver is a text-type cell, this method resizes the drawing rectangle for the title (theRect) inward by a small offset to accommodate the cell border. If the receiver is not a text-type cell, the method does nothing.

37.61.24 wantsNotificationForMarkedText as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the field editor initiated by the receiver should post text change notifications.
Notes: Returns true if the field editor initiated by the receiver should post text change notifications (NSTextDidChangeNotification) while editing marked text; otherwise, they are delayed until the marked text confirmation.

37.61.25 Properties

37.61.26 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The alignment of text in the receiver..
Notes: The alignment of text in the receiver (one of the following constants: NSLeftTextAlignment, NSRightTextAlignment,NSCenterTextAlignment, NSJustifiedTextAlignment, NSNaturalTextAlignment).
The default value is NSNaturalTextAlignment.
(Read and Write property)

37.61.27 allowsEditingTextAttributes as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver allows user editing of textual attributes.
Notes: (Read and Write property)

37.61.28 allowsMixedState as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver supports three states.
Notes: Valus is true if the receiver supports all three states (on, off, and mixed), otherwise false (the receiver supports only the on and off states).
(Read and Write property)

37.61.29 allowsUndo as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver assumes responsibility for undo operations.
Notes: By default, the NSTextFieldCell class uses this feature to handle undo operations for edited text. Other controls set a value that is appropriate for their implementation.
Available in Mac OS X v10.4 and later.
(Read and Write property)

37.61.30 attributedStringValue as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The value of the receiver's cell as an attributed string using the receiver's formatter object (if one exists).
Notes: The textual attributes are the default paragraph style, the receiver's font and alignment, and whether the receiver is enabled and scrollable.

For Mac OS X v10.3 and later: If you use a class that responds to the selector attributedStringValue for the object value of a cell, then the cell will use that method to fetch the string to draw rather than using stringValue.
(Read and Write property)

37.61.31 backgroundStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the background style for the receiver.
Notes: The background describes the surface the cell is drawn onto in drawWithFrame A control typically sets this before it asks the cell to draw. A cell may draw differently based on background characteristics. For example, a tableview drawing a cell in a selected row might set cell.backgroundStyle=NSBackgroundStyleDark. A text cell might decide to render its text white as a result. A rating-style level indicator might draw its stars white instead of gray.
Available in Mac OS X v10.5 and later.
(Read and Write property)

37.61.32 baseWritingDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The initial writing direction used to determine the actual writing direction for text.
Notes: The default value is NSWritingDirectionNatural.
The Text system uses this value as a hint for calculating the actual direction for displaying Unicode characters. You should not need to call this method directly.
(Read and Write property)

37.61.33 Bezeled as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver has a bezeled border.
Notes: (Read and Write property)

37.61.34 Bordered as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver has a plain border.
Notes: (Read and Write property)

37.61.35 className as string

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The name of this NSCell class.
Example:

```
Var c as new NSActionCellMBS("Hello")
MessageBox c.className // shows "NSActionCell"
```

Notes: (Read only property)

37.61.36 classPath as string

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The path of this NSCell class.
Example:

```
Var c as new NSActionCellMBS("Hello")
MessageBox c.classPath // shows "NSActionCell:NSCell:NSObject"
```

Notes: Useful for debugging to know what super classes the view has.
(Read only property)

37.61.37 Continuous as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver's cell sends its action message continuously to its target during mouse tracking.
Notes: (Read and Write property)

37.61.38 controlSize as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The size of the receiver.
Notes: Can be NSRegularControlSize, NSMiniControlSize or NSSmallControlSize.
(Read and Write property)

37.61.39 controlTint as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's control tint.
Notes: Can be NSGraphiteControlTint, NSBlueControlTint, NSClearControlTint or NSDefaultControlTint.
(Read and Write property)

37.61.40 controlView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's control view.
Notes: The control view represents the control currently being rendered by the cell.
(Read and Write property)

37.61.41 doubleValue as Double

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The value of the receiver's cell as a double-precision floating-point number.
Notes: The value of the cell interpreted as a double-precision floating-point number. If the receiver is not a text-type cell or the cell value is not scannable, returns 0.
(Read and Write property)

37.61.42 Editable as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver is editable.
Notes: (Read and Write property)

37.61.43 Enabled as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver is enabled or disabled.
Notes: (Read and Write property)

37.61.44 floatValue as Double

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The value of the receiver's cell as a single-precision floating-point number.
Notes: Returns the value of the cell interpreted as a single-precision floating-point number. If the receiver is not a text-type cell or the cell value is not scannable, returns 0.
(Read and Write property)

37.61.45 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The font used to display text in the receiver.
Notes: The receiver's current font, or nil if the receiver is not a text-type cell.
(Read and Write property)

37.61.46 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The internal NSCell reference.
Notes: (Read and Write property)

37.61.47 hasValidObjectValue as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver has a valid object value.
Notes: A valid object value is one that the receiver's formatter can "understand." Objects are always assumed to be valid unless they are rejected by the formatter.
(Read only property)

37.61.48 Highlighted as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver is highlighted.
Notes: (Read and Write property)

37.61.49 Identifier as String

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: A string that identifies this user interface item.
Notes: It should be set to a unique value on NSViews when they are intended to be used inside a view-based NSTableView. Identifiers should be unique per-window. For programmatically created user interface items, you would typically set this value in code after creating a view but before adding it to a window. You may also want to set an identifier on a window, after creating it programmatically, to identify the window easily when it is reopened. You should not change the identifier after a view is added to a window. Identifiers beginning with an underscore are reserved for the system. In framework classes that implement this protocol, the accessor methods are not intended to be overridden.

To help avoid collision of identifiers, it is recommended that identifiers use the same prefix as is used for the framework or application. For example, identifiers for standard AppKit interface items, such as the open panel, will begin with "NS".

The slash '/', backslash '\', and colon ':' characters are reserved and should not be used in identifiers.
(Read and Write property)

37.61.50 image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The image displayed by the receiver (if any).
Notes: The image displayed by the receiver, or nil if the receiver is not an image-type cell.
(Read and Write property)

37.61.51 importsGraphics as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the text of the receiver can contain imported graphics.
Notes: true if the receiver's text is in the RTFD format and supports imported graphics, otherwise false.
(Read and Write property)

37.61.52 interiorBackgroundStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the interior background style for the receiver.
Notes: The interior background style describes the surface drawn onto in drawInteriorWithFrame:inView:. This is often the same as the backgroundStyle, but a button that draws a bezel would have a different interiorBackgroundStyle.
This is both an override point and a useful method to call. In a custom button with a custom bezel you can override this method to describe that surface. A cell that has custom interior drawing might query this

method to help pick an image that looks good on the cell. Calling this method gives you some independence from changes in framework art style.
Available in Mac OS X v10.5 and later.
(Read only property)

37.61.53 intValue as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's value as an integer.
Notes: The value of the cell interpreted as an integer. If the receiver is not a text-type cell or the cell value is not scannable, returns 0.
On Mac OS X v10.5 and later, you should use integerValue instead.
(Read and Write property)

37.61.54 isOpaque as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver is opaque (nontransparent).
Notes: (Read only property)

37.61.55 keyEquivalent as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the key equivalent to clicking the cell.
Notes: Subclasses can override this method to return a string with a valid character for the key equivalent.
(Read only property)

37.61.56 lineBreakMode as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The line break mode currently used when drawing text.
Notes: The line break mode the receiver currently uses when drawing text (one of the following constants: NSLineBreakByWordWrapping, NSLineBreakByCharWrapping, NSLineBreakByClipping, NSLineBreakByTruncatingHead, NSLineBreakByTruncatingTail, or NSLineBreakByTruncatingMiddle).
Available in Mac OS X v10.4 and later.
(Read and Write property)

37.61.57 menu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's contextual menu.
Notes: The receiver's contextual menu, or nil if no menu is assigned.
(Read and Write property)

37.61.58 mnemonicLocation as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The position of the underlined mnemonic character in the receiver's title.
Notes: A zero-based index into the receiver's title string indicating the position of the character. If there is no mnemonic character, this method returns NSNotFound.
Mnemonics are not supported in Mac OS X.
(Read and Write property)

37.61.59 refusesFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver should not become the first responder.
Notes: To find out whether the receiver can become first responder at this time, use the method acceptsFirstResponder.
(Read and Write property)

37.61.60 Scrollable as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver scrolls excess text past the cell's bounds.
Notes: (Read and Write property)

37.61.61 Selectable as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the text of the receiver can be selected.
Notes: (Read and Write property)

37.61.62 sendsActionOnEndEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver's NSControl object sends its action message whenever the user finishes editing the cell's text.
Notes: If this method returns true, the receiver's NSControl object sends its action message when the user does one of the following:

- Presses the Return key
- Presses the Tab key to move out of the field
- Clicks another text field

If it returns false, the cell's NSControl object sends its action message only when the user presses the Return key.
(Read and Write property)

37.61.63 showsFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver should draw some indication of its first responder status.
Notes: The NSCell class itself does not draw a first-responder indicator. Subclasses may use the returned value to determine whether or not they should draw one, however.
(Read and Write property)

37.61.64 state as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's state.
Notes: Cells can have two or three states. If the receiver has two states, it returns either NSOffState (the normal or unpressed state) or NSOnState (the alternate or pressed state). If it has three, it may also return NSMixedState, indicating the feature is in effect somewhere.
To check whether the receiver uses the mixed state, use the method allowsMixedState.
Note that the value state returns may not be the same value you passed into setState.
(Read and Write property)

37.61.65 stringValue as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The value of the receiver's cell as a string.
Notes: If no formatter exists and the cell's value is a string, this method returns the value as a plain, attributed, or localized formatted string. If the value is not a string or cannot be converted to one, this method returns an empty string.

For Mac OS X v10.3 and later: If you use a class that responds to the selector attributedStringValue for the object value of a cell, the cell uses that method to fetch the string to draw rather than the stringValue method.
(Read and Write property)

37.61.66 tag as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The tag identifying the receiver.
Notes: The tag value. The NSCell implementation of this method returns –1.
Tags allow you to identify particular cells. Tag values are not used internally; they are only changed by external invocations of setTag:. You typically set tag values in Interface Builder and use them at runtime in your application. When you set the tag of a control with a single cell in Interface Builder, it sets the tags of both the control and the cell to the same value as a convenience.
(Read and Write property)

37.61.67 title as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's title.
Notes: Subclasses (such as NSButtonCell) may override this method to return a different value.
(Read and Write property)

37.61.68 truncatesLastVisibleLine as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether the receiver truncates and adds the ellipsis character to the last visible line if the text doesn't fit into the cell bounds.
Notes: The line break mode must be either NSLineBreakByWordWrapping or NSLineBreakByCharWrapping. Otherwise, this setting is ignored.
Available in Mac OS X v10.5 and later.

(Read and Write property)

37.61.69 type as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The type of the cell, changing it to a text cell, image cell, or null cell.
Notes: If the cell is already the same type as the one specified in the aType parameter, this method does nothing.
If aType is NSTextCellType, this method converts the receiver to a cell of that type, giving it a default title and setting the font to the system font at the default size. If aType is NSImageCellType, the cell type is not changed until you set a new non-nil image.
(Read and Write property)

37.61.70 userInterfaceLayoutDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: The layout direction of the user interface.
Notes: This property specifies the general user interface layout flow directions. For subclasses that have multiple visual components in a single cell instance, this property should specify the directionality or flow of components.

NSUserInterfaceLayoutDirectionLeftToRight = 0
NSUserInterfaceLayoutDirectionRightToLeft = 1

Available in OS X v10.6 and later.
(Read and Write property)

37.61.71 usesSingleLineMode as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether the text cell restricts layout and rendering of its content to a single line.
Notes: If true, the cell ignores the return value from wraps, interprets NSLineBreakByWordWrapping and NSLineBreakByCharWrapping returned by lineBreakMode as NSLineBreakByClipping, and configures the field editor to ignore key binding commands that insert paragraph and line separators.

The field editor bound to a single line cell filters paragraph and line separator insertion from user actions. Cells in the single line mode use the fixed baseline layout. The text baseline position is determined solely by the control size regardless of content font style or size.

(Read and Write property)

37.61.72 wraps as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether text in the receiver wraps when its length exceeds the frame of the cell.
Notes: If the text of the receiver is an attributed string value you must explicitly set the paragraph style line break mode. Calling this method with the value true is equivalent to calling the setLineBreakMode: method with the value NSLineBreakByWordWrapping.
(Read and Write property)

37.61.73 cellAttribute(aParameter as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The value for the specified cell attribute.
Notes: aParameter: The cell attribute whose value you want to get. Attributes include the receiver's current state and whether it is disabled, editable, or highlighted.

Returns the value for the cell attribute specified by aParameter.
(Read and Write computed property)

37.61.74 focusRingType as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The type of focus ring currently set for the receiver.
Notes: You can disable a view's focus ring drawing by overriding this method so it always returns NSFocusRingTypeNone, or by calling setFocusRingType: with NSFocusRingTypeNone. You should only disable a view from drawing its focus ring if you want to draw your own focus ring, or if there isn't sufficient space to display a focus ring in the default location.
Available in Mac OS X v10.3 and later.
(Read and Write computed property)

37.61.75 Constants

Constants

Constant	Value	Description
NSAnyType	0	One of the constants specify how a cell formats numeric data. Any value is allowed. Deprecated in Mac OS X v10.4 and later.
NSBlueControlTint	1	One of the constants specify a cell's tint. Aqua control tint Available in Mac OS X v10.3 and later.
NSCellAllowsMixedState	16	One of the constants specify how a button behaves when pressed and how displays its state. Lets the cell's state be NSMixedState, as well as NSOffState and NSOnState
NSCellChangesContents	14	One of the constants specify how a button behaves when pressed and how displays its state. If the cell's state is NSMixedState or NSOnState, displays the cell's alternat image.
NSCellDisabled	0	One of the constants specify how a button behaves when pressed and how displays its state. Does not let the user manipulate the cell.
NSCellEditable	3	One of the constants specify how a button behaves when pressed and how displays its state. Lets the user edit the cell's contents.
NSCellHasImageHorizontal	12	One of the constants specify how a button behaves when pressed and how displays its state. Controls the position of the cell's image: places the image on the right of an text in the cell. Together, NSCellHasImageOnLeftOrBottom, NSCellHasImageHorizontal, an NSCellHasOverlappingImage control the position of the cell's image and tex To place the image above, set none of them. To place the image below, se NSCellHasImageOnLeftOrBottom. To place the image to the right, set NSCel HasImageHorizontal. To place the image to the left, set NSCellHasImageHor izontal and NSCellHasImageOnLeftOrBottom. To place the image directl over, set NSCellHasOverlappingImage.
NSCellHasImageOnLeftOrBottom	13	One of the constants specify how a button behaves when pressed and how displays its state. Controls the position of the cell's image: places the image on the left of c below any text in the cell. See NSCellHasImageHorizontal for more details.
NSCellHasOverlappingImage	11	One of the constants specify how a button behaves when pressed and how displays its state. Controls the position of the cell's image: places the image over any text in th cell. See NSCellHasImageHorizontal for more details.
NSCellHighlighted	5	One of the constants specify how a button behaves when pressed and how displays its state. Draws the cell with a highlighted appearance. (Deprecated. Use Highlighte instead.)
NSCellHitContentArea	1	One of the constants are used by hitTestForEvent to determine the effect of a event. A content area in the cell. Available in Mac OS X v10.5 and later.
NSCellHitEditableTextArea	2	One of the constants are used by hitTestForEvent to determine the effect of a event. An editable text area of the cell. Available in Mac OS X v10.5 and later.
NSCellHitNone	0	One of the constants are used by hitTestForEvent to determine the effect of a event. An empty area, or did not hit in the cell. Available in Mac OS X v10.5 and later.
NSCellHitTrackableArea	4	One of the constants are used by hitTestForEvent to determine the effect of a event.

Background Styles

Constant	Value	Description
NSBackgroundStyleDark	1	The background is a dark color. Light content contrasts well with this background. Available in Mac OS X v10.5 and later.
NSBackgroundStyleLight	0	The background is a light color. Dark content contrasts well with this background. Available in Mac OS X v10.5 and later.
NSBackgroundStyleLowered	3	The background is intended to appear lower than the content drawn on it. Content might need to be embossed. Available in Mac OS X v10.5 and later.
NSBackgroundStyleRaised	2	The background is intended to appear higher than the content drawn on it. Content might need to be inset. Available in Mac OS X v10.5 and later.

Scaling Modes

Constant	Value	Description
NSImageScaleAxesIndependently	1	Scale each dimension to exactly fit destination. This setting does not preserve the aspect ratio of the image. Available in Mac OS X v10.5 and later.
NSImageScaleNone	2	Do not scale the image. Available in Mac OS X v10.5 and later.
NSImageScaleProportionallyDown	0	If it is too large for the destination, scale the image down while preserv aspect ratio. Available in Mac OS X v10.5 and later.
NSImageScaleProportionallyUpOrDown	3	Scale the image to its maximum possible dimensions while both staying the destination area and preserving its aspect ratio. Available in Mac OS X v10.5 and later.

37.62 class NSClipViewMBS

37.62.1 class NSClipViewMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: An NSClipView contains and scrolls the document view displayed by an NSScrollView.
Notes: You normally don't need to program with NSClipViews, as NSScrollView handles most of the details of their operation.

An NSClipView holds the document view of an NSScrollView, clipping the document view to its frame, handling the details of scrolling in an efficient manner, and updating the NSScrollView when the document view's size or position changes. You don't normally use the NSClipView class directly; it's provided primarily as the scrolling machinery for the NSScrollView class. However, you might use the NSClipView class to implement a class similar to NSScrollView.

Interaction With NSScrollView
When using an NSClipView within an NSScrollView (the usual configuration), you should issue messages that control background drawing state to the NSScrollView, rather than messaging the NSClipView directly. This recommendation applies to the following methods:

- backgroundColor
- drawsBackground

The NSClipView methods are intended for when the NSClipView is used independently of a containing NSScrollView. In the usual case, NSScrollView should be allowed to manage the background-drawing properties of its associated NSClipView.

There is only one background-drawing state per NSScrollView/NSClipView pair. The two objects do not maintain independent and distinct drawsBackground and backgroundColor properties; rather, NSScrollView's accessors for these properties largely defer to the associated NSClipView and allow the NSClipView to maintain the state. In Mac OS X v10.2 and earlier system versions, NSScrollView maintained a cache of the last state it set for its NSClipView. If the NSClipView was sent a setDrawsBackground: message directly, the cache might not reflect the state accurately. This caching of state has been removed in Mac OS X v10.3.

It is also important to note that sending a setDrawsBackground message with a parameter of false to an NSScrollView has the added effect of sending the NSClipView a setCopiesOnScroll message with a parameter of false. The side effect of sending the setDrawsBackground message directly to the NSClipView is the appearance of "trails" (vestiges of previous drawing) in the document view as it is scrolled.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

Blog Entries

- MBS Real Studio Plugins, version 11.3pr1

37.62.2 Methods

37.62.3 autoscroll(theEvent as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Scrolls the receiver proportionally to theEvent's distance outside of it.
Notes: theEvent's location should be expressed in the window's base coordinate system (which it normally is), not the receiving NSClipView's. Returns true if any scrolling is performed; otherwise returns false.

Never invoke this method directly; instead, the NSClipView's document view should repeatedly send itself autoscroll: messages when the cursor is dragged outside the NSClipView's frame during a modal event loop initiated by a mouse-down event. The NSView class implements autoscroll to forward the message to the receiver's superview; thus the message is ultimately forwarded to the NSClipView.

37.62.4 constrainScrollPoint(newOrigin as NSPointMBS) as NSPointMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns a scroll point adjusted from proposedNewOrigin, if necessary, to guarantee the receiver will still lie within its document view.
Notes: For example, if proposedNewOrigin's y coordinate lies to the left of the document view's origin, then the y coordinate returned is set to that of the document view's origin.

37.62.5 Constructor

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new clipview with the given size and position.
Example:

```
Var x as new NSClipViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.62.6 Constructor(Handle as Integer) 7320
- 37.62.7 Constructor(left as Double, top as Double, width as Double, height as Double) 7320

37.62.6 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSClipView handle.
Example:

```
Var t as new NSClipViewMBS(0, 0, 100, 100)
Var v as new NSClipViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSClipView and the plugin retains this handle.
See also:

- 37.62.5 Constructor 7319
- 37.62.7 Constructor(left as Double, top as Double, width as Double, height as Double) 7320

37.62.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new NSClipView with the given size and position.
Example:

```
Var x as new NSClipViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.62.5 Constructor 7319
- 37.62.6 Constructor(Handle as Integer) 7320

37.62.8 documentRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle defining the document view's frame, adjusted to the size of the receiver if the document view is smaller.
Notes: In other words, this rectangle is always at least as large as the receiver itself.

The document rectangle is used in conjunction with an NSClipView's bounds rectangle to determine values for the indicators of relative position and size between the NSClipView and its document view. For example, NSScrollView uses these rectangles to set the size and position of the knobs in its scrollers. When the

document view is much larger than the NSClipView, the knob is small; when the document view is near the same size, the knob is large; and when the document view is the same size or smaller, there is no knob.

37.62.9 documentVisibleRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the exposed rectangle of the receiver's document view, in the document view's own coordinate system.
Notes: Note that this rectangle doesn't reflect the effects of any clipping that may occur above the NSClipView itself. To get the portion of the document view that's guaranteed to be visible, send it a visibleRect message.

37.62.10 reflectScrolledClipView(clipView as NSClipViewMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Adjusts the receiver's scrollers to reflect the size and positioning of its content view.

37.62.11 scrollClipView(clipview as NSClipViewMBS, toPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Notifies the superview of a clip view that the clip view needs to reset the origin of its bounds rectangle.

37.62.12 scrollToPoint(newOrigin as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Changes the origin of the receiver's bounds rectangle to newOrigin.

37.62.13 viewBoundsChanged(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Handles an NSViewBoundsDidChangeNotification, passed in the aNotification argument, by updating a containing NSScrollView based on the new bounds.

37.62.14 viewFrameChanged(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Handles an NSViewFrameDidChangeNotification, passed in the aNotification argument, by updating a containing NSScrollView based on the new frame.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.62.15 Properties

37.62.16 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The color of the receiver's background.
Notes: (Read and Write computed property)

37.62.17 copiesOnScroll as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver copies rendered images while scrolling.
Notes: If true, the receiver copies the existing rendered image to its new location while scrolling and only draws exposed portions of its document view. If false, the receiver always forces its document view to draw itself on scrolling.
(Read and Write computed property)

37.62.18 documentCursor as Variant

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The cursor object used over the receiver.
Notes: Value is an NSCursorMBS object.
(Read and Write computed property)

37.62.19 documentView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The document view.
Notes: Gets or sets the receiver's document view. On set removes any previous document view, and sets

the origin of the receiver's bounds rectangle to the origin of the new view's frame rectangle.

If the receiver is contained in an NSScrollView, you should set the NSScrollView DocumentView instead, so it can perform whatever updating it needs.

In the process of setting the document view, this method registers the receiver for the notifications NSViewFrameDidChangeNotification and NSViewBoundsDidChangeNotification, adjusts the key view loop to include the new document view, and updates a parent NSScrollView's display if needed using reflectScrolledClipView.
(Read and Write computed property)

37.62.20 drawsBackground as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver draws its background color.
Notes: If your NSClipView is enclosed in an NSScrollView, you should set the DrawsBackground on the NSScrollView.
(Read and Write computed property)

37.62.21 Constants

Findbar position constants.

Constant	Value	Description
NSClipViewFindBarPositionAboveContent	1	The find bar is displayed above the scroll view content. Available in Mac OS X v10.7 and later.
NSClipViewFindBarPositionAboveHorizontalRuler	0	The find bar is displayed above the horizontal ruler, if visibl Available in Mac OS X v10.7 and later.
NSClipViewFindBarPositionBelowContent	2	The find bar is displayed below the scroll view content. Available in Mac OS X v10.7 and later.

Elasticity behavior constants.

Constant	Value	Description
NSScrollElasticityAllowed	2	Allow content to be scrolled past its bounds on this axis in an elastic fashion. Available in Mac OS X v10.7 and later.
NSScrollElasticityAutomatic	0	Automatically determine whether to allow elasticity on this axis. Available in Mac OS X v10.7 and later.
NSScrollElasticityNone	1	Disallow scrolling beyond document bounds on this axis. Available in Mac OS X v10.7 and later.

37.63 control NSComboBoxControlMBS

37.63.1 control NSComboBoxControlMBS

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSComboBox.
Notes: This control embeds a special NSComboBox subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

37.63.2 Properties

37.63.3 View as NSComboBoxMBS

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.63.4 Events

37.63.5 Action

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: The action event run, when e.g. return key is pressed.

37.63.6 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.63.7 Close

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

37.63.8 Closing

Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.63.9 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.63.10 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.63.11 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.63.12 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

37.63.13 FocusLost

Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.63.14 FocusReceived

Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.63.15 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.63.16 GotFocus

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

37.63.17 LostFocus

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.63.18 MenuBarSelected

Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.63.19 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.63.20 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.63.21 MouseUp(x As Integer, y As Integer)

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.63.22 Open

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

37.63.23 Opening

Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.63.24 ScaleFactorChanged(NewFactor as double)

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.63.25 SelectionDidChange

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the pop-up list selection has finished changing.

37.63.26 SelectionIsChanging

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the pop-up list selection is changing.

37.63.27 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text begins an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

37.63.28 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: Sent when the text in the receiving control changes.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

37.63.29 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text ends an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

37.63.30 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.63.31 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.63.32 WillDismiss

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the pop-up list is about to be dismissed.

37.63.33 WillPopUp

MBS MacControls Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop only.

Function: Informs you that the pop-up list is about to be displayed.

37.63.34 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.64 class NSComboBoxMBS

37.64.1 class NSComboBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The ComboBox control from Cocoa.
Example:

```
// This example needs a window with ComboBox1.
// add items to a Xojo combo box via Cocoa and select the first one
Var c As NSComboBoxMBS = ComboBox1.NSComboBoxMBS

c.addItemWithObjectValue "Apple"
c.addItemWithObjectValue "Banana"
c.addItemWithObjectValue "Cherry"
c.selectItemAtIndex 0
c.completes = True // autocomplete while typing
c.numberOfVisibleItems = 5

MessageBox c.numberOfItems.ToString + " items"
```

Notes: An NSComboBox is a kind of NSControl that allows you to either enter text directly (as you would with an NSTextField) or click the attached arrow at the right of the combo box and select from a displayed ("pop-up") list of items.
Subclass of the NSTextFieldMBS class.

37.64.2 Methods

37.64.3 addItemWithObjectValue(value as Variant)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Adds an object to the end of the receiver's internal item list.
Notes: anObject: The object to add to the internal item list.

This method logs a warning if usesDataSource returns true.

37.64.4 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new button with size 100/100 and position 0/0

Example:

```
Var t as new NSComboBoxMBS(0, 0, 100, 20)
```

Notes: On success the handle property is not zero.
See also:

- 37.64.5 Constructor(Handle as Integer) 7333
- 37.64.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7333

37.64.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSComboBox handle.
Example:

```
Var t as new NSComboBoxMBS(0, 0, 100, 100)
Var v as new NSComboBoxMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSComboBox and the plugin retains this handle.
See also:

- 37.64.4 Constructor 7332
- 37.64.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7333

37.64.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new combo box with the given size and position.
Example:

```
Var left,top,width,height as Integer
// define rectangle
Var x as new NSComboBoxMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:

- 37.64.4 Constructor 7332
- 37.64.5 Constructor(Handle as Integer) 7333

37.64.7 deselectItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Deselects the pop-up list item at the specified index if it's selected.
Notes: index: The index of the item to deselect.

If the selection does in fact change, this method posts an NSComboBoxSelectionDidChangeNotification to the default notification center.

37.64.8 indexOfItemWithObjectValue(value as Variant) as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Searches the receiver's internal item list for the specified object and returns the lowest matching index.
Notes: anObject: The object for which to return the index.

Returns the lowest index in the internal item list whose corresponding value is equal to that of the specified object. Objects are considered equal if they have the same id or if isEqual returns true.

If none of the objects in the receiver's internal item list are equal to anObject, indexOfItemWithObjectValue returns NSNotFound (-1).

This method logs a warning if usesDataSource returns true.

37.64.9 indexOfSelectedItem as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the last item selected from the pop-up list.
Notes: Returns the index of the last item selected from the receiver's pop-up list or -1 if no item is selected.

Note that nothing is initially selected in a newly initialized combo box.

37.64.10 noteNumberOfItemsChanged

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the number of items in its data source has changed.

Notes: This method allows the receiver to update the scrollers in its displayed pop-up list without actually reloading data into the receiver. It is particularly useful for a data source that continually receives data in the background over a period of time, in which case the NSComboBox can remain responsive to the user while the data is received.

See the NSComboBoxDataSource informal protocol specification for information on the messages an NSComboBox sends to its data source.

37.64.11 numberOfItems as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the total number of items in the pop-up list.

37.64.12 reloadData

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Marks the receiver as needing redisplay, so that it will reload the data for visible pop-up items and draw the new values.

37.64.13 removeAllItems

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Removes all items from the receiver's internal item list.
Notes: This method logs a warning if usesDataSource returns true.

37.64.14 removeItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Removes the object at the specified location from the receiver's internal item list.
Notes: index: The index of the object to remove. All items beyond index are moved up one slot to fill the gap.

The removed object receives a release message. This method raises an NSRangeException if index is beyond the end of the list and logs a warning if usesDataSource returns true.

37.64.15 removeItemWithObjectValue(value as Variant)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Removes all occurrences of the given object from the receiver's internal item list.
Notes: anObject: The object to remove from the internal item list. Objects are considered equal if they have the same id or if isEqual: returns true.

This method logs a warning if usesDataSource returns true.

37.64.16 scrollItemAtIndexToTop(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Scrolls the receiver's pop-up list vertically so that the item at the specified index is as close to the top as possible.
Notes: index: The index of the item to scroll to the top.

The pop-up list need not be displayed at the time this method is invoked.

37.64.17 scrollItemAtIndexToVisible(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Scrolls the receiver's pop-up list vertically so that the item at the specified index is visible.
Notes: index: The index of the item to make visible.

The pop-up list need not be displayed at the time this method is invoked.

37.64.18 selectItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the pop-up list row at the given index.
Notes: index: The index of the item to select in the pop-up list.

Posts an NSComboBoxSelectionDidChangeNotification to the default notification center if the selection does in fact change. Note that this method does not alter the contents of the combo box's text field—see Setting the Combo Box's Value for more information.

37.64.19 selectItemWithObjectValue(value as Variant)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the first pop-up list item that corresponds to the given object.
Notes: anObject: The object to select in the pop-up list. Objects are considered equal if they have the same id or if isEqual: returns true.

This method logs a warning if usesDataSource returns true. Posts an NSComboBoxSelectionDidChangeNotification to the default notification center if the selection does in fact change. Note that this method doesn't alter the contents of the combo box's text field—see Setting the Combo Box's Value for more information.

37.64.20 Properties

37.64.21 completes as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether the receiver tries to complete what the user types in the text field.
Notes: Returns true if the receiver tries to complete what the user types in the text field; otherwise false.
(Read and Write computed property)

37.64.22 hasVerticalScroller as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether the receiver will display a vertical scroller.
Notes: Returns true if the receiver will display a vertical scroller; otherwise false.

Note that the scroller will be displayed even if the pop-up list contains fewer items than will fit in the area specified for display.
(Read and Write computed property)

37.64.23 intercellSpacing as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the horizontal and vertical spacing between cells in the receiver's pop-up list.
Notes: Returns the space between cells in the pop-up list. The default spacing is (3.0, 2.0).
(Read and Write computed property)

37.64.24 isButtonBordered as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the combo box button is set to display a border.
Notes: True if the button has a border; otherwise false.
Available in Mac OS X v10.3 and later
(Read and Write computed property)

37.64.25 itemHeight as Double

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the height of each item in the receiver's pop-up list.
Notes: The default item height is 16.0.
(Read and Write computed property)

37.64.26 numberOfVisibleItems as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the maximum number of items visible in the pop-up list.
Notes: The maximum number of items visible at any one time in the pop-up list.
(Read and Write computed property)

37.64.27 usesDataSource as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver uses an external data source to populate its pop-up list.
Notes: True if the receiver uses an external data source to populate the receiver's pop-up list, false if it uses an internal item list.
(Read and Write computed property)

37.65 class NSControlMBS

37.65.1 class NSControlMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop & iOS.

Function: The Cocoa class for a NSControl.
Example:

```
// This example needs a window with Button1.
// use a smaller control size and a bold font for a button
Var c As NSControlMBS = Button1.NSButtonMBS
c.controlSize = 1 // NSControlSizeSmall
c.font = NSFontMBS.boldSystemFontOfSize(11)
c.sizeToFit
MessageBox "Title: " + c.stringValue + ", enabled: " + c.isEnabled.ToString
```

Notes: You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

37.65.2 Methods

37.65.3 abortEditing as Boolean

MBS MacCocoa Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Terminates the current editing operation and discards any edited text.
Notes: Returns true if there was a field editor associated with the control; otherwise, false.

If there was a field editor, this method removes the field editor,Äôs delegate.
Because the control discards any edits, it doesn,Äôt call controlTextDidEndEditing.

37.65.4 calcSize

MBS MacCocoa Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Recomputes any internal sizing information for the receiver, if necessary.
Notes: This method uses the calcDrawInfo method of its cell to perform the calculations. Most controls maintain a flag that informs them if any of their cells have been modified in such a way that the location or size of the cell should be recomputed. If such a modification happens, this method is automatically invoked before the control is displayed. You should never need to invoke it yourself.

37.65.5 ConnectActionEvent

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Connects the action event.
Notes: If you want to use addhandler with this class and the action event, you need to call ConnectActionEvent after addhandler to actually have the plugin put things in place for handling the event.

37.65.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with size 100/100 and position 0/0
Example:

```
Var t as new NSControlMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.65.7 Constructor(Handle as Integer) 7341
- 37.65.8 Constructor(left as Double, top as Double, width as Double, height as Double) 7341

37.65.7 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSControl handle.
Example:

```
Var t as new NSControlMBS(0, 0, 100, 100)
Var v as new NSControlMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSControl and the plugin retains this handle.
See also:

- 37.65.6 Constructor 7340
- 37.65.8 Constructor(left as Double, top as Double, width as Double, height as Double) 7341

37.65.8 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with the given size and position.
Example:

```
Var x as new NSControlMBS(0, 0, 100, 20)
```

Notes: On success the handle property is not zero.
See also:

- 37.65.6 Constructor 7340
- 37.65.7 Constructor(Handle as Integer) 7341

37.65.9 Destructor

MBS MacCocoa Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The destructor.

37.65.10 EnableEvents

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: Enables events after you assigned methods to them with AddHandler.

37.65.11 performClick

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Simulates a single mouse click on the receiver.
Notes: This method calls the performClick method of the receiver's cell. This method raises an exception if the action message cannot be successfully sent.

37.65.12 selectCell(Cell as NSCellMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Selects the specified cell and redraws the control as needed.
Notes: Cell: The cell to select. The cell must belong to the receiver.

If the cell is already selected (or does not belong to the receiver), this method does nothing. If the cell belongs to the receiver and is not selected, this method changes its state to NSOnState and redraws the cell.

37.65.13 sendAction

MBS MacCocoa Plugin, Plugin Version: 24.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Raises the action event.
Notes: We call action selector on the target object.

37.65.14 setNeedsDisplay

MBS MacCocoa Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Marks the receiver as needing redisplay (assuming automatic display is enabled).
Notes: This method also recalculates the dimensions of the control as needed.

37.65.15 sizeToFit

MBS MacCocoa Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Resizes the receiver's frame so that it is the minimum size needed to contain its cell.
Notes: If you want a multiple-cell custom subclass of NSControl to size itself to fit its cells, you must override this method. This method neither redisplays the receiver nor marks it as needing display. You must do this yourself with either thedisplay or setNeedsDisplay method.

37.65.16 validateEditing

MBS MacCocoa Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Validates changes to any user-typed text.
Notes: Validation sets the object value of the cell to the current contents of the cell's editor (the NSText object used for editing), storing it as a simple string or an attributed string object based on the attributes of the editor.

37.65.17 Properties

37.65.18 ActionSelector as String

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the selector.
Notes: The new action-message selector to associate with the receiver's cell. Specify NULL to prevent action messages from being sent to the receiver's target.
(Read and Write property)

37.65.19 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: The alignment mode of the text in the view's cell.
Example:

```
Var n as NSControlMBS // your control
n.alignment=3
```

Notes: One of the following constants: NSLeftTextAlignment, NSRightTextAlignment,NSCenterTextAlignment, NSJustifiedTextAlignment, or NSNaturalTextAlignment. The default value is NSNaturalTextAlignment.

Constants:

NSLeftTextAlignment = 0
Text is visually left aligned.

NSRightTextAlignment = 1
Text is visually right aligned.

NSCenterTextAlignment = 2
Text is visually center aligned.

NSJustifiedTextAlignment = 3
Text is justified.

NSNaturalTextAlignment = 4
Use the natural alignment of the text's script.
(Read and Write property)

37.65.20 attributedStringValue as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: The value of the view's cell as an attributed string.
Notes: The value of the cell interpreted as an attributed string, or an empty attributed string if the receiver has no cell.

If the control contains many cells (for example, NSMatrix), then the value of the currently selected cell is returned. If the control is in the process of editing the affected cell, then it invokes the validateEditing method before extracting and returning the value.
(Read and Write property)

37.65.21 baseWritingDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The initial writing direction used to determine the actual writing direction for text.
Notes: One of the following values: NSWritingDirectionNatural, NSWritingDirectionLeftToRight, or NSWritingDirectionRightToLeft. The default value is NSWritingDirectionNatural.

The Text system uses this value as a hint for calculating the actual direction for displaying Unicode charac-

ters. You should not need to call this method directly.
(Read and Write property)

37.65.22 cell as Variant

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The receiver's cell object.
Notes: Cocoa controls often have a frame control and inside a Cell which implements the raw functionality. This way you can for example have a table which embeds such cell controls inside the table cells.

Use this method with great care as it can irrevocably damage the affected control; specifically, you should only use this method in initializers for subclasses of NSControl.
(Read and Write property)

37.65.23 controlSize as Integer

MBS MacCocoa Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The size of the cell.
Notes: Use this property to change the rendered size of the cell and its control.

Changing the cell,Äôs control size does not change the font used by the cell. Use the systemFontSize class method of NSFontMBS to obtain an appropriate font based on the new control size.

If you set this property for Xojo's controls, you may need to set it again in Resized events as it may reset to the default.

Use constants:

ControlSizeRegular	0	Regular
ControlSizeSmall	1	Small size
ControlSizeMini	2	Mini size
ControlSizeLarge	3	Large size

(Read and Write property)

37.65.24 currentEditor as Variant

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Returns the current field editor for the control.
Notes: Returns the field editor for the current control, or nil if the receiver does not have a field editor.

When the receiver is a control displaying editable text (for example, a text field) and it is the first responder, it has a field editor, which is returned by this method. The field editor is a single NSTextView object that is shared among all the controls in a window for light text-editing needs. It is automatically instantiated when needed.
(Read only property)

37.65.25 doubleValue as Double

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The double value of the control.
Notes: (Read and Write property)

37.65.26 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: The font used to draw text in the receiver's cell.
Notes: f the cell is being edited, the text in the cell is redrawn in the new font, and the cell's editor (the NSText object used globally for editing) is updated with the new font object.
(Read and Write property)

37.65.27 ignoresMultiClick as boolean

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver ignores multiple clicks made in rapid succession.
Example:

```
Var n as NSControlMBS // your control
n.ignoresMultiClick=True
```

Notes: True if the view ignores multiple clicks; otherwise, false.
(Read and Write property)

37.65.28 integerValue as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The value of the receiver's cell as an Integer value.
Notes: If the control contains many cells (for example, NSMatrix), then the value of the currently selected cell is returned. If the control is in the process of editing the affected cell, then it invokes the validateEditing method before extracting and returning the value.

Available in OS X v10.5 and later.
(Read and Write property)

37.65.29 intValue as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The integer value of the control.
Example:

```
Var n as new nsbuttonMBS(0,0,100,100)

n.intValue=1
MessageBox str(n.intValue) // shows 1
n.intValue=0
MessageBox str(n.intValue) // shows 0
```

Notes: (Read and Write property)

37.65.30 isContinuous as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver's cell sends its action message continuously to its target during mouse tracking.
Notes: True if the action message should be sent continuously; otherwise, false.
(Read and Write property)

37.65.31 isEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop & iOS.

Function: Whether the receiver reacts to mouse events.

Notes: True if the view responds to mouse events; otherwise, false.
(Read and Write property)

37.65.32 isHighlighted as Boolean

MBS MacCocoa Plugin, Plugin Version: 25.3, Platform: iOS, Targets: Desktop & iOS.

Function: A Boolean value indicating whether the control draws a highlight.
Notes: When the value of this property is true, the control draws a highlight; otherwise, the control doesn,Äôt draw a highlight. Controls automatically set and clear this state in response to appropriate touch events. You can change the value of this property as needed to apply or remove a highlight programmatically The default value of this property is false for a newly created control. You can set a control,Äôs initial selected state in your storyboard file.
(Read and Write property)

37.65.33 isSelected as Boolean

MBS MacCocoa Plugin, Plugin Version: 25.3, Platform: iOS, Targets: iOS only.

Function: A Boolean value indicating whether the control is in the selected state.
Notes: Set the value of this property to true to select it or false to deselect it. Most controls don,Äôt modify their appearance or behavior when selected, but some do. For example, the UISegmentedControl class tracks whether a segment is selected and draws it differently when it is.
The default value of this property is false for a newly created control. You can set a control,Äôs initial selected state in your storyboard file.
(Read and Write property)

37.65.34 refusesFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver refuses the first responder role.
Notes: By default, the user can advance the focus of keyboard events between controls by pressing the Tab key; when this focus—or first responder status—is indicated for a control (by the insertion point or, for nontext controls, a faint rectangle), the user can activate the control by pressing the Space bar.
(Read and Write property)

37.65.35 selectedCell as NSCellMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's selected cell.
Notes: The default implementation of this method simply returns the control's associated cell (or nil if no cell has been set). Subclasses of NSControl that manage multiple cells (such as NSMatrix and NSForm) must override this method to return the cell selected by the user.
(Read only property)

37.65.36 selectedTag as Integer

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: The tag of the views's selected cell.
Notes: (Read only property)

37.65.37 stringValue as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The string value of the control.
Notes: (Read and Write property)

37.65.38 tag as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The tag identifying the object.
Notes: You can set this property to the value you need.
(Read and Write property)

37.65.39 Events

37.65.40 Action

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop & iOS.

Function: The control's action was triggered.
Notes: For a button if it was pressed.

37.65.41 TextDidBeginEditing(fieldEditor as Variant, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop & iOS.

Function: Sent when a control with editable text begins an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

See TextDidEndEditing for an explanation of why you may not always get one invocation of TextDidBeginEditing for each invocation of TextDidEndEditing.

37.65.42 TextDidChange(fieldEditor as Variant, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop & iOS.

Function: Sent when the text in the receiving control changes.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

37.65.43 TextDidEndEditing(fieldEditor as Variant, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop & iOS.

Function: Sent when a control with editable text ends an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

Warning: In some cases, such as when editing within an instance of NSOutlineView, this method may be invoked without a previous invocation of TextDidBeginEditing. You will only get the TextDidBeginEditing: notification if the user actually types something, but you can get the TextDidEndEditing notification if the user just double-clicks the field and then clicks outside the field, without typing.

37.65.44 textShouldBeginEditing(fieldEditor as Variant) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop & iOS.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.65.45 textShouldEndEditing(fieldEditor as Variant) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop & iOS.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.65.46 Constants

Control Sizes

Constant	Value	Description
ControlSizeExtraLarge	4	A extra size larger than the default control size. For macOS 26 or newer. A control version that is substantially sized. The largest control size. Resolves to ControlSizeLarge on platforms other than visionOS.
ControlSizeLarge	3	A size larger than the default control size.
ControlSizeMini	2	The smallest control size.
ControlSizeRegular	0	The default control size.
ControlSizeSmall	1	A size smaller than the default control size. This constant is for controls that can,Äôt be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. Use a small system font with a small control.

37.66 control NSDatePickerControlMBS

37.66.1 control NSDatePickerControlMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The control to put a Mac OS X date picker on a Xojo window.
Notes: This control embeds a special NSDatePicker subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.
Blog Entries

- MBS Xojo Plugins, version 19.2pr1
- MBS Xojo / Real Studio Plugins, version 15.0pr7

37.66.2 Properties

37.66.3 AcceptTabs as Boolean

MBS MacControls Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes: If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

37.66.4 View as NSDatePickerMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The reference to the underlaying NSDatePicker.
Notes: (Read only property)

37.66.5 Events

37.66.6 Action

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when user clicks on a date/time and changes something.

37.66.7 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.66.8 Close

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

37.66.9 Closing

Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.66.10 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.66.11 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or

false to give others a chance.

37.66.12 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.66.13 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

37.66.14 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.66.15 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.66.16 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.66.17 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

37.66.18 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.66.19 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.66.20 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.66.21 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.66.22 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.66.23 Open

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

37.66.24 Opening

Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.66.25 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.66.26 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.67 class NSDatePickerMBS

37.67.1 class NSDatePickerMBS

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The plugin class for a Cocoa date picker.
Example:

```
// This example needs a window with DateTimePicker1.
// show a graphical calendar and limit the range to the next 30 days
Var d As NSDatePickerMBS = DateTimePicker1.NSDatePickerMBS

d.datePickerStyle = NSDatePickerMBS.NSClockAndCalendarDatePickerStyle
d.datePickerElements = NSDatePickerMBS.NSYearMonthDayDatePickerElementFlag
d.minDateTime = DateTime.Now
d.maxDateTime = DateTime.Now.AddInterval(0, 0, 30)
```

Notes: NSDatePicker is a subclass of NSControl that provides a user interface for displaying and editing an NSDate object.
Subclass of the NSControlMBS class.

- Adding NSDatePickerMBS class.

37.67.2 Methods

37.67.3 Constructor

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new date picker with size 100/100 and position 0/0
Example:

```
Var t as new NSDatePickerMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.67.4 Constructor(Handle as Integer) 7359
- 37.67.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7359

37.67.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSDatePicker handle.
Example:

```
Var t as new NSDatePickerMBS(0, 0, 100, 100)
Var v as new NSDatePickerMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSDatePicker and the plugin retains this handle.
See also:

- 37.67.3 Constructor 7358
- 37.67.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7359

37.67.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new date picker with the given size and position.
Example:

```
Var x as new NSDatePickerMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.67.3 Constructor 7358
- 37.67.4 Constructor(Handle as Integer) 7359

37.67.6 Properties

37.67.7 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The background color.
Notes: See also drawsBackground property.
(Read and Write property)

37.67.8 Bezeled as Boolean

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver has a bezeled border.
Notes: True if the receiver has a bezeled border, false otherwise.
(Read and Write property)

37.67.9 Bordered as Boolean

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver has a plain border.
Notes: True if the receiver has a plain border, false otherwise.
(Read and Write property)

37.67.10 calendar as NSCalendarMBS

MBS MacControls Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The calendar.
Notes: (Read and Write property)

37.67.11 datePickerElements as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: A bitmask that indicates which visual elements of the date picker are currently shown, and which won't be usable because they are hidden.
Notes: (Read and Write property)

37.67.12 datePickerMode as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The date picker mode.
Notes: (Read and Write property)

37.67.13 datePickerStyle as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The date picker style.
Notes: (Read and Write property)

37.67.14 dateTimeValue as dateTime

MBS MacControls Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The current date value.
Notes: (Read and Write property)

37.67.15 dateValue as date

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The current date value.
Notes: For a range of dates, this is start date and you use timeInterval to get the second one.
(Read and Write property)

37.67.16 drawsBackground as Boolean

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver draws the background.
Notes: True if the receiver draws the background, false otherwise.
(Read and Write property)

37.67.17 locale as NSLocaleMBS

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The locale.
Notes: (Read and Write property)

37.67.18 maxDate as date

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The maximum date.
Notes: nil indicates no maximum date.
(Read and Write property)

37.67.19 maxDateTime as dateTime

MBS MacControls Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The maximum date.
Notes: nil indicates no maximum date.
(Read and Write property)

37.67.20 minDate as date

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The minimum date.
Notes: nil indicates no minimum date.
(Read and Write property)

37.67.21 minDateTime as dateTime

MBS MacControls Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The minimum date.
Notes: nil indicates no minimum date.
(Read and Write property)

37.67.22 textColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The text color.
Notes: (Read and Write property)

37.67.23 timeInterval as Double

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The time interval that represents the date range.
Notes: The time interval that represents the receiver's date range. The date range begins at the date returned by dateValue. This method returns 0 when the receiver is not in the NSRangeDateMode mode. (Read and Write property)

37.67.24 timeZone as NSTimeZoneMBS

MBS MacControls Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The time zone.
Notes: (Read and Write property)

37.67.25 Constants

Date Picker Style Constants

Constant	Value	Description
NSClockAndCalendarDatePickerStyle	1	Provide a visual clock and calendar style interface.
NSTextFieldAndStepperDatePickerStyle	0	Provide a text field and stepper style interface.
NSTextFieldDatePickerStyle	2	Provide a text field interface.

Element Flag Constants

Constant	Value	Description
NSEraDatePickerElementFlag	&h100	Display and allow editing of the era of the date, if applicable. This flag has been declared for possible future use, and does not effect.
NSHourMinuteDatePickerElementFlag	&hC	Display and allow editing of the hour and minute elements of th
NSHourMinuteSecondDatePickerElementFlag	&hE	Display and allow editing of the hour, minute and second elemen
NSTimeZoneDatePickerElementFlag	&h10	Display and allow editing of the time zone. This flag has been declared for possible future use, and does not effect.
NSYearMonthDatePickerElementFlag	&hC0	Display and allow editing of the year and month elements of the
NSYearMonthDayDatePickerElementFlag	&hE0	Display and allow editing of the year, month and day elements o

Date Picker Mode Constants

Constant	Value	Description
NSRangeDateMode	1	Allow selection of a range of dates. (First implemented in Mac OS X v 10.5.)
NSSingleDateMode	0	Allow selection of a single date.

37.68 class NSImageCellMBS

37.68.1 class NSImageCellMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: An NSImageCell object displays a single image (encapsulated in an NSImage object) in a frame.
Example:

```
// show an image with a gray bezel frame, scaled to fit
Var view As New NSImageViewMBS(20, 20, 128, 128)
view.image = NSImageMBS.imageNamed(NSImageMBS.NSImageNameComputer)

Var cell As NSImageCellMBS = view.cell
cell.imageFrameStyle = NSImageCellMBS.NSImageFrameGrayBezel
cell.imageScaling = NSImageCellMBS.NSImageScaleProportionallyUpOrDown
cell.imageAlignment = NSImageCellMBS.NSImageAlignCenter
Self.NSWindowMBS.contentView.addSubview view
```

Notes: This class provides methods for choosing the frame and for aligning and scaling the image to fit the frame.

The object value of an NSImageCell object must be an NSImage object, so if you use the setObjectValue: method of NSCell, be sure to supply an NSImage object as an argument. Because an NSImage object does not need to be converted for display, do not use the NSCell methods relating to formatters.

An NSImageCellMBS object is usually associated with some kind of control object—an NSImageViewMBS, an NSMatrix, or an NSTableViewMBS.
Subclass of the NSCellMBS class.
Blog Entries

- MBS Xojo Plugins, version 21.2pr1

37.68.2 Methods

37.68.3 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with an image.
Example:

```
Var pic as Picture = LogoMBS(500)
Var n as NSImageMBS = new NSImageMBS(pic)
Var c as new NSImageCellMBS(n)
```

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath

See also:

- 37.68.4 Constructor(text as string) 7365

37.68.4 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with a text.
Example:

```
Var c as new NSImageCellMBS("Hello")
MessageBox c.StringValue
```

See also:

- 37.68.3 Constructor(image as NSImageMBS) 7364

37.68.5 Properties

37.68.6 imageAlignment as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The alignment of the receiver's image relative to its frame.
Notes: For a list of possible values, see NSImageAlign* constants. The default value is NSImageAlignCenter.
(Read and Write property)

37.68.7 imageFrameStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The style of the frame that borders the image.
Notes: Value is one of the frame style constants. For a list of frame styles, see NSImageFrame* constants.
(Read and Write property)

37.68.8 imageScaling as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The scaling mode used to fit the receiver's image into the frame.
Notes: Value is one of the image scaling constants. For a list of possible values, see NSScale* constants.
(Read and Write property)

37.68.9 Constants

Constants

Constant	Value	Description
NSImageAlignBottom	5	One of the constants to specify the location of the image in the frame using the imageAlignment property. Align the image with the bottom edge of the cell.
NSImageAlignBottomLeft	6	One of the constants to specify the location of the image in the frame using the imageAlignment property. Align the image with the bottom and left edges of the cell.
NSImageAlignBottomRight	7	One of the constants to specify the location of the image in the frame using the imageAlignment property. Align the image with the bottom and right edges of the cell.
NSImageAlignCenter	0	One of the constants to specify the location of the image in the frame using the imageAlignment property. Center the image in the cell.
NSImageAlignLeft	4	One of the constants to specify the location of the image in the frame using the imageAlignment property. Align the image with the left edge of the cell.
NSImageAlignRight	8	One of the constants to specify the location of the image in the frame using the imageAlignment property. Position the image along the right edge of the cell.
NSImageAlignTop	1	One of the constants to specify the location of the image in the frame using the imageAlignment property. Position the image along the top edge of the cell.
NSImageAlignTopLeft	2	One of the constants to specify the location of the image in the frame using the imageAlignment property. Align the image with the top and left edges of the cell.
NSImageAlignTopRight	3	One of the constants to specify the location of the image in the frame using the imageAlignment property. Align the image with the top and right edges of the cell.
NSImageFrameButton	4	One of the frame constants for the imageFrameStyle property. A convex bezel that makes the image stand out in relief, like a button
NSImageFrameGrayBezel	2	One of the frame constants for the imageFrameStyle property. A gray, concave bezel that makes the image look sunken
NSImageFrameGroove	3	One of the frame constants for the imageFrameStyle property. A thin groove that looks etched around the image
NSImageFrameNone	0	One of the frame constants for the imageFrameStyle property. An invisible frame
NSImageFramePhoto	1	One of the frame constants for the imageFrameStyle property. A thin black outline and a dropped shadow

Scale Methods

Constant	Value	Description
NSImageScaleAxesIndependently	1	Scale each dimension to exactly fit destination. This setting does not p the aspect ratio of the image.
NSImageScaleNone	2	Do not scale the image.
NSImageScaleProportionallyDown	0	If it is too large for the destination, scale the image down while preserv aspect ratio.
NSImageScaleProportionallyUpOrDown	3	Scale the image to its maximum possible dimensions while both staying the destination area and preserving its aspect ratio.
NSScaleNone	2	Do not scale the image.
NSScaleProportionally	0	If it is too large for the destination, scale the image down while preserv aspect ratio.
NSScaleToFit	1	Scale each dimension to exactly fit destination. This setting does not p the aspect ratio of the image.

37.69 class NSImageViewMBS

37.69.1 class NSImageViewMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: An NSImageView object displays a single image from an NSImage object in a frame and can optionally allow a user to drag an image to it.
Example:

```
// This example needs a window with ImageWell1.
ImageWell1.NSImageViewMBS.alphaValue = 0.5
```

Notes: You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSControlMBS class.

37.69.2 Methods

37.69.3 addSymbolEffect(symbolEffect as NSSymbolEffectMBS)

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Adds a symbol effect to the image view with default options and animation.
Example:

```
// This example needs a window with ImageViewer1.
Var n As NSImageMBS = NSImageMBS.imageWithSystemSymbolName("globe")

Var iv As NSImageViewMBS = ImageViewer1.NSImageViewMBS
iv.Image = n
```

iv.addSymbolEffect NSSymbolVariableColorEffectMBS.effect.effectWithReversing

See also:

- 37.69.4 addSymbolEffect(symbolEffect as NSSymbolEffectMBS, options as NSSymbolEffectOptionsMBS) 7370
- 37.69.5 addSymbolEffect(symbolEffect as NSSymbolEffectMBS, options as NSSymbolEffectOptionsMBS, animated as boolean) 7370

37.69.4 addSymbolEffect(symbolEffect as NSSymbolEffectMBS, options as NSSymbolEffectOptionsMBS)

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Adds a symbol effect to the image view with specified options and default animation.
See also:

- 37.69.3 addSymbolEffect(symbolEffect as NSSymbolEffectMBS) 7369
- 37.69.5 addSymbolEffect(symbolEffect as NSSymbolEffectMBS, options as NSSymbolEffectOptionsMBS, animated as boolean) 7370

37.69.5 addSymbolEffect(symbolEffect as NSSymbolEffectMBS, options as NSSymbolEffectOptionsMBS, animated as boolean)

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Adds a symbol effect to the image view with specified options and animation.
See also:

- 37.69.3 addSymbolEffect(symbolEffect as NSSymbolEffectMBS) 7369
- 37.69.4 addSymbolEffect(symbolEffect as NSSymbolEffectMBS, options as NSSymbolEffectOptionsMBS) 7370

37.69.6 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new imageview with size 100/100 and position 0/0
Example:

```
Var t as new NSImageViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.69.7 Constructor(Handle as Integer) 7371
- 37.69.8 Constructor(left as Double, top as Double, width as Double, height as Double) 7371

37.69.7 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSImageView handle.
Example:

```
Var t as new NSImageViewMBS(0, 0, 100, 100)
Var v as new NSImageViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSImageView and the plugin retains this handle.
See also:

- 37.69.6 Constructor 7370
- 37.69.8 Constructor(left as Double, top as Double, width as Double, height as Double) 7371

37.69.8 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new image view with the given size and position.
Example:

```
Var x as new NSImageViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.69.6 Constructor 7370
- 37.69.7 Constructor(Handle as Integer) 7371

37.69.9 imageViewWithImage(Image as NSImageMBS) as NSImageViewMBS

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Creates a non-editable image view containing the provided image.
Notes: The image is scaled proportionally down to fit the view, and is centered within the view.

37.69.10 removeAllSymbolEffects

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Removes all symbol effects from the image view with default options and animation.
See also:

- 37.69.11 removeAllSymbolEffects(options as NSSymbolEffectOptionsMBS) 7372
- 37.69.12 removeAllSymbolEffects(options as NSSymbolEffectOptionsMBS, animated as boolean) 7372

37.69.11 removeAllSymbolEffects(options as NSSymbolEffectOptionsMBS)

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Removes all symbol effects from the image view with specified options and default animation.
See also:

- 37.69.10 removeAllSymbolEffects 7372
- 37.69.12 removeAllSymbolEffects(options as NSSymbolEffectOptionsMBS, animated as boolean) 7372

37.69.12 removeAllSymbolEffects(options as NSSymbolEffectOptionsMBS, animated as boolean)

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Removes all symbol effects from the image view with specified options and animation.
See also:

- 37.69.10 removeAllSymbolEffects 7372
- 37.69.11 removeAllSymbolEffects(options as NSSymbolEffectOptionsMBS) 7372

37.69.13 removeSymbolEffectOfType(symbolEffect as NSSymbolEffectMBS)

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Removes from the image view the symbol effect matching the type of effect passed in, with default options and animation.
See also:

- 37.69.14 removeSymbolEffectOfType(symbolEffect as NSSymbolEffectMBS, options as NSSymbolEffectOptionsMBS) 7373
- 37.69.15 removeSymbolEffectOfType(symbolEffect as NSSymbolEffectMBS, options as NSSymbolEffectOptionsMBS, animated as boolean) 7373

37.69.14 removeSymbolEffectOfType(symbolEffect as NSSymbolEffectMBS, options as NSSymbolEffectOptionsMBS)

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Removes from the image view the symbol effect matching the type of effect passed in, with specified options and default animation.
See also:

- 37.69.13 removeSymbolEffectOfType(symbolEffect as NSSymbolEffectMBS) 7372
- 37.69.15 removeSymbolEffectOfType(symbolEffect as NSSymbolEffectMBS, options as NSSymbolEffectOptionsMBS, animated as boolean) 7373

37.69.15 removeSymbolEffectOfType(symbolEffect as NSSymbolEffectMBS, options as NSSymbolEffectOptionsMBS, animated as boolean)

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Removes from the image view the symbol effect matching the type of effect passed in, with specified options and animation.
See also:

- 37.69.13 removeSymbolEffectOfType(symbolEffect as NSSymbolEffectMBS) 7372
- 37.69.14 removeSymbolEffectOfType(symbolEffect as NSSymbolEffectMBS, options as NSSymbolEffectOptionsMBS) 7373

37.69.16 setSymbolImage(image as NSImageMBS, transition as NSSymbolContentTransitionMBS)

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Sets the symbol image on the image view with a symbol content transition and default options.
Notes: Passing in a non-symbol image will result in undefined behavior.
See also:

- 37.69.17 setSymbolImage(image as NSImageMBS, transition as NSSymbolContentTransitionMBS, options as NSSymbolEffectOptionsMBS) 7374

37.69.17 setSymbolImage(image as NSImageMBS, transition as NSSymbolContentTransitionMBS, options as NSSymbolEffectOptionsMBS)

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Sets the symbol image on the image view with a symbol content transition and specified options.
Notes: Passing in a non-symbol image will result in undefined behavior.
See also:

- 37.69.16 setSymbolImage(image as NSImageMBS, transition as NSSymbolContentTransitionMBS) 7373

37.69.18 Properties

37.69.19 allowsCutCopyPaste as Boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver allows the user to cut, copy and paste the image contents.
Notes: True if the user can cut, copy, and paste the image contents; otherwise, false to prevent the use of pasteboard operations.
(Read and Write property)

37.69.20 animates as Boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver automatically plays animated images.
Notes: True if the receiver automatically plays animated images; otherwise, false. The default value is true for NSImageView objects you create programmatically. For NSImageView objects loaded from a nib file, the control takes the value set in Interface Builder.

The timing and looping characteristics of the animation are taken from the image data. If this method returns false, the receiver displays the first frame of the animation only.
(Read and Write property)

37.69.21 contentTintColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: A tint color to be used when rendering template image content.
Notes: This color may be combined with other effects to produce a theme-appropriate rendition of the template image. A nil value indicates the standard set of effects without color modification. The default value is nil.

(Read and Write property)

37.69.22 defaultPreferredImageDynamicRange as Integer

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Default preferred image dynamic range.
Notes: Defaults to 'NSImageDynamicRangeConstrainedHigh' on macOS 14 and higher, 'NSImageDynamicRangeStandard' otherwise. Set to another value to change the default for all subsequently created 'NSImageView's in your app.
(Read only property)

37.69.23 Editable as Boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the user can drag a new image into the frame.
Notes: True if the user can drag an image into the receiver's frame; otherwise, false.
(Read and Write property)

37.69.24 image as NSImageMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the NSImage object displayed by the receiver.
Notes: (Read and Write property)

37.69.25 imageAlignment as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The alignment of the receiver's image relative to its frame.
Notes: For a list of possible values, see NSImageAlign* constants. The default value is NSImageAlignCenter.
(Read and Write property)

37.69.26 imageDynamicRange as Integer

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Resolved dynamic range based on fully resolved image content.
Notes: Note: this will return 'NSImageDynamicRangeUnspecified' if the image view has not or can not resolve the content (either because it has no resolvable image content or has not resolved because the image view hasn't displayed.)
(Read only property)

37.69.27 imageFrameStyle as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The style of the frame that borders the image.
Example:

```
// load a HDR image and show it with full dynamic range

Var f As FolderItem = SpecialFolder.Desktop.Child("IMG_6052.jpeg")
var n as new NSImageMBS(f)
Var vi As NSImageViewMBS = me.NSImageViewMBS
vi.imageFrameStyle = NSImageViewMBS.NSImageFrameNone
vi.preferredImageDynamicRange = vi.NSImageDynamicRangeHigh
vi.Image = n
```

Notes: Value is one of the frame style constants. For a list of frame styles, see NSImageFrame* constants.
(Read and Write property)

37.69.28 imageScaling as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The scaling mode used to fit the receiver's image into the frame.
Example:

```
// This example needs a window with ImageWell1.
ImageWell1.NSImageViewMBS.imageScaling = NSImageViewMBS.NSScaleNone
```

Notes: Value is one of the image scaling constants. For a list of possible values, see NSScale* constants.
(Read and Write property)

37.69.29 preferredImageDynamicRange as Integer

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Preferred dynamic range when displaying an image in the receiving image view.
Example:

```
// load a HDR image and show it with full dynamic range

Var f As FolderItem = SpecialFolder.Desktop.Child("IMG_6052.jpeg")
var n as new NSImageMBS(f)
Var vi As NSImageViewMBS = me.NSImageViewMBS
vi.imageFrameStyle = NSImageViewMBS.NSImageFrameNone
vi.preferredImageDynamicRange = vi.NSImageDynamicRangeHigh
vi.Image = n
```

Notes: (Read and Write property)

37.69.30 symbolConfiguration as NSImageSymbolConfigurationMBS

MBS MacControls Plugin, Plugin Version: 25.5, Platform: macOS, Targets: Desktop only.

Function: Specifies a combination of point size, weight, and scale to use when sizing and displaying symbol images.
Notes: If a symbol configuration isn't provided, the image view uses a default size, weight, and scale provided by the system. The default value is 'nil'.
(Read and Write property)

37.69.31 Constants

Constants

Constant	Value	Description
NSImageAlignBottom	5	One of the constants to specify the location of the image in the frame using the imageAlignment property. Align the image with the bottom edge of the cell.
NSImageAlignBottomLeft	6	One of the constants to specify the location of the image in the frame using the imageAlignment property. Align the image with the bottom and left edges of the cell.
NSImageAlignBottomRight	7	One of the constants to specify the location of the image in the frame using the imageAlignment property. Align the image with the bottom and right edges of the cell.
NSImageAlignCenter	0	One of the constants to specify the location of the image in the frame using the imageAlignment property. Center the image in the cell.
NSImageAlignLeft	4	One of the constants to specify the location of the image in the frame using the imageAlignment property. Align the image with the left edge of the cell.
NSImageAlignRight	8	One of the constants to specify the location of the image in the frame using the imageAlignment property. Position the image along the right edge of the cell.
NSImageAlignTop	1	One of the constants to specify the location of the image in the frame using the imageAlignment property. Position the image along the top edge of the cell.
NSImageAlignTopLeft	2	One of the constants to specify the location of the image in the frame using the imageAlignment property. Align the image with the top and left edges of the cell.
NSImageAlignTopRight	3	One of the constants to specify the location of the image in the frame using the imageAlignment property. Align the image with the top and right edges of the cell.
NSImageFrameButton	4	One of the frame constants for the imageFrameStyle property. A convex bezel that makes the image stand out in relief, like a button
NSImageFrameGrayBezel	2	One of the frame constants for the imageFrameStyle property. A gray, concave bezel that makes the image look sunken
NSImageFrameGroove	3	One of the frame constants for the imageFrameStyle property. A thin groove that looks etched around the image
NSImageFrameNone	0	One of the frame constants for the imageFrameStyle property. An invisible frame
NSImageFramePhoto	1	One of the frame constants for the imageFrameStyle property. A thin black outline and a dropped shadow

Dynamic Range

Constant	Value	Description
NSImageDynamicRangeConstrainedHigh	1	Allow image content to use extended dynamic range if it has high range content.
NSImageDynamicRangeHigh	2	Allow constrained HDR image content. Useful when mixing HDR a content.
NSImageDynamicRangeStandard	0	Restrict the image content dynamic range to the standard range rega the actual range of the image content.
NSImageDynamicRangeUnspecified	-1	Unspecified

Scale Methods

Constant	Value	Description
NSImageScaleAxesIndependently	1	Scale each dimension to exactly fit destination. This setting does not p the aspect ratio of the image.
NSImageScaleNone	2	Do not scale the image.
NSImageScaleProportionallyDown	0	If it is too large for the destination, scale the image down while preserv aspect ratio.
NSImageScaleProportionallyUpOrDown	3	Scale the image to its maximum possible dimensions while both staying the destination area and preserving its aspect ratio.
NSScaleNone	2	Do not scale the image.
NSScaleProportionally	0	If it is too large for the destination, scale the image down while preserv aspect ratio.
NSScaleToFit	1	Scale each dimension to exactly fit destination. This setting does not p the aspect ratio of the image.

37.70 class NSMenuItemCellMBS

37.70.1 class NSMenuItemCellMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: NSMenuItemCell is a class that handles the measurement and display of a single menu item in its encompassing frame.
Notes: Instances of NSMenuItemCellMBS work in conjunction with an NSMenuViewMBS object to control the overall appearance of the menu.
Subclass of the NSButtonCellMBS class.

- MBS Xojo Plugins, version 17.1pr5

37.70.2 Methods

37.70.3 calcSize

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Calculates the minimum required width and height of the receiver,Äôs menu item.
Notes: The calculated values are cached for future use. This method also calculates the sizes of individual components of the cell,Äôs menu item and caches those values.
This method is invoked automatically when necessary. You should not need to invoke it directly.

37.70.4 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The private constructor.
Notes: Don't use it.
See also:

- 37.70.5 Constructor(text as string) 7380

37.70.5 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The constructor.
See also:

- 37.70.4 Constructor(image as NSImageMBS) 7380

37.70.6 Properties

37.70.7 menuItem as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The menu item object associated with the cell.
Notes: (Read and Write property)

37.70.8 needsDisplay as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the menu item needs to be displayed.
Notes: Set this property to true when you want the menu item to be drawn.
(Read and Write property)

37.70.9 needsSizing as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the size of the menu needs to be calculated.
Notes: When the value of this property is true, the next attempt to obtain size information about the menu cause the calcSize method to be called. When the value of the property is false, the size information is obtained from the currently cached values.
Subclasses that drastically change the way a menu item is drawn can change the value of this property to update the menu item information. Other parts of your application should not need to change this property directly. The cell checks this value of this property as necessary when the content of its menu item changes.
(Read and Write property)

37.70.10 tag as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The integer tag of the selected menu item.
Notes: If no item is selected, the value in this property is 0.
(Read and Write property)

37.71 control NSOutlineControlMBS

37.71.1 control NSOutlineControlMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The control for a NSOutlineView.
Notes: Please use NSOutlineControlMBS for hierarchical lists and NSTableControlMBS for normal lists.

37.71.2 Properties

37.71.3 AcceptTabs as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes: If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

37.71.4 allowsColumnReordering as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to rearrange columns by dragging their headers.
Notes: The default value of this property is true, which allows the user to rearrange the table view,Äôs columns. You can rearrange columns programmatically regardless of this setting.
(Read and Write property)

37.71.5 allowsColumnResizing as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to resize columns by dragging between their headers.
Notes: The default of this property is true, which allows the user to resize the table view,Äôs columns. You can resize columns programmatically regardless of this setting.
(Read and Write property)

37.71.6 allowsColumnSelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select columns by clicking their headers.
Notes: The default is false, which prevents the user from selecting columns (if you create the table view in Interface Builder, the default value is true). You can select columns programmatically regardless of this setting.
(Read and Write property)

37.71.7 allowsEmptySelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select zero columns or rows.
Notes: The default is true, which allows the user to select zero columns or rows.
(Read and Write property)

37.71.8 allowsMultipleSelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select more than one column or row at a time.
Notes: The default is false, which allows the user to select only one column or row at a time. You can select multiple columns or rows programmatically regardless of this setting.
(Read and Write property)

37.71.9 autohidesScrollers as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view automatically hides its scroll bars when they are not needed.
Notes: The horizontal and vertical scroll bars are hidden independently of each other. When the value of this property is YES and the content of the scroll view doesn't extend beyond the size of the clip view on a given axis, the scroller on that axis is removed to leave more room for the content.
(Read and Write property)

37.71.10 hasHorizontalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view has a horizontal scroller.
Notes: When the value of this property is true, the scroll view allocates and displays a horizontal scroller as needed. The default value of this property is false.
(Read and Write property)

37.71.11 hasVerticalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view has a vertical scroller.
Notes: When the value of this property is true, the scroll view allocates and displays a vertical scroller as needed. The default value of this property is false.
(Read and Write property)

37.71.12 ScrollView as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The scroll view used in this control.
Notes: (Read only property)

37.71.13 View as NSOutlineViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The outline view used in this control.
Notes: (Read only property)

See also:

- 37.71.99 view(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSViewMBS 7409

37.71.14 Events

37.71.15 acceptDrop(info as NSDraggingInfoMBS, item as NSOutlineViewItemMBS, index as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether a drop operation was successful.
Notes: info: An object that contains more information about this dragging operation.
item: The parent of the item over which the cursor was placed when the mouse button was released.
index: The index of the child of item over which the cursor was placed when the mouse button was released.

Return true if the drop operation was successful, otherwise false.

The data source should incorporate the data from the dragging pasteboard in the implementation of this method. You can get the data for the drop operation from info using the draggingPasteboard method.
The return value indicates success or failure of the drag operation to the system.

37.71.16 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.71.17 childOfItem(index as Integer, item as NSOutlineViewItemMBS) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the child item at the specified index of a given item.
Notes: index: The index of the child item from item to return.
item: An item in the data source.

Return the child item at index of item. If item is nil, returns the appropriate child item of the root object.

Children of a given parent item are accessed sequentially. In order for the collapsed state of the outline view to remain consistent when it is reloaded you must always return the same object for a specified child and item.

Do not call reloadData from this method.

This event is called very frequently, so it must be efficient.

37.71.18 Close

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

37.71.19 Closing

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.71.20 ColumnDidMove(notification as NSNotificationMBS, OldColumn as Integer, NewColumn as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked whenever the user moves a column in the outline view.

37.71.21 ColumnDidResize(notification as NSNotificationMBS, tableColumn as NSTableColumnMBS, OldWidth as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked whenever the user resizes a column in the outline view.

37.71.22 concludeDragOperation(info as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

37.71.23 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.71.24 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.71.25 dataCell(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSCellMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the cell to use in a given column for a given item.
Notes: tableColumn: The table column for which the cell is required. This value may be nil.

item: The item for which the cell is required.

Return the cell to use in column tableColumn for item item, or nil. The cell must properly implement copyWithZone (since it may be copied by by the outline view).

You can return a different data cell for any particular combination of table column and item, or a cell that will be used for the entire row (a full-width cell). If tableColumn is non-nil, you should return a cell. Typically, you should default to returning the result from [tableColumn dataCellForRow:row] .
When each row (identified by the item) is being drawn, this method is first called with a nil value for tableColumn. At this time, you can return a cell that is used to draw the entire row, acting like a group. If you do return a cell for the nil table column, your implementations of the other corresponding data source and delegate methods must be prepared to be invoked with a nil value for tableColumn. If do not return a cell for the nil table column, the method is called once for each column in the outline view, as usual.

37.71.26 didAddRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Implemented to know when a new row view is added to the table.
Notes: rowView: The new row view.
row: The row to which the view was added.

This evemt is for NSView-based outline views. At this point, you can choose to add in extra views or modify any properties on rowView.

37.71.27 didClickTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Sent at the time the mouse button subsequently goes up in outlineView and tableColumn has been ‚Äúclicked‚Äù without having been dragged anywhere.

37.71.28 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.71.29 didDragTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Sent at the time the mouse button goes up in outlineView and tableColumn has been dragged during the time the mouse button was down.

37.71.30 didRemoveRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Implemented to know when a row view is removed from the table
Notes: rowView: The row view that was removed.
row: The number of the row that was removed due to being moved offscreen, or -1 if the row was removed from the table so it is no longer valid.

The removed rowView may be reused by the table, so any additionally inserted views should be removed at this point.

37.71.31 didTile

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The tableview did tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

37.71.32 DoubleClick

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse made a double click.

37.71.33 draggingEnded(info as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

37.71.34 draggingExited(info as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

37.71.35 draggingSessionEnded(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Implement this method to know when the given dragging session has ended.
Notes: session: The dragging session that ended.
screenPoint: The point onscreen at which the drag ended.
operation: A mask specifying the types of drag operations permitted by the dragging source.

You can implement this optional delegate method to know when the dragging source operation ended at a specific location, such as the trash (by checking for an operation of NSDragOperationDelete).

37.71.36 draggingSessionWillBegin(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, draggedItems() as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Implement this method know when the given dragging session is about to begin and potentially modify the dragging session.
Notes: session: The dragging session that is about to begin.
screenPoint: The point onscreen at which the drag is to begin.
draggedItems: A array of items to be dragged, excluding items for which pasteboardWriterForItem returns nil.

The draggedItems array directly matches the pasteboard writer array used to begin the dragging session with the NSView method beginDraggingSessionWithItems. Hence, the order is deterministic, and can be used in acceptDrop when enumerating the NSDraggingInfo protocol's pasteboard classes.

37.71.37 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

37.71.38 FocusLost

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.71.39 FocusReceived

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control itself got focus.

In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.71.40 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.71.41 GotFocus

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

37.71.42 heightOfRowByItem(item as NSOutlineViewItemMBS) as Double

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the height in points of the row containing item.
Notes: item: The row item.

Return the height of the row.

Values returned by this method should not include intercell spacing and must be greater than 0.
Implement this event to support an outline view with varying row heights.

For large tables in particular, you should make sure that this method is efficient. NSOutlineView may cache the values this method returns, so if you would like to change a row's height make sure to invalidate the row height by calling noteHeightOfRowsWithIndexesChanged. NSOutlineView automatically invalidates its entire row height cache in reloadData and noteNumberOfRowsChanged.

If you call viewAtColumn or rowViewAtRow within your implementation of this method, an exception is

thrown.

To avoid the possibility of a hang due to unexpected recursion, don,Äôt call geometry-calculating methods such as bounds, rectOfColumn, or any NSTableView method that calls tile within your implementation of this method.

37.71.43 isGroupItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean that indicates whether a given row should be drawn in the ,Äúgroup row,Äù style.
Notes: item: An item in the outline view.

Return true to indicate a particular row should have the "group row" style drawn for that row, otherwise false.

If the cell in that row is an instance of NSTextFieldCell and contains only a string value, the ,Äúgroup row,Äù style attributes are automatically applied for that cell.

37.71.44 isItemExpandable(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the a given item is expandable.
Notes: item: An item in the data source.

Returns true if item can be expanded to display its children, otherwise NO.

This method may be called quite often, so it must be efficient.

Do not call reloadData from this method.

37.71.45 ItemDidCollapse(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the did collapse notification is posted—that is, whenever the user collapses an item in the outline view.

37.71.46 ItemDidExpand(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when notification is posted—that is, whenever the user expands an item in the outline view.

37.71.47 itemForPersistentObject(PersistentObject as Variant) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked by outlineView to return the item for the archived object.
Notes: object: An archived representation of an item in outlineView's data source.

Return the unarchived item corresponding to object. If the item is an archived object, this method may return the object.

When the outline view is restoring the saved expanded items, this method is called for each expanded item, to translate the archived object to an outline view item.

You must implement this method if you are automatically saving expanded items (that is, if autosaveExpandedItems returns true).

37.71.48 ItemWillCollapse(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when notification is posted—that is, whenever the user is about to collapse an item in the outline view.

37.71.49 ItemWillExpand(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when notification is posted—that is, whenever the user is about to expand an item in the outline view.

37.71.50 LeftMouseDown(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has pressed the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.71.51 LeftMouseDragged(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has moved the mouse with the left button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.71.52 LeftMouseUp(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has released the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.71.53 LostFocus

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.71.54 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.71.55 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.71.56 mouseDownInHeaderOfTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Event sent whenever the mouse button is clicked in outlineView while the cursor is in a column header tableColumn.

37.71.57 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.71.58 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.71.59 namesOfPromisedFilesDroppedAtDestination(dropDestination as folderItem, DraggedItems() as NSOutlineViewItemMBS) as string()

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns an array of filenames for the created files that the receiver promises to create.
Notes: dropDestination: The drop location where the files are created.
items: The items being dragged.

Returns an array of filenames (not full paths) for the created files that the receiver promises to create.

For more information on file promise dragging, see documentation on the NSDraggingSource protocol and namesOfPromisedFilesDroppedAtDestination.

37.71.60 nextTypeSelectMatchFromItem(startItem as NSOutlineViewItemMBS, endItem as NSOutlineViewItemMBS, searchString as String) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the first item that matches the searchString from within the range of startItem to endItem.
Notes: startItem: The first item to search.
endItem: The item before which to stop searching. It is possible for endItem to be less than startItem if the search will wrap.
searchString: The string for which to search.

Returns the first item—from within the range of startItem to endItem—that matches the searchString, or nil if there is no match.

Implement this method if you want to control how type selection works. You should include startItem as a possible match, but do not include endItem.
It is not necessary to implement this event in order to support type select.

37.71.61 numberOfChildrenOfItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the number of child items encompassed by a given item.
Notes: item: An item in the data source.

Returns the number of child items encompassed by item. If item is nil, this method should return the number of children for the top-level item.

The numberOfChildrenOfItem method is called very frequently, so it must be efficient.

Do not call reloadData from this method.

37.71.62 objectValue(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked by outlineView to return the data object associated with the specified item.
Notes: tableColumn: A column in outlineView.
item: An item in the data source in the specified tableColumn of the view.

Returns the item is located in the specified tableColumn of the view.

Do not call reloadData from this method.

37.71.63 Open

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

37.71.64 Opening

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.71.65 OtherMouseDown(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has pressed a mouse button other than the left or right one.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.71.66 OtherMouseDragged(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.71.67 OtherMouseUp(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has released a mouse button other than the left or right button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.71.68 pasteboardWriterForItem(item as NSOutlineViewItemMBS) as NSPasteboardItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Implement this method to enable the table to be an NSDraggingSource that supports dragging multiple items.
Notes: item: The item for which to return a pasteboard writer.

Returns a NSPasteboardItem object.

If this method is implemented, then writeItems is not called.

37.71.69 persistentObjectForItem(item as NSOutlineViewItemMBS) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked by outlineView to return an archived object for item.
Notes: item: The item for which to return an archived object.

Returns an archived representation of item. If the item is an archived object, this method may return the item.

When the outline view is saving the expanded items, this method is called for each expanded item, to translate the outline view item to an archived object.

You must implement this method if you are automatically saving expanded items (that is, if autosaveExpandedItems returns true).

37.71.70 RightMouseDown(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Informs the view that the user has pressed the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.71.71 RightMouseDragged(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has moved the mouse with the right button pressed .
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

37.71.72 RightMouseUp(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the user has released the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide

event from Xojo runtime.

37.71.73 rowViewForItem(item as NSOutlineViewItemMBS) as NSTableRowViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Implement this method to return a custom NSTableRowView for a particular item.
Notes: item: The item displayed by the returned table row view.

Return an instance or subclass of NSTableRowView. If nil is returned, a NSTableRowView instance is created and used.

This method, if implemented, is only invoked for NSView-based outline views.

37.71.74 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.71.75 SelectionDidChange(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the selection did change notification is posted—that is, immediately after the outline view,Äôs selection has changed.

37.71.76 selectionIndexesForProposedSelection(proposedSelectionIndexes as NSIndexSetMBS) as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the delegate to modify the proposed selection.
Notes: proposedSelectionIndexes: An index set containing the indexes of the proposed selection.
Return an NSIndexSet instance containing the indexes of the new selection. Return proposedSelectionIndexes if the proposed selection is acceptable, or the value of the table view,Äôs existing selection to avoid changing the selection.

This method may be called multiple times with one new index added to the existing selection to find out if a particular index can be selected when the user is extending the selection with the keyboard or mouse.

Implementation of this method is optional. If implemented, this method will be called instead of willDisplayOutlineCell.

If not implemented or returns nil, the plugin will return proposedSelectionIndexes.

37.71.77 SelectionIsChanging(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when notification is posted—that is, whenever the outline view,Äôs selection changes.

37.71.78 selectionShouldChangeInOutlineView as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the outline view should change its selection.
Notes: Return true to permit outlineView to change its selection (typically a row being edited), false to deny permission.

For example, if the user is editing a cell and enters an improper value, the delegate can prevent the user from selecting or editing any other cells until a proper value has been entered into the original cell. You can implement this method for complex validation of edited rows based on the values of any of their cells.

37.71.79 setObjectValue(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Set the data object for a given item in a given column.
Notes: object: The new value for the item.
tableColumn: A column in outlineView.
item: An item in the data source in the specified tableColumn of the view.

The item is located in the specified tableColumn of the view.

Do not call reloadData from this method.

37.71.80 shouldCollapseAutoExpandedItemsForDeposited(deposited as Boolean, superResult as Boolean) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether auto-expanded items should return to their original collapsed state.
Notes: deposited: If true, the drop terminated successfully; if false the drop failed.

Return true if auto-expanded items should return to their original collapsed state; otherwise false.

Implement this event to provide custom behavior. If the target of a drop is not auto-expanded (by hovering long enough) the drop target still gets expanded after a successful drop unless this method returns true. The default implementation returns false after a successful drop.
This method is called in a variety of situations. For example, it is called shortly after the acceptDrop method is called and also if the drag exits the outline view (exiting the view is treated the same as a failed drop). The return value of the acceptDrop method determines the incoming value of the deposited parameter.

37.71.81 shouldCollapseItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the outline view should collapse a given item.
Notes: item: The item that should collapse.

Return true to permit outlineView to collapse item, false to deny permission.

You can implement this method to disallow collapsing of specific items. For example, if the first row of your outline view should not be collapsed, your delegate method could contain this line of code:

return rowForItem(item) <>0

37.71.82 shouldEdit(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMB as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the outline view should allow editing of a given item in a given table column.
Notes: tableColumn: The table column.
item: The item.

Returns true to permit outlineView to edit the cell specified by tableColumn and item, false to deny permission.
If this method returns true, the cell may still not be editable—for example, if you have set up a custom NSTextFieldCell as a data cell, it must return true for isEditable to allow editing.

You can implement this method to disallow editing of specific cells.

37.71.83 shouldExpandItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the outline view should expand a given item.
Notes: item: The item that should expand.

Returns true to permit outlineView to expand item, false to deny permission.
You can implement this method to disallow expanding of specific items.

37.71.84 shouldReorderColumn(columnIndex as Integer, newColumnIndex as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Sent to the delegate to allow or prohibit the specified column to be dragged to a new location.
Notes: columnIndex: The index of the column being dragged.
newColumnIndex: The proposed target index of the column.

Returns true if the column reordering should be allowed, otherwise false.

When a column is initially dragged by the user, the delegate is first called with a newColumnIndex value of -1. Returning false will disallow that column from being reordered at all. Returning true allows it to be reordered, and the delegate will be called again when the column reaches a new location.

The actual NSTableColumn instance can be retrieved from the tableColumns array.
If this method is not implemented, all columns are considered reorderable.

37.71.85 shouldSelectItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the outline view should select a given item.

Notes: item: The item.

Return true to permit outlineView to select item, false to deny permission.

You implement this event to disallow selection of particular items.
For better performance and finer grain control over the selection, use dataCell.

37.71.86 shouldSelectTableColumn(tableColumn as NSTableColumnMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the outline view should select a given table column.
Notes: tableColumn: The table column.

Return true to permit outlineView to select tableColumn, false to deny permission.

You can implement this method to disallow selection of specific columns.

37.71.87 shouldShowCellExpansion(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the delegate to control cell expansion for a specific column and item.
Notes: tableColumn: A table column in the outline view.
item: An item in the outline view.

Returns true to allow an expansion tooltip to appear in the column tableColumn for item item, otherwise false.

Cell expansion can occur when the mouse hovers over the specified cell and the cell contents are unable to be fully displayed within the cell. If this method returns true, the full cell contents will be shown in a special floating tool tip view, otherwise the content is truncated.

37.71.88 shouldShowOutlineCellForItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether the specified item should display the outline cell (the disclosure triangle).
Notes: item: An item in the outline view.

Returns true if the outline cell should be displayed, otherwise false.

Returning false causes frameOfOutlineCellAtRow to return NSZeroRect, hiding the cell. In addition, the row will not be collapsible by keyboard shortcuts.
This method is called only for expandable rows.

37.71.89 shouldTrackCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether a given cell should be tracked.
Notes: cell: The cell used to display item item in column tableColumn
tableColumn: A table column in the outline view.
item: An item in the outline view.

Returns true if the cell should be tracked for the item item in column tableColumn, otherwise false.

Normally, only selectable or selected cells can be tracked. If you implement this method, cells which are not selectable or selected can be tracked (and vice-versa). For example, this allows you to have a button cell in a table which does not change the selection, but can still be clicked on and tracked.

37.71.90 shouldTypeSelectForEvent(e as NSEventMBS, searchString as String) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether type select should proceed for a given event and search string.
Notes: e: The event that caused the message to be sent.
searchString: The string for which searching is to proceed. The search string is nil if no type select has begun.

Return true if type select should proceed, otherwise false.

Generally, this method will be called from keyDown and the event will be a key event.

37.71.91 sizeToFitWidthOfColumn(Column as Integer) as Double

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked to allow the delegate to provide custom sizing behavior when a column,Äôs resize divider is double clicked.
Notes: column: The index of the column.

Returns the width of the specified column.

By default, NSOutlineView iterates every row in the table, accesses a cell via preparedCellAtColumn, and requests the cellSize to find the appropriate largest width to use.
For accurate results and performance, it is recommended that this method is implemented when using large tables. By default, large tables use a monte carlo simulation instead of iterating every row.

37.71.92 sortDescriptorsDidChange(oldDescriptors() as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Invoked by an outline view to notify the data source that the descriptors changed and the data may need to be resorted.
Notes: oldDescriptors: An array that contains the previous descriptors.

The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source does not itself manage them, you can get outlineView's current sort descriptors by sending it a sortDescriptors message.

37.71.93 textShouldBeginEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow.

37.71.94 textShouldEndEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow.

37.71.95 toolTipForCell(cell as NSCellMBS, byref rect as NSRectMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS, mouseLocation as NSPointMBS) as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: When the cursor pauses over a given cell, the value returned from this method is displayed in a tooltip.
Notes: cell: The cell for which to generate a tooltip.
rect: The proposed active area of the tooltip. To control the default active area, you can modify the rect parameter. By default, rect is computed as cell.drawingRectForBounds(cellFrame).
tc: The table column that contains cell.
item: The item for which to display a tooltip.
mouseLocation: The current mouse location in view coordinates.

If you don,Äôt want a tooltip at that location, return nil or the empty string.

37.71.96 typeSelectString(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the string that is used for type selection for a given column and item.
Notes: tableColumn: A table column in the outline view.
item: An item in the outline view.

Return the string that is used for type selection. You may want to change what is searched for based on what is displayed, or simply return nil for that row and/or column to not be searched

Implement this method if you want to control the string that is used for type selection. You may want to change what is searched for based on what is displayed, or simply return nil to specify that the given row and/or column should not be searched. By default, all cells with text in them are searched.

The default value when this delegate method is not implemented is:

outlineView.preparedCellAtColumn(tableColumn, outlineView.rowForItem(item)).stringValue
and you can return this value from the event if you wish.

37.71.97 updateDraggingItemsForDrag(draggingInfo as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Implement this method to enable the table to update dragging items as they are dragged over the view.
Notes: draggingInfo: The dragging info object.

37.71.98 validateDrop(info as NSDraggingInfoMBS, proposedItem as NSOutlineViewItemMBS, proposedChildIndex as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Used by an outline view to determine a valid drop target.
Notes: info: An object that contains more information about this dragging operation.
item: The proposed parent.
index: The proposed child location.

Returns a value that indicates which dragging operation the data source will perform.

Based on the mouse position, the outline view will suggest a proposed drop location. The data source may ‚Äúretarget‚Äù a drop if desired by calling setDropItem and returning something other than NSDragOperationNone. You may choose to retarget for various reasons (for example, for better visual feedback when inserting into a sorted position).
Implementation of this method is optional.

37.71.99 view(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Implemented to return the view used to display the specified item and column.
Notes: tableColumn: The table column, or nil if the row is a group row.
item: The item displayed by the returned view.

Return the view to display the specified column and row. Returning nil is acceptable, in which case a view is not shown at that location.

This method is required if you wish to use NSView objects instead of NSCell objects for the cells within an outline view. Cells and views cannot be mixed within the same outline view.
It is recommended that the implementation of this method first call the NSTableView method makeViewWithIdentifier passing, respectively, the tableColumn parameter,Äôs identifier and self as the owner to attempt to reuse a view that is no longer visible. The frame of the view returned by this method is not important, and is automatically set by the outline view.
The view's properties should be properly set up before returning the result.
When using Cocoa bindings, this method is optional if at least one identifier has been associated with the table view at design time. If this method is not implemented, the outline view automatically calls makeViewWithIdentifier with the tableColumn parameter,Äôs identifier and the outline view,Äôs delegate as parameters, to attempt to reuse a previous view or automatically unarchive a prototype associated with the table view.
The autoresizingMask of the returned view is automatically set to NSViewHeightSizable to resize properly on row height changes.
See also:

- 37.71.13 View as NSOutlineViewMBS 7384

37.71.100 willDisplayCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Informs the delegate that the cell specified by the column and item will be displayed.
Notes: cell: The cell.
tableColumn: The table column.
item: The item.

You can implement this method to modify cell to provide further setup for the cell in tableColumn and item. It is not safe to do drawing inside this method—you should only set up state for cell.

37.71.101 willDisplayOutlineCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Informs the delegate that an outline view is about to display a cell used to draw the expansion symbol.
Notes: cell: The cell.
tableColumn: The table column.
item: The item.

Informs the event that outlineView is about to display cell—an expandable cell (a cell that has the expansion symbol)—for the column and item specified by tableColumn and item. The delegate can modify cell to alter

its display attributes.
This method is not invoked when outlineView is about to display a non-expandable cell.

37.71.102 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.71.103 willTile

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The tableview will tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

37.71.104 writeItems(items() as NSOutlineViewItemMBS, pasteboard as NSPasteboardMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether a drag operation is allowed.
Notes: items: An array of the items participating in the drag.
pasteboard: The pasteboard to which to write the drag data.

Returns true if the drag operation is allowed, otherwise false.

Invoked by outlineView after it has been determined that a drag should begin, but before the drag has been started.
To refuse the drag, return false. To start a drag, return true and place the drag data onto the pboard (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the outline view once this call returns with true.

37.72 class NSOutlineViewItemMBS

37.72.1 class NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to subclass for your items.
Blog Entries

- MBS Xojo Plugins, version 17.1pr4

37.72.2 Methods

37.72.3 Constructor

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.

37.72.4 sortedArrayUsingDescriptor(values() as NSOutlineViewItemMBS, sortDescriptor as NSSortDescriptorMBS) as NSOutlineViewItemMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a copy of the receiving array sorted as specified by a given a sort descriptor.
Notes: sortDescriptor: The NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptor.

37.72.5 sortedArrayUsingDescriptors(values() as NSOutlineViewItemMBS, sortDescriptor() as NSSortDescriptorMBS) as NSOutlineViewItemMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a copy of the receiving array sorted as specified by a given array of sort descriptors.
Notes: sortDescriptors: An array of NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptors.

The first descriptor specifies the primary key path to be used in sorting the receiving array,Äôs contents. Any subsequent descriptors are used to further refine sorting of objects with duplicate values. See NSSort-

Descriptor for additional information.

37.72.6 Properties

37.72.7 Description as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The description text property.
Notes: (Read only property)
See also:

- 37.72.11 Description as String 7414

37.72.8 Handle as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

37.72.9 valueForKey(key as String) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get/set the value for the property identified by a given key.
Notes: key: The name of one of the receiver's properties.
(Read and Write computed property)
See also:

- 37.72.14 valueForKey(key as string) as Variant 7415

37.72.10 Events

37.72.11 Description as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The event when system queries description for object.
See also:

- 37.72.7 Description as String 7414

37.72.12 setValueForKey(key as string, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the property of the receiver specified by a given key to a given value.
Notes: value: The value for the property identified by key.
key: The name of one of the receiver's properties.

If key identifies a to-one relationship, relate the object specified by value to the receiver, unrelating the previously related object if there was one. Given a collection object and a key that identifies a to-many relationship, relate the objects contained in the collection to the receiver, unrelating previously related objects if there were any.
The search pattern that setValueForKey uses is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
In a reference-counted environment, if the instance variable is accessed directly, value is retained.

37.72.13 setValueForUndefinedKey(key as string, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked by setValueForKey when it finds no property for a given key.
Notes: value: The value for the key identified by key.
key: A string that is not equal to the name of any of the receiver's properties.

Subclasses can override this method to handle the request in some other way. The default implementation raises an NSUndefinedKeyException.

37.72.14 valueForKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Return the value for the property identified by a given key.
Notes: key: The name of one of the receiver's properties.

Returns the value for the property identified by key.

If event is not implemented, the search pattern that valueForKey uses to find the correct value to return is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
See also:

- 37.72.9 valueForKey(key as String) as Variant 7414

37.72.15 valueForUndefinedKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Invoked by valueForKey when it finds no property corresponding to a given key.
Notes: key: A string that is not equal to the name of any of the receiver's properties.

Subclasses can override this method to return an alternate value for undefined keys. The default implementation raises an NSUndefinedKeyException.

37.73 class NSOutlineViewMBS

37.73.1 class NSOutlineViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The class for a hierarchical list.
Example:

```
// This example needs a window with NSOutlineControlMBS1.
// change the indentation of an outline view and remember expanded items
Var outline As NSOutlineViewMBS = NSOutlineControlMBS1.View
outline.indentationPerLevel = 20
outline.autosaveName = "ProjectTree"
outline.autosaveExpandedItems = True
outline.reloadData
```

Notes: NSOutlineView is a subclass of NSTableView that uses a row-and-column format to display hierarchical data that can be expanded and collapsed, such as directories and files in a file system. A user can expand and collapse rows, edit values, and resize and rearrange columns.

Like a table view, an outline view does not store its own data, instead it retrieves data values as needed from a data source to which it has a weak reference.

MBS Plugin provides all events in NSOutlineControlMBS control.

An outline view has the following features:

- A user can expand and collapse rows.
- Each item in the outline view must be unique. In order for the collapsed state to remain consistent between reloads the item's pointer must remain the same and the item must maintain isEqual: sameness.
- The view gets data from a data source (see NSOutlineControlMBS).
- The view retrieves only the data that needs to be displayed.

Subclass of the NSTableViewMBS class.
Blog Entries

- MBS Xojo Plugins, version 17.1pr4

37.73.2 Methods

37.73.3 child(index as Integer, ofItem as NSOutlineViewItemMBS) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the specified child of an item.
Notes: index: The index of the child item in the parent.
item: The parent item whose child item you want to retrieve.

Returns the child item or nil if the item could not be found.

You can call this method on an outline view with either a static or dynamic data source. For an outline view whose contents are dynamic, this method may call out to the child event of the associated data source.

37.73.4 childIndexForItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the child index of the specified item within its parent.
Notes: The performance of this method is O(1) at best and O(n) at worst.

37.73.5 collapseItem(item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Collapses a given item.
Notes: If item is not expanded or not expandable, does nothing
If collapsing takes place, posts item collapse notification.
See also:

- 37.73.6 collapseItem(item as NSOutlineViewItemMBS, collapseChildren as Boolean) 7418

37.73.6 collapseItem(item as NSOutlineViewItemMBS, collapseChildren as Boolean)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Collapses a given item and, optionally, its children.
Notes: item: An item in the receiver.
Starting in OS X version 10.5, passing 'nil' will collapse each item under the root in the outline view.
collapseChildren: If true, recursively collapses item and its children. If NO, collapses item only (identical to

collapseItem:).

For example, this method is invoked with the collapseChildren parameter set to true when a user Option-clicks the disclosure triangle for an item in the outline view (to collapse the item and all its contained items). For each item collapsed, posts an item collapsed notification.
See also:

- 37.73.5 collapseItem(item as NSOutlineViewItemMBS) 7418

37.73.7 Constructor

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new outline view with size 100/100 and position 0/0
Example:

```
Var t as new NSOutlineViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.73.8 Constructor(Handle as Integer) 7419
- 37.73.9 Constructor(left as Double, top as Double, width as Double, height as Double) 7420

37.73.8 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSOutlineView handle.
Example:

```
Var t as new NSOutlineViewMBS(0, 0, 100, 100)
Var v as new NSOutlineViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSOutlineViewMBS and the plugin retains this handle.
See also:

- 37.73.7 Constructor 7419
- 37.73.9 Constructor(left as Double, top as Double, width as Double, height as Double) 7420

37.73.9 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new outline view with the given size and position.
Example:

```
Var x as new NSOutlineViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.73.7 Constructor 7419
- 37.73.8 Constructor(Handle as Integer) 7419

37.73.10 expandItem(item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Expands a given item.
Notes: If item is not expandable or is already expanded, does nothing.
If expanding takes place, posts an item expanded notification.
See also:

- 37.73.11 expandItem(item as NSOutlineViewItemMBS, expandChildren as Boolean) 7420

37.73.11 expandItem(item as NSOutlineViewItemMBS, expandChildren as Boolean)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Expands a specified item and, optionally, its children.
Notes: item: An item in the receiver.
Starting in OS X version 10.5, passing 'nil' will expand each item under the root in the outline view.

expandChildren: If true, recursively expands item and its children. If false, expands item only (identical to expandItem).

For example, this method is invoked with the expandChildren parameter set to YES when a user Option-clicks the disclosure triangle for an item in the outline view (to expand the item and all its contained items).
For each item expanded, posts an item expanded notification.
See also:

- 37.73.10 expandItem(item as NSOutlineViewItemMBS) 7420

37.73.12 frameOfOutlineCellAtRow(row as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the frame of the outline cell for a given row.
Notes: row: The index of the row for which to return the frame.

Returns the frame of the outline cell for the row at index row, considering the current indentation and the value in the indentationMarkerFollowsCell property. If the row at index row is not an expandable row, returns NSZeroRect.

You can override this method in a subclass to return a custom frame for the outline button cell. If your override returns an empty rect, no outline cell is drawn for that row. You might do that, for example, so that the disclosure triangle will not be shown for a row that should never be expanded.

37.73.13 insertItemsAtIndexes(indexes as NSIndexSetMBS, Parent as NSOutlineViewItemMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Inserts new items at the given indexes in the given parent with the specified optional animations.
Notes: indexes: Indexes at which to insert items.
parent: The parent for the items, or nil if the parent is the root.
animationOptions: Animated slide effects used when inserting items.

This method parallels the insertRowsAtIndexes method of NSTableView and is used in a way similar to the insertObjects method of NSMutableArray. The method does nothing if parent is not expanded. The actual item values are determined by the data source,Äôs child event (which is called only after endUpdates to ensure data source integrity).

NSCell-based outline views must first call beginUpdates before calling this method.

You can call this method multiple times within the same beginUpdates/endUpdates block; new insertions move previously inserted new items, just like modifying an array. Inserting an index beyond what is available throws an exception.

37.73.14 insertRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Private method to block you from calling this method in NSTableViewMBS.

37.73.15 isExpandable(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether a given item is expandable.
Notes: True if item is expandable—that is, item can contain other items, otherwise false.

37.73.16 isItemExpanded(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether a given item is expanded.
Notes: True if item is expanded, otherwise false.

37.73.17 itemAtRow(row as Integer) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the item associated with a given row.
Notes: row: The index of a row in the receiver.

Returns the item associated with row.

37.73.18 levelForItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the indentation level for a given item.
Notes: The indentation level for item. If item is nil (which is the root item), returns -1.
The levels are zero-based—that is, the first level of displayed items is level 0.

37.73.19 levelForRow(row as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the indentation level for a given row.
Notes: The indentation level for row. For an invalid row, returns -1.

The levels are zero-based—that is, the first level of displayed items is level 0.

37.73.20 moveItemAtIndex(oldIndex as Integer, oldParent as NSOutlineViewItemMBS, newIndex as Integer, newParent as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Moves an item at a given index in the given parent to a new index in a new parent.
Notes: fromIndex: Index of the item to be moved.
oldParent: The parent of the item to be moved.
toIndex: Index in the new parent to which the item is moved.
newParent: The parent of the item after it is moved.

This method parallels the moveRowAtIndex method of NSTableView. The newParent can be the same as oldParent to reorder an item within the same parent.

NSCell-based outline views must first call beginUpdates before calling this method.

You can call this method multiple times within the same beginUpdates/endUpdates block. Moving from an invalid index, or to an invalid index, throws an exception.

37.73.21 moveRowAtIndex(oldIndex as Integer, newIndex as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Private method to block you from calling this method in NSTableViewMBS.

37.73.22 NSOutlineViewColumnDidMoveNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted whenever a column is moved by user action in an NSOutlineView object.
Notes: The notification object is the NSOutlineView object in which a column moved. The userInfo dictionary contains the following information:

NSOldColumn: An NSNumber object containing the integer value of the column,Äôs original index
NSNewColumn: An NSNumber object containing the integer value of the column,Äôs present index

37.73.23 NSOutlineViewColumnDidResizeNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted whenever a column is resized in an NSOutlineView object.
Notes: The notification object is the NSOutlineView object in which a column was resized. The userInfo dictionary contains the following information:

NSTableColumn: The column that was resized.
NSOldWidth: An NSNumber object containing the column,Äôs original width

37.73.24 NSOutlineViewDisclosureButtonKey as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: These key is used by the outline view to create disclosure buttons that collapse and expand items.
Notes: The normal triangle disclosure button.

37.73.25 NSOutlineViewItemDidCollapseNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted whenever an item is collapsed in an NSOutlineView object.
Notes: The notification object is the NSOutlineView object in which an item was collapsed. A collapsed item,Äôs children lose their status as being selected. The userInfo dictionary contains the following information:

NSObject: The item that was collapsed (an id)

37.73.26 NSOutlineViewItemDidExpandNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted whenever an item is expanded in an NSOutlineView object.
Notes: The notification object is the NSOutlineView object in which an item was expanded. The userInfo dictionary contains the following information:

NSObject: The item that was expanded (an id)

37.73.27 NSOutlineViewItemWillCollapseNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted before an item is collapsed (after the user clicks the arrow but before the item is collapsed).
Notes: The notification object is the NSOutlineView object that contains the item about to be collapsed. A collapsed item,Äôs children will lose their status as being selected. The userInfo dictionary contains the following information:

NSObject: The item about to be collapsed (an id)

37.73.28 NSOutlineViewItemWillExpandNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted before an item is expanded (after the user clicks the arrow but before the item is collapsed).
Notes: The notification object is the outline view that contains an item about to be expanded. The userInfo dictionary contains the following information:

NSObject: The item that is to be expanded (an id)

37.73.29 NSOutlineViewSelectionDidChangeNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted after the outline view's selection changes.
Notes: The notification object is the outline view whose selection changed. This notification does not contain a userInfo dictionary.

37.73.30 NSOutlineViewSelectionIsChangingNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted as the outline view,Äôs selection changes (while the mouse button is still down).
Notes: The notification object is the outline view whose selection is changing. This notification does not contain a userInfo dictionary.

37.73.31 NSOutlineViewShowHideButtonKey as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: These key is used by the outline view to create disclosure buttons that collapse and expand items.
Notes: The Show/Hide button.

37.73.32 numberOfChildrenOfItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the number of children for the specified parent item.
Notes: item: The parent item.

Returns the number of children associated with the parent.

You can call this method on an outline view with either a static or dynamic data source. For an outline view whose contents are dynamic, this method may call out to the numberOfChildrenOfItem event of the associated data source.

37.73.33 parentForItem(item as NSOutlineViewItemMBS) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the parent for a given item.
Notes: item: The item for which to return the parent.

Returns the parent for item, or nil if the parent is the root.

37.73.34 reloadItem(item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Reloads and redisplays the data for the given item.
Notes: Reloading the cell views associated with item occurs only in apps that link against macOS 10.12 and later.
This method may cause the outline view to change its selection without calling the SelectionDidChange event.
See also:

• 37.73.35 reloadItem(item as NSOutlineViewItemMBS, reloadChildren as Boolean) 7427

37.73.35 reloadItem(item as NSOutlineViewItemMBS, reloadChildren as Boolean)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Reloads a given item and, optionally, its children.
Notes: item: An item in the receiver.
Starting in OS X version 10.5, passing 'nil' will reload everything under the root in the outline view.

reloadChildren: If true, recursively reloads item and its children. If false, reloads item only (identical to reloadItem).

It is not necessary, or efficient, to reload children if the item is not expanded.
See also:

• 37.73.34 reloadItem(item as NSOutlineViewItemMBS) 7426

37.73.36 removeItemsAtIndexes(indexes as NSIndexSetMBS, Parent as NSOutlineViewItemMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Removes items at the given indexes in the given parent with the specified optional animations.
Notes: indexes: Indexes of the items to be removed.
parent: The parent of the items to be removed.
animationOptions: Animated slide effects used when removing items.

This method parallels the removeRowsAtIndexes method of NSTableView and is used in a way similar to the removeObjectsAtIndexes method of NSMutableArray. The method does nothing if parent is not expanded. If any of the child items is expanded, then all of its child rows are also be removed.

NSCell-based outline views must first call beginUpdates before calling this method.

You can call this method multiple times within the same beginUpdates/endUpdates block; changes work just like modifying an array. Removing an item at an index beyond what is available throws an exception.

37.73.37 removeRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Private method to block you from calling this method in NSTableViewMBS.

37.73.38 rowForItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the row associated with a given item.
Notes: The row associated with item, or -1 if item is nil or cannot be found.

37.73.39 setDropItem(item as NSOutlineViewItemMBS, dropChildIndex as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Used to ‚Äúretarget‚Äù a proposed drop.
Notes: item: The target item.
index: The drop index.

For example, to specify a drop on someOutlineItem, you specify item as someOutlineItem and index as NSOutlineViewDropOnItemIndex. To specify a drop between child 2 and 3 of someOutlineItem, you specify item as someOutlineItem and index as 3 (children are a zero-based index). To specify a drop on an un-expandable someOutlineItem, you specify item as someOutlineItem and index as NSOutlineViewDropOnItemIndex.

37.73.40 Properties

37.73.41 autoresizesOutlineColumn as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the outline view resizes its outline column when the user expands or collapses items.
Notes: The outline column contains the cells with the expansion symbols and is generally the first column. The default value of this property is true, which causes the outline column to be resized.
The outline column is resized based on how many indentation levels are exposed or hidden. For example, if expanding a row exposes a single indentation level, the outline column width is increased by one indentationPerLevel.
(Read and Write property)

37.73.42 autosaveExpandedItems as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the expanded items are automatically saved across launches of the app.
Notes: When the value of this property is true, the outline view saves the state of its expanded items and restores that state the next time the user launches the app. (If the outline view,Äôs autosaveName property is nil, or if you have not implemented the itemForPersistentObject and persistentObjectForItem events, this setting is ignored and outline information is not saved.) The configuration data is saved separately for each user and for each app. The default value of this property is NO.
You can have separate settings for the autosaveExpandedItems and autosaveTableColumns properties, so you could, for example, save expanded item information, but not table column positions.
(Read and Write property)

37.73.43 indentationMarkerFollowsCell as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the indentation marker symbol displayed in the outline column should be indented along with the cell contents.
Notes: When the value of this property is true, the indentation marker is indented along with the cell contents. When the value is false, the marker is always displayed left-justified in the column. The default value of this property is true.
(Read and Write property)

37.73.44 indentationPerLevel as Double

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The per-level indentation, measured in points.
Notes: (Read and Write property)

37.73.45 outlinetableColumn as NSTableColumnMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The table column in which hierarchical data is displayed.
Notes: Each level of hierarchical data is indented by the amount specified by the indentationPerLevel property (the default is 16.0), and decorated with the indentation marker (disclosure triangle) on rows that are expandable. Outline table column data is archived with the rest of the outline view,Äôs state information. Attempts to set the value of this property to nil are silently ignored.

(Read and Write property)

37.73.46 stronglyReferencesItems as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the outline view retains and releases the objects returned from its data source.
Notes: For Xojo applications we highly recommend to keep all items in arrays in Xojo, so they are not released by Xojo too early!

When the value of this property is true, the outline view retains and releases the objects returned to it from dataSource. When the value is NO, the outline view treats the objects as opaque items and assumes that the client has a retain on them. The default value is YES for applications linked on macOS 10.12 and later, and false for applications linked on earlier versions of macOS. If you require the legacy behavior and your app links in macOS 10.12 or later, the value of this property must be explicitly set toNO in code, because it is not encoded in the nib. In general, this is required if the items themselves create a retain cycle.
(Read and Write property)

37.73.47 userInterfaceLayoutDirection as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The user interface layout direction.
Notes: When set to NSUserInterfaceLayoutDirectionRightToLeft, the outline view displays the disclosure triangle to the right of the cell instead of the left. The default value is NSUserInterfaceLayoutDirectionLeftToRight.
(Read and Write property)

37.73.48 Constants

Constants

Constant	Value	Description
NSOutlineViewDropOnItemIndex	-1	May be used as a valid child index of a drop target item. In this case, the drop will happen directly on the target item.

37.74 class NSPathComponentCellMBS

37.74.1 class NSPathComponentCellMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The NSPathComponentCell class displays a component of a path.
Notes: An NSPathCellMBS object manages a collection of NSPathComponentCellMBS objects, in conjunction with an NSPathControlMBS object, to represent a path.
Subclass of the NSTextFieldCellMBS class.

- NSSegmentedControl and NSPathControl
- MBS Real Studio Plugins, version 12.0pr6

37.74.2 Methods

37.74.3 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with a text.

37.74.4 Properties

37.74.5 File as folderitem

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The value of the portion of the path from the root through the component represented by the receiver.
Notes: (Read and Write property)

37.74.6 Image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The image displayed for this component cell.
Notes: Generally, a 16-by-16–point image fits best when the path style is NSPathStyleStandard or NSPathStylePopUp, and a 14-by-14–point image is best when the path style is NSPathStyleNavigationBar.
Available in Mac OS X v10.5 and later.

(Read and Write property)

37.74.7 URL as string

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The value of the portion of the path from the root through the component represented by the receiver.
Notes: (Read and Write property)

37.75 control NSPathControlControlMBS

37.75.1 control NSPathControlControlMBS

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The Xojo control to host a NSPathControl.
Notes: We know the fact, that the control wrapping the segmented control has control twice in the name. Suggestions to rename are welcome, but unlikely to happen as it would break code.

37.75.2 Properties

37.75.3 View as NSPathControlMBS

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The reference to the underlaying NSPathControlMBS.
Notes: (Read only property)

37.75.4 Events

37.75.5 Action

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when user clicks on a date/time and changes something.

37.75.6 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.75.7 Close

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

37.75.8 Closing

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.75.9 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.75.10 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.75.11 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.75.12 DoubleClick

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: Called when a double click happened.
Notes: May call Action event before.

37.75.13 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

37.75.14 FocusLost

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.75.15 FocusReceived

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.75.16 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.75.17 GotFocus

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

37.75.18 LostFocus

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.75.19 MenuBarSelected

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.75.20 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.75.21 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.75.22 MouseUp(x As Integer, y As Integer)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.75.23 Open

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.
Example:

```
Sub Open() Handles Open
// set small font
Var p As NSPathControlMBS = Me.View
p.Font = NSFontMBS.systemFontOfSize(10)

// disable focus ring
p.focusRingType = p.NSFocusRingTypeNone
End Sub
```

37.75.24 Opening

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.
Example:

```
Sub Open() Handles Open
// set small font
Var p As NSPathControlMBS = Me.View
p.Font = NSFontMBS.systemFontOfSize(10)

// disable focus ring
p.focusRingType = p.NSFocusRingTypeNone
End Sub
```

37.75.25 ScaleFactorChanged(NewFactor as double)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.75.26 willDisplayOpenPanel(openPanel as Variant)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: Implement this method to customize the Open panel shown by a pop-up–style path.

Notes: This method is called before the Open panel is shown but after its allowed file types are set to the cell's allowed types. At this time, you can further customize the Open panel as required. This method is called only when the style is set to NSPathStylePopUp. Implementation of this method is optional.

openPanel is a NSOpenPanelMBS object.

37.75.27 willPopUpMenu(menu as Variant)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: Implement this method to customize the menu of a pop-up–style path.
Notes: This event is called before the pop-up menu is shown. At this time, you can further customize the menu as required, adding and removing items. This method is called only when the style is set to NSPathStylePopUp. Implementation of this method is optional.

Menu is a NSMenuMBS object.

37.75.28 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.76 class NSPathControlItemMBS

37.76.1 class NSPathControlItemMBS

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: The class for an item in the path control.
Notes: NSPathControlItemMBS class is used to represent an individual path segment in an NSPathControlMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

37.76.2 Methods

37.76.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

37.76.4 Properties

37.76.5 AttributedTitle as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: The title of the path item.
Notes: (Read and Write property)

37.76.6 File as FolderItem

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: A folderitem for the partial path from the beginning up to this particular item.
Notes: (Read only property)

37.76.7 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

37.76.8 Image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: The image/icon shown for this particular component along the path.
Notes: The NSPathControlItemMBS can display both an image and title. When drawing, your image will be scaled to fit the available area, which in 10.10 and earlier releases is 16x16 points for NSPathStyleStandard or NSPathStylePopUp, and 14x14 points for NSPathStyleNavigationBar.
(Read and Write property)

37.76.9 Title as String

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: The title of the path item.
Notes: (Read and Write property)

37.76.10 URL as String

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: A url for the partial path from the beginning up to this particular item.
Notes: (Read only property)

37.77 class NSPathControlMBS

37.77.1 class NSPathControlMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: NSPathControl is a subclass of NSControl that represents a file system path or virtual path.
Example:

```
// add a path control to the window showing the documents folder
Var p As New NSPathControlMBS(20, 20, 400, 24)
p.pathStyle = NSPathControlMBS.NSPathStylePopUp
p.File = SpecialFolder.Documents

// add it to the content view of the window
Self.NSWindowMBS.contentView.addSubview p
```

Notes: The NSPathControl class uses NSPathCell to implement its user interface. NSPathControl provides cover methods for most NSPathCell methods—the cover method simply invokes the corresponding cell method. See also NSPathComponentCell, which represents individual components of the path, and two associated protocols: NSPathCellDelegate and NSPathControlDelegate.

NSPathControl has three styles represented by the NSPathStyle enumeration constants NSPathStyleStandard, NSPathStyleNavigationBar, and NSPathStylePopUp. The represented path can be a file system path or any other type of path leading through a sequence of nodes or components, as defined by the programmer.

NSPathControl automatically supports drag and drop, which can be further customized via delegate methods. To accept drag and drop, NSPathControl calls registerForDraggedTypes: with NSFilenamesPboardType and NSURLPboardType. When the URL value in the NSPathControl object changes because of an automatic drag and drop operation or the user selecting a new path via the open panel, the action is sent. On Mac OS X v10.5 the value returned by clickedPathComponentCell is nil, on Mac OS X v10.6 and later, clickedPathComponentCell returns the clicked cell.
Subclass of the NSControlMBS class.

37.77.2 Methods

37.77.3 allowedTypes as String()

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: Specifies the allowed types when the control isEditable.
Notes: The allowedTypes can contain a file extension (without the period that begins the extension) or UTI (Uniform Type Identifier). To allow folders, include the UTI 'public.folder'. To allow all types, use 'nil'. If allowedTypes is an empty array, nothing will be allowed. The default value is 'nil', allowing all types.

37.77.4 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new path control with size 100/100 and position 0/0
Example:

```
Var t as new NSPathControlMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.77.5 Constructor(Handle as Integer) 7443
- 37.77.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7444

37.77.5 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSPathControl handle.
Example:

```
Var t as new NSPathControlMBS(0, 0, 100, 100)
Var v as new NSPathControlMBS(t.handle)
```

```
MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSPathControl and the plugin retains this handle.
See also:

- 37.77.4 Constructor 7443
- 37.77.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7444

37.77.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new path control with the given size and position.
Example:

```
Var x as new NSPathControlMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.77.4 Constructor 7443
- 37.77.5 Constructor(Handle as Integer) 7443

37.77.7 pathComponentCells as NSPathComponentCellMBS()

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Returns an array of the NSPathComponentCell objects currently being displayed.
Notes: Available in Mac OS X v10.5 and later.

37.77.8 pathItems as NSPathControlItemMBS()

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: The array of NSPathControlItems currently being displayed.
Notes: Each item must be an NSPathControlItemMBS. Do not subclass NSPathControlItemMBS.

37.77.9 setAllowedTypes(items() as String)

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: Specifies the allowed types when the control isEditable.
Notes: The allowedTypes can contain a file extension (without the period that begins the extension) or UTI (Uniform Type Identifier). To allow folders, include the UTI 'public.folder'. To allow all types, use 'nil'. If allowedTypes is an empty array, nothing will be allowed. The default value is 'nil', allowing all types.

37.77.10 setDraggingSourceOperationMask(mask as Integer, local as boolean)

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Configures the default value returned from draggingSourceOperationMaskForLocal.
Notes: mask: The types of drag operations allowed.
isLocal: If true, mask applies when the drag destination object is in the same application as the receiver; if false, mask applies when the destination object is outside the receiver's application.

By default, draggingSourceOperationMaskForLocal returns NSDragOperationEvery when isLocal is true and NSDragOperationNone when isLocal is false.

Available in Mac OS X v10.5 and later.

37.77.11 setPathComponentCells(cells() as NSPathComponentCellMBS)

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Sets the array of NSPathComponentCell objects currently being displayed.
Notes: cells: An array of NSPathComponentCell objects.

Each item in the array must be an instance of NSPathComponentCell or a subclass thereof. You cannot set this value to nil, but you can set it to an empty array.

Available in Mac OS X v10.5 and later.

37.77.12 setPathItems(items() as NSPathControlItemMBS)

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: Sets the array of NSPathControlItems currently being displayed.

37.77.13 Properties

37.77.14 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The background color.
Notes: By default, the background is set to a light blue color for NSPathStyleStandard and nil for the other styles. You can use NSColorMBS.clearColor to make the background transparent.
Available in Mac OS X v10.5 and later.
(Read and Write property)

37.77.15 clickedPathComponentCell as NSPathComponentCellMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Returns component cell that was clicked.
Notes: The value returned is generally valid only when the action or double action is being sent.
Note: In Mac OS X 10.5 and earlier the returned value was nil if no cell had been clicked. In Mac OS X 10.6, the folder of the cell that the user selected is returned instead.
(Read only property)

37.77.16 clickedPathItem as NSPathControlItemMBS

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: The clicked NSPathControlItem, or nil, if no item has been clicked.
Notes: The clickedPathItem is generally only valid while the action or doubleAction event is being sent.
(Read only property)

37.77.17 editable as Boolean

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: Whether this control is editable.
Notes: e.g. user can rename file.
(Read and Write property)

37.77.18 File as folderitem

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The path property.
Notes: When setting, an array of NSPathComponentCell objects is automatically set based on the path in url. If url is a file URL (returns true from isFileURL), the images are automatically filled with file icons, if the path exists. The URL value itself is stored in the objectValue property of the cell.

See also URL property.
(Read and Write property)

37.77.19 Menu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The menu used for the path control's cells.
Notes: Available in Mac OS X v10.6 and later.
(Read and Write property)

37.77.20 pathStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The path style.
Notes: Either NSPathStyleStandard or NSPathStylePopUp.
(Read and Write property)

37.77.21 placeholderAttributedString as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: The placeholder string.
Notes: If there are no components in the path, the placeholder is drawn instead (if non-nil). We first try to draw the placeholderAttributedString. If it's nil, then the placeholderString will be drawn with correct default attributes.
(Read and Write property)

37.77.22 placeholderString as String

MBS MacCocoa Plugin, Plugin Version: 24.2, Platform: macOS, Targets: Desktop only.

Function: The placeholder string.
Notes: If there are no components in the path, the placeholder is drawn instead (if non-nil). We first try to draw the placeholderAttributedString. If it's nil, then the placeholderString will be drawn with correct

default attributes.
(Read and Write property)

37.77.23 URL as string

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The path property.
Notes: When setting, an array of NSPathComponentCell objects is automatically set based on the path in url. If url is a file URL (returns true from isFileURL), the images are automatically filled with file icons, if the path exists. The URL value itself is stored in the objectValue property of the cell.

See also File property.
(Read and Write property)

37.77.24 Events

37.77.25 DoubleClick

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Called on a double click.

37.77.26 willDisplayOpenPanel(openPanel as Variant)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: Implement this method to customize the Open panel shown by a pop-up–style path.
Notes: This method is called before the Open panel is shown but after its allowed file types are set to the cell's allowed types. At this time, you can further customize the Open panel as required. This method is called only when the style is set to NSPathStylePopUp. Implementation of this method is optional.

openPanel is a NSOpenPanelMBS object.

37.77.27 willPopUpMenu(menu as Variant)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: Implement this method to customize the menu of a pop-up–style path.
Notes: This event is called before the pop-up menu is shown. At this time, you can further customize the

menu as required, adding and removing items. This method is called only when the style is set to NSPathStylePopUp. Implementation of this method is optional.

Menu is a NSMenuMBS object.

37.77.28 Constants

Path Style Constants

Constant	Value	Description
NSPathStyleNavigationBar	1	The navigation bar display style and behavior. Similar to the NSPathStyleStandard with the navigation bar drawing style. Also known as the breadcrumb style. Available in Mac OS X v10.5 and later.
NSPathStylePopUp	2	The pop-up display style and behavior. Only the last path component is displayed with an icon image and component name. The full path is shown when the user clicks on the cell. If the cell is editable, a Choose item is included to enable selecting a different path. Available in Mac OS X v10.5 and later.
NSPathStyleStandard	0	The standard display style and behavior. All path component cells are displayed with an icon image and component name. If the path can not fully be displayed, the middle parts are truncated as required. Available in Mac OS X v10.5 and later.

37.78 class NSPopUpButtonCellMBS

37.78.1 class NSPopUpButtonCellMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The NSPopUpButtonCell class defines the visual appearance of pop-up buttons that display pop-up or pull-down menus.
Example:

```
// show a pull-down menu with an arrow at the bottom
Var popup As New NSPopUpButtonMBS(20, 20, 160, 26)
popup.addItemWithTitle "Actions" // first item is the title of a pull-down menu
popup.addItemWithTitle "Copy"
popup.addItemWithTitle "Paste"

Var cell As NSPopUpButtonCellMBS = popup.cell
cell.pullsDown = True
cell.arrowPosition = NSPopUpButtonCellMBS.NSPopUpArrowAtBottom
Self.NSWindowMBS.contentView.addSubview popup
```

Notes: Pop-up menus present the user with a set of choices, much the way radio buttons do, but using much less space. Pull-down menus also provide a set of choices but present the information in a slightly different way, usually to provide a set of commands from which the user can choose.

The NSPopUpButtonCellMBS class implements the user interface for the NSPopUpButtonMBS class.
Changes made to a menu (such as adding, removing, or changing the items) are not apparent while the menu is being displayed or interacted with.
Subclass of the NSMenuItemCellMBS class.
Blog Entries

- MBS Xojo Plugins, version 17.1pr5

37.78.2 Methods

37.78.3 addItemsWithTitles(itemTitles() as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Adds multiple items to the end of the menu.
Notes: itemTitles: An array of strings containing the titles of the items you want to add. Each string in the array should be unique. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

The new menu items use the pop-up button,Äôs default action and target, but you can change these using

the setAction: and setTarget: methods of the corresponding NSMenuItem object.

If you want to move an item, it,Äôs better to invoke removeItemWithTitle: explicitly and then call this method. After adding the items, this method uses the synchronizeTitleAndSelectedItem method to make sure the item being displayed matches the currently selected item.

Because this method searches for duplicate items, it should not be used if you are adding items to an already populated menu with more than a few hundred items. In a situation like this, add items directly to the receiver's menu instead.

37.78.4 addItemWithTitle(title as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Adds an item with the specified title to the end of the menu.
Notes: title: The title of the new menu item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

The menu item uses the pop-up button,Äôs default action and target, but you can change these using the setAction: and setTarget: methods of the corresponding NSMenuItemMBS object.
Because this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. In a situation like this, add items directly to the button's menu instead.

37.78.5 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The private constructor.
See also:

- 37.78.6 Constructor(text as string, pullsDown as boolean) 7451

37.78.6 Constructor(text as string, pullsDown as boolean)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns an NSPopUpButtonCell object initialized with the specified title.
See also:

- 37.78.5 Constructor(image as NSImageMBS) 7451

37.78.7 dismissPopUp

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Dismisses the pop-up button,Äôs menu by ordering its window out.
Notes: If the pop-up button was not displaying its menu, this method does nothing.
You normally do not call this method explicitly. It is called by the Application Kit automatically to dismiss the menu for the pop-up button.

37.78.8 indexOfItem(item as NSMenuItemMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the specified menu item.
Notes: item: The menu item whose index you want.

Returns the index of the item or -1 if no such item was found.

37.78.9 indexOfItemWithTag(tag as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the menu item with the specified tag.
Notes: tag: The tag of the menu item you want.

Returns the index of the item or -1 if no item with the specified tag was found.

Tags are values your application assigns to an object to identify it. You can assign tags to menu items using the tag property of NSMenuItemMBS.

37.78.10 indexOfItemWithTitle(title as String) as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the item with the specified title.
Notes: title: The title of the item you want. You must not pass nil for this parameter.

Returns the index of the item or -1 if no item with the specified title was found.

37.78.11 insertItemWithTitle(title as string, atIndex as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Inserts an item at the specified position in the menu.
Notes: title: The title of the new item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added
index: The zero-based index at which to insert the item. Specifying 0 inserts the item at the top of the menu.

The value in index must represent a valid position in the array. The menu item at index and all those that follow it are shifted down one slot to make room for the new menu item.
This method assigns the pop-up button,Äôs default action and target to the new menu item. This triggers the action event of the NSActionCellMBS.

Because this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. In a situation like this, add items directly to the button's menu instead.

37.78.12 itemArray as NSMenuItemMBS()

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: An array of NSMenuItemMBS objects that represent the items in the menu.

37.78.13 itemAtIndex(Index as Integer) as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the menu item at the specified index.
Notes: index: The index of the item you want. The specified index must refer to an existing menu item.

Returns the menu item, or nil if no item exists at the specified index.

37.78.14 itemTitleAtIndex(Index as Integer) as String

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the title of the item at the specified index.
Notes: index: The index of the item you want.

Returns the title of the item, or an empty string if no item exists at the specified index.

37.78.15 itemTitles as String()

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: An array of strings containing the titles of every item in the menu.
Notes: The titles appear in the order in which the items appear in the menu. If the menu contains separator items, the array contains an empty string ("") for each separator item.

37.78.16 itemWithTitle(title as String) as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the menu item with the specified title.
Notes: title: The title of the menu item you want.

Returns the menu item, or nil if no item with the specified title exists in the menu.

37.78.17 removeAllItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Removes all items in the receiver,Äôs item menu.

37.78.18 removeItemAtIndex(Index as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Removes the item at the specified index.
Notes: index: The zero-based index indicating which item to remove. Specifying 0 removes the item at the top of the menu. The index must be valid and non-negative.

37.78.19 removeItemWithTitle(title as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Removes the item with the specified title from the menu.
Notes: title: The title of the item you want to remove. If no menu item exists with the specified title, this

method triggers an assertion.

37.78.20 selectItem(item as NSMenuItemMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Selects the specified menu item.
Notes: item: The menu item to select, or nil if you want to deselect all menu items.

By default, selecting or deselecting a menu item from a pop-up menu changes its state. Selecting a menu item from a pull-down menu does not automatically alter the state of the item. To disassociate the current selection from the state of menu items, set the altersStateOfSelectedItem property to NO.

37.78.21 selectItemAtIndex(Index as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Selects the item in the menu at the specified index.
Notes: index: The index of the item you want to select, or -1 you want to deselect all menu items.

By default, selecting or deselecting a menu item from a pop-up menu changes its state. Selecting a menu item from a pull-down menu does not automatically alter the state of the item. To disassociate the current selection from the state of menu items, set the altersStateOfSelectedItem property to false.
Subclassers can override this method to catch all select calls.

37.78.22 selectItemWithTag(tag as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Selects the menu item with the specified tag.
Notes: tag: The tag of the item you want to select.

Returns true if the item was successfully selected; otherwise, false.

If no item with the specified tag is found, this method returns false and leaves the menu state unchanged. You typically assign tags to menu items from Interface Builder, but you can also assign them programmatically using the tag property of NSMenuItemMBS.

37.78.23 selectItemWithTitle(title as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Selects the item with the specified title.
Notes: title: The title of the item to select. If you specify nil, an empty string, or a string that does not match the title of a menu item, this method deselects the currently selected item.

By default, selecting or deselecting a menu item changes its state. To disassociate the current selection from the state of menu items, set the altersStateOfSelectedItem property to false.

37.78.24 setTitle(title as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Sets the string displayed in the receiver when the user isn,Äôt pressing the mouse button.
Notes: title: The string to display.

For pull-down menus that get their titles from a menu item, this method simply sets the pop-up button cell,Äôs menu item to the first item in the menu. For pop-up menus, if a menu item whose title matches aString exists, this method makes that menu item the current selection; otherwise, it creates a new menu item with the title aString, adds it to the pop-up menu, and selects it.

37.78.25 synchronizeTitleAndSelectedItem

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Synchronizes the pop-up button,Äôs displayed item with the currently selected menu item.
Notes: If no item is currently selected, this method synchronizes the pop-up buttons displayed item with the first menu item. If the pop-up button cell does not get its displayed item from a menu item, this method does nothing.
For pull-down menus, this method sets the displayed item to the title first menu item.
If the pop-up button,Äôs menu does not contain any menu items, this method sets the pop-up button,Äôs displayed item to nil, resulting in nothing being displayed in the control.

37.78.26 Properties

37.78.27 altersStateOfSelectedItem as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates if the pop-up button links the state of the selected menu item to

the current selection.
Notes: When the value of this property is true (which is the default value), the state of the selected item is set to NSOnState. When the value of this property is false, the items in the menu are left alone. When you change the value of this property, the state of the currently selected item is updated appropriately.
Note that this property affects only pop-up buttons (it is ignored for pull-down menus).
(Read and Write property)

37.78.28 arrowPosition as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The position of the arrow displayed on the button.
Notes: When the value of this property is NSPopUpNoArrow, the control displays no arrow. NSPopUpArrowAtCenter displays the arrow centered horizontally within the cell and NSPopUpArrowAtBottom displays the arrow at the edge of the cell. This property is used with preferredEdge to determine the exact location and orientation of the arrow.
This property applies to only bezel style and borderless pop-up buttons.
(Read and Write property)

37.78.29 autoenablesItems as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates if the button automatically enables and disables its items every time a user event occurs.
Notes: When the value of this property is true, the button automatically enables and disables items. The default value is true. For more information about enabling and disabling menu items, see NSMenuValidation.
(Read and Write property)

37.78.30 indexOfSelectedItem as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The index of the item last selected by the user.
Notes: The value of this property is the index of the selected item, or -1 if no item is selected.
(Read only property)

37.78.31 lastItem as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The last item in the menu.
Notes: (Read only property)

37.78.32 menu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The pop-up button,Äôs associated menu.
Notes: (Read and Write property)

37.78.33 numberOfItems as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The number of items in the menu.
Notes: (Read only property)

37.78.34 preferredEdge as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The edge of the cell from which the menu should pop out when screen conditions are restrictive.
Notes: At display time, if attaching the menu to the preferred edge would cause part of the menu to be obscured, the pop-up button may use a different edge. If no preferred edge is set, the pop-up button uses the bottom edge by default, which is NSMaxYEdge for flipped views or NSMinYEdge for unflipped views. Additional values for this property include NSMinXEdge and NSMaxXEdge.
The exact location of the arrow is determined by examining the value of this property and arrowPosition.

If the arrow position is NSPopUpArrowAtCenter, the arrow stays in the center of the button and the value of this property determines which edge the arrow points to: NSMinXEdge points to the left, NSMaxYEdge points to the top, NSMaxXEdge points to the right, and NSMinYEdge points to the bottom.

If the arrow position is NSPopUpArrowAtBottom, the value of this property determines which edge at which the arrow is placed: NSMinXEdge places the arrow at the center of the left side, pointing to the left, NSMinYEdge places the arrow at bottom right corner, pointing up, NSMaxXEdge places the arrow at the center of the right side, pointing to the right, and NSMaxYEdge places the arrow at the bottom right corner, pointing down.
(Read and Write property)

37.78.35 pullsDown as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates the behavior of the button,Äôs menu.
Notes: When the value of this property is true, the menu behaves like a pull-down menu; when the value is false, it behaves like a pop-up menu. If you use this property to change the menu type from a pop-up menu to a pull-down menu, and the cell alters the state of its selected items, the state of the currently selected item is set to NSOffState before the menu type is changed.
(Read and Write property)

37.78.36 selectedItem as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The menu item last selected by the user.
Notes: The value of this property is the menu item that is currently selected, or nil if no item is selected. The last selected menu item is the one that was highlighted when the user released the mouse button. It is possible for a pull-down menu,Äôs selected item to be its first item.
(Read only property)

37.78.37 titleOfSelectedItem as String

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The title of the item last selected by the user.
Notes: The value of this property is the title of the selected menu item, or an empty string if no item is selected.
(Read only property)

37.78.38 usesItemFromMenu as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates if the control uses an item from the menu for its own title.
Notes: When the value of this property is true, a pull-down menu uses the title of the first menu item, and a pop-up menu uses the title of the currently selected menu (if no menu item is selected, the pop-up button displays no item and is drawn empty). When the value is false, the menu item set with menuItem (NSMenuItemMBS) is always displayed. The default value is true.
(Read and Write property)

37.78.39 Constants

Constants

Constant	Value	Description
NSPopUpArrowAtBottom	2	One of the arrowPosition constants. Arrow is drawn at the edge of the button, pointing toward the preferredEdge.
NSPopUpArrowAtCenter	1	One of the arrowPosition constants. Arrow is centered vertically, pointing toward the preferredEdge.
NSPopUpNoArrow	0	One of the arrowPosition constants. Does not display any arrow in the control.

37.79 control NSPopUpButtonControlMBS

37.79.1 control NSPopUpButtonControlMBS

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSPopUpButtonControl.
Notes: This control embeds a special NSPopUpButtonControl subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Blog Entries

- New desktop controls
- MBS Xojo / Real Studio Plugins, version 13.2pr6

37.79.2 Properties

37.79.3 View as NSPopUpButtonMBS

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.79.4 Events

37.79.5 Action

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The action event.

37.79.6 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.79.7 Close

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

37.79.8 Closing

Plugin Version: 13.2, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.79.9 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.79.10 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.79.11 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.79.12 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

37.79.13 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.79.14 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.79.15 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.79.16 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

37.79.17 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.79.18 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.79.19 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.79.20 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.79.21 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.79.22 Open

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

37.79.23 Opening

Plugin Version: 13.2, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.79.24 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.79.25 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.80 class NSPopUpButtonMBS

37.80.1 class NSPopUpButtonMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: An NSPopUpButton object controls a pop-up menu or a pull-down menu from which a user can select an item.
Example:

```
// This example needs a window with PopupMenu1.
// get cocoa view for the popupmenu
Var p as NSPopUpButtonMBS = PopupMenu1.NSPopUpButtonMBS

// find a menu entry
Var it as NSMenuItemMBS = p.itemAtIndex(0)

// get a picture
Var pic as Picture = LogoMBS(500)
Var img as new NSImageMBS(pic)
img.setSize 16,16

// and assign icon
it.image = img
```

Notes: The NSPopUpButton class defines objects that implement the pop-up and pull-down menus of the graphical user interface.

An NSPopUpButton object uses an NSPopUpButtonCell object to implement its user interface.

Note that while a menu is tracking, adding, removing, or changing items on the menu is not reflected.
Subclass of the NSButtonMBS class.

37.80.2 Methods

37.80.3 addItemsWithTitles(titles() as string)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Adds multiple items to the end of the menu.
Notes: temTitles: An array of strings containing the titles of the items you want to add. Each string in the array should be unique. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

If you want to move an item, it's better to invoke removeItemWithTitle: explicitly and then send this method. After adding the items, this method uses the synchronizeTitleAndSelectedItem method to make sure the item being displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding items to an already populated menu with more than a few hundred items. Add items directly to the receiver's menu instead.

37.80.4 addItemWithTitle(title as string)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Adds an item with the specified title to the end of the menu.
Notes: title: The title of the menu-item entry. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

If you want to move an item, it's better to invoke removeItemWithTitle explicitly and then send this method. After adding the item, this method calls the synchronizeTitleAndSelectedItem method to make sure the item being displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. Add items directly to the receiver's menu instead.

37.80.5 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new button with size 100/100 and position 0/0
Example:

```
Var t as new NSPopUpButtonMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.80.6 Constructor(Handle as Integer) 7469
- 37.80.7 Constructor(left as Double, top as Double, width as Double, height as Double) 7469

- 37.80.8 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean) 7470

37.80.6 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSPopUpButton handle.
Example:

```
Var t as new NSPopUpButtonMBS(0, 0, 100, 100)
Var v as new NSPopUpButtonMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSPopUpButton and the plugin retains this handle.
See also:

- 37.80.5 Constructor 7468
- 37.80.7 Constructor(left as Double, top as Double, width as Double, height as Double) 7469
- 37.80.8 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean) 7470

37.80.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new popup button with the given size and position.
Example:

```
Var x as new NSPopUpButtonMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.80.5 Constructor 7468
- 37.80.6 Constructor(Handle as Integer) 7469
- 37.80.8 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean) 7470

37.80.8 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates an NSPopUpButton object initialized to the specified dimensions.
Notes: left,top,width,height: The frame rectangle for the button, specified in the parent view's coordinate system.

pullsDown: true if you want the receiver to display a pull-down menu; otherwise, false if you want it to display a pop-up menu.
See also:

- 37.80.5 Constructor 7468
- 37.80.6 Constructor(Handle as Integer) 7469
- 37.80.7 Constructor(left as Double, top as Double, width as Double, height as Double) 7469

37.80.9 indexOfItem(item as NSMenuItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the specified menu item.
Notes: item: The menu item whose index you want.

Returns the index of the item or -1 if no such item was found.
This method invokes the method of the same name of its NSPopUpButtonCell object.

37.80.10 indexOfItemWithTag(tag as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the menu item with the specified tag.
Notes: tag: The tag of the menu item you want.

Returns the index of the item or -1 if no item with the specified tag was found.

This method invokes the method of the same name of its NSPopUpButtonCell object.

37.80.11 indexOfItemWithTitle(title as string) as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the item with the specified title.
Notes: title: The title of the item you want.

Returns the index of the item or -1 if no item with the specified title was found.

37.80.12 indexOfSelectedItem as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the item last selected by the user.
Notes: The index of the selected item, or -1 if no item is selected.

37.80.13 insertItemWithTitle(title as string, atIndex as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Inserts an item at the specified position in the menu.
Notes: title: The title of the new item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added

index: The zero-based index at which to insert the item. Specifying 0 inserts the item at the top of the menu.

If you want to move an item, it's better to invoke removeItemWithTitle: explicitly and then send this method. After adding the item, this method uses the synchronizeTitleAndSelectedItem method to make sure the item displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. Add items directly to the receiver's menu instead.

37.80.14 itemAtIndex(index as Integer) as NSMenuItemMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the menu item at the specified index.
Notes: index: The index of the item you want.

Returns the menu item, or nil if no item exists at the specified index.

37.80.15 itemWithTitle(title as string) as NSMenuItemMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the menu item with the specified title.
Notes: title: The title of the menu item you want.

The menu item, or nil if no item with the specified title exists in the menu.

37.80.16 lastItem as NSMenuItemMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the last item in the menu.

37.80.17 removeAllItems

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Removes all items in the receiver's item menu.
Notes: After removing the items, this method uses the synchronizeTitleAndSelectedItem method to refresh the menu.

37.80.18 removeItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Removes the item at the specified index.
Notes: index: The zero-based index indicating which item to remove. Specifying 0 removes the item at the top of the menu.

After removing the item, this method uses the synchronizeTitleAndSelectedItem method to make sure the title displayed matches the currently selected item.

37.80.19 removeItemWithTitle(title as string)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Removes the item with the specified title from the menu.
Notes: title: The title of the item you want to remove. If no menu item exists with the specified title, this method triggers an assertion.

This method removes the first item it finds with the specified name. This method then uses synchronizeTitleAndSelectedItem to refresh the menu.

37.80.20 selectItem(item as NSMenuItemMBS)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the specified menu item.
Notes: item: The menu item to select, or nil if you want to deselect all menu items.

37.80.21 selectItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the item in the menu at the specified index.
Notes: index: The index of the item you want to select, or -1 you want to deselect all menu items.

37.80.22 selectItemWithTag(tag as Integer) as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the menu item with the specified tag.
Notes: tag: The tag of the item you want to select.

Returns true if the item was successfully selected; otherwise, false.

If no item with the specified tag is found, this method returns false and leaves the menu state unchanged.

You typically assign tags to menu items from Interface Builder, but you can also assign them programmatically using the setTag: method of NSMenuItem.

Available in Mac OS X v10.4 and later.

37.80.23 selectItemWithTitle(title as string)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the item with the specified title.
Notes: title: The title of the item to select. If you specify an empty string, or a string that does not match the title of a menu item, this method deselects the currently selected item.

37.80.24 setTitle(title as string)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Sets the string displayed in the receiver when the user isn't pressing the mouse button.
Notes: If the receiver displays a pop-up menu, this method changes the current item to be the item with the specified title, adding a new item by that name if one does not already exist. If the receiver displays a pull-down list, this method sets its title to the specified string.

37.80.25 synchronizeTitleAndSelectedItem

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Ensures that the item being displayed by the receiver agrees with the selected item.
Notes: If there's no selected item, this method selects the first item in the item menu and sets the receiver's item to match. For pull-down menus, this method makes sure that the first item is being displayed (the NSPopUpButtonCell object must be set to use the selected menu item, which happens by default).

37.80.26 titleOfSelectedItem as string

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the title of the item last selected by the user.
Notes: Returns the title of the selected menu item, or an empty string if no item is selected.

37.80.27 Properties

37.80.28 arrowPosition as Integer

MBS MacControls Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The position of the arrow displayed.
Notes: If you specify NSPopUpNoArrow, the receiver displays no arrow. NSPopUpArrowAtCenter displays the arrow centered horizontally within the cell. NSPopUpArrowAtBottom displays the arrow at the edge of the cell. This method works with setPreferredEdge: to determine the exact location and orientation of the arrow. For more information, see setPreferredEdge:.

This method is ignored unless the receiver is a pull-down list with a beveled border.
(Read and Write property)

37.80.29 autoenablesItems as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver automatically enables and disables its items every time a user event occurs.
Notes: true if the receiver automatically enables and disables items; otherwise, false. The default value is true.
(Read and Write property)

37.80.30 menu as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the pop-up button's associated menu.
Notes: (Read and Write property)

37.80.31 numberOfItems as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the number of items in the menu.
Notes: (Read only property)

37.80.32 pullsDown as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating the behavior of the control's menu.
Notes: True if the menu behaves like a pull-down menu; otherwise, false if it behaves like a pop-up menu.
(Read and Write property)

37.80.33 selectedItem as NSMenuItemMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the menu item last selected by the user.
Notes: Returns the menu item that is currently selected, or nil if no item is selected.

The last selected menu item is the one that was highlighted when the user released the mouse button. It is possible for a pull-down menu's selected item to be its first item.
(Read and Write computed property)

37.80.34 Constants

Arrow Position Constants

Constant	Value	Description
NSPopUpArrowAtBottom	2	Arrow is drawn at the edge of the button, pointing toward the preferredEdge.
NSPopUpArrowAtCenter	1	Arrow is centered vertically, pointing toward the preferredEdge.
NSPopUpNoArrow	0	Does not display any arrow in the receiver.

37.81 class NSProgressIndicatorMBS

37.81.1 class NSProgressIndicatorMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The NSProgressIndicator class lets an application display a progress indicator to show that a lengthy task is under way.
Example:

```
// This example needs a window with ProgressWheel1.
// start and stop the spinning animation of a Xojo progress wheel
Var p As NSProgressIndicatorMBS = ProgressWheel1.NSProgressIndicatorMBS

p.isIndeterminate = True
p.startAnimation
// ... do some work ...
p.stopAnimation
```

Notes: Some progress indicators are indeterminate and do nothing more than spin to show that the application is busy. Others are determinate and show the percentage of the task that has been completed.

This also eliminates the hung appearance is you move the window or open a menu. Unlike the RB progress controls that pause when you do these things, the Cocoa version continues to update.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

37.81.2 Methods

37.81.3 Constructor

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new progress indicator with size 100/100 and position 0/0
Example:

```
Var t as new NSProgressIndicatorMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.81.4 Constructor(Handle as Integer) 7478
- 37.81.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7478

37.81.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSProgressIndicator handle.
Example:

```
Var t as new NSProgressIndicatorMBS(0, 0, 100, 100)
Var v as new NSProgressIndicatorMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSProgressIndicator and the plugin retains this handle.
See also:

- 37.81.3 Constructor 7477
- 37.81.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7478

37.81.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new progress indicator with the given size and position.
Example:

```
Var x as new NSProgressIndicatorMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.81.3 Constructor 7477
- 37.81.4 Constructor(Handle as Integer) 7478

37.81.6 incrementBy(delta as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Advances the progress bar of a determinate progress indicator by the specified amount.
Notes: The amount by which to increment the progress bar. For example, if you want to advance a progress bar from 0.0 to 100.0 in 20 steps, you would invoke incrementBy 20 times with a delta value of 5.0.

37.81.7 sizeToFit

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method resizes the receiver to an appropriate size depending on what style returns.
Notes: Use this after you set style to re-size the receiver.

37.81.8 startAnimation

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Starts the animation of an indeterminate progress indicator.
Notes: Does nothing for a determinate progress indicator.

37.81.9 stopAnimation

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Stops the animation of an indeterminate progress indicator.
Notes: Does nothing for a determinate progress indicator.

37.81.10 Properties

37.81.11 controlSize as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The size of the receiver.
Notes: (Read and Write computed property)

37.81.12 controlTint as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The receiver's control tint.
Notes: (Read and Write computed property)

37.81.13 doubleValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: A value that indicates the current extent of the progress bar of a determinate progress indicator.
Notes: The value representing the current extent of a determinate progress bar. For example, a determinate progress indicator goes from 0.0 to 100.0 by default. If the progress bar has advanced halfway across the view, the value returned by doubleValue would be 50.0. An indeterminate progress indicator does not use this value.
(Read and Write computed property)

37.81.14 isBezeled as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver's frame has a bezel.
Notes: True if the receiver's frame has a three-dimensional bezel; otherwise, false.
(Read and Write computed property)

37.81.15 isDisplayedWhenStopped as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver shows itself even when it's not animating.
Notes: True if the progress indicator shows itself even when it's not animating. By default, this returns returns true if style is NSProgressIndicatorBarStyle and false if style isNSProgressIndicatorSpinningStyle.
(Read and Write computed property)

37.81.16 isIndeterminate as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver is indeterminate.
Notes: This method only has an effect if style returns NSProgressIndicatorBarStyle. If style returns NSProgressIndicatorSpinningStyle, the indicator is always indeterminate, regardless of what you pass to this method.
(Read and Write computed property)

37.81.17 maxValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The maximum value for the receiver.
Notes: The maximum value of the progress indicator. An indeterminate progress indicator does not use this value.
(Read and Write computed property)

37.81.18 minValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The minimum value for the receiver.
Notes: An indeterminate progress indicator does not use this value.
(Read and Write computed property)

37.81.19 style as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The style of the progress indicator (bar or spinning).
Notes: Either NSProgressIndicatorBarStyle or NSProgressIndicatorSpinningStyle.
(Read and Write computed property)

37.81.20 usesThreadedAnimation as boolean

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A hint as to whether the receiver should implement animation of the progress indicator in a separate thread.
Notes: Value is true to indicate that animation of the progress indicator should occur in a separate thread; otherwise, false. This value is only a hint and may be ignored.

If the application becomes multithreaded as a result of an invocation of this method, the application's performance could become noticeably slower.
(Read and Write computed property)

37.81.21 Constants

Constants

Constant	Value	Description
NSBlueControlTint	1	One of the constants to specify a the control tint. Aqua control tint
NSClearControlTint	7	One of the constants to specify a the control tint. Clear control tint
NSDefaultControlTint	0	One of the constants to specify a the control tint. The current default tint setting
NSGraphiteControlTint	6	One of the constants to specify a the control tint. Graphite control tint
NSMiniControlSize	2	One of the values for the ControlSize property. The control has a smaller size than NSSmallControlSize.
NSProgressIndicatorBarStyle	0	One of the constants for the style property. A rectangular indicator that can be determinate or indeterminate
NSProgressIndicatorPreferredAquaThickness	12	One of the constants to specify the height of a progress indicator.
NSProgressIndicatorPreferredLargeThickness	18	One of the constants to specify the height of a progress indicator.
NSProgressIndicatorPreferredSmallThickness	10	One of the constants to specify the height of a progress indicator.
NSProgressIndicatorPreferredThickness	14	One of the constants to specify the height of a progress indicator.
NSProgressIndicatorSpinningStyle	1	One of the constants for the style property. A small square indicator that can be indeterminate only .
NSRegularControlSize	0	One of the values for the ControlSize property. The control is sized as regular.
NSSmallControlSize	1	One of the values for the ControlSize property. This constant is for controls that cannot be resized in one direct push buttons, radio buttons, checkboxes, sliders, scroll bars, pop tabs, and progress indicators. You should use a small system font control.

37.82 class NSRefreshControllerMBS

37.82.1 class NSRefreshControllerMBS

MBS MacControls Plugin, Plugin Version: 26.3, Platform: macOS, Targets: Desktop only.

Function: A controller that provides pull-to-refresh functionality for scroll views.
Example:

```
// This example needs a window with TextArea1.
// add pull-to-refresh to a scroll view (macOS 26 or newer)
Var refresh As New NSRefreshControllerMBS
refresh.setActionDelegate AddressOf RefreshNow
TextArea1.NSScrollViewMBS.refreshController = refresh

// a method in the window:
Sub RefreshNow()
// reload your data here, then stop the spinner
TextArea1.Text = "Reloaded at " + DateTime.Now.ToString
TextArea1.NSScrollViewMBS.refreshController.endRefreshing
End Sub
```

Notes: NSRefreshController enables users to trigger refresh operations by pulling down on scrollable content. Add a refresh controller to an NSScrollView to provide this functionality. Configure the target delegate to handle refresh events.

Requires macOS 27 or later.

- MBS Xojo Plugins, version 26.3pr2

37.82.2 Methods

37.82.3 beginRefreshing

MBS MacControls Plugin, Plugin Version: 26.3, Platform: macOS, Targets: Desktop only.

Function: Tells the refresh controller that a refresh operation has begun.
Notes: Call this method to programmatically start a refresh operation. The refresh controller enters the refreshing state and displays its activity indicator. This is typically used when you want to show a refresh initiated by something other than user interaction.

37.82.4 Constructor

MBS MacControls Plugin, Plugin Version: 26.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

37.82.5 endRefreshing

MBS MacControls Plugin, Plugin Version: 26.3, Platform: macOS, Targets: Desktop only.

Function: Tells the refresh controller that a refresh operation has ended.
Notes: Call this method when your refresh operation completes. The refresh controller returns to its default appearance and exits the refreshing state.

37.82.6 setActionDelegate(del as NSRefreshControllerActionMBS)

MBS MacControls Plugin, Plugin Version: 26.3, Platform: macOS, Targets: Desktop only.

Function: Sets the action delegate.

37.82.7 Properties

37.82.8 attributedTitle as NSAttributedStringMBS

MBS MacControls Plugin, Plugin Version: 26.3, Platform: macOS, Targets: Desktop only.

Function: The styled text to display in the refresh controller.
Notes: Use this property to provide additional context about the refresh operation.
(Read and Write property)

37.82.9 Handle as Integer

MBS MacControls Plugin, Plugin Version: 26.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

37.82.10 isRefreshing as Boolean

MBS MacControls Plugin, Plugin Version: 26.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether a refresh operation is in progress.
Notes: The default value of this property is false. When the user triggers a refresh, this property automatically becomes true. Call endRefreshing when your refresh operation completes to reset this property to false.
(Read only property)

37.82.11 tintColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 26.3, Platform: macOS, Targets: Desktop only.

Function: The tint color for the refresh controller.
Notes: (Read and Write property)

37.82.12 Delegates

37.82.13 NSRefreshControllerActionMBS

MBS MacControls Plugin, Plugin Version: 26.3, Platform: macOS, Targets: Desktop only.

Function: The delegate for receiving the action.

37.83 class NSScrollerMBS

37.83.1 class NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: An NSScroller object controls scrolling of a document view within an NSScrollView's clip view (or potentially another kind of container view).
Example:

```
// This example needs a window with TextArea1.
// show the scroll position of a text area and use the dark knob style
Var scroller As NSScrollerMBS = TextArea1.NSScrollViewMBS.verticalScroller
If scroller = Nil Then Return

scroller.knobStyle = NSScrollerMBS.NSScrollerKnobStyleDark
MessageBox "Knob size: " + Format(scroller.knobProportion * 100, "0") + "% of the track" + EndOfLine
+ _
"Overlay scrollers: " + Str(scroller.scrollerStyle = NSScrollerMBS.NSScrollerStyleOverlay)
```

Notes: It typically displays a pair of buttons that the user can click to scroll by a small amount (called a line increment or decrement) and Alt-click to scroll by a large amount (called a page increment or decrement), plus a slot containing a knob that the user can drag directly to the desired location. The knob indicates both the position within the document view and, by varying in size within the slot, the amount visible relative to the size of the document view. You can configure whether an NSScroller object uses scroll buttons, but it always draws the knob when there's room for it.

Don't use an NSScroller when an NSSlider would be better. A slider represents a range of values for something in the application and lets the user choose a setting. A scroller represents the relative position of the visible portion of a view and lets the user choose which portion to view.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSControlMBS class.

37.83.2 Methods

37.83.3 checkSpaceForParts

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Checks to see if there is enough room in the receiver to display the knob and buttons.
Notes: usableParts returns the state calculated by this method. You should never need to invoke this method; it's invoked automatically whenever the NSScroller's size changes.

37.83.4 Constructor

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new scroller with size 100/100 and position 0/0
Example:

```
Var t as new NSScrollerMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.83.5 Constructor(Handle as Integer) 7487
- 37.83.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7488

37.83.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSScroller handle.
Example:

```
Var t as new NSScrollerMBS(0, 0, 100, 100)
Var v as new NSScrollerMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSScroller and the plugin retains this handle.
See also:

- 37.83.4 Constructor 7487
- 37.83.6 Constructor(left as Double, top as Double, width as Double, height as Double) 7488

37.83.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new scroller with the given size and position.
Example:

```
Var x as new NSScrollerMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.83.4 Constructor 7487
- 37.83.5 Constructor(Handle as Integer) 7487

37.83.7 drawArrow(Arrow as Integer, highlight as boolean)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Draws the scroll button indicated by arrow, which is either NSScrollerIncrementArrow (the down or right scroll button) or NSScrollerDecrementArrow (up or left).
Notes: If flag is true, the button is drawn highlighted; otherwise it's drawn normally. You should never need to invoke this method directly, but may wish to override it to customize the appearance of scroll buttons.
Calling this method on CustomNSScrollerMBS objects does not trigger the drawArrow event.

37.83.8 drawKnob

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Draws the knob.
Notes: You should never need to invoke this method directly, but may wish to override it to customize the appearance of the knob.
Calling this method on CustomNSScrollerMBS objects does not trigger the drawKnob event.

37.83.9 drawKnobSlotInRect(slotRect as NSRectMBS, highlight as boolean)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Draws the knob slow in the rectangle.
Notes: Calling this method on CustomNSScrollerMBS objects does not trigger the drawKnobSlotInRect event.

37.83.10 drawParts

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Caches images for the scroll buttons and knob.
Notes: It's invoked only once when the NSScroller is created. You may want to override this method if you alter the look of the NSScroller, but you should never invoke it directly.

Calling this method on CustomNSScrollerMBS objects does not trigger the drawParts event.

37.83.11 highlight(flag as boolean)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Highlights or unhighlights the scroll button the user clicked.
Notes: The receiver invokes this method while tracking the mouse; you should not invoke it directly. If flag is true, the appropriate part is drawn highlighted; otherwise it's drawn normally.

37.83.12 hitPart as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns a part code indicating the manner in which the scrolling should be performed.
Notes: This method is typically invoked by an NSScrollView to determine how to scroll its document view when it receives an action message from the NSScroller.

37.83.13 isCompatibleWithOverlayScrollers as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the class is compatible with overlay scroller style and behavior.
Notes: Returns true if the class is compatible with overlay scroller style and behavior, otherwise false.
The plugin implements this so you can query the value.

37.83.14 NSPreferredScrollerStyleDidChangeNotification as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: A notification name.
Notes: Posted if the preferred scroller style changes.

Available in Mac OS X v10.7 and later.

37.83.15 preferredScrollerStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the style of scrollers that applications should use wherever possible.
Notes: The preferred scroller style is determined by the Appearance preference panel's "Show scroll bars" setting for the current user, and—when the user's preference is set to "Automatically based on input device"—by the set of built-in and connected pointing devices and the user's scroll capability preference settings for them. The preferred scroller style may therefore change over time, and applications should be prepared to adapt their user interfaces to the new scroller style if needed.

In most cases, updating to a new scroller style is automatic: When the preferred scroller style changes, AppKit notifies all NSScrollView instances, sending setScrollerStyle to each with the new style, which causes each scroll view to automatically re-tile (update its layout) to adapt to the new scroller style. Some NSScrollView instances may refuse the new scroller style setting if they cannot accommodate it for compatibility reasons (the presence of accessory views or legacy scroller subclasses prevent use of overlay scrollers), but most instances will switch to the specified new preferred scroller style.

If you need to be notified of changes to the preferred scroller style, you can register to receive NSPreferredScrollerStyleDidChangeNotification notifications.

Available in Mac OS X v10.7 and later.

37.83.16 rectForPart(part as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle occupied by aPart, which for this method is interpreted literally rather than as an indicator of scrolling direction.
Notes: Note the interpretations of NSScrollerDecrementPage and NSScrollerIncrementPage. The actual part of an NSScroller that causes page-by-page scrolling varies, so as a convenience these part codes refer to useful parts different from the scroll buttons.

Returns NSRectMBS.Zero if the part requested isn't present on the receiver.

37.83.17 scrollerWidth as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the width of "normal-sized" instances.
Notes: NSScrollView uses this value to lay out its components. Subclasses that use a different width should override this method.

37.83.18 scrollerWidthForControlSize(controlsize as Integer) as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the width of the scroller based on controlSize.

37.83.19 setFloatValue(aFloat as Double, proportion as Double)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Sets the position of the knob to aFloat, which is a value from 0.0 (indicating the top or left end) to 1.0 (the bottom or right end).
Notes: Also sets the proportion of the knob slot filled by the knob to knobProp, also a value from 0.0 (minimal size) to 1.0 (fills the slot).

Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

37.83.20 testPart(p as NSPointMBS) as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the part that would be hit by a mouse-down event at p (expressed in the window's coordinate system).
Notes: Note the interpretations of NSScrollerDecrementPage and NSScrollerIncrementPage. The actual part of an NSScroller that causes page-by-page scrolling varies, so as a convenience these part codes refer to useful parts different from the scroll buttons.

37.83.21 trackKnob(theEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Tracks the knob and sends action messages to the receiver's target.
Notes: This method is invoked automatically when the receiver receives theEvent mouse-down event in the knob; you should not invoke it directly.

37.83.22 trackScrollButtons(theEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Tracks the scroll buttons and sends action messages to the receiver's target.
Notes: This method is invoked automatically when the receiver receives theEvent mouse-down event in a scroll button; you should not invoke this method directly.

37.83.23 usableParts as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns a value indicating which parts of the receiver are displayed and usable.

37.83.24 Properties

37.83.25 arrowsPosition as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The location of the scroll buttons within the receiver.
Notes: Can be NSScrollerArrowsMaxEnd, NSScrollerArrowsMinEnd, NSScrollerArrowsDefaultSetting or NSScrollerArrowsNone.
(Read and Write computed property)

37.83.26 controlSize as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The size of the receiver.
Notes: Can be NSRegularControlSize, NSMiniControlSize or NSSmallControlSize.
(Read and Write computed property)

37.83.27 controlTint as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The receiver's control tint.
Notes: Can be NSGraphiteControlTint, NSBlueControlTint, NSClearControlTint or NSDefaultControlTint.
(Read and Write computed property)

37.83.28 knobProportion as Double

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: The portion of the knob slot the knob should fill, as a floating-point value from 0.0 (minimal size) to 1.0 (fills the slot).
Notes: Can be set on Mac OS X 10.5 directly.
(Read and Write computed property)

37.83.29 knobStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The knob style.
Notes: The value of this property does not affect legacy scrollers. NSScrollerKnobStyleDefault is appropriate for a wide range of content, but in some cases choosing an alternative knob style may enhance visibility of the scroller knob atop some kinds of content.

Available in Mac OS X v10.7 and later.

use constants: NSScrollerKnobStyleDefault, NSScrollerKnobStyleDark or NSScrollerKnobStyleLight.
(Read and Write computed property)

37.83.30 scrollerStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The scroller style.
Notes: or a scroller that's managed by an NSScrollView object, the setter is automatically invoked by the scroll view with the appropriate setting, according to the user's Appearance preference settings and possibly what pointing device(s) are present (see preferredScrollerStyle).
Available in Mac OS X v10.7 and later.
(Read and Write computed property)

37.83.31 Constants

Constants

Constant	Value	Description
NSAllScrollerParts	2	One of the constants to specify which parts of the scroller are visible. Scroller has at least a knob, possibly also scroll buttons.
NSBlueControlTint	1	One of the constants to specify a the control tint. Aqua control tint
NSClearControlTint	7	One of the constants to specify a the control tint. Clear control tint
NSDefaultControlTint	0	One of the constants to specify a the control tint. The current default tint setting
NSGraphiteControlTint	6	One of the constants to specify a the control tint. Graphite control tint
NSMiniControlSize	2	One of the values for the ControlSize property. The control has a smaller size than NSSmallControlSize.
NSNoScrollerParts	0	One of the constants to specify which parts of the scroller are visible. Scroller has neither a knob nor scroll buttons, only the knob slot.
NSOnlyScrollerArrows	1	One of the constants to specify which parts of the scroller are visible. Scroller has only scroll buttons, no knob.
NSRegularControlSize	0	One of the values for the ControlSize property. The control is sized as regular.
NSScrollerArrowsDefaultSetting	0	One of the constants to specify where the scroller's buttons appear with the arrowsPosition property. Contains the information from the AppleScrollBarVariant default value.
NSScrollerArrowsMaxEnd	0	One of the constants to specify where the scroller's buttons appear with the arrowsPosition property. Buttons at bottom or right. This constant has been deprecated.
NSScrollerArrowsMinEnd	1	One of the constants to specify where the scroller's buttons appear with the arrowsPosition property. Buttons at top or left. This has been deprecated.
NSScrollerArrowsNone	2	One of the constants to specify where the scroller's buttons appear with the arrowsPosition property. No buttons.
NSScrollerDecrementArrow	1	One of the constants describe the two scroller buttons and are used by drawArrow. The down or right scroll button.
NSScrollerDecrementLine	4	One of the constants to specify the different parts of the scroller. Up or left by a small amount.
NSScrollerDecrementPage	1	One of the constants to specify the different parts of the scroller. Up or left by a large amount.
NSScrollerIncrementArrow	0	One of the constants describe the two scroller buttons and are used by drawArrow. The up or left scroll button.
NSScrollerIncrementLine	5	One of the constants to specify the different parts of the scroller. Down or right by a small amount.
NSScrollerIncrementPage	3	One of the constants to specify the different parts of the scroller. Down or right by a large amount.
NSScrollerKnob	2	One of the constants to specify the different parts of the scroller. Directly to the NSScroller's value, as given by floatValue.
NSScrollerKnobSlot	6	One of the constants to specify the different parts of the scroller. Directly to the NSScroller's value, as given by floatValue.
NSScrollerNoPart	0	One of the constants to specify the different parts of the scroller. Don't scroll at all.
NSSmallControlSize	1	One of the values for the ControlSize property. This constant is for controls that cannot be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. You should use a small system font with a small control.

Knob style constants

Constant	Value	Description
NSScrollerKnobStyleDark	1	Specifies a dark knob. This style is particularly good against a light background. Available in Mac OS X v10.7 and later.
NSScrollerKnobStyleDefault	0	Specifies a dark knob with a light border. This is the default style; it is good against any background. Available in Mac OS X v10.7 and later.
NSScrollerKnobStyleLight	2	Specifies a light knob. This style is particularly good against a dark background. Available in Mac OS X v10.7 and later.

Scroller Style Constants

Constant	Value	Description
NSScrollerStyleLegacy	0	Specifies legacy-style scrollers as prior to Mac OS X v10.7. Available in Mac OS X v10.7 and later.
NSScrollerStyleOverlay	1	Specifies overlay-style scrollers in Mac OS X v10.7 and later. Available in Mac OS X v10.7 and later.

37.84 class NSScrollViewMBS

37.84.1 class NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The Cocoa class for a view which has scrollbars.
Example:

```
// This example needs a window with TextArea1.
// let the scrollbars of a Xojo text area hide automatically
Var s As NSScrollViewMBS = TextArea1.NSScrollViewMBS

s.autohidesScrollers = True
s.hasHorizontalScroller = False
s.flashScrollers
```

Notes: Embed another view inside it to add scrolling.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

37.84.2 Methods

37.84.3 Constructor

MBS MacControls Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new scrollview with size 100/100 and position 0/0
Example:

```
Var t as new NSScrollViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.84.4 Constructor(Handle as Integer) 7497
- 37.84.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7497

37.84.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSScrollView handle.
Example:

```
Var t as new NSScrollViewMBS(0, 0, 100, 100)
Var v as new NSScrollViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSScrollView and the plugin retains this handle.
See also:

- 37.84.3 Constructor 7497
- 37.84.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7497

37.84.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Creates a new scrollview with the given size and position.
Example:

```
Var x as new NSScrollViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.84.3 Constructor 7497
- 37.84.4 Constructor(Handle as Integer) 7497

37.84.6 flashScrollers

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Flash the overlay scroll bars.
Notes: This method is only to scroll views that use overlay scrollers.

This method can be invoked to cause the overlay scroller knobs to be momentarily shown. This may be desirable when changing a document view's size or swapping new content into the view, or to give the user a sense of the current position within the scrollable range at each step of an incremental search or similar operation.

Available in Mac OS X v10.7 and later.

37.84.7 reflectScrolledClipView(clipView as NSClipViewMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Adjusts the receiver's scrollers to reflect the size and positioning of its content view.
Notes: ClipView: The clip view being adjusted to. If aClipView is any view object other than the receiver's content view, the method does nothing.

This method is invoked automatically during scrolling and when an NSClipView object's relationship to its document view changes; you should rarely need to invoke it yourself, but may wish to override it for custom updating or other behavior. If you override this method, be sure to call the superclass implementation. If you do not, other controls (such as the current scrollers) may not be updated properly.

Available in Mac OS X v10.0 and later.

37.84.8 tile

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Lays out the components of the receiver: the content view, the scrollers, and the ruler views.
Notes: You rarely need to invoke this method, but subclasses may override it to manage additional com-

ponents.

37.84.9 Properties

37.84.10 autohidesScrollers as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: True when autohiding is set for scroll bars in the scrollview.
Notes: (Read and Write property)

37.84.11 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The background color.
Notes: (Read and Write property)

37.84.12 borderType as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The border type.
Notes: Specifies the appearance of the style of the scroll view's border. See NSBorderType for a list of possible values.
Use constants NSNoBorder = 0, NSLineBorder = 1, NSBezelBorder = 2 or NSGrooveBorder = 3.
(Read and Write property)

37.84.13 contentSize as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the size of the receiver's content view.
Notes: (Read only property)

37.84.14 contentView as NSClipViewMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The content view.
Notes: If view has a document view, this method also sets the receiver's document view to be the document view of view. The original content view retains its document view.
(Read and Write property)

37.84.15 documentCursor as Variant

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The cursor used when the cursor is over the content view.
Notes: Value is an NSCursorMBS object.
(Read and Write property)

37.84.16 documentView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The view the receiver scrolls within its content view.
Notes: (Read and Write property)

37.84.17 documentVisibleRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the portion of the document view, in its own coordinate system, visible through the receiver's content view.
Notes: (Read only property)

37.84.18 drawsBackground as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the scrollview draws its background.
Notes: (Read and Write property)

37.84.19 FindBarPosition as Integer

MBS MacControls Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: The position of the find bar.
Notes: See NSScrollViewFindBarPosition* constants for possible values.
(Read and Write property)

37.84.20 FindBarView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: The view assigned by the text bar as the find bar view for the container.
Notes: This property is managed by NSTextFinderMBS and you must not set this property.
The container may freely modify the view's width, but should not modify its height.
(Read only property)

37.84.21 FindBarVisible as Boolean

MBS MacControls Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: Whether the container should display its find bar.
Notes: When this property is true and the findBarView property is set, then the find bar is displayed by the container. Otherwise, the find bar is not displayed.
The default value should be false.
(Read and Write property)

37.84.22 hasHorizontalRuler as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: True if the receiver maintains a horizontal ruler view, false if it doesn't.
Notes: (Read and Write property)

37.84.23 hasHorizontalScroller as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver keeps a horizontal scroller
Notes: (Read and Write property)

37.84.24 hasVerticalRuler as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Determines whether the scrollview keeps a vertical ruler object.
Notes: (Read and Write property)

37.84.25 hasVerticalScroller as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: True if the scrollview displays a vertical scroller, false if it doesn't.
Notes: (Read and Write property)

37.84.26 horizontalLineScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The amount by which the receiver scrolls itself horizontally when scrolling line by line to aFloat, expressed in the content view's coordinate system.
Notes: This amount is the amount used when the user clicks the scroll arrows on the horizontal scroll bar without holding down a modifier key. When displaying text in an NSScrollView, for example, you might set this amount to the height of a single line of text in the default font.
(Read and Write property)

37.84.27 horizontalPageScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The amount of the document view kept visible when scrolling horizontally page by page, expressed in the content view's coordinate system.
Notes: This amount is used when the user clicks the scroll arrows on the horizontal scroll bar while holding down the Option key.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page.
(Read and Write property)

37.84.28 horizontalScrollElasticity as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The scroll view's horizontal elasticity mode.
Notes: A scroll view can scroll its contents past its bounds to achieve an elastic effect.

When set to NSScrollElasticityAutomatic, scrolling the horizontal axis beyond its document bounds only occurs if the document width is greater than the view width or, the vertical scroller is hidden and the horizontal scroller is visible.

The default value is NSScrollElasticityAutomatic.

Available in Mac OS X v10.7 and later.
(Read and Write property)

37.84.29 horizontalScroller as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The receiver's horizontal scroller, regardless of whether the receiver is currently displaying it, or nil if the receiver has none.
Notes: (Read and Write property)

37.84.30 lineScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The horizontal and vertical line scroll amounts to aFloat.
Notes: The line scroll is the amount by which the receiver scrolls itself when scrolling line by line, expressed in the content view's coordinate system. It's used when the user clicks the scroll arrows without holding down a modifier key. When displaying text in an NSScrollView, for example, you might set this value to the height of a single line of text in the default font.

As part of its implementation, this method sets VerticalLineScroll and HorizontalLineScroll.
(Read and Write property)

37.84.31 maximumNumberOfTouchesForScrolling as Integer

MBS MacControls Plugin, Plugin Version: 26.5, Platform: macOS, Targets: Desktop only.

Function: The maximum number of touches needed for scrolling
Notes: Set this property to 0 to require exactly minimumNumberOfTouchesForScrolling touches to recognize the gesture. Defaults to NSIntegerMax.

Requires MacOS 27.0 or newer.
(Read and Write property)

37.84.32 minimumNumberOfTouchesForScrolling as Integer

MBS MacControls Plugin, Plugin Version: 26.5, Platform: macOS, Targets: Desktop only.

Function: The minimum number of touches needed for scrolling.
Notes: Defaults to 1.

Requires MacOS 27.0 or newer.
(Read and Write property)

37.84.33 pageScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The vertical page scroll amount: the amount of the document view kept visible when scrolling vertically page by page, expressed in the content view's coordinate system.
Notes: This amount is used when the user clicks the scroll arrows on the vertical scroll bar while holding down the Option key. As part of its implementation, this method calls verticalPageScroll.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page.

Note that a scroll view can have two different page scroll amounts: verticalPageScroll and horizontalPageScroll. Use this method only if you can be sure they're both the same.
(Read and Write property)

37.84.34 refreshController as NSRefreshControllerMBS

MBS MacControls Plugin, Plugin Version: 26.3, Platform: macOS, Targets: Desktop only.

Function: The refresh controller associated with this scroll view.
Notes: Setting this property adds the refresh controller to the scroll view, enabling pull-to-refresh function-

ality. Set to nil to remove it.

Requires macOS 27 or later.
(Read and Write property)

37.84.35 rulersVisible as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether rulers should be visible.
Notes: (Read and Write property)

37.84.36 scrollerKnobStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The knob style of scroll views that use the overlay scroller style.
Notes: Applicable only to scroll views that use overlay scrollers.
Available in Mac OS X v10.7 and later.
(Read and Write property)

37.84.37 scrollerStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The scroller style used by the scroll view.
Notes: This setting is automatically set at runtime, based on the user's preference setting and, if relevant, the set of connected pointing devices and their configured scroll capabilities, as determined by the NSScroller method preferredScrollerStyle.

Setting an scroll view's scroller style sets the style of both the horizontal and vertical scrollers. If the scroll view subsequently creates or is assigned a new horizontal or vertical scroller, they will be assigned the same scroller style that was assigned to the scroll view..

Available in Mac OS X v10.7 and later.
(Read and Write property)

37.84.38 scrollsDynamically as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: True if the scrollview redraws its document view while tracking the knob, false if it redraws only when the scroller knob is released.
Notes: NSScrollView scrolls dynamically by default.
(Read and Write property)

37.84.39 TouchScrollingEnabled as Boolean

MBS MacControls Plugin, Plugin Version: 26.5, Platform: macOS, Targets: Desktop only.

Function: Enable touch scrolling.
Notes: Defaults to true.

Requires MacOS 27.0 or newer.
(Read and Write property)

37.84.40 usesPredominantAxisScrolling as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether the scroll view uses a predominant scrolling axis for content.
Notes: Whether the scroll view supports a predominant scrolling direction. true if there is a predominant scrolling direction; otherwise false.

Some content is scrollable in both the horizontal and vertical axes, but is predominantly scrolled one axis at a time. Other content (such as a drawing canvas) should scroll freely in both axes.

Traditionally this is not an issue with scroll wheels since they can only scroll in one direction at a time. With scroll balls and touch surfaces, it becomes more difficult to determine the user's intention.

This property helps a scroll view determine the user's intention by specifying if there is a predominant scrolling axis for content.

The default value is true.

Available in Mac OS X v10.7 and later.
(Read and Write property)

37.84.41 verticalLineScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The amount by which the view scrolls itself vertically when scrolling line by line to aFloat, expressed in the content view's coordinate system.
Notes: This value is the amount used when the user clicks the scroll arrows on the vertical scroll bar without holding down a modifier key. When displaying text in an NSScrollView, for example, you might set this value to the height of a single line of text in the default font.
(Read and Write property)

37.84.42 verticalPageScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The amount of the document view kept visible when scrolling vertically page by page to aFloat, expressed in the content view's coordinate system.
Notes: This amount is used when the user clicks the scroll arrows on the vertical scroll bar while holding down the Option key.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page. Thus, setting the page scroll amount to 0.0 implies that the entire visible portion of the document view is replaced when a page scroll occurs.
(Read and Write property)

37.84.43 verticalScrollElasticity as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The scroll view's vertical elasticity mode.
Notes: A scroll view can scroll its contents past its bounds to achieve an elastic effect.

When set to NSScrollElasticityAutomatic, scrolling the vertical axis beyond its document bounds occurs if any of the following are true: the vertical scroller is visible, the content height is greater than view height, or the horizontal scroller hidden.

Available in Mac OS X v10.7 and later.
(Read and Write property)

37.84.44 verticalScroller as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The receiver's vertical scroller, regardless of whether the receiver is currently displaying it, or nil if the receiver has none.
Notes: (Read and Write property)

37.84.45 Constants

Elasticity behavior Constants

Constant	Value	Description
NSScrollElasticityAllowed	2	Allow content to be scrolled past its bounds on this axis in an elastic fashion. Available in Mac OS X v10.7 and later.
NSScrollElasticityAutomatic	0	Automatically determine whether to allow elasticity on this axis. Available in Mac OS X v10.7 and later.
NSScrollElasticityNone	1	Disallow scrolling beyond document bounds on this axis. Available in Mac OS X v10.7 and later.

Findbar position constants

Constant	Value	Description
NSScrollViewFindBarPositionAboveContent	1	The find bar is displayed above the scroll view content. Available in Mac OS X v10.7 and later.
NSScrollViewFindBarPositionAboveHorizontalRuler	0	The find bar is displayed above the horizontal ruler, if visi Available in Mac OS X v10.7 and later.
NSScrollViewFindBarPositionBelowContent	2	The find bar is displayed below the scroll view content. Available in Mac OS X v10.7 and later.

37.85 class NSSearchFieldCellMBS

37.85.1 class NSSearchFieldCellMBS

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The programmatic interface for text fields that are used for text-based searches.
Example:

```
// add a search field that remembers the last 10 searches
Var field As New NSSearchFieldMBS(20, 20, 200, 24)
Var cell As NSSearchFieldCellMBS = field.cell
cell.maximumRecents = 10
cell.recentsAutosaveName = "MySearches" // stored in the preferences
Self.NSWindowMBS.contentView.addSubview field
```

Notes: The NSSearchFieldCell class defines the programmatic interface for text fields that are optimized for text-based searches. An NSSearchFieldCell object is ‚Äúwrapped‚Äù by an NSSearchFieldMBS control object, which directly inherits from the NSTextFieldMBS class. The search field implemented by these classes presents a standard user interface for searches, including a search button, a cancel button, and a pop-up icon menu for listing recent search strings and custom search categories.

When the user types and then pauses, the cell‚Äôs action message is sent to its target. You can query the cell‚Äôs string value for the current text to search for. Do not rely on the sender of the action to be an NSMenuMBS object because the menu may change. If you need to change the menu, modify the search menu template and update the value in the searchMenuTemplate property.
Subclass of the NSTextFieldCellMBS class.

37.85.2 Methods

37.85.3 cancelButtonRectForBounds(rect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: Queries the location of the cancel button.
Notes: This may invoke the cancelButtonRectForBounds event for NSSearchFieldControlMBS control.

37.85.4 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor not to use.
See also:

- 37.85.5 Constructor(text as string) 7510

37.85.5 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.
See also:

- 37.85.4 Constructor(image as NSImageMBS) 7510

37.85.6 recentSearches as String()

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: An array of the recent search strings to display in the pop-up icon menu of the search field.
Notes: This property contains an array of string objects, each of which contains a search string either displayed in the search menu or from a recent autosave archive. If there have been no recent searches and no prior searches saved under an autosave name, this array may be empty. When loading your interface, you might set the value of this property to a set of saved search strings.

37.85.7 resetCancelButtonCell

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: Resets the cancel button cell to its default attributes.
Notes: This method resets the target, action, regular image, and pressed image for the cancel button cell. By default, when users click the cancel button, the delete: action message is sent up the responder chain to the first NSText object that can handle it. This method gives you a way to customize the cancel button for specific situations and then reset the button defaults without having to undo changes individually.

37.85.8 resetSearchButtonCell

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: Resets the search button cell to its default attributes.
Notes: This method resets the target, action, regular image, and pressed image for the search button cell.

By default, when users click the search button or press the Return key, the action defined for the receiver is sent to its designated target. This method gives you a way to customize the search button for specific situations and then reset the button defaults without having to undo changes individually.

37.85.9 searchButtonRectForBounds(rect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: Queries the location of the search button.
Notes: This may invoke the searchButtonRectForBounds event for NSSearchFieldControlMBS control.

37.85.10 searchTextRectForBounds(rect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: Queries the location of the search text.
Notes: This may invoke the searchTextRectForBounds event for NSSearchFieldControlMBS control.

37.85.11 setRecentSearches(RecentSearches() as String = nil)

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: An array of the recent search strings to display in the pop-up icon menu of the search field.
Notes: This property contains an array of string objects, each of which contains a search string either displayed in the search menu or from a recent autosave archive. If there have been no recent searches and no prior searches saved under an autosave name, this array may be empty. When loading your interface, you might set the value of this property to a set of saved search strings.

37.85.12 Properties

37.85.13 cancelButtonCell as NSButtonCellMBS

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The button cell used to display the cancel-button image.
Example:

```
Sub Opening()
// let's display number of results or similar
Var n As NSSearchFieldMBS = Me.View
Var c As NSSearchFieldCellMBS = n.cell
```

```
Var b as NSButtonCellMBS = c.cancelButtonCell

b.title = "22"
b.imagePosition = b.NSImageRight
b.alignment = NSTextViewMBS.NSRightTextAlignment
End Sub
```

Notes: (Read and Write property)

37.85.14 maximumRecents as Integer

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The maximum number of search strings that can appear in the search menu.
Notes: The value of this property must be between 0 and 254. Specifying a negative value for the property sets it to the default value, which is 10. Specifying a value greater than 254 sets the property to 254.
When the maximum number of search strings is exceeded, the oldest search string on the menu is dropped.
(Read and Write property)

37.85.15 recentsAutosaveName as String

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The autosave name under which the search field automatically saves the list of recent search strings.
Notes: The autosave name is used as a key in the standard user defaults to save the recent searches. If you specify nil or an empty string for this parameter, no autosave name is set and searches are not automatically saved.
(Read and Write property)

37.85.16 searchButtonCell as NSButtonCellMBS

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The button cell used to display the search-button image.
Notes: (Read and Write property)

37.85.17 searchMenuTemplate as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The menu object used to dynamically construct the search field,Äôs pop-up icon menu.
Notes: The cell looks for the tag constants described in Menu tags to determine how to populate the menu with items related to recent searches. For an example of how you might set up the search menu template, see Configuring a Search Menu:
https://developer.apple.com/library/archive/documentation/Cocoa/Conceptual/SearchFields/Articles/MenuTemplate.html#//apple_ref/doc/uid/20002245
(Read and Write property)

37.85.18 sendsSearchStringImmediately as Boolean

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the cell calls its action method immediately when an appropriate action occurs.
Notes: When the value of this property is true, the cell calls its action method immediately upon notification of any changes to the search field. When the value is NO, the cell pauses briefly after receiving a notification and then calls its action method. Pausing gives the user an opportunity to type more text into the search field and minimize the number of searches that are performed.
(Read and Write property)

37.85.19 sendsWholeSearchString as Boolean

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the cell calls its search action method when the user clicks the search button (or presses Return) or after each keystroke.
Notes: When the value of this property is true, the cell calls its action method when the user clicks the search button or presses Return. When the value is false, the cell calls the action method after each keystroke. The default value of this property is false.
(Read and Write property)

37.85.20 Constants

Menu Tags

Constant	Value	Description
ClearRecentsMenuItemTag	1002	The menu item for clearing the current set of recent string searches in the menu.
NoRecentsMenuItemTag	1003	The menu item that describes a lack of recent search strings.
RecentsMenuItemTag	1001	The location of recent search strings in the ,Äúrecents,Äù menu group.
RecentsTitleMenuItemTag	1000	The menu item that provides the title of the menu group for recent search strings.

37.86 control NSSearchFieldControlMBS

37.86.1 control NSSearchFieldControlMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSSearchField.
Notes: This control embeds a special NSSearchField subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

37.86.2 Properties

37.86.3 View as NSSearchFieldMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.86.4 Events

37.86.5 Action

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The action event run, when e.g. return key is pressed.

37.86.6 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.86.7 cancelButtonRectForBounds(controlRect as NSRectMBS, cellRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: Modifies the bounding rectangle for the cancel button cell.
Example:

```
Function cancelButtonRectForBounds(controlRect as NSRectMBS, cellRect as NSRectMBS) Handles cancelButtonRectForBounds as NSRectMBS
// make room for our found text
cellRect.Width = cellRect.Width + 20
cellRect.X = cellRect.x - 20

return cellRect
End Function
```

Notes: controlRect: The current bounding rectangle for the cancel button.
cellRect: The default cell rectangle.

Return the updated bounding rectangle to use for the cancel button. The default value is the value passed into the rect parameter.

Subclasses can override this method to return a new bounding rectangle for the cancel button cell. You might use this method to provide a custom layout for the search field control.

37.86.8 Close

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

37.86.9 Closing

Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.86.10 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.86.11 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.86.12 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.86.13 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

37.86.14 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.86.15 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.86.16 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.86.17 GotFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

37.86.18 LostFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.86.19 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.86.20 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.86.21 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.86.22 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.86.23 Open

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

37.86.24 Opening

Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.86.25 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.86.26 searchButtonRectForBounds(controlRect as NSRectMBS, cellRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: Modifies the bounding rectangle for the search button cell.
Notes: controlRect: The current bounding rectangle for the search button.
cellRect: The default cell rectangle.

The updated bounding rectangle to use for the search button. The default value is the value passed into the rect parameter.

Subclasses can override this method to return a new bounding rectangle for the search button cell. You might use this method to provide a custom layout for the search field control.

37.86.27 searchFieldDidEndSearching

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: The event that is called when the search field has ended its search for content.

37.86.28 searchFieldDidStartSearching

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: The event that is called when the search field begins searching for content.

37.86.29 searchTextRectForBounds(controlRect as NSRectMBS, cellRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: Modifies the bounding rectangle for the search-text field cell.
Notes: controlRect: The current bounding rectangle for the search text field.
cellRect: The default cell rectangle.

Return the updated bounding rectangle to use for the search text field. The default value is the value passed into the rect parameter.

Subclasses can override this method to return a new bounding rectangle for the text-field cell object. You

might use this method to provide a custom layout for the search field control.

37.86.30 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text begins an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

37.86.31 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Sent when the text in the receiving control changes.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

37.86.32 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text ends an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this

event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

37.86.33 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.86.34 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.86.35 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.87 class NSSearchFieldMBS

37.87.1 class NSSearchFieldMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: An NSSearchField object implements a text field control that is optimized for performing text-based searches.
Example:

```
// create searchfield
Var n as new NSSearchFieldMBS(0,0,100,20)

// set placeholder
Var x as NSTextFieldCellMBS = n.cell
x.placeholderString = "Test"
```

Notes: The control provides a customized text field for entering search data, a search button, a cancel button, and a pop-up icon menu for listing recent search strings and custom search categories.

An NSSearchField object wraps an NSSearchFieldCell object. Access to most search field attributes occurs through the cell, which provides a more comprehensive programmatic interface for manipulating the search field. You can use an NSSearchField object though to manipulate some aspects of the search field. For additional information about search fields and how to manipulate them, see the NSSearchFieldCell class.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSTextFieldMBS class.

37.87.2 Methods

37.87.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new search field with size 100/100 and position 0/0
Example:

```
Var t as new NSSearchFieldMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.87.4 Constructor(Handle as Integer) 7524
- 37.87.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7524

37.87.4 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSSearchField handle.
Example:

```
Var t as new NSSearchFieldMBS(0, 0, 100, 100)
Var v as new NSSearchFieldMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSSearchField and the plugin retains this handle.
See also:

- 37.87.3 Constructor 7523
- 37.87.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7524

37.87.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new search field with the given size and position.
Example:

```
Var x as new NSSearchFieldMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.87.3 Constructor 7523
- 37.87.4 Constructor(Handle as Integer) 7524

37.87.6 recentSearches as string()

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Returns the list of recent search strings for the control.
Notes: An array of strings, each of which contains a search string either displayed in the search menu or from a recent autosave archive. If there have been no recent searches and no prior searches saved under an autosave name, this array may be empty.

37.87.7 setRecentSearches(values() as string)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Sets the list of recent search strings to list in the pop-up icon menu of the receiver.
Notes: You might use this method to set the recent list of searches from an archived copy.

37.87.8 Properties

37.87.9 cancelButtonBounds as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: Queries the location of the cancel button.
Notes: This may invoke the cancelButtonRectForBounds event for NSSearchFieldControlMBS control.
(Read only property)

37.87.10 maximumRecents as Integer

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The maximum number of search strings that can appear in the search menu.
Notes: The maximum number of search strings that can appear in the menu. This value can be between 0 and 254. Specifying a value less than 0 sets the value to the default, which is 10. Specifying a value greater than 254 sets the maximum to 254.

When the limit is exceeded, the oldest search string on the menu is dropped.
(Read and Write property)

37.87.11 recentsAutosaveName as string

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The key under which the prior list of recent search strings has been archived.
Notes: The autosave name, which is used as a key in the standard user defaults to save the recent searches. The default value is "", which causes searches not to be autosaved.
(Read and Write property)

37.87.12 Scrollable as Boolean

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver scrolls excess text past the cell's bounds.
Notes: (Read and Write property)

37.87.13 searchButtonBounds as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: Queries the location of the search button.
Notes: This may invoke the searchButtonRectForBounds event for NSSearchFieldControlMBS control.
(Read only property)

37.87.14 searchMenuTemplate as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The menu template object used to dynamically construct the search pop-up icon menu.
Notes: The receiver looks for the tag constants described in Menu tags to determine how to populate the menu with items related to recent searches. (See constants)

To modify the actual menu shown, please use NSMenuItemMBS.validateMenuItem event. There you can for example set the state of the menu item shown. The SearchField makes a copy of the NSMenuItem, so the menuitem where the event is called, is not the one shown. It's the one passes as parameter.
(Read and Write property)

37.87.15 searchTextBounds as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 26.2, Platform: macOS, Targets: Desktop only.

Function: Queries the location of the search text.
Notes: This may invoke the searchTextRectForBounds event for NSSearchFieldControlMBS control.
(Read only property)

37.87.16 sendsSearchStringImmediately as boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Whether the cell sends its action message to the target immediately upon notification of any changes to the search field text or after a brief pause.
Notes: True to send the cell's action immediately upon notification of any changes to the search field; otherwise, false if you want the cell to pause briefly before sending its action message. Pausing gives the user the opportunity to type more text into the search field before initiating the search.
(Read and Write property)

37.87.17 sendsWholeSearchString as boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver sends the search action message when the user clicks the search button (or presses return) or after each keystroke.
Notes: True to send the action message all at once when the user clicks the search button or presses return; otherwise, False to send the search string after each keystroke.
(Read and Write property)

37.87.18 Constants

Search menu template constants

Constant	Value	Description
NSSearchFieldClearRecentsMenuItemTag	1002	Identifies the menu item for clearing the current set of recent string in the menu. This item is hidden if there are no recent strings.
NSSearchFieldNoRecentsMenuItemTag	1003	Identifies the menu item that describes a lack of recent search str example, ”No recent searches”). This item is hidden if there have been recent searches.
NSSearchFieldRecentsMenuItemTag	1001	Identifies where recent search strings should appear in the ”recent group.
NSSearchFieldRecentsTitleMenuItemTag	1000	Identifies the menu item that is the title of the menu group for rece strings. This item is hidden if there are no recent strings. You may use this tagged item for separator characters that also do no if there are no recent strings to display.

37.88 control NSSecureTextFieldControlMBS

37.88.1 control NSSecureTextFieldControlMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSSecureTextField.
Notes: This control embeds a special NSSecureTextField subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

37.88.2 Properties

37.88.3 echosBullets as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver echoes a bullet character rather than each character typed.
Example:

```
Var t as NSSecureTextFieldControlMBS // your textfield
t.echosBullets = true
```

Notes: If true, bullets are echoed. If false, the cursor is moved for each character typed, but nothing is displayed.
(Read and Write property)

37.88.4 View as NSSecureTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes: Use this object to set more options on the control.
(Read only property)

37.88.5 Events

37.88.6 Action

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The control's action was triggered.
Notes: The text changed.

37.88.7 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.88.8 Close

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

37.88.9 Closing

Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.88.10 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.88.11 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.88.12 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.88.13 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

37.88.14 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.88.15 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.88.16 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.88.17 GotFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

37.88.18 LostFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.88.19 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.88.20 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.88.21 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.88.22 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.88.23 Open

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

37.88.24 Opening

Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.88.25 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.88.26 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text begins an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

37.88.27 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Sent when the text in the receiving control changes.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDid-

ChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

37.88.28 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Sent when a control with editable text ends an editing session.
Notes: Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

37.88.29 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.88.30 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

37.88.31 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.89 class NSSecureTextFieldMBS

37.89.1 class NSSecureTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: NSSecureTextField is a subclass of NSTextField that hides its text from display or other access via the user interface.
Notes: It's suitable for use as a password-entry object or for any item in which a secure value must be kept.

NSSecureTextField uses NSSecureTextFieldCell to implement its user interface.
Subclass of the NSTextFieldMBS class.

- MBS REALbasic Plugins, version 11.1pr3

37.89.2 Methods

37.89.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new secure text field with size 100/100 and position 0/0
Example:

```
Var t as new NSSecureTextFieldMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.89.4 Constructor(Handle as Integer) 7537
- 37.89.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7538

37.89.4 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSSecureTextField handle.
Example:

```
Var t as new NSSecureTextFieldMBS(0, 0, 100, 100)
Var v as new NSSecureTextFieldMBS(t.handle)
```

```
MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSSecureTextField and the plugin retains this handle.
See also:

- 37.89.3 Constructor 7537
- 37.89.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7538

37.89.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new secure text field with the given size and position.
Example:

```
Var x as new NSSecureTextFieldMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.89.3 Constructor 7537
- 37.89.4 Constructor(Handle as Integer) 7537

37.89.6 Properties

37.89.7 echosBullets as boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver echoes a bullet character rather than each character typed.
Example:

```
Var t as NSSecureTextFieldMBS // your textfield
t.echosBullets = true
```

Notes: If true, bullets are echoed. If false, the cursor is moved for each character typed, but nothing is displayed.
(Read and Write computed property)

37.90 control NSSegmentedControlControlMBS

37.90.1 control NSSegmentedControlControlMBS

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The Xojo control to host a NSSegmentedControl.
Notes: We know the fact, that the control wrapping the segmented control has control twice in the name. Suggestions to rename are welcome, but unlikely to happen as it would break code.
Blog Entries

37.90.2 Properties

37.90.3 View as NSSegmentedControlMBS

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The reference to the underlaying NSSegmentedControlMBS.
Notes: (Read only property)

37.90.4 Events

37.90.5 Action

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when user clicks on a date/time and changes something.

37.90.6 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.90.7 Close

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

37.90.8 Closing

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.90.9 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.90.10 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.90.11 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.90.12 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

37.90.13 FocusLost

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.90.14 FocusReceived

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.90.15 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.90.16 GotFocus

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

37.90.17 LostFocus

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.90.18 MenuBarSelected

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.90.19 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.90.20 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.90.21 MouseUp(x As Integer, y As Integer)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.90.22 Open

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

37.90.23 Opening

Plugin Version: 24.0, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.90.24 ScaleFactorChanged(NewFactor as double)

MBS MacCocoa Plugin, Plugin Version: 24.0, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.90.25 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.91 class NSSegmentedControlMBS

37.91.1 class NSSegmentedControlMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The plugin class for a Cocoa NSSegmentedControl.
Example:

```
// This example needs a window with SegmentedButton1.
// change the style of a Xojo segmented button and show the selected segment
Var s As NSSegmentedControlMBS = SegmentedButton1.NSSegmentedControlMBS

s.segmentStyle = NSSegmentedControlMBS.NSSegmentStyleSeparated

If s.selectedSegment >= 0 Then
MessageBox "Selected: " + s.labelForSegment(s.selectedSegment) + " of " + s.segmentCount.ToString + "
segments"
End If
```

Notes: An NSSegmentedControl object implements a horizontal button made of multiple segments.

The NSSegmentedControl class uses an NSSegmentedCell class to implement much of the control's functionality. Most methods in NSSegmentedControl are simply "cover methods" that call the corresponding method in NSSegmentedCell. The methods of NSSegmentedCell that do not have covers relate to accessing and setting values for tags and tool tips; programatically setting the key segment; and establishing the mode of the control.

The features of a segmented control include:

- Each segment can have an image, text (label), menu, tooltip, and tag
- Either the whole control or individual segments can be enabled or disabled
- There are three tracking modes for segments: select one mode (also known as radio button mode and illustrated by Finder's view mode selection control), momentary mode (as illustrated by Safari's toolbar buttons), or select any mode (where any combination of buttons may be on or off)
- Each segment can be either a fixed width or autosized to fit the contents
- If a segment has text and is marked as autosizing, then the text may be truncated so that the control completely fits
- If an image is too large to fit in a segment, it is clipped
- Full keyboard control of the user interface

Subclass of the NSControlMBS class.

37.91.2 Methods

37.91.3 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new path control with size 100/100 and position 0/0
Example:

```
Var t as new NSSegmentedControlMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.91.4 Constructor(Handle as Integer) 7546
- 37.91.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7547

37.91.4 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSPathControl handle.
Example:

```
Var t as new NSSegmentedControlMBS(0, 0, 100, 100)
Var v as new NSSegmentedControlMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSSegmentedControl and the plugin retains this handle.
See also:

- 37.91.3 Constructor 7546
- 37.91.5 Constructor(left as Double, top as Double, width as Double, height as Double) 7547

37.91.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new path control with the given size and position.
Example:

```
Var x as new NSSegmentedControlMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.91.3 Constructor 7546
- 37.91.4 Constructor(Handle as Integer) 7546

37.91.6 makeNextSegmentKey

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Selects the next segment.
Notes: The next segment is the one to the right of the currently selected segment. For the last segment, the selection wraps back to the beginning of the control.

37.91.7 makePreviousSegmentKey

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Selects the previous segment.
Notes: The previous segment is the one to the left of the currently selected segment. For the first segment, the selection wraps around to the last segment of the control.

37.91.8 selectSegmentWithTag(Tag as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Selects the segment with the specified tag.
Notes: tag: The tag associated with the desired segment.
True if the segment was selected successfully; otherwise, false.

Typically, you use Interface Builder to specify the tag for each segment. You may also set this value programmatically using the setTag:forSegment: method of NSSegmentedCell.

37.91.9 Properties

37.91.10 cellTrackingMode as Integer

MBS MacCocoa Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: The tracking mode used for the segments of the receiver.
Notes: Possible values for trackingMode are described in NSSegmentSwitchTracking. The default value is NSSegmentSwitchTrackingSelectOne.

This property was named only trackingMode in 15.1 and older plugins.
(Read and Write property)

37.91.11 doubleValueForSelectedSegment as Double

MBS MacCocoa Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Query the double value for selected segment.
Notes: This message is valid only for trackingMode = NSSegmentSwitchTrackingMomentaryAccelerator and provides the double value for the selected segment.
Available on Mac OS X 10.10.3.
(Read only property)

37.91.12 role as Integer

MBS MacCocoa Plugin, Plugin Version: 26.5, Platform: macOS, Targets: Desktop only.

Function: The role of this segmented control.
Notes: Requires MacOS 27.0 or newer.
(Read and Write property)

37.91.13 segmentCount as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Returns the number of segments in the receiver.
Notes: (Read and Write property)

37.91.14 segmentStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The visual style used to display the receiver.
Notes: See style constants.
Available in Mac OS X v10.5 and later.
(Read and Write property)

37.91.15 selectedSegment as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The index of the selected segment of the receiver.
Notes: The index of the currently selected segment or -1 if no segment is selected. If the receiver allows multiple selections, this method returns the most recently selected segment.
(Read and Write property)

37.91.16 springLoaded as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Sends action on deep-press or extended hover while dragging.
Notes: Defaults to false.
(Read and Write property)

37.91.17 trackingMode as Integer

MBS MacCocoa Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: The type of tracking behavior the control exhibits.
Notes: An NSSegmentSwitchTracking value specifies how the control responds when the user presses a keyboard key or clicks, force clicks (applies pressure in a pressure-sensitive system), releases pressure, and so on.

see NSSegmentSwitchTracking* constants.
Available on Mac OS X 10.10.3 and newer.
(Read and Write property)

37.91.18 imageForSegment(segment as Integer) as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The image for the specified segment.
Notes: image: The image to apply to the segment or nil if you want to clear the existing image. Images are not scaled to fit inside a segment. If the image is larger than the available space, it is clipped.
segment: The index of the segment whose image you want to set. This method raises an NSRangeException if the index is out of bounds.
(Read and Write computed property)

37.91.19 imageScalingForSegment(segment as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The scaling mode used to display the specified segment's image.
Notes: scaling: One of the image scaling constants. For a list of possible values, see constants.
segment: The index of the segment whose enabled state you want to get. This method raises an NSRange-Exception if the index is out of bounds.
Available in Mac OS X v10.5 and later.
(Read and Write computed property)

37.91.20 isEnabledForSegment(segment as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The enabled state of the specified segment.
Notes: True to enable the segment; otherwise, false to disable it.
segment: The index of the segment you want to enable or disable. This method raises an NSRangeException if the index is out of bounds.
(Read and Write computed property)

37.91.21 isSelectedForSegment(segment as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The selection state of the specified segment.

Notes: True if you want to select the segment; otherwise, false.

segment: The index of the segment whose selection state you want to set. This method raises an NSRangeException if the index is out of bounds.

If the receiver allows only a single selection, this method deselects any other selected segments.
(Read and Write computed property)

37.91.22 labelForSegment(segment as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The label for the specified segment.
Notes: label: The label you want to display in the segment. If the width of the string is greater than the width of the segment, the string's text is truncated during drawing.
segment: The index of the segment whose label you want to set. This method raises an NSRangeException if the index is out of bounds.
(Read and Write computed property)

37.91.23 menuForSegment(segment as Integer) as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The menu for the specified segment.
Notes: menu: The menu you want to add to the segment or nil to clear the current menu. This menu is displayed when the user clicks and holds the mouse button while the mouse is over the segment.
segment: The index of the segment whose menu you want to set. This method raises an NSRangeException if the index is out of bounds.

Adding a menu to a segment allows that segment to be used as a pop-up button.
(Read and Write computed property)

37.91.24 tagForSegment(segment as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The tag value for the segment.
Notes: segment: The index of the segment whose width you want to get. This method raises an NSRangeException if the index is out of bounds.

The tag is an integer you define to identify your items.
(Read and Write computed property)

37.91.25 ToolTipForSegment(segment as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The tool tip for the specified segment.
Notes: segment: The index of the segment whose tool tip you want to set. This method raises an NSRangeException if the index is out of bounds.

Tool tips are currently not displayed. Apple may change that in the future.
(Read and Write computed property)

37.91.26 widthForSegment(segment as Integer) as Double

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The width of the specified segment.
Notes: width: The width of the segment, measured in points. Specify the value 0 if you want the segment to be sized to fit the available space automatically.
segment: The index of the segment whose width you want to set. This method raises an NSRangeException if the index is out of bounds.
(Read and Write computed property)

37.91.27 Constants

Scaling Modes

Constant	Value	Description
NSImageScaleAxesIndependently	1	Scale each dimension to exactly fit destination. This setting does not preserve the aspect ratio of the image. Available in Mac OS X v10.5 and later.
NSImageScaleNone	2	Do not scale the image. Available in Mac OS X v10.5 and later.
NSImageScaleProportionallyDown	0	If it is too large for the destination, scale the image down while preserv aspect ratio. Available in Mac OS X v10.5 and later.
NSImageScaleProportionallyUpOrDown	3	Scale the image to its maximum possible dimensions while both staying the destination area and preserving its aspect ratio. Available in Mac OS X v10.5 and later.

Style Constants

Constant	Value	Description
NSSegmentStyleAutomatic	0	The appearance of the segmented control is automatically determined based o the type of window in which the control is displayed and the position withi the window.
NSSegmentStyleCapsule	5	The control is displayed using the capsule style.
NSSegmentStyleRounded	1	The control is displayed using the rounded style.
NSSegmentStyleRoundRect	3	The control is displayed using the round rect style.
NSSegmentStyleSeparated	8	The segments in the control are displayed very close to each other but no touching. For example, Safari in macOS 10.10 and later uses this style for th previous and next page segmented control.
NSSegmentStyleSmallSquare	6	The control is displayed using the small square style.
NSSegmentStyleTexturedRounded	2	The control is displayed using the textured rounded style.
NSSegmentStyleTexturedSquare	4	The control is displayed using the textured square style.

Constants for the Switch Tracking

Constant	Value	Description
NSSegmentSwitchTrackingMomentary	2	A segment is selected only when tracking.
NSSegmentSwitchTrackingMomentaryAccelerator	3	accelerator behavior, only selected while tracking.
NSSegmentSwitchTrackingSelectAny	1	Any segment can be selected.
NSSegmentSwitchTrackingSelectOne	0	Only one segment may be selected.

Roles

Constant	Value	Description
RoleAutomatic	0	Automatic
RoleTabs	1	Tabs
RoleValueSelection	2	Value Selection

37.92 class NSSliderMBS

37.92.1 class NSSliderMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: An NSSlider object displays a range of values for something in the application.
Example:

```
// This example needs a window with Slider1.
// show 11 tick marks on a Xojo slider and only allow values on tick marks
Var s As NSSliderMBS = Slider1.NSSliderMBS

s.numberOfTickMarks = 11
s.allowsTickMarkValuesOnly = True
s.trackFillColor = NSColorMBS.systemRedColor
```

Notes: Sliders can be vertical or horizontal bars or circular dials. An indicator, or knob, notes the current setting. The user can move the knob in the slider's bar—or rotate the knob in a circular slider—to change the setting.

The NSSlider class uses the NSSliderCell class to implement its user interface.
Subclass of the NSControlMBS class.

37.92.2 Methods

37.92.3 acceptsFirstMouse(event as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes: The receiver can either return a value unconditionally or use the location of event e to determine

whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

37.92.4 closestTickMarkValueToValue(value as Double) as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the value of the tick mark closest to the specified value.

37.92.5 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new slider with size 100/100 and position 0/0
Example:

```
Var t as new NSSliderMBS
```

Notes: On success the handle property is not zero.
See also:

- 37.92.6 Constructor(Handle as Integer) 7555
- 37.92.7 Constructor(left as Double, top as Double, width as Double, height as Double) 7556

37.92.6 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSSlider handle.
Example:

```
Var t as new NSSliderMBS(0, 0, 100, 100)
Var v as new NSSliderMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSSlider and the plugin retains this handle.
See also:

- 37.92.5 Constructor 7555
- 37.92.7 Constructor(left as Double, top as Double, width as Double, height as Double) 7556

37.92.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new slider with the given size and position.
Example:

```
Var x as new NSSliderMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 37.92.5 Constructor 7555
- 37.92.6 Constructor(Handle as Integer) 7555

37.92.8 indexOfTickMarkAtPoint(p as NSPointMBS) as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the tick mark closest to the location of the receiver represented by the given point.
Notes: Returns the index of the tick mark closest to the location specified by point. If point is not within the bounding rectangle (plus an extra pixel of space) of any tick mark, the method returns NSNotFound.
In its implementation of this method, the receiving NSSlider instance simply invokes the method of the same name of its NSSliderCell instance. This method invokes rectOfTickMarkAtIndex: for each tick mark on the slider until it finds a tick mark containing the point.
See also:

- 37.92.9 indexOfTickMarkAtPoint(x as Double, y as Double) as Integer 7556

37.92.9 indexOfTickMarkAtPoint(x as Double, y as Double) as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the tick mark closest to the location of the receiver represented by the given point.
Notes: The index of the tick mark closest to the location specified by point. If point is not within the bounding rectangle (plus an extra pixel of space) of any tick mark, the method returns NSNotFound (&h7fffffff).
See also:

- 37.92.8 indexOfTickMarkAtPoint(p as NSPointMBS) as Integer 7556

37.92.10 rectOfTickMarkAtIndex(index as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the bounding rectangle of the tick mark at the given index.
Notes: If no tick mark is associated with index, the method raises NSRangeException.

37.92.11 tickMarkValueAtIndex(index as Integer) as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's value represented by the tick mark at the specified index.

37.92.12 Properties

37.92.13 allowsTickMarkValuesOnly as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver fixes its values to those values represented by its tick marks.
Notes: True if the slider fixes its values to the values represented by its tick marks; otherwise, false.
(Read and Write property)

37.92.14 altIncrementValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The amount by which the receiver changes its value when the user Option–drags the slider knob.
Notes: The amount by which the value changes when the user drags the slider knob with the Option key held down. Unless you assign a value to AltIncrementValue, altIncrementValue returns –1.0, and the receiver behaves no differently with the Option key down than with it up.
(Read and Write property)

37.92.15 image as NSImageMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: This method has been deprecated. Returns nil.
Notes: The slider may scale and distort barImage to fit inside the bar.

The knob may cover part of the image. If you want the image to be visible all the time, you're better off placing it near the slider.

This method has been deprecated by Apple.
(Read and Write property)

37.92.16 isVertical as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns an integer indicating the orientation (horizontal or vertical) of the slider.
Notes: 1 if the receiver is vertical, 0 if it's horizontal, and –1 if the orientation can't be determined (for example, if the slider hasn't been displayed yet). A slider is defined as vertical if its height is greater than its width.

Settable with macOS 10.12.
(Read and Write property)

37.92.17 knobThickness as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The knob's thickness, in pixels.
Notes: The thickness of the slider knob. The thickness is defined to be the extent of the knob along the long dimension of the bar. In a vertical slider, then, a knob's thickness is its height; in a horizontal slider, a knob's thickness is its width.
(Read only property)

37.92.18 maxValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The maximum value the receiver can send to its target.
Notes: The slider's maximum value. A horizontal slider sends its maximum value when the knob is at the right end of the bar; a vertical slider sends it when the knob is at the top.
(Read and Write property)

37.92.19 minValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: the minimum value the receiver can send to its target.
Notes: The slider's minimum value. A vertical slider sends its minimum value when its knob is at the bottom; a horizontal slider, when its knob is all the way to the left.
(Read and Write property)

37.92.20 neutralValue as Double

MBS MacControls Plugin, Plugin Version: 25.3, Platform: macOS, Targets: Desktop only.

Function: The neutral value.
Notes: The value this slider will be filled from. This slider will be filled from its neutralValue to its current value. If neutralValue has not been explicitly set before, access to neutralValue will return minValue.

For macOS 26 or newer.
(Read and Write property)

37.92.21 numberOfTickMarks as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The number of tick marks associated with the receiver.
Notes: The number of the slider's tick marks.The tick marks assigned to the minimum and maximum values are included.
(Read and Write property)

37.92.22 sliderType as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The slider type.
Notes: Either NSLinearSlider or NSCircularSlider.
(Read and Write property)

37.92.23 tickMarkPosition as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: How the receiver's tick marks are aligned with it.
Notes: A constant indicating the position of the tick marks. Possible values are NSTickMarkBelow, NSTickMarkAbove, NSTickMarkLeft, and NSTickMarkRight (the last two are for vertical sliders). The default alignments are NSTickMarkBelow and NSTickMarkLeft.

(Read and Write property)

37.92.24 title as string

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The receiver's title.
Notes: The default title is the empty string.
(Read and Write property)

37.92.25 titleCell as NSCellMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the cell used to draw the receiver's title.
Notes: You only need to invoke this method if the default title cell, NSTextFieldCell, doesn't suit your needs—that is, you want to display the title in a manner that NSTextFieldCell doesn't permit. When you do choose to override the default, titleCell should be an instance of a subclass of NSTextFieldCell.

This method has been deprecated by Apple.
(Read and Write property)

37.92.26 titleColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the color used to draw the receiver's title.
Notes: This method has been deprecated by Apple.
(Read and Write property)

37.92.27 titleFont as NSFontMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the font used to draw the receiver's title.
Notes: This method has been deprecated by Apple.
(Read and Write property)

37.92.28 trackFillColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The color of the filled portion of the slider track, in appearances that support it.
Notes: Requires macOS 10.12.2 or newer.
(Read and Write property)

37.92.29 Constants

Constants

Constant	Value	Description
NSCircularSlider	1	One of the slider type constants. A circular slider; that is, a dial.
NSLinearSlider	0	One of the slider type constants. A bar-shaped slider.
NSTickMarkAbove	1	One of the values for the tickMarkPosition property. Tick marks above (for horizontal sliders).
NSTickMarkBelow	0	One of the values for the tickMarkPosition property. Tick marks below (for horizontal sliders); the default for horizontal sliders.
NSTickMarkLeft	1	One of the values for the tickMarkPosition property. Tick marks to the left (for vertical sliders); the default. for vertical sliders
NSTickMarkRight	0	One of the values for the tickMarkPosition property. Tick marks to the right (for vertical sliders).

37.93 control NSSplitViewControlMBS

37.93.1 control NSSplitViewControlMBS

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Our control to wrap a NSSplitViewMBS object.
Blog Entries

- MBS Xojo Plugins, version 23.5pr7
- News from the MBS Xojo Plugins Version 23.4
- MonkeyBread Software Releases the MBS Xojo Plugins in version 23.4

37.93.2 Properties

37.93.3 View as NSSplitViewMBS

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The reference to the underlaying NSSplitView.
Notes: (Read only property)

37.93.4 Events

37.93.5 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

37.93.6 canCollapseSubview(subview as NSViewMBS) as Boolean

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to determine whether the user can collapse and expand the specified subview.
Notes: subview: The subview to collapse.

Returns true if subview collapses when the user drags a divider beyond the halfway mark between its minimum size and its edge; otherwise, false.

The subview expands when the user drags the divider beyond the halfway mark between its minimum size and its edge.

To specify the minimum size, define the constrainMaxCoordinate and constrainMinCoordinate events. A subview can collapse only if you also define constrainMinCoordinate.
A collapsed subview isn,Äôt visible, but the split view object retains it with the same size as before the collapse.
If the events are implemented, the subviews can,Äôt collapse.

37.93.7 Close

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

37.93.8 Closing

Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

37.93.9 constrainMaxCoordinate(proposedMaximumPosition as double, dividerIndex as Integer) as Double

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to constrain the maximum coordinate limit of a divider when the user drags it.
Notes: proposedMax: The proposed maximum coordinate limit of the subview in the split view,Äôs flipped coordinate system.
dividerIndex: Specifies the divider the user is moving, with the first divider being 0 and increasing from top to bottom (or left to right).

Returns the maximum coordinate limit of the divider.

The delegate receives this message before the split view begins tracking the mouse to position a divider. You can further constrain the limits, but you can,Äôt extend the divider limits.
If the split bars are horizontal (views are one on top of the other), proposedMax is the bottom limit. If the split bars are vertical (views are side by side), proposedMax is the right limit. The initial value of proposedMax is the bottom (or right side) of the subview after the divider.

37.93.10 constrainMinCoordinate(proposedMinimumPosition as double, dividerIndex as Integer) as Double

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to constrain the minimum coordinate limit of a divider when the user drags it.
Notes: proposedMin: The proposed minimum coordinate limit of the subview in the split view,Äôs flipped coordinate system.
dividerIndex: Specifies the divider the user is moving, with the first divider being 0 and increasing from top to bottom (or left to right).

Returns the minimum coordinate limit of the divider.

The delegate receives this message before the split view begins tracking the cursor to position a divider. You can further constrain the limits, but you can,Äôt extend the divider limits.
If the split bars are horizontal (views are one on top of the other), proposedMin is the top limit. If the split bars are vertical (views are side by side), proposedMin is the left limit. The initial value of proposedMin is the top (or left side) of the subview before the divider.

37.93.11 constrainSplitPosition(proposedPosition as double, dividerIndex as Integer) as Double

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to constrain the divider to certain positions.
Notes: proposedPosition: The cursor,Äôs current position, and the proposed position of the divider.
dividerIndex: The index of the divider the user is moving, with the first divider being 0 and increasing from top to bottom (or left to right).

Returns the position for constraining the divider.

If the delegate implements this method, the split view calls it repeatedly as the user moves the divider.

If a subview,Äôs height must be a multiple of a certain number, use this method to return the multiple nearest to proposedPosition.

37.93.12 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

37.93.13 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

37.93.14 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

37.93.15 drawDivider(graphics as NSGraphicsMBS, Rect as NSRectMBS) as Boolean

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Draws a divider between two of the split view,Äôs subviews.
Example:

```
Function drawDivider(graphics as NSGraphicsMBS, Rect as NSRectMBS) Handles drawDivider as Boolean

// draw a red box with blue border
graphics.setFillColor NSColorMBS.redColor
graphics.setStrokeColor NSColorMBS.blueColor

Var r As New NSRectMBS(rect.X, rect.y + rect.Height/2 - 5, 10, 10)
```

```
graphics.fillRect r
graphics.strokeRect r

Return True
End Function
```

Notes: Rect: The entire divider rectangle in the split view,Äôs flipped coordinate system.

If you override this method to use a custom style for the divider, you may need to change the size of the divider.

37.93.16 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

37.93.17 FocusLost

Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.93.18 FocusReceived

Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

37.93.19 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

37.93.20 GotFocus

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

37.93.21 LostFocus

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

37.93.22 MenuBarSelected

Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

37.93.23 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

37.93.24 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

37.93.25 MouseUp(x As Integer, y As Integer)

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

37.93.26 Open

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

37.93.27 Opening

Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

37.93.28 resizeSubviewsWithOldSize(oldSize as NSSizeMBS)

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to specify custom sizing behavior for the subviews of the split view.
Notes: oldSize: The size of the split view before the user resizes it.

If the delegate implements this method, it receives this message after the split view resizes.

Resize the subviews so that the sum of the sizes of the subviews plus the sum of the thickness of the dividers equals the size of the new frame of the NSSplitView. You can get the thickness of a divider through the dividerThickness method.

If you implement this delegate method to resize subviews on your own, the NSSplitViewMBS doesn,Äôt perform any error checking for you. However, you can invoke adjustSubviews() to perform the default sizing behavior.

37.93.29 ScaleFactorChanged(NewFactor as double)

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

37.93.30 shouldAdjustSizeOfSubview(view as NSViewMBS) as Boolean

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to specify whether to resize the subview.
Notes: subview: The subview to resize.

If adjustSubviews() can change the size of the subview, return true; otherwise, false. By returning false, you lock the size of the split view subview while the split view resizes.

Regardless of the value that this method returns, adjustSubviews() may change the origin of the subview.

Nonresizable subviews may resize to prevent an invalid subview layout.
If a split view has no delegate, or if its delegate doesn,Äôt respond to this message, the split view behaves as if this method returns true.

37.93.31 shouldHideDivider(dividerIndex as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Allows the delegate to determine whether the user can drag a divider or adjust it off the edge of the split view.
Notes: dividerIndex: The zero-based index of the divider.

Return true if the user can drag the divider off the edge of the split view, resulting in it not being visible.

If a split view has no delegate, or if its delegate doesn,Äôt respond to this message, the split view behaves as if it has a delegate that returns false when it receives this message.

37.93.32 splitViewDidResizeSubviews

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate when the split view resizes its subviews.
Notes: The control invokes this event after the split view resizes two of its subviews in response to the repositioning of a divider.

37.93.33 splitViewWillResizeSubviews

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Notifies the delegate when the split view is about to resize its subviews.
Notes: The control invokes this method before the split view resizes two of its subviews in response to the repositioning of a divider.

37.93.34 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS MacCocoa Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

37.94 class NSSplitViewMBS

37.94.1 class NSSplitViewMBS

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: A view that arranges two or more views in a linear stack running horizontally or vertically.
Example:

```
// This example needs a window with TextArea1 and TextArea2.
Sub Opening()
// add sub views
Var view As NSSplitViewMBS = Me.View

view.Vertical = True
view.addArrangedSubview TextArea1.NSViewMBS
view.addArrangedSubview TextArea2.NSViewMBS

End Sub
```

Notes: By default, dividers have a horizontal orientation so that the split view arranges its panes vertically from top to bottom.

Divider indices are zero-based. If the Vertical property is false, which is the default value, the top divider has an index of 0. If isVertical is true, the leading divider has an index of 0.
Subclass of the NSViewMBS class.

37.94.2 Methods

37.94.3 addArrangedSubview(view as NSViewMBS)

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Adds a view as an arranged split pane.
Notes: If the view isn,Äôt a subview of the split view, calling this method adds it to the split view,Äôs subviews array.

37.94.4 adjustSubviews

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Adjusts the sizes of the split view,Äôs subviews so they (plus the dividers) fill the split view.
Notes: When you call this method, the split view,Äôs subviews resize proportionally; the relative sizes of the subviews don,Äôt change.

The default implementation of this method resizes subviews proportionally so that the ratio of heights (when using horizontal dividers) or widths (when using vertical dividers) doesn,Äôt change, even though the absolute sizes change.

Call this method on split views where you,Äôve added or removed subviews to reestablish the consistency of subview placement.

This method invalidates the cursor when it is over a divider, ensuring the cursor is always of the correct type during and after resizing animations.

37.94.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new split view with size 100/100 and position 0/0
Example:

```
Var t as new NSDatePickerMBS
```

Notes: On success the handle property is not zero.
