60.151.5 AttributeinputBackgroundImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Maximum attribute.
Notes: This attribute should have this content:

Name:	inputBackgroundImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.151.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Maximum attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

60.151.7 inputBackgroundImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Background Image
Notes:

Name:	inputBackgroundImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
Type:	CIAttributeTypeImage

See AttributeinputBackgroundImage for more details.
(Read and Write property)

60.151.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.152 class CIFilterMBS

60.152.1 class CIFilterMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: CIFilter are filter objects for CoreImage that encapsulate the filter with its attributes.
Example:

```
// blur a picture file with a Core Image filter and save the result as PNG
Var image As New CIImageMBS(SpecialFolder.Desktop.Child("test.jpg"))

// each filter has its own subclass, e.g. CIFilterGaussianBlurMBS
Var blur As New CIFilterGaussianBlurMBS
blur.inputImage = image
blur.inputRadius = 10.0

Var result As CIImageMBS = blur.outputImage
Var context As New CIContextMBS
Var error As NSErrorMBS
If Not context.writePNGRepresentationOfImage(result, SpecialFolder.Desktop.Child("blurred.png"), error)
Then
MessageBox error.localizedDescription
End If

// list the names of all available filters
// Var names() As String = CIFilterMBS.FilterNamesInCategory(CIFilterMBS.kCICategoryBuiltIn)
```

Notes: Mac OS X 10.4 only.

60.152.2 Methods

60.152.3 attributesDictionary as dictionary

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns a dictionary of key-value pairs that describe the filter.
Example:

```
Var d as new CIFilterComicEffectMBS
Var a as Dictionary = d.attributesDictionary

break // see values in debugger
```

Notes: Returns a dictionary that contains a key for each input and output parameter for the filter. Each key is a dictionary that contains all the attributes of an input or output parameter.

60.152.4 AttributesItem(index as Integer) as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Returns the attribute with the given index.
Notes: Index is zero based.
Nil on any error.
See also:

- 60.152.5 AttributesItem(name as string) as CIAttributeMBS 10751

60.152.5 AttributesItem(name as string) as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Returns the attribute with the given name.
Notes: nil on error.
See also:

- 60.152.4 AttributesItem(index as Integer) as CIAttributeMBS 10751

60.152.6 AttributesName(index as Integer) as string

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: The name of the attribute with the given index.

60.152.7 Categories as string()

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Array of filter category names.
Notes: nil on any error.

60.152.8 Constructor(Handle as Integer)

MBS MacCI Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Initializes object with given object reference.
Notes: ref should be a CIFilter* and the object is retained.
Raises UnsupportedOperationException if object is not a CIFilter.

60.152.9 copy as CIFilterMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Creates a copy of the filter.

60.152.10 filterArrayFromSerializedXMP(xmpData as MemoryBlock, extent as CGRectMBS, byref NSError as Variant) as CIFilterMBS()

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Returns an array of filter objects de-serialized from XMP data.
Notes: xmpData: The XMP data created previously by calling serializedXMPFromFilters.
extent: The extent of the image from which the XMP data was extracted.
e: The address of an variant for receiving errors, otherwise nil. This is a NSErrorMBS.

Available in OS X v10.9 and later.

60.152.11 FilterNamesInCategories(categories() as String) as string()

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Returns an array containing all published filter names that belong to all listed categories.
Notes: categories: string array with the constants kCICategory*.
Returns nil on any error.

60.152.12 FilterNamesInCategory(category as String) as string()

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Returns an array containing all published filter names in a category.
Example:

```
// This example needs a window with StaticText1 and ListBox1.
// load list of filters into Listbox

Var a() as string
Var cf as CIFilterMBS

// get all image categories
a=ciFilterMBS.FilterNamesInCategory(CIFilterMBS.kCICategoryStillImage)

StaticText1.text=str(a.LastIndex)+" filters."

for each s as string in a

// add to listbox
ListBox1.AddRow s

// load this filter
cf=CIFilterMBS.FilterWithName(s)

// And look into the attributes for the Displayname
if cf<>nil then
ListBox1.CellTextAt(ListBox1.LastAddedRowIndex,1)=cf.DisplayName
end if
next
```

Notes: nil on any error.

60.152.13 FilterWithHandle(handle as Integer) as CIFilterMBS

MBS MacCI Plugin, Plugin Version: 10.4, Platform: macOS, Targets: All.

Function: Creates a new filter object based on the given handle.
Example:

```
// some filter
Var x as new CIFilterCropMBS

// create a copy
Var f as CIFilterMBS = CIFilterMBS.FilterWithHandle(x.Handle)
```

```
// and show name
MessageBox f.FilterName
```

Notes: The object is retained.
Returns nil on error.

60.152.14 filterWithImageData(Data as MemoryBlock, options as Dictionary) as CIFilterMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Returns a CIFilter that will in turn return a properly processed CIImage as "outputImage".
Notes: Note that when using this initializer, you should pass in a source type identifier hint (kCGImageSourceTypeIdentifierHint) key/value pair in order to help the decoder determine the file type, as otherwise confusion and incorrect results are possible.

60.152.15 filterWithImageFile(File as FolderItem, options as Dictionary) as CIFilterMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Returns a CIFilter that will in turn return a properly processed CIImage as "outputImage".

60.152.16 filterWithImageURL(URL as String, options as Dictionary) as CIFilterMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Returns a CIFilter that will in turn return a properly processed CIImage as "outputImage".

60.152.17 FilterWithName(name as String) as CIFilterMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new filter of type 'name'. All input values will be undefined.
Example:

```
Var cf as CIFilterMBS
// load this filter
cf=CIFilterMBS.FilterWithName("CIAffineTile")
```

Notes: Returns filter object for the name if found.
See also:

- 60.152.18 FilterWithName(name as String, options as Dictionary) as CIFilterMBS 10755

60.152.18 FilterWithName(name as String, options as Dictionary) as CIFilterMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Creates a new filter of type 'name'.
Notes: The filter's input parameters are set from the dictionary of key-value pairs.
On OSX, any of the filter input parameters not specified in the dictionary will be undefined.
On iOS, any of the filter input parameters not specified in the dictionary will be set to default values.
Available in macOS 10.10 or newer.
See also:

- 60.152.17 FilterWithName(name as String) as CIFilterMBS 10754

60.152.19 InputKeys as string()

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Returns an array containing the names of all inputs in the filter.

60.152.20 kCIActiveKeys as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Read-only array containing a list of keys that affect the output image.
Depending on the RAW decoder version (kCIInputDecoderVersionKey) and the input image type, some input keys might have no effect.

60.152.21 kCIApplyOptionColorSpace as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the apply options.
Notes: If used, the value of the kCIApplyOptionColorSpace key be must be an RGB CGColorSpaceMBS.
Using this option specifies that the output of the kernel is in this color space.
If not specified, the output of the kernel is in the working color space of the rendering CIContextMBS.

60.152.22 kCIApplyOptionDefinition as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the apply options.

60.152.23 kCIApplyOptionExtent as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the apply options.

60.152.24 kCIApplyOptionUserInfo as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the apply options.

60.152.25 kCIAttributeClass as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Class name of the filter.
Notes: The class name of the filter.

60.152.26 kCIAttributeDefault as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Default value for the slider.
Notes: The default value, specified as a floating-point value, for a filter parameter.

60.152.27 kCIAttributeDescription as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the filter attributes.
Notes: The localized description of the filter. This description should inform the end user what the filter does and be short enough to display in the user interface for the filter. It is not intended to be technically detailed.

60.152.28 kCIAttributeDisplayName as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Display name of this attribute (localized).
Notes: The localized version of the filter name that is displayed in the user interface.

60.152.29 kCIAttributeFilterAvailable_iOS as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the filter attributes.
Notes: The iOS version in which the filter first became available, specified as a string.

60.152.30 kCIAttributeFilterAvailable_Mac as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the filter attributes.
Notes: The OS X version in which the filter first became available, specified as a string.

60.152.31 kCIAttributeFilterCategories as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Array of filter category names (see below)
Notes: An array of filter category keys that specifies all the categories in which the filter is a member.

60.152.32 kCIAttributeFilterDisplayName as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Name of the filter intended for UI display (eg. localized).
Notes: The localized display name of the attribute.

60.152.33 kCIAttributeFilterName as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: The constant for the name of the filter.

60.152.34 kCIAttributeIdentity as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: The identity value for this attribute.
Notes: If supplied as a value for a parameter, the parameter has no effect on the input image.

60.152.35 kCIAttributeMax as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Maximum value for the attribute.
Notes: The maximum value for a filter parameter, specified as a floating-point value.

60.152.36 kCIAttributeMin as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Minimum value for the attribute.
Notes: The minimum value for a filter parameter, specified as a floating-point value.

60.152.37 kCIAttributeName as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the filter attributes.
Notes: The name of the attribute.

60.152.38 kCIAttributeReferenceDocumentation as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the filter attributes.
Notes: The localized reference documentation for the filter. The reference should provide developers with technical details.

60.152.39 kCIAttributeSliderMax as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Default value for the slider.
Notes: The maximum value, specified as a floating-point value, to use for a slider that controls input values for a filter parameter.

60.152.40 kCIAttributeSliderMin as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Minimum value for the slider.
Notes: The minimum value, specified as a floating-point value, to use for a slider that controls input values for a filter parameter.

60.152.41 kCIAttributeType as string

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Type of the attribute.
Notes: An attribute may have a type which defines what kind this attribute type is.
e.g. a number attribute may be a time or a distance.

60.152.42 kCIAttributeTypeAngle as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the types for numbers.
Notes: An angle.

60.152.43 kCIAttributeTypeBoolean as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the types for numbers.
Notes: A Boolean value.

60.152.44 kCIAttributeTypeColor as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the attribute data types.
Notes: A Core Image color (CIColor object) that specifies red, green, and blue component values.

60.152.45 kCIAttributeTypeCount as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the attribute data types.
Notes: A positive integer value.

60.152.46 kCIAttributeTypeDistance as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the types for numbers.
Notes: A distance.

60.152.47 kCIAttributeTypeGradient as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the types for colors.
Notes: An n-by-1 gradient image used to describe a color ramp.

60.152.48 kCIAttributeTypeImage as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the attribute data types.
Notes: A CIImage object.

60.152.49 kCIAttributeTypeInteger as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the attribute data types.
Notes: An integer value.

60.152.50 kCIAttributeTypeOffset as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the types for 2-element vectors.
Notes: An offset. (A 2-element vector type.)

60.152.51 kCIAttributeTypeOpaqueColor as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the types for colors.
Notes: A Core Image color (CIColor object) that specifies red, green, and blue component values. Use this key for colors with no alpha component. If the key is not present, Core Image assumes color with alpha.

60.152.52 kCIAttributeTypePosition as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the types for 2-element vectors.
Notes: A two-dimensional location in the working coordinate space. (A 2-element vector type.)

60.152.53 kCIAttributeTypePosition3 as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the types for 3-element vectors.
Notes: A three-dimensional location in the working coordinate space. (A 3-element vector type.)

60.152.54 kCIAttributeTypeRectangle as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the types for 4-element vectors.
Notes: A Core Image vector that specifies the x and y values of the rectangle origin, and the width (w) and height (h) of the rectangle. The vector takes the form [x, y, w, h] . (A 4-element vector type.)

60.152.55 kCIAttributeTypeScalar as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the types for numbers.
Notes: A scalar value.

60.152.56 kCIAttributeTypeTime as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the attribute data types.
Notes: A parametric time for transitions, specified as a floating-point value in the range of 0.0 to 1.0.

60.152.57 kCIAttributeTypeTransform as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the attribute data types.
Notes: An CGAffineTransform is associated with attribute.

60.152.58 kCICategoryBlur as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that softens images, decreasing the contrast between the edges in an image. Examples of blur filters are Gaussian blur and zoom blur.

60.152.59 kCICategoryBuiltIn as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter provided by Core Image. This distinguishes built-in filters from plug-in filters.

60.152.60 kCICategoryColorAdjustment as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that changes color values. Color adjustment filters are used to eliminate color casts, adjust hue, and correct brightness and contrast. Color adjustment filters do not perform color management; ColorSync performs color management. You can use Quartz 2D to specify the color space associated with an image.

60.152.61 kCICategoryColorEffect as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that modifies the color of an image to achieve an artistic effect. Examples of color effect filters include filters that change a color image to a sepia image or a monochrome image or that produces such effects as posterizing.

60.152.62 kCICategoryCompositeOperation as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter operates on two image sources, using the color values of one image to operate on the other. Composite filters perform computations such as computing maximum values, minimum values, and multiplying values between input images. You can use compositing filters to add effects to an image, crop an image, and achieve a variety of other effects.

60.152.63 kCICategoryDistortionEffect as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that reshapes an image by altering its geometry to create a 3D effect. Using distortion filters, you can displace portions of an image, apply lens effects, make a bulge in an image, and perform other operation to achieve an artistic effect.

60.152.64 kCICategoryFilterGenerator as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter created by chaining several filters together and then packaged as a CIFilterGenerator object.

60.152.65 kCICategoryGenerator as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that generates a pattern, such as a solid color, a checkerboard, or a star shine. The generated output is typically used as input to another filter.

60.152.66 kCICategoryGeometryAdjustment as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that changes the geometry of an image. Some of these filters are used to warp an image to achieve an artistic effects, but these filters can also be used to correct problems in the source image. For example, you can apply an affine transform to straighten an image that is rotated with respect to the horizon.

60.152.67 kCICategoryGradient as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that generates a fill whose color varies smoothly. Exactly how color varies depends on the type of gradient—linear, radial, or Gaussian.

60.152.68 kCICategoryHalftoneEffect as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that simulates a variety of halftone screens, to mimic the halftone process used in print media. The output of these filters has the familiar ‚Äúnewspaper‚Äù look of the various dot patterns. Filters are typically named after the pattern created by the virtual halftone screen, such as circular screen or hatched screen.

60.152.69 kCICategoryHighDynamicRange as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that works on high dynamic range pixels.

60.152.70 kCICategoryInterlaced as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that works on interlaced images.

60.152.71 kCICategoryNonSquarePixels as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that works on non-square pixels.

60.152.72 kCICategoryReduction as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that reduces image data. These filters are used to solve image analysis problems.

60.152.73 kCICategorySharpen as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that sharpens images, increasing the contrast between the edges in an image. Examples of sharpen filters are unsharp mask and sharpen luminance.

60.152.74 kCICategoryStillImage as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that works on still images.

60.152.75 kCICategoryStylize as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that makes a photographic image look as if it was painted or sketched. These filters are typically used alone or in combination with other filters to achieve artistic effects.

60.152.76 kCICategoryTileEffect as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that typically applies an effect to an image and then create smaller versions of the image (tiles), which are then laid out to create a pattern that,Äôs infinite in extent.

60.152.77 kCICategoryTransition as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that provides a bridge between two or more images by applying a motion effect that defines how the pixels of a source image yield to that of the destination image.

60.152.78 kCICategoryVideo as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: One of the categories.
Notes: A filter that works on video images.

60.152.79 kCIInputAllowDraftModeKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Boolean: Setting Draft Mode to true can improve image decoding speed without minimal loss of quality.
The default value is false.

60.152.80 kCIInputAngleKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.81 kCIInputAspectRatioKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.82 kCIInputBackgroundImageKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.83 kCIInputBaselineExposureKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Float: A value controlling the amount of baseline exposure applied to the image.
A value of 0 indicates no baseline exposure, i.e. linear response. Default varies from with camera settings.
Available on macOS 10.12 or newer.

60.152.84 kCIInputBiasKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.85 kCIInputBoostKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Float: A value in the range of 0...1, controlling the amount of boost applied to the image.
A value of 0 indicates no boost, i.e. linear response. Default is 1, full boost.

60.152.86 kCIInputBoostShadowAmountKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Float: The amount to boost the shadow areas of the image. Can be used to lighten details in shadows.
Has no effect if the image used for initialization was not RAW.

60.152.87 kCIInputBrightnessKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.88 kCIInputCenterKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.89 kCIInputColorKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.90 kCIInputColorNoiseReductionAmountKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Double: The amount of color noise reduction applied. Range is 0 to 1.

60.152.91 kCIInputContrastKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.92 kCIInputDecoderVersionKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Version string representing the decoder version to be used. A newly initialized object defaults to the newest available decoder version for the given image type. User can request an alternative, older version in order to maintain compatibility with older releases. Must be one of kCISupportedDecoderVersions (below), otherwise a nil output image will be generated.

60.152.93 kCIInputDepthImageKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the common filter parameter keys.
Notes: Available on macOS 10.13 or newer.

60.152.94 kCIInputDisableGamutMapKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Boolean: Setting DisableGamutMap to true disables gamut mapping.
The default value is false.

60.152.95 kCIInputDisparityImageKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the common filter parameter keys.
Notes: Available on macOS 10.13 or newer.

60.152.96 kCIInputEnableChromaticNoiseTrackingKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Boolean: Determines if progressive chromatic noise tracking (based on ISO and exposure time) should be used. default = true. Has no effect if the image used for initialization was not RAW.

60.152.97 kCIInputEnableSharpeningKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Boolean: Determines if the default sharpening should be on. default = true. Has no effect if the image used for initialization was not RAW.

60.152.98 kCIInputEnableVendorLensCorrectionKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Boolean: Determines if the default vendor lens correction be on. default = true if raw image used for initialization contains lens distortion parameters.

60.152.99 kCIInputEVKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.100 kCIInputExtentKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.101 kCIInputGradientImageKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.102 kCIInputIgnoreImageOrientationKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Boolean: Normally, an image is loaded in its proper orientation, given the associated metadata gives

an indication about the orientation. For special purposes it may be useful to load the image in its physical orientation. The exact meaning of this is dependent on the image in question. The default value is false.

60.152.103 kCIInputImageKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.104 kCIInputImageOrientationKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Integer: Overriding this value allows the user to change the orientation of the image. The valid values are in range 1...8 and follow the EXIF specification. Changing this value makes for instance rotation in 90-degree increments easy. The value is disregarded when the kCIInputIgnoreImageOrientationKey flag is set.

60.152.105 kCIInputIntensityKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.106 kCIInputLinearSpaceFilter as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: CIFilterMBS: CIFilter to be applied to the RAW image while it is in linear space.

60.152.107 kCIInputLuminanceNoiseReductionAmountKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Double: The amount of luminance noise reduction applied. Range is 0 to 1.

60.152.108 kCIInputMaskImageKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.109 kCIInputMoireAmountKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Double: The amount of moire reduction applied. Range is 0 to 1.
Available on macOS 10.13

60.152.110 kCIInputNeutralChromaticityXKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Float: The X value of the chromaticity. You can always query this value and you'll get the current X value for neutral X,Y.

60.152.111 kCIInputNeutralChromaticityYKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Float: The Y value of the chromaticity. You can always query this value and you'll get the current Y value for neutral X,Y.

60.152.112 kCIInputNeutralLocationKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: CIVector: (x, y) location in geometric coordinates of the unrotated output image that should be used as neutral.
You can't query this value - it's undefined for reading.

60.152.113 kCIInputNeutralTemperatureKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Float: The color temperature to be considered neutral. You can always query this value and you'll get the current value for temperature.

60.152.114 kCIInputNeutralTintKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Float: The tint to be considered neutral. You can always query this value and you'll get the current value for tint.

60.152.115 kCIInputNoiseReductionAmountKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Double: The amount of noise reduction applied. Range is 0 to 1.

60.152.116 kCIInputNoiseReductionContrastAmountKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Double: The amount of noise reduction contrast applied. Range is 0 to 1.

60.152.117 kCIInputNoiseReductionDetailAmountKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Double: The amount of noise reduction detail applied. Range is 0 to 1.

60.152.118 kCIInputNoiseReductionSharpnessAmountKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Double: The amount of noise reduction sharpness applied. Range is 0 to 1.

60.152.119 kCIInputRadiusKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.120 kCIInputRefractionKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.121 kCIInputSaturationKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.122 kCIInputScaleFactorKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Float: The desired scale factor at which the image will be eventually drawn. Setting this value can greatly improve the drawing performance. A value of 1 would mean identity, values smaller than 1 will result in a smaller output image. Changing the Scale Factor with enabled Draft Mode may also improve performance.

60.152.123 kCIInputScaleKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.124 kCIInputShadingImageKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.125 kCIInputSharpnessKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.126 kCIInputTargetImageKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.127 kCIInputTimeKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.128 kCIInputTransformKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.129 kCIInputVersionKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.130 kCIInputWeightsKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the common filter parameter keys.

60.152.131 kCIInputWidthKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the input keys.

60.152.132 kCIOutputImageKey as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The key for the output image.

60.152.133 kCIOutputNativeSizeKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: CIVector containing the full native size of the unscaled image. The vector's X value is the width, Y is the height.
This is not affected by changing either kCIInputIgnoreImageOrientationKey or kCIInputImageOrientationKey.

60.152.134 kCISupportedDecoderVersionsKey as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the options for image filter initialization.
Notes: Array of dictionary: Array of all supported decoder versions for the given image type, sorted in increasingly newer order. Each entry is a NSDictionary with a number of key/value pairs. All entries would represent a valid version identifier to be passed in for kCIInputDecoderVersion. This value can be only read; setting this value will raise an exception. Currently, the only defined key is @"version" which has as a value an String uniquely describing a given decoder version. This string may not be suitable for user interface display.

60.152.135 kCIUIParameterSet as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Sets of controls for various user scenarios.
Notes: The set of input parameters to use. The associated value can be kCIUISetBasic, kCIUISetIntermediate, kCIUISetAdvanced, or kCIUISetDevelopment.

60.152.136 kCIUISetAdvanced as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the UI Set constants.
Notes: Controls that are appropriate for an advanced user scenario.

60.152.137 kCIUISetBasic as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the UI Set constants.
Notes: Controls that are appropriate for a basic user scenario, that is, the minimum of settings to control the filter.

60.152.138 kCIUISetDevelopment as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the UI Set constants.
Notes: Controls that should be visible only for development purposes.

60.152.139 kCIUISetIntermediate as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the UI Set constants.
Notes: Controls that are appropriate for an intermediate user scenario.

60.152.140 localizedDescriptionForFilterName(filterName as String) as String

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns the localized description of a filter for display in the user interface.
Example:

```
MessageBox CIFilterMBS.localizedDescriptionForFilterName("CIComicEffect")
```

Notes: filterName: The filter name.
Returns the localized description of the filter.

Available in OS X v10.5 and later.

60.152.141 LocalizedNameForCategory(name as String) as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: The localized name of a category.

60.152.142 LocalizedNameForFilterName(name as String) as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Returns the localized name of a filter.

60.152.143 localizedReferenceDocumentationForFilterName(filterName as String) as String

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns the location of the localized reference documentation that describes the filter.
Example:

MessageBox CIFilterMBS.localizedReferenceDocumentationForFilterName("CIComicEffect")

Notes: filterName: The filter name.

Returns an URL that specifies the location of the localized documentation, or "" if the filter does not provide localized reference documentation.

The URL can be a local file or a remote document on a web server. Because filters created prior to OS X v10.5 could return nil, you should be make sure that your code handles this case gracefully.

Available in OS X v10.5 and later.

60.152.144 OutputKeys as string()

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Returns an array containing the names of all outputs in the filter.

60.152.145 serializedXMPFromFilters(filters() as CIFilterMBS, extent as CGRectMBS) as Memoryblock

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Serializes filter parameters into XMP form that is suitable for embedding in an image.
Notes: filters: The array of filters to serialize. See Discussion for the filters that can be serialized.
extent: The extent of the input image to the filter.

At this time the only filters classes that can be serialized using this method are, CIAffineTransform, CICrop, and the filters returned by the CIImage methods autoAdjustmentFilters and autoAdjustmentFiltersWithOptions. The parameters of other filter classes will not be serialized.

Available in OS X v10.9 and later.

60.152.146 SetDefaults

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Sets all inputs to their default values (where default values are defined, other inputs are left as-is).

60.152.147 Properties

60.152.148 AttributesCount as Integer

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Number of attributes.
Notes: (Read only property)

60.152.149 description as String

MBS MacCI Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the textual description for this filter.
Notes: (Read only property)

60.152.150 DisplayName as string

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Name of the filter intended for UI display (eg. localized)
Example:

```
Var cf as new CIFilterLuminosityBlendModeMBS
MessageBox cf.DisplayName // shows: "Luminosity Blend Mode"
```

Notes: (Read only property)

60.152.151 Enabled as Boolean

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Whether filter is enabled for animation.
Notes: The 'enabled' property is used only by CoreAnimation and is animatable.
In Core Animation, a CIFilter only applied to its input when this property is set to true.
(Read and Write property)

60.152.152 FilterName as string

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Name of the filter.
Notes: (Read only property)

60.152.153 Handle as Integer

MBS MacCI Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: The handle to the internal used CIFilter reference.
Notes: (Read only property)

60.152.154 Name as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The filter name.
Notes: On OSX this property is read-write. This can be useful when using CIFilters with CALayers to

construct unique keypaths.
For example, to set an attribute of a filter attached to a layer, a path such as "filters.myExposureFilter.inputEV" could be used.
CALayer animations may also access filter attributes via key-paths.
(Read and Write property)

60.152.155 outputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The output image.
Notes: Available directly on OS X 10.10 or newer, but our plugin implements it also for older versions by using valueForKey internally.
(Read only property)

60.152.156 ValueAsAffineTransform(key as string) as NSAffineTransformMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Get or set a value as an affine transform.
Notes: On if attributes classname is NSAffineTransform.
(Read and Write computed property)

60.152.157 ValueAsCIColor(key as string) as CIColorMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Get or set a value as a color.
Notes: On if attributes classname is CIColor.
(Read and Write computed property)

60.152.158 ValueAsCIImage(key as string) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Get or set a value as an image.
Notes: On if attributes classname is NSImage.
(Read and Write computed property)

60.152.159 ValueAsCIVector(key as string) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Get or set a value as a vector.
Notes: On if attributes classname is CIVector.
(Read and Write computed property)

60.152.160 ValueAsData(key as string) as memoryblock

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Get or set a value as a memoryblock.
Notes: On if attributes classname is memoryblock.
(Read and Write computed property)

60.152.161 ValueAsNumber(key as string) as Double

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Get or set a value as a double.
Notes: On if attributes classname is number.
(Read and Write computed property)

60.152.162 ValueAsString(key as string) as String

MBS MacCI Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Get or set a value as a string.
Notes: On if attributes classname is NSString.
(Read and Write computed property)

60.153 class CIFilterMedianFilterMBS

60.153.1 class CIFilterMedianFilterMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Median filter.
Notes: Details for this filter:

FilterName:	CIMedianFilter
DisplayName English:	Median
DisplayName German:	Median
DisplayName French:	M√©dian
DisplayName Italian:	Mediana
DisplayName Spanish:	Mediano

Categories:

- CICategoryBlur: Blur
- CICategoryStillImage: Still Image
- CICategoryVideo: Video
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.153.2 Methods

60.153.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.153.4 Properties

60.153.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Median attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.153.6 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.154 class CIFilterMeshGeneratorMBS

60.154.1 class CIFilterMeshGeneratorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Mesh Generator filter.
Example:

```
// generate an image with the Mesh Generator filter
Var filter As New CIFilterMeshGeneratorMBS
filter.inputColor = New CIColorMBS(1, 1, 1, 1)
filter.inputWidth = 1.5 // range 1 to 10

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture(300, 300)
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIMeshGenerator
DisplayName English:	Mesh Generator
DisplayName German:	Gittergenerator
DisplayName French:	G√©n√©rateur de maillage
DisplayName Italian:	Generatore di mesh
DisplayName Spanish:	Generador de mallas

Categories:

- CICategoryGenerator: Generator
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputWidth: Width
- inputColor: Color

- inputMesh: Mesh

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.154.2 Methods

60.154.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.154.4 Properties

60.154.5 AttributeinputColor as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Mesh Generator attribute.
Notes: This attribute should have this content:

Name:	inputColor
Class:	CIColorMBS
Type:	CIAttributeTypeColor
DisplayName English:	Color
DisplayName German:	Farbe
DisplayName French:	Couleur
DisplayName Italian:	Colore
DisplayName Spanish:	Color
DefaultColor:	Red = 1, Green = 1, Blue = 1, Alpha = 1
IdentityNumber:	0

(Read only property)

60.154.6 AttributeinputMesh as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Mesh Generator attribute.
Notes: This attribute should have this content:

Name:	inputMesh
Class:	Variant
DisplayName:	Mesh
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.154.7 AttributeinputWidth as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Mesh Generator attribute.
Notes: This attribute should have this content:

Name:	inputWidth
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
DefaultNumber:	1.5
IdentityNumber:	0
SliderMaxNumber:	10
SliderMinNumber:	1

(Read only property)

60.154.8 inputColor as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Color
Notes:

Name:	inputColor
Class:	CIColorMBS (CIColor)
DisplayName English:	Color
DisplayName German:	Farbe
DisplayName French:	Couleur
DisplayName Italian:	Colore
DisplayName Spanish:	Color
Type:	CIAttributeTypeColor

See AttributeinputColor for more details.
(Read and Write property)

60.154.9 inputMesh as Variant

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Mesh
Notes:

Name:	inputMesh
Class:	Variant (NSArray)
DisplayName English:	Mesh
DisplayName German:	Mesh
DisplayName French:	Mesh
DisplayName Italian:	Mesh
DisplayName Spanish:	Mesh

See AttributeinputMesh for more details.
(Read and Write property)

60.154.10 inputWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Width
Notes:

See AttributeinputWidth for more details.
(Read and Write property)

Name:	inputWidth
Class:	double (NSNumber)
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
Type:	CIAttributeTypeDistance

60.155 class CIFilterMinimumComponentMBS

60.155.1 class CIFilterMinimumComponentMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Minimum Component filter.
Notes: Details for this filter:

FilterName:	CIMinimumComponent
DisplayName English:	Minimum Component
DisplayName German:	Minimaler Kanal
DisplayName French:	Composante minimum
DisplayName Italian:	Componente minimo
DisplayName Spanish:	Componente m√nimo

Categories:

- CICategoryColorEffect: Color Effect
- CICategoryVideo: Video
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.155.2 Methods

60.155.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.155.4 Properties

60.155.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Minimum Component attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.155.6 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.156 class CIFilterMinimumCompositingMBS

60.156.1 class CIFilterMinimumCompositingMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Minimum filter.
Notes: Details for this filter:

FilterName:	CIMinimumCompositing
DisplayName English:	Minimum
DisplayName German:	Minimum
DisplayName French:	Minimum
DisplayName Italian:	Minima
DisplayName Spanish:	M√nimo

Categories:

- CICategoryCompositeOperation: Composite Operation
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputBackgroundImage: Background Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.156.2 Methods

60.156.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.156.4 Properties

60.156.5 AttributeinputBackgroundImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Minimum attribute.
Notes: This attribute should have this content:

Name:	inputBackgroundImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.156.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Minimum attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

60.156.7 inputBackgroundImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Background Image
Notes:

Name:	inputBackgroundImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
Type:	CIAttributeTypeImage

See AttributeinputBackgroundImage for more details.
(Read and Write property)

60.156.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.157 class CIFilterMixMBS

60.157.1 class CIFilterMixMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Mix filter.
Example:

```
// apply the Mix filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterMixMBS
filter.inputImage = image
filter.inputBackgroundImage = image
filter.inputAmount = 1 // range 0 to 1

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIMix
DisplayName English:	Mix
DisplayName German:	Mix
DisplayName French:	M√©lange
DisplayName Italian:	Mix
DisplayName Spanish:	Mezcla

Categories:

- CICategoryStylize: Stylize
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputBackgroundImage: Background Image
- inputAmount: Amount

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.157.2 Methods

60.157.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.157.4 Properties

60.157.5 AttributeinputAmount as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Mix attribute.
Notes: This attribute should have this content:

(Read only property)

60.157.6 AttributeinputBackgroundImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Mix attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputAmount
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Amount
DisplayName German:	St√§rke
DisplayName French:	Montant
DisplayName Italian:	Quantit√†
DisplayName Spanish:	Cantidad
DefaultNumber:	1
IdentityNumber:	1
SliderMaxNumber:	1
SliderMinNumber:	0

Name:	inputBackgroundImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
DefaultNumber:	0
IdentityNumber:	0

60.157.7 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Mix attribute.
Notes: This attribute should have this content:

(Read only property)

60.157.8 inputAmount as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Amount
Notes:

See AttributeinputAmount for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

Name:	inputAmount
Class:	double (NSNumber)
DisplayName English:	Amount
DisplayName German:	St√§rke
DisplayName French:	Montant
DisplayName Italian:	Quantit√†
DisplayName Spanish:	Cantidad
Type:	CIAttributeTypeScalar

60.157.9 inputBackgroundImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Background Image
Notes:

Name:	inputBackgroundImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
Type:	CIAttributeTypeImage

See AttributeinputBackgroundImage for more details.
(Read and Write property)

60.157.10 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.158 class CIFilterModTransitionMBS

60.158.1 class CIFilterModTransitionMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Mod filter.
Example:

```
// apply the Mod Transition filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterModTransitionMBS
filter.inputImage = image
filter.inputTargetImage = image
filter.inputAngle = 2 // range -6.283185 to 6.283185
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputCompression = 300 // range 100 to 800
filter.inputRadius = 150 // range 1 to 200
filter.inputTime = 0.5 // range 0 to 1

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIModTransition
DisplayName English:	Mod
DisplayName German:	Mod
DisplayName French:	Mod
DisplayName Italian:	Mod
DisplayName Spanish:	Mod

Categories:

- CICategoryTransition: Transition
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputTargetImage: Target Image
- inputCenter: Center
- inputTime: Time
- inputAngle: Angle
- inputRadius: Radius
- inputCompression: Compression

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.158.2 Methods

60.158.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.158.4 Properties

60.158.5 AttributeinputAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Mod attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
DefaultNumber:	2
IdentityNumber:	0
SliderMaxNumber:	6.283185
SliderMinNumber:	-6.283185

60.158.6 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Mod attribute.
Notes: This attribute should have this content:

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

(Read only property)

60.158.7 AttributeinputCompression as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Mod attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputCompression
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Compression
DisplayName German:	Komprimierung
DisplayName French:	Compression
DisplayName Italian:	Compressione
DisplayName Spanish:	Compresi√n
DefaultNumber:	300
IdentityNumber:	0
MaxNumber:	0
MinNumber:	1
SliderMaxNumber:	800
SliderMinNumber:	100

60.158.8 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Mod attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.158.9 AttributeinputRadius as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Mod attribute.
Notes: This attribute should have this content:

Name:	inputRadius
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
DefaultNumber:	150
IdentityNumber:	0
MaxNumber:	0
MinNumber:	1
SliderMaxNumber:	200
SliderMinNumber:	1

(Read only property)

60.158.10 AttributeinputTargetImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Mod attribute.
Notes: This attribute should have this content:

Name:	inputTargetImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Target Image
DisplayName German:	Zielbild
DisplayName French:	Image cible
DisplayName Italian:	Immagine target
DisplayName Spanish:	Imagen de destino
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.158.11 AttributeinputTime as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Mod attribute.
Notes: This attribute should have this content:

Name:	inputTime
Class:	double
Type:	CIAttributeTypeTime
DisplayName English:	Time
DisplayName German:	Zeit
DisplayName French:	Dur√©e
DisplayName Italian:	Tempo
DisplayName Spanish:	Tiempo
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	1
MinNumber:	0
SliderMaxNumber:	1
SliderMinNumber:	0

(Read only property)

60.158.12 inputAngle as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Angle
Notes:

Name:	inputAngle
Class:	double (NSNumber)
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
Type:	CIAttributeTypeAngle

See AttributeinputAngle for more details.
(Read and Write property)

60.158.13 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.158.14 inputCompression as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Compression
Notes:

Name:	inputCompression
Class:	double (NSNumber)
DisplayName English:	Compression
DisplayName German:	Komprimierung
DisplayName French:	Compression
DisplayName Italian:	Compressione
DisplayName Spanish:	Compresi√n
Type:	CIAttributeTypeDistance

See AttributeinputCompression for more details.
(Read and Write property)

60.158.15 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.158.16 inputRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius
Notes:

Name:	inputRadius
Class:	double (NSNumber)
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
Type:	CIAttributeTypeDistance

See AttributeinputRadius for more details.
(Read and Write property)

60.158.17 inputTargetImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Target Image
Notes:

Name:	inputTargetImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Target Image
DisplayName German:	Zielbild
DisplayName French:	Image cible
DisplayName Italian:	Immagine target
DisplayName Spanish:	Imagen de destino
Type:	CIAttributeTypeImage

See AttributeinputTargetImage for more details.
(Read and Write property)

60.158.18 inputTime as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Time
Notes:

Name:	inputTime
Class:	double (NSNumber)
DisplayName English:	Time
DisplayName German:	Zeit
DisplayName French:	Dur√©e
DisplayName Italian:	Tempo
DisplayName Spanish:	Tiempo
Type:	CIAttributeTypeTime

See AttributeinputTime for more details.
(Read and Write property)

60.159 class CIFilterMorphologyGradientMBS

60.159.1 class CIFilterMorphologyGradientMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Morphology Gradient filter.
Notes: Details for this filter:

FilterName:	CIMorphologyGradient
DisplayName English:	Morphology Gradient
DisplayName German:	Morphologischer Verlauf
DisplayName French:	Gradient morphologique
DisplayName Italian:	Gradiente morfologico
DisplayName Spanish:	Gradiente morfol√gico

Categories:

- CICategoryBlur: Blur
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputRadius: Radius

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.159.2 Methods

60.159.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.159.4 Properties

60.159.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Morphology Gradient attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.159.6 AttributeinputRadius as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Morphology Gradient attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputRadius
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
DefaultNumber:	5
IdentityNumber:	0
SliderMaxNumber:	50
SliderMinNumber:	0

60.159.7 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.159.8 inputRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius
Notes:

See AttributeinputRadius for more details.
(Read and Write property)

Name:	inputRadius
Class:	double (NSNumber)
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
Type:	CIAttributeTypeDistance

60.160 class CIFilterMorphologyMaximumMBS

60.160.1 class CIFilterMorphologyMaximumMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Morphology Maximum filter.
Notes: Details for this filter:

FilterName:	CIMorphologyMaximum
DisplayName English:	Morphology Maximum
DisplayName German:	Morphologisches Maximum
DisplayName French:	Maximum morphologique
DisplayName Italian:	Massimo morfologico
DisplayName Spanish:	M√°ximo morfol√gico

Categories:

- CICategoryBlur: Blur
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputRadius: Radius

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.160.2 Methods

60.160.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.160.4 Properties

60.160.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Morphology Maximum attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.160.6 AttributeinputRadius as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Morphology Maximum attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputRadius
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
DefaultNumber:	0
IdentityNumber:	0
SliderMaxNumber:	50
SliderMinNumber:	0

60.160.7 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.160.8 inputRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius
Notes:

See AttributeinputRadius for more details.
(Read and Write property)

Name:	inputRadius
Class:	double (NSNumber)
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
Type:	CIAttributeTypeDistance

60.161 class CIFilterMorphologyMinimumMBS

60.161.1 class CIFilterMorphologyMinimumMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Morphology Minimum filter.
Notes: Details for this filter:

FilterName:	CIMorphologyMinimum
DisplayName English:	Morphology Minimum
DisplayName German:	Morphologisches Minimum
DisplayName French:	Minimum morphologique
DisplayName Italian:	Minimo morfologico
DisplayName Spanish:	M√nimo morfol√gico

Categories:

- CICategoryBlur: Blur
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputRadius: Radius

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.161.2 Methods

60.161.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.161.4 Properties

60.161.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Morphology Minimum attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.161.6 AttributeinputRadius as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Morphology Minimum attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputRadius
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Radius
DisplayName German:	Radius

60.161.7 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.161.8 inputRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius
Notes:

See AttributeinputRadius for more details.
(Read and Write property)

Name:	inputRadius
Class:	double (NSNumber)
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
Type:	CIAttributeTypeDistance

60.162 class CIFilterMorphologyRectangleMaximumMBS

60.162.1 class CIFilterMorphologyRectangleMaximumMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Morphology Rectangle Maximum filter.
Example:

```
// apply the Morphology Rectangle Maximum filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterMorphologyRectangleMaximumMBS
filter.inputImage = image
filter.inputHeight = 5 // range 1 to 49
filter.inputWidth = 5 // range 1 to 49

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIMorphologyRectangleMaximum
DisplayName English:	Morphology Rectangle Maximum
DisplayName German:	Maximum des Morphologierechtecks
DisplayName French:	Maximum morphologique (rectangulaire)
DisplayName Italian:	Massimo morfologico rettangolare
DisplayName Spanish:	M√°ximo morfol√gico rectangular

Categories:

- CICategoryBlur: Blur
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputWidth: Width
- inputHeight: Height

Output:

- outputImage

Subclass of the CIFilterMBS class.
Blog Entries

- MBS Xojo Plugins, version 23.0pr5

60.162.2 Methods

60.162.3 Constructor

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.162.4 Properties

60.162.5 AttributeinputHeight as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: Details about the Morphology Rectangle Maximum attribute.
Notes: This attribute should have this content:

(Read only property)

60.162.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: Details about the Morphology Rectangle Maximum attribute.
Notes: This attribute should have this content:

Name:	inputHeight

(Read and Write property)

60.164 class CIFilterMotionBlurMBS

60.164.1 class CIFilterMotionBlurMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Motion Blur filter.
Example:

```
// apply the Motion Blur filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterMotionBlurMBS
filter.inputImage = image
filter.inputAngle = 0 // range -3.141593 to 3.141593
filter.inputRadius = 20 // range 0 to 100

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIMotionBlur
DisplayName English:	Motion Blur
DisplayName German:	Bewegungsunsch√§rfe
DisplayName French:	Flou mouvement
DisplayName Italian:	Sfumatura movimento
DisplayName Spanish:	Difuminado de movimiento

Categories:

- CICategoryBlur: Blur
- CICategoryStillImage: Still Image
- CICategoryVideo: Video
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputRadius: Radius
- inputAngle: Angle

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.164.2 Methods

60.164.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.164.4 Properties

60.164.5 AttributeinputAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Motion Blur attribute.
Notes: This attribute should have this content:

(Read only property)

60.164.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Motion Blur attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Angle

Type:	CIAttributeTypeImage

60.167 class CIFilterNinePartStretchedMBS

60.167.1 class CIFilterNinePartStretchedMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Nine Part Stretched filter.
Example:

```
// apply the Nine Part Stretched filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterNinePartStretchedMBS
filter.inputImage = image
filter.inputBreakpoint0 = New CIVectorMBS(50, 50)
filter.inputBreakpoint1 = New CIVectorMBS(150, 150)
filter.inputGrowAmount = New CIVectorMBS(100, 100)

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CINinePartStretched
DisplayName English:	Nine Part Stretched
DisplayName German:	Neun Teile gedehnt
DisplayName French:	√âtir√© en neuf parties
DisplayName Italian:	Con allungamento in nove parti
DisplayName Spanish:	Estirado en nueve partes

Categories:

- CICategoryDistortionEffect: Distortion Effect
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputBreakpoint0: Breakpoint0
- inputBreakpoint1: Breakpoint1
- inputGrowAmount: Grow Amount

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.167.2 Methods

60.167.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.167.4 Properties

60.167.5 AttributeinputBreakpoint0 as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Nine Part Stretched attribute.
Notes: This attribute should have this content:

Name:	inputBreakpoint0
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName:	Breakpoint0
DefaultVector:	[50 50]
IdentityVector:	n/a

(Read only property)

60.167.6 AttributeinputBreakpoint1 as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Nine Part Stretched attribute.
Notes: This attribute should have this content:

Name:	inputBreakpoint1
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName:	Breakpoint1
DefaultVector:	[150 150]
IdentityVector:	n/a

(Read only property)

60.167.7 AttributeinputGrowAmount as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Nine Part Stretched attribute.
Notes: This attribute should have this content:

Name:	inputGrowAmount
Class:	CIVectorMBS
Type:	CIAttributeTypeOffset
DisplayName English:	Grow Amount
DisplayName German:	Wachstum
DisplayName French:	Degr√© d‚Äôagrandissement
DisplayName Italian:	Quantit√† di sviluppo
DisplayName Spanish:	Cantidad de crecimiento
DefaultVector:	[100 100]
IdentityVector:	n/a

(Read only property)

60.167.8 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Nine Part Stretched attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.167.9 inputBreakpoint0 as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Breakpoint0
Notes:

Name:	inputBreakpoint0
Class:	CIVectorMBS (CIVector)
DisplayName English:	Breakpoint0
DisplayName German:	Breakpoint0
DisplayName French:	Breakpoint0
DisplayName Italian:	Breakpoint0
DisplayName Spanish:	Breakpoint0
Type:	CIAttributeTypePosition

See AttributeinputBreakpoint0 for more details.
(Read and Write property)

60.167.10 inputBreakpoint1 as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Breakpoint1
Notes:

Name:	inputBreakpoint1
Class:	CIVectorMBS (CIVector)
DisplayName English:	Breakpoint1
DisplayName German:	Breakpoint1
DisplayName French:	Breakpoint1
DisplayName Italian:	Breakpoint1
DisplayName Spanish:	Breakpoint1
Type:	CIAttributeTypePosition

See AttributeinputBreakpoint1 for more details.
(Read and Write property)

60.167.11 inputGrowAmount as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Grow Amount
Notes:

Name:	inputGrowAmount
Class:	CIVectorMBS (CIVector)
DisplayName English:	Grow Amount
DisplayName German:	Wachstum
DisplayName French:	Degr√© d,Äôagrandissement
DisplayName Italian:	Quantit√† di sviluppo
DisplayName Spanish:	Cantidad de crecimiento
Type:	CIAttributeTypeOffset

See AttributeinputGrowAmount for more details.
(Read and Write property)

60.167.12 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.168 class CIFilterNinePartTiledMBS

60.168.1 class CIFilterNinePartTiledMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Nine Part Tiled filter.
Example:

```
// apply the Nine Part Tiled filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterNinePartTiledMBS
filter.inputImage = image
filter.inputBreakpoint0 = New CIVectorMBS(50, 50)
filter.inputBreakpoint1 = New CIVectorMBS(150, 150)
filter.inputFlipYTiles = 1
filter.inputGrowAmount = New CIVectorMBS(100, 100)

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CINinePartTiled
DisplayName English:	Nine Part Tiled
DisplayName German:	Neun Teile gekachelt
DisplayName French:	Mosa√Øque en neuf parties
DisplayName Italian:	Con schema a mosaico in nove parti
DisplayName Spanish:	Mosaico en nueve partes

Categories:

- CICategoryDistortionEffect: Distortion Effect
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputBreakpoint0: Breakpoint0
- inputBreakpoint1: Breakpoint1
- inputGrowAmount: Grow Amount
- inputFlipYTiles: Flip Y Tiles

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.168.2 Methods

60.168.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.168.4 Properties

60.168.5 AttributeinputBreakpoint0 as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Nine Part Tiled attribute.
Notes: This attribute should have this content:

Name:	inputBreakpoint0
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName:	Breakpoint0
DefaultVector:	[50 50]
IdentityVector:	n/a

(Read only property)

60.168.6 AttributeinputBreakpoint1 as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Nine Part Tiled attribute.
Notes: This attribute should have this content:

Name:	inputBreakpoint1
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName:	Breakpoint1
DefaultVector:	[150 150]
IdentityVector:	n/a

(Read only property)

60.168.7 AttributeinputFlipYTiles as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Nine Part Tiled attribute.
Notes: This attribute should have this content:

Name:	inputFlipYTiles
Class:	double
Type:	CIAttributeTypeBoolean
DisplayName English:	Flip Y Tiles
DisplayName German:	Y-Kacheln spiegeln
DisplayName French:	Retourner les mosa√Øques¬†Y
DisplayName Italian:	Capovolge caselle Y
DisplayName Spanish:	Voltear teselas en Y
DefaultNumber:	1
IdentityNumber:	0
MaxNumber:	1
MinNumber:	0

(Read only property)

60.168.8 AttributeinputGrowAmount as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Nine Part Tiled attribute.
Notes: This attribute should have this content:

Name:	inputGrowAmount
Class:	CIVectorMBS
Type:	CIAttributeTypeOffset
DisplayName English:	Grow Amount
DisplayName German:	Wachstum
DisplayName French:	Degr√© d,Äôagrandissement
DisplayName Italian:	Quantit√† di sviluppo
DisplayName Spanish:	Cantidad de crecimiento
DefaultVector:	[100 100]
IdentityVector:	n/a

(Read only property)

60.168.9 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Nine Part Tiled attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.168.10 inputBreakpoint0 as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Breakpoint0
Notes:

Name:	inputBreakpoint0
Class:	CIVectorMBS (CIVector)
DisplayName English:	Breakpoint0
DisplayName German:	Breakpoint0
DisplayName French:	Breakpoint0
DisplayName Italian:	Breakpoint0
DisplayName Spanish:	Breakpoint0
Type:	CIAttributeTypePosition

See AttributeinputBreakpoint0 for more details.
(Read and Write property)

60.168.11 inputBreakpoint1 as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Breakpoint1
Notes:

Name:	inputBreakpoint1
Class:	CIVectorMBS (CIVector)
DisplayName English:	Breakpoint1
DisplayName German:	Breakpoint1
DisplayName French:	Breakpoint1
DisplayName Italian:	Breakpoint1
DisplayName Spanish:	Breakpoint1
Type:	CIAttributeTypePosition

See AttributeinputBreakpoint1 for more details.
(Read and Write property)

60.168.12 inputFlipYTiles as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Flip Y Tiles
Notes:

See AttributeinputFlipYTiles for more details.
(Read and Write property)

Name:	inputFlipYTiles
Class:	double (NSNumber)
DisplayName English:	Flip Y Tiles
DisplayName German:	Y-Kacheln spiegeln
DisplayName French:	Retourner les mosa√Øques¬†Y
DisplayName Italian:	Capovolge caselle Y
DisplayName Spanish:	Voltear teselas en Y
Type:	CIAttributeTypeBoolean

60.168.13 inputGrowAmount as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Grow Amount
Notes:

Name:	inputGrowAmount
Class:	CIVectorMBS (CIVector)
DisplayName English:	Grow Amount
DisplayName German:	Wachstum
DisplayName French:	Degr√© d,Äôagrandissement
DisplayName Italian:	Quantit√† di sviluppo
DisplayName Spanish:	Cantidad de crecimiento
Type:	CIAttributeTypeOffset

See AttributeinputGrowAmount for more details.
(Read and Write property)

60.168.14 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.169 class CIFilterNoiseReductionMBS

60.169.1 class CIFilterNoiseReductionMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Noise Reduction filter.
Example:

```
// apply the Noise Reduction filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterNoiseReductionMBS
filter.inputImage = image
filter.inputNoiseLevel = 0.02 // range 0 to 0.1
filter.inputSharpness = 0.4 // range 0 to 2

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CINoiseReduction
DisplayName English:	Noise Reduction
DisplayName German:	Rauschunterdr√ºckung
DisplayName French:	R√©duction du bruit
DisplayName Italian:	Riduzione disturbo
DisplayName Spanish:	Reducci√n de ruido

Categories:

- CICategoryBlur: Blur
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputNoiseLevel: Noise Level
- inputSharpness: Sharpness

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.169.2 Methods

60.169.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.169.4 Properties

60.169.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Noise Reduction attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.169.6 AttributeinputNoiseLevel as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Noise Reduction attribute.
Notes: This attribute should have this content:

Name:	inputNoiseLevel
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Noise Level
DisplayName German:	Rauschpegel
DisplayName French:	Niveau de bruit
DisplayName Italian:	Livello disturbo
DisplayName Spanish:	Nivel de ruido
DefaultNumber:	0.02
IdentityNumber:	0
SliderMaxNumber:	0.1
SliderMinNumber:	0

(Read only property)

60.169.7 AttributeinputSharpness as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Noise Reduction attribute.
Notes: This attribute should have this content:

(Read only property)

60.169.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputSharpness
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Sharpness
DisplayName German:	Sch√§rfe
DisplayName French:	Nettet√©
DisplayName Italian:	Nitidezza
DisplayName Spanish:	Nitidez
DefaultNumber:	0.4
IdentityNumber:	0
SliderMaxNumber:	2
SliderMinNumber:	0

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.169.9 inputNoiseLevel as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Noise Level
Notes:

Name:	inputNoiseLevel
Class:	double (NSNumber)
DisplayName English:	Noise Level
DisplayName German:	Rauschpegel
DisplayName French:	Niveau de bruit
DisplayName Italian:	Livello disturbo
DisplayName Spanish:	Nivel de ruido
Type:	CIAttributeTypeScalar

See AttributeinputNoiseLevel for more details.
(Read and Write property)

60.169.10 inputSharpness as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Sharpness
Notes:

Name:	inputSharpness
Class:	double (NSNumber)
DisplayName English:	Sharpness
DisplayName German:	Sch√§rfe
DisplayName French:	Nettet√©
DisplayName Italian:	Nitidezza
DisplayName Spanish:	Nitidez
Type:	CIAttributeTypeScalar

See AttributeinputSharpness for more details.
(Read and Write property)

60.170 class CIFilterOpTileMBS

60.170.1 class CIFilterOpTileMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Op Tile filter.
Example:

```
// apply the Op Tile filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterOpTileMBS
filter.inputImage = image
filter.inputAngle = 0 // range -3.141593 to 3.141593
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputScale = 2.8 // range 0.1 to 10
filter.inputWidth = 65 // range 1 to 1000

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIOpTile
DisplayName English:	Op Tile
DisplayName German:	Op kacheln
DisplayName French:	Mosa√Øque op√©rationnelle
DisplayName Italian:	Mosaico ottico
DisplayName Spanish:	Mosaico √ptico

Categories:

- CICategoryTileEffect: Tile Effect
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputCenter: Center
- inputScale: Scale
- inputAngle: Angle
- inputWidth: Width

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.170.2 Methods

60.170.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.170.4 Properties

60.170.5 AttributeinputAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Op Tile attribute.
Notes: This attribute should have this content:

(Read only property)

60.170.6 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
DefaultNumber:	0
IdentityNumber:	0
SliderMaxNumber:	3.141593
SliderMinNumber:	-3.141593

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

Function: Details about the Op Tile attribute.
Notes: This attribute should have this content:

(Read only property)

60.170.7 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Op Tile attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

60.170.8 AttributeinputScale as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Op Tile attribute.
Notes: This attribute should have this content:

Name:	inputScale
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Scale
DisplayName German:	Skalierung
DisplayName French:	√âchelle
DisplayName Italian:	Scala
DisplayName Spanish:	Escala
DefaultNumber:	2.8
IdentityNumber:	1
SliderMaxNumber:	10
SliderMinNumber:	0.1

(Read only property)

60.170.9 AttributeinputWidth as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Op Tile attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputWidth
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
DefaultNumber:	65
IdentityNumber:	65
SliderMaxNumber:	1000
SliderMinNumber:	1

60.170.10 inputAngle as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Angle
Notes:

Name:	inputAngle
Class:	double (NSNumber)
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
Type:	CIAttributeTypeAngle

See AttributeinputAngle for more details.
(Read and Write property)

60.170.11 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center
Notes:

See AttributeinputCenter for more details.
(Read and Write property)

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

60.170.12 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.170.13 inputScale as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Scale
Notes:

Name:	inputScale
Class:	double (NSNumber)
DisplayName English:	Scale
DisplayName German:	Skalierung
DisplayName French:	√âchelle
DisplayName Italian:	Scala
DisplayName Spanish:	Escala
Type:	CIAttributeTypeScalar

See AttributeinputScale for more details.
(Read and Write property)

60.170.14 inputWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Width
Notes:

Name:	inputWidth
Class:	double (NSNumber)
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
Type:	CIAttributeTypeDistance

See AttributeinputWidth for more details.
(Read and Write property)

60.171 class CIFilterOverlayBlendModeMBS

60.171.1 class CIFilterOverlayBlendModeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Overlay Blend Mode filter.
Notes: Details for this filter:

FilterName:	CIOverlayBlendMode
DisplayName English:	Overlay Blend Mode
DisplayName German:	Mischmethode ,Äû√úberlagerung,Äú
DisplayName French:	Mode de fusion Superposition
DisplayName Italian:	Modalit√† sfumatura sovrapposizione
DisplayName Spanish:	Superponer modo de mezcla

Categories:

- CICategoryCompositeOperation: Composite Operation
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputBackgroundImage: Background Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.171.2 Methods

60.171.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.171.4 Properties

60.171.5 AttributeinputBackgroundImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Overlay Blend Mode attribute.
Notes: This attribute should have this content:

Name:	inputBackgroundImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.171.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Overlay Blend Mode attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

60.171.7 inputBackgroundImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Background Image
Notes:

Name:	inputBackgroundImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
Type:	CIAttributeTypeImage

See AttributeinputBackgroundImage for more details.
(Read and Write property)

60.171.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.172 class CIFilterPageCurlTransitionMBS

60.172.1 class CIFilterPageCurlTransitionMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Page Curl filter.
Example:

```
// apply the Page Curl Transition filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterPageCurlTransitionMBS
filter.inputImage = image
filter.inputBacksideImage = image
filter.inputShadingImage = image
filter.inputTargetImage = image
filter.inputAngle = 0 // range -3.141593 to 3.141593
Var inputExtentValues() As Double = Array(0.0, 0.0, 300.0, 300.0)
filter.inputExtent = New CIVectorMBS(inputExtentValues)
filter.inputRadius = 100 // range 0.01 to 400
filter.inputTime = 0.5 // range 0 to 1

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIPageCurlTransition
DisplayName English:	Page Curl
DisplayName German:	Umbl√§ttern
DisplayName French:	Repli de page
DisplayName Italian:	Ricciolo pagina
DisplayName Spanish:	Ondulaci√n de p√°gina

Categories:

- CICategoryTransition: Transition
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In

- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputTargetImage: Target Image
- inputBacksideImage: Backside Image
- inputShadingImage: Shading Image
- inputExtent: Extent
- inputTime: Time
- inputAngle: Angle
- inputRadius: Radius

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.172.2 Methods

60.172.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.172.4 Properties

60.172.5 AttributeinputAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Page Curl attribute.
Notes: This attribute should have this content:

Name:	inputAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
DefaultNumber:	0
IdentityNumber:	0
SliderMaxNumber:	3.141593
SliderMinNumber:	-3.141593

(Read only property)

60.172.6 AttributeinputBacksideImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Page Curl attribute.
Notes: This attribute should have this content:

Name:	inputBacksideImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Backside Image
DisplayName German:	Bild auf der Hinterseite
DisplayName French:	Image arri√®re
DisplayName Italian:	Immagine posteriore
DisplayName Spanish:	Imagen de reverso
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.172.7 AttributeinputExtent as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Page Curl attribute.
Notes: This attribute should have this content:

Name:	inputExtent
Class:	CIVectorMBS
Type:	CIAttributeTypeRectangle
DisplayName English:	Extent
DisplayName German:	Betrag
DisplayName French:	√âtendue
DisplayName Italian:	Ampiezza
DisplayName Spanish:	Amplitud
DefaultVector:	[0 0 300 300]
IdentityVector:	n/a

(Read only property)

60.172.8 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Page Curl attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.172.9 AttributeinputRadius as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Page Curl attribute.
Notes: This attribute should have this content:

Name:	inputRadius
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Radius
DisplayName German:	Radius

60.172.10 AttributeinputShadingImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Page Curl attribute.
Notes: This attribute should have this content:

Name:	inputShadingImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Shading Image
DisplayName German:	Bild schattieren
DisplayName French:	Image d,Äôombrage
DisplayName Italian:	Immagine ombreggiatura
DisplayName Spanish:	Imagen de sombra
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.172.11 AttributeinputTargetImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Page Curl attribute.
Notes: This attribute should have this content:

Name:	inputTargetImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Target Image
DisplayName German:	Zielbild
DisplayName French:	Image cible
DisplayName Italian:	Immagine target
DisplayName Spanish:	Imagen de destino
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.172.12 AttributeinputTime as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Page Curl attribute.
Notes: This attribute should have this content:

Name:	inputTime
Class:	double
Type:	CIAttributeTypeTime
DisplayName English:	Time
DisplayName German:	Zeit
DisplayName French:	Dur√©e
DisplayName Italian:	Tempo
DisplayName Spanish:	Tiempo
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	1
MinNumber:	0
SliderMaxNumber:	1
SliderMinNumber:	0

(Read only property)

60.172.13 inputAngle as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Angle
Notes:

Name:	inputAngle
Class:	double (NSNumber)
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
Type:	CIAttributeTypeAngle

See AttributeinputAngle for more details.
(Read and Write property)

60.172.14 inputBacksideImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Backside Image
Notes:

Name:	inputBacksideImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Backside Image
DisplayName German:	Bild auf der Hinterseite
DisplayName French:	Image arri√®re
DisplayName Italian:	Immagine posteriore
DisplayName Spanish:	Imagen de reverso
Type:	CIAttributeTypeImage

See AttributeinputBacksideImage for more details.
(Read and Write property)

60.172.15 inputExtent as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Extent
Notes:

Name:	inputExtent
Class:	CIVectorMBS (CIVector)
DisplayName English:	Extent
DisplayName German:	Betrag
DisplayName French:	√âtendue
DisplayName Italian:	Ampiezza
DisplayName Spanish:	Amplitud
Type:	CIAttributeTypeRectangle

See AttributeinputExtent for more details.
(Read and Write property)

60.172.16 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.172.17 inputRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius
Notes:

See AttributeinputRadius for more details.
(Read and Write property)

Name:	inputRadius
Class:	double (NSNumber)
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
Type:	CIAttributeTypeDistance

60.172.18 inputShadingImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Shading Image
Notes:

Name:	inputShadingImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Shading Image
DisplayName German:	Bild schattieren
DisplayName French:	Image d,Äôombrage
DisplayName Italian:	Immagine ombreggiatura
DisplayName Spanish:	Imagen de sombra
Type:	CIAttributeTypeImage

See AttributeinputShadingImage for more details.
(Read and Write property)

60.172.19 inputTargetImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Target Image
Notes:

Name:	inputTargetImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Target Image
DisplayName German:	Zielbild
DisplayName French:	Image cible
DisplayName Italian:	Immagine target
DisplayName Spanish:	Imagen de destino
Type:	CIAttributeTypeImage

See AttributeinputTargetImage for more details.
(Read and Write property)

60.172.20 inputTime as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Time
Notes:

Name:	inputTime
Class:	double (NSNumber)
DisplayName English:	Time
DisplayName German:	Zeit
DisplayName French:	Dur√©e
DisplayName Italian:	Tempo
DisplayName Spanish:	Tiempo
Type:	CIAttributeTypeTime

See AttributeinputTime for more details.
(Read and Write property)

60.173 class CIFilterPageCurlWithShadowTransitionMBS

60.173.1 class CIFilterPageCurlWithShadowTransitionMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Page Curl With Shadow filter.
Example:

```
// apply the Page Curl With Shadow Transition filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterPageCurlWithShadowTransitionMBS
filter.inputImage = image
filter.inputBacksideImage = image
filter.inputTargetImage = image
filter.inputAngle = 0 // range -3.141593 to 3.141593
Var inputExtentValues() As Double = Array(0.0, 0.0, 0.0, 0.0)
filter.inputExtent = New CIVectorMBS(inputExtentValues)
filter.inputRadius = 100 // range 0.01 to 400
filter.inputShadowAmount = 0.7 // range 0 to 1
Var inputShadowExtentValues() As Double = Array(0.0, 0.0, 0.0, 0.0)
filter.inputShadowExtent = New CIVectorMBS(inputShadowExtentValues)
filter.inputShadowSize = 0.5 // range 0 to 1
filter.inputTime = 0.5 // range 0 to 1

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIPageCurlWithShadowTransition
DisplayName English:	Page Curl With Shadow
DisplayName German:	Umbl√§ttern mit Schatten
DisplayName French:	Repli de page avec ombre
DisplayName Italian:	Piega pagina con ombra
DisplayName Spanish:	P√°gina con el borde ondulado y sombra

Categories:

- CICategoryTransition: Transition
- CICategoryVideo: Video

- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputTargetImage: Target Image
- inputBacksideImage: Backside Image
- inputExtent: Extent
- inputTime: Time
- inputAngle: Angle
- inputRadius: Radius
- inputShadowSize: Shadow Size
- inputShadowAmount: Shadow Amount
- inputShadowExtent: Shadow Extent

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.173.20 inputShadowAmount as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Shadow Amount
Notes:

Name:	inputShadowAmount
Class:	double (NSNumber)
DisplayName English:	Shadow Amount
DisplayName German:	Schattenumfang
DisplayName French:	Quantit√© d,Äôombre
DisplayName Italian:	Quantit√† ombreggiatura
DisplayName Spanish:	Cantidad de sombreado
Type:	CIAttributeTypeDistance

See AttributeinputShadowAmount for more details.
(Read and Write property)

60.173.21 inputShadowExtent as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Shadow Extent
Notes:

Name:	inputShadowExtent
Class:	CIVectorMBS (CIVector)
DisplayName English:	Shadow Extent
DisplayName German:	Schattenausdehnung
DisplayName French:	√âtendue de l,Äôombre
DisplayName Italian:	Estensione ombreggiatura
DisplayName Spanish:	Extensi√n de la sombra
Type:	CIAttributeTypeRectangle

See AttributeinputShadowExtent for more details.
(Read and Write property)

60.173.22 inputShadowSize as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Shadow Size
Notes:

Name:	inputShadowSize
Class:	double (NSNumber)
DisplayName English:	Shadow Size
DisplayName German:	Schattengr√√üe
DisplayName French:	Taille de l,Äôombre
DisplayName Italian:	Dimensioni ombreggiatura
DisplayName Spanish:	Tama√±o de la sombra
Type:	CIAttributeTypeDistance

See AttributeinputShadowSize for more details.
(Read and Write property)

60.173.23 inputTargetImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Target Image
Notes:

Name:	inputTargetImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Target Image
DisplayName German:	Zielbild
DisplayName French:	Image cible
DisplayName Italian:	Immagine target
DisplayName Spanish:	Imagen de destino
Type:	CIAttributeTypeImage

See AttributeinputTargetImage for more details.
(Read and Write property)

60.173.24 inputTime as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Time
Notes:

Name:	inputTime
Class:	double (NSNumber)
DisplayName English:	Time
DisplayName German:	Zeit
DisplayName French:	Dur√©e
DisplayName Italian:	Tempo
DisplayName Spanish:	Tiempo
Type:	CIAttributeTypeTime

See AttributeinputTime for more details.

60.174 class CIFilterPaletteCentroidMBS

60.174.1 class CIFilterPaletteCentroidMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Palette Centroid filter.
Example:

```
// apply the Palette Centroid filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterPaletteCentroidMBS
filter.inputImage = image
filter.inputPaletteImage = image
filter.inputPerceptual = 0

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIPaletteCentroid
DisplayName English:	Palette Centroid
DisplayName German:	Palettenschwerpunkt
DisplayName French:	Centro√Øde de la palette
DisplayName Italian:	Centroide tavolozza
DisplayName Spanish:	Centroide de la paleta

Categories:

- CICategoryColorEffect: Color Effect
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image

- inputPaletteImage: Palette Image
- inputPerceptual: Perceptual

Output:

- outputImage

Subclass of the CIFilterMBS class.

Class:	double
Type:	CIAttributeTypeBoolean
DisplayName:	Perceptual
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	1
MinNumber:	0

(Read only property)

60.175.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.175.9 inputPaletteImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: The attribute Palette Image
Notes:

Name:	inputPaletteImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Palette Image
DisplayName German:	Palettenbild
DisplayName French:	Image de la palette
DisplayName Italian:	Immagine tavolozza
DisplayName Spanish:	Imagen de la paleta
Type:	CIAttributeTypeImage

See AttributeinputPaletteImage for more details.
(Read and Write property)

60.175.10 inputPerceptual as double

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: The attribute Perceptual
Notes:

Name:	inputPerceptual
Class:	double (NSNumber)
DisplayName English:	Perceptual
DisplayName German:	Perceptual
DisplayName French:	Perceptual
DisplayName Italian:	Perceptual
DisplayName Spanish:	Perceptual
Type:	CIAttributeTypeBoolean

See AttributeinputPerceptual for more details.
(Read and Write property)

60.176 class CIFilterParallelogramTileMBS

60.176.1 class CIFilterParallelogramTileMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Parallelogram Tile filter.
Example:

```
// apply the Parallelogram Tile filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterParallelogramTileMBS
filter.inputImage = image
filter.inputAcuteAngle = 1.570796 // range -3.141593 to 3.141593
filter.inputAngle = 0 // range -3.141593 to 3.141593
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputWidth = 100 // range 1 to 200

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIParallelogramTile
DisplayName English:	Parallelogram Tile
DisplayName German:	Parallelogramme
DisplayName French:	Mosa√Øque de parall√©logrammes
DisplayName Italian:	Mosaico parallelogramma
DisplayName Spanish:	Mosaico paralelogramo

Categories:

- CICategoryTileEffect: Tile Effect
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputCenter: Center
- inputAngle: Angle
- inputAcuteAngle: Acute Angle
- inputWidth: Width

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.176.2 Methods

60.176.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.176.4 Properties

60.176.5 AttributeinputAcuteAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Parallelogram Tile attribute.
Notes: This attribute should have this content:

(Read only property)

60.176.6 AttributeinputAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputAcuteAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Acute Angle
DisplayName German:	Spitzer Winkel
DisplayName French:	Angle aigu
DisplayName Italian:	Angolo acuto
DisplayName Spanish:	√Ångulo agudo
DefaultNumber:	1.570796
IdentityNumber:	1.570796
SliderMaxNumber:	3.141593
SliderMinNumber:	-3.141593

Name:	inputAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
DefaultNumber:	0
IdentityNumber:	0
SliderMaxNumber:	3.141593
SliderMinNumber:	-3.141593

Function: Details about the Parallelogram Tile attribute.
Notes: This attribute should have this content:

(Read only property)

60.176.7 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Parallelogram Tile attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

60.176.8 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Parallelogram Tile attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.176.9 AttributeinputWidth as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Parallelogram Tile attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputWidth
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
DefaultNumber:	100
IdentityNumber:	100
SliderMaxNumber:	200
SliderMinNumber:	1

60.176.10 inputAcuteAngle as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Acute Angle
Notes:

Name:	inputAcuteAngle
Class:	double (NSNumber)
DisplayName English:	Acute Angle
DisplayName German:	Spitzer Winkel
DisplayName French:	Angle aigu
DisplayName Italian:	Angolo acuto
DisplayName Spanish:	√Ångulo agudo
Type:	CIAttributeTypeAngle

See AttributeinputAcuteAngle for more details.
(Read and Write property)

60.176.11 inputAngle as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Angle
Notes:

See AttributeinputAngle for more details.
(Read and Write property)

Name:	inputAngle
Class:	double (NSNumber)
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
Type:	CIAttributeTypeAngle

60.176.12 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.176.13 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.176.14 inputWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Width
Notes:

Name:	inputWidth
Class:	double (NSNumber)
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
Type:	CIAttributeTypeDistance

See AttributeinputWidth for more details.
(Read and Write property)

60.177 class CIFilterPDF417BarcodeGeneratorMBS

60.177.1 class CIFilterPDF417BarcodeGeneratorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage PDF417 Barcode Generator filter.
Example:

```
// generate an image with the PDF417Barcode Generator filter
Var filter As New CIFilterPDF417BarcodeGeneratorMBS
filter.inputAlwaysSpecifyCompaction = 0 // range 0 to 1
filter.inputCompactStyle = 0 // range 0 to 1
filter.inputCompactionMode = 0 // range 0 to 3
filter.inputCorrectionLevel = 0 // range 0 to 8
filter.inputDataColumns = 0 // range 1 to 30
filter.inputMaxHeight = 0 // range 13 to 283
filter.inputMaxWidth = 0 // range 56 to 583
filter.inputMessage = "Hello World"
filter.inputMinHeight = 0 // range 13 to 283
filter.inputMinWidth = 0 // range 56 to 583
filter.inputPreferredAspectRatio = 0 // range 0 to 9223372000000000000
filter.inputRows = 0 // range 3 to 90

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture(300, 300)
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIPDF417BarcodeGenerator
DisplayName English:	PDF417 Barcode Generator
DisplayName German:	PDF417 Barcode-Generator
DisplayName French:	G√©n√©rateur de code-barres PDF417
DisplayName Italian:	Generatore codice a barre PDF417
DisplayName Spanish:	Generador de c√digos de barras PDF417

Categories:

- CICategoryGenerator: Generator
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In

Input:

- inputMessage: Message
- inputMinWidth: Min Width
- inputMaxWidth: Max Width
- inputMinHeight: Min Height
- inputMaxHeight: Max Height
- inputDataColumns: Data Columns
- inputRows: Rows
- inputPreferredAspectRatio: Preferred Aspect Ratio
- inputCompactionMode: Compaction Mode
- inputCompactStyle: Compact Style
- inputCorrectionLevel: Correction Level
- inputAlwaysSpecifyCompaction: Always Specify Compaction

Output:

- outputImage
- outputCGImage

Subclass of the CIFilterMBS class.

- Presentation from Munich conference about MBS Plugins.

60.177.2 Methods

60.177.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.177.4 Properties

60.177.5 AttributeinputAlwaysSpecifyCompaction as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the PDF417 Barcode Generator attribute.
Notes: This attribute should have this content:

Name:	inputAlwaysSpecifyCompaction
Class:	double
Type:	CIAttributeTypeBoolean
DisplayName English:	Always Specify Compaction
DisplayName German:	Komprimierung immer angeben
DisplayName French:	Toujours indiquer le compactage
DisplayName Italian:	Specifica sempre la compressione
DisplayName Spanish:	Especificar compactaci√n siempre
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	1
MinNumber:	0
SliderMaxNumber:	1
SliderMinNumber:	0

(Read only property)

60.177.6 AttributeinputCompactionMode as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the PDF417 Barcode Generator attribute.
Notes: This attribute should have this content:

(Read only property)

60.177.7 AttributeinputCompactStyle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the PDF417 Barcode Generator attribute.
Notes: This attribute should have this content:

Name:	inputCompactionMode
Class:	double
Type:	CIAttributeTypeInteger
DisplayName English:	Compaction Mode
DisplayName German:	Komprimierungsmodus
DisplayName French:	Mode de compactage
DisplayName Italian:	Modalit√† di compressione
DisplayName Spanish:	Modo de compactaci√n
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	3
MinNumber:	0
SliderMaxNumber:	3
SliderMinNumber:	0

Name:	inputCompactStyle
Class:	double
Type:	CIAttributeTypeBoolean
DisplayName English:	Compact Style
DisplayName German:	Komprimierungsstil
DisplayName French:	Style compact
DisplayName Italian:	Stile compatto
DisplayName Spanish:	Estilo compacto
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	1
MinNumber:	0
SliderMaxNumber:	1
SliderMinNumber:	0

(Read only property)

60.177.8 AttributeinputCorrectionLevel as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the PDF417 Barcode Generator attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputCorrectionLevel
Class:	double
Type:	CIAttributeTypeInteger
DisplayName English:	Correction Level
DisplayName German:	Korrekturstufe
DisplayName French:	Niveau de correction
DisplayName Italian:	Livello di correzione
DisplayName Spanish:	Nivel de correcci√n
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	8
MinNumber:	0
SliderMaxNumber:	8
SliderMinNumber:	0

60.177.9 AttributeinputDataColumns as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the PDF417 Barcode Generator attribute.
Notes: This attribute should have this content:

Name:	inputDataColumns
Class:	double
Type:	CIAttributeTypeInteger
DisplayName English:	Data Columns
DisplayName German:	Datenspalten
DisplayName French:	Colonnes de donn√©es
DisplayName Italian:	Colonne dati
DisplayName Spanish:	Columnas de datos
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	30
MinNumber:	1
SliderMaxNumber:	30
SliderMinNumber:	1

(Read only property)

60.177.10 AttributeinputMaxHeight as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the PDF417 Barcode Generator attribute.
Notes: This attribute should have this content:

Name:	inputMaxHeight
Class:	double
Type:	CIAttributeTypeInteger
DisplayName English:	Max Height
DisplayName German:	Max. H√he
DisplayName French:	Hauteur max.
DisplayName Italian:	Altezza massima
DisplayName Spanish:	Altura m√°x.

SliderMinNumber:	56

(Read only property)

60.177.12 AttributeinputMessage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the PDF417 Barcode Generator attribute.
Notes: This attribute should have this content:

Name:	inputMessage
Class:	Memoryblock
DisplayName English:	Message
DisplayName German:	Nachricht
DisplayName French:	Message
DisplayName Italian:	Messaggio
DisplayName Spanish:	Mensaje
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.177.13 AttributeinputMinHeight as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the PDF417 Barcode Generator attribute.
Notes: This attribute should have this content:

(Read only property)

60.177.14 AttributeinputMinWidth as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the PDF417 Barcode Generator attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputMinHeight
Class:	double
Type:	CIAttributeTypeInteger
DisplayName English:	Min Height
DisplayName German:	Min. H√he
DisplayName French:	Hauteur min.
DisplayName Italian:	Altezza minima
DisplayName Spanish:	Altura m√n.
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	283
MinNumber:	13
SliderMaxNumber:	283
SliderMinNumber:	13

Name:	inputMinWidth
Class:	double
Type:	CIAttributeTypeInteger
DisplayName English:	Min Width
DisplayName German:	Min. Breite
DisplayName French:	Largeur min.
DisplayName Italian:	Larghezza minima
DisplayName Spanish:	Anchura m√n.
DefaultNumber:	0

MinNumber:	3
SliderMaxNumber:	90
SliderMinNumber:	3

(Read only property)

60.177.17 inputAlwaysSpecifyCompaction as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Always Specify Compaction
Notes:

See AttributeinputAlwaysSpecifyCompaction for more details.
(Read and Write property)

Name:	inputAlwaysSpecifyCompaction
Class:	double (NSNumber)
DisplayName English:	Always Specify Compaction
DisplayName German:	Komprimierung immer angeben
DisplayName French:	Toujours indiquer le compactage
DisplayName Italian:	Specifica sempre la compressione
DisplayName Spanish:	Especificar compactaci√n siempre
Type:	CIAttributeTypeBoolean

60.177.18 inputCompactionMode as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Compaction Mode
Notes:

Name:	inputCompactionMode
Class:	double (NSNumber)
DisplayName English:	Compaction Mode
DisplayName German:	Komprimierungsmodus
DisplayName French:	Mode de compactage
DisplayName Italian:	Modalit√† di compressione
DisplayName Spanish:	Modo de compactaci√n
Type:	CIAttributeTypeInteger

See AttributeinputCompactionMode for more details.
(Read and Write property)

60.177.19 inputCompactStyle as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Compact Style
Notes:

See AttributeinputCompactStyle for more details.
(Read and Write property)

Name:	inputCompactStyle
Class:	double (NSNumber)
DisplayName English:	Compact Style
DisplayName German:	Komprimierungsstil
DisplayName French:	Style compact
DisplayName Italian:	Stile compatto
DisplayName Spanish:	Estilo compacto
Type:	CIAttributeTypeBoolean

60.177.20 inputCorrectionLevel as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Correction Level
Notes:

Name:	inputCorrectionLevel
Class:	double (NSNumber)
DisplayName English:	Correction Level
DisplayName German:	Korrekturstufe
DisplayName French:	Niveau de correction
DisplayName Italian:	Livello di correzione
DisplayName Spanish:	Nivel de correcci√n
Type:	CIAttributeTypeInteger

See AttributeinputCorrectionLevel for more details.
(Read and Write property)

60.177.21 inputDataColumns as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Data Columns
Notes:

Name:	inputDataColumns
Class:	double (NSNumber)
DisplayName English:	Data Columns
DisplayName German:	Datenspalten
DisplayName French:	Colonnes de donn√©es
DisplayName Italian:	Colonne dati
DisplayName Spanish:	Columnas de datos
Type:	CIAttributeTypeInteger

See AttributeinputDataColumns for more details.
(Read and Write property)

60.177.22 inputMaxHeight as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Max Height
Notes:

Name:	inputMaxHeight
Class:	double (NSNumber)
DisplayName English:	Max Height
DisplayName German:	Max. H√he
DisplayName French:	Hauteur max.
DisplayName Italian:	Altezza massima
DisplayName Spanish:	Altura m√°x.
Type:	CIAttributeTypeInteger

See AttributeinputMaxHeight for more details.
(Read and Write property)

60.177.23 inputMaxWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Max Width
Notes:

Name:	inputMaxWidth
Class:	double (NSNumber)
DisplayName English:	Max Width
DisplayName German:	Max. Breite
DisplayName French:	Largeur max.
DisplayName Italian:	Larghezza massima
DisplayName Spanish:	Anchura m√°x.
Type:	CIAttributeTypeInteger

See AttributeinputMaxWidth for more details.
(Read and Write property)

60.177.24 inputMessage as Memoryblock

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Message
Notes:

Name:	inputMessage
Class:	Memoryblock (NSData)
DisplayName English:	Message
DisplayName German:	Nachricht
DisplayName French:	Message
DisplayName Italian:	Messaggio
DisplayName Spanish:	Mensaje

See AttributeinputMessage for more details.
(Read and Write property)

60.177.25 inputMinHeight as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Min Height
Notes:

Name:	inputMinHeight
Class:	double (NSNumber)
DisplayName English:	Min Height
DisplayName German:	Min. H√he
DisplayName French:	Hauteur min.
DisplayName Italian:	Altezza minima
DisplayName Spanish:	Altura m√n.
Type:	CIAttributeTypeInteger

See AttributeinputMinHeight for more details.
(Read and Write property)

60.177.26 inputMinWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Min Width
Notes:

Name:	inputMinWidth
Class:	double (NSNumber)
DisplayName English:	Min Width
DisplayName German:	Min. Breite
DisplayName French:	Largeur min.
DisplayName Italian:	Larghezza minima
DisplayName Spanish:	Anchura m√n.
Type:	CIAttributeTypeInteger

See AttributeinputMinWidth for more details.
(Read and Write property)

60.177.27 inputPreferredAspectRatio as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Preferred Aspect Ratio
Notes:

Name:	inputPreferredAspectRatio
Class:	double (NSNumber)
DisplayName English:	Preferred Aspect Ratio
DisplayName German:	Bevorzugtes Seitenverh√§ltnis
DisplayName French:	Proportions pr√©f√©r√©es
DisplayName Italian:	Proporzioni preferite
DisplayName Spanish:	Proporciones preferidas

See AttributeinputPreferredAspectRatio for more details.
(Read and Write property)

60.177.28 inputRows as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Rows
Notes:

See AttributeinputRows for more details.
(Read and Write property)

Name:	inputRows
Class:	double (NSNumber)
DisplayName English:	Rows
DisplayName German:	Zeilen
DisplayName French:	Rang√©es
DisplayName Italian:	Righe
DisplayName Spanish:	Filas
Type:	CIAttributeTypeInteger

60.178 class CIFilterPersonSegmentationMBS

60.178.1 class CIFilterPersonSegmentationMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Person Segmentation filter.
Notes: Details for this filter:

FilterName:	CIPersonSegmentation
DisplayName English:	Person Segmentation
DisplayName German:	Personensegmentierung
DisplayName French:	Segmentation des personnes
DisplayName Italian:	Segmentazione persone
DisplayName Spanish:	Segmentaci√n de personas

Categories:

- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryStylize: Stylize

Input:

- inputImage: Image
- inputQualityLevel: Quality Level

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.178.6 AttributeinputQualityLevel as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: Details about the Person Segmentation attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputQualityLevel
Class:	double
DisplayName English:	Quality Level
DisplayName German:	Qualit√§tsstufe
DisplayName French:	Niveau de qualit√©
DisplayName Italian:	Livello qualit√†
DisplayName Spanish:	Nivel de calidad
DefaultNumber:	0
IdentityNumber:	0

60.178.7 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.178.8 inputQualityLevel as double

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: The attribute Quality Level
Notes:

Name:	inputQualityLevel
Class:	double (NSNumber)
DisplayName English:	Quality Level
DisplayName German:	Qualit√§tsstufe
DisplayName French:	Niveau de qualit√©
DisplayName Italian:	Livello qualit√†
DisplayName Spanish:	Nivel de calidad

See AttributeinputQualityLevel for more details.
(Read and Write property)

60.179 class CIFilterPerspectiveCorrectionMBS

60.179.1 class CIFilterPerspectiveCorrectionMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Perspective Correction filter.
Example:

```
// apply the Perspective Correction filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterPerspectiveCorrectionMBS
filter.inputImage = image
filter.inputBottomLeft = New CIVectorMBS(155, 153)
filter.inputBottomRight = New CIVectorMBS(548, 140)
filter.inputCrop = 1
filter.inputTopLeft = New CIVectorMBS(118, 484)
filter.inputTopRight = New CIVectorMBS(646, 507)

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIPerspectiveCorrection
DisplayName English:	Perspective Correction
DisplayName German:	Perspektivenkorrektur
DisplayName French:	Correction de la perspective
DisplayName Italian:	Correzione prospettiva
DisplayName Spanish:	Correcci√n de la perspectiva

Categories:

- CICategoryGeometryAdjustment: Geometry Adjustment
- CICategoryStillImage: Still Image
- CICategoryVideo: Video
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputTopLeft: Top Left
- inputTopRight: Top Right
- inputBottomRight: Bottom Right
- inputBottomLeft: Bottom Left
- inputCrop: Crop

Output:

- outputImage

Subclass of the CIFilterMBS class.

(Read only property)

60.179.11 inputBottomLeft as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Bottom Left
Notes:

See AttributeinputBottomLeft for more details.
(Read and Write property)

60.179.12 inputBottomRight as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputBottomLeft
Class:	CIVectorMBS (CIVector)
DisplayName English:	Bottom Left
DisplayName German:	Unten links
DisplayName French:	En bas √† gauche
DisplayName Italian:	In basso a sinistra
DisplayName Spanish:	Abajo izquierda
Type:	CIAttributeTypePosition

Function: The attribute Bottom Right
Notes:

Name:	inputBottomRight
Class:	CIVectorMBS (CIVector)
DisplayName English:	Bottom Right
DisplayName German:	Unten rechts
DisplayName French:	En bas √† droite
DisplayName Italian:	In basso a destra
DisplayName Spanish:	Abajo derecha
Type:	CIAttributeTypePosition

See AttributeinputBottomRight for more details.
(Read and Write property)

60.179.13 inputCrop as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Crop
Notes:

Name:	inputCrop
Class:	double (NSNumber)
DisplayName English:	Crop
DisplayName German:	Crop
DisplayName French:	Crop
DisplayName Italian:	Crop
DisplayName Spanish:	Crop
Type:	CIAttributeTypeBoolean

See AttributeinputCrop for more details.
(Read and Write property)

60.179.14 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.179.15 inputTopLeft as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Top Left
Notes:

Name:	inputTopLeft
Class:	CIVectorMBS (CIVector)
DisplayName English:	Top Left
DisplayName German:	Oben links
DisplayName French:	En haut √† gauche
DisplayName Italian:	In alto a sinistra
DisplayName Spanish:	Arriba izquierda
Type:	CIAttributeTypePosition

See AttributeinputTopLeft for more details.
(Read and Write property)

60.179.16 inputTopRight as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Top Right
Notes:

Name:	inputTopRight
Class:	CIVectorMBS (CIVector)
DisplayName English:	Top Right
DisplayName German:	Oben rechts
DisplayName French:	En haut √† droite
DisplayName Italian:	In alto a destra
DisplayName Spanish:	Arriba derecha
Type:	CIAttributeTypePosition

See AttributeinputTopRight for more details.
(Read and Write property)

60.180 class CIFilterPerspectiveRotateMBS

60.180.1 class CIFilterPerspectiveRotateMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Perspective Rotate filter.
Example:

```
// apply the Perspective Rotate filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterPerspectiveRotateMBS
filter.inputImage = image
filter.inputFocalLength = 28
filter.inputPitch = 0
filter.inputRoll = 0
filter.inputYaw = 0

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIPerspectiveRotate
DisplayName English:	Perspective Rotate
DisplayName German:	Perspektivisch drehen
DisplayName French:	Rotation en perspective
DisplayName Italian:	Rotazione prospettica
DisplayName Spanish:	Rotaci√n de perspectiva

Categories:

- CICategoryGeometryAdjustment: Geometry Adjustment
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputFocalLength: Focal Length
- inputPitch: Pitch
- inputYaw: Yaw
- inputRoll: Roll

Output:

- outputImage
- outputTransform

Subclass of the CIFilterMBS class.

(Read only property)

60.182.9 AttributeinputTopRight as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Perspective Transform attribute.
Notes: This attribute should have this content:

(Read only property)

60.182.10 inputBottomLeft as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Bottom Left
Notes:

Name:	inputTopRight
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Top Right
DisplayName German:	Oben rechts
DisplayName French:	En haut √† droite
DisplayName Italian:	In alto a destra
DisplayName Spanish:	Arriba derecha
DefaultVector:	[646 507]
IdentityVector:	n/a

Name:	inputBottomLeft
Class:	CIVectorMBS (CIVector)
DisplayName English:	Bottom Left
DisplayName German:	Unten links
DisplayName French:	En bas √† gauche
DisplayName Italian:	In basso a sinistra
DisplayName Spanish:	Abajo izquierda
Type:	CIAttributeTypePosition

See AttributeinputBottomLeft for more details.
(Read and Write property)

60.182.11 inputBottomRight as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Bottom Right
Notes:

Name:	inputBottomRight
Class:	CIVectorMBS (CIVector)
DisplayName English:	Bottom Right
DisplayName German:	Unten rechts
DisplayName French:	En bas √† droite
DisplayName Italian:	In basso a destra
DisplayName Spanish:	Abajo derecha
Type:	CIAttributeTypePosition

See AttributeinputBottomRight for more details.
(Read and Write property)

60.182.12 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.182.13 inputTopLeft as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Top Left
Notes:

Name:	inputTopLeft
Class:	CIVectorMBS (CIVector)
DisplayName English:	Top Left
DisplayName German:	Oben links
DisplayName French:	En haut √† gauche
DisplayName Italian:	In alto a sinistra
DisplayName Spanish:	Arriba izquierda
Type:	CIAttributeTypePosition

See AttributeinputTopLeft for more details.
(Read and Write property)

60.182.14 inputTopRight as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Top Right
Notes:

Name:	inputTopRight
Class:	CIVectorMBS (CIVector)
DisplayName English:	Top Right
DisplayName German:	Oben rechts
DisplayName French:	En haut √† droite
DisplayName Italian:	In alto a destra
DisplayName Spanish:	Arriba derecha
Type:	CIAttributeTypePosition

See AttributeinputTopRight for more details.
(Read and Write property)

60.183 class CIFilterPerspectiveTransformWithExtentMBS

60.183.1 class CIFilterPerspectiveTransformWithExtentMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Perspective Transform with Extent filter.
Example:

```
// apply the Perspective Transform With Extent filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterPerspectiveTransformWithExtentMBS
filter.inputImage = image
filter.inputBottomLeft = New CIVectorMBS(155, 153)
filter.inputBottomRight = New CIVectorMBS(548, 140)
Var inputExtentValues() As Double = Array(0.0, 0.0, 300.0, 300.0)
filter.inputExtent = New CIVectorMBS(inputExtentValues)
filter.inputTopLeft = New CIVectorMBS(118, 484)
filter.inputTopRight = New CIVectorMBS(646, 507)

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIPerspectiveTransformWithExtent
DisplayName English:	Perspective Transform with Extent
DisplayName German:	Perspektivische Transformation mit Ausbreitung
DisplayName French:	Transformation de perspective avec Extent
DisplayName Italian:	Trasformazione prospettiva con ampiezza
DisplayName Spanish:	Transformaci√n en perspectiva con amplitud

Categories:

- CICategoryGeometryAdjustment: Geometry Adjustment
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputExtent: Extent
- inputTopLeft: Top Left
- inputTopRight: Top Right
- inputBottomRight: Bottom Right
- inputBottomLeft: Bottom Left

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.183.2 Methods

60.183.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.183.4 Properties

60.183.5 AttributeinputBottomLeft as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Perspective Transform with Extent attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputBottomLeft
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Bottom Left
DisplayName German:	Unten links
DisplayName French:	En bas √† gauche
DisplayName Italian:	In basso a sinistra
DisplayName Spanish:	Abajo izquierda
DefaultVector:	[155 153]
IdentityVector:	n/a

60.183.6 AttributeinputBottomRight as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Perspective Transform with Extent attribute.
Notes: This attribute should have this content:

Name:	inputBottomRight
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Bottom Right
DisplayName German:	Unten rechts
DisplayName French:	En bas √† droite
DisplayName Italian:	In basso a destra
DisplayName Spanish:	Abajo derecha
DefaultVector:	[548 140]
IdentityVector:	n/a

(Read only property)

60.183.7 AttributeinputExtent as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Perspective Transform with Extent attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputExtent
Class:	CIVectorMBS
Type:	CIAttributeTypeRectangle
DisplayName English:	Extent
DisplayName German:	Betrag
DisplayName French:	√âtendue
DisplayName Italian:	Ampiezza
DisplayName Spanish:	Amplitud
DefaultVector:	[0 0 300 300]
IdentityVector:	n/a

60.183.8 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Perspective Transform with Extent attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.183.9 AttributeinputTopLeft as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Perspective Transform with Extent attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputTopLeft
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Top Left
DisplayName German:	Oben links
DisplayName French:	En haut √† gauche
DisplayName Italian:	In alto a sinistra
DisplayName Spanish:	Arriba izquierda
DefaultVector:	[118 484]
IdentityVector:	n/a

60.183.10 AttributeinputTopRight as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Perspective Transform with Extent attribute.
Notes: This attribute should have this content:

Name:	inputTopRight
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Top Right
DisplayName German:	Oben rechts
DisplayName French:	En haut √† droite
DisplayName Italian:	In alto a destra
DisplayName Spanish:	Arriba derecha
DefaultVector:	[646 507]
IdentityVector:	n/a

(Read only property)

60.183.11 inputBottomLeft as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Bottom Left
Notes:

See AttributeinputBottomLeft for more details.
(Read and Write property)

Name:	inputBottomLeft
Class:	CIVectorMBS (CIVector)
DisplayName English:	Bottom Left
DisplayName German:	Unten links
DisplayName French:	En bas √† gauche
DisplayName Italian:	In basso a sinistra
DisplayName Spanish:	Abajo izquierda
Type:	CIAttributeTypePosition

60.183.12 inputBottomRight as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Bottom Right
Notes:

Name:	inputBottomRight
Class:	CIVectorMBS (CIVector)
DisplayName English:	Bottom Right
DisplayName German:	Unten rechts
DisplayName French:	En bas √† droite
DisplayName Italian:	In basso a destra
DisplayName Spanish:	Abajo derecha
Type:	CIAttributeTypePosition

See AttributeinputBottomRight for more details.
(Read and Write property)

60.183.13 inputExtent as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Extent
Notes:

Name:	inputExtent
Class:	CIVectorMBS (CIVector)
DisplayName English:	Extent
DisplayName German:	Betrag
DisplayName French:	√âtendue
DisplayName Italian:	Ampiezza
DisplayName Spanish:	Amplitud
Type:	CIAttributeTypeRectangle

See AttributeinputExtent for more details.
(Read and Write property)

60.183.14 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.183.15 inputTopLeft as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Top Left
Notes:

Name:	inputTopLeft
Class:	CIVectorMBS (CIVector)
DisplayName English:	Top Left
DisplayName German:	Oben links
DisplayName French:	En haut √† gauche
DisplayName Italian:	In alto a sinistra
DisplayName Spanish:	Arriba izquierda
Type:	CIAttributeTypePosition

See AttributeinputTopLeft for more details.
(Read and Write property)

60.183.16 inputTopRight as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Top Right
Notes:

Name:	inputTopRight
Class:	CIVectorMBS (CIVector)
DisplayName English:	Top Right
DisplayName German:	Oben rechts
DisplayName French:	En haut √† droite
DisplayName Italian:	In alto a destra
DisplayName Spanish:	Arriba derecha
Type:	CIAttributeTypePosition

See AttributeinputTopRight for more details.
(Read and Write property)

60.184 class CIFilterPhotoEffectChromeMBS

60.184.1 class CIFilterPhotoEffectChromeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Photo Effect Chrome filter.
Notes: Details for this filter:

FilterName:	CIPhotoEffectChrome
DisplayName English:	Photo Effect Chrome
DisplayName German:	Fotoeffekt ,ÄûChrom,Äú
DisplayName French:	Effet de photo Chrom√©
DisplayName Italian:	Effetto foto Chrome
DisplayName Spanish:	Efecto fotogr√°fico Chrome

Categories:

- CICategoryColorEffect: Color Effect
- CICategoryVideo: Video
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryXMPSerializable: CICategoryXMPSerializable

Input:

- inputImage: Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.184.2 Methods

60.184.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.184.4 Properties

60.184.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Photo Effect Chrome attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.184.6 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.185 class CIFilterPhotoEffectFadeMBS

60.185.1 class CIFilterPhotoEffectFadeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Photo Effect Fade filter.
Notes: Details for this filter:

FilterName:	CIPhotoEffectFade
DisplayName English:	Photo Effect Fade
DisplayName German:	Fotoeffekt ,ÄûAlt,Äú
DisplayName French:	Effet de photo Fondu
DisplayName Italian:	Effetto foto Dissolvenza
DisplayName Spanish:	Efecto fotogr√°fico Fundido

Categories:

- CICategoryColorEffect: Color Effect
- CICategoryVideo: Video
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryXMPSerializable: CICategoryXMPSerializable

Input:

- inputImage: Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.185.2 Methods

60.185.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.185.4 Properties

60.185.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Photo Effect Fade attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.185.6 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.186 class CIFilterPhotoEffectInstantMBS

60.186.1 class CIFilterPhotoEffectInstantMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Photo Effect Instant filter.
Notes: Details for this filter:

FilterName:	CIPhotoEffectInstant
DisplayName English:	Photo Effect Instant
DisplayName German:	Fotoeffekt ,ÄûSofortbild,Äú
DisplayName French:	Effet de photo Instantan√©
DisplayName Italian:	Effetto foto Instant

60.191 class CIFilterPhotoEffectTransferMBS

60.191.1 class CIFilterPhotoEffectTransferMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Photo Effect Transfer filter.
Notes: Details for this filter:

FilterName:	CIPhotoEffectTransfer
DisplayName English:	Photo Effect Transfer
DisplayName German:	Fotoeffekt ,ÄûTransfer,Äú
DisplayName French:	Effet de photo Transfert
DisplayName Italian:	Effetto foto Transfer
DisplayName Spanish:	Efecto fotogr√°fico Transfer

Categories:

- CICategoryColorEffect: Color Effect
- CICategoryVideo: Video
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryXMPSerializable: CICategoryXMPSerializable

Input:

- inputImage: Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.191.2 Methods

60.191.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.191.4 Properties

60.191.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Photo Effect Transfer attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.191.6 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.192 class CIFilterPinchDistortionMBS

60.192.1 class CIFilterPinchDistortionMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Pinch Distortion filter.
Example:

```
// apply the Pinch Distortion filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterPinchDistortionMBS
filter.inputImage = image
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputRadius = 300 // range 0 to 1000
filter.inputScale = 0.5 // range 0 to 2

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIPinchDistortion
DisplayName English:	Pinch Distortion
DisplayName German:	Verzerrung ,ÄûDr√ºcken,Äú
DisplayName French:	D√©formation Pincement
DisplayName Italian:	Distorsione minima
DisplayName Spanish:	Distorsi√n por contracci√n

Categories:

- CICategoryDistortionEffect: Distortion Effect
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputCenter: Center
- inputRadius: Radius
- inputScale: Scale

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.192.2 Methods

60.192.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.192.4 Properties

60.192.5 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Pinch Distortion attribute.
Notes: This attribute should have this content:

(Read only property)

60.192.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Pinch Distortion attribute.
Notes: This attribute should have this content:

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.192.7 AttributeinputRadius as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Pinch Distortion attribute.
Notes: This attribute should have this content:

(Read only property)

60.192.8 AttributeinputScale as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Pinch Distortion attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputRadius
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
DefaultNumber:	300
IdentityNumber:	0
SliderMaxNumber:	1000
SliderMinNumber:	0

Name:	inputScale
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Scale
DisplayName German:	Skalierung
DisplayName French:	√âchelle
DisplayName Italian:	Scala
DisplayName Spanish:	Escala
DefaultNumber:	0.5
IdentityNumber:	0
SliderMaxNumber:	2
SliderMinNumber:	0

60.192.9 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center
Notes:

See AttributeinputCenter for more details.
(Read and Write property)

60.192.10 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.192.11 inputRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius
Notes:

Name:	inputRadius
Class:	double (NSNumber)
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
Type:	CIAttributeTypeDistance

See AttributeinputRadius for more details.
(Read and Write property)

60.192.12 inputScale as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Scale
Notes:

Name:	inputScale
Class:	double (NSNumber)
DisplayName English:	Scale
DisplayName German:	Skalierung
DisplayName French:	√âchelle
DisplayName Italian:	Scala
DisplayName Spanish:	Escala
Type:	CIAttributeTypeScalar

See AttributeinputScale for more details.
(Read and Write property)

60.193 class CIFilterPinLightBlendModeMBS

60.193.1 class CIFilterPinLightBlendModeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Pin Light Blend Mode filter.
Notes: Details for this filter:

FilterName:	CIPinLightBlendMode
DisplayName English:	Pin Light Blend Mode
DisplayName German:	Mischmethode ,ÄûPunktuelles Licht,Äú
DisplayName French:	√âpingler le mode de fusion Lumi√®re
DisplayName Italian:	Modalit√† sfumatura luce puntiforme
DisplayName Spanish:	Modo de mezcla por luz focal

Categories:

- CICategoryCompositeOperation: Composite Operation
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputBackgroundImage: Background Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.193.2 Methods

60.193.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.193.4 Properties

60.193.5 AttributeinputBackgroundImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Pin Light Blend Mode attribute.
Notes: This attribute should have this content:

Name:	inputBackgroundImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.193.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Pin Light Blend Mode attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

60.193.7 inputBackgroundImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Background Image
Notes:

Name:	inputBackgroundImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
Type:	CIAttributeTypeImage

See AttributeinputBackgroundImage for more details.
(Read and Write property)

60.193.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.194 class CIFilterPixellateMBS

60.194.1 class CIFilterPixellateMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Pixelate filter.
Example:

```
// apply the Pixellate filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterPixellateMBS
filter.inputImage = image
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputScale = 8 // range 1 to 100

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIPixellate
DisplayName English:	Pixelate
DisplayName German:	Pixeln
DisplayName French:	Pix√©liser
DisplayName Italian:	Suddividi in pixel
DisplayName Spanish:	Pixelar

Categories:

- CICategoryStylize: Stylize
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputCenter: Center
- inputScale: Scale

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.194.2 Methods

60.194.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.194.4 Properties

60.194.5 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Pixelate attribute.
Notes: This attribute should have this content:

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

(Read only property)

60.194.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Pixelate attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.194.7 AttributeinputScale as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Pixelate attribute.
Notes: This attribute should have this content:

(Read only property)

60.194.8 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center
Notes:

See AttributeinputCenter for more details.
(Read and Write property)

Name:	inputScale
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Scale
DisplayName German:	Skalierung
DisplayName French:	√âchelle
DisplayName Italian:	Scala
DisplayName Spanish:	Escala
DefaultNumber:	8
IdentityNumber:	0
MaxNumber:	0
MinNumber:	1
SliderMaxNumber:	100
SliderMinNumber:	1

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

60.194.9 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.194.10 inputScale as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Scale
Notes:

Name:	inputScale
Class:	double (NSNumber)
DisplayName English:	Scale
DisplayName German:	Skalierung
DisplayName French:	√âchelle
DisplayName Italian:	Scala
DisplayName Spanish:	Escala
Type:	CIAttributeTypeDistance

See AttributeinputScale for more details.
(Read and Write property)

60.195 class CIFilterPointillizeMBS

60.195.1 class CIFilterPointillizeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Pointillize filter.
Example:

```
// apply the Pointillize filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterPointillizeMBS
filter.inputImage = image
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputRadius = 20 // range 1 to 100

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIPointillize
DisplayName English:	Pointillize
DisplayName German:	Punktieren
DisplayName French:	Pointilliste
DisplayName Italian:	Divisione in punti
DisplayName Spanish:	Puntillear

Categories:

- CICategoryStylize: Stylize
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputRadius: Radius
- inputCenter: Center

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.195.2 Methods

60.195.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.195.4 Properties

60.195.5 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Pointillize attribute.
Notes: This attribute should have this content:

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

(Read only property)

60.195.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Pointillize attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.195.7 AttributeinputRadius as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Pointillize attribute.
Notes: This attribute should have this content:

(Read only property)

60.195.8 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center
Notes:

See AttributeinputCenter for more details.
(Read and Write property)

Name:	inputRadius
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
DefaultNumber:	20
IdentityNumber:	1
MaxNumber:	0
MinNumber:	1
SliderMaxNumber:	100
SliderMinNumber:	1

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

60.195.9 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.195.10 inputRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius
Notes:

Name:	inputRadius
Class:	double (NSNumber)
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
Type:	CIAttributeTypeDistance

See AttributeinputRadius for more details.
(Read and Write property)

60.196 class CIFilterQRCodeGeneratorMBS

60.196.1 class CIFilterQRCodeGeneratorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage QR Code Generator filter.
Notes: Details for this filter:

FilterName:	CIQRCodeGenerator
DisplayName English:	QR Code Generator
DisplayName German:	QR-Code-Generator
DisplayName French:	G√©n√©rateur de code¬†QR
DisplayName Italian:	Generatore codice QR
DisplayName Spanish:	Generador de c√digos QR

Categories:

- CICategoryGenerator: Generator
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In

Input:

- inputMessage: Message
- inputCorrectionLevel: Correction Level

Output:

- outputImage
- outputCGImage

Subclass of the CIFilterMBS class.

60.196.2 Methods

60.196.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.196.4 Properties

60.196.5 AttributeinputCorrectionLevel as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the QR Code Generator attribute.
Notes: This attribute should have this content:

Name:	inputCorrectionLevel
Class:	String
DisplayName English:	Correction Level
DisplayName German:	Korrekturstufe
DisplayName French:	Niveau de correction
DisplayName Italian:	Livello di correzione
DisplayName Spanish:	Nivel de correcci√n
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.196.6 AttributeinputMessage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the QR Code Generator attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputMessage
Class:	Memoryblock
DisplayName English:	Message
DisplayName German:	Nachricht
DisplayName French:	Message
DisplayName Italian:	Messaggio
DisplayName Spanish:	Mensaje
DefaultNumber:	0
IdentityNumber:	0

60.196.7 inputCorrectionLevel as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Correction Level
Notes:

Name:	inputCorrectionLevel
Class:	String (NSString)
DisplayName English:	Correction Level
DisplayName German:	Korrekturstufe
DisplayName French:	Niveau de correction
DisplayName Italian:	Livello di correzione
DisplayName Spanish:	Nivel de correcci√n

See AttributeinputCorrectionLevel for more details.
(Read and Write property)

60.196.8 inputMessage as Memoryblock

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Message
Notes:

Name:	inputMessage
Class:	Memoryblock (NSData)
DisplayName English:	Message
DisplayName German:	Nachricht
DisplayName French:	Message
DisplayName Italian:	Messaggio
DisplayName Spanish:	Mensaje

See AttributeinputMessage for more details.
(Read and Write property)

60.197 class CIFilterRadialGradientMBS

60.197.1 class CIFilterRadialGradientMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Radial Gradient filter.
Example:

```
// generate an image with the Radial Gradient filter
Var filter As New CIFilterRadialGradientMBS
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputColor0 = New CIColorMBS(1, 1, 1, 1)
filter.inputColor1 = New CIColorMBS(0, 0, 0, 1)
filter.inputRadius0 = 5 // range 0 to 800
filter.inputRadius1 = 100 // range 0 to 800

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture(300, 300)
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIRadialGradient
DisplayName English:	Radial Gradient
DisplayName German:	Radialer Verlauf
DisplayName French:	D√©grad√© radial
DisplayName Italian:	Gradiente radiale
DisplayName Spanish:	Degradado radial

Categories:

- CICategoryGradient: Gradient
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputCenter: Center

- inputRadius0: Radius 1
- inputRadius1: Radius 2
- inputColor0: Color 1
- inputColor1: Color 2

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.197.9 AttributeinputRadius1 as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Radial Gradient attribute.
Notes: This attribute should have this content:

(Read only property)

60.197.10 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputRadius1
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Radius 2
DisplayName German:	Radius 2
DisplayName French:	Rayon 2
DisplayName Italian:	Raggio 2
DisplayName Spanish:	Radio 2
DefaultNumber:	100
IdentityNumber:	0
SliderMaxNumber:	800
SliderMinNumber:	0

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.197.11 inputColor0 as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Color 1
Notes:

See AttributeinputColor0 for more details.
(Read and Write property)

60.197.12 inputColor1 as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputColor0
Class:	CIColorMBS (CIColor)
DisplayName English:	Color 1
DisplayName German:	Farbe 1
DisplayName French:	Couleur 1
DisplayName Italian:	Colore 1
DisplayName Spanish:	Color 1
Type:	CIAttributeTypeColor

Function: The attribute Color 2
Notes:

Name:	inputColor1
Class:	CIColorMBS (CIColor)
DisplayName English:	Color 2
DisplayName German:	Farbe 2
DisplayName French:	Couleur 2
DisplayName Italian:	Colore 2
DisplayName Spanish:	Color 2
Type:	CIAttributeTypeColor

See AttributeinputColor1 for more details.
(Read and Write property)

60.197.13 inputRadius0 as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius 1
Notes:

Name:	inputRadius0
Class:	double (NSNumber)
DisplayName English:	Radius 1
DisplayName German:	Radius 1
DisplayName French:	Rayon 1
DisplayName Italian:	Raggio 1
DisplayName Spanish:	Radio 1
Type:	CIAttributeTypeDistance

See AttributeinputRadius0 for more details.
(Read and Write property)

60.197.14 inputRadius1 as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius 2
Notes:

Name:	inputRadius1
Class:	double (NSNumber)
DisplayName English:	Radius 2
DisplayName German:	Radius 2
DisplayName French:	Rayon 2
DisplayName Italian:	Raggio 2
DisplayName Spanish:	Radio 2
Type:	CIAttributeTypeDistance

See AttributeinputRadius1 for more details.
(Read and Write property)

60.198 class CIFilterRandomGeneratorMBS

60.198.1 class CIFilterRandomGeneratorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Random Generator filter.
Notes: Details for this filter:

FilterName:	CIRandomGenerator
DisplayName English:	Random Generator
DisplayName German:	Zufallsmuster
DisplayName French:	G√©n√©rateur al√©atoire
DisplayName Italian:	Generatore casuale
DisplayName Spanish:	Generador aleatorio

Categories:

- CICategoryGenerator: Generator
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In

Input:

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.198.2 Methods

60.198.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.199 class CIFilterRippleTransitionMBS

60.199.1 class CIFilterRippleTransitionMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Ripple filter.
Example:

```
// apply the Ripple Transition filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterRippleTransitionMBS
filter.inputImage = image
filter.inputShadingImage = image
filter.inputTargetImage = image
filter.inputCenter = New CIVectorMBS(150, 150)
Var inputExtentValues() As Double = Array(0.0, 0.0, 300.0, 300.0)
filter.inputExtent = New CIVectorMBS(inputExtentValues)
filter.inputScale = 50 // range -50 to 50
filter.inputTime = 0.5 // range 0 to 1
filter.inputWidth = 100 // range 10 to 300

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIRippleTransition
DisplayName English:	Ripple
DisplayName German:	Wellen
DisplayName French:	Ondulation
DisplayName Italian:	Increspatura
DisplayName Spanish:	Ondas

Categories:

- CICategoryTransition: Transition
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In

- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputTargetImage: Target Image
- inputShadingImage: Shading Image
- inputCenter: Center
- inputExtent: Extent
- inputTime: Time
- inputWidth: Width
- inputScale: Scale

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.199.2 Methods

60.199.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.199.4 Properties

60.199.5 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Ripple attribute.
Notes: This attribute should have this content:

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

(Read only property)

60.199.6 AttributeinputExtent as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Ripple attribute.
Notes: This attribute should have this content:

Name:	inputExtent
Class:	CIVectorMBS
Type:	CIAttributeTypeRectangle
DisplayName English:	Extent
DisplayName German:	Betrag
DisplayName French:	√âtendue
DisplayName Italian:	Ampiezza
DisplayName Spanish:	Amplitud
DefaultVector:	[0 0 300 300]
IdentityVector:	n/a

(Read only property)

60.199.7 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Ripple attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.199.8 AttributeinputScale as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Ripple attribute.
Notes: This attribute should have this content:

Name:	inputScale
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Scale
DisplayName German:	Skalierung
DisplayName French:	√âchelle
DisplayName Italian:	Scala
DisplayName Spanish:	Escala
DefaultNumber:	50
IdentityNumber:	0
MaxNumber:	0
MinNumber:	-50
SliderMaxNumber:	50
SliderMinNumber:	-50

(Read only property)

60.199.9 AttributeinputShadingImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Ripple attribute.
Notes: This attribute should have this content:

Name:	inputShadingImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Shading Image
DisplayName German:	Bild schattieren
DisplayName French:	Image d,Äôombrage
DisplayName Italian:	Immagine ombreggiatura
DisplayName Spanish:	Imagen de sombra
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.199.10 AttributeinputTargetImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Ripple attribute.
Notes: This attribute should have this content:

Name:	inputTargetImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Target Image
DisplayName German:	Zielbild
DisplayName French:	Image cible
DisplayName Italian:	Immagine target
DisplayName Spanish:	Imagen de destino
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.199.11 AttributeinputTime as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Ripple attribute.
Notes: This attribute should have this content:

Name:	inputTime
Class:	double
Type:	CIAttributeTypeTime
DisplayName English:	Time
DisplayName German:	Zeit
DisplayName French:	Dur√©e
DisplayName Italian:	Tempo
DisplayName Spanish:	Tiempo
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	1
MinNumber:	0
SliderMaxNumber:	1
SliderMinNumber:	0

(Read only property)

60.199.12 AttributeinputWidth as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Ripple attribute.
Notes: This attribute should have this content:

Name:	inputWidth
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
DefaultNumber:	100
IdentityNumber:	0
MaxNumber:	0
MinNumber:	1
SliderMaxNumber:	300
SliderMinNumber:	10

(Read only property)

60.199.13 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.199.14 inputExtent as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Extent
Notes:

Name:	inputExtent
Class:	CIVectorMBS (CIVector)
DisplayName English:	Extent
DisplayName German:	Betrag
DisplayName French:	√âtendue
DisplayName Italian:	Ampiezza
DisplayName Spanish:	Amplitud
Type:	CIAttributeTypeRectangle

See AttributeinputExtent for more details.
(Read and Write property)

60.199.15 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.199.16 inputScale as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Scale
Notes:

Name:	inputScale
Class:	double (NSNumber)
DisplayName English:	Scale
DisplayName German:	Skalierung
DisplayName French:	√âchelle
DisplayName Italian:	Scala
DisplayName Spanish:	Escala
Type:	CIAttributeTypeScalar

See AttributeinputScale for more details.
(Read and Write property)

60.199.17 inputShadingImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Shading Image
Notes:

Name:	inputShadingImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Shading Image
DisplayName German:	Bild schattieren
DisplayName French:	Image d,Äôombrage
DisplayName Italian:	Immagine ombreggiatura
DisplayName Spanish:	Imagen de sombra
Type:	CIAttributeTypeImage

See AttributeinputShadingImage for more details.
(Read and Write property)

60.199.18 inputTargetImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Target Image
Notes:

Name:	inputTargetImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Target Image
DisplayName German:	Zielbild
DisplayName French:	Image cible
DisplayName Italian:	Immagine target
DisplayName Spanish:	Imagen de destino
Type:	CIAttributeTypeImage

See AttributeinputTargetImage for more details.
(Read and Write property)

60.199.19 inputTime as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Time
Notes:

See AttributeinputTime for more details.
(Read and Write property)

Name:	inputTime
Class:	double (NSNumber)
DisplayName English:	Time
DisplayName German:	Zeit
DisplayName French:	Dur√©e
DisplayName Italian:	Tempo
DisplayName Spanish:	Tiempo
Type:	CIAttributeTypeTime

60.199.20 inputWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Width
Notes:

Name:	inputWidth
Class:	double (NSNumber)
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
Type:	CIAttributeTypeDistance

See AttributeinputWidth for more details.
(Read and Write property)

60.200 class CIFilterRoundedRectangleGeneratorMBS

60.200.1 class CIFilterRoundedRectangleGeneratorMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Rounded Rectangle Generator filter.
Example:

```
// generate an image with the Rounded Rectangle Generator filter
Var filter As New CIFilterRoundedRectangleGeneratorMBS
filter.inputColor = New CIColorMBS(1, 1, 1, 1)
Var inputExtentValues() As Double = Array(0.0, 0.0, 100.0, 100.0)
filter.inputExtent = New CIVectorMBS(inputExtentValues)
filter.inputRadius = 10 // range 0 to 100

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture(300, 300)
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIRoundedRectangleGenerator
DisplayName English:	Rounded Rectangle Generator
DisplayName German:	Abgerundetes Rechteck-Generator
DisplayName French:	G√©n√©rateur de rectangle aux angles arrondis
DisplayName Italian:	Generatore rettangolo arrotondato
DisplayName Spanish:	Generador de rect√°ngulos redondeados

Categories:

- CICategoryGenerator: Generator
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputExtent: Extent
- inputRadius: Radius

- inputColor: Color

Output:

- outputImage

Subclass of the CIFilterMBS class.
Blog Entries

- MBS Xojo Plugins, version 23.0pr5

60.200.2 Methods

60.200.3 Constructor

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.200.4 Properties

60.200.5 AttributeinputColor as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: Details about the Rounded Rectangle Generator attribute.
Notes: This attribute should have this content:

Name:	inputColor
Class:	CIColorMBS
Type:	CIAttributeTypeColor
DisplayName English:	Color
DisplayName German:	Farbe
DisplayName French:	Couleur
DisplayName Italian:	Colore
DisplayName Spanish:	Color
DefaultColor:	Red = 1, Green = 1, Blue = 1, Alpha = 1
IdentityNumber:	0

(Read only property)

60.200.6 AttributeinputExtent as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: Details about the Rounded Rectangle Generator attribute.
Notes: This attribute should have this content:

Name:	inputExtent
Class:	CIVectorMBS
Type:	CIAttributeTypeRectangle
DisplayName English:	Extent
DisplayName German:	Betrag
DisplayName French:	√âtendue

60.204 class CIFilterSaturationBlendModeMBS

60.204.1 class CIFilterSaturationBlendModeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Saturation Blend Mode filter.
Notes: Details for this filter:

FilterName:	CISaturationBlendMode
DisplayName English:	Saturation Blend Mode
DisplayName German:	Mischmethode ,ÄûS√§ttigung,Äú
DisplayName French:	Mode de fusion Saturation
DisplayName Italian:	Modalit√† sfumatura saturazione
DisplayName Spanish:	Modo de mezcla de saturaci√n

Categories:

- CICategoryCompositeOperation: Composite Operation
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputBackgroundImage: Background Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.204.2 Methods

60.204.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.204.4 Properties

60.204.5 AttributeinputBackgroundImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Saturation Blend Mode attribute.
Notes: This attribute should have this content:

Name:	inputBackgroundImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.204.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Saturation Blend Mode attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

60.204.7 inputBackgroundImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Background Image
Notes:

Name:	inputBackgroundImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
Type:	CIAttributeTypeImage

See AttributeinputBackgroundImage for more details.
(Read and Write property)

60.204.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.205 class CIFilterScreenBlendModeMBS

60.205.1 class CIFilterScreenBlendModeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Screen Blend Mode filter.
Notes: Details for this filter:

FilterName:	CIScreenBlendMode
DisplayName English:	Screen Blend Mode
DisplayName German:	Mischmethode ,ÄûBlende,Äú
DisplayName French:	Mode de fusion √âcran
DisplayName Italian:	Modalit√† sfumatura schermo
DisplayName Spanish:	Modo de mezcla de pantalla

Categories:

- CICategoryCompositeOperation: Composite Operation
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputBackgroundImage: Background Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.205.2 Methods

60.205.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.205.4 Properties

60.205.5 AttributeinputBackgroundImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Screen Blend Mode attribute.
Notes: This attribute should have this content:

Name:	inputBackgroundImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.205.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Screen Blend Mode attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

60.205.7 inputBackgroundImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Background Image
Notes:

Name:	inputBackgroundImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
Type:	CIAttributeTypeImage

See AttributeinputBackgroundImage for more details.
(Read and Write property)

60.205.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.206 class CIFilterSepiaToneMBS

60.206.1 class CIFilterSepiaToneMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Sepia Tone filter.
Notes: Details for this filter:

FilterName:	CISepiaTone
DisplayName English:	Sepia Tone
DisplayName German:	Sepia-Farbt√ne
DisplayName French:	Ton s√©pia
DisplayName Italian:	Tonalit√† seppia
DisplayName Spanish:	Tono sepia

Categories:

- CICategoryColorEffect: Color Effect
- CICategoryVideo: Video
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In
- CICategoryXMPSerializable: CICategoryXMPSerializable

Input:

- inputImage: Image
- inputIntensity: Intensity

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.206.2 Methods

60.206.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.206.4 Properties

60.206.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sepia Tone attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.206.6 AttributeinputIntensity as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sepia Tone attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputIntensity
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Intensity
DisplayName German:	Intensit√§t
DisplayName French:	Intensit√©
DisplayName Italian:	Intensit√†
DisplayName Spanish:	Intensidad
DefaultNumber:	1
IdentityNumber:	0
SliderMaxNumber:	1
SliderMinNumber:	0

60.206.7 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.206.8 inputIntensity as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Intensity
Notes:

See AttributeinputIntensity for more details.
(Read and Write property)

Name:	inputIntensity
Class:	double (NSNumber)
DisplayName English:	Intensity
DisplayName German:	Intensit√§t
DisplayName French:	Intensit√©
DisplayName Italian:	Intensit√†
DisplayName Spanish:	Intensidad
Type:	CIAttributeTypeScalar

60.207 class CIFilterShadedMaterialMBS

60.207.1 class CIFilterShadedMaterialMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Shaded Material filter.
Example:

```
// apply the Shaded Material filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterShadedMaterialMBS
filter.inputImage = image
filter.inputShadingImage = image
filter.inputScale = 10 // range 0.5 to 200

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIShadedMaterial
DisplayName English:	Shaded Material
DisplayName German:	Schattiertes Material
DisplayName French:	Mat√©riau ombr√©
DisplayName Italian:	Materiale ombreggiato
DisplayName Spanish:	Material sombreado

Categories:

- CICategoryStylize: Stylize
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputShadingImage: Shading Image
- inputScale: Scale

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.207.2 Methods

60.207.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.207.4 Properties

60.207.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Shaded Material attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.207.6 AttributeinputScale as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Shaded Material attribute.
Notes: This attribute should have this content:

Name:	inputScale
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Scale
DisplayName German:	Skalierung
DisplayName French:	√âchelle
DisplayName Italian:	Scala
DisplayName Spanish:	Escala
DefaultNumber:	10
IdentityNumber:	0
SliderMaxNumber:	200
SliderMinNumber:	0.5

(Read only property)

60.207.7 AttributeinputShadingImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Shaded Material attribute.
Notes: This attribute should have this content:

(Read only property)

60.207.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputShadingImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Shading Image
DisplayName German:	Bild schattieren
DisplayName French:	Image d,Äôombrage
DisplayName Italian:	Immagine ombreggiatura
DisplayName Spanish:	Imagen de sombra
DefaultNumber:	0
IdentityNumber:	0

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.207.9 inputScale as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Scale
Notes:

Name:	inputScale
Class:	double (NSNumber)
DisplayName English:	Scale
DisplayName German:	Skalierung
DisplayName French:	√âchelle
DisplayName Italian:	Scala
DisplayName Spanish:	Escala
Type:	CIAttributeTypeDistance

See AttributeinputScale for more details.
(Read and Write property)

60.207.10 inputShadingImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Shading Image
Notes:

Name:	inputShadingImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Shading Image
DisplayName German:	Bild schattieren
DisplayName French:	Image d,Äôombrage
DisplayName Italian:	Immagine ombreggiatura
DisplayName Spanish:	Imagen de sombra
Type:	CIAttributeTypeImage

See AttributeinputShadingImage for more details.
(Read and Write property)

60.208 class CIFilterShapeMBS

60.208.1 class CIFilterShapeMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: A class to represent a filer shape in Xojo.
Example:

```
// combine rectangles to describe the area a Core Image filter works on
Var a As CIFilterShapeMBS = CIFilterShapeMBS.shapeWithRect(New CGRectMBS(0, 0, 100, 100))
Var b As New CIFilterShapeMBS(New CGRectMBS(50, 50, 100, 100))

Var both As CIFilterShapeMBS = a.UnionWith(b)
Var common As CIFilterShapeMBS = a.IntersectWith(b)
Var smaller As CIFilterShapeMBS = a.InsetByX(10, 10)

MessageBox "Union: " + both.extent.Width.ToString + " x " + both.extent.Height.ToString + EndOfLine
+ _
"Intersection: " + common.extent.Width.ToString + " x " + common.extent.Height.ToString + EndOfLine
+ _
"Inset: " + smaller.extent.Width.ToString + " x " + smaller.extent.Height.ToString
```

Blog Entries

- MBS Real Studio Plugins, version 12.1pr5

60.208.2 Methods

60.208.3 Constructor(cgrect as CGRectMBS)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Create a shape representing the smallest integral rect containing 'cgrect'.
See also:

- 60.208.4 Constructor(Handle as Integer) 11070

60.208.4 Constructor(Handle as Integer)

MBS MacCI Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Initializes object with given object reference.
Notes: ref should be a CIFilterShape* and the object is retained.
Raises UnsupportedOperationException if object is not a CIFilterShape.
See also:

• 60.208.3 Constructor(cgrect as CGRectMBS) 11070

60.208.5 copy as CIFilterShapeMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates a copy of the filter shape object.

60.208.6 InsetByX(x as Integer, y as Integer) as CIFilterShapeMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Create a shape representing the shape inset by 'delta'.

60.208.7 IntersectWith(s as CIFilterShapeMBS) as CIFilterShapeMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Create a shape representing the intersection of the shape and 's'.

60.208.8 IntersectWithRect(cgrect as CGRectMBS) as CIFilterShapeMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Create a shape representing the intersection of the shape and the smallest integral rect containing 'cgrect'.

60.208.9 shapeWithRect(r as CGRectMBS) as CIFilterShapeMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates a filter shape object and initializes it with a rectangle.
Notes: R: A rectangle. The filter shape object will contain the smallest integral rectangle specified by this argument.

60.208.10 TransformBy(CGAffineTransform as NSAffineTransformMBS, flag as boolean) as CIFilterShapeMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Create a shape from the result of transforming the shape by CGAffineTransform.
Notes: If flag is false the new shape will contain all pixels in the transformed shape (and possibly some outside the transformed shape).
If flag is false the new shape will contain a subset of the pixels in the transformed shape (but none of those outside the transformed shape).

60.208.11 UnionWith(s as CIFilterShapeMBS) as CIFilterShapeMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Create a shape representing the union of the shape and 's'.

60.208.12 UnionWithRect(cgrect as CGRectMBS) as CIFilterShapeMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Create a shape representing the union of the shape and the smallest integral rect containing 'cgrect'.

60.208.13 Properties

60.208.14 description as String

MBS MacCI Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the textual description for this filter shape.
Notes: (Read only property)

60.208.15 extent as CGRectMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The extent of the filter shape.
Notes: Extent is a rectangle that describes the filter shape in the working coordinate space with a fixed area.
Available in OS X v10.11 and later.
(Read only property)

60.208.16 Handle as Integer

MBS MacCI Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: The handle to the internal used CIFilterShape reference.
Notes: (Read only property)

60.209 class CIFilterSharpenLuminanceMBS

60.209.1 class CIFilterSharpenLuminanceMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Sharpen Luminance filter.
Example:

```
// apply the Sharpen Luminance filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterSharpenLuminanceMBS
filter.inputImage = image
filter.inputRadius = 1.69 // range 0 to 20
filter.inputSharpness = 0.4 // range 0 to 2

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CISharpenLuminance
DisplayName English:	Sharpen Luminance
DisplayName German:	Luminanz scharfzeichnen
DisplayName French:	Renforcer la luminance
DisplayName Italian:	Luminosit√† nitidezza
DisplayName Spanish:	Agudizar luminancia

Categories:

- CICategorySharpen: Sharpen
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputSharpness: Sharpness
- inputRadius: Radius

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.209.2 Methods

60.209.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.209.4 Properties

60.209.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sharpen Luminance attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine

(Read only property)

60.209.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputSharpness
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Sharpness
DisplayName German:	Sch√§rfe
DisplayName French:	Nettet√©
DisplayName Italian:	Nitidezza
DisplayName Spanish:	Nitidez
DefaultNumber:	0.4
IdentityNumber:	0
SliderMaxNumber:	2
SliderMinNumber:	0

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.209.9 inputRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius
Notes:

Name:	inputRadius
Class:	double (NSNumber)
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
Type:	CIAttributeTypeScalar

See AttributeinputRadius for more details.
(Read and Write property)

60.209.10 inputSharpness as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Sharpness
Notes:

Name:	inputSharpness
Class:	double (NSNumber)
DisplayName English:	Sharpness
DisplayName German:	Sch√§rfe
DisplayName French:	Nettet√©
DisplayName Italian:	Nitidezza
DisplayName Spanish:	Nitidez
Type:	CIAttributeTypeScalar

See AttributeinputSharpness for more details.
(Read and Write property)

60.210 class CIFilterSixfoldReflectedTileMBS

60.210.1 class CIFilterSixfoldReflectedTileMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Sixfold Reflected Tile filter.
Example:

```
// apply the Sixfold Reflected Tile filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterSixfoldReflectedTileMBS
filter.inputImage = image
filter.inputAngle = 0 // range -3.141593 to 3.141593
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputWidth = 100 // range 1 to 200

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CISixfoldReflectedTile
DisplayName English:	Sixfold Reflected Tile
DisplayName German:	6-fach reflektierte Kachel
DisplayName French:	Mosa√Øque r√©fl√©chie 6 fois
DisplayName Italian:	Mosaico riflesso in sei direzioni
DisplayName Spanish:	Mosaico reflejado seis veces

Categories:

- CICategoryTileEffect: Tile Effect
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputCenter: Center
- inputAngle: Angle
- inputWidth: Width

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.210.2 Methods

60.210.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.210.4 Properties

60.210.5 AttributeinputAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sixfold Reflected Tile attribute.
Notes: This attribute should have this content:

(Read only property)

60.210.6 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sixfold Reflected Tile attribute.
Notes: This attribute should have this content:

Name:	inputAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
DefaultNumber:	0
IdentityNumber:	0
SliderMaxNumber:	3.141593
SliderMinNumber:	-3.141593

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre

60.210.7 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sixfold Reflected Tile attribute.
Notes: This attribute should have this content:

(Read only property)

60.210.8 AttributeinputWidth as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sixfold Reflected Tile attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

Name:	inputWidth
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
DefaultNumber:	100
IdentityNumber:	100
SliderMaxNumber:	200
SliderMinNumber:	1

(Read only property)

60.210.9 inputAngle as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Angle
Notes:

See AttributeinputAngle for more details.
(Read and Write property)

60.210.10 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputAngle
Class:	double (NSNumber)
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
Type:	CIAttributeTypeAngle

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.210.11 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.210.12 inputWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Width
Notes:

Name:	inputWidth
Class:	double (NSNumber)
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
Type:	CIAttributeTypeDistance

See AttributeinputWidth for more details.
(Read and Write property)

60.211 class CIFilterSixfoldRotatedTileMBS

60.211.1 class CIFilterSixfoldRotatedTileMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Sixfold Rotated Tile filter.
Example:

```
// apply the Sixfold Rotated Tile filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterSixfoldRotatedTileMBS
filter.inputImage = image
filter.inputAngle = 0 // range -3.141593 to 3.141593
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputWidth = 100 // range 1 to 200

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CISixfoldRotatedTile
DisplayName English:	Sixfold Rotated Tile
DisplayName German:	6-fach gedrehte Kachel
DisplayName French:	Mosa√Øque pivot√©e 6 fois
DisplayName Italian:	Mosaico ruotato in sei direzioni
DisplayName Spanish:	Mosaico rotado seis veces

Categories:

- CICategoryTileEffect: Tile Effect
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputCenter: Center
- inputAngle: Angle
- inputWidth: Width

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.211.2 Methods

60.211.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.211.4 Properties

60.211.5 AttributeinputAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sixfold Rotated Tile attribute.
Notes: This attribute should have this content:

(Read only property)

60.211.6 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sixfold Rotated Tile attribute.
Notes: This attribute should have this content:

Name:	inputAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo

DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
DefaultNumber:	100
IdentityNumber:	100
SliderMaxNumber:	200
SliderMinNumber:	1

(Read only property)

60.211.9 inputAngle as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Angle
Notes:

See AttributeinputAngle for more details.
(Read and Write property)

60.211.10 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputAngle
Class:	double (NSNumber)
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
Type:	CIAttributeTypeAngle

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.211.11 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.211.12 inputWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Width
Notes:

Name:	inputWidth
Class:	double (NSNumber)
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
Type:	CIAttributeTypeDistance

See AttributeinputWidth for more details.
(Read and Write property)

60.212 class CIFilterSmoothLinearGradientMBS

60.212.1 class CIFilterSmoothLinearGradientMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Smooth Linear Gradient filter.
Example:

```
// generate an image with the Smooth Linear Gradient filter
Var filter As New CIFilterSmoothLinearGradientMBS
filter.inputColor0 = New CIColorMBS(1, 1, 1, 1)
filter.inputColor1 = New CIColorMBS(0, 0, 0, 1)
filter.inputPoint0 = New CIVectorMBS(0, 0)
filter.inputPoint1 = New CIVectorMBS(200, 200)

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture(300, 300)
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CISmoothLinearGradient
DisplayName English:	Smooth Linear Gradient
DisplayName German:	Glatter linearer Verlauf
DisplayName French:	D√©grad√© lin√©aire lisse
DisplayName Italian:	Gradiente lineare graduale
DisplayName Spanish:	Suavizar el degradado lineal

Categories:

- CICategoryGradient: Gradient
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputPoint0: Point 0

- inputPoint1: Point 1
- inputColor0: Color 1
- inputColor1: Color 2

Output:

- outputImage

Subclass of the CIFilterMBS class.

Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

60.216.7 inputBackgroundImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Background Image
Notes:

Name:	inputBackgroundImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
Type:	CIAttributeTypeImage

See AttributeinputBackgroundImage for more details.
(Read and Write property)

60.216.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.217 class CIFilterSourceOverCompositingMBS

60.217.1 class CIFilterSourceOverCompositingMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Source Over filter.
Notes: Details for this filter:

FilterName:	CISourceOverCompositing
DisplayName English:	Source Over
DisplayName German:	Quelle √ºber
DisplayName French:	Source au-dessus
DisplayName Italian:	Sorgente sovrapposizione
DisplayName Spanish:	Alrededor de la fuente

Categories:

- CICategoryCompositeOperation: Composite Operation
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputBackgroundImage: Background Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.217.2 Methods

60.217.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.217.4 Properties

60.217.5 AttributeinputBackgroundImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Source Over attribute.
Notes: This attribute should have this content:

Name:	inputBackgroundImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.217.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Source Over attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

60.217.7 inputBackgroundImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Background Image
Notes:

Name:	inputBackgroundImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
Type:	CIAttributeTypeImage

See AttributeinputBackgroundImage for more details.
(Read and Write property)

60.217.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.218 class CIFilterSpotColorMBS

60.218.1 class CIFilterSpotColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Spot Color filter.
Example:

```
// apply the Spot Color filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterSpotColorMBS
filter.inputImage = image
filter.inputCenterColor1 = New CIColorMBS(0.0784, 0.0627, 0.0706, 1)
filter.inputCenterColor2 = New CIColorMBS(0.5255, 0.3059, 0.3451, 1)
filter.inputCenterColor3 = New CIColorMBS(0.9216, 0.4549, 0.3333, 1)
filter.inputCloseness1 = 0.22 // range 0 to 0.5
filter.inputCloseness2 = 0.15 // range 0 to 0.5
filter.inputCloseness3 = 0.5 // range 0 to 0.5
filter.inputContrast1 = 0.98 // range 0 to 1
filter.inputContrast2 = 0.98 // range 0 to 1
filter.inputContrast3 = 0.99 // range 0 to 1
filter.inputReplacementColor1 = New CIColorMBS(0.4392, 0.1922, 0.1961, 1)
filter.inputReplacementColor2 = New CIColorMBS(0.9137, 0.5608, 0.5059, 1)
filter.inputReplacementColor3 = New CIColorMBS(0.9098, 0.7529, 0.6078, 1)

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CISpotColor
DisplayName English:	Spot Color
DisplayName German:	Spot-Farbe
DisplayName French:	Couleur de la tache
DisplayName Italian:	Colore tinta piatta
DisplayName Spanish:	Color del punto

Categories:

- CICategoryBuiltIn: Built-In

- CICategoryStillImage: Still Image
- CICategoryVideo: Video
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryStylize: Stylize

Input:

- inputImage: Image
- inputCenterColor1: Center Color 1
- inputReplacementColor1: Replacement Color 1
- inputCloseness1: Closeness 1
- inputContrast1: Contrast 1
- inputCenterColor2: Center Color 2
- inputReplacementColor2: Replacement Color 2
- inputCloseness2: Closeness 2
- inputContrast2: Contrast 2
- inputCenterColor3: Center Color 3
- inputReplacementColor3: Replacement Color 3
- inputCloseness3: Closeness 3
- inputContrast3: Contrast 3

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.218.2 Methods

60.218.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.218.4 Properties

60.218.5 AttributeinputCenterColor1 as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Spot Color attribute.
Notes: This attribute should have this content:

Name:	inputCenterColor1
Class:	CIColorMBS
Type:	CIAttributeTypeColor
DisplayName English:	Center Color 1
DisplayName German:	Mittenfarbe 1
DisplayName French:	Couleur centrale 1
DisplayName Italian:	Colore centrale 1
DisplayName Spanish:	Color del centro 1
DefaultColor:	Red = 0.0784, Green = 0.0627, Blue = 0.0706, Alpha = 1
IdentityNumber:	0

(Read only property)

60.218.6 AttributeinputCenterColor2 as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Spot Color attribute.
Notes: This attribute should have this content:

Name:	inputCenterColor2
Class:	CIColorMBS
Type:	CIAttributeTypeColor
DisplayName English:	Center Color 2
DisplayName German:	Mittenfarbe 2
DisplayName French:	Couleur centrale 2
DisplayName Italian:	Colore centrale 2
DisplayName Spanish:	Color del centro 2
DefaultColor:	Red = 0.5255, Green = 0.3059, Blue = 0.3451, Alpha = 1
IdentityNumber:	0

(Read only property)

60.218.7 AttributeinputCenterColor3 as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Spot Color attribute.
Notes: This attribute should have this content:

Name:	inputCenterColor3
Class:	CIColorMBS
Type:	CIAttributeTypeColor
DisplayName English:	Center Color 3
DisplayName German:	Mittenfarbe 3
DisplayName French:	Couleur centrale 3
DisplayName Italian:	Colore centrale 3

DefaultColor:	Red = 0.9216, Green = 0.4549, Blue = 0.3333, Alpha = 1
IdentityNumber:	0

(Read only property)

60.218.8 AttributeinputCloseness1 as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Spot Color attribute.
Notes: This attribute should have this content:

Name:	inputCloseness1
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Closeness 1
DisplayName German:	N√§he 1
DisplayName French:	Rapprochement 1
DisplayName Italian:	Distanza 1
DisplayName Spanish:	Acercamiento 1
DefaultNumber:	0.22
IdentityNumber:	0
SliderMaxNumber:	0.5
SliderMinNumber:	0

(Read only property)

60.218.9 AttributeinputCloseness2 as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Spot Color attribute.
Notes: This attribute should have this content:

Name:	inputCloseness2
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Closeness 2
DisplayName German:	N√§he 2
DisplayName French:	Rapprochement 2
DisplayName Italian:	Distanza 2
DisplayName Spanish:	Acercamiento 2
DefaultNumber:	0.15
IdentityNumber:	0
SliderMaxNumber:	0.5
SliderMinNumber:	0

(Read only property)

60.218.10 AttributeinputCloseness3 as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Spot Color attribute.
Notes: This attribute should have this content:

Name:	inputCloseness3
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Closeness 3
DisplayName German:	N√§he 3
DisplayName French:	Rapprochement 3

IdentityNumber:	0

(Read only property)

60.218.18 inputCenterColor1 as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center Color 1
Notes:

See AttributeinputCenterColor1 for more details.
(Read and Write property)

60.218.19 inputCenterColor2 as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputCenterColor1
Class:	CIColorMBS (CIColor)
DisplayName English:	Center Color 1
DisplayName German:	Mittenfarbe 1
DisplayName French:	Couleur centrale 1
DisplayName Italian:	Colore centrale 1
DisplayName Spanish:	Color del centro 1
Type:	CIAttributeTypeColor

Function: The attribute Center Color 2
Notes:

Name:	inputCenterColor2
Class:	CIColorMBS (CIColor)
DisplayName English:	Center Color 2
DisplayName German:	Mittenfarbe 2
DisplayName French:	Couleur centrale 2
DisplayName Italian:	Colore centrale 2
DisplayName Spanish:	Color del centro 2
Type:	CIAttributeTypeColor

See AttributeinputCenterColor2 for more details.
(Read and Write property)

60.218.20 inputCenterColor3 as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center Color 3
Notes:

Name:	inputCenterColor3
Class:	CIColorMBS (CIColor)
DisplayName English:	Center Color 3
DisplayName German:	Mittenfarbe 3
DisplayName French:	Couleur centrale 3
DisplayName Italian:	Colore centrale 3
DisplayName Spanish:	Color del centro 3
Type:	CIAttributeTypeColor

See AttributeinputCenterColor3 for more details.
(Read and Write property)

60.218.21 inputCloseness1 as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Closeness 1
Notes:

Name:	inputCloseness1
Class:	double (NSNumber)
DisplayName English:	Closeness 1
DisplayName German:	N√§he 1
DisplayName French:	Rapprochement 1
DisplayName Italian:	Distanza 1
DisplayName Spanish:	Acercamiento 1
Type:	CIAttributeTypeScalar

See AttributeinputCloseness1 for more details.
(Read and Write property)

60.218.22 inputCloseness2 as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Closeness 2
Notes:

Name:	inputCloseness2
Class:	double (NSNumber)
DisplayName English:	Closeness 2
DisplayName German:	N√§he 2
DisplayName French:	Rapprochement 2
DisplayName Italian:	Distanza 2
DisplayName Spanish:	Acercamiento 2
Type:	CIAttributeTypeScalar

See AttributeinputCloseness2 for more details.
(Read and Write property)

60.218.23 inputCloseness3 as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Closeness 3
Notes:

Name:	inputCloseness3
Class:	double (NSNumber)
DisplayName English:	Closeness 3
DisplayName German:	N√§he 3
DisplayName French:	Rapprochement 3
DisplayName Italian:	Distanza 3
DisplayName Spanish:	Acercamiento 3
Type:	CIAttributeTypeScalar

See AttributeinputCloseness3 for more details.
(Read and Write property)

60.218.24 inputContrast1 as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Contrast 1
Notes:

Name:	inputContrast1
Class:	double (NSNumber)
DisplayName English:	Contrast 1
DisplayName German:	Kontrast 1
DisplayName French:	Contraste 1
DisplayName Italian:	Contrasto 1
DisplayName Spanish:	Contraste 1
Type:	CIAttributeTypeScalar

See AttributeinputContrast1 for more details.
(Read and Write property)

60.218.25 inputContrast2 as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Contrast 2
Notes:

See AttributeinputContrast2 for more details.
(Read and Write property)

Name:	inputContrast2
Class:	double (NSNumber)
DisplayName English:	Contrast 2
DisplayName German:	Kontrast 2
DisplayName French:	Contraste 2
DisplayName Italian:	Contrasto 2
DisplayName Spanish:	Contraste 2
Type:	CIAttributeTypeScalar

60.218.26 inputContrast3 as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Contrast 3
Notes:

Name:	inputContrast3
Class:	double (NSNumber)
DisplayName English:	Contrast 3
DisplayName German:	Kontrast 3
DisplayName French:	Contraste 3
DisplayName Italian:	Contrasto 3
DisplayName Spanish:	Contraste 3
Type:	CIAttributeTypeScalar

See AttributeinputContrast3 for more details.
(Read and Write property)

60.218.27 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.218.28 inputReplacementColor1 as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Replacement Color 1
Notes:

Name:	inputReplacementColor1
Class:	CIColorMBS (CIColor)
DisplayName English:	Replacement Color 1
DisplayName German:	Ersetzungsfarbe 1
DisplayName French:	Couleur de remplacement 1
DisplayName Italian:	Colore di sostituzione 1
DisplayName Spanish:	Color de reemplazo 1
Type:	CIAttributeTypeColor

See AttributeinputReplacementColor1 for more details.
(Read and Write property)

60.218.29 inputReplacementColor2 as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Replacement Color 2
Notes:

Name:	inputReplacementColor2
Class:	CIColorMBS (CIColor)
DisplayName English:	Replacement Color 2
DisplayName German:	Ersetzungsfarbe 2
DisplayName French:	Couleur de remplacement 2
DisplayName Italian:	Colore di sostituzione 2
DisplayName Spanish:	Color de reemplazo 2
Type:	CIAttributeTypeColor

See AttributeinputReplacementColor2 for more details.
(Read and Write property)

60.218.30 inputReplacementColor3 as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Replacement Color 3
Notes:

Name:	inputReplacementColor3
Class:	CIColorMBS (CIColor)
DisplayName English:	Replacement Color 3
DisplayName German:	Ersetzungsfarbe 3
DisplayName French:	Couleur de remplacement 3
DisplayName Italian:	Colore di sostituzione 3
DisplayName Spanish:	Color de reemplazo 3
Type:	CIAttributeTypeColor

See AttributeinputReplacementColor3 for more details.
(Read and Write property)

60.219 class CIFilterSpotLightMBS

60.219.1 class CIFilterSpotLightMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Spot Light filter.
Example:

```
// apply the Spot Light filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterSpotLightMBS
filter.inputImage = image
filter.inputBrightness = 3 // range 0 to 10
filter.inputColor = New CIColorMBS(1, 1, 1, 1)
filter.inputConcentration = 0.1 // range 0.001 to 1.5
filter.inputLightPointsAt = New CIVectorMBS(200, 200, 0)
filter.inputLightPosition = New CIVectorMBS(400, 600, 150)

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CISpotLight
DisplayName English:	Spot Light
DisplayName German:	Rampenlicht
DisplayName French:	Phare
DisplayName Italian:	Luminosit√† tinta piatta
DisplayName Spanish:	Luz concentrada

Categories:

- CICategoryStylize: Stylize
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputLightPosition: Light Position
- inputLightPointsAt: Light Points At
- inputBrightness: Brightness
- inputConcentration: Concentration
- inputColor: Color

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.219.2 Methods

60.219.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.219.4 Properties

60.219.5 AttributeinputBrightness as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Spot Light attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputBrightness
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Brightness
DisplayName German:	Helligkeit
DisplayName French:	Luminosit√©
DisplayName Italian:	Luminosit√†
DisplayName Spanish:	Brillo
DefaultNumber:	3
IdentityNumber:	1
SliderMaxNumber:	10
SliderMinNumber:	0

60.219.6 AttributeinputColor as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Spot Light attribute.
Notes: This attribute should have this content:

Name:	inputColor
Class:	CIColorMBS
Type:	CIAttributeTypeOpaqueColor
DisplayName English:	Color
DisplayName German:	Farbe
DisplayName French:	Couleur
DisplayName Italian:	Colore
DisplayName Spanish:	Color
DefaultColor:	Red = 1, Green = 1, Blue = 1, Alpha = 1
IdentityNumber:	0

(Read only property)

60.219.7 AttributeinputConcentration as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Spot Light attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputConcentration
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Concentration
DisplayName German:	Konzentration
DisplayName French:	Concentration
DisplayName Italian:	Concentrazione
DisplayName Spanish:	Concentraci√n
DefaultNumber:	0.1
IdentityNumber:	20
MaxNumber:	0
MinNumber:	0.001
SliderMaxNumber:	1.5
SliderMinNumber:	0.001

60.219.8 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Spot Light attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen

60.219.9 AttributeinputLightPointsAt as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Spot Light attribute.
Notes: This attribute should have this content:

Name:	inputLightPointsAt
Class:	CIVectorMBS
Type:	CIAttributeTypePosition3
DisplayName English:	Light Points At
DisplayName German:	Lichtpunkte bei
DisplayName French:	Points lumineux √†
DisplayName Italian:	Punti luce a
DisplayName Spanish:	El foco apunta a
DefaultVector:	[200 200 0]
IdentityVector:	n/a

(Read only property)

60.219.10 AttributeinputLightPosition as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Spot Light attribute.
Notes: This attribute should have this content:

Name:	inputLightPosition
Class:	CIVectorMBS
Type:	CIAttributeTypePosition3
DisplayName English:	Light Position
DisplayName German:	Lichtposition
DisplayName French:	Position de la lumi√®re
DisplayName Italian:	Posizione luce
DisplayName Spanish:	Posici√n de la luz
DefaultVector:	[400 600 150]
IdentityVector:	n/a

(Read only property)

60.219.11 inputBrightness as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Brightness
Notes:

See AttributeinputBrightness for more details.

Name:	inputBrightness
Class:	double (NSNumber)
DisplayName English:	Brightness
DisplayName German:	Helligkeit
DisplayName French:	Luminosit√©
DisplayName Italian:	Luminosit√†
DisplayName Spanish:	Brillo
Type:	CIAttributeTypeDistance

(Read and Write property)

60.219.12 inputColor as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Color
Notes:

Name:	inputColor
Class:	CIColorMBS (CIColor)
DisplayName English:	Color
DisplayName German:	Farbe
DisplayName French:	Couleur
DisplayName Italian:	Colore
DisplayName Spanish:	Color
Type:	CIAttributeTypeOpaqueColor

See AttributeinputColor for more details.
(Read and Write property)

60.219.13 inputConcentration as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Concentration
Notes:

See AttributeinputConcentration for more details.
(Read and Write property)

Name:	inputConcentration
Class:	double (NSNumber)
DisplayName English:	Concentration
DisplayName German:	Konzentration
DisplayName French:	Concentration
DisplayName Italian:	Concentrazione
DisplayName Spanish:	Concentraci√n
Type:	CIAttributeTypeScalar

60.219.14 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.219.15 inputLightPointsAt as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Light Points At
Notes:

Name:	inputLightPointsAt
Class:	CIVectorMBS (CIVector)
DisplayName English:	Light Points At
DisplayName German:	Lichtpunkte bei
DisplayName French:	Points lumineux √†
DisplayName Italian:	Punti luce a
DisplayName Spanish:	El foco apunta a
Type:	CIAttributeTypePosition3

See AttributeinputLightPointsAt for more details.
(Read and Write property)

60.219.16 inputLightPosition as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Light Position
Notes:

Name:	inputLightPosition
Class:	CIVectorMBS (CIVector)
DisplayName English:	Light Position
DisplayName German:	Lichtposition
DisplayName French:	Position de la lumi√®re
DisplayName Italian:	Posizione luce
DisplayName Spanish:	Posici√n de la luz
Type:	CIAttributeTypePosition3

See AttributeinputLightPosition for more details.
(Read and Write property)

60.220 class CIFilterSRGBToneCurveToLinearMBS

60.220.1 class CIFilterSRGBToneCurveToLinearMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage sRGB Tone Curve to Linear filter.
Notes: Details for this filter:

FilterName:	CISRGBToneCurveToLinear
DisplayName English:	sRGB Tone Curve to Linear
DisplayName German:	sRGB-Farbtonkurve in eine lineare Farbtonkurve
DisplayName French:	Courbe tonale sRGB vers lin√©aire
DisplayName Italian:	Da curva tonale sRGB a lineare
DisplayName Spanish:	Curva tonal de sRGB a lineal

Categories:

- CICategoryColorAdjustment: Color Adjustment
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.220.2 Methods

60.220.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.220.4 Properties

60.220.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the sRGB Tone Curve to Linear attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.220.6 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.221 class CIFilterStarShineGeneratorMBS

60.221.1 class CIFilterStarShineGeneratorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Star Shine filter.
Example:

```
// generate an image with the Star Shine Generator filter
Var filter As New CIFilterStarShineGeneratorMBS
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputColor = New CIColorMBS(1, 0.8, 0.6, 1)
filter.inputCrossAngle = 0.6 // range -3.141593 to 3.141593
filter.inputCrossOpacity = -2 // range -8 to 0
filter.inputCrossScale = 15 // range 0 to 100
filter.inputCrossWidth = 2.5 // range 0.5 to 10
filter.inputEpsilon = -2 // range -8 to 0
filter.inputRadius = 50 // range 0 to 300

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture(300, 300)
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIStarShineGenerator
DisplayName English:	Star Shine
DisplayName German:	Sternenlicht
DisplayName French:	Brillance d,Äô√©toile
DisplayName Italian:	Stella luminosa
DisplayName Spanish:	Brillo estrellado

Categories:

- CICategoryGenerator: Generator
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputCenter: Center
- inputColor: Color
- inputRadius: Radius
- inputCrossScale: Cross Scale
- inputCrossAngle: Cross Angle
- inputCrossOpacity: Cross Opacity
- inputCrossWidth: Cross Width
- inputEpsilon: Epsilon

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.221.2 Methods

60.221.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.221.4 Properties

60.221.5 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Star Shine attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

60.221.6 AttributeinputColor as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Star Shine attribute.
Notes: This attribute should have this content:

Name:	inputColor
Class:	CIColorMBS
Type:	CIAttributeTypeColor
DisplayName English:	Color
DisplayName German:	Farbe
DisplayName French:	Couleur
DisplayName Italian:	Colore
DisplayName Spanish:	Color
DefaultColor:	Red = 1, Green = 0.8, Blue = 0.6, Alpha = 1
IdentityNumber:	0

(Read only property)

60.221.7 AttributeinputCrossAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Star Shine attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputCrossAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Cross Angle
DisplayName German:	Cross-Winkel

DisplayName Italian:	Angolo incrociato
DisplayName Spanish:	√Ångulo cruzado
DefaultNumber:	0.6
IdentityNumber:	0
SliderMaxNumber:	3.141593
SliderMinNumber:	-3.141593

60.221.8 AttributeinputCrossOpacity as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Star Shine attribute.
Notes: This attribute should have this content:

Name:	inputCrossOpacity
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Cross Opacity
DisplayName German:	Cross-Deckkraft
DisplayName French:	Opacit√© crois√©e
DisplayName Italian:	Opacit√† incrociata
DisplayName Spanish:	Opacidad cruzada
DefaultNumber:	-2
IdentityNumber:	-2
MaxNumber:	0
MinNumber:	-8
SliderMaxNumber:	0
SliderMinNumber:	-8

(Read only property)

60.221.9 AttributeinputCrossScale as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Star Shine attribute.
Notes: This attribute should have this content:

Name:	inputCrossScale
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Cross Scale
DisplayName German:	Cross-Skalierung
DisplayName French:	√âchelle crois√©e
DisplayName Italian:	Scala incrociata
DisplayName Spanish:	Escala cruzada
DefaultNumber:	15
IdentityNumber:	15
SliderMaxNumber:	100
SliderMinNumber:	0

(Read only property)

60.221.10 AttributeinputCrossWidth as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Star Shine attribute.
Notes: This attribute should have this content:

Name:	inputCrossWidth
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Cross Width
DisplayName German:	Cross-Breite
DisplayName French:	Largeur crois√©e
DisplayName Italian:	Larghezza incrociata
DisplayName Spanish:	Anchura cruzada
DefaultNumber:	2.5
IdentityNumber:	0
SliderMaxNumber:	10
SliderMinNumber:	0.5

(Read only property)

60.221.11 AttributeinputEpsilon as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Star Shine attribute.
Notes: This attribute should have this content:

Name:	inputEpsilon
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Epsilon
DisplayName German:	Epsilon
DisplayName French:	Epsilon
DisplayName Italian:	Ipsilon
DisplayName Spanish:	√âpsilon
DefaultNumber:	-2
IdentityNumber:	-2
MaxNumber:	0
MinNumber:	-8
SliderMaxNumber:	0
SliderMinNumber:	-8

(Read only property)

60.221.12 AttributeinputRadius as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Star Shine attribute.
Notes: This attribute should have this content:

Name:	inputRadius
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
DefaultNumber:	50
IdentityNumber:	0
SliderMaxNumber:	300
SliderMinNumber:	0

(Read only property)

60.221.13 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.221.14 inputColor as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Color
Notes:

Name:	inputColor
Class:	CIColorMBS (CIColor)
DisplayName English:	Color
DisplayName German:	Farbe
DisplayName French:	Couleur
DisplayName Italian:	Colore
DisplayName Spanish:	Color
Type:	CIAttributeTypeColor

See AttributeinputColor for more details.
(Read and Write property)

60.221.15 inputCrossAngle as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Cross Angle
Notes:

Name:	inputCrossAngle
Class:	double (NSNumber)
DisplayName English:	Cross Angle
DisplayName German:	Cross-Winkel
DisplayName French:	Angle crois√©
DisplayName Italian:	Angolo incrociato
DisplayName Spanish:	√Ångulo cruzado
Type:	CIAttributeTypeAngle

See AttributeinputCrossAngle for more details.
(Read and Write property)

60.221.16 inputCrossOpacity as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Cross Opacity
Notes:

Name:	inputCrossOpacity
Class:	double (NSNumber)
DisplayName English:	Cross Opacity
DisplayName German:	Cross-Deckkraft
DisplayName French:	Opacit√© crois√©e
DisplayName Italian:	Opacit√† incrociata
DisplayName Spanish:	Opacidad cruzada
Type:	CIAttributeTypeScalar

See AttributeinputCrossOpacity for more details.
(Read and Write property)

60.221.17 inputCrossScale as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Cross Scale
Notes:

See AttributeinputCrossScale for more details.
(Read and Write property)

Name:	inputCrossScale
Class:	double (NSNumber)
DisplayName English:	Cross Scale
DisplayName German:	Cross-Skalierung
DisplayName French:	√âchelle crois√©e
DisplayName Italian:	Scala incrociata
DisplayName Spanish:	Escala cruzada
Type:	CIAttributeTypeScalar

60.221.18 inputCrossWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Cross Width
Notes:

Name:	inputCrossWidth
Class:	double (NSNumber)
DisplayName English:	Cross Width
DisplayName German:	Cross-Breite
DisplayName French:	Largeur crois√©e
DisplayName Italian:	Larghezza incrociata
DisplayName Spanish:	Anchura cruzada
Type:	CIAttributeTypeDistance

See AttributeinputCrossWidth for more details.
(Read and Write property)

60.221.19 inputEpsilon as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Epsilon
Notes:

Name:	inputEpsilon
Class:	double (NSNumber)
DisplayName English:	Epsilon
DisplayName German:	Epsilon
DisplayName French:	Epsilon
DisplayName Italian:	Ipsilon
DisplayName Spanish:	√âpsilon
Type:	CIAttributeTypeScalar

See AttributeinputEpsilon for more details.
(Read and Write property)

60.221.20 inputRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius
Notes:

Name:	inputRadius
Class:	double (NSNumber)
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
Type:	CIAttributeTypeDistance

See AttributeinputRadius for more details.
(Read and Write property)

60.222 class CIFilterStraightenFilterMBS

60.222.1 class CIFilterStraightenFilterMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Straighten filter.
Notes: Details for this filter:

FilterName:	CIStraightenFilter
DisplayName English:	Straighten
DisplayName German:	Begradigen
DisplayName French:	Redresser
DisplayName Italian:	Raddrizza
DisplayName Spanish:	Enderezar

Categories:

- CICategoryGeometryAdjustment: Geometry Adjustment
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputAngle: Angle

Output:

- outputImage

Subclass of the CIFilterMBS class.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr5

60.222.2 Methods

60.222.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.222.4 Properties

60.222.5 AttributeinputAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Straighten attribute.
Notes: This attribute should have this content:

Name:	inputAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo

60.223 class CIFilterStretchCropMBS

60.223.1 class CIFilterStretchCropMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Stretch Crop filter.
Example:

```
// apply the Stretch Crop filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterStretchCropMBS
filter.inputImage = image
filter.inputCenterStretchAmount = 0.25 // range 0 to 1
filter.inputCropAmount = 0.25 // range 0 to 1
filter.inputSize = New CIVectorMBS(1280, 720)

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIStretchCrop
DisplayName English:	Stretch Crop
DisplayName German:	Schnitt dehnen
DisplayName French:	√âtirer le recadrage
DisplayName Italian:	Allarga o ritaglia
DisplayName Spanish:	Estirar recorte

Categories:

60.224 class CIFilterStripesGeneratorMBS

60.224.1 class CIFilterStripesGeneratorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Stripes filter.
Example:

```
// generate an image with the Stripes Generator filter
Var filter As New CIFilterStripesGeneratorMBS
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputColor0 = New CIColorMBS(1, 1, 1, 1)
filter.inputColor1 = New CIColorMBS(0, 0, 0, 1)
filter.inputSharpness = 1 // range 0 to 1
filter.inputWidth = 80 // range 0 to 800

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture(300, 300)
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIStripesGenerator
DisplayName English:	Stripes
DisplayName German:	Streifen
DisplayName French:	Rayures
DisplayName Italian:	Strisce
DisplayName Spanish:	Franjas

Categories:

- CICategoryGenerator: Generator
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputCenter: Center

- inputColor0: Color 1
- inputColor1: Color 2
- inputWidth: Width
- inputSharpness: Sharpness

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.224.2 Methods

60.224.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.224.4 Properties

60.224.5 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Stripes attribute.
Notes: This attribute should have this content:

(Read only property)

60.224.6 AttributeinputColor0 as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Stripes attribute.
Notes: This attribute should have this content:

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

Name:	inputColor0
Class:	CIColorMBS
Type:	CIAttributeTypeColor
DisplayName English:	Color 1
DisplayName German:	Farbe 1
DisplayName French:	Couleur 1
DisplayName Italian:	Colore 1
DisplayName Spanish:	Color 1
DefaultColor:	Red = 1, Green = 1, Blue = 1, Alpha = 1
IdentityNumber:	0

(Read only property)

60.224.7 AttributeinputColor1 as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Stripes attribute.
Notes: This attribute should have this content:

Name:	inputColor1
Class:	CIColorMBS
Type:	CIAttributeTypeColor
DisplayName English:	Color 2
DisplayName German:	Farbe 2
DisplayName French:	Couleur 2
DisplayName Italian:	Colore 2
DisplayName Spanish:	Color 2
DefaultColor:	Red = 0, Green = 0, Blue = 0, Alpha = 1
IdentityNumber:	0

(Read only property)

60.224.8 AttributeinputSharpness as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Stripes attribute.
Notes: This attribute should have this content:

Name:	inputSharpness
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Sharpness
DisplayName German:	Sch√§rfe
DisplayName French:	Nettet√©
DisplayName Italian:	Nitidezza
DisplayName Spanish:	Nitidez
DefaultNumber:	1
IdentityNumber:	0
MaxNumber:	1
MinNumber:	0
SliderMaxNumber:	1
SliderMinNumber:	0

(Read only property)

60.224.9 AttributeinputWidth as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Stripes attribute.
Notes: This attribute should have this content:

(Read only property)

60.224.10 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center
Notes:

Name:	inputWidth
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
DefaultNumber:	80
IdentityNumber:	0
SliderMaxNumber:	800
SliderMinNumber:	0

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.224.11 inputColor0 as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Color 1
Notes:

Name:	inputColor0
Class:	CIColorMBS (CIColor)
DisplayName English:	Color 1
DisplayName German:	Farbe 1
DisplayName French:	Couleur 1
DisplayName Italian:	Colore 1
DisplayName Spanish:	Color 1
Type:	CIAttributeTypeColor

See AttributeinputColor0 for more details.
(Read and Write property)

60.224.12 inputColor1 as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Color 2
Notes:

Name:	inputColor1
Class:	CIColorMBS (CIColor)
DisplayName English:	Color 2
DisplayName German:	Farbe 2
DisplayName French:	Couleur 2
DisplayName Italian:	Colore 2
DisplayName Spanish:	Color 2
Type:	CIAttributeTypeColor

See AttributeinputColor1 for more details.
(Read and Write property)

60.224.13 inputSharpness as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Sharpness
Notes:

Name:	inputSharpness
Class:	double (NSNumber)
DisplayName English:	Sharpness
DisplayName German:	Sch√§rfe
DisplayName French:	Nettet√©
DisplayName Italian:	Nitidezza
DisplayName Spanish:	Nitidez
Type:	CIAttributeTypeScalar

See AttributeinputSharpness for more details.
(Read and Write property)

60.224.14 inputWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Width
Notes:

Name:	inputWidth
Class:	double (NSNumber)
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
Type:	CIAttributeTypeDistance

See AttributeinputWidth for more details.
(Read and Write property)

60.225 class CIFilterSubtractBlendModeMBS

60.225.1 class CIFilterSubtractBlendModeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Subtract Blend Mode filter.
Notes: Details for this filter:

FilterName:	CISubtractBlendMode
DisplayName English:	Subtract Blend Mode
DisplayName German:	Mischmethode ,ÄûSubtrahieren,Äú
DisplayName French:	Mode de fusion Soustraction
DisplayName Italian:	Modalit√† sfumatura sottrazione
DisplayName Spanish:	Restar modo de mezcla

Categories:

- CICategoryCompositeOperation: Composite Operation
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputBackgroundImage: Background Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.225.2 Methods

60.225.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.225.4 Properties

60.225.5 AttributeinputBackgroundImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Subtract Blend Mode attribute.
Notes: This attribute should have this content:

Name:	inputBackgroundImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.225.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Subtract Blend Mode attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

60.225.7 inputBackgroundImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Background Image
Notes:

Name:	inputBackgroundImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Background Image
DisplayName German:	Hintergrundbild
DisplayName French:	Image d,Äôarri√®re-plan
DisplayName Italian:	Immagine di sfondo
DisplayName Spanish:	Imagen de fondo
Type:	CIAttributeTypeImage

See AttributeinputBackgroundImage for more details.
(Read and Write property)

60.225.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.226 class CIFilterSunbeamsGeneratorMBS

60.226.1 class CIFilterSunbeamsGeneratorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Sunbeams filter.
Example:

```
// generate an image with the Sunbeams Generator filter
Var filter As New CIFilterSunbeamsGeneratorMBS
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputColor = New CIColorMBS(1, 0.5, 0, 1)
filter.inputMaxStriationRadius = 2.58 // range 0 to 10
filter.inputStriationContrast = 1.375 // range 0 to 5
filter.inputStriationStrength = 0.5 // range 0 to 3
filter.inputSunRadius = 40 // range 0 to 800
filter.inputTime = 0 // range 0 to 1

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture(300, 300)
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CISunbeamsGenerator
DisplayName English:	Sunbeams
DisplayName German:	Sonnenstrahlen
DisplayName French:	Rayons solaires
DisplayName Italian:	Raggi di sole
DisplayName Spanish:	Rayos de sol

Categories:

- CICategoryGenerator: Generator
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputCenter: Center
- inputColor: Color
- inputSunRadius: Sun Radius
- inputMaxStriationRadius: Maximum Striation Radius
- inputStriationStrength: Striation Strength
- inputStriationContrast: Striation Contrast
- inputTime: Time

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.226.2 Methods

60.226.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.226.4 Properties

60.226.5 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sunbeams attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

60.226.6 AttributeinputColor as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sunbeams attribute.
Notes: This attribute should have this content:

Name:	inputColor
Class:	CIColorMBS
Type:	CIAttributeTypeColor
DisplayName English:	Color
DisplayName German:	Farbe
DisplayName French:	Couleur
DisplayName Italian:	Colore
DisplayName Spanish:	Color
DefaultColor:	Red = 1, Green = 0.5, Blue = 0, Alpha = 1
IdentityNumber:	0

(Read only property)

60.226.7 AttributeinputMaxStriationRadius as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sunbeams attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputMaxStriationRadius
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Maximum Striation Radius
DisplayName German:	Maximaler Radius f√ºr Riffelung

DisplayName Italian:	Raggio di massima striatura
DisplayName Spanish:	Radio de estriaci√n m√°ximo
DefaultNumber:	2.58
IdentityNumber:	2.58
SliderMaxNumber:	10
SliderMinNumber:	0

60.226.8 AttributeinputStriationContrast as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sunbeams attribute.
Notes: This attribute should have this content:

Name:	inputStriationContrast
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Striation Contrast
DisplayName German:	Kontrast f√ºr Riffelung
DisplayName French:	Contraste des stries
DisplayName Italian:	Contrasto striatura
DisplayName Spanish:	Contraste de la estriaci√n
DefaultNumber:	1.375
IdentityNumber:	1.375
SliderMaxNumber:	5
SliderMinNumber:	0

(Read only property)

60.226.9 AttributeinputStriationStrength as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sunbeams attribute.
Notes: This attribute should have this content:

Name:	inputStriationStrength
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Striation Strength
DisplayName German:	St√§rke der Riffelung
DisplayName French:	Force des stries
DisplayName Italian:	Livello striatura
DisplayName Spanish:	Intensidad de la estriaci√n
DefaultNumber:	0.5
IdentityNumber:	0.5
SliderMaxNumber:	3
SliderMinNumber:	0

(Read only property)

60.226.10 AttributeinputSunRadius as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sunbeams attribute.
Notes: This attribute should have this content:

Name:	inputSunRadius
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Sun Radius
DisplayName German:	Radius der Sonne
DisplayName French:	Rayon du soleil
DisplayName Italian:	Raggio del sole
DisplayName Spanish:	Radio solar
DefaultNumber:	40
IdentityNumber:	40
SliderMaxNumber:	800
SliderMinNumber:	0

(Read only property)

60.226.11 AttributeinputTime as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Sunbeams attribute.
Notes: This attribute should have this content:

Name:	inputTime
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Time
DisplayName German:	Zeit
DisplayName French:	Dur√©e
DisplayName Italian:	Tempo
DisplayName Spanish:	Tiempo
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	1
MinNumber:	0
SliderMaxNumber:	1
SliderMinNumber:	0

(Read only property)

60.226.12 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.226.13 inputColor as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Color
Notes:

Name:	inputColor
Class:	CIColorMBS (CIColor)
DisplayName English:	Color
DisplayName German:	Farbe
DisplayName French:	Couleur
DisplayName Italian:	Colore
DisplayName Spanish:	Color
Type:	CIAttributeTypeColor

See AttributeinputColor for more details.
(Read and Write property)

60.226.14 inputMaxStriationRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Maximum Striation Radius
Notes:

Name:	inputMaxStriationRadius
Class:	double (NSNumber)
DisplayName English:	Maximum Striation Radius
DisplayName German:	Maximaler Radius f√°r Riffelung
DisplayName French:	Rayon maximum des stries
DisplayName Italian:	Raggio di massima striatura
DisplayName Spanish:	Radio de estriaci√n m√°ximo
Type:	CIAttributeTypeScalar

See AttributeinputMaxStriationRadius for more details.
(Read and Write property)

60.226.15 inputStriationContrast as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Striation Contrast
Notes:

See AttributeinputStriationContrast for more details.
(Read and Write property)

Name:	inputStriationContrast
Class:	double (NSNumber)
DisplayName English:	Striation Contrast
DisplayName German:	Kontrast f√ºr Riffelung
DisplayName French:	Contraste des stries
DisplayName Italian:	Contrasto striatura
DisplayName Spanish:	Contraste de la estriaci√n
Type:	CIAttributeTypeScalar

60.226.16 inputStriationStrength as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Striation Strength
Notes:

Name:	inputStriationStrength
Class:	double (NSNumber)
DisplayName English:	Striation Strength
DisplayName German:	St√§rke der Riffelung
DisplayName French:	Force des stries
DisplayName Italian:	Livello striatura
DisplayName Spanish:	Intensidad de la estriaci√n
Type:	CIAttributeTypeScalar

See AttributeinputStriationStrength for more details.
(Read and Write property)

60.226.17 inputSunRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Sun Radius
Notes:

Name:	inputSunRadius
Class:	double (NSNumber)
DisplayName English:	Sun Radius
DisplayName German:	Radius der Sonne
DisplayName French:	Rayon du soleil
DisplayName Italian:	Raggio del sole
DisplayName Spanish:	Radio solar
Type:	CIAttributeTypeDistance

See AttributeinputSunRadius for more details.
(Read and Write property)

60.226.18 inputTime as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Time
Notes:

Name:	inputTime
Class:	double (NSNumber)
DisplayName English:	Time
DisplayName German:	Zeit
DisplayName French:	Dur√©e
DisplayName Italian:	Tempo
DisplayName Spanish:	Tiempo
Type:	CIAttributeTypeScalar

See AttributeinputTime for more details.
(Read and Write property)

60.227 class CIFilterSwipeTransitionMBS

60.227.1 class CIFilterSwipeTransitionMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Swipe filter.
Example:

```
// apply the Swipe Transition filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterSwipeTransitionMBS
filter.inputImage = image
filter.inputTargetImage = image
filter.inputAngle = 0 // range -3.141593 to 3.141593
filter.inputColor = New CIColorMBS(1, 1, 1, 1)
Var inputExtentValues() As Double = Array(0.0, 0.0, 300.0, 300.0)
filter.inputExtent = New CIVectorMBS(inputExtentValues)
filter.inputOpacity = 0 // range 0 to 1
filter.inputTime = 0.5 // range 0 to 1
filter.inputWidth = 300 // range 0.1 to 800

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CISwipeTransition
DisplayName English:	Swipe
DisplayName German:	Wischen
DisplayName French:	Balayer
DisplayName Italian:	Colpo
DisplayName Spanish:	Barrido

Categories:

- CICategoryTransition: Transition
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In

- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputTargetImage: Target Image
- inputExtent: Extent
- inputColor: Color
- inputTime: Time
- inputAngle: Angle
- inputWidth: Width
- inputOpacity: Opacity

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.227.2 Methods

60.227.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.227.4 Properties

60.227.5 AttributeinputAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Swipe attribute.
Notes: This attribute should have this content:

Name:	inputAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
DefaultNumber:	0
IdentityNumber:	0
SliderMaxNumber:	3.141593

(Read only property)

60.227.6 AttributeinputColor as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Swipe attribute.
Notes: This attribute should have this content:

Name:	inputColor
Class:	CIColorMBS
Type:	CIAttributeTypeOpaqueColor
DisplayName English:	Color
DisplayName German:	Farbe
DisplayName French:	Couleur
DisplayName Italian:	Colore
DisplayName Spanish:	Color
DefaultColor:	Red = 1, Green = 1, Blue = 1, Alpha = 1
IdentityNumber:	0

(Read only property)

60.227.7 AttributeinputExtent as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Swipe attribute.
Notes: This attribute should have this content:

Name:	inputExtent
Class:	CIVectorMBS
Type:	CIAttributeTypeRectangle
DisplayName English:	Extent
DisplayName German:	Betrag
DisplayName French:	√âtendue
DisplayName Italian:	Ampiezza
DisplayName Spanish:	Amplitud
DefaultVector:	[0 0 300 300]
IdentityVector:	n/a

(Read only property)

60.227.8 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Swipe attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.227.9 AttributeinputOpacity as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Swipe attribute.
Notes: This attribute should have this content:

Name:	inputOpacity
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Opacity
DisplayName German:	Deckkraft
DisplayName French:	Opacit√©
DisplayName Italian:	Opacit√†
DisplayName Spanish:	Opacidad
DefaultNumber:	0
IdentityNumber:	0
SliderMaxNumber:	1
SliderMinNumber:	0

(Read only property)

60.227.10 AttributeinputTargetImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Swipe attribute.
Notes: This attribute should have this content:

Name:	inputTargetImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Target Image
DisplayName German:	Zielbild
DisplayName French:	Image cible
DisplayName Italian:	Immagine target
DisplayName Spanish:	Imagen de destino
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.227.11 AttributeinputTime as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Swipe attribute.
Notes: This attribute should have this content:

Name:	inputTime
Class:	double
Type:	CIAttributeTypeTime
DisplayName English:	Time
DisplayName German:	Zeit
DisplayName French:	Dur√©e
DisplayName Italian:	Tempo
DisplayName Spanish:	Tiempo
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	1
MinNumber:	0
SliderMaxNumber:	1
SliderMinNumber:	0

(Read only property)

60.227.12 AttributeinputWidth as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Swipe attribute.
Notes: This attribute should have this content:

Name:	inputWidth
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
DefaultNumber:	300
IdentityNumber:	0
MaxNumber:	0
MinNumber:	0.1
SliderMaxNumber:	800
SliderMinNumber:	0.1

(Read only property)

60.227.13 inputAngle as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Angle
Notes:

Name:	inputAngle
Class:	double (NSNumber)
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
Type:	CIAttributeTypeAngle

See AttributeinputAngle for more details.
(Read and Write property)

60.227.14 inputColor as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Color
Notes:

Name:	inputColor
Class:	CIColorMBS (CIColor)
DisplayName English:	Color
DisplayName German:	Farbe
DisplayName French:	Couleur
DisplayName Italian:	Colore
DisplayName Spanish:	Color
Type:	CIAttributeTypeOpaqueColor

See AttributeinputColor for more details.
(Read and Write property)

60.227.15 inputExtent as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Extent
Notes:

Name:	inputExtent
Class:	CIVectorMBS (CIVector)
DisplayName English:	Extent
DisplayName German:	Betrag
DisplayName French:	√âtendue
DisplayName Italian:	Ampiezza
DisplayName Spanish:	Amplitud
Type:	CIAttributeTypeRectangle

See AttributeinputExtent for more details.
(Read and Write property)

60.227.16 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.227.17 inputOpacity as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Opacity
Notes:

See AttributeinputOpacity for more details.
(Read and Write property)

Name:	inputOpacity
Class:	double (NSNumber)
DisplayName English:	Opacity
DisplayName German:	Deckkraft
DisplayName French:	Opacit√©
DisplayName Italian:	Opacit√†
DisplayName Spanish:	Opacidad
Type:	CIAttributeTypeScalar

60.227.18 inputTargetImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Target Image
Notes:

Name:	inputTargetImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Target Image
DisplayName German:	Zielbild
DisplayName French:	Image cible
DisplayName Italian:	Immagine target
DisplayName Spanish:	Imagen de destino
Type:	CIAttributeTypeImage

See AttributeinputTargetImage for more details.
(Read and Write property)

60.227.19 inputTime as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Time
Notes:

Name:	inputTime
Class:	double (NSNumber)
DisplayName English:	Time
DisplayName German:	Zeit
DisplayName French:	Dur√©e
DisplayName Italian:	Tempo
DisplayName Spanish:	Tiempo
Type:	CIAttributeTypeTime

See AttributeinputTime for more details.
(Read and Write property)

60.227.20 inputWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Width
Notes:

Name:	inputWidth
Class:	double (NSNumber)
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
Type:	CIAttributeTypeDistance

See AttributeinputWidth for more details.
(Read and Write property)

60.228 class CIFilterTemperatureAndTintMBS

60.228.1 class CIFilterTemperatureAndTintMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Temperature and Tint filter.
Example:

```
// apply the Temperature And Tint filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterTemperatureAndTintMBS
filter.inputImage = image
filter.inputNeutral = New CIVectorMBS(6500, 0)
filter.inputTargetNeutral = New CIVectorMBS(6500, 0)

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CITemperatureAndTint
DisplayName English:	Temperature and Tint
DisplayName German:	Temperatur und F√§rbung
DisplayName French:	Temp√©rature et teinte
DisplayName Italian:	Temperatura e tinta
DisplayName Spanish:	Temperatura y tinte

Categories:

- CICategoryColorAdjustment: Color Adjustment
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputNeutral: Neutral
- inputTargetNeutral: Target Neutral

Output:

- outputImage

Subclass of the CIFilterMBS class.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr5

60.228.2 Methods

60.228.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.228.4 Properties

60.228.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Temperature and Tint attribute.
Notes: This attribute should have this content:

(Read only property)

60.228.6 AttributeinputNeutral as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

Function: Details about the Temperature and Tint attribute.
Notes: This attribute should have this content:

Name:	inputNeutral
Class:	CIVectorMBS
Type:	CIAttributeTypeOffset
DisplayName:	Neutral
DefaultVector:	[6500 0]
IdentityVector:	[6500 0]

(Read only property)

60.228.7 AttributeinputTargetNeutral as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Temperature and Tint attribute.
Notes: This attribute should have this content:

Name:	inputTargetNeutral
Class:	CIVectorMBS
Type:	CIAttributeTypeOffset
DisplayName English:	Target Neutral
DisplayName German:	Zielneutral
DisplayName French:	Couleur neutre cible
DisplayName Italian:	Elemento neutro target
DisplayName Spanish:	Neutro para el destino
DefaultVector:	[6500 0]
IdentityVector:	[6500 0]

(Read only property)

60.228.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.228.9 inputNeutral as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Neutral
Notes:

Name:	inputNeutral
Class:	CIVectorMBS (CIVector)
DisplayName English:	Neutral
DisplayName German:	Neutral
DisplayName French:	Neutral
DisplayName Italian:	Neutral
DisplayName Spanish:	Neutral
Type:	CIAttributeTypeOffset

See AttributeinputNeutral for more details.
(Read and Write property)

60.228.10 inputTargetNeutral as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Target Neutral
Notes:

Name:	inputTargetNeutral
Class:	CIVectorMBS (CIVector)
DisplayName English:	Target Neutral
DisplayName German:	Zielneutral
DisplayName French:	Couleur neutre cible
DisplayName Italian:	Elemento neutro target
DisplayName Spanish:	Neutro para el destino
Type:	CIAttributeTypeOffset

See AttributeinputTargetNeutral for more details.
(Read and Write property)

60.229 class CIFilterTextImageGeneratorMBS

60.229.1 class CIFilterTextImageGeneratorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Text Image Generator filter.
Example:

```
// generate an image with the Text Image Generator filter
Var filter As New CIFilterTextImageGeneratorMBS
filter.inputFontSize = 12 // range 9 to 128
filter.inputPadding = 0 // range 0 to 50
filter.inputScaleFactor = 1 // range 1 to 4

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture(300, 300)
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CITextImageGenerator
DisplayName English:	Text Image Generator
DisplayName German:	Textbildgenerator
DisplayName French:	G√©n√©rateur d,Äôimage de texte
DisplayName Italian:	Generatore immagine di testo
DisplayName Spanish:	Generador de im√°genes con texto

Categories:

- CICategoryGenerator: Generator
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In

Input:

- inputText: Text
- inputFontName: Font Name
- inputFontSize: Font Size

- inputScaleFactor: Scale Factor
- inputPadding: Padding

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.229.2 Methods

60.229.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.229.4 Properties

60.229.5 AttributeinputFontName as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Text Image Generator attribute.
Notes: This attribute should have this content:

Name:	inputFontName
Class:	String
DisplayName English:	Font Name
DisplayName German:	Schriftname
DisplayName French:	Nom de la police
DisplayName Italian:	Nome font
DisplayName Spanish:	Nombre de tipo de letra
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.229.6 AttributeinputFontSize as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Text Image Generator attribute.
Notes: This attribute should have this content:

Name:	inputFontSize
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Font Size
DisplayName German:	Schriftgr√√üe
DisplayName French:	Taille de la police
DisplayName Italian:	Dimensioni font
DisplayName Spanish:	Tama√±o de letra
DefaultNumber:	12
IdentityNumber:	0
SliderMaxNumber:	128
SliderMinNumber:	9

(Read only property)

60.229.7 AttributeinputPadding as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: Details about the Text Image Generator attribute.
Notes: This attribute should have this content:

Name:	inputPadding
Class:	double
Type:	CIAttributeTypeInteger
DisplayName:	Padding
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	200
MinNumber:	0
SliderMaxNumber:	50
SliderMinNumber:	0

(Read only property)

60.229.8 AttributeinputScaleFactor as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Text Image Generator attribute.
Notes: This attribute should have this content:

Name:	inputScaleFactor
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Scale Factor
DisplayName German:	Skalierungsfaktor
DisplayName French:	Facteur d,Äô√©chelle
DisplayName Italian:	Fattore di scala
DisplayName Spanish:	Factor de escala
DefaultNumber:	1
IdentityNumber:	0
SliderMaxNumber:	4
SliderMinNumber:	1

(Read only property)

60.229.9 AttributeinputText as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Text Image Generator attribute.
Notes: This attribute should have this content:

Name:	inputText
Class:	String
DisplayName:	Text
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.229.10 inputFontName as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Font Name
Notes:

Name:	inputFontName
Class:	String (NSString)
DisplayName English:	Font Name
DisplayName German:	Schriftname
DisplayName French:	Nom de la police
DisplayName Italian:	Nome font
DisplayName Spanish:	Nombre de tipo de letra

See AttributeinputFontName for more details.
(Read and Write property)

60.229.11 inputFontSize as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Font Size
Notes:

Name:	inputFontSize
Class:	double (NSNumber)
DisplayName English:	Font Size
DisplayName German:	Schriftgr√√üe
DisplayName French:	Taille de la police
DisplayName Italian:	Dimensioni font
DisplayName Spanish:	Tama√±o de letra
Type:	CIAttributeTypeScalar

See AttributeinputFontSize for more details.
(Read and Write property)

60.229.12 inputPadding as double

MBS MacCI Plugin, Plugin Version: 23.0, Platform: macOS, Targets: All.

Function: The attribute Padding
Notes:

See AttributeinputPadding for more details.
(Read and Write property)

Name:	inputPadding
Class:	double (NSNumber)
DisplayName English:	Padding
DisplayName German:	Padding
DisplayName French:	Padding
DisplayName Italian:	Padding
DisplayName Spanish:	Padding
Type:	CIAttributeTypeInteger

60.229.13 inputScaleFactor as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Scale Factor
Notes:

Name:	inputScaleFactor
Class:	double (NSNumber)
DisplayName English:	Scale Factor
DisplayName German:	Skalierungsfaktor
DisplayName French:	Facteur d,Äô√©chelle
DisplayName Italian:	Fattore di scala
DisplayName Spanish:	Factor de escala
Type:	CIAttributeTypeScalar

See AttributeinputScaleFactor for more details.
(Read and Write property)

60.229.14 inputText as String

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Text
Notes:

Name:	inputText
Class:	String (NSString)
DisplayName English:	Text
DisplayName German:	Text
DisplayName French:	Text
DisplayName Italian:	Text
DisplayName Spanish:	Text

See AttributeinputText for more details.
(Read and Write property)

60.230 class CIFilterThermalMBS

60.230.1 class CIFilterThermalMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Thermal filter.
Notes: Details for this filter:

FilterName:	CIThermal
DisplayName English:	Thermal
DisplayName German:	W√§rmebild
DisplayName French:	Thermique
DisplayName Italian:	Termico
DisplayName Spanish:	T√©rmica

Categories:

- CICategoryColorEffect: Color Effect
- CICategoryVideo: Video
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.230.2 Methods

60.230.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.230.4 Properties

60.230.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Thermal attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.230.6 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.231 class CIFilterToneCurveMBS

60.231.1 class CIFilterToneCurveMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Tone Curve filter.
Example:

```
// apply the Tone Curve filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterToneCurveMBS
filter.inputImage = image
filter.inputPoint0 = New CIVectorMBS(0, 0)
filter.inputPoint1 = New CIVectorMBS(0.25, 0.25)
filter.inputPoint2 = New CIVectorMBS(0.5, 0.5)
filter.inputPoint3 = New CIVectorMBS(0.75, 0.75)
filter.inputPoint4 = New CIVectorMBS(1, 1)

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIToneCurve
DisplayName English:	Tone Curve
DisplayName German:	Farbtonkurve
DisplayName French:	Courbe tonale
DisplayName Italian:	Curva tonale
DisplayName Spanish:	Curva tonal

Categories:

- CICategoryColorAdjustment: Color Adjustment
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels

- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputPoint0: Point 0
- inputPoint1: Point 1
- inputPoint2: Point 2
- inputPoint3: Point 3
- inputPoint4: Point 4

Output:

- outputImage

Subclass of the CIFilterMBS class.

(Read and Write property)

60.232 class CIFilterTorusLensDistortionMBS

60.232.1 class CIFilterTorusLensDistortionMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Torus Lens Distortion filter.
Example:

```
// apply the Torus Lens Distortion filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterTorusLensDistortionMBS
filter.inputImage = image
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputRadius = 160 // range 0 to 500
filter.inputRefraction = 1.7 // range 0 to 5
filter.inputWidth = 80 // range 0 to 200

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CITorusLensDistortion
DisplayName English:	Torus Lens Distortion
DisplayName German:	Verzerrung ,ÄûTorus-Linse,Äú
DisplayName French:	D√©formation Lentille torique
DisplayName Italian:	Distorsione lenti Torus
DisplayName Spanish:	Distorsi√n por lente toroidal

Categories:

- CICategoryDistortionEffect: Distortion Effect
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputCenter: Center
- inputRadius: Radius
- inputWidth: Width
- inputRefraction: Refraction

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.232.2 Methods

60.232.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.232.4 Properties

60.232.5 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Torus Lens Distortion attribute.
Notes: This attribute should have this content:

(Read only property)

60.232.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

Function: Details about the Torus Lens Distortion attribute.
Notes: This attribute should have this content:

(Read only property)

60.232.7 AttributeinputRadius as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Torus Lens Distortion attribute.
Notes: This attribute should have this content:

(Read only property)

60.232.8 AttributeinputRefraction as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Torus Lens Distortion attribute.

Name:	inputRadius
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
DefaultNumber:	160
IdentityNumber:	0
SliderMaxNumber:	500
SliderMinNumber:	0

Notes: This attribute should have this content:

Name:	inputRefraction
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Refraction
DisplayName German:	Lichtbrechung
DisplayName French:	R√©fraction
DisplayName Italian:	Rifrazione
DisplayName Spanish:	Refracci√n
DefaultNumber:	1.7
IdentityNumber:	1
SliderMaxNumber:	5
SliderMinNumber:	0

(Read only property)

60.232.9 AttributeinputWidth as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Torus Lens Distortion attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputWidth
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
DefaultNumber:	80
IdentityNumber:	0
SliderMaxNumber:	200
SliderMinNumber:	0

60.232.10 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.232.11 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.232.12 inputRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius
Notes:

Name:	inputRadius
Class:	double (NSNumber)
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
Type:	CIAttributeTypeDistance

See AttributeinputRadius for more details.
(Read and Write property)

60.232.13 inputRefraction as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Refraction
Notes:

Name:	inputRefraction
Class:	double (NSNumber)
DisplayName English:	Refraction
DisplayName German:	Lichtbrechung
DisplayName French:	R√©fraction
DisplayName Italian:	Rifrazione
DisplayName Spanish:	Refracci√n
Type:	CIAttributeTypeScalar

See AttributeinputRefraction for more details.
(Read and Write property)

60.232.14 inputWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Width
Notes:

Name:	inputWidth
Class:	double (NSNumber)
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
Type:	CIAttributeTypeDistance

See AttributeinputWidth for more details.
(Read and Write property)

60.233 class CIFilterTriangleKaleidoscopeMBS

60.233.1 class CIFilterTriangleKaleidoscopeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Triangle Kaleidoscope filter.
Example:

```
// apply the Triangle Kaleidoscope filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterTriangleKaleidoscopeMBS
filter.inputImage = image
filter.inputDecay = 0.85 // range 0 to 1
filter.inputPoint = New CIVectorMBS(150, 150)
filter.inputRotation = 5.924285 // range 0 to 6.283185
filter.inputSize = 700 // range 0 to 1000

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CITriangleKaleidoscope
DisplayName English:	Triangle Kaleidoscope
DisplayName German:	Dreieckskaleidoskop
DisplayName French:	Kal√©idoscope en forme de triangle
DisplayName Italian:	Caleidoscopio triangolare
DisplayName Spanish:	Caleidoscopio triangular

Categories:

- CICategoryTileEffect: Tile Effect
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputPoint: Point
- inputSize: Size
- inputRotation: Rotation
- inputDecay: Decay

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.233.2 Methods

60.233.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.233.4 Properties

60.233.5 AttributeinputDecay as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Triangle Kaleidoscope attribute.
Notes: This attribute should have this content:

(Read only property)

60.233.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputDecay
Class:	double
Type:	CIAttributeTypeScalar
DisplayName:	Decay
DefaultNumber:	0.85
IdentityNumber:	0
SliderMaxNumber:	1
SliderMinNumber:	0

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

Function: Details about the Triangle Kaleidoscope attribute.
Notes: This attribute should have this content:

(Read only property)

60.233.7 AttributeinputPoint as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Triangle Kaleidoscope attribute.
Notes: This attribute should have this content:

(Read only property)

60.233.8 AttributeinputRotation as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Triangle Kaleidoscope attribute.
Notes: This attribute should have this content:

Name:	inputPoint
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Point
DisplayName German:	Point
DisplayName French:	Point
DisplayName Italian:	Punto
DisplayName Spanish:	Punto
DefaultVector:	[150 150]
IdentityVector:	n/a

Name:	inputRotation
Class:	double
Type:	CIAttributeTypeAngle
DisplayName:	Rotation
DefaultNumber:	5.924285
IdentityNumber:	0
SliderMaxNumber:	6.283185
SliderMinNumber:	0

(Read only property)

60.233.9 AttributeinputSize as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Triangle Kaleidoscope attribute.
Notes: This attribute should have this content:

Name:	inputSize
Class:	double
Type:	CIAttributeTypeScalar
DisplayName:	Size
DefaultNumber:	700
IdentityNumber:	0
SliderMaxNumber:	1000
SliderMinNumber:	0

(Read only property)

60.233.10 inputDecay as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Decay
Notes:

Name:	inputDecay
Class:	double (NSNumber)
DisplayName English:	Decay
DisplayName German:	Decay
DisplayName French:	Decay
DisplayName Italian:	Decay
DisplayName Spanish:	Decay
Type:	CIAttributeTypeScalar

See AttributeinputDecay for more details.
(Read and Write property)

60.233.11 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.233.12 inputPoint as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Point
Notes:

Name:	inputPoint
Class:	CIVectorMBS (CIVector)
DisplayName English:	Point
DisplayName German:	Point
DisplayName French:	Point
DisplayName Italian:	Punto
DisplayName Spanish:	Punto
Type:	CIAttributeTypePosition

See AttributeinputPoint for more details.
(Read and Write property)

60.233.13 inputRotation as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Rotation
Notes:

Name:	inputRotation
Class:	double (NSNumber)
DisplayName English:	Rotation
DisplayName German:	Rotation
DisplayName French:	Rotation
DisplayName Italian:	Rotation
DisplayName Spanish:	Rotation
Type:	CIAttributeTypeAngle

See AttributeinputRotation for more details.
(Read and Write property)

60.233.14 inputSize as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Size
Notes:

Name:	inputSize
Class:	double (NSNumber)
DisplayName English:	Size
DisplayName German:	Size
DisplayName French:	Size
DisplayName Italian:	Size
DisplayName Spanish:	Size
Type:	CIAttributeTypeScalar

See AttributeinputSize for more details.
(Read and Write property)

60.234 class CIFilterTriangleTileMBS

60.234.1 class CIFilterTriangleTileMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Triangle Tile filter.
Example:

```
// apply the Triangle Tile filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterTriangleTileMBS
filter.inputImage = image
filter.inputAngle = 0 // range -3.141593 to 3.141593
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputWidth = 100 // range 1 to 200

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CITriangleTile
DisplayName English:	Triangle Tile
DisplayName German:	Dreieckig kacheln
DisplayName French:	Mosa√Øque de triangles
DisplayName Italian:	Mosaico triangolare
DisplayName Spanish:	Mosaico triangular

Categories:

- CICategoryTileEffect: Tile Effect
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputCenter: Center
- inputAngle: Angle
- inputWidth: Width

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.234.2 Methods

60.234.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.234.4 Properties

60.234.5 AttributeinputAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Triangle Tile attribute.
Notes: This attribute should have this content:

(Read only property)

60.234.6 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Triangle Tile attribute.
Notes: This attribute should have this content:

Name:	inputAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
DefaultNumber:	0
IdentityNumber:	0
SliderMaxNumber:	3.141593
SliderMinNumber:	-3.141593

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

(Read only property)

60.234.7 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Triangle Tile attribute.
Notes: This attribute should have this content:

(Read only property)

60.234.8 AttributeinputWidth as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Triangle Tile attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

Name:	inputWidth
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
DefaultNumber:	100
IdentityNumber:	0
SliderMaxNumber:	200
SliderMinNumber:	1

(Read only property)

60.234.9 inputAngle as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Angle
Notes:

See AttributeinputAngle for more details.
(Read and Write property)

60.234.10 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputAngle
Class:	double (NSNumber)
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
Type:	CIAttributeTypeAngle

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.234.11 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.234.12 inputWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Width
Notes:

Name:	inputWidth
Class:	double (NSNumber)
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
Type:	CIAttributeTypeDistance

See AttributeinputWidth for more details.
(Read and Write property)

60.235 class CIFilterTwelvefoldReflectedTileMBS

60.235.1 class CIFilterTwelvefoldReflectedTileMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Twelvefold Reflected Tile filter.
Example:

```
// apply the Twelvefold Reflected Tile filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterTwelvefoldReflectedTileMBS
filter.inputImage = image
filter.inputAngle = 0 // range -3.141593 to 3.141593
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputWidth = 100 // range 1 to 200

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CITwelvefoldReflectedTile
DisplayName English:	Twelvefold Reflected Tile
DisplayName German:	12-fach reflektierte Kachel
DisplayName French:	Mosa√Øque r√©fl√©chie 12 fois
DisplayName Italian:	Mosaico riflesso in dodici direzioni
DisplayName Spanish:	Mosaico reflejado doce veces

Categories:

- CICategoryTileEffect: Tile Effect
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputCenter: Center
- inputAngle: Angle
- inputWidth: Width

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.235.2 Methods

60.235.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.235.4 Properties

60.235.5 AttributeinputAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Twelvefold Reflected Tile attribute.
Notes: This attribute should have this content:

(Read only property)

60.235.6 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Twelvefold Reflected Tile attribute.
Notes: This attribute should have this content:

Name:	inputAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
DefaultNumber:	0
IdentityNumber:	0
SliderMaxNumber:	3.141593

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Angle
Notes:

See AttributeinputAngle for more details.
(Read and Write property)

60.235.10 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputAngle
Class:	double (NSNumber)
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
Type:	CIAttributeTypeAngle

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.235.11 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.235.12 inputWidth as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Width
Notes:

Name:	inputWidth
Class:	double (NSNumber)
DisplayName English:	Width
DisplayName German:	Breite
DisplayName French:	Largeur
DisplayName Italian:	Larghezza
DisplayName Spanish:	Anchura
Type:	CIAttributeTypeDistance

See AttributeinputWidth for more details.
(Read and Write property)

60.236 class CIFilterTwirlDistortionMBS

60.236.1 class CIFilterTwirlDistortionMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Twirl Distortion filter.
Example:

```
// apply the Twirl Distortion filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterTwirlDistortionMBS
filter.inputImage = image
filter.inputAngle = 3.141593 // range -12.56637 to 12.56637
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputRadius = 300 // range 0 to 500

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CITwirlDistortion
DisplayName English:	Twirl Distortion
DisplayName German:	Verzerrung ,ÄûWirbeln,Äú
DisplayName French:	D√©formation Spirale
DisplayName Italian:	Distorsione spirale
DisplayName Spanish:	Distorsi√n por giro

Categories:

- CICategoryDistortionEffect: Distortion Effect
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputCenter: Center
- inputRadius: Radius
- inputAngle: Angle

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.236.2 Methods

60.236.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.236.4 Properties

60.236.5 AttributeinputAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Twirl Distortion attribute.
Notes: This attribute should have this content:

SliderMinNumber:	0

(Read only property)

60.236.9 inputAngle as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Angle
Notes:

See AttributeinputAngle for more details.
(Read and Write property)

60.236.10 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputAngle
Class:	double (NSNumber)
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
Type:	CIAttributeTypeAngle

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.236.11 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.236.12 inputRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius
Notes:

Name:	inputRadius
Class:	double (NSNumber)
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
Type:	CIAttributeTypeDistance

See AttributeinputRadius for more details.
(Read and Write property)

60.237 class CIFilterUnsharpMaskMBS

60.237.1 class CIFilterUnsharpMaskMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Unsharp Mask filter.
Example:

```
// apply the Unsharp Mask filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterUnsharpMaskMBS
filter.inputImage = image
filter.inputIntensity = 0.5 // range 0 to 1
filter.inputRadius = 2.5 // range 0 to 100

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIUnsharpMask
DisplayName English:	Unsharp Mask
DisplayName German:	Unscharf maskieren
DisplayName French:	Rendre le masque flou
DisplayName Italian:	Maschera di contrasto
DisplayName Spanish:	Desenfocar m√°scara

Categories:

- CICategorySharpen: Sharpen
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputRadius: Radius
- inputIntensity: Intensity

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.237.2 Methods

60.237.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.237.4 Properties

60.237.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Unsharp Mask attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.237.6 AttributeinputIntensity as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Unsharp Mask attribute.
Notes: This attribute should have this content:

Name:	inputIntensity
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Intensity
DisplayName German:	Intensit√§t
DisplayName French:	Intensit√©
DisplayName Italian:	Intensit√†
DisplayName Spanish:	Intensidad
DefaultNumber:	0.5
IdentityNumber:	0
SliderMaxNumber:	1
SliderMinNumber:	0

(Read only property)

60.237.7 AttributeinputRadius as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Unsharp Mask attribute.
Notes: This attribute should have this content:

(Read only property)

60.237.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputRadius
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
DefaultNumber:	2.5
IdentityNumber:	0
SliderMaxNumber:	100
SliderMinNumber:	0

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.237.9 inputIntensity as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Intensity
Notes:

Name:	inputIntensity
Class:	double (NSNumber)
DisplayName English:	Intensity
DisplayName German:	Intensit√§t
DisplayName French:	Intensit√©
DisplayName Italian:	Intensit√†
DisplayName Spanish:	Intensidad
Type:	CIAttributeTypeScalar

See AttributeinputIntensity for more details.
(Read and Write property)

60.237.10 inputRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius
Notes:

Name:	inputRadius
Class:	double (NSNumber)
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
Type:	CIAttributeTypeDistance

See AttributeinputRadius for more details.
(Read and Write property)

60.238 class CIFilterVibranceMBS

60.238.1 class CIFilterVibranceMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Vibrance filter.
Notes: Details for this filter:

FilterName:	CIVibrance
DisplayName English:	Vibrance
DisplayName German:	Lebendigkeit
DisplayName French:	Brillance
DisplayName Italian:	Vividezza
DisplayName Spanish:	Vivacidad

Categories:

- CICategoryColorAdjustment: Color Adjustment
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputAmount: Amount

Output:

- outputImage

Subclass of the CIFilterMBS class.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr5

60.238.2 Methods

60.238.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.238.4 Properties

60.238.5 AttributeinputAmount as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Vibrance attribute.
Notes: This attribute should have this content:

Name:	inputAmount
Class:	double
Type:	CIAttributeTypeScalar
DisplayName English:	Amount
DisplayName German:	St√§rke
DisplayName French:	Montant
DisplayName Italian:	Quantit√†
DisplayName Spanish:	Cantidad
DefaultNumber:	0
IdentityNumber:	0
MaxNumber:	1
MinNumber:	-1

60.239 class CIFilterVignetteEffectMBS

60.239.1 class CIFilterVignetteEffectMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Vignette Effect filter.
Example:

```
// apply the Vignette Effect filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterVignetteEffectMBS
filter.inputImage = image
filter.inputCenter = New CIVectorMBS(150, 150)
filter.inputFalloff = 0.5 // range 0 to 1
filter.inputIntensity = 1 // range -1 to 1
filter.inputRadius = 150 // range 0 to 2000

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIVignetteEffect
DisplayName English:	Vignette Effect
DisplayName German:	Vignetteneffekt
DisplayName French:	Effet de vignette
DisplayName Italian:	Effetto vignettatura
DisplayName Spanish:	Efecto de degradado

Categories:

- CICategoryColorEffect: Color Effect
- CICategoryVideo: Video
- CICategoryInterlaced: Interlaced
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputCenter: Center
- inputRadius: Radius
- inputIntensity: Intensity
- inputFalloff: Falloff

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.239.2 Methods

60.239.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.239.4 Properties

60.239.5 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Vignette Effect attribute.
Notes: This attribute should have this content:

(Read and Write property)

60.240 class CIFilterVignetteMBS

60.240.1 class CIFilterVignetteMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Vignette filter.
Example:

```
// apply the Vignette filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterVignetteMBS
filter.inputImage = image
filter.inputIntensity = 0 // range -1 to 1
filter.inputRadius = 1 // range 0 to 2

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIVignette
DisplayName English:	Vignette
DisplayName German:	Vignette
DisplayName French:	Vignette
DisplayName Italian:	Vignettatura
DisplayName Spanish:	Degradado

Categories:

- CICategoryColorEffect: Color Effect
- CICategoryVideo: Video
- CICategoryInterlaced: Interlaced
- CICategoryStillImage: Still Image
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputIntensity: Intensity
- inputRadius: Radius

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.240.2 Methods

60.240.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.240.4 Properties

60.240.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Vignette attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen

- inputRadius: Radius
- inputAngle: Angle

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.242.2 Methods

60.242.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.242.4 Properties

60.242.5 AttributeinputAngle as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Vortex Distortion attribute.
Notes: This attribute should have this content:

(Read only property)

60.242.6 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Vortex Distortion attribute.
Notes: This attribute should have this content:

Name:	inputAngle
Class:	double
Type:	CIAttributeTypeAngle
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
DefaultNumber:	56.54867
IdentityNumber:	0
SliderMaxNumber:	94.24778
SliderMinNumber:	-94.24778

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

(Read only property)

60.242.7 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Vortex Distortion attribute.
Notes: This attribute should have this content:

(Read only property)

60.242.8 AttributeinputRadius as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Vortex Distortion attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

Name:	inputRadius
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
DefaultNumber:	300
IdentityNumber:	0
SliderMaxNumber:	800
SliderMinNumber:	0

(Read only property)

60.242.9 inputAngle as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Angle
Notes:

See AttributeinputAngle for more details.
(Read and Write property)

60.242.10 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Name:	inputAngle
Class:	double (NSNumber)
DisplayName English:	Angle
DisplayName German:	Winkel
DisplayName French:	Angle
DisplayName Italian:	Angolo
DisplayName Spanish:	√Ångulo
Type:	CIAttributeTypeAngle

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.242.11 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.242.12 inputRadius as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Radius
Notes:

Name:	inputRadius
Class:	double (NSNumber)
DisplayName English:	Radius
DisplayName German:	Radius
DisplayName French:	Rayon
DisplayName Italian:	Raggio
DisplayName Spanish:	Radio
Type:	CIAttributeTypeDistance

See AttributeinputRadius for more details.
(Read and Write property)

60.243 class CIFilterWhitePointAdjustMBS

60.243.1 class CIFilterWhitePointAdjustMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage White Point Adjust filter.
Notes: Details for this filter:

FilterName:	CIWhitePointAdjust
DisplayName English:	White Point Adjust
DisplayName German:	Wei√üpunkt anpassen
DisplayName French:	Ajustement du point blanc
DisplayName Italian:	Regolazione punto di bianco
DisplayName Spanish:	Ajuste de punto blanco

Categories:

- CICategoryColorAdjustment: Color Adjustment
- CICategoryVideo: Video
- CICategoryStillImage: Still Image
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryHighDynamicRange: High Dynamic Range
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image
- inputColor: Color

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.243.2 Methods

60.243.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.243.4 Properties

60.243.5 AttributeinputColor as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the White Point Adjust attribute.
Notes: This attribute should have this content:

Name:	inputColor
Class:	CIColorMBS
Type:	CIAttributeTypeColor
DisplayName English:	Color
DisplayName German:	Farbe
DisplayName French:	Couleur
DisplayName Italian:	Colore
DisplayName Spanish:	Color
DefaultColor:	Red = 1, Green = 1, Blue = 1, Alpha = 1
IdentityNumber:	0

(Read only property)

60.243.6 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the White Point Adjust attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

60.243.7 inputColor as CIColorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Color
Notes:

Name:	inputColor
Class:	CIColorMBS (CIColor)
DisplayName English:	Color
DisplayName German:	Farbe
DisplayName French:	Couleur
DisplayName Italian:	Colore
DisplayName Spanish:	Color
Type:	CIAttributeTypeColor

See AttributeinputColor for more details.
(Read and Write property)

60.243.8 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.244 class CIFilterXRayMBS

60.244.1 class CIFilterXRayMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage X-Ray filter.
Notes: Details for this filter:

FilterName:	CIXRay
DisplayName English:	X-Ray
DisplayName German:	R√ntgen
DisplayName French:	Rayon X
DisplayName Italian:	Raggi X
DisplayName Spanish:	Rayos X

Categories:

- CICategoryColorEffect: Color Effect
- CICategoryVideo: Video
- CICategoryInterlaced: Interlaced
- CICategoryNonSquarePixels: Non-Square Pixels
- CICategoryStillImage: Still Image
- CICategoryBuiltIn: Built-In

Input:

- inputImage: Image

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.244.2 Methods

60.244.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.244.4 Properties

60.244.5 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the X-Ray attribute.
Notes: This attribute should have this content:

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

(Read only property)

60.244.6 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

See AttributeinputImage for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

60.245 class CIFilterZoomBlurMBS

60.245.1 class CIFilterZoomBlurMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The Xojo class for the CoreImage Zoom Blur filter.
Example:

```
// apply the Zoom Blur filter
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGCreateImageMBS(pic))

Var filter As New CIFilterZoomBlurMBS
filter.inputImage = image
filter.inputAmount = 20 // range -200 to 200
filter.inputCenter = New CIVectorMBS(150, 150)

Var result As CIImageMBS = filter.outputImage
Var output As Picture = result.RenderPicture
// show output in a Canvas or ImageViewer
```

Notes: Details for this filter:

FilterName:	CIZoomBlur
DisplayName English:	Zoom Blur
DisplayName German:	Zoom weichzeichnen
DisplayName French:	Zoom flou
DisplayName Italian:	Sfumatura zoom
DisplayName Spanish:	Ampliar difuminado

Categories:

- CICategoryBlur: Blur
- CICategoryStillImage: Still Image
- CICategoryVideo: Video
- CICategoryBuiltIn: Built-In
- CICategoryHighDynamicRange: High Dynamic Range

Input:

- inputImage: Image
- inputCenter: Center
- inputAmount: Amount

Output:

- outputImage

Subclass of the CIFilterMBS class.

60.245.2 Methods

60.245.3 Constructor

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: On success the handle property is not zero and the filter has the default values set.

60.245.4 Properties

60.245.5 AttributeinputAmount as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Zoom Blur attribute.
Notes: This attribute should have this content:

(Read only property)

60.245.6 AttributeinputCenter as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Zoom Blur attribute.
Notes: This attribute should have this content:

(Read only property)

Name:	inputAmount
Class:	double
Type:	CIAttributeTypeDistance
DisplayName English:	Amount
DisplayName German:	St√§rke
DisplayName French:	Montant
DisplayName Italian:	Quantit√†
DisplayName Spanish:	Cantidad
DefaultNumber:	20
IdentityNumber:	0
SliderMaxNumber:	200
SliderMinNumber:	-200

Name:	inputCenter
Class:	CIVectorMBS
Type:	CIAttributeTypePosition
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
DefaultVector:	[150 150]
IdentityVector:	n/a

60.245.7 AttributeinputImage as CIAttributeMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Details about the Zoom Blur attribute.
Notes: This attribute should have this content:

(Read only property)

60.245.8 inputAmount as double

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Amount
Notes:

See AttributeinputAmount for more details.
(Read and Write property)

Name:	inputImage
Class:	CIImageMBS
Type:	CIAttributeTypeImage
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
DefaultNumber:	0
IdentityNumber:	0

Name:	inputAmount
Class:	double (NSNumber)
DisplayName English:	Amount
DisplayName German:	St√§rke
DisplayName French:	Montant
DisplayName Italian:	Quantit√†
DisplayName Spanish:	Cantidad
Type:	CIAttributeTypeDistance

60.245.9 inputCenter as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Center
Notes:

Name:	inputCenter
Class:	CIVectorMBS (CIVector)
DisplayName English:	Center
DisplayName German:	Mitte
DisplayName French:	Centre
DisplayName Italian:	Centro
DisplayName Spanish:	Centro
Type:	CIAttributeTypePosition

See AttributeinputCenter for more details.
(Read and Write property)

60.245.10 inputImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The attribute Image
Notes:

Name:	inputImage
Class:	CIImageMBS (CIImage)
DisplayName English:	Image
DisplayName German:	Bild
DisplayName French:	Image
DisplayName Italian:	Immagine
DisplayName Spanish:	Imagen
Type:	CIAttributeTypeImage

See AttributeinputImage for more details.
(Read and Write property)

60.246 class CIImageMBS

60.246.1 class CIImageMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: The class for a CoreImage Image object.
Example:

```
// take a picture and scale it
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = CIImageMBS.imageWithPicture(pic)

Var filter As New CIFilterLanczosScaleTransformMBS

Const targetWidth = 600.0
Const targetHeight = 400.0

Var scale As Double = targetHeight / image.Extent.Height
Var aspect As Double = targetWidth / (image.Extent.Width * scale)

filter.inputImage = image
filter.inputScale = scale
filter.inputAspectRatio = aspect

Var result As Picture = filter.outputImage.RenderPicture

Backdrop = result
```

60.246.2 Methods

60.246.3 AsNSImageMBS as Variant

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates a NSImageMBS which references the given CIImage.
Example:

```
// make a dummy CIImage
Var Logo as Picture = LogoMBS(500)
Var jpeg as string = PictureToJPEGStringMBS(logo, 80)
Var ci as CIImageMBS = CIImageMBS.imageWithData(jpeg)

// convert to NSImage
Var ni as NSImageMBS = ci.AsNSImageMBS

// and display
Backdrop = ni.CopyPictureWithMask
```

Notes: Returns nil on error.
Result declared as Variant to avoid plugin dependencies.

60.246.4 autoAdjustmentFilters as CIFilterMBS()

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns all filters that perform auto adjustment.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var image as CIImageMBS = CIImageMBS.imageWithContentsOfFile(f)

Var filters() as CIFilterMBS = image.autoAdjustmentFilters

Var beginImage as CIImageMBS = image
for each filter as CIFilterMBS in filters
filter.ValueAsCIImage("inputImage") = beginImage
beginImage = filter.ValueAsCIImage("outputImage")
next
```

```
Backdrop = beginImage.RenderPicture
```

Notes: An array of auto adjustment filters to apply to the image. The filters are preset with values for correcting deficiencies in the supplied image.

60.246.5 autoAdjustmentFiltersWithOptions(options as dictionary) as CIFilterMBS()

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns a subset of the filters that perform auto adjustment.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
Var image as CIImageMBS = CIImageMBS.imageWithContentsOfFile(f)

Var options as new Dictionary
options.Value(CIImageMBS.kCIImageAutoAdjustEnhance) = true
options.Value(CIImageMBS.kCIImageAutoAdjustRedEye) = true

Var filters() as CIFilterMBS = image.autoAdjustmentFiltersWithOptions(options)

Var beginImage as CIImageMBS = image
for each filter as CIFilterMBS in filters
filter.ValueAsCIImage("inputImage") = beginImage
beginImage = filter.ValueAsCIImage("outputImage")
next

Backdrop = beginImage.RenderPicture
```

Notes: options: You can control which filters are returned by supplying one or more of the keys described in "Auto Adjustment Keys."
The options dictionary can also contain a CIDetectorImageOrientation key. This key is a number with the same value as defined by the TIFF and EXIF specifications; values can range from 1 through 8. The value specifies where the origin (0,0) of the image is located. If not present, the default value is 1, which means the origin of the image is top, left. For details on the image origin specified by each value, see kCGImagePropertyOrientation.

Returns an array of auto adjustment filters, filtered by the supplied options, to apply to the image. The filters are preset with values for correcting deficiencies in the supplied image.

60.246.6 Constructor(cgimage as CGImageMBS, cgcolorspace as CGColorSpaceMBS)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on a CGImage.
Notes: cgcolorspace: Use this colorspace when opening the image.
On success, the handle is not zero.

- 60.246.13 Constructor(file as FolderItem) 11298
- 60.246.14 Constructor(file as FolderItem, cgcolorspace as CGColorSpaceMBS) 11298
- 60.246.15 Constructor(Handle as Integer) 11299

60.246.7 Constructor(cgimage as CGImageMBS, options as Dictionary = nil)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on a CGImage.
Notes: On success, the handle is not zero.
See also:

- 60.246.6 Constructor(cgimage as CGImageMBS, cgcolorspace as CGColorSpaceMBS) 11294
- 60.246.8 Constructor(CGLayer as CGLayerMBS, options as Dictionary = nil) 11295
- 60.246.9 Constructor(data as memoryblock) 11295
- 60.246.10 Constructor(data as memoryblock, BytesPerRow as Integer, width as Integer, height as Integer, format as Integer, cgcolorspace as CGColorSpaceMBS) 11296
- 60.246.11 Constructor(data as memoryblock, cgcolorspace as CGColorSpaceMBS) 11297
- 60.246.12 Constructor(data as Memoryblock, Length as Integer, BytesPerRow as Integer, width as Integer, height as Integer, format as Integer, cgcolorspace as CGColorSpaceMBS) 11297
- 60.246.13 Constructor(file as FolderItem) 11298
- 60.246.14 Constructor(file as FolderItem, cgcolorspace as CGColorSpaceMBS) 11298
- 60.246.15 Constructor(Handle as Integer) 11299

60.246.8 Constructor(CGLayer as CGLayerMBS, options as Dictionary = nil)

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an image object from the contents supplied by a CGLayer object, using the specified options.
Notes: layer: A CGLayer object. For more information see Quartz 2D Programming Guide and CGLayer Reference.
options: A dictionary specifying image options.

Returns an image object initialized with the contents of the layer object and set up with the specified options.

- 60.246.14 Constructor(file as FolderItem, cgcolorspace as CGColorSpaceMBS) 11298
- 60.246.15 Constructor(Handle as Integer) 11299

60.246.9 Constructor(data as memoryblock)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on the image file content stored inside the data string.
Example:

```
Var p as Picture = LogoMBS(500)
Var data as string = PictureToPNGStringMBS(p,80)
Var i as new CIImageMBS(data)

Var c as new CIFilterCircularWrapMBS
c.inputImage = i

Var o as CIImageMBS = c.outputImage
Backdrop = o.RenderPicture
```

Notes: On success, the handle is not zero.

- 60.246.13 Constructor(file as FolderItem) 11298
- 60.246.14 Constructor(file as FolderItem, cgcolorspace as CGColorSpaceMBS) 11298
- 60.246.15 Constructor(Handle as Integer) 11299

60.246.10 Constructor(data as memoryblock, BytesPerRow as Integer, width as Integer, height as Integer, format as Integer, cgcolorspace as CGColorSpaceMBS)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage from a RAW memory buffer.
Notes: Format must be one of this constants: kCIFormatRGBAf, kCIFormatRGBA16 and kCIFormatARGB8.

On success, the handle is not zero.

- 60.246.15 Constructor(Handle as Integer) 11299

60.246.11 Constructor(data as memoryblock, cgcolorspace as CGColorSpaceMBS)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on the image file content stored inside the data string.
Notes: cgcolorspace: Use this colorspace when opening the image.

On success, the handle is not zero.

- 60.246.12 Constructor(data as Memoryblock, Length as Integer, BytesPerRow as Integer, width as Integer, height as Integer, format as Integer, cgcolorspace as CGColorSpaceMBS) 11297
- 60.246.13 Constructor(file as FolderItem) 11298
- 60.246.14 Constructor(file as FolderItem, cgcolorspace as CGColorSpaceMBS) 11298
- 60.246.15 Constructor(Handle as Integer) 11299

60.246.12 Constructor(data as Memoryblock, Length as Integer, BytesPerRow as Integer, width as Integer, height as Integer, format as Integer, cgcolorspace as CGColorSpaceMBS)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage from a RAW memory buffer.
Notes: Data points directly to the row data.
Length is the size of the memoryblock in bytes.
BytesPerRow is the size of a row in bytes.
Width and height are the dimensions of the image.
Format must be one of this constants: kCIFormatRGBAf, kCIFormatRGBA16 and kCIFormatARGB8.
Colorspace is the CoreGraphics Colorspace object to be used.

On success, the handle is not zero.

60.246.13 Constructor(file as FolderItem)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on a the content of the file.
Notes: On success, the handle is not zero.
See also:

- 60.246.6 Constructor(cgimage as CGImageMBS, cgcolorspace as CGColorSpaceMBS) 11294

- 60.246.15 Constructor(Handle as Integer) 11299

60.246.14 Constructor(file as FolderItem, cgcolorspace as CGColorSpaceMBS)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on a the content of the file.
Notes: cgcolorspace: Use this colorspace when opening the image.

On success, the handle is not zero.

- 60.246.15 Constructor(Handle as Integer) 11299

60.246.15 Constructor(Handle as Integer)

MBS MacCI Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Initializes object with given object reference.
Notes: ref should be a CIImage* and the object is retained.
Raises UnsupportedOperationException if object is not a CIImage.

60.246.16 copy as CIImageMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Creates a copy of the image.

60.246.17 CreateCGImage(r as CGRectMBS = nil) as CGImageMBS

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a new image with the content of the CIImage.
Example:

```
Var logo as Picture = LogoMBS(500)
Var ci as CIImageMBS = CIImageMBS.imageWithPicture(logo)
Var cg as CGImageMBS = ci.CreateCGImage
Backdrop = cg.Picture
```

Notes: Render the region 'r' of image 'im' into a temporary buffer using the context, then create and return a new CoreGraphics image with the results.
If r is nil, the whole image extent is used.
See also:

- 60.246.18 CreateCGImage(r as CGRectMBS, ColorSpace as CGColorSpaceMBS) as CGImageMBS 11300

60.246.18 CreateCGImage(r as CGRectMBS, ColorSpace as CGColorSpaceMBS) as CGImageMBS

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a new image with the content of the CIImage.
Notes: Render the region 'r' of image 'im' into a temporary buffer using the context, then create and return a new CoreGraphics image with the results.
If r is nil, the whole image extent is used.
See also:

- 60.246.17 CreateCGImage(r as CGRectMBS = nil) as CGImageMBS 11300

60.246.19 emptyImage as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates and returns an empty image object.
Example:

```
Var image as CIImageMBS = CIImageMBS.emptyImage
MessageBox str(image.Width) // shows zero
```

Notes: Available in OS X v10.5 and later.

60.246.20 imageByApplyingOrientation(orientation as Integer) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Returns a new image representing the original image with a transform appied to it based on an orientation value.
Example:

```
// This example needs a window with ImageViewer1.
// use CIImage to rotate to always be top left orientation
Var ciImage As CIImageMBS = New CIImageMBS(file)

Var orientation As Integer = ciImage.properties.Lookup("Orientation", 0)
if orientation <>0 then
ciImage = ciImage.imageByApplyingOrientation(orientation)
end if

Var cgPic As CGImageMBS = ciImage.CreateCGImage
Var pic As Picture = cgPic.Picture
ImageViewer1.Image = pic
```

Notes: Orientation values from 1 to 8 as defined in the TIFF spec are supported.
Returns original image if the image is of infinite extent.

Possible orientation values:

Value	orientation	details
1	top left	row 0 top, col 0 lhs
2	top right	row 0 top, col 0 rhs
3	bottom right	row 0 bottom, col 0 rhs
4	bottom left	row 0 bottom, col 0 lhs
5	left top	row 0 lhs, col 0 top
6	right top	row 0 rhs, col 0 top
7	right bottom	row 0 rhs, col 0 bottom
8	left bottom	row 0 lhs, col 0 bottom

60.246.21 ImageByApplyingTransform(transform as NSAffineTransformMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a new image representing the original image with the transform 'matrix' appended to it.

60.246.22 imageByClampingToExtent as CIImageMBS

MBS MacCI Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Return a new infinte image by replicating the pixels of the receiver image's extent.

60.246.23 imageByCompositingOverImage(dest as CIImageMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Returns a new image created by compositing the original image over the specified destination image.
Notes: dest: An image to serve as the destination of the compositing operation.

Returns an image object representing the result of the compositing operation.

Calling this method is equivalent to using the CISourceOverCompositing filter. To use other compositing operations and blending modes, create a CIFilter object using one of the built-in filters from the CICategoryCompositeOperation category. For details, see Core Image Filter Reference.

Available in OS X v10.4 and later.

60.246.24 imageByCroppingToRect(r as CGRectMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns a new image that represents the original image after cropping to a rectangle.
Notes: Available in OS X v10.5 and later.

60.246.25 imageWithCGImage(CGImage as CGImageMBS, colorspace as CGColorSpaceMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates and returns an image object from a Quartz 2D image using the specified color space.
Notes: Returns nil on any error.
See also:

- 60.246.26 imageWithCGImage(CGImage as CGImageMBS, options as Dictionary = nil) as CIImageMBS 11303

60.246.26 imageWithCGImage(CGImage as CGImageMBS, options as Dictionary = nil) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates and returns an image object from a Quartz 2D image.
Notes: Returns nil on any error.
See also:

- 60.246.25 imageWithCGImage(CGImage as CGImageMBS, colorspace as CGColorSpaceMBS) as CIImageMBS 11303

60.246.27 imageWithCGLayer(CGImage as CGImageMBS, options as Dictionary = nil) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an image object from the contents supplied by a CGLayer object, using the specified options.
Notes: layer: A CGLayer object. For more information see Quartz 2D Programming Guide and CGLayer Reference.
options: A dictionary specifying image options.

An image object initialized with the contents of the layer object and set up with the specified options.

60.246.28 imageWithColor(color as CIColorMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates and returns an image of infinite extent that is initialized the specified color.
Notes: Returns the image object initialized with the color represented by the CIColorMBS object.

Available in OS X v10.5 and later.

60.246.29 imageWithContentsOfFile(file as folderitem) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates and returns an image object from the contents of a file.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
Var image as CIImageMBS = CIImageMBS.imageWithContentsOfFile(file)
Backdrop = image.RenderPicture
```

Notes: Returns nil on any error.
See also:

- 60.246.30 imageWithContentsOfFile(file as folderitem, colorspace as CGColorSpaceMBS) as CIImageMBS 11304

60.246.30 imageWithContentsOfFile(file as folderitem, colorspace as CGColorSpaceMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates and returns an image object from the contents of a file.
Notes: Returns nil on any error.
See also:

- 60.246.29 imageWithContentsOfFile(file as folderitem) as CIImageMBS 11304

60.246.31 imageWithContentsOfFileMT(file as folderitem) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates and returns an image object from the contents of a file.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
Var image as CIImageMBS = CIImageMBS.imageWithContentsOfFileMT(file)
Backdrop = image.RenderPicture
```

Notes: Returns nil on any error.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.
See also:

- 60.246.32 imageWithContentsOfFileMT(file as folderitem, colorspace as CGColorSpaceMBS) as CIImageMBS 11305

60.246.32 imageWithContentsOfFileMT(file as folderitem, colorspace as CGColorSpaceMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates and returns an image object from the contents of a file.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
Var cs as CGColorSpaceMBS = CGColorSpaceMBS.CreateDeviceRGB
Var image as CIImageMBS = CIImageMBS.imageWithContentsOfFileMT(file, cs)
Backdrop = image.RenderPicture
```

Notes: Returns nil on any error.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.
See also:

- 60.246.31 imageWithContentsOfFileMT(file as folderitem) as CIImageMBS 11304

60.246.33 imageWithContentsOfPath(Path as string, colorspace as CGColorSpaceMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates and returns an image object from the contents of a file.
Example:

```
// load image
Var inputimage as CIImageMBS = CIImageMBS.imageWithContentsOfPath("/Library/Desktop Pictures/Rice
Paddy.jpg", nil)
```

```
// rotate 90¬∞
Var ScaleXFilter as new CIFilterAffineTransformMBS
ScaleXFilter.inputImage = inputimage
Var af as new NSAffineTransformMBS
af.translate(inputimage.height,0)
af.rotateByDegrees(90)
ScaleXFilter.inputTransform=af

// produce output
Var outputimage as CIImageMBS = ScaleXFilter.outputImage
Var e as CGRectMBS = outputimage.Extent
Backdrop = outputimage.RenderPicture
Title = Str(Backdrop.Width)+" x "+str(Backdrop.Height)

// write to PNG file
Var n as NSImageMBS = outputimage.AsNSImageMBS
Var data as string = n.PNGRepresentation

Var f as FolderItem = SpecialFolder.Desktop.Child("test.png")
Var b as BinaryStream = BinaryStream.Create(f, true)
b.Write data
b.Close
```

Notes: Returns nil on any error.

60.246.34 imageWithContentsOfURL(url as String) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates and returns an image object from the contents of a file.
Notes: Returns nil on any error.
See also:

- 60.246.35 imageWithContentsOfURL(URL as string, colorspace as CGColorSpaceMBS) as CIImageMBS
11306

60.246.35 imageWithContentsOfURL(URL as string, colorspace as CGColorSpaceMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates and returns an image object from the contents of a file.
Notes: Returns nil on any error.
See also:

• 60.246.34 imageWithContentsOfURL(url as String) as CIImageMBS 11306

60.246.36 imageWithData(data as memoryblock, Options as Dictionary = nil) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Creates and returns an image object initialized with the supplied image data.
Example:

```
Var logo as Picture = LogoMBS(500)
Var jpegData as string = PictureToJPEGStringMBS(logo, 75)
Var image as CIImageMBS = CIImageMBS.imageWithData(jpegData)
Backdrop = image.RenderPicture
```

Notes: data: The data object that holds the contents of an image file (such as TIFF, GIF, JPG, or whatever else the system supports). The image data must be premultiplied.

Returns an image object initialized with the supplied data, or nil if the method cannot create an image representation from the contents of the supplied data object.

60.246.37 imageWithDataMT(data as memoryblock, Options as Dictionary = nil) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates and returns an image object initialized with the supplied image data.
Example:

```
Var logo as Picture = LogoMBS(500)
Var jpegData as string = PictureToJPEGStringMBS(logo, 75)
Var image as CIImageMBS = CIImageMBS.imageWithDataMT(jpegData)
Backdrop = image.RenderPicture
```

Notes: data: The data object that holds the contents of an image file (such as TIFF, GIF, JPG, or whatever else the system supports). The image data must be premultiplied.

Returns an image object initialized with the supplied data, or nil if the method cannot create an image representation from the contents of the supplied data object.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

60.246.38 imageWithPicture(Pic as Picture) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates and returns an image object from a Xojo Picture.
Example:

```
Var logo as Picture = LogoMBS(500)
Var ci as CIImageMBS = CIImageMBS.imageWithPicture(logo)
Var cg as CGImageMBS = ci.CreateCGImage
Backdrop = cg.Picture
```

Notes: Returns nil on any error.

60.246.39 kCIImageAutoAdjustCrop as string

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A key used to specify whether to return a filter that crops the image to focus on detected features.
Notes: The value associated with this key is a Boolean value. If true, the returned filters include an operation that crops the image around the features specified with the kCIImageAutoAdjustFeatures option (or any features detected in the image, if that option is not present). Supply false to indicate not to return a crop filter. If you don,Äôt specify this option, Core Image assumes its value is false.

Available in OS X v10.10 and later.

60.246.40 kCIImageAutoAdjustEnhance as string

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: One of the Keys used in the options dictionary to control which filters Core Image returns.
Notes: A key used to specify whether to return enhancement filters.
The value associated with this key is a CFBoolean value. Supply false to indicate not to return enhancement filters. If you don't specify this option, Core Image assumes its value is true.

60.246.41 kCIImageAutoAdjustFeatures as string

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: One of the Keys used in the options dictionary to control which filters Core Image returns.
Notes: A key used to specify an array of features to which to apply enhancement and red eye filter.
The associated value is an array of CIFeatureMBS objects. If you don't supply an array, the receiver will search for features using the CIDetectorMBS class.

60.246.42 kCIImageAutoAdjustLevel as string

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A key used to specify whether to return a filter that rotates the image to keep a level perspective.
Notes: The value associated with this key is a Boolean value. If true, Core Image analyzes the image to determine whether it would benefit from rotation—for example, a landscape photo in which the horizon is not horizontal—and returns a filter to perform that rotation. Supply false to indicate not to return a rotation filter. If you don,Äôt specify this option, Core Image assumes its value is false.

Available in OS X v10.10 and later.

60.246.43 kCIImageAutoAdjustRedEye as string

MBS MacCI Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: One of the Keys used in the options dictionary to control which filters Core Image returns.
Notes: A key used to specify whether to return a red eye filter.
The value associated with this key is a Boolean value. Supply false to indicate not to return a red eye filter. If you don't specify this option, Core Image assumes its value is true.

60.246.44 kCIImageTextureFormat as string

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: One of the keys in the options dictionary when initializing an image.
Notes: The key for an OpenGL texture format. The value for this key must be an NSNumber object containing a Core Image pixel format constant. (See "Pixel Formats.") You may only use this key when initializing an image using the initWithTexture method.
Available in OS X v10.9 and later.

60.246.45 kCIImageTextureTarget as string

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: One of the keys in the options dictionary when initializing an image.
Notes: The key for an OpenGL texture target. The value for this key must be an NSNumber object containing a supported OpenGL texture target constant, either GL_TEXTURE_2D or GL_TEXTURE_RECTANGLE_ARB. You may only use this key when initializing an image using the initWithTexture method. Available in OS X v10.9 and later.

60.246.46 normalizeCIImageOrientation(startDeviceOrientation as Integer, isFrontCamera as Boolean = false) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: Normalizes an image based on the device orientation.
Notes: This checks the current device orientation and the given start orientation to rotate the image to be normal orientation for display.

If front camera parameter is true, the rotation is adjusted by additional 180¬∞ rotation.

Returns a new image.

60.246.47 properties as Dictionary

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns the metadata properties of an image.
Notes: If the image is the output of one or more CIFilters, then the metadata of the root inputImage will be returned.

60.246.48 releaseHandle

MBS MacCI Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Decrements the retain count of a CIImage reference.
Notes: Each retain must have a release. Too many releases and your app will crash, too many retains and it will leak memory.
Use only if you really know what you are doing.

60.246.49 RenderNSImage(UseSoftwareRenderer as boolean = false) as Variant

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a picture based of the CIImage content.
Example:

```
Var f as CIFilterEdgesMBS

f=new CIFilterEdgesMBS
f.inputImage=NewCIImagewithFileMBS(SpecialFolder.Desktop.Child("Paris.jpg"))
f.inputIntensity=5

Var n as NSImageMBS
n=f.outputImage.RenderNSImage(false)
```

Notes: Creates a new NSImage, creates a CGContext for it, draws the image into the buffer and returns it as a Xojo object.

Returns nil on failure.
Rendering the image will cause the calculations to be done so this call is quite expensive.

If UseSoftwareRenderer is true, the hardware acceleration is not used.

60.246.50 RenderPicture(Width as Integer = 0, Height as Integer = 0, UseSoftwareRenderer as boolean = false) as Picture

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: Desktop only.

Function: Creates a picture based of the CIImage content.
Example:

```
Var f as CIFilterEdgesMBS

f=new CIFilterEdgesMBS
f.inputImage=NewCIImagewithFileMBS(SpecialFolder.Desktop.Child("Paris.jpg"))
f.inputIntensity=5
Backdrop=f.outputImage.RenderPicture
```

Notes: Creates a new image buffer, creates a CGContext for it, draws the image into the buffer and returns it as a picture with mask. If you need picture with alpha channel, please use RenderPictureWithAlpha function.

Returns nil on failure.
Rendering the image will cause the calculations to be done so this call is quite expensive.

If UseSoftwareRenderer is true, the hardware acceleration is not used.

60.246.51 RenderPictureWithAlpha(Width as Integer = 0, Height as Integer = 0, UseSoftwareRenderer as boolean = false) as Picture

MBS MacCI Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Creates a picture based of the CIImage content.
Example:

```
Var f as CIFilterEdgesMBS

f=new CIFilterEdgesMBS
f.inputImage=NewCIImagewithFileMBS(SpecialFolder.Desktop.Child("Paris.jpg"))
f.inputIntensity=5
Backdrop= f.outputImage.RenderPictureWithAlphaMT
```

Notes: Creates a new image buffer, creates a CGContext for it, draws the image into the buffer and returns it as a Xojo picture with alpha channel.

Returns nil on failure.
Rendering the image will cause the calculations to be done so this call is quite expensive.

If UseSoftwareRenderer is true, the hardware acceleration is not used.

60.246.52 RenderPictureWithAlphaMT(Width as Integer = 0, Height as Integer = 0, UseSoftwareRenderer as boolean = false) as Picture

MBS MacCI Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: Creates a picture based of the CIImage content.
Notes: Same as the other RenderPictureWithAlpha function, but threaded.

Creates a new image buffer, creates a CGContext for it, draws the image into the buffer and returns it as a Xojo picture with alpha channel.

Returns nil on failure.
Rendering the image will cause the calculations to be done so this call is quite expensive.

If UseSoftwareRenderer is true, the hardware acceleration is not used.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

60.246.53 retainHandle

MBS MacCI Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Increments the retain count of a CIImage reference.
Notes: Each retain must have a release. Too many releases and your app will crash, too many retains and it will leak memory.
Use only if you really know what you are doing.

60.246.54 scaleTo(width as Integer, height as Integer) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: Scales picture to target size.
Example:

```
Var pic As Picture = LogoMBS(500)
Var image As CIImageMBS = CIImageMBS.imageWithPicture(pic)

Const targetWidth = 600.0
Const targetHeight = 400.0

#If mbs.VersionNumber <21.2 Then

Var filter As New CIFilterLanczosScaleTransformMBS

Var scale As Double = targetHeight / image.Extent.Height
Var aspect As Double = targetWidth / (image.Extent.Width * scale)

filter.inputImage = image
filter.inputScale = scale
filter.inputAspectRatio = aspect

Var outputImage As CIImageMBS = filter.outputImage

#Else
```

```
Var outputImage As CIImageMBS = image.scaleTo(targetWidth, targetHeight)

#EndIf

Var result As Picture = outputImage.RenderPicture
Backdrop = result
```

Notes: We use CILanczosScaleTransform filter internally like in the example code for older plugin versions.

60.246.55 Properties

60.246.56 colorSpace as CGColorSpaceMBS

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns if possible the color space of the image it was defined in.
Notes: This method will return nil, if the color space cannot be determined.
(Read only property)

60.246.57 Definition as CIFilterShapeMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Return the Domain of Definition of the image.
Notes: Nil on any error.
(Read only property)

60.246.58 description as String

MBS MacCI Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the textual description for this image.
Example:

```
Var p as Picture = LogoMBS(500)
Var data as string = PictureToPNGStringMBS(p,80)
Var i as new CIImageMBS(data)
MessageBox i.description
```

Notes: (Read only property)

60.246.59 Extent as CGRectMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: The extent of the image in world coordinates.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")

Var i as new CIImageMBS(f)
Var r as CGRectMBS = i.Extent

MessageBox str(r.Width)+" x "+str(r.Height)
```

Notes: Can be undefined. In that case x/y are -Infinity and width/height are Infinity (3.402823466 * 10^38).
(Read only property)

60.246.60 Handle as Integer

MBS MacCI Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: The handle to the CIImage object used internally.
Notes: (Read only property)

60.246.61 Height as Double

MBS MacCI Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: The height of the image in pixel.
Notes: (Read only property)

60.246.62 RetainCount as Integer

MBS MacCI Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the retain count of the CIImage reference.
Notes: This is useful for debugging.
The retain count is for the CIImage reference, not the CIImageMBS object.
(Read only property)

60.246.63 url as string

MBS MacCI Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: Returns the URL of a file based image.
Notes: Returns the URL of the image when the image was created using the imageWithContentsOfURL APIs.
This method will return nil, if the URL cannot be determined.
(Read only property)

60.246.64 Width as Double

MBS MacCI Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: The width of the image in pixel.
Notes: (Read only property)

60.246.65 Constants

Constants

Constant	Value	Description
kCIFormatARGB8	23	One of the pixel formats: 32bpp, fixed point.
kCIFormatRGBA16	27	One of the pixel formats: 64bpp, fixed point.
kCIFormatRGBAf	34	One of the pixel formats: 128bpp, floating point.

60.247 class CIPDF417CodeDescriptorMBS

60.247.1 class CIPDF417CodeDescriptorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: CIPDF417CodeDescriptor is a concrete subclass of CIBarcodeDescriptor that defines an abstract representation of a PDF417 code symbol.
Notes: Refer to the ISO/IEC 15438:2006(E) for the PDF417 symbol specification.
Subclass of the CIBarcodeDescriptorMBS class.

60.247.2 Methods

60.247.3 Constructor(errorCorrectedPayload as MemoryBlock, isCompact as Boolean, rowCount as Integer, columnCount as Integer)

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Initializes a descriptor that can be used as input to CIBarcodeGenerator

60.247.4 descriptorWithPayload(errorCorrectedPayload as MemoryBlock, isCompact as Boolean, rowCount as Integer, columnCount as Integer) as CIPDF417CodeDescriptorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Construct a descriptor that can be used as input to CIBarcodeGenerator

60.247.5 Properties

60.247.6 columnCount as Integer

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Indicates the number of columns in the rectangular matrix, excluding the columns used to indicate the symbol structure.
Notes: columnCount values range from 1 to 30.
(Read only property)

60.247.7 errorCorrectedPayload as MemoryBlock

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The error-corrected codewords which comprise the PDF417 symbol. The first codeword indicates the number of data codewords in the errorCorrectedPayload.
Notes: PDF417 codes are comprised of a start character on the left and a stop character on the right. Each row begins and ends with special characters indicating the current row as well as information about the dimensions of the PDF417 symbol. The errorCorrectedPayload represents the sequence of PDF417 codewords that make up the body of the message. The first codeword indicates the number of codewords in the message. This count includes the "count" codeword and any padding codewords, but does not include the error correction codewords. Each codeword is a 16-bit value in the range of 0...928. The sequence is to be interpreted as described in the PDF417 bar code symbology specification – ISO/IEC 15438:2006(E).
(Read only property)

60.247.8 isCompact as Boolean

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: A boolean indicating whether the symbol is compact.
Notes: Compact PDF417 symbols have abbreviated right-side guard bars.
(Read only property)

60.247.9 rowCount as Integer

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Indicates the number of rows in the rectangular matrix.
Notes: rowCount values range from 3 to 90.
(Read only property)

60.248 class CIQRCodeDescriptorMBS

60.248.1 class CIQRCodeDescriptorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: CIQRCodeDescriptor is a concrete subclass of CIBarcodeDescriptor that defines an abstract representation of a QR code symbol.
Notes: Subclass of the CIBarcodeDescriptorMBS class.

60.248.2 Methods

60.248.3 Constructor(errorCorrectedPayload as MemoryBlock, symbolVersion as Integer, maskPattern as Integer, errorCorrectionLevel as Integer)

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Initializes a descriptor that can be used as input to CIBarcodeGenerator.

60.248.4 descriptorWithPayload(errorCorrectedPayload as MemoryBlock, symbolVersion as Integer, maskPattern as Integer, errorCorrectionLevel as Integer) as CIQRCodeDescriptorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Construct a descriptor that can be used as input to CIBarcodeGenerator.

60.248.5 Properties

60.248.6 errorCorrectedPayload as MemoryBlock

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The error-corrected codewords that comprise the QR code symbol.
Notes: QR Codes are formally specified in ISO/IEC 18004:2006(E). Section 6.4.10 ”Bitstream to codeword conversion” specifies the set of 8-bit codewords in the symbol immediately prior to splitting the message into blocks and applying error correction.

During decode, error correction is applied and if successful, the message is re-ordered to the state immediately following ”Bitstream to codeword coversion.” The errorCorrectedPayload corresponds to this sequence of 8-bit codewords.

(Read only property)

60.248.7 errorCorrectionLevel as Integer

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The error correction level of the QR code.
Notes: QR Codes support four levels of Reed-Solomon error correction, in increasing error correction capability: L, M, Q, and H.
(Read only property)

60.248.8 maskPattern as Integer

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The data mask pattern for the QR code symbol.
Notes: QR Codes support eight data mask patterns, which are used to avoid large black or large white areas inside the symbol body. Valid values range from 0 to 7.
(Read only property)

60.248.9 symbolVersion as Integer

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The version property corresponds to the size of the QR Code.
Notes: QR Codes are square. ISO/IEC 18004 defines versions from 1 to 40, where a higher symbol version indicates a larger data carrying capacity. This field is required in order to properly interpret the error corrected payload.
(Read only property)

60.248.10 Constants

Error Correction

Constant	Value	Description
ErrorCorrectionLevelH	72	Indicates that approximately 65% of the symbol data is dedicated to error correction.
ErrorCorrectionLevelL	76	Indicates that approximately 20% of the symbol data is dedicated to error correction.
ErrorCorrectionLevelM	77	Indicates that approximately 37% of the symbol data is dedicated to error correction.
ErrorCorrectionLevelQ	81	Indicates that approximately 55% of the symbol data is dedicated to error correction.

60.249 class CIQRCodeFeatureMBS

60.249.1 class CIQRCodeFeatureMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The feature for a detected QRCode.
Example:

```
// read the text of QR codes in a picture
Var image As New CIImageMBS(SpecialFolder.Desktop.Child("qrcode.png"))
Var detector As CIDetectorMBS = CIDetectorMBS.detectorOfType(CIDetectorMBS.CIDetectorTypeQR-
Code)

For Each feature As CIFeatureMBS In detector.featuresInImage(image)
If feature IsA CIQRCodeFeatureMBS Then
Var qr As CIQRCodeFeatureMBS = CIQRCodeFeatureMBS(feature)
MessageBox qr.messageString + EndOfLine + "at " + Format(qr.topLeft.x, "0") + ", " + Format(qr.topLeft.y,
"0")
End If
Next
```

Notes: A CIQRCodeFeature describes a Quick Response code (a two-dimensional barcode using the ISO/IEC 18004:2006 standard) detected in a video or still image. The properties of a QR code feature identify the corners of the barcode as it appears in perspective in the image and provide the message decoded from the barcode.

To detect QR codes in an image or video, choose the CIDetectorTypeQRCode type when initializing a CIDetector object.
Subclass of the CIFeatureMBS class.

60.249.2 Methods

60.249.3 Constructor(Handle as Integer)

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Initializes an object using the given handle.

60.249.4 Properties

60.249.5 bottomLeft as CGPointMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The lower left corner of the detected barcode, in image coordinates.
Notes: (Read only property)

60.249.6 bottomRight as CGPointMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The lower right corner of the detected barcode, in image coordinates.
Notes: (Read only property)

60.249.7 messageString as string

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The string decoded from the detected barcode.
Notes: (Read only property)

60.249.8 symbolDescriptor as CIQRCodeDescriptorMBS

MBS MacCI Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The QRCode symbol descriptor.
Notes: Available on macOS 10.13 or newer.
(Read only property)

60.249.9 topLeft as CGPointMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The upper left corner of the detected barcode, in image coordinates.
Notes: (Read only property)

60.249.10 topRight as CGPointMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The upper right corner of the detected barcode, in image coordinates.
Notes: (Read only property)

60.250 class CIRectangleFeatureMBS

60.250.1 class CIRectangleFeatureMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: A CIRectangleFeature object describes a quadrilateral region detected in a video or still image.
Notes: A detected rectangle feature is not necessarily rectangular in the plane of the image; rather, the feature identifies a shape that may be rectangular in space but which appears in perspective in the image—for example, a paper or book on a desk. The properties of a rectangle feature identify its corners in image coordinates.

For example, you can use rectangle feature detection together with the CIPerspectiveCorrection filter to detect rectangular objects in an image or video and transform them to their original orientation.

To detect rectangles in an image or video, choose the CIDetectorTypeRectangle type when initializing a CIDetector object, and use the CIDetectorAspectRatio option to specify the approximate shape of rectangular features to search for.
Subclass of the CIFeatureMBS class.

60.250.2 Methods

60.250.3 Constructor(Handle as Integer)

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates a new object from a handle.

60.250.4 Properties

60.250.5 bottomLeft as CGPointMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The lower left corner of the detected rectangle, in image coordinates.
Notes: (Read only property)

60.250.6 bottomRight as CGPointMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The lower right corner of the detected rectangle, in image coordinates.
Notes: (Read only property)

60.250.7 topLeft as CGPointMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The upper left corner of the detected rectangle, in image coordinates.
Notes: (Read only property)

60.250.8 topRight as CGPointMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The upper right corner of the detected rectangle, in image coordinates.
Notes: (Read only property)

60.251 class CISamplerMBS

60.251.1 class CISamplerMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: The Xojo class to wrap a CoreImage sampler.
Example:

```
// create a sampler for an image, e.g. as input for a custom Core Image kernel
Var image As New CIImageMBS(SpecialFolder.Desktop.Child("test.jpg"))
Var sampler As CISamplerMBS = CISamplerMBS.samplerWithImage(image)

MessageBox "Sampler covers " + sampler.Extent.Width.ToString + " x " + sampler.Extent.Height.ToString
+ " pixels"
```

60.251.2 Methods

60.251.3 Constructor(ciImage as CIImageMBS)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new sampler based on the given image.
Notes: On success handle will not be 0.
See also:

- 60.251.4 Constructor(ciImage as CIImageMBS, matrix as NSAffineTransformMBS, WrapMode as String, FilterMode as string) 11327
- 60.251.5 Constructor(Handle as Integer) 11328

60.251.4 Constructor(ciImage as CIImageMBS, matrix as NSAffineTransformMBS, WrapMode as String, FilterMode as string)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new sampler based on the given image.
Notes:

On success handle will not be 0.
See also:

- 60.251.3 Constructor(ciImage as CIImageMBS) 11327
- 60.251.5 Constructor(Handle as Integer) 11328

matrix: An affine transformation [a b c d tx ty] defining the transformation to be applied to the sampler.

wrapmode: A string defining how pixels outside the sampler's extent are produced. Options include kCISamplerWrapBlack (pixels are transparent black, the default) and kCISamplerWrapClamp (coordinates are clamped to the extent).

FilterMode: A string defining the filter to use when sampling the image. One of kCISamplerFilterNearest (point sampling) or kCISamplerFilterLinear (bilinear interpolation, the default).

60.251.5 Constructor(Handle as Integer)

MBS MacCI Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Initializes object with given object reference.
Notes: ref should be a CISampler* and the object is retained.
Raises UnsupportedOperationException if object is not a CISampler.
See also:

- 60.251.3 Constructor(ciImage as CIImageMBS) 11327
- 60.251.4 Constructor(ciImage as CIImageMBS, matrix as NSAffineTransformMBS, WrapMode as String, FilterMode as string) 11327

60.251.6 copy as CISamplerMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates a copy of the sampler.

60.251.7 kCISamplerAffineMatrix as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the option keys for creating a sampler.
Notes: The key for an affine matrix. The associated value is an NSArray object ([a b c d tx ty]) that defines the transformation to apply to the sampler.

Available in OS X v10.4 and later.

60.251.8 kCISamplerColorSpace as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the option keys for creating a sampler.
Notes: The key for the color space to use when sampling the image. The associated value must be an RGB CGColorSpaceRef object. Using this option specifies that samples should be converted to this color space before being passed to a kernel. If not specified, samples will be passed to the kernel in the working color space of the Core Image context used to render the image.

Available in OS X v10.4 and later.

60.251.9 kCISamplerFilterLinear as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the values for filter modes.
Notes: Bilinear interpolation.

60.251.10 kCISamplerFilterMode as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the option keys for creating a sampler.
Notes: The key for the filtering to use when sampling the image. Possible values are kCISamplerFilterNearest and kCISamplerFilterLinear.

Available in OS X v10.4 and later.

60.251.11 kCISamplerFilterNearest as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the values for filter modes.
Notes: Nearest neighbor sampling.

60.251.12 kCISamplerWrapBlack as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the values for wrap modes.
Notes: Pixels are transparent black.

60.251.13 kCISamplerWrapClamp as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the values for wrap modes.
Notes: Coordinates are clamped to the extent.

60.251.14 kCISamplerWrapMode as String

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the option keys for creating a sampler.
Notes: The key for the sampler wrap mode. The wrap mode specifies how Core Image produces pixels that are outside the extent of the sample. Possible values are kCISamplerWrapBlack and kCISamplerWrapClamp.

Available in OS X v10.4 and later.

60.251.15 samplerWithImage(ciImage as CIImageMBS) as CISamplerMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates and returns a sampler that references an image.
Notes: A sampler object that references the image specified by the ciImage argument.
See also:

- 60.251.16 samplerWithImage(ciImage as CIImageMBS, matrix as NSAffineTransformMBS, WrapMode as String, FilterMode as string) as CISamplerMBS 11330
- 60.251.17 samplerWithImage(ciImage as CIImageMBS, Options as Dictionary) as CISamplerMBS 11331

60.251.16 samplerWithImage(ciImage as CIImageMBS, matrix as NSAffineTransformMBS, WrapMode as String, FilterMode as string) as CISamplerMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates a new sampler based on the given image.
Notes:

matrix:	An affine transformation [a b c d tx ty] defining the transformation to be applied to the sampler.
wrapmode:	A string defining how pixels outside the sampler's extent are produced. Options include kCISamplerWrapBlack (pixels are transparent black, the default) and kCISamplerWrapClamp (coordinates are clamped to the extent).
FilterMode:	A string defining the filter to use when sampling the image. One of kCISamplerFilterNearest (point sampling) or kCISamplerFilterLinear (bilinear interpolation, the default).

On success handle will not be nil.
See also:

- 60.251.15 samplerWithImage(ciImage as CIImageMBS) as CISamplerMBS 11330
- 60.251.17 samplerWithImage(ciImage as CIImageMBS, Options as Dictionary) as CISamplerMBS 11331

60.251.17 samplerWithImage(ciImage as CIImageMBS, Options as Dictionary) as CISamplerMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates and returns a sampler that references an image using options specified in a dictionary.
Notes: See kCISampler* shared methods for constants.
See also:

- 60.251.15 samplerWithImage(ciImage as CIImageMBS) as CISamplerMBS 11330
- 60.251.16 samplerWithImage(ciImage as CIImageMBS, matrix as NSAffineTransformMBS, WrapMode as String, FilterMode as string) as CISamplerMBS 11330

60.251.18 Properties

60.251.19 Definiton as CIFilterShapeMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Returns the shape containing the Domain Of Definition (DOD) of the sampler.
Notes: The DOD is defined such that it contains all non-transparent pixels produced by referencing the sampler.
(Read only property)

60.251.20 description as String

MBS MacCI Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the textual description for this sampler.
Notes: (Read only property)

60.251.21 Extent as CGRectMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Returns the extent of the sampler.
Notes: Sampling outside the extent will bring the sampler's wrap mode into action.

Returns nil on any error.
(Read only property)

60.251.22 Handle as Integer

MBS MacCI Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: The handle to the internal used CISampler reference.
Notes: (Read only property)

60.252 class CITextFeatureMBS

60.252.1 class CITextFeatureMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The class for a text feature.
Example:

```
// find text areas in a picture with Core Image
Var image As New CIImageMBS(SpecialFolder.Desktop.Child("sign.jpg"))
Var options As New Dictionary
options.Value(CIDetectorMBS.CIDetectorReturnSubFeatures) = True
Var detector As CIDetectorMBS = CIDetectorMBS.detectorOfType(CIDetectorMBS.CIDetectorTypeText,
Nil, options)

For Each f As CIFeatureMBS In detector.featuresInImage(image, options)
If f IsA CITextFeatureMBS Then
Var t As CITextFeatureMBS = CITextFeatureMBS(f)
System.DebugLog "Text area at " + Format(t.topLeft.x, "0") + "/" + Format(t.topLeft.y, "0") + " with "
+ t.subFeatures.Count.ToString + " characters"
End If
Next
```

Notes: A CITextFeature object describes a quadrilateral region likely to contain upright text detected in a video or still image. The properties of a text feature identify its corners in image coordinates.

Use this class to locate areas of text within an image—for example, to extract and perspective-correct those portions of the image before performing your own optical character recognition or other processing tasks.

To detect rectangles in an image or video, choose the CIDetectorTypeText type when initializing a CIDetector object, and use the CIDetectorImageOrientation option to specify the desired orientation for finding upright text.
Subclass of the CIFeatureMBS class.

60.252.2 Methods

60.252.3 Constructor(Handle as Integer)

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The constructor to create an object from a handle.

60.252.4 subFeatures as CIFeatureMBS()

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: An array containing additional features detected within the feature.
Notes: A text detector can identify both a major region that is likely to contain text as well as the areas within that region that likely to contain individual text features. Such features might be single characters, groups of closely-packed characters, or entire words.

Core Image populates this array only if you enable the CIDetectorReturnSubFeatures option when retrieving features.

60.252.5 Properties

60.252.6 bottomLeft as CGPointMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The lower left corner of the detected text region, in image coordinates.
Notes: (Read only property)

60.252.7 bottomRight as CGPointMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The lower right corner of the detected text region, in image coordinates.
Notes: (Read only property)

60.252.8 topLeft as CGPointMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The upper left corner of the detected text region, in image coordinates.
Notes: (Read only property)

60.252.9 topRight as CGPointMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: The upper right corner of the detected text region, in image coordinates.
Notes: (Read only property)

60.253 class CIVectorMBS

60.253.1 class CIVectorMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: A class for a vector in the CoreImage world.
Example:

```
// vectors are used to pass points and rectangles to Core Image filters
Var image As New CIImageMBS(SpecialFolder.Desktop.Child("test.jpg"))
Var extent As CGRectMBS = image.Extent

// darken the corners around the center of the picture
Var vignette As New CIFilterVignetteEffectMBS
vignette.inputImage = image
vignette.inputCenter = CIVectorMBS.vectorWithXY(extent.MidX, extent.MidY)
vignette.inputRadius = extent.Width / 2
vignette.inputIntensity = 1.0

// crop to the left half: x, y, width and height
Var crop As New CIFilterCropMBS
crop.inputImage = vignette.outputImage
crop.inputRectangle = New CIVectorMBS(0, 0, extent.Width / 2, extent.Height)

Var context As New CIContextMBS
Var error As NSErrorMBS
If Not context.writePNGRepresentationOfImage(crop.outputImage, SpecialFolder.Desktop.Child("result.png"),
error) Then
MessageBox error.localizedDescription
End If
```

Notes: May contain one to four floating point values.

60.253.2 Methods

60.253.3 CGAffineTransformValue as CGAffineTransformMBS

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Returns the values stored in the CIVector object as an affine transform.
Example:

```
Var p as new CGAffineTransformMBS
Var v as new CIVectorMBS(p)
Var x as CGAffineTransformMBS = v.CGAffineTransformValue
MessageBox str(x.A)+" "+str(x.B)+" "+str(x.C)+" "+str(x.D)+" "+str(x.TX)+" "+str(x.TY)
```

Notes: The first six values in the vector become the values that comprise the affine transform.
Available in OS X v10.9 and later.

60.253.4 CGPointValue as CGPointMBS

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Returns the values stored in the CIVector object as a point.
Example:

```
Var p as new CGPointMBS(10, 20)
Var v as CIVectorMBS = CIVectorMBS.vectorWithCGPoint(p)

Var x as CGPointMBS = v.CGPointValue
MessageBox str(x.x)+" "+str(x.y)
```

Notes: The vector's X and Y property values become the CGPoint's X and Y values.
Available in OS X v10.9 and later.

60.253.5 CGRectValue as CGRectMBS

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Returns the values stored in the CIVector object as an rect.
Example:

```
Var p as new CGRectMBS(10, 20, 30, 40)
Var v as CIVectorMBS = CIVectorMBS.vectorWithCGRect(p)

Var x as CGRectMBS = v.CGRectValue
MessageBox str(x.Origin.X)+" "+str(x.Origin.y)+" "+str(x.Size.Width)+" "+str(x.Size.Height)
```

Notes: The vector's X, Y, Z and W property values become the CGRect's X, Y, height and width values.
Available in OS X v10.9 and later.

60.253.6 Constructor(Handle as Integer)

MBS MacCI Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Initializes object with given object reference.
Notes: ref should be a CIVector* and the object is retained.
Raises UnsupportedOperationException if object is not a CIVector.

- 60.253.16 Constructor(x as Double, y as Double, z as Double, w as Double) 11344

60.253.7 Constructor(p as CGPointMBS)

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Initializes a vector that is initialized with values provided by a CGPoint.
Example:

```
Var p as new CGPointMBS(10, 20)
Var v as new CIVectorMBS(p)

MessageBox str(v.x)+" "+str(v.y)
```

Notes: The CGPoint's X and Y values are stored in the vector's X and Y properties.
Available in OS X v10.9 and later.

- 60.253.12 Constructor(values() as single) 11341
- 60.253.13 Constructor(x as Double) 11342
- 60.253.14 Constructor(x as Double, y as Double) 11343
- 60.253.15 Constructor(x as Double, y as Double, z as Double) 11343
- 60.253.16 Constructor(x as Double, y as Double, z as Double, w as Double) 11344

60.253.8 Constructor(r as CGRectMBS)

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Initializes a vector that is initialized with values provided by a CGRect.
Example:

```
Var p as new CGRectMBS(10, 20, 30, 40)
Var v as new CIVectorMBS(p)
Var x as CGRectMBS = v.CGRectValue
MessageBox str(x.Origin.X)+" "+str(x.Origin.y)+" "+str(x.Size.Width)+" "+str(x.Size.Height)
```

Notes: The CGRect structure's X, Y, height and width values are stored in the vector's X, Y, Z and W properties.
Available in OS X v10.9 and later.
See also:

- 60.253.6 Constructor(Handle as Integer) 11338
- 60.253.7 Constructor(p as CGPointMBS) 11338
- 60.253.9 Constructor(StringRepresentation as String) 11340
- 60.253.10 Constructor(t as CGAffineTransformMBS) 11340
- 60.253.11 Constructor(values() as Double) 11341
- 60.253.12 Constructor(values() as single) 11341
- 60.253.13 Constructor(x as Double) 11342
- 60.253.14 Constructor(x as Double, y as Double) 11343
- 60.253.15 Constructor(x as Double, y as Double, z as Double) 11343
- 60.253.16 Constructor(x as Double, y as Double, z as Double, w as Double) 11344

60.253.9 Constructor(StringRepresentation as String)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new vector based on content of the string.
Example:

```
Var v as CIVectorMBS
v=New CIVectorMBS(" [ 1 2 3 ] ")
```

See also:

- 60.253.7 Constructor(p as CGPointMBS) 11338
- 60.253.8 Constructor(r as CGRectMBS) 11339
- 60.253.10 Constructor(t as CGAffineTransformMBS) 11340
- 60.253.11 Constructor(values() as Double) 11341
- 60.253.12 Constructor(values() as single) 11341
- 60.253.13 Constructor(x as Double) 11342
- 60.253.14 Constructor(x as Double, y as Double) 11343
- 60.253.15 Constructor(x as Double, y as Double, z as Double) 11343
- 60.253.16 Constructor(x as Double, y as Double, z as Double, w as Double) 11344

60.253.10 Constructor(t as CGAffineTransformMBS)

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Initializes a vector that is initialized with values provided by a CGAffineTransform.
Example:

```
Var p as new CGAffineTransformMBS
Var v as new CIVectorMBS(p)
Var x as CGAffineTransformMBS = v.CGAffineTransformValue
MessageBox str(x.A)+" "+str(x.B)+" "+str(x.C)+" "+str(x.D)+" "+str(x.TX)+" "+str(x.TY)
```

Notes: The six values that comprise the affine transform fill the first six positions of the resulting CIVector object.
Available in OS X v10.9 and later.

- 60.253.7 Constructor(p as CGPointMBS) 11338
- 60.253.8 Constructor(r as CGRectMBS) 11339
- 60.253.9 Constructor(StringRepresentation as String) 11340
- 60.253.11 Constructor(values() as Double) 11341
- 60.253.12 Constructor(values() as single) 11341
- 60.253.13 Constructor(x as Double) 11342
- 60.253.14 Constructor(x as Double, y as Double) 11343
- 60.253.15 Constructor(x as Double, y as Double, z as Double) 11343
- 60.253.16 Constructor(x as Double, y as Double, z as Double, w as Double) 11344

60.253.11 Constructor(values() as Double)

MBS MacCI Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Initializes a new vector with given values.
See also:

- 60.253.6 Constructor(Handle as Integer) 11338
- 60.253.7 Constructor(p as CGPointMBS) 11338
- 60.253.8 Constructor(r as CGRectMBS) 11339
- 60.253.9 Constructor(StringRepresentation as String) 11340
- 60.253.10 Constructor(t as CGAffineTransformMBS) 11340
- 60.253.12 Constructor(values() as single) 11341
- 60.253.13 Constructor(x as Double) 11342
- 60.253.14 Constructor(x as Double, y as Double) 11343
- 60.253.15 Constructor(x as Double, y as Double, z as Double) 11343
- 60.253.16 Constructor(x as Double, y as Double, z as Double, w as Double) 11344

60.253.12 Constructor(values() as single)

MBS MacCI Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Initializes a new vector with given values.
See also:

- 60.253.6 Constructor(Handle as Integer) 11338

- 60.253.7 Constructor(p as CGPointMBS) 11338
- 60.253.8 Constructor(r as CGRectMBS) 11339
- 60.253.9 Constructor(StringRepresentation as String) 11340
- 60.253.10 Constructor(t as CGAffineTransformMBS) 11340
- 60.253.11 Constructor(values() as Double) 11341
- 60.253.13 Constructor(x as Double) 11342
- 60.253.14 Constructor(x as Double, y as Double) 11343
- 60.253.15 Constructor(x as Double, y as Double, z as Double) 11343
- 60.253.16 Constructor(x as Double, y as Double, z as Double, w as Double) 11344

60.253.13 Constructor(x as Double)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new vector based on one value.
Example:

```
Var x as Double
Var v as CIVectorMBS
v=New CIVectorMBS(x)
```

See also:

- 60.253.6 Constructor(Handle as Integer) 11338
- 60.253.7 Constructor(p as CGPointMBS) 11338
- 60.253.8 Constructor(r as CGRectMBS) 11339
- 60.253.9 Constructor(StringRepresentation as String) 11340
- 60.253.10 Constructor(t as CGAffineTransformMBS) 11340
- 60.253.11 Constructor(values() as Double) 11341
- 60.253.12 Constructor(values() as single) 11341
- 60.253.14 Constructor(x as Double, y as Double) 11343
- 60.253.15 Constructor(x as Double, y as Double, z as Double) 11343
- 60.253.16 Constructor(x as Double, y as Double, z as Double, w as Double) 11344

60.253.14 Constructor(x as Double, y as Double)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new vector based on two values.
Example:

```
Var x,y as Double
Var v as CIVectorMBS
v=New CIVectorMBS(x,y)
```

See also:

- 60.253.6 Constructor(Handle as Integer) 11338
- 60.253.7 Constructor(p as CGPointMBS) 11338
- 60.253.8 Constructor(r as CGRectMBS) 11339
- 60.253.9 Constructor(StringRepresentation as String) 11340
- 60.253.10 Constructor(t as CGAffineTransformMBS) 11340
- 60.253.11 Constructor(values() as Double) 11341
- 60.253.12 Constructor(values() as single) 11341
- 60.253.13 Constructor(x as Double) 11342
- 60.253.15 Constructor(x as Double, y as Double, z as Double) 11343
- 60.253.16 Constructor(x as Double, y as Double, z as Double, w as Double) 11344

60.253.15 Constructor(x as Double, y as Double, z as Double)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new vector based on three values.
Example:

```
Var x,y,z as Double
Var v as CIVectorMBS
v=New CIVectorMBS(x,y,z)
```

See also:

- 60.253.6 Constructor(Handle as Integer) 11338
- 60.253.7 Constructor(p as CGPointMBS) 11338
- 60.253.8 Constructor(r as CGRectMBS) 11339

- 60.253.9 Constructor(StringRepresentation as String) 11340
- 60.253.10 Constructor(t as CGAffineTransformMBS) 11340
- 60.253.11 Constructor(values() as Double) 11341
- 60.253.12 Constructor(values() as single) 11341
- 60.253.13 Constructor(x as Double) 11342
- 60.253.14 Constructor(x as Double, y as Double) 11343
- 60.253.16 Constructor(x as Double, y as Double, z as Double, w as Double) 11344

60.253.16 Constructor(x as Double, y as Double, z as Double, w as Double)

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new vector based on 4 values.
Example:

```
Var x,y,z,w as Double
Var v as CIVectorMBS
v=New CIVectorMBS(x,y,z,w)
```

See also:

- 60.253.6 Constructor(Handle as Integer) 11338
- 60.253.7 Constructor(p as CGPointMBS) 11338
- 60.253.8 Constructor(r as CGRectMBS) 11339
- 60.253.9 Constructor(StringRepresentation as String) 11340
- 60.253.10 Constructor(t as CGAffineTransformMBS) 11340
- 60.253.11 Constructor(values() as Double) 11341
- 60.253.12 Constructor(values() as single) 11341
- 60.253.13 Constructor(x as Double) 11342
- 60.253.14 Constructor(x as Double, y as Double) 11343
- 60.253.15 Constructor(x as Double, y as Double, z as Double) 11343

60.253.17 copy as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Creates a copy of the vector object.

60.253.18 Value(index as Integer) as Double

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: The value with the given index.
Notes: Index is zero based.

60.253.19 vectorWithCGAffineTransform(t as CGAffineTransformMBS) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Creates and returns a vector that is initialized with values provided by a CGAffineTransform.
Example:

```
Var p as new CGAffineTransformMBS
Var v as CIVectorMBS = CIVectorMBS.vectorWithCGAffineTransform(p)
Var x as CGAffineTransformMBS = v.CGAffineTransformValue
MessageBox str(x.A)+" "+str(x.B)+" "+str(x.C)+" "+str(x.D)+" "+str(x.TX)+" "+str(x.TY)
```

Notes: t: A transform.
Returns a vector initialized with the specified values.

The six values that comprise the affine transform fill the first six positions of the resulting CIVector object.

60.253.20 vectorWithCGPoint(p as CGPointMBS) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Creates and returns a vector that is initialized with values provided by a CGPoint.
Example:

```
Var p as new CGPointMBS(10, 20)
Var v as CIVectorMBS = CIVectorMBS.vectorWithCGPoint(p)

MessageBox str(v.x)+" "+str(v.y)
```

Notes: p: A point.
A vector initialized with the specified values.

The CGPoint's X and Y values are stored in the vector's X and Y properties.

60.253.21 vectorWithCGRect(r as CGRectMBS) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Creates and returns a vector that is initialized with values provided by a CGRect.
Example:

```
Var p as new CGRectMBS(10, 20, 30, 40)
Var v as CIVectorMBS = CIVectorMBS.vectorWithCGRect(p)

Var x as CGRectMBS = v.CGRectValue
MessageBox str(x.Origin.X)+" "+str(x.Origin.y)+" "+str(x.Size.Width)+" "+str(x.Size.Height)
```

Notes: r: A rect.

Returns a vector initialized with the specified values.
The CGRect's X, Y, height and width values are stored in the vector's X, Y, Z and W properties.

60.253.22 vectorWithString(s as string) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Creates a new vector based on content of the string.

60.253.23 vectorWithValues(values() as Double) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates a new vector based on the given values.
See also:

- 60.253.24 vectorWithValues(values() as single) as CIVectorMBS 11346

60.253.24 vectorWithValues(values() as single) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Creates a new vector based on the given values.
See also:

- 60.253.23 vectorWithValues(values() as Double) as CIVectorMBS 11346

60.253.25 vectorWithX(x as Double) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Creates a new vector based on one value.

60.253.26 vectorWithXY(x as Double, y as Double) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Creates a new vector based on two values.

60.253.27 vectorWithXYZ(x as Double, y as Double, z as Double) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Creates a new vector based on three values.

60.253.28 vectorWithXYZW(x as Double, y as Double, z as Double, w as Double) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Creates a new vector based on 4 values.

60.253.29 Properties

60.253.30 Count as Integer

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Return the number of values stored in the vector.
Notes: (Read only property)

60.253.31 Description as String

MBS MacCI Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the textual description for this vector.
Notes: (Read only property)

60.253.32 Handle as Integer

MBS MacCI Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: The handle to the CIVector reference used.
Notes: (Read only property)

60.253.33 StringRepresentation as String

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Returns the vector as a string
Example:

```
Var v as CIVectorMBS

v=NewCIVectorWithXYZMBS(1,2,3)

MessageBox v.StringRepresentation // shows " [ 1 2 3 ] "
```

Notes: Value is "" on any error.
(Read only property)

60.253.34 W as Double

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: The W value.
Notes: (Read only property)

60.253.35 X as Double

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: The X value.
Notes: (Read only property)

60.253.36 Y as Double

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: The Y value.
Notes: (Read only property)

60.253.37 Z as Double

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: The Z value.
Notes: (Read only property)

60.254 class NSAffineTransformMBS

60.254.1 class NSAffineTransformMBS

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: A class for transformation.
Example:

```
// move and rotate a point with an affine transform
Var t As New NSAffineTransformMBS
t.translate(100, 50)
t.rotateByDegrees(90)
t.scale(2)

Var px As Double = 10
Var py As Double = 0
t.transformPoint(px, py)

MessageBox "Transformed point: " + Format(px, "0.0") + ", " + Format(py, "0.0") + EndOfLine + _
"Matrix: " + t.StringValue
```

Notes: As being used by CoreImage and by the NS* classes, it is a free plugin class requiring no registration.

60.254.2 Methods

60.254.3 appendTransform(transform as NSAffineTransformMBS)

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Transforms the transformation by applying the given transform on the current one.

60.254.4 CGAffineTransformToNSAffineTransform(CGAffineTransform as Variant) as NSAffineTransformMBS

MBS Main Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Converts NSAffineTransformMBS to CGAffineTransformMBS.
Example:

```
Var n as new NSAffineTransformMBS(1,2,3,4,5,6)
Var c as CGAffineTransformMBS = NSAffineTransformMBS.NSAffineTransformToCGAffineTransform(n)
Var r as NSAffineTransformMBS = NSAffineTransformMBS.CGAffineTransformToNSAffineTransform(c)

Break // check in debugger
```

Notes: To reduce plugin interdependencies, the parameter is declared as Variant and not as CGAffineTransformMBS.

60.254.5 Constructor

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: The constructor to create a new transformation.
Notes: On success the handle property will not be 0.
See also:

- 60.254.6 Constructor(m11 as Double, m12 as Double, m21 as Double, m22 as Double, tx as Double, ty as Double) 11351
- 60.254.7 Constructor(transform as NSAffineTransformMBS) 11351

60.254.6 Constructor(m11 as Double, m12 as Double, m21 as Double, m22 as Double, tx as Double, ty as Double)

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a new NSAffineTransformMBS based on the given values.
See also:

- 60.254.5 Constructor 11351
- 60.254.7 Constructor(transform as NSAffineTransformMBS) 11351

60.254.7 Constructor(transform as NSAffineTransformMBS)

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new transformation based on the values of an existing transformation.
Notes: On success the handle property will not be 0.
See also:

- 60.254.5 Constructor 11351
- 60.254.6 Constructor(m11 as Double, m12 as Double, m21 as Double, m22 as Double, tx as Double, ty as Double) 11351

60.254.8 getValues(byref m11 as Double, byref m12 as Double, byref m21 as Double, byref m22 as Double , byref tx as Double, byref tY as Double)

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Copies all the values from the internal matrix.

60.254.9 invert

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Inverts the transformation.

60.254.10 NSAffineTransformToCGAffineTransform(NSAffineTransform as NSAffineTransformMBS) as Variant

MBS Main Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Converts NSAffineTransformMBS to CGAffineTransformMBS.
Example:

```
Var n as new NSAffineTransformMBS(1,2,3,4,5,6)
Var c as CGAffineTransformMBS = NSAffineTransformMBS.NSAffineTransformToCGAffineTransform(n)
Var r as NSAffineTransformMBS = NSAffineTransformMBS.CGAffineTransformToNSAffineTransform(c)

Break // check in debugger
```

Notes: To reduce plugin interdependencies, the result is declared as Variant and not as CGAffineTransformMBS.

60.254.11 Operator_Convert as String

MBS Main Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Returns stringValue.

60.254.12 Operator_Multiply(other as NSAffineTransformMBS) as NSAffineTransformMBS

MBS Main Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Multiplies both matrix where self is on the left side.

60.254.13 Operator_MultiplyRight(other as NSAffineTransformMBS) as NSAffineTransformMBS

MBS Main Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Multiplies both matrix where self is on the right side.

60.254.14 prependTransform(transform as NSAffineTransformMBS)

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Transforms the transformation by applying the given transform on the current one.

60.254.15 rotateByDegrees(angle as Double)

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Rotates transformation by the given angle in degrees.
Example:

```
Var t as new NSAffineTransformMBS
t.rotateByDegrees 90 // rotate by 90 degrees
```

60.254.16 rotateByRadians(angle as Double)

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Rotates transformation by the given angle in radians.
Example:

```
const pi=3.14159265
Var t as new NSAffineTransformMBS
t.rotateByDegrees pi // rotate by 180 degrees
```

60.254.17 scale(scale as Double)

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Scales the transformation.
Example:

```
Var t as new NSAffineTransformMBS
t.scale 2.0 // double size
```

See also:

- 60.254.18 scale(scaleX as Double, scaleY as Double) 11354

60.254.18 scale(scaleX as Double, scaleY as Double)

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Scales transformation.
Example:

```
Var t as new NSAffineTransformMBS
t.scale 1,2
```

See also:

- 60.254.17 scale(scale as Double) 11354

60.254.19 setValues(m11 as Double, m12 as Double, m21 as Double, m22 as Double , tx as Double, tY as Double)

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Sets all the values from the internal matrix.

60.254.20 transform as NSAffineTransformMBS

MBS Main Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Creates and returns a new NSAffineTransform object initialized to the identity matrix.
Example:

```
Var a as NSAffineTransformMBS = NSAffineTransformMBS.transform
MessageBox str(a.m11)+", "+str(a.m12)+", "+str(a.m21)+", "+str(a.m22)+", "+str(a.tx)+", "+str(a.ty)
```

Notes: This matrix transforms any point to the same point.

60.254.21 transformBezierPath(NSBezierPath as Variant) as Variant

MBS Main Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Transforms a bezier path with current transformation.

60.254.22 transformPoint(byref x as Double, byref y as Double)

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Transforming the given point.

60.254.23 transformSize(byref width as Double, byref height as Double)

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Transforming the given size.

60.254.24 translate(deltaX as Double, deltaY as Double)

MBS Main Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Translates by the given delta.

60.254.25 Properties

60.254.26 Data as MemoryBlock

MBS Main Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: The transform data structure.
Example:

```
Var n as new NSAffineTransformMBS(1,2,3,4,5,6)
Var m as MemoryBlock = n.Data

Break // check in debugger
```

Notes: Returns a copy of the structure as memoryblock.
Can be set with memoryblock of right size and content.

Due to CoreGraphics using 32bit floats in 32bit app, you need to use SingleValue there in the memoryblock which has a size of 24 bytes.

For 64-bit application, the sizes double and you need to use DoubleValue.
(Read and Write property)

60.254.27 Handle as Integer

MBS Main Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

60.254.28 m11 as Double

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The matrix value at position 1/1.
Notes: (Read only property)

60.254.29 m12 as Double

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The matrix value at position 1/2.
Notes: (Read only property)

60.254.30 m21 as Double

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The matrix value at position 2/1.
Notes: (Read only property)

60.254.31 m22 as Double

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The matrix value at position 2/2.
Notes: (Read only property)

60.254.32 StringValue as String

MBS Main Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The string representation.
Notes: (Read only property)

60.254.33 tx as Double

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The translate X value.
Notes: (Read only property)

60.254.34 ty as Double

MBS Main Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The translate Y value.
Notes: (Read only property)

60.255 Globals

60.255.1 NewCIColorMBS(red as single, green as single, blue as single, alpha as single=1.0) as CIColorMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new color based on the given values.
Example:

```
// create a Core Image color, e.g. for a color filter
Var c As CIColorMBS = NewCIColorMBS(1.0, 0.5, 0.0) // orange, alpha 1
MessageBox c.Red.ToString + ", " + c.Green.ToString + ", " + c.Blue.ToString
```

Notes: Returns nil on any error.
Requires Mac OS X 10.4 to work.

60.255.2 NewCIColorWithCGColorMBS(CGColor as Variant) as CIColorMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new CIColor based on the given CoreGraphics color.
Notes: CGColor parameter must be a CGColorMBS object. We use variant to reduce dependency to other plugins.

Returns nil on any error.
Requires Mac OS X 10.4 to work.

60.255.3 NewCIColorWithStringMBS(s as String) as CIColorMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new CIColor based on the given string.
Example:

```
Var c as CIColorMBS

c=NewCIColorWithStringMBS("1 0.5 0 1")

MessageBox c.stringRepresentation // shows "1 0.5 0 1"
```

Notes: Returns nil on any error.
Requires Mac OS X 10.4 to work.

60.255.4 NewCIContextMBS(cgcontext as CGContextMBS) as CIContextMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Create a new CoreImage context object without options, all output will be drawn into the CG context.
Notes: Returns nil on any error.
Requires Mac OS X 10.4 to work.
See also:

- 60.255.5 NewCIContextMBS(cgcontext as CGContextMBS, OutputColorSpace as CGColorSpaceMBS, WorkingColorSpace as CGColorSpaceMBS, UseSoftwareRenderer as Boolean) as CIContextMBS 11359

60.255.5 NewCIContextMBS(cgcontext as CGContextMBS, OutputColorSpace as CGColorSpaceMBS, WorkingColorSpace as CGColorSpaceMBS, UseSoftwareRenderer as Boolean) as CIContextMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Create a new CoreImage context object with options, all output will be drawn into the CG context.
Notes: OutputColorSpace: A CGColorSpaceMBS object defining the color space in which all intermediate operations are performed.
WorkingColorSpace: A CGColorSpaceRef object defining the color space that images are converted to before rendering into the context.
UseSoftwareRenderer: Whether you want software renderer only.

Returns nil on any error.
Requires Mac OS X 10.4 to work.
See also:

- 60.255.4 NewCIContextMBS(cgcontext as CGContextMBS) as CIContextMBS 11359

60.255.6 NewCIImagewithBitmapDataMBS(data as memoryblock, BytesPerRow as Integer, Width as Integer, Height as Integer, Format as Integer, colorspace as CGColorSpaceMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage from a RAW memory buffer.
Notes: Format must be one of this constants: kCIFormatRGBAf, kCIFormatRGBA16 and kCIFormatARGB8.

Returns nil on any error.
Requires Mac OS X 10.4 to work.

60.255.7 NewCIImagewithBitmapMemoryMBS(data as memoryblock, DataLength as Integer, BytesPerRow as Integer, Width as Integer, Height as Integer, Format as Integer, colorspace as CGColorSpaceMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage from a RAW memory buffer.
Notes: Data points directly to the row data.
Length is the size of the memoryblock in bytes.
BytesPerRow is the size of a row in bytes.
Width and height are the dimensions of the image.
Format must be one of this constants: kCIFormatRGBAf, kCIFormatRGBA16 and kCIFormatARGB8.
Colorspace is the CoreGraphics Colorspace object to be used.

Returns nil on any error.
Requires Mac OS X 10.4 to work.

60.255.8 NewCIImagewithCGImageMBS(cgimage as CGImageMBS, cgcolorspace as CGColorSpaceMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on a CGImage.
Notes: cgcolorspace: Use this colorspace when opening the image.
Returns nil on any error.
Requires Mac OS X 10.4 to work.
See also:

- 60.255.9 NewCIImagewithCGImageMBS(cgimage as CGImageMBS, options as dictionary = nil) as CIImageMBS 11360

60.255.9 NewCIImagewithCGImageMBS(cgimage as CGImageMBS, options as dictionary = nil) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on a CGImage.
Example:

```
// create a Core Image image from a Xojo picture via CGImage
Var pic As New Picture(200, 100)
pic.Graphics.DrawingColor = &c3366CC
pic.Graphics.FillOval(0, 0, 200, 100)
Var image As CIImageMBS = NewCIImagewithCGImageMBS(CGImageMBS.CreateImage(pic))
MessageBox image.Width.ToString + " x " + image.Height.ToString
```

Notes: Returns nil on any error.
Requires Mac OS X 10.4 to work.
See also:

- 60.255.8 NewCIImagewithCGImageMBS(cgimage as CGImageMBS, cgcolorspace as CGColorSpaceMBS) as CIImageMBS 11360

60.255.10 NewCIImagewithDataMBS(Data as memoryblock, cgcolorspace as CGColorSpaceMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on the image file content stored inside the data string.
Notes: cgcolorspace: Use this colorspace when opening the image.

Returns nil on any error.
Requires Mac OS X 10.4 to work.
See also:

- 60.255.11 NewCIImagewithDataMBS(Data as Memoryblock, Options as Dictionary = nil) as CIImageMBS 11361

60.255.11 NewCIImagewithDataMBS(Data as Memoryblock, Options as Dictionary = nil) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on the image file content stored inside the data string.
Example:

```
// create a Core Image image from JPEG or PNG data in memory
Var data As MemoryBlock = BinaryStream.Open(SpecialFolder.Desktop.Child("photo.jpg")).Read(100000000)
Var image As CIImageMBS = NewCIImagewithDataMBS(data)
If image = Nil Then Return
Var pic As Picture = image.RenderPicture
```

Notes: Returns nil on any error.
Requires Mac OS X 10.4 to work.

See also:

- 60.255.10 NewCIImagewithDataMBS(Data as memoryblock, cgcolorspace as CGColorSpaceMBS) as CIImageMBS 11361

60.255.12 NewCIImagewithFileMBS(file as folderitem) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on a the content of the file.
Example:

```
// load a picture with Core Image, blur it and render it back to a Xojo picture
Var image As CIImageMBS = NewCIImagewithFileMBS(SpecialFolder.Desktop.Child("photo.jpg"))
If image = Nil Then Return

Var blur As New CIFilterGaussianBlurMBS
blur.inputImage = image
blur.inputRadius = 8
Var result As Picture = blur.outputImage.RenderPicture
```

Notes: Returns nil on any error.
Requires Mac OS X 10.4 to work.

In plugin version 7.5 and Mac OS X 10.4.10 this method leaks the data because of a bug in the framework.
See also:

- 60.255.13 NewCIImagewithFileMBS(file as folderitem, cgcolorspace as CGColorSpaceMBS) as CIImageMBS 11362

60.255.13 NewCIImagewithFileMBS(file as folderitem, cgcolorspace as CGColorSpaceMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on a the content of the file.
Notes: cgcolorspace: Use this colorspace when opening the image.

Returns nil on any error.
Requires Mac OS X 10.4 to work.

In plugin version 7.5 and Mac OS X 10.4.10 this method leaks the data because of a bug in the framework.
See also:

- 60.255.12 NewCIImagewithFileMBS(file as folderitem) as CIImageMBS 11362

60.255.14 NewCIImagewithURLMBS(url as String) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on a the content of the file where the URL points to.
Example:

```
// load an image with Core Image from a file URL
Var url As String = SpecialFolder.Desktop.Child("photo.jpg").URLPath
Var image As CIImageMBS = NewCIImagewithURLMBS(url)
If image <>Nil Then MessageBox image.Width.ToString + " x " + image.Height.ToString
```

Notes: Returns nil on any error.
Requires Mac OS X 10.4 to work.
See also:

- 60.255.15 NewCIImagewithURLMBS(url as String, cgcolorspace as CGColorSpaceMBS) as CIImageMBS 11363

60.255.15 NewCIImagewithURLMBS(url as String, cgcolorspace as CGColorSpaceMBS) as CIImageMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a CIImage based on a the content of the file where the URL points to.
Notes: cgcolorspace: Use this colorspace when opening the image.

Returns nil on any error.
Requires Mac OS X 10.4 to work.
See also:

- 60.255.14 NewCIImagewithURLMBS(url as String) as CIImageMBS 11363

60.255.16 NewCISamplerMBS(ciImage as CIImageMBS) as CISamplerMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new sampler based on the given image.
Example:

```
// create a sampler for an image, e.g. as input for a custom kernel
Var image As CIImageMBS = NewCIImagewithFileMBS(SpecialFolder.Desktop.Child("photo.jpg"))
If image = Nil Then Return
Var sampler As CISamplerMBS = NewCISamplerMBS(image)
MessageBox sampler.Extent.Width.ToString + " x " + sampler.Extent.Height.ToString
```

Notes: Returns nil on any error.
Requires Mac OS X 10.4 to work.
See also:

- 60.255.17 NewCISamplerMBS(ciImage as CIImageMBS, matrix as NSAffineTransformMBS, WrapMode as String, FilterMode as string) as CISamplerMBS 11364

60.255.17 NewCISamplerMBS(ciImage as CIImageMBS, matrix as NSAffineTransformMBS, WrapMode as String, FilterMode as string) as CISamplerMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new sampler based on the given image.
Notes:

matrix:	An affine transformation [a b c d tx ty] defining the transformation to be applied to the sampler.
wrapmode:	A string defining how pixels outside the sampler's extent are produced. Options include kCISamplerWrapBlack (pixels are transparent black, the default) and kCISamplerWrapClamp (coordinates are clamped to the extent).
FilterMode:	A string defining the filter to use when sampling the image. One of kCISamplerFilterNearest (point sampling) or kCISamplerFilterLinear (bilinear interpolation, the default).

Returns nil on any error.
Requires Mac OS X 10.4 to work.
See also:

- 60.255.16 NewCISamplerMBS(ciImage as CIImageMBS) as CISamplerMBS 11363

60.255.18 NewCIVectorWithStringMBS(s as string) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new vector based on content of the string.
Example:

```
Var v as CIVectorMBS
v=NewCIVectorWithStringMBS(" [ 1 2 3 ] ")
```

Notes: Returns nil on any error.
Requires Mac OS X 10.4 to work.

60.255.19 NewCIVectorWithXMBS(x as Double) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new vector based on one value.
Example:

```
Var x as Double = 1
Var v as CIVectorMBS
v=NewCIVectorWithXMBS(x)
```

Notes: Returns nil on any error.
Requires Mac OS X 10.4 to work.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.2pr1

60.255.20 NewCIVectorWithXYMBS(x as Double, y as Double) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new vector based on two values.
Example:

```
Var x as Double = 1
Var y as Double = 2
Var v as CIVectorMBS
v=NewCIVectorWithXYMBS(x,y)
```

Notes: Returns nil on any error.
Requires Mac OS X 10.4 to work.

60.255.21 NewCIVectorWithXYZMBS(x as Double, y as Double, z as Double) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new vector based on three values.
Example:

```
Var x as Double = 1
Var y as Double = 2
Var z as Double = 3
Var v as CIVectorMBS
v=NewCIVectorWithXYZMBS(x,y,z)
```

Notes: Returns nil on any error.
Requires Mac OS X 10.4 to work.

60.255.22 NewCIVectorWithXYZWMBS(x as Double, y as Double, z as Double, w as Double) as CIVectorMBS

MBS MacCI Plugin, Plugin Version: 7.3, Platform: macOS, Targets: All.

Function: Creates a new vector based on 4 values.
Example:

```
Var x as Double = 1
Var y as Double = 2
Var z as Double = 3
Var w as Double = 4
Var v as CIVectorMBS
v=NewCIVectorWithXYZWMBS(x,y,z,w)
```

Notes: Returns nil on any error.
Requires Mac OS X 10.4 to work.

Chapter 61

CoreLocation

61.1 class CLGeocodeCompletionHandlerMBS

61.1.1 class CLGeocodeCompletionHandlerMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The class to receive the Complete event from a geocoder.

61.1.2 Events

61.1.3 Completed(geocoder as CLGeocoderMBS, placemarks() as CLPlacemarkMBS, error as NSErrorMBS, tag as Variant)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The event to be called when a geocoding request is complete.
Notes: Upon completion of a geocoding request, a block of this form is called to give you a chance to process the results. The parameters of this block are as follows:

placemark: Contains an array of CLPlacemark objects. For most geocoding requests, this array should contain only one entry. However, forward-geocoding requests may return multiple placemark objects in situations where the specified address could not be resolved to a single location.
If the request was canceled or there was an error in obtaining the placemark information, this parameter is nil.
error: Contains an error object (if any) indicating why the placemark data was not returned. For a list of possible error codes, see CLLocationManager Class Reference.

Available in OS X v10.8 and later.
Tag parameter added in version 14.2.

61.2 class CLGeocoderMBS

61.2.1 class CLGeocoderMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The CLGeocoder class provides services for converting between a coordinate (specified as a latitude and longitude) and the user-friendly representation of that coordinate.
Example:

```
// find the coordinates for an address
// MyGeocodeHandler is a subclass of CLGeocodeCompletionHandlerMBS with the Completed event implemented.
// Geocoder is a property of the window: Geocoder As CLGeocoderMBS
// Handler is a property of the window: Handler As MyGeocodeHandler
Geocoder = New CLGeocoderMBS
Handler = New MyGeocodeHandler
Geocoder.geocodeAddressString("Brandenburger Tor, Berlin", Handler)

// in MyGeocodeHandler:
Sub Completed(geocoder As CLGeocoderMBS, placemarks() As CLPlacemarkMBS, error As NSErrorMBS,
tag As Variant) Handles Completed
If error <>Nil Then
System.DebugLog error.localizedDescription
Return
End If
For Each place As CLPlacemarkMBS In placemarks
System.DebugLog place.name + ", " + place.locality + ": " + _
place.location.latitude.ToString + " / " + place.location.longitude.ToString
Next
End Sub
```

Notes: A user-friendly representation of the coordinate typically consists of the street, city, state, and country information corresponding to the given location, but it may also contain a relevant point of interest, landmarks, or other identifying information. A geocoder object is a single-shot object that works with a network-based service to look up placemark information for its specified coordinate value.

To use a geocoder object, create it and call one of its forward- or reverse-geocoding methods to begin the request. Reverse-geocoding requests take a latitude and longitude value and find a user-readable address. Forward-geocoding requests take a user-readable address and find the corresponding latitude and longitude value. Forward-geocoding requests may also return additional information about the specified location, such as a point of interest or building at that location. For both types of request, the results are returned using a CLPlacemark object. In the case of forward-geocoding requests, multiple placemark objects may be returned if the provided information yielded multiple possible locations.

To make smart decisions about what types of information to return, the geocoder server uses all the informa-

tion provided to it when processing the request. For example, if the user is moving quickly along a highway, it might return the name of the overall region, and not the name of a small park that the user is passing through.

Applications should be conscious of how they use geocoding. Here are some rules of thumb for using this class effectively:

Send at most one geocoding request for any one user action.
If the user performs multiple actions that involve geocoding the same location, reuse the results from the initial geocoding request instead of starting individual requests for each action.
When you want to update the user's current location automatically (such as when the user is moving), issue new geocoding requests only when the user has moved a significant distance and after a reasonable amount of time has passed. For example, in a typical situation, you should not send more than one geocoding request per minute.
Do not start a geocoding request at a time when the user will not see the results immediately. For example, do not start a request if your application is inactive or in the background.
The computer or device must have access to the network in order for the geocoder object to return detailed placemark information. Although, the geocoder stores enough information locally to report the localized country name and ISO country code for many locations. If country information is not available for a specific location, the geocoder may still report an error to your completion block.

61.2.2 Methods

61.2.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns true if this class is available.

61.2.4 cancelGeocode

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Cancels a pending geocoding request.
Notes: You can use this method to cancel a pending request and free up the resources associated with that request. Canceling a pending request causes the completion handler event to be called.

If the request is not pending, because it has already returned or has not yet begun, this method does nothing.
Available in OS X v10.8 and later.

61.2.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The constructor.

61.2.6 geocodeAddressDictionary(addressDictionary as Dictionary, completionHandler as CLGeocodeCompletionHandlerMBS, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Submits a forward-geocoding request using the specified address dictionary.
Notes: addressDictionary: An Address Book dictionary containing information about the address to look up.
completionHandler: A handler object containing the code to execute at the end of the request. This code is called whether the request is successful or unsuccessful.

This method submits the specified location data to the geocoding server asynchronously and returns. Your completion handler block will be executed on the main thread. After initiating a forward-geocoding request, do not attempt to initiate another forward- or reverse-geocoding request.
Available in OS X v10.8 and later.

61.2.7 geocodeAddressString(addressString as string, completionHandler as CLGeocodeCompletionHandlerMBS, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Submits a forward-geocoding request using the specified string.
Notes: addressString: A string describing the location you want to look up. For example, you could specify the string "1 Infinite Loop, Cupertino, CA" to locate Apple headquarters.
completionHandler: A handler object containing the code to execute at the end of the request. This code is called whether the request is successful or unsuccessful.

This method submits the specified location data to the geocoding server asynchronously and returns. Your completion handler block will be executed on the main thread. After initiating a forward-geocoding request, do not attempt to initiate another forward- or reverse-geocoding request.
Available in OS X v10.8 and later.
See also:

- 61.2.8 geocodeAddressString(addressString as string, region as CLRegionMBS, completionHandler as CLGeocodeCompletionHandlerMBS, tag as Variant = nil) 11372
- 61.2.9 geocodeAddressString(addressString as string, region as CLRegionMBS, preferredLocale as NSLocaleMBS, completionHandler as CLGeocodeCompletionHandlerMBS, tag as variant = nil) 11373

61.2.8 geocodeAddressString(addressString as string, region as CLRegionMBS, completionHandler as CLGeocodeCompletionHandlerMBS, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Submits a forward-geocoding request using the specified string and region information.
Notes: addressString: A string describing the location you want to look up. For example, you could specify the string "1 Infinite Loop, Cupertino, CA" to locate Apple headquarters.
region: A geographical region to use as a hint when looking up the specified address. Specifying a region lets you prioritize the returned set of results to locations that are close to some specific geographical area, which is typically the user's current location. If nil and the application is authorized for location services, the set of results is prioritized based on the user's approximate location. Invoking this method does not trigger a location services authorization request.
completionHandler: A handler object containing the code to execute at the end of the request. This code is called whether the request is successful or unsuccessful.

This method submits the specified location data to the geocoding server asynchronously and returns. Your completion handler block will be executed on the main thread. After initiating a forward-geocoding request, do not attempt to initiate another forward- or reverse-geocoding request.
Available in OS X v10.8 and later.
See also:

- 61.2.7 geocodeAddressString(addressString as string, completionHandler as CLGeocodeCompletionHandlerMBS, tag as Variant = nil) 11372
- 61.2.9 geocodeAddressString(addressString as string, region as CLRegionMBS, preferredLocale as NSLocaleMBS, completionHandler as CLGeocodeCompletionHandlerMBS, tag as variant = nil) 11373

61.2.9 geocodeAddressString(addressString as string, region as CLRegionMBS, preferredLocale as NSLocaleMBS, completionHandler as CLGeocodeCompletionHandlerMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Submits a forward-geocoding request using the specified string and region information.
Notes: addressString: A string describing the location you want to look up. For example, you could specify the string "1 Infinite Loop, Cupertino, CA" to locate Apple headquarters.
region: A geographical region to use as a hint when looking up the specified address. Specifying a region lets you prioritize the returned set of results to locations that are close to some specific geographical area, which is typically the user's current location. If nil and the application is authorized for location services, the set of results is prioritized based on the user's approximate location. Invoking this method does not trigger a location services authorization request.
completionHandler: A handler object containing the code to execute at the end of the request. This code is called whether the request is successful or unsuccessful.

This method submits the specified location data to the geocoding server asynchronously and returns. Your completion handler block will be executed on the main thread. After initiating a forward-geocoding request, do not attempt to initiate another forward- or reverse-geocoding request.

Available in OS X v10.8 and later.
For macOS 10.13 or newer we can optionally pass preferred locale.
See also:

- 61.2.7 geocodeAddressString(addressString as string, completionHandler as CLGeocodeCompletionHandlerMBS, tag as Variant = nil) 11372
- 61.2.8 geocodeAddressString(addressString as string, region as CLRegionMBS, completionHandler as CLGeocodeCompletionHandlerMBS, tag as Variant = nil) 11372

61.2.10 geocodePostalAddress(postalAddress as Variant, completionHandler as CLGeocodeCompletionHandlerMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Queries coordinates for postal address.
Notes: postalAddress must be a CNPostalAddressMBS.
For macOS 10.13 or newer.
See also:

- 61.2.11 geocodePostalAddress(postalAddress as Variant, preferredLocale as NSLocaleMBS, completionHandler as CLGeocodeCompletionHandlerMBS, tag as variant = nil) 11374

61.2.11 geocodePostalAddress(postalAddress as Variant, preferredLocale as NSLocaleMBS, completionHandler as CLGeocodeCompletionHandlerMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Queries coordinates for postal address.
Notes: postalAddress must be a CNPostalAddressMBS.
For macOS 10.13 or newer.
See also:

- 61.2.10 geocodePostalAddress(postalAddress as Variant, completionHandler as CLGeocodeCompletionHandlerMBS, tag as variant = nil) 11373

61.2.12 isGeocoding as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the receiver is in the middle of geocoding its value. (read-only)
Notes: This property contains the value true if the process is ongoing or false if the process is done or has not yet been initiated.
Available in OS X v10.8 and later.

61.2.13 reverseGeocodeLocation(location as CLLocationMBS, completionHandler as CLGeocodeCompletionHandlerMBS, tag as Variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Submits a reverse-geocoding request for the specified location.
Notes: location: The location object containing the coordinate data to look up.
completionHandler: The handler object containing the code to execute at the end of the request. This code is called whether the request is successful or unsuccessful.

This method submits the specified location data to the geocoding server asynchronously and returns. Your completion handler block will be executed on the main thread. After initiating a reverse-geocoding request, do not attempt to initiate another reverse- or forward-geocoding request.

Available in OS X v10.8 and later.
See also:

- 61.2.14 reverseGeocodeLocation(location as CLLocationMBS, preferredLocale as NSLocaleMBS, completionHandler as CLGeocodeCompletionHandlerMBS, tag as variant = nil) 11375

61.2.14 reverseGeocodeLocation(location as CLLocationMBS, preferredLocale as NSLocaleMBS, completionHandler as CLGeocodeCompletionHandlerMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Submits a reverse-geocoding request for the specified location.
Notes: location: The location object containing the coordinate data to look up.
completionHandler: The handler object containing the code to execute at the end of the request. This code is called whether the request is successful or unsuccessful.

This method submits the specified location data to the geocoding server asynchronously and returns. Your completion handler block will be executed on the main thread. After initiating a reverse-geocoding request, do not attempt to initiate another reverse- or forward-geocoding request.

Available in OS X v10.8 and later.
For macOS 10.13 or newer we can optionally pass preferred locale.
See also:

- 61.2.13 reverseGeocodeLocation(location as CLLocationMBS, completionHandler as CLGeocodeCompletionHandlerMBS, tag as Variant = nil) 11374

61.2.15 Properties

61.2.16 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

61.3 class CLHeadingMBS

61.3.1 class CLHeadingMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: A CLHeading object contains heading data generated by a CLLocationManager object.
Example:

```
// show the compass heading of the device
// MyLocationManager is a subclass of CLLocationManagerMBS with the didUpdateHeading event implemented.
// Manager is a property of the window: Manager As MyLocationManager
If Not CLLocationManagerMBS.headingAvailable Then
MessageBox "This device has no compass."
Return
End If
Manager = New MyLocationManager
Manager.startUpdatingHeading

// in MyLocationManager:
Sub didUpdateHeading(newHeading As CLHeadingMBS) Handles didUpdateHeading
System.DebugLog "Heading " + Format(newHeading.trueHeading, "0") + "¬∞ true, " + Format(newHeading.magneticHeading, "0") + "¬∞ magnetic, accuracy " + Format(newHeading.headingAccuracy, "0") + "¬∞"
End Sub
```

Notes: The heading data consists of computed values for true and magnetic north. It also includes the raw data for the three-dimensional vector used to compute those values.

Typically, you do not create instances of this class yourself, nor do you subclass it. Instead, you receive instances of this class through the delegate assigned to the CLLocationManager object whose startUpdatingHeading method you called.

Note: If you want heading objects to contain valid data for the trueHeading property, your location manager object should also be configured to deliver location updates. You can start the delivery of these updates by calling the location manager object's startUpdatingLocation method.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

61.3.2 Methods

61.3.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns true if this class is available.

61.3.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

61.3.5 copy as CLHeadingMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Creates a clone of this object.

61.3.6 DateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time at which this heading was determined. (read-only)
Notes: Available in OS X v10.7 and later.

61.3.7 description as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the heading data in a formatted text string.
Notes: A string of the form "magneticHeading <magnetic>trueHeading <heading>accuracy <accuracy>x <x>y <y>z <z>@ <date-time>" where <magnetic>, <heading>, <accuracy>, <x>, <y>, and <z>are formatted floating-point numbers and <date-time>is a formatted date string that includes date, time, and time zone information.

Available in OS X v10.7 and later.

61.3.8 headingAccuracy as Double

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The maximum deviation (measured in degrees) between the reported heading and the true geomagnetic heading. (read-only)

Notes: A positive value in this property represents the potential error between the value reported by the magneticHeading property and the actual direction of magnetic north. Thus, the lower the value of this property, the more accurate the heading. A negative value means that the reported heading is invalid, which can occur when the device is uncalibrated or there is strong interference from local magnetic fields.

Available in OS X v10.7 and later.

61.3.9 kCLHeadingFilterNone as Double

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Special value for heading filter to define that you don't want to filter.

61.3.10 magneticHeading as Double

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The heading (measured in degrees) relative to magnetic north. (read-only)
Notes: The value in this property represents the heading relative to the magnetic North Pole, which is different from the geographic North Pole. The value 0 means the device is pointed toward magnetic north, 90 means it is pointed east, 180 means it is pointed south, and so on. The value in this property should always be valid.

If the headingAccuracy property contains a negative value, the value in this property should be considered unreliable.

Available in OS X v10.7 and later.

61.3.11 timestamp as date

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time at which this heading was determined. (read-only)
Notes: Available in OS X v10.7 and later.

61.3.12 trueHeading as Double

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The heading (measured in degrees) relative to true north. (read-only)
Notes: The value in this property represents the heading relative to the geographic North Pole. The value 0 means the device is pointed toward true north, 90 means it is pointed due east, 180 means it is pointed due south, and so on. A negative value indicates that the heading could not be determined.

Important This property contains a valid value only if location updates are also enabled for the corresponding location manager object. Because the position of true north is different from the position of magnetic north on the Earth's surface, Core Location needs the current location of the device to compute the value of this property.

Available in OS X v10.7 and later.

61.3.13 x as Double

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The geomagnetic data (measured in microteslas) for the x-axis. (read-only)
Notes: This value represents the x-axis deviation from the magnetic field lines being tracked by the device. Available in OS X v10.7 and later.

61.3.14 y as Double

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The geomagnetic data (measured in microteslas) for the y-axis. (read-only)
Notes: This value represents the y-axis deviation from the magnetic field lines being tracked by the device. Available in OS X v10.7 and later.

61.3.15 z as Double

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The geomagnetic data (measured in microteslas) for the z-axis. (read-only)
Notes: This value represents the z-axis deviation from the magnetic field lines being tracked by the device. Available in OS X v10.7 and later.

61.3.16 Properties

61.3.17 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

61.4 class CLLocationCoordinate2DMBS

61.4.1 class CLLocationCoordinate2DMBS

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: The class for a location coordinate.

61.4.2 Methods

61.4.3 Constructor(latitude as Double = 0.0, longitude as Double = 0.0)

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Initializes a coordinate with values.

61.4.4 Properties

61.4.5 latitude as Double

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: The latitude.
Notes: (Read and Write property)

61.4.6 longitude as Double

MBS MacFrameworks Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: The longitude.
Notes: (Read and Write property)

61.5 class CLLocationManagerMBS

61.5.1 class CLLocationManagerMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The CoreLocation base class.
Example:

Var c as new CLLocationManagerMBS

c.startUpdatingLocation

Notes: The CLLocationManagerMBS class defines the interface for configuring the delivery of location- and heading-related events to your application. You use an instance of this class to establish the parameters that determine when location and heading events should be delivered. You can also a location manager object to retrieve the most recent location data.

To use a CLLocationManagerMBS object to deliver location events, create an instance, configure the desired accuracy and distance filter values, and call the startUpdatingLocation method. The location service returns an initial location as quickly as possible, returning cached information when available. After delivery of the initial event notification, the CLLocationManagerMBS object may deliver additional events if the minimum threshold distance (as specified by the distanceFilter property) is exceeded or a more accurate location value is determined.

Important: The user has the option of denying an application's access to the location service data. During its initial uses by an application, the Core Location framework prompts the user to confirm that using the location service is acceptable. If the user denies the request, the CLLocationManagerMBS object reports an appropriate error to its delegate during future requests.

See also documentation from Apple for the CLLocationManager class:
https://developer.apple.com/library/mac/#documentation/CoreLocation/Reference/CLLocationManager_Class/CLLocationManager/CLLocationManager.html

See WindowsLocationManagerMBS class for Windows.

- 22.2, page 68: Find Yourself, How to determine the location of devices with MBS under Windows and Mac by Stefanie Juchmes-Simonis

61.5.2 Methods

61.5.3 authorizationStatus as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns the application's authorization status for using location services.
Notes: The authorization status of a given application is managed by the system and determined by several factors. Applications must be explicitly authorized to use location services by the user and location services must themselves currently be enabled for the system. This authorization takes place automatically when your application first attempts to use location services.

Available on Mac OS X 10.7 or later.

61.5.4 CheckEvents

MBS MacFrameworks Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Checks for new events.
Notes: This is a helper app to make CoreLocation geocoder work in web projects.
Should not be called in desktop apps.
But for a web app, use a Timer (not WebTimer) to run it on main loop every few milliseconds (e.g. 500 ms).

61.5.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The constructor.
Example:

```
Var c as new CLLocationManagerMBS

MessageBox str(c.Handle) // not zero on success
```

61.5.6 deferredLocationUpdatesAvailable as boolean

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Returns true if the device supports deferred location updates, otherwise false.
Notes: Requires Mac OS X 10.9.

61.5.7 Destructor

MBS MacFrameworks Plugin, Plugin Version: 13.0, Platform: macOS, Targets: All.

Function: The destructor.

61.5.8 dismissHeadingCalibrationDisplay

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Dismisses the heading calibration view from the screen immediately.
Notes: Core Location uses the heading calibration alert to calibrate the available heading hardware as needed. The display of this view is automatic, assuming your delegate supports displaying the view at all. If the view is displayed, you can use this method to dismiss it after an appropriate amount of time to ensure that your application's user interface is not unduly disrupted.

61.5.9 headingAvailable as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the location manager is able to generate heading-related events.
Example:

```
MessageBox "headingAvailable available: "+str(CLLocationManagerMBS.headingAvailable)
```

Notes: Returns true if heading data is available or false if it is not.

Heading data may not be available on all iOS-based devices. You should check the value returned by this method before asking the location manager to deliver heading-related events.

Available on Mac OS X 10.7 or later.

61.5.10 kCLErrorDomain as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The domain for Core Location errors. This value is used in the NSError class.

61.5.11 kCLErrorUserInfoAlternateRegionKey as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: A key in the user information dictionary of an kCLErrorRegionMonitoringResponseDelayed error whose value is a CLRegionMBS object that the location services can more effectively monitor.

61.5.12 locationServicesAvailable as boolean

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Whether the CoreLocation framework is available.
Example:

```
if CLLocationManagerMBS.locationServicesAvailable then
if CLLocationManagerMBS.locationServicesEnabled then
MessageBox "available and enabled"
else
MessageBox "available and not enabled"
end if
else
MessageBox "Not available"
end if
```

Notes: Returns true on Mac OS X 10.6 and false on all other systems.

61.5.13 locationServicesEnabled as boolean

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether location services are enabled on the device.
Example:

```
if CLLocationManagerMBS.locationServicesAvailable then
if CLLocationManagerMBS.locationServicesEnabled then
MessageBox "available and enabled"
else
```

```
MessageBox "available and not enabled"
end if
else
MessageBox "Not available"
end if
```

61.5.14 monitoredRegions as CLRegionMBS()

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The array of shared regions monitored by all location manager objects.
Notes: You cannot add regions to this property directly. Instead, you must register regions by calling the startMonitoringForRegion method. The regions in this property are shared by all instances of the CLLocationManagerMBS class in your application.

The objects in this set may not necessarily be the same objects you specified at registration time. Only the region data itself is maintained by the system. Therefore, the only way to uniquely identify a registered region is using its identifier property.

The location manager persists region data between launches of your application. If your application is terminated and then relaunched, the contents of this property are repopulated with region objects that contain the previously registered data.

Available on Mac OS X 10.7 or later.

61.5.15 regionMonitoringAvailable as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns a Boolean indicating whether region monitoring is supported on the current device.
Example:

MessageBox "regionMonitoringAvailable available: "+str(CLLocationManagerMBS.regionMonitoringAvailable)

Notes: Available on Mac OS X 10.7 or later.

Returns true if region monitoring is available or false if it is not.

Support for region monitoring may not be available on all devices and models. You should check the value of this property before attempting to set up any regions or initiate region monitoring.

Even if region monitoring support is present on a device, it may still be unavailable because the user disabled it for the current application or for all applications.

61.5.16 regionMonitoringEnabled as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns a Boolean indicating whether region monitoring is currently enabled.
Notes: Returns true if region monitoring is available and is currently enabled or false if it is unavailable or not enabled.

The user can enable or disable location services (including region monitoring) altogether from the System Preferences.

You should check the return value of this method before starting region monitoring updates to determine if the user currently allows location services to be used at all. If this method returns false and you start region monitoring updates anyway, the Core Location framework prompts the user with a confirmation panel asking whether location services should be reenabled.

This method does not check to see if region monitoring capabilities are actually supported by the device. Therefore, you should also check the return value of the regionMonitoringAvailable class method before attempting to start region monitoring services.

Available on Mac OS X 10.7 or later.

61.5.17 significantLocationChangeMonitoringAvailable as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns true if the device supports significant location change monitoring, otherwise false.
Example:

MessageBox "significantLocationChangeMonitoringAvailable available: "+str(CLLocationManagerMBS.significantLocationChangeMonitoringAvailable)

Notes: Available on Mac OS X 10.7 or later.

This method indicates whether the device is able to report updates based on significant location changes only. (This primarily involves detecting changes in the cell tower currently associated with the device.) This capability provides tremendous power savings for applications that want to track a user's approximate

location and do not need highly accurate position information.

61.5.18 startMonitoringForRegion(region as CLRegionMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Starts monitoring the specified region.
Notes: region: The region object that defines the boundary to monitor. This parameter must not be nil.

You must call this method separately for each region you want to monitor. If an existing region with the same identifier is already being monitored by the application, the old region is replaced by the new one. The regions you add using this method are shared by all location manager objects in your application and stored in the monitoredRegions property.

Region events are delivered to the didEnterRegion and didExitRegion events. If there is an error, the location manager calls the monitoringDidFailForRegion event instead.

61.5.19 startMonitoringSignificantLocationChanges

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Starts the generation of updates based on significant location changes.
Example:

```
Var c as new CLLocationManagerMBS

c.startMonitoringSignificantLocationChanges
```

Notes: This method initiates the delivery of location events asynchronously, returning shortly after you call it. Location events are delivered to your delegate's didUpdateToLocation event. The first event to be delivered is usually the most recently cached location event (if any) but may be a newer event in some circumstances. Obtaining a current location fix may take several additional seconds, so be sure to check the timestamps on the location events in your event code.

After returning a current location fix, the receiver generates update events only when a significant change in the user's location is detected. For example, it might generate a new event when the device becomes associated with a different cell tower. It does not rely on the value in the distanceFilter property to generate events. Calling this method several times in succession does not automatically result in new events being generated. Calling stopMonitoringSignificantLocationChanges in between, however, does cause a new initial event to be sent the next time you call this method.

In addition to your subclass implementing the didUpdateToLocation event, it should also implement the

didFailWithError event to respond to potential errors.

Available in Mac OS X 10.7 or later.

61.5.20 startUpdatingHeading

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Starts the generation of updates that report the user's current heading.
Notes: This method returns immediately. Calling this method when the receiver is stopped causes it to obtain an initial heading and notify your delegate. After that, the receiver generates update events when the value in the headingFilter property is exceeded.

Before calling this method, you should always check the headingAvailable property to see whether heading information is supported on the current device. If heading information is not supported, calling this method has no effect and does not result in the delivery of events to your delegate.

Calling this method several times in succession does not automatically result in new events being generated. Calling stopUpdatingHeading in between, however, does cause a new initial event to be sent the next time you call this method.

If you start this service and your application is suspended, the system stops the delivery of events until your application starts running again (either in the foreground or background). If your application is terminated, the delivery of new heading events stops altogether and must be restarted by your code when the application is relaunched.

Heading events are delivered to the didUpdateHeading event. If there is an error, the location manager calls the
didFailWithError event instead.

61.5.21 startUpdatingLocation

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Starts the generation of updates that report the user's current location.
Example:

```
Var c as new CLLocationManagerMBS

c.startUpdatingLocation
```

Notes: This method returns immediately. Calling this method when the receiver is stopped causes it to obtain an initial location fix (which may take several seconds) and notify your delegate. After that, the receiver generates update events primarily when the value in the distanceFilter property is exceeded. Updates may be delivered in other situations though. For example, the receiver may send another notification if the hardware gathers a more accurate location reading.

Calling this method several times in succession does not automatically result in new events being generated. Calling stopUpdatingLocation in between, however, does cause a new initial event to be sent the next time you call this method.

61.5.22 stopMonitoringForRegion(region as CLRegionMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Stops monitoring the specified region.
Notes: region: The region object currently being monitored. This parameter must not be nil.

If the specified region object is not currently being monitored, this method has no effect.

Available on Mac OS X 10.7 or later.

61.5.23 stopMonitoringSignificantLocationChanges

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Stops the delivery of location events based on significant location changes.
Notes: Use this method to stop the delivery of location events that was started using the startMonitoringSignificantLocationChanges method.
Available on Mac OS X 10.7 or later.

61.5.24 stopUpdatingHeading

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Stops the generation of heading updates.
Notes: Call this method whenever your code no longer needs to receive heading-related events. Disabling event delivery gives the receiver the option of disabling the appropriate hardware (and thereby saving power) when no clients need location data. You can always restart the generation of heading updates by calling the startUpdatingHeading method again.

61.5.25 stopUpdatingLocation

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Stops the generation of location updates.
Example:

```
Var c as new CLLocationManagerMBS

c.startUpdatingLocation
// later
c.stopUpdatingLocation
```

Notes: You should call this method whenever your code no longer needs to receive location-related events. Disabling event delivery gives the receiver the option of disabling the appropriate hardware (and thereby saving power) when no clients need location data. You can always restart the generation of location updates by calling the startUpdatingLocation method again.

61.5.26 Properties

61.5.27 desiredAccuracy as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The desired accuracy of the location data.
Example:

```
Var c as new CLLocationManagerMBS

c.desiredAccuracy=CLLocationMBS.kCLLocationAccuracyBest
```

Notes: The receiver does its best to achieve the requested accuracy; however, the actual accuracy is not guaranteed.

You should assign a value to this property that is appropriate for your usage scenario. In other words, if you need only the current location within a few kilometers, you should not specify kCLLocationAccuracyBest for the accuracy. Determining a location with greater accuracy requires more time and more power.

When requesting high accuracy location data, the initial event delivered by the location service may not have the accuracy you requested. The location service delivers the initial event as quickly as possible. It then continues to determine the location with the accuracy you requested and delivers additional events, as necessary, when that data is available.

The default value of this property is kCLLocationAccuracyBest.

(Read and Write property)

61.5.28 distanceFilter as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The minimum distance (measured in meters) a device must move laterally before an update event is generated.
Example:

```
Var c as new CLLocationManagerMBS
c.distanceFilter=CLLocationMBS.kCLDistanceFilterNone
```

Notes: This distance is measured relative to the previously delivered location. Use the value kCLDistanceFilterNone to be notified of all movements.

The default value of this property is kCLDistanceFilterNone.
(Read and Write property)

61.5.29 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The internal reference to the CLLocationManager object.
Example:

```
Var c as new CLLocationManagerMBS

MessageBox str(c.Handle) // not zero on success
```

Notes: (Read and Write property)

61.5.30 location as CLLocationMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The most recently retrieved user location.
Example:

```
Var c as new CLLocationMBS(1,2,3,4,5,nil)

MessageBox c.description
```

Notes: The value of this property is nil if no location data has ever been retrieved.

It is a good idea to check the timestamp of the location that is returned. If the receiver is currently gathering location data, but the minimum distance filter is large, the returned location might be relatively old. If it is, you can stop the receiver and start it again to force an update.
(Read only property)

61.5.31 maximumRegionMonitoringDistance as Double

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The largest boundary distance that can be assigned to a region.
Notes: This property defines the largest boundary distance allowed from a region's center point. Attempting to monitor a region with a distance larger than this value causes the location manager to send a kCLErrorRegionMonitoringFailure error to the delegate.

If region monitoring is unavailable or not supported, the value in this property is -1.

Available on Mac OS X 10.7 or later.
(Read only property)

61.5.32 purpose as string

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: An application-provided string that describes the reason for using location services.
Notes: If this property is not "" and the system needs to ask for the user's consent to use location services, it displays the provided string. You can use this string to explain why your application is using location services.

You must set the value of this property prior to starting any location services. Because the string is ultimately displayed to the user, you should always load it from a localized strings file.

Available on Mac OS X 10.7 or later.
(Read and Write property)

61.5.33 Events

61.5.34 didChangeAuthorizationStatus(status as Integer)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Tells the delegate that the authorization status for the application changed.
Notes: status: The new authorization status for the application.

This method is called whenever the application's ability to use location services changes. Changes can occur because the user allowed or denied the use of location services for your application or for the system as a whole.

61.5.35 didEnterRegion(region as CLRegionMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Tells the delegate that the user entered the specified region.
Notes: region: An object containing information about the region that was entered.

The region object provided may not be the same one that was registered. As a result, you should never perform pointer-level comparisons to determine equality. Instead, use the region's identifier string to determine if your delegate should respond.

61.5.36 didExitRegion(region as CLRegionMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Tells the delegate that the user left the specified region.
Notes: manager: The location manager object reporting the event.
region: An object containing information about the region that was exited.

The region object provided may not be the same one that was registered. As a result, you should never perform pointer-level comparisons to determine equality. Instead, use the region's identifier string to determine if your delegate should respond.

61.5.37 didFailWithError(error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Tells you that the location manager was unable to retrieve a location value.

Notes: error: The error object containing the reason why the location could not be retrieved.

If the location service is unable to retrieve a location fix right away, it reports a kCLErrorLocationUnknown error and keeps trying. In such a situation, you can simply ignore the error and wait for a new event.

If the user denies your application's use of the location service, this method reports a kCLErrorDenied error. Upon receiving such an error, you should stop the location service.

61.5.38 didFinishDeferredUpdatesWithError(error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Invoked when deferred updates will no longer be delivered.
Notes: Stopping location, disallowing deferred updates, and meeting a specified criterion are all possible reasons for finishing deferred updates.

An error will be returned if deferred updates end before the specified criteria are met (see CLError).
Requires Mac OS X 10.9.

61.5.39 didStartMonitoringForRegion(region as CLRegionMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Tells you that a new region is being monitored.
Notes: region: The region that is being monitored.

61.5.40 didUpdate(newLocation as CLLocationMBS, oldLocation as CLLocationMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Tells you that a new location value is available.
Notes: newLocation: The new location data.
oldLocation: The location data from the previous update. If this is the first update event delivered by this location manager, this parameter is nil.

By the time this event is called, the new location data is also available directly from the CLLocationManagerMBS object. The newLocation parameter may contain the data that was cached from a previous usage of the location service. You can use the timestamp property of the location object to determine how recent the location data is.

61.5.41 didUpdateHeading(newHeading as CLHeadingMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Tells you that the location manager received updated heading information.
Notes: Implementation of this method is optional but expected if you start heading updates using the startUpdatingHeading method.

The location manager object calls this method after you initially start the heading service. Subsequent events are delivered when the previously reported value changes by more than the value specified in the headingFilter property of the location manager object.

61.5.42 didUpdateLocations(locations() as CLLocationMBS)

MBS MacFrameworks Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: Invoked when new locations are available.
Notes: Required for delivery of deferred locations.
If implemented, updates will not be delivered to didUpdate.
Requires Mac OS X 10.9.

61.5.43 monitoringDidFailForRegion(region as CLRegionMBS, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Tells the delegate that a region monitoring error occurred.
Notes: region: The region for which the error occurred.
error: An error object containing the error code that indicates why region monitoring failed.

If an error occurs while trying to monitor a given region, the location manager sends this message to its delegate. Region monitoring might fail because the region itself cannot be monitored or because there was a more general failure in configuring the region monitoring service.

Although implementation of this event is optional, it is recommended that you implement it if you use region monitoring in your application.

61.5.44 Constants

Constants

Constant	Value	Description
kCLErrorDenied	1	One of the error codes reported by the location manager error event. Access to the location service was denied by the user.
kCLErrorLocationUnknown	0	One of the error codes reported by the location manager error event. The location manager was unable to obtain a location value right now.

Authorization Status Constants.

Constant	Value	Description
kCLAuthorizationStatusAuthorized	3	This application is authorized to use location services.
kCLAuthorizationStatusDenied	2	The user explicitly denied the use of location services for this applica location services are currently disabled in Settings.
kCLAuthorizationStatusNotDetermined	0	The user has not yet made a choice regarding whether this application location services.
kCLAuthorizationStatusRestricted	1	This application is not authorized to use location services. The user change this application's status, possibly due to active restrictions s parental controls being in place.

Device Orientation Constants

Constant	Value	Description
kCLDeviceOrientationFaceDown	6	The device is held parallel to the ground with the screen facing dow
kCLDeviceOrientationFaceUp	5	The device is held parallel to the ground with the screen facing upw
kCLDeviceOrientationLandscapeLeft	3	The device is in landscape mode, with the device held upright and button on the right side.
kCLDeviceOrientationLandscapeRight	4	The device is in landscape mode, with the device held upright and button on the left side.
kCLDeviceOrientationPortrait	1	The device is in portrait mode, with the device held upright and button at the bottom.
kCLDeviceOrientationPortraitUpsideDown	2	The device is in portrait mode but upside down, with the device he and the home button at the top.
kCLDeviceOrientationUnknown	0	The orientation is currently not known.

Corelocation Error Codes

Constant	Value	Description
kCLErrorGeocodeCanceled	10	The geocode request was canceled.
kCLErrorGeocodeFoundNoResult	8	The geocode request yielded no result.
kCLErrorGeocodeFoundPartialResult	9	The geocode request yielded a partial result.
kCLErrorHeadingFailure	3	The heading could not be determined.
kCLErrorNetwork	2	The network was unavailable or a network error occurred.
kCLErrorRegionMonitoringDenied	4	Access to the region monitoring service was denied by the user.
kCLErrorRegionMonitoringFailure	5	A registered region cannot be monitored.
kCLErrorRegionMonitoringResponseDelayed	7	Core Location will deliver events but they may be delayed.
kCLErrorRegionMonitoringSetupDelayed	6	Core Location could not initialize the region monitoring feature in

61.6 class CLLocationMBS

61.6.1 class CLLocationMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: A CLLocationMBS object represents the location data generated by a CLLocationManagerMBS object.
Example:

```
Var c as new CLLocationMBS(50,7)

MessageBox c.description

// example output: <+50.00000000, +7.00000000>+/- 0.00m (speed -1.00 mps / course -1.00) @ 2009-08-28 23:59:58 +0200
```

Notes: This object incorporates the geographical coordinates and altitude of the device's location along with values indicating the accuracy of the measurements and when those measurements were made. On some devices, this class also reports information about the speed and heading in which the device is moving.

Typically, you use a CLLocationManagerMBS object to create instances of this class based on the last known location of the user's device. You can create instances yourself, however, if you want to cache custom location data or get the distance between two different coordinate points.

This class is designed to be used as is and should not be subclassed.

Requires Mac OS X 10.6

61.6.2 Methods

61.6.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns true if this class is available.

61.6.4 Constructor(latitude as Double, longitude as Double)

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Initializes and returns a location object with the specified latitude and longitude.
Example:

```
Var c as new CLLocationMBS(50,7)

MessageBox c.description

// example output: <+50.00000000, +7.00000000>+/- 0.00m (speed -1.00 mps / course -1.00) @ 2009-08-28 23:59:58 +0200
```

Notes: latitude: The latitude of the coordinate point.
longitude: The longitude of the coordinate point.

Typically, you acquire location objects from the location service, but you can use this method to create new location objects for other uses in your application. When using this method, the other properties of the object are initialized to appropriate values. In particular, the altitude and horizontalAccuracy properties are set to 0, the verticalAccuracy property is set to -1 to indicate that the altitude value is invalid, and the timestamp property is set to the time at which the instance was initialized.

Requires Mac OS X 10.6
See also:

- 61.6.5 Constructor(latitude as Double, longitude as Double, altitude as Double, horizontalAccuracy as Double, verticalAccuracy as Double, course as Double, speed as Double, timestamp as date) 11402
- 61.6.6 Constructor(latitude as double, longitude as double, altitude as double, horizontalAccuracy as double, verticalAccuracy as double, course as double, speed as double, timestamp as dateTime) 11402
- 61.6.7 Constructor(latitude as Double, longitude as Double, altitude as Double, horizontalAccuracy as Double, verticalAccuracy as Double, timestamp as date) 11403

- 61.6.8 Constructor(latitude as double, longitude as double, altitude as double, horizontalAccuracy as double, verticalAccuracy as double, timestamp as dateTime) 11404

61.6.5 Constructor(latitude as Double, longitude as Double, altitude as Double, horizontalAccuracy as Double, verticalAccuracy as Double, course as Double, speed as Double, timestamp as date)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a location object with the specified coordinate and course information.
Notes: latitude and longitude: A coordinate structure containing the latitude and longitude values.
altitude: The altitude value for the location.
horizontalAccuracy: The accuracy of the coordinate value. Specifying a negative number indicates that the coordinate value is invalid.
verticalAccuracy: The accuracy of the altitude value. Specifying a negative number indicates that the altitude value is invalid.
course: The direction of travel for the location.
speed: The current speed associated with this location.
timestamp: The time to associate with the location object. Typically, you would set this to the current time.

Typically, you acquire location objects from the location service, but you can use this method to create new location objects for other uses in your application.

Available on Mac OS X 10.7 or newer.

- 61.6.8 Constructor(latitude as double, longitude as double, altitude as double, horizontalAccuracy as double, verticalAccuracy as double, timestamp as dateTime) 11404

61.6.7 Constructor(latitude as Double, longitude as Double, altitude as Double, horizontalAccuracy as Double, verticalAccuracy as Double, timestamp as date)

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns a location object with the specified coordinate information.
Example:

```
Var c as new CLLocationMBS(1,2,3,4,5,nil)

MessageBox c.description
```

Notes: coordinate: A coordinate structure containing the latitude and longitude values.
altitude: The altitude value for the location.
horizontalAccuracy: The accuracy of the coordinate value. Specifying a negative number indicates that the coordinate value is invalid.
verticalAccuracy: The accuracy of the altitude value. Specifying a negative number indicates that the altitude value is invalid.
timestamp: The time to associate with the location object. Typically, you would set this to the current time.

Typically, you acquire location objects from the location service, but you can use this method to create new location objects for other uses in your application.

- 61.6.8 Constructor(latitude as double, longitude as double, altitude as double, horizontalAccuracy as double, verticalAccuracy as double, timestamp as dateTime) 11404

61.6.8 Constructor(latitude as double, longitude as double, altitude as double, horizontalAccuracy as double, verticalAccuracy as double, timestamp as dateTime)

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Initializes and returns a location object with the specified coordinate information.
See also:

- 61.6.4 Constructor(latitude as Double, longitude as Double) 11401
- 61.6.5 Constructor(latitude as Double, longitude as Double, altitude as Double, horizontalAccuracy as Double, verticalAccuracy as Double, course as Double, speed as Double, timestamp as date) 11402
- 61.6.6 Constructor(latitude as double, longitude as double, altitude as double, horizontalAccuracy as double, verticalAccuracy as double, course as double, speed as double, timestamp as dateTime) 11402
- 61.6.7 Constructor(latitude as Double, longitude as Double, altitude as Double, horizontalAccuracy as Double, verticalAccuracy as Double, timestamp as date) 11403

61.6.9 copy as CLLocationMBS

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a copy of the object.
Example:

```
Var c as new CLLocationMBS(5,6)

Var n as CLLocationMBS = c.copy

MessageBox n.description
```

Notes: Internally a new CLLocation object is created with a copy of the data.

61.6.10 distanceFromLocation(location as CLLocationMBS) as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the distance (in meters) between the two locations.
Example:

```
// Nickenich 50¬∞ 24' 48" N, 7¬∞ 19' 47" E
// Andernach 50¬∞ 26' 23" N, 7¬∞ 24' 6" E

Var c1 as new CLLocationMBS(50.439722, 7.40167) // Andernach
Var c2 as new CLLocationMBS(50.413333, 7.32972) // Nickenich
```

MessageBox str(c1.distanceFromLocation(c2))+" meter"

Notes: This method measures the distance between the two locations by tracing a line between them that follows the curvature of the Earth. The resulting arc is a smooth curve and does not take into account specific altitude changes between the two locations.

61.6.11 kCLDistanceFilterNone as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: This constant indicates the minimum distance required before an event is generated.
Notes: All movements are reported.

61.6.12 kCLLocationAccuracyBest as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: A constant value you can use to specify the accuracy of a location.
Example:

Var c as new CLLocationManagerMBS

c.desiredAccuracy=CLLocationMBS.kCLLocationAccuracyBest

Notes: Use the best possible accuracy.

61.6.13 kCLLocationAccuracyBestForNavigation as Double

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: A constant value you can use to specify the accuracy of a location.
Notes: Available on Mac OS X 10.7 or later.

61.6.14 kCLLocationAccuracyHundredMeters as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: A constant value you can use to specify the accuracy of a location.
Example:

```
Var c as new CLLocationManagerMBS

c.desiredAccuracy=CLLocationMBS.kCLLocationAccuracyHundredMeters
```

Notes: Accurate to within one hundred meters.

61.6.15 kCLLocationAccuracyKilometer as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: A constant value you can use to specify the accuracy of a location.
Example:

```
Var c as new CLLocationManagerMBS

c.desiredAccuracy=CLLocationMBS.kCLLocationAccuracyKilometer
```

Notes: Accurate to the nearest kilometer.

61.6.16 kCLLocationAccuracyNearestTenMeters as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: A constant value you can use to specify the accuracy of a location.
Example:

```
Var c as new CLLocationManagerMBS

c.desiredAccuracy=CLLocationMBS.kCLLocationAccuracyNearestTenMeters
```

Notes: Accurate to within ten meters of the desired target.

61.6.17 kCLLocationAccuracyThreeKilometers as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: A constant value you can use to specify the accuracy of a location.
Example:

```
Var c as new CLLocationManagerMBS

c.desiredAccuracy=CLLocationMBS.kCLLocationAccuracyThreeKilometers
```

Notes: Accurate to the nearest three kilometers.

61.6.18 Properties

61.6.19 altitude as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The altitude in meters.
Example:

```
Var c as new CLLocationMBS(1,2,3,4,5,nil)

MessageBox str(c.altitude)
```

Notes: Positive values indicate altitudes above sea level. Negative values indicate altitudes below sea level.
(Read only property)

61.6.20 course as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The direction in which the device is travelling.
Example:

```
Var c as CLLocationManagerMBS // your global instance

Var l as CLLocationMBS = c.location

if l<>Nil then
MessageBox str(l.course)
end if
```

Notes: Course values are measured in degrees starting at due north and continuing clockwise around the compass. Thus, north is 0 degrees, east is 90 degrees, south is 180 degrees, and so on. Course values may not be available on all devices. A negative value indicates that the direction is invalid.
(Read only property)

61.6.21 DateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time at which this location was determined.
Notes: (Read only property)

61.6.22 description as string

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the location data in a formatted text string.
Example:

```
Var c as new CLLocationMBS(50.439722, 7.40167)

MessageBox C.description
// shows for example:
// <+50.43972200, +7.40167000>+/- 0.00m (speed -1.00 mps / course -1.00) @ 2009-08-29 14:22:39 +0200
```

Notes: A string of the form "«latitude», <longitude»+/- <accuracy>m (speed <speed>kph / heading <heading>) @ <date-time>", where <latitude>, <longitude>, <accuracy>, <speed>, and <heading>are formatted floating point numbers and <date-time>is a formatted date string that includes date, time, and time zone information.

The returned string is intended for display purposes only.
(Read only property)

61.6.23 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The internal reference to the CLLocation object.
Example:

```
Var c as CLLocationManagerMBS // your global instance

Var l as CLLocationMBS = c.location

if l<>Nil then
MessageBox str(l.handle)
end if
```

Notes: (Read and Write property)

61.6.24 horizontalAccuracy as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The radius of uncertainty for the location, measured in meters.
Example:

```
Var c as CLLocationManagerMBS // your global instance

Var l as CLLocationMBS = c.location

if l<>Nil then
MessageBox str(l.horizontalAccuracy)
end if
```

Notes: The coordinate's latitude and longitude identify the center of the circle and this value indicates the radius of that circle. A negative value indicates that the coordinate's latitude and longitude are invalid. (Read only property)

61.6.25 latitude as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The geographical coordinate information.
Example:

```
Var c as new CLLocationMBS(50.413333, 7.32972)

MessageBox str(C.latitude) // shows 50.413333
```

Notes: (Read only property)

61.6.26 longitude as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The geographical coordinate information.
Example:

```
Var c as new CLLocationMBS(50.413333, 7.32972)
```

```
MessageBox str(C.longitude) // shows 7.32972
```

Notes: (Read only property)

61.6.27 speed as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The instantaneous speed of the device in meters per second.
Example:

```
Var c as CLLocationManagerMBS // your global instance

Var l as CLLocationMBS = c.location

if l<>Nil then
MessageBox str(l.speed)
end if
```

Notes: This value reflects the instantaneous speed of the device in the direction of its current heading. A negative value indicates an invalid speed. Because the actual speed can change many times between the delivery of subsequent location events, you should use this property for informational purposes only.
(Read only property)

61.6.28 timestamp as date

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time at which this location was determined.
Example:

```
Var c as CLLocationManagerMBS // your global instance

Var l as CLLocationMBS = c.location

if l<>Nil then
MessageBox l.timestamp.SQLDateTime
end if
```

Notes: (Read only property)

61.6.29 verticalAccuracy as Double

MBS MacFrameworks Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The accuracy of the altitude value in meters.
Example:

```
Var c as CLLocationManagerMBS // your global instance

Var l as CLLocationMBS = c.location

if l<>Nil then
MessageBox str(l.verticalAccuracy)
end if
```

Notes: The value in the altitude property could be plus or minus the value indicated by this property. A negative value indicates that the altitude value is invalid.
(Read only property)

61.7 class CLPlacemarkMBS

61.7.1 class CLPlacemarkMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: A CLPlacemark object stores placemark data for a given latitude and longitude.
Example:

```
// find the address of a location
// MyGeocodeHandler is a subclass of CLGeocodeCompletionHandlerMBS with the Completed event implemented.
// Geocoder is a property of the window: Geocoder As CLGeocoderMBS
// Handler is a property of the window: Handler As MyGeocodeHandler
Geocoder = New CLGeocoderMBS
Handler = New MyGeocodeHandler
Geocoder.reverseGeocodeLocation(New CLLocationMBS(50.3569, 7.5890), Handler)

// in MyGeocodeHandler:
Sub Completed(geocoder As CLGeocoderMBS, placemarks() As CLPlacemarkMBS, error As NSErrorMBS, tag As Variant) Handles Completed
For Each p As CLPlacemarkMBS In placemarks
System.DebugLog p.thoroughfare + " " + p.subThoroughfare + ", " + p.postalCode + " " + p.locality + ", " + p.country + " (" + p.ISOcountryCode + ")"
Next
End Sub
```

Notes: Placemark data includes information such as the country, state, city, and street address associated with the specified coordinate. It can also include points of interest and geographically related data. Placemark objects are typically generated by a CLGeocoder object, although you can also create them explicitly yourself.

61.7.2 Methods

61.7.3 areasOfInterest as string()

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The relevant areas of interest associated with the placemark. (read-only)
Notes: Examples of an area of interest are the name of a military base or large national park or an attraction such as Eiffel Tower, Disneyland, or Golden Gate Park.
Available in OS X v10.8 and later.

61.7.4 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns true if this class is available.

61.7.5 Constructor(placement as CLPlacemarkMBS)

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Initializes and returns a placemark object from another placemark object.
Notes: You can use this method to transfer information from one placemark object to another placemark object.
Available in OS X v10.8 and later.

61.7.6 copy as CLPlacemarkMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Creates a clone of this object.

61.7.7 Properties

61.7.8 addressDictionary as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: A dictionary containing the Address Book keys and values for the placemark. (read-only)
Notes: The keys in this dictionary are those defined by the Address Book framework and used to access address information for a person. For a list of the strings that can be in this dictionary, see the Address Property constants in ABPerson Reference.

You can format the contents of this dictionary to get a full address string as opposed to building the address yourself.

Available in OS X v10.8 and later.
(Read only property)

61.7.9 administrativeArea as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The state or province associated with the placemark. (read-only)
Notes: If the placemark location is Apple's headquarters, for example, the value for this property would be the string "CA" or "California".
Available in OS X v10.8 and later.
(Read only property)

61.7.10 country as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The name of the country associated with the placemark. (read-only)
Notes: If the placemark location is Apple's headquarters, for example, the value for this property would be the string "United States".
Available in OS X v10.8 and later.
(Read only property)

61.7.11 description as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The description for debugging.

Notes: (Read only property)

61.7.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

61.7.13 inlandWater as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The name of the inland water body associated with the placemark. (read-only)
Notes: For coordinates that lie over an inland body of water, this property contains the name of that water body—the name of a lake, stream, river, or other waterway.
Available in OS X v10.8 and later.
(Read only property)

61.7.14 ISOcountryCode as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The abbreviated country name. (read-only)
Notes: This string is the standard abbreviation used to refer to the country. For example, if the placemark location is Apple's headquarters, the value for this property would be the string "US".
Available in OS X v10.8 and later.
(Read only property)

61.7.15 locality as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The city associated with the placemark. (read-only)
Notes: If the placemark location is Apple's headquarters, for example, the value for this property would be the string "Cupertino".
Available in OS X v10.8 and later.
(Read only property)

61.7.16 location as CLLocationMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The location object containing latitude and longitude information. (read-only)
Notes: This object is used to initialize the placemark object.
Available in OS X v10.8 and later.
(Read only property)

61.7.17 name as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The name of the placemark. (read-only)
Notes: Available in OS X v10.8 and later.
(Read only property)

61.7.18 ocean as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The name of the ocean associated with the placemark. (read-only)
Notes: For coordinates that lie over an ocean, this property contains the name of the ocean.
Available in OS X v10.8 and later.
(Read only property)

61.7.19 postalAddress as variant

MBS MacFrameworks Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The address as CNPostalAddressMBS object.
Notes: Value is a CNPostalAddressMBS. We use variant to reduce dependency to other plugins.
(Read only property)

61.7.20 postalCode as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The postal code associated with the placemark. (read-only)
Notes: If the placemark location is Apple's headquarters, for example, the value for this property would be the string "95014".
Available in OS X v10.8 and later.

(Read only property)

61.7.21 region as CLRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The geographic region associated with the placemark. (read-only)
Notes: Available in OS X v10.8 and later.
(Read only property)

61.7.22 subAdministrativeArea as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Additional administrative area information for the placemark. (read-only)
Notes: Subadministrative areas typically correspond to counties or other regions that are then organized into a larger administrative area or state. For example, if the placemark location is Apple's headquarters, the value for this property would be the string "Santa Clara", which is the county in California that contains the city of Cupertino.

Available in OS X v10.8 and later.
(Read only property)

61.7.23 subLocality as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Additional city-level information for the placemark. (read-only)
Notes: This property contains additional information, such as the name of the neighborhood or landmark associated with the placemark. It might also refer to a common name that is associated with the location.
Available in OS X v10.8 and later.
(Read only property)

61.7.24 subThoroughfare as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Additional street-level information for the placemark. (read-only)
Notes: Subthroughfares provide information such as the street number for the location. For example, if the placemark location is Apple's headquarters (1 Infinite Loop), the value for this property would be the string

”1”.

Available in OS X v10.8 and later.
(Read only property)

61.7.25 thoroughfare as string

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The street address associated with the placemark. (read-only)
Notes: The street address contains the street name. For example, if the placemark location is Apple’s headquarters, the value for this property would be the string ”Infinite Loop”.

Available in OS X v10.8 and later.
(Read only property)

61.8 class CLRegionMBS

61.8.1 class CLRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The CLRegion class defines a geographical area that can be tracked.
Example:

```
Var c as new CLRegionMBS(50.413333, 7.329722, 3000, "Nickenich")

MessageBox c.identifier+" "+str(c.latitude)+"/"+str(c.longitude)+", "+str(c.radius)+"m"
```

Notes: When an instance of this class is registered with a CLLocationManagerMBS object, the location manager generates an appropriate event whenever the user crosses the boundaries of the defined area.

To use this class, create an instance of it and use the startMonitoringForRegion method of a CLLocationManager object to begin monitoring it.

Please also check the documentation from Apple for the CLRegion class.
Available on Mac OS X 10.7 or later.
Blog Entries

- MBS Real Studio Plugins, version 11.2pr11
- Lion arrived

61.8.2 Methods

61.8.3 Available as boolean

MBS MacFrameworks Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns true if this class is available.

61.8.4 Constructor(latitude as Double, longitude as Double, radius as Double, identifier as string)

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes a region object defining a circular area.
Notes: latitude and longitude: The center point of the region.
radius: The distance (measured in meters) from the center point that marks the boundary of the region.
identifier: A unique identifier to associate with the region object. You use this identifier to differentiate

regions within your application. This value must not be "".

identifier is a description for the region that could be displayed to the user, and ideally should be chosen by the user.

On success the handle property is not zero.

61.8.5 containsCoordinate(latitude as Double, longitude as Double) as boolean

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the region contains the specified coordinate.
Notes: latitude and longitude: The coordinate to test against the region.

Returns true if the coordinate lies within the region's boundaries or false if it does not.

61.8.6 copy as CLRegionMBS

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Creates a copy of the region object.

61.8.7 identifier as string

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The identifier for the region object.
Example:

```
Var c as new CLRegionMBS(50.413333, 7.329722, 3000, "Nickenich")
MessageBox c.identifier
```

61.8.8 latitude as Double

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The position of the center of the region.

61.8.9 longitude as Double

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The position of the center of the region.

61.8.10 radius as Double

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The radius (measured in meters) that defines the region's outer boundary.

61.8.11 Properties

61.8.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The internal CLRegion object reference.
Notes: (Read and Write property)

Chapter 62

CoreML

62.1 class MLArrayBatchProviderMBS

62.1.1 class MLArrayBatchProviderMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: A convenience wrapper for batches of feature providers.
Notes: This batch provider supports an array of feature providers or a dictionary of arrays of feature values.
Available on MacOS 10.14 or newer.
Subclass of the MLBatchProviderMBS class.
Blog Entries

- Update Machine Learning Model on Device
- MBS Xojo Plugins, version 19.6pr3

62.1.2 Methods

62.1.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Checks whether class is available.
Notes: Returns true in MacOS 10.14 or newer.

62.1.4 Constructor(value as Dictionary, byref Error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates a batch provider based on feature names and their associated arrays of data.
Notes: dictionary: A dictionary which maps feature names to an array of values. The error case occurs when all the arrays do not have the same length or the values in an aray are not expressible as an MLFeatureValueMBS.
See also:

- 62.1.5 Constructor(values() as MLFeatureProviderMBS) 11424

62.1.5 Constructor(values() as MLFeatureProviderMBS)

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates the batch provider based on the array of feature providers.
Notes: array: The array of feature providers for the batch.
See also:

- 62.1.4 Constructor(value as Dictionary, byref Error as NSErrorMBS) 11423

62.1.6 values as MLFeatureProviderMBS()

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The array of feature providers.

62.2 class MLBatchProviderMBS

62.2.1 class MLBatchProviderMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: An interface that represents a collection of feature providers.
Notes: Similar to the MLFeatureProviderMBS, this interface allows you to define your own batch provider. If you collect your data asynchronously or it is memory intensive, implement this protocol on your data structure to optimize performance with batch processing.

Available on MacOS 10.14 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 19.6pr3

62.2.2 Methods

62.2.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The private constructor.

62.2.4 featuresAtIndex(index as Integer) as MLFeatureProviderMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Returns the feature provider at the given index.

62.2.5 Properties

62.2.6 Count as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The number of feature providers in this batch.
Notes: (Read only property)

62.2.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.3 class MLDictionaryConstraintMBS

62.3.1 class MLDictionaryConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Constraint describing expected NSDictionary properties.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

62.3.2 Methods

62.3.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Checks whether class is available.
Notes: Returns true in MacOS 10.13 or newer.

62.3.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The private constructor.

62.3.5 Properties

62.3.6 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.3.7 keyType as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Required key type.
Notes: See MLFeatureValueMBS.Type* constants.

(Read only property)

62.4 class MLDictionaryFeatureProviderMBS

62.4.1 class MLDictionaryFeatureProviderMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: A concrete convenience class conforming to MLFeatureProvider protocol.
Notes: Subclass of the MLFeatureProviderMBS class.
Blog Entries

- Update Machine Learning Model on Device

62.4.2 Methods

62.4.3 Constructor(content as Dictionary, byref error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Create from a generic dictionary by converting all values to MLFeatureValues or from a dictionary with values already stored as MLFeatureValues.
Notes: An error results if the values are not or cannot be represented as MLFeatureValues.

62.4.4 objectForKeyedSubscript(script as string) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Get the value for specified feature.

62.4.5 Properties

62.4.6 Content as Dictionary

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Dictionary holding the feature values.
Notes: When you query this, you get a copy of the dictionary, so any modification doesn't go back to the feature provider.
(Read only property)

62.5 class MLFeatureDescriptionMBS

62.5.1 class MLFeatureDescriptionMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Description of a feature.
Example:

```
// show the inputs a Core ML model expects
Var error As NSErrorMBS
Var compiled As String = MLModelMBS.compileModelAtURL(NSFileCoordinatorMBS.FileURL(SpecialFolder.Desktop.Child("MyModel.mlmodel")), error)
Var model As MLModelMBS = MLModelMBS.modelWithContentsOfURL(compiled, error)
If model = Nil Then Return

Var lines() As String
For Each entry As DictionaryEntry In model.modelDescription.inputDescriptionsByName
Var d As MLFeatureDescriptionMBS = entry.Value
Var kind As String = "type " + d.Type.ToString
If d.Type = MLFeatureDescriptionMBS.TypeImage Then kind = "image " + d.imageConstraint.pixelsWide.ToString + " x " + d.imageConstraint.pixelsHigh.ToString
If d.Type = MLFeatureDescriptionMBS.TypeDouble Then kind = "number"
lines.Add d.Name + ": " + kind + If(d.isOptional, " (optional)", "")
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

62.5.2 Methods

62.5.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The private constructor.

62.5.4 copy as MLFeatureDescriptionMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Creates a copy.

62.5.5 isAllowedValue(value as MLFeatureValueMBS) as boolean

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Check if MLFeatureValue is valid based on this description.

62.5.6 Properties

62.5.7 dictionaryConstraint as MLDictionaryConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Constraint for dictionary.
Notes: Only set when type is dictionary.
(Read only property)

62.5.8 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.5.9 imageConstraint as MLImageConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Constraint for image.
Notes: Only set when type is image.
(Read only property)

62.5.10 isOptional as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Whether this feature can take an undefined value or not.
Notes: (Read only property)

62.5.11 multiArrayConstraint as MLMultiArrayConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Constraint for multi array.
Notes: Only set when type is array.
(Read only property)

62.5.12 Name as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Name of feature.
Notes: (Read only property)

62.5.13 sequenceConstraint as MLSequenceConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The constraints for a sequence feature.
Notes: (Read only property)

62.5.14 Type as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Type of data.
Notes: (Read only property)

62.5.15 Constants

Value Types

Constant	Value	Description
TypeDictionary	6	Numerically weighted hashable objects (e.g. word counts)
TypeDouble	2	Continuous values
TypeImage	4	CVPixelBufferRef or converted by plugin to Xojo picture.
TypeInt64	1	Discrete values, sometimes used to hold numeric encoding of a categorical value
TypeInvalid	0	Undefined type.
TypeMultiArray	5	An array of values.
TypeSequence	7	The possible types for feature values, input features, and output features.
TypeString	3	Text or categorical strings

62.6 class MLFeatureProviderMBS

62.6.1 class MLFeatureProviderMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Protocol for accessing a feature value for a feature name.
Notes: In Xojo defined as class, but in objective-c just a protocol.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

62.6.2 Methods

62.6.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The private constructor.

62.6.4 featureNames as String()

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Queries list of all feature names available.

62.6.5 featureValueForName(featureName as String) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Queries value for feature by name.
Notes: Returns nil if the provided featureName is not in the set of featureNames

62.6.6 Properties

62.6.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.7 class MLFeatureValueMBS

62.7.1 class MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: An immutable variant holding a data value of a supported MLFeatureType.
Example:

```
// create feature values for the inputs of a Core ML model
Var count As MLFeatureValueMBS = MLFeatureValueMBS.featureValueWithInt64(3)
Var name As MLFeatureValueMBS = MLFeatureValueMBS.featureValueWithString("Xojo")
Var factor As MLFeatureValueMBS = MLFeatureValueMBS.featureValueWithDouble(0.75)

MessageBox "count: " + count.int64Value.ToString + EndOfLine + _
"name: " + name.stringValue + EndOfLine + _
"factor: " + factor.doubleValue.ToString

// put them into a dictionary with the input names and use MLDictionaryFeatureProviderMBS
```

Notes: MLFeatureValue does not support type conversion in its accessor properties.
It can also have a missing or undefined value of a well defined type.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

62.7.2 Methods

62.7.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The private constructor.

62.7.4 copy as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Creates a copy.

62.7.5 featureValueWithCGImage(image as variant, orientation as integer = -1, constraint as MLImageConstraintMBS, options as Dictionary = nil, byref error as NSErrorMBS) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Wraps an image as a value for a feature, given an image,Äôs URL and constraints.
Notes: Available on macOS 10.15 or newer.
If orientation is in range 1 to 8, we pass that as orientation. Otherwise orientation will come from EXIF
See also:

- 62.7.6 featureValueWithCGImage(image as variant, orientation as integer = -1, pixelsWide as Integer, pixelsHigh as Integer, pixelFormatType as String, options as Dictionary = nil, byref error as NSErrorMBS) as MLFeatureValueMBS 11436

62.7.6 featureValueWithCGImage(image as variant, orientation as integer = -1, pixelsWide as Integer, pixelsHigh as Integer, pixelFormatType as String, options as Dictionary = nil, byref error as NSErrorMBS) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Wraps an image as a value for a feature, given an image, its width, and its height, in pixels.
Notes: Available on macOS 10.15 or newer.
If orientation is in range 1 to 8, we pass that as orientation. Otherwise orientation will come from EXIF
See also:

- 62.7.5 featureValueWithCGImage(image as variant, orientation as integer = -1, constraint as MLImageConstraintMBS, options as Dictionary = nil, byref error as NSErrorMBS) as MLFeatureValueMBS 11436

62.7.7 featureValueWithDictionary(value as Dictionary, byref error as NSErrorMBS) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Creates new feature based on a dictionary.
Notes: Copies the dictionary.
For encoding a sparse feature set or for encoding probabilities. Input keys that are not number or string are rejected on construction and return a MLModelErrorFeatureTypeMismatch error. Further validation for consistency occurs on evaluation.

62.7.8 featureValueWithDouble(value as double) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Returns feature object for given value.

62.7.9 featureValueWithImageFile(File as FolderItem, orientation as integer = -1, constraint as MLImageConstraintMBS, options as Dictionary = nil, byref error as NSErrorMBS) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Wraps an image as a value for a feature, given an image and its constraints.
Notes: Available on macOS 10.15 or newer.
If orientation is in range 1 to 8, we pass that as orientation. Otherwise orientation will come from EXIF
See also:

- 62.7.10 featureValueWithImageFile(File as FolderItem, orientation as integer = -1, pixelsWide as Integer, pixelsHigh as Integer, pixelFormatType as String, options as Dictionary = nil, byref error as NSErrorMBS) as MLFeatureValueMBS 11437

62.7.10 featureValueWithImageFile(File as FolderItem, orientation as integer = -1, pixelsWide as Integer, pixelsHigh as Integer, pixelFormatType as String, options as Dictionary = nil, byref error as NSErrorMBS) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Wraps an image as a value for a feature, given an image,Äôs URL, and its width and height, in pixels.
Notes: Available on macOS 10.15 or newer.
If orientation is in range 1 to 8, we pass that as orientation. Otherwise orientation will come from EXIF
See also:

- 62.7.9 featureValueWithImageFile(File as FolderItem, orientation as integer = -1, constraint as MLImageConstraintMBS, options as Dictionary = nil, byref error as NSErrorMBS) as MLFeatureValueMBS 11437

62.7.11 featureValueWithInt64(value as Int64) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Returns feature object for given value.

62.7.12 featureValueWithMultiArray(value as MLMultiArrayMBS) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Returns feature object for given value.

62.7.13 featureValueWithPicture(value as Picture) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Returns feature object for given value.

62.7.14 featureValueWithPixelBuffer(Handle as Integer) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Wraps a pixel buffer as a value for a feature.

62.7.15 featureValueWithSequence(sequence as MLSequenceMBS) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Wraps a sequence as a value for a feature.

62.7.16 featureValueWithString(value as string) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Returns feature object for given value.

62.7.17 isEqualToFeatureValue(value as MLFeatureValueMBS) as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Queries whether two feature objects are the same.

62.7.18 MLFeatureValueImageOptionCropAndScale as String

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The option you use to crop and scale an image when creating an image feature value.

62.7.19 MLFeatureValueImageOptionCropRect as String

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The option you use to crop an image when creating an image feature value.

62.7.20 undefinedFeatureValueWithType(type as Integer) as MLFeatureValueMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Represent an undefined value of a specified type.

62.7.21 Properties

62.7.22 CIImageValue as Variant

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Queries image as CIImageMBS object.
Notes: Value is a CIImageMBS. We use variant to reduce dependency to other plugins.
(Read only property)

62.7.23 dictionaryValue as Dictionary

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Populated value if the type is TypeDictionary.
Notes: When you query the dictionary, you get a copy.
(Read only property)

62.7.24 doubleValue as Double

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Populated value if the type is TypeDouble.
Notes: (Read only property)

62.7.25 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.7.26 imageBufferValue as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The image, or pixelBuffer, wrapped in this feature value.
Notes: The handle for a CVPixelBufferMBS object.
(Read only property)

62.7.27 int64Value as Int64

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Populated value if the type is TypeInt64.
Notes: (Read only property)

62.7.28 multiArrayValue as MLMultiArrayMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Populated value if the type is TypeMultiArray.
Notes: (Read only property)

62.7.29 PictureHeight as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The picture height.
Notes: Populated value if the type is TypeImage.
(Read only property)

62.7.30 PictureValue as Picture

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Populated value if the type is TypeImage.
Notes: (Read only property)

62.7.31 PictureWidth as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The picture width.
Notes: Populated value if the type is TypeImage.
(Read only property)

62.7.32 sequenceValue as MLSequenceMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The sequence wrapped in this feature value.
Notes: (Read only property)

62.7.33 stringValue as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Populated value if the type is TypeString.
Notes: (Read only property)

62.7.34 Type as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Type of the value for which the corresponding property below is held.
Notes: (Read only property)

62.7.35 Undefined as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: True if the value represents a missing or undefined value.
Notes: (Read only property)

62.7.36 value as Variant

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Queries value as variant.
Notes: (Read only property)

62.7.37 Constants

Value Types

Constant	Value	Description
TypeDictionary	6	Numerically weighted hashable objects (e.g. word counts)
TypeDouble	2	Continuous values
TypeImage	4	CVPixelBufferRef or converted by plugin to Xojo picture.
TypeInt64	1	Discrete values, sometimes used to hold numeric encoding of a categorical value
TypeInvalid	0	Undefined type.
TypeMultiArray	5	An array of values.
TypeSequence	7	The possible types for feature values, input features, and output features.
TypeString	3	Text or categorical strings

62.8 class MLImageConstraintMBS

62.8.1 class MLImageConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Constraint on image properties.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

62.8.2 Methods

62.8.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The private constructor.

62.8.4 Properties

62.8.5 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.8.6 pixelFormatType as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The accepted kCVPixelFormatType for the image.
Notes: (Read only property)

62.8.7 pixelsHigh as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The required height of the image.
Notes: (Read only property)

62.8.8 pixelsWide as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The required width of the image.
Notes: (Read only property)

62.8.9 sizeConstraint as MLImageSizeConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Additional sizes this image feature supports.
Notes: Available on MacOS 10.14 or newer.
(Read only property)

62.9 class MLImageSizeConstraintMBS

62.9.1 class MLImageSizeConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: A list or range of sizes that augment an image constraint's default size.
Example:

```
// show which image sizes a Core ML model accepts as input
// model is a MLModelMBS, see MLModelDescriptionMBS
Var model As MLModelMBS // your model
If model = Nil Then Return

For Each entry As DictionaryEntry In model.modelDescription.inputDescriptionsByName
Var d As MLFeatureDescriptionMBS = entry.Value
If d.imageConstraint = Nil Then Continue
Var sizes As MLImageSizeConstraintMBS = d.imageConstraint.sizeConstraint
For Each s As MLImageSizeMBS In sizes.enumeratedImageSizes
System.DebugLog entry.Key.StringValue + ": " + s.pixelsWide.ToString + " x " + s.pixelsHigh.ToString
Next
Next
```

Notes: You use an MLImageSizeConstraint to express what image sizes of an image feature a model will accept as input or produce as output.

Use type to determine which properties describe what image sizes the model's image feature expects as input or produces as output.

If type is:

- TypeRange, the image feature accepts any image that has a width in pixelsWideRange and a height in pixelsHighRange.
- TypeEnumerated, the image feature accepts any image size listed in enumeratedImageSizes.
- TypeUnspecified, the MLImageSizeConstraint instance is not configured and should be ignored. Instead, use the image feature's default image size constraint, defined by pixelsWide and pixelsHigh.

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

62.9.2 Methods

62.9.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Checks whether class is available.
Notes: Returns true in MacOS 10.14 or newer.

62.9.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The private constructor.

62.9.5 enumeratedImageSizes as MLImageSizeMBS()

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: An array of image sizes a model's image feature accepts as input or produces as output.

62.9.6 Properties

62.9.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.9.8 pixelsHighRange as NSRangeMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The range of heights a model's image feature accepts as input or produces as output.
Notes: (Read only property)

62.9.9 pixelsWideRange as NSRangeMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The range of widths a model's image feature accepts as input or produces as output.
Notes: (Read only property)

62.9.10 type as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Indicator of which properties to inspect for this image size constraint.
Notes: (Read only property)

62.9.11 Constants

Types

Constant	Value	Description
TypeEnumerated	2	The image feature accepts image sizes listed in an array.
TypeRange	3	The image feature accepts image sizes defined by a range of widths and a range of heights.
TypeUnspecified	0	The image size constraint is not configured and should be ignored.

62.10 class MLImageSizeMBS

62.10.1 class MLImageSizeMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The width and height of an image feature size.
Notes: Available on MacOS 10.14 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 19.6pr3

62.10.2 Methods

62.10.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Checks whether class is available.
Notes: Returns true in MacOS 10.14 or newer.

62.10.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The private constructor.

62.10.5 Properties

62.10.6 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.10.7 pixelsHigh as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The height of an image feature in pixels.
Notes: (Read only property)

62.10.8 pixelsWide as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The width of an image feature in pixels.
Notes: (Read only property)

62.11 class MLKeyMBS

62.11.1 class MLKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: An abstract base class for machine learning key types.
Notes: You don,Äôt create use this class directly. Instead, use a class that inherits from this one, such as MLParameterKey or MLMetricKey.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

62.11.2 Methods

62.11.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Checks whether class is available.
Notes: Returns true in MacOS 10.15 or newer.

62.11.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The private constructor.

62.11.5 copy as MLKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Copies the object.

62.11.6 Properties

62.11.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.11.8 Name as String

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The name of the machine learning key.
Notes: (Read only property)

62.11.9 Scope as String

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The scope value.
Notes: (Read only property)

62.12 class MLMetricKeyMBS

62.12.1 class MLMetricKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: A key for the metrics dictionary in an update context.
Notes: Available in MacOS 10.15 or newer.
Subclass of the MLKeyMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

62.12.2 Methods

62.12.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The private constructor.

62.12.4 Properties

62.12.5 epochIndex as MLMetricKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The key you use to access the epoch index (an Int64 value).
Notes: Use this key to fetch the epoch index value in the metrics dictionary.
(Read only property)

62.12.6 lossValue as MLMetricKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The key you use to access the current loss (a float value).
Notes: Use this key to fetch the loss value in the metrics dictionary.
(Read only property)

62.12.7 miniBatchIndex as MLMetricKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The key you use to access the mini-batch index (an Int64 value) within an epoch.
Notes: Use this key to fetch the mini-batch index value in the metrics dictionary.
(Read only property)

62.13 class MLModelConfigurationMBS

62.13.1 class MLModelConfigurationMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The settings for creating or updating a machine learning model.
Example:

```
// load a Core ML model and only use the CPU, e.g. for reproducible results
Var config As New MLModelConfigurationMBS
config.computeUnits = MLModelConfigurationMBS.ComputeUnitsCPUOnly

Var error As NSErrorMBS
Var model As MLModelMBS = MLModelMBS.modelWithContentsOfFile(SpecialFolder.Desktop.Child("MyModel.mlmodelc"), config, error)
If model = Nil Then
MessageBox error.localizedDescription
Else
MessageBox "Model loaded."
End If
```

Notes: Available in MacOS 10.14 or newer.

62.13.2 Methods

62.13.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Checks whether class is available.
Notes: Returns true in MacOS 10.14 or newer.

62.13.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The constructor.

62.13.5 copy as MLModelConfigurationMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates a copy of the model configuration.

62.13.6 Properties

62.13.7 allowLowPrecisionAccumulationOnGPU as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: A Boolean value that determines whether to allow low-precision accumulation on a GPU.
Notes: (Read and Write property)

62.13.8 computeUnits as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The processing unit or units the model uses to make predictions.
Notes: (Read and Write property)

62.13.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.13.10 parameters as Dictionary

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Optional dictionary with any requested changes to model or update parameters.
Notes: (Read and Write property)

62.13.11 preferredMetalDevice as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The metal device you prefer this model use to make predictions (inference) and update the model.
Notes: If preferredMetalDevice is 0, the default value, Core ML chooses a metal device for you.
Until we have a class for MLDevice, you pass the handle here directly.
(Read and Write property)

62.13.12 Constants

Compute Units

Constant	Value	Description
ComputeUnitsAll	2	The option you choose to allow the model to use all compute units available, including the neural engine.
ComputeUnitsCPUAndGPU	1	The option you choose to allow the model to use both the CPU and GPU, but not the neural engine.
ComputeUnitsCPUOnly	0	The option you choose to limit the model to only use the CPU.

62.14 class MLModelDescriptionMBS

62.14.1 class MLModelDescriptionMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: A description of a model containing input and output feature descriptions, optionally outputted features with special meaning and metadata.
Example:

```
// show inputs, outputs and metadata of a Core ML model
Var error As NSErrorMBS
Var compiled As String = MLModelMBS.compileModelAtURL(NSFileCoordinatorMBS.FileURL(Special-
Folder.Desktop.Child("MyModel.mlmodel")), error)
Var model As MLModelMBS = MLModelMBS.modelWithContentsOfURL(compiled, error)
If model = Nil Then Return

Var d As MLModelDescriptionMBS = model.modelDescription
Var lines() As String
For Each entry As DictionaryEntry In d.inputDescriptionsByName
lines.Add "Input: " + entry.Key.StringValue
Next
For Each entry As DictionaryEntry In d.outputDescriptionsByName
lines.Add "Output: " + entry.Key.StringValue
Next
lines.Add "Predicted feature: " + d.predictedFeatureName + ", updatable: " + d.isUpdatable.ToString
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

62.14.2 Methods

62.14.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The private constructor.

62.14.4 Properties

62.14.5 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.14.6 inputDescriptionsByName as Dictionary

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Description of the inputs to the model.
Notes: (Read only property)

62.14.7 isUpdatable as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether you can update the model with additional training.
Notes: Available on Mac OS 10.15 or newer.
(Read only property)

62.14.8 metadata as Dictionary

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Optional metadata describing the model.
Notes: (Read only property)

62.14.9 outputDescriptionsByName as Dictionary

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Description of the outputs from the model.
Notes: (Read only property)

62.14.10 parameterDescriptionsByKey as Dictionary

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Allows for access of each parameter as parameter description.
Notes: (Read only property)

62.14.11 predictedFeatureName as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Name of the primary target / predicted output feature in the output descriptions.
Notes: (Read only property)

62.14.12 predictedProbabilitiesName as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Key for all predicted probabilities stored as a MLFeatureTypeDictionary in the output descriptions.
Notes: (Read only property)

62.14.13 trainingInputDescriptionsByName as Dictionary

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Provides access to each training input as a feature description, given the name of the input.
Notes: Available on MacOS 101.5 or newer.
(Read only property)

62.15 class MLModelMBS

62.15.1 class MLModelMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Construct a model and evaluate on a specific set of input features.
Example:

```
// compile and load a Core ML model and show its inputs and outputs
Var source As FolderItem = SpecialFolder.Desktop.Child("MyModel.mlmodel")
Var error As NSErrorMBS

Var compiled As FolderItem = MLModelMBS.compileModelFile(source, error)
If compiled = Nil Then
MessageBox "Compile failed: " + error.localizedDescription
Return
End If

Var model As MLModelMBS = MLModelMBS.modelWithContentsOfFile(compiled, error)
If model = Nil Then
MessageBox "Load failed: " + error.localizedDescription
Return
End If

Var description As MLModelDescriptionMBS = model.modelDescription
Var lines() As String
For Each key As Variant In description.inputDescriptionsByName.Keys
lines.Add "Input: " + key.StringValue
Next
For Each key As Variant In description.outputDescriptionsByName.Keys
lines.Add "Output: " + key.StringValue
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Inputs and outputs are accessed via the MLFeatureProvider protocol.
Returns a model or nil if there is an error.

Available on macOS 10.13 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

62.15.2 Methods

62.15.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Whether CoreML is available.
Notes: Should return true on macOS 10.13 or newer.

62.15.4 compileModelAtURL(URL as string, byref error as NSErrorMBS) as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Compile a .mlmodel for this device.
Notes: URL: URL file path to .mlmodel file you wish to compile
error: Any errors are surfaced here

Returns a URL to the compiled .mlmodelc bundle if successful.
The model is compiled to a temporary location on disk.
You must move the compiled model to a permenant location if you wish to keep it.

62.15.5 compileModelFile(File as folderItem, byref error as NSErrorMBS) as folderItem

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Compile a .mlmodel for this device.
Example:

```
Var SourceFile as FolderItem = SpecialFolder.Desktop.child("resnet50.MLmodel")
Var Error as NSErrorMBS

Var Tempfile as FolderItem = MLModelMBS.compileModelFile(SourceFile, Error)

if Tempfile <>nil then
tempfile.MoveFileTo SpecialFolder.Desktop
MessageBox "OK"
else
MessageBox Error.localizedDescription
end if
```

Notes: File: FolderItem for .mlmodel file you wish to compile

error: Any errors are surfaced here

Returns a folderitem to the compiled .mlmodelc bundle if successful.
The model is compiled to a temporary location on disk.
You must move the compiled model to a permenant location if you wish to keep it.

62.15.6 Constructor

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The private constructor.

62.15.7 MLModelAuthorKey as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the keys for the metadata dictionary.
Notes: The author of this model.

62.15.8 MLModelCreatorDefinedKey as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the keys for the metadata dictionary.
Notes: Any additional pertinent information specified by the model creator.

62.15.9 MLModelDescriptionKey as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the keys for the metadata dictionary.
Notes: A short description of what the model does and/or its purpose

62.15.10 MLModelErrorDomain as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The error domain string for the CoreML errors.

62.15.11 MLModelLicenseKey as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the keys for the metadata dictionary.
Notes: License information for the model.

62.15.12 MLModelVersionStringKey as String

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: One of the keys for the metadata dictionary.
Notes: A version number encoded as a string.

62.15.13 modelWithContentsOfFile(file as FolderItem, byref error as NSErrorMBS) as MLModelMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Construct a model given the location of its on-disk representation.
Notes: Returns nil on error.
See also:

- 62.15.14 modelWithContentsOfFile(file as FolderItem, configuration as MLModelConfigurationMBS, byref error as NSErrorMBS) as MLModelMBS 11463

62.15.14 modelWithContentsOfFile(file as FolderItem, configuration as MLModelConfigurationMBS, byref error as NSErrorMBS) as MLModelMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates a Core ML model object from a compiled model file and a custom configuration.
Notes: File: The path to a compiled model file (ModelName.mlmodelc), typically with the URL returned from compileModelAtURL:error:.
configuration: The model settings for a new model object.

However, if the wrapper class doesn't meet your app's needs or you need to customize the model's configuration, then use this initializer to create a model object from any compiled model file your app has access to. Typically, you use this initializer after your app has downloaded and compiled a model, which is one technique for saving space in your app.

11463

62.15.15 modelWithContentsOfPath(Path as string, byref error as NSErrorMBS) as MLModelMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Construct a model given the location of its on-disk representation.
Notes: Returns nil on error.
See also:

- 62.15.16 modelWithContentsOfPath(Path as string, configuration as MLModelConfigurationMBS, byref error as NSErrorMBS) as MLModelMBS 11464

62.15.16 modelWithContentsOfPath(Path as string, configuration as MLModelConfigurationMBS, byref error as NSErrorMBS) as MLModelMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates a Core ML model object from a compiled model file and a custom configuration.
Notes: Path: The path to a compiled model file (ModelName.mlmodelc), typically with the URL returned from compileModelAtURL:error:.
configuration: The model settings for a new model object.

However, if the wrapper class doesn't meet your app's needs or you need to customize the model's configuration, then use this initializer to create a model object from any compiled model file your app has access to. Typically, you use this initializer after your app has downloaded and compiled a model, which is one technique for saving space in your app.

62.15.17 modelWithContentsOfURL(URL as string, byref error as NSErrorMBS) as MLModelMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Construct a model given the location of its on-disk representation.
Notes: Returns nil on error.
See also:

- 62.15.18 modelWithContentsOfURL(URL as string, configuration as MLModelConfigurationMBS, byref error as NSErrorMBS) as MLModelMBS 11465

62.15.18 modelWithContentsOfURL(URL as string, configuration as MLModelConfigurationMBS, byref error as NSErrorMBS) as MLModelMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates a Core ML model object from a compiled model file and a custom configuration.
Notes: URL: The path to a compiled model file (ModelName.mlmodelc), typically with the URL returned from compileModelAtURL:error:.
configuration: The model settings for a new model object.

However, if the wrapper class doesn't meet your app's needs or you need to customize the model's configuration, then use this initializer to create a model object from any compiled model file your app has access to. Typically, you use this initializer after your app has downloaded and compiled a model, which is one technique for saving space in your app.

- 62.15.17 modelWithContentsOfURL(URL as string, byref error as NSErrorMBS) as MLModelMBS 11464

62.15.19 parameterValueForKey(key as MLParameterKeyMBS, byref error as NSErrorMBS) as Variant

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Provides value for the given parameter.
Notes: Returns nil on error.
Available on MacOS 10.15 or newer.

62.15.20 predictionFromFeatures(input as MLFeatureProviderMBS, options as MLPredictionOptionsMBS = nil, byref error as NSErrorMBS) as MLFeatureProviderMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: All models can predict on a specific set of input features.

62.15.21 predictionFromFeaturesMT(input as MLFeatureProviderMBS, options as MLPredictionOptionsMBS = nil, byref error as NSErrorMBS) as MLFeatureProviderMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: All models can predict on a specific set of input features.
Notes: The work is performed on an extra thread, so this function can yield time to other Xojo threads. And it calles the Working event regularly.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

62.15.22 predictionsFromBatch(inputBatch as MLBatchProviderMBS, byref error as NSErrorMBS) as MLBatchProviderMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Predicts output feature values from the given a batch of input feature values.
Notes: inputBatch: The batch of feature values the model needs to make its predictions.

Returns a batch provider that represents the model,Äôs predictions for the batch of inputs.
See also:

- 62.15.23 predictionsFromBatch(inputBatch as MLBatchProviderMBS, options as MLPredictionOptionsMBS, byref error as NSErrorMBS) as MLBatchProviderMBS 11466

62.15.23 predictionsFromBatch(inputBatch as MLBatchProviderMBS, options as MLPredictionOptionsMBS, byref error as NSErrorMBS) as MLBatchProviderMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Predicts output feature values from the given a batch of input feature values and prediction options.
Notes: inputBatch: The batch of feature values the model needs to make its predictions.
options: All the options to be applied to the prediction.

Returns a batch provider that represents the model,Äôs predictions for the batch of inputs.
See also:

- 62.15.22 predictionsFromBatch(inputBatch as MLBatchProviderMBS, byref error as NSErrorMBS) as MLBatchProviderMBS 11466

62.15.24 Properties

62.15.25 configuration as MLModelConfigurationMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The configuration of the model set during initialization.
Notes: (Read only property)

62.15.26 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.15.27 modelDescription as MLModelDescriptionMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: A model holds a description of its required inputs and expected outputs.
Notes: (Read only property)

62.15.28 Constants

Errors

Constant	Value	Description
ErrorCustomLayer	4	An error related to a custom layer in your model.
ErrorCustomModel	5	An error related to your custom model.
ErrorDescriptionMismatch	2	Mismatch error.
ErrorFeatureType	1	Type error.
ErrorGeneric	0	Generic error.
ErrorIO	3	I/O file error.
ErrorParameters	7	An error related to missing or invalid model parameters.
ErrorUpdate	6	An error related to updating a model.

62.16 class MLMultiArrayConstraintMBS

62.16.1 class MLMultiArrayConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Constraint describing expected MLMultiArray properties.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

62.16.2 Methods

62.16.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The private constructor.

62.16.4 shape as Integer()

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Required shape of array.
Notes: One value for each dimension.

62.16.5 Properties

62.16.6 dataType as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Required dataType.
Notes: (Read only property)

62.16.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.16.8 shape0 as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The shape(0) value.
Notes: Convenience property to see value in debugger.
(Read only property)

62.16.9 shape1 as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The shape(1) value.
Notes: Convenience property to see value in debugger.
(Read only property)

62.16.10 shape2 as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The shape(2) value.
Notes: Convenience property to see value in debugger.
(Read only property)

62.16.11 shapeConstraint as MLMultiArrayShapeConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The constraint on the shape of the multiarray.
Notes: (Read only property)

62.17 class MLMultiArrayMBS

62.17.1 class MLMultiArrayMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The class for a Multidimensional Array.
Example:

```
// create a 2 x 3 array of doubles for model input and read it back
Var shape() As Integer = Array(2, 3)
Var error As NSErrorMBS
Var a As New MLMultiArrayMBS(shape, MLMultiArrayMBS.DataTypeDouble, error)
If error <>Nil Then
MessageBox error.localizedDescription
Return
End If

// fill through the data pointer
Var p As Ptr = a.dataPointer
For i As Integer = 0 To a.count - 1
p.Double(i * 8) = i * 1.5
Next

Var index() As Integer = Array(1, 2) // row 1, column 2
MessageBox a.count.ToString + " values, value at 1/2: " + a.doubleValue(index).ToString

// pass it to a model with MLFeatureValueMBS.featureValueWithMultiArray
```

62.17.2 Methods

62.17.3 Constructor(dataPointer as Ptr, shape() as Integer, dataType as Integer, strides() as Integer, byref error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Create by wrapping existing data.
Notes: Please make sure that memory is not deallocated too early, e.g. by subclassing and freeing it in destructor.
See also:

- 62.17.4 Constructor(shape() as Integer, dataType as Integer, byref error as NSErrorMBS) 11471

62.17.4 Constructor(shape() as Integer, dataType as Integer, byref error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Create by C-style contiguous array by allocating and managing the necessary memory.
See also:

- 62.17.3 Constructor(dataPointer as Ptr, shape() as Integer, dataType as Integer, strides() as Integer, byref error as NSErrorMBS) 11470

62.17.5 shape as Integer()

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: An array containing the sizes of each dimension in the multiarray.

62.17.6 strides as Integer()

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: An array containing the stride in memory for each dimension.
Notes: The element referred to by a multidimensional index is located at an offset equal to sum_d index [d] *strides [d] . This offset is in the units of the specified dataType.

62.17.7 Properties

62.17.8 count as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Count of total number of elements.
Notes: (Read only property)

62.17.9 dataPointer as Ptr

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Unsafe pointer to underlying buffer holding the data.
Notes: (Read only property)

62.17.10 dataType as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Type of element held.
Notes: See DataType* constants.
(Read only property)

62.17.11 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.17.12 shape0 as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The shape(0) value.
Notes: Convenience property to see value in debugger.
(Read only property)

62.17.13 shape1 as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The shape(1) value.
Notes: Convenience property to see value in debugger.
(Read only property)

62.17.14 shape2 as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The shape(2) value.
Notes: Convenience property to see value in debugger.

(Read only property)

62.17.15 strides0 as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The strides(0) value.
Notes: Convenience property to see value in debugger.
(Read only property)

62.17.16 strides1 as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The strides(1) value.
Notes: Convenience property to see value in debugger.
(Read only property)

62.17.17 strides2 as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The strides(2) value.
Notes: Convenience property to see value in debugger.
(Read only property)

62.17.18 doubleValue(index as Integer) as Double

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Query or set value for single dimensional array.
Notes: Pass the index for the value to query.
(Read and Write computed property)
See also:

- 62.17.19 doubleValue(indexes() as Integer) as Double 11473

62.17.19 doubleValue(indexes() as Integer) as Double

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Query or set value for multi dimensional array.
Notes: Pass one index value for each dimension in the array.
(Read and Write computed property)
See also:

- 62.17.18 doubleValue(index as Integer) as Double 11473

62.17.20 integerValue(index as Integer) as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Query or set value for single dimensional array.
Notes: Pass the index for the value to query.
(Read and Write computed property)
See also:

- 62.17.21 integerValue(indexes() as Integer) as Integer 11474

62.17.21 integerValue(indexes() as Integer) as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Query or set value for multi dimensional array.
Notes: Pass one index value for each dimension in the array.
(Read and Write computed property)
See also:

- 62.17.20 integerValue(index as Integer) as Integer 11474

62.17.22 singleValue(index as Integer) as Single

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Query or set value for single dimensional array.
Notes: Pass the index for the value to query.
(Read and Write computed property)
See also:

- 62.17.23 singleValue(indexes() as Integer) as Single 11474

62.17.23 singleValue(indexes() as Integer) as Single

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Query or set value for multi dimensional array.
Notes: Pass one index value for each dimension in the array.
(Read and Write computed property)
See also:

- 62.17.22 singleValue(index as Integer) as Single 11474

62.17.24 Constants

Data Types

Constant	Value	Description
DataTypeDouble	&h10040	Data is double values.
DataTypeFloat16	&h10010	Data is Float16 values. Sadly Xojo doesn't have a native Float16 data type.
DataTypeFloat32	&h10020	Data is single values (32-bit).
DataTypeFloat64	&h10040	Data is Float64 values. Use double in Xojo.
DataTypeInt32	&h20020	Data is 32-bit integer values.
DataTypeInt8	&h20008	Data is 8-bit integer values. For macOS 26.0 and newer.

62.18 class MLMultiArrayShapeConstraintMBS

62.18.1 class MLMultiArrayShapeConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The lists of shapes or ranges of shapes that constrain a multiarray feature.
Notes: Available in MacOS 10.14 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 19.6pr3

62.18.2 Methods

62.18.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The private constructor.

62.18.4 enumeratedShapes as Variant

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Array of allowed shapes for a multiarray feature.

62.18.5 sizeRangeForDimension as NSRangeMBS()

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The allowable range for a dimention of the multiarray.

62.18.6 Properties

62.18.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.18.8 type as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The type of the shape constraint.
Notes: (Read only property)

62.18.9 Constants

Types

Constant	Value	Description
TypeEnumerated	2	The constraint is an array of allowed shapes.
TypeRange	3	The constraint is a set of ranges allowed for the array shape.
TypeUnspecified	1	The constraint type is undefined.

62.19 class MLNumericConstraintMBS

62.19.1 class MLNumericConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The value limitations of a number.
Notes: Available on MacOS 10.15 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 19.6pr3

62.19.2 Methods

62.19.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Checks whether class is available.
Notes: Returns true in MacOS 10.15 or newer.

62.19.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The private constructor.

62.19.5 enumeratedNumbers as Double()

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: A set of the numbers allowed in this constraint.

62.19.6 Properties

62.19.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.19.8 maxNumber as Double

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The largest numerical value allowed by this constraint.
Notes: (Read only property)

62.19.9 minNumber as Double

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The smallest numerical value allowed by this constraint.
Notes: (Read only property)

62.20 class MLParameterDescriptionMBS

62.20.1 class MLParameterDescriptionMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The description of a model parameter that includes a default value and a constraint, if applicable.
Notes: Available for MacOS 10.15 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

62.20.2 Methods

62.20.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Checks whether class is available.
Notes: Returns true in MacOS 10.15 or newer.

62.20.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The private constructor.

62.20.5 Properties

62.20.6 defaultValue as Variant

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The default value for the parameter.
Notes: (Read only property)

62.20.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.20.8 key as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The key for this parameter description value.
Notes: (Read only property)

62.20.9 numericConstraint as MLNumericConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The constraints of this parameter description value, if and only if the value is numerical.
Notes: (Read only property)

62.21 class MLParameterKeyMBS

62.21.1 class MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: A key for model and update parameter dictionaries.
Notes: Subclass of the MLKeyMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

62.21.2 Methods

62.21.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The private constructor.

62.21.4 scopedTo(scope as String) as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Returns a new MLParameterKey instance after adding additional scoping.

62.21.5 Properties

62.21.6 beta1 as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The key you use to access the beta1 parameter for the Adam optimizer (a Double value).
Notes: Double parameter used to control the beta1 of Adam optimizer. Adjustable at load-time.
(Read only property)

62.21.7 beta2 as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The key you use to access the beta2 parameter for the Adam optimizer (a Double value).
Notes: Double parameter used to control the beta2 of Adam optimizer. Adjustable at load-time.
(Read only property)

62.21.8 biases as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: MLMultiArrayMBS parameter returned when client requests for biases of a particular layer using a scoped parameter.
Notes: (Read only property)

62.21.9 epochs as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The key you use to access the epochs parameter for the optimizer (an Int64 value).
Notes: Int64 parameter used to specify the number of epochs used by optimizer. Adjustable at load-time.
(Read only property)

62.21.10 eps as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The key you use to access the eps parameter for the Adam optimizer (a Double value).
Notes: Double parameter used to control the epsilon of Adam optimizer. Adjustable at load-time.
(Read only property)

62.21.11 learningRate as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The key you use to access the parameter for the optimizer,Äôs learning rate (a Double value).
Notes: Double parameter used to control the learning rate of an optimizer. Adjustable in progress.
(Read only property)

62.21.12 linkedModelFileName as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The key you use to access the name of the linked model.
Notes: (Read only property)

62.21.13 linkedModelSearchPath as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The key you use to access the search path for the linked model.
Notes: (Read only property)

62.21.14 miniBatchSize as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The key you use to access the mini batch-size parameter for the optimizer (an Int64 value).
Notes: Int64 parameter used to specify the size of a miniBatch used by optimizer. Adjustable at load-time.
(Read only property)

62.21.15 momentum as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The key you use to access the parameter for the optimizer,Äôs momentum gradient (a Double value).
Notes: Double parameter used to control the momentum of gradient based optimizers. Adjustable at load-time.
(Read only property)

62.21.16 numberOfNeighbors as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Int64 parameter used to specify the number of neighbors to use for class affinity (applicable to kNN).
Notes: Not adjustable in progress.
(Read only property)

62.21.17 seed as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Int64 parameter used to specify the seed to be used if shuffling data between epochs.
Notes: Adjustable at load-time.
(Read only property)

62.21.18 shuffle as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Bool parameter used to specify whether to shuffle the data between epochs.
Notes: Adjustable at load-time.
(Read only property)

62.21.19 weights as MLParameterKeyMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: MLMultiArrayMBS parameter returned when client requests for weights of a particular layer using a scoped parameter.
Notes: (Read only property)

62.22 class MLPredictionOptionsMBS

62.22.1 class MLPredictionOptionsMBS

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: An object to hold options / controls / parameters of how model prediction is performed

62.22.2 Methods

62.22.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The constructor.

62.22.4 Properties

62.22.5 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.22.6 usesCPUOnly as Boolean

MBS Mac64bit Plugin, Plugin Version: 17.4, Platform: macOS, Targets: All.

Function: Set to true to force computation to be on the CPU only
Notes: (Read and Write property)

62.23 class MLSequenceConstraintMBS

62.23.1 class MLSequenceConstraintMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The constraints for a sequence feature.
Notes: Available on MacOS 10.14 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 19.6pr3

62.23.2 Methods

62.23.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Checks whether class is available.
Notes: Returns true in MacOS 10.14 or newer.

62.23.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The private constructor.

62.23.5 Properties

62.23.6 countRange as NSRangeMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The range of values allowed for the sequence's length.
Notes: (Read only property)

62.23.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.23.8 valueDescription as MLFeatureDescriptionMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The description that all sequence elements must match.
Notes: (Read only property)

62.24 class MLSequenceMBS

62.24.1 class MLSequenceMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: A sequence of data used as a feature input or feature output for a model.
Example:

```
// pass a sequence of words as input feature to a Core ML model
Var words() As String = Array("the", "quick", "brown", "fox")
Var sequence As MLSequenceMBS = MLSequenceMBS.sequenceWithStringArray(words)
Var feature As MLFeatureValueMBS = MLFeatureValueMBS.featureValueWithSequence(sequence)

MessageBox sequence.stringValues.Count.ToString + " words in the sequence"
```

Notes: Data from sensors (a time series) or language (a series of words) are often manipulated as sequences by machine learning models. These sequences can have variable lengths depending on their context. MLSequenceMBS explicitly encodes a sequence of strings or integers to support a series of data points as a single input.

If you need to process a sequence of values individually, one at a time, see Making Predictions with a Sequence of Inputs for details.
https://developer.apple.com/documentation/coreml/core_ml_api/making_predictions_with_a_sequence_of_inputs

Available in MacOS 10.14 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 19.6pr3

62.24.2 Methods

62.24.3 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The private constructor.

62.24.4 emptySequenceWithType(type as Integer) as MLSequenceMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates an empty sequence of the given type.
Notes: Type: The MLFeatureType for the sequence. Must be either MLFeatureTypeString or MLFeatureTypeInt64.

62.24.5 int64Values as Int64()

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The integer elements of the sequence.

62.24.6 sequenceWithInt64Array(int64Values() as Int64) as MLSequenceMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates a sequence from an array of integers.

62.24.7 sequenceWithStringArray(stringValues() as String) as MLSequenceMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates a sequence from an array of strings.

62.24.8 stringValues as String()

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The string elements of the sequence.

62.24.9 Properties

62.24.10 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.24.11 type as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The type of value held in the sequence.
Notes: (Read only property)

62.25 class MLTaskMBS

62.25.1 class MLTaskMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: An abstract base class for machine learning tasks.
Notes: You don,Äôt create use this class directly. Instead, use a class that inherits from this one, such as MLUpdateTaskMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 19.6pr3

62.25.2 Methods

62.25.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Checks whether class is available.
Notes: Returns true in MacOS 10.15 or newer.

62.25.4 cancel

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Cancels a machine learning task before it completes.

62.25.5 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The private constructor.

62.25.6 resume

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Begins or resumes a machine learning task.
Notes: Use this method to start a task for the first time or resumes a task that has paused. Tasks pause

when they notify your app,Äôs progress handlers, such as those you provide to an MLUpdateProgressHandlersMBS instance.

62.25.7 Properties

62.25.8 Error as NSErrorMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The underlying error if the task is in a failed state.
Notes: (Read only property)

62.25.9 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.25.10 State as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The current state of the machine learning task.
Notes: (Read only property)

62.25.11 TaskIdentifier as String

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: A unique name of the task to distinguish it from all other tasks at runtime.
Notes: (Read only property)

62.25.12 Constants

Task States

Constant	Value	Description
StateCancelling	3	The state of a machine learning task that,Äôs in mid-termination, before it could finish successfully.
StateCompleted	4	The state of a machine learning task that has finished successfully.
StateFailed	5	The state of a machine learning task that has terminated due to an error.
StateRunning	2	The state of a machine learning task that,Äôs executing.
StateSuspended	1	The state of a machine learning task that,Äôs paused.

62.26 class MLUpdateContextMBS

62.26.1 class MLUpdateContextMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The context an update task provides to your app,Äôs completion and update progress handlers.
Blog Entries

- Update Machine Learning Model on Device

62.26.2 Methods

62.26.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Checks whether class is available.
Notes: Returns true in MacOS 10.15 or newer.

62.26.4 Constructor

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The constructor.

62.26.5 writeToFile(file as FolderItem, byref error as NSErrorMBS) as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Exports a machine learning file to the file system.
Notes: file: The location in the file system where the file should be written.
Error: will return any error message.

Returns true on success or false on failure.
Requires MacOS 10.15 or newer.

62.26.6 Properties

62.26.7 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.26.8 Metrics as Dictionary

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The training metrics of the model for the update task, contained in a dictionary.
Notes: (Read only property)

62.26.9 Model as MLModelMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The underlying Core ML model stored in memory.
Notes: (Read only property)

62.26.10 Parameters as Dictionary

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The parameters for the update task.
Notes: (Read only property)

62.26.11 ProgressEvent as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The event type that triggered an update task to notify your app,Äôs completion and update progress handlers.
Notes: (Read only property)

62.26.12 Task as MLUpdateTaskMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The update task that generated the update context.
Notes: (Read only property)

62.26.13 Constants

Progress Event Types

Constant	Value	Description
ProgressEventEpochEnd	2	An event that represents the end of training epoch.
ProgressEventMiniBatchEnd	4	An event that represents the end of a mini-batch within a training epoch.
ProgressEventTrainingBegin	1	An event that represents the start of training.

62.27 class MLUpdateProgressHandlersMBS

62.27.1 class MLUpdateProgressHandlersMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: A collection of closures an update task uses to notify your app of its progress.
Notes: Available in MacOS 10.15 or newer.
Blog Entries

- Update Machine Learning Model on Device
- MBS Xojo Plugins, version 19.6pr3

62.27.2 Methods

62.27.3 available as Boolean

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Checks whether class is available.
Notes: Returns true in MacOS 10.15 or newer.

62.27.4 Constructor(interestedEvents as Integer)

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates the collection of event handlers for an update task uses to notify your app of its progress.
Notes: interestedEvents: The events for which the update task will call your closures for, contained in an option set.

62.27.5 Properties

62.27.6 Handle as Integer

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

62.27.7 Events

62.27.8 completionHandler(context as MLUpdateContextMBS)

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The event that an update tasks uses to notify you when it is complete.

62.27.9 progressHandler(context as MLUpdateContextMBS)

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The event an update task uses to notify your app.
Notes: The update task only uses this event for the events you specified in interestedEvents.

62.27.10 Constants

Progress Event Types

Constant	Value	Description
ProgressEventEpochEnd	2	An event that represents the end of training epoch.
ProgressEventMiniBatchEnd	4	An event that represents the end of a mini-batch within a training epoch.
ProgressEventTrainingBegin	1	An event that represents the start of training.

62.28 class MLUpdateTaskMBS

62.28.1 class MLUpdateTaskMBS

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: A task that updates a model with additional training data.
Notes: Use an MLUpdateTaskMBS to update a machine learning model on a user,Äôs device.

Available on MacOS 10.15 or newer.
Subclass of the MLTaskMBS class.

62.28.2 Methods

62.28.3 Constructor(file as FolderItem, trainingData as MLArrayBatchProviderMBS, configuration as MLModelConfigurationMBS, byref error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates an update task for your model, given its file URL, training data, and your completion handler.
Notes: file: The location in the file system of a model file (ModelName.mlmodelc).
trainingData: The update data for the model, contained in a batch provider.
configuration: The model settings for a updated model object.

Calls later completionHandler event.
See also:

- 62.28.4 Constructor(file as FolderItem, trainingData as MLArrayBatchProviderMBS, configuration as MLModelConfigurationMBS, progressHandlers as MLUpdateProgressHandlersMBS, byref error as NSErrorMBS) 11500

62.28.4 Constructor(file as FolderItem, trainingData as MLArrayBatchProviderMBS, configuration as MLModelConfigurationMBS, progressHandlers as MLUpdateProgressHandlersMBS, byref error as NSErrorMBS)

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates an update task for your model, given its file URL, training data, and your progress handlers.
Notes: file: The location in the file system of a model file (ModelName.mlmodelc).
trainingData: The update data for the model, contained in a batch provider.
configuration: The model settings for a updated model object.
progressHandlers: The closures the task calls during the update process.
See also:

- 62.28.3 Constructor(file as FolderItem, trainingData as MLArrayBatchProviderMBS, configuration as MLModelConfigurationMBS, byref error as NSErrorMBS) 11500

62.28.5 resumeWithParameters(updateParameters as Dictionary)

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Resumes a model update with updated parameter values.
Notes: updateParameters: Model training parameter values to replace those currently set in the update task.

Use this method to resume the model update task with newer parameter values. You use this method within the closures you provide in an MLUpdateProgressHandlersMBS instance to resume the MLUpdateTaskMBS.

62.28.6 Events

62.28.7 completionHandler(context as MLUpdateContextMBS)

MBS Mac64bit Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: The complete event.
Notes: Called only if you use constructor without passing MLUpdateProgressHandlersMBS object, because if you use MLUpdateProgressHandlersMBS, the event is called there.

Chapter 63

CoreText

63.1 class CoreTextMBS

63.1.1 class CoreTextMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The central CoreText class.
Example:

```
// use a font file in the app without installing it for the user
Var file As FolderItem = SpecialFolder.Desktop.Child("MyFont.ttf")
If Not CoreTextMBS.IsSupportedFontFile(file) Then Return

Var error As CFErrorMBS
If CoreTextMBS.RegisterFontsForFile(file, CoreTextMBS.kCTFontManagerScopeProcess, error) Then
MessageBox "Font registered, Core Text version " + Hex(CoreTextMBS.CoreTextVersion)
End If
```

Notes: Some global methods, constants and events for CoreText.

63.1.2 Methods

63.1.3 AvailableFontFamilyNames as string()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns an array of visible font family names sorted for user interface display.

63.1.4 AvailableFontURLs as string()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of font URLs.

63.1.5 AvailablePostScriptNames as string()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns an array of unique PostScript font names for the fonts.

63.1.6 CompareFontFamilyNames(name1 as string, name2 as string) as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A comparator function to compare font family names and sort them according to Apple guidelines.
Notes: family1: The first localized font family name to compare, as a string.
family2: The second localized font family name to compare, as a string.

Returns a CFComparisonResult value indicating the sort order for the two family names. kCFComparisonResultGreatherThan (1) if family1 is greater than family2, kCFComparisonResultLessThan (-1) if family1 is less than family2, and kCFComparisonResultEqualTo (0) if they are equal.

This CFComparatorFunction function compares font family names and sorts them in the Apple preferred order, accounting for foundry prefix. Family names with recognized prefixes are sorted after the unprefixed names in prefix order.

63.1.7 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The constructor.

63.1.8 CoreTextVersion as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the version of the CoreText framework.
Notes: This function returns a number indicating the version of the CoreText framework. Note that framework version is not always an accurate indicator of feature availability. The recommended way to use this function is first to check that the function pointer is non nil (plugin will do and raise exceptions), followed by calling it and comparing its result to a defined constant (or constants).
Returns the version number. This value is for comparison with the constants beginning with kCTVersionNumber.

63.1.9 CreateFontDescriptorFromData(data as memoryblock) as CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a font descriptor representing the font in the supplied data.
Notes: Note: the font descriptor is not available through font descriptor matching.

data: A memoryblock containing font data.

Returns a font descriptor created from the data, or nil on error.
See also:

- 63.1.10 CreateFontDescriptorFromData(data as string) as CTFontDescriptorMBS 11505

63.1.10 CreateFontDescriptorFromData(data as string) as CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a font descriptor representing the font in the supplied data.
Notes: Note: the font descriptor is not available through font descriptor matching.

data: A string containing font data.

Returns a font descriptor created from the data, or nil on error.
See also:

- 63.1.9 CreateFontDescriptorFromData(data as memoryblock) as CTFontDescriptorMBS 11505

63.1.11 CreateFontDescriptorsFromFile(file as folderitem) as CTFontDescriptorMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns an array of font descriptors representing each of the fonts in the specified file.
Example:

```
Var file as FolderItem = SpecialFolder.Desktop.Child("Didot.ttc")

Var descriptor() as CTFontDescriptorMBS
Var result() as string

descriptor = CoreTextMBS.CreateFontDescriptorsFromFile(file)

for i as Integer = 0 to descriptor.LastIndex
result.Add descriptor(i).Displayname
next

MessageBox Join(result, EndOfLine)
```

Notes: file: A folderitem referencing a valid font file.

63.1.12 CreateFontDescriptorsFromURL(URL as string) as CTFontDescriptorMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns an array of font descriptors representing each of the fonts in the specified URL.
Notes: URL: A file system URL referencing a valid font file.

63.1.13 Destructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The destructor.

63.1.14 EnableFontDescriptors(descriptors() as CTFontDescriptorMBS, enable as boolean)

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Enables or disables the matching font descriptors for font descriptor matching.
Notes: descriptors: Array of font descriptors.

enable: Boolean value indicating whether the fonts matching descriptors should be enabled for font descriptor matching.

63.1.15 GetScopeForFile(file as folderitem) as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the registration scope of the specified folderitem.
Notes: The registration scope of the specified file or kCTFontManagerScopeNone if not currently registered.
Available in OS X v10.6 and later.

63.1.16 GetScopeForURL(URL as string) as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the registration scope of the specified URL.
Notes: The registration scope of the specified URL or kCTFontManagerScopeNone if not currently registered.
Available in OS X v10.6 and later.

63.1.17 IsSupportedFontFile(file as folderitem) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Determines whether the referenced font data is supported on the current platform.
Notes: Returns true if the folderitem refers to a valid font that can be used on the current platform; false otherwise.

63.1.18 IsSupportedFontURL(URL as string) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Determines whether the referenced font data (usually by file URL) is supported on the current platform.
Notes: Returns true if the URL refers to a valid font that can be used on the current platform; false otherwise.

63.1.19 kCTBaselineClassAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Key to reference a baseline class override.
Notes: Value must be one of the kCTBaselineClass constants. Normally, glyphs on the line will be assigned baseline classes according to the 'bsln' or 'BASE' table in the font. This attribute may be used to change this assignment.

see also: kCTBaselineClassRoman, kCTBaselineClassIdeographicCentered, kCTBaselineClassIdeographicLow, kCTBaselineClassIdeographicHigh, kCTBaselineClassHanging, kCTBaselineClassMath.

63.1.20 kCTBaselineInfoAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Key to reference a baseline info dictionary.
Notes: Value must be a CFDictionaryRef. Normally, baseline offsets will be assigned based on the 'bsln' or 'BASE' table in the font. This attribute may be used to assign different offsets. Each key in the dictionary is one of the kCTBaselineClass constants and the value is a number of the baseline offset in points. You only need to specify the offsets you wish to change.

63.1.21 kCTBaselineReferenceInfoAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Key to reference a baseline info dictionary for the reference baseline.
Notes: Value must be a Dictionary. All glyphs in a run are assigned a baseline class and then aligned to the offset for that class in the reference baseline baseline info. See the discussion of kCTBaselineInfoAttributeName for information about the contents of the dictionary. You can also use the kCTBaselineReferenceFont key to specify that the baseline offsets of a particular CTFontMBS should be used as the reference offsets.

63.1.22 kCTCharacterShapeAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Controls glyph selection.
Notes: Value must be a number. Default is value is 0 (disabled). A non-zero value is interpreted as an SFNT kCharacterShapeType selector + 1; see SFNTLayoutTypes.h for selectors. For example, an attribute value of 1 corresponds to kTraditionalCharactersSelector.

63.1.23 kCTFontAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The key for the font.
Notes: Value must be a CTFontMBS. Default is Helvetica 12.

63.1.24 kCTFontManagerBundleIdentifier as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: CTFontManage bundle identifier.
Notes: The CTFontManager bundle identifier to be used with get or set global auto-activation settings.

63.1.25 kCTFontManagerErrorDomain as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The error domain for CoreText.
Notes: CFError objects with this domain have error codes corresponding to one of the CTFontManagerError errors listed in "Font Registration Errors" and "Font Unregistration Errors."

63.1.26 kCTFontManagerErrorFontURLsKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: User info key to be used with CFError references returned from registration functions.
Notes: The value associated with this key in the user info dictionary of a CFError object is a CFArray of font URLs that failed with the given error.

63.1.27 kCTFontManagerRegisteredFontsChangedNotification as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Notification name for font registry changes.
Notes: This is the string to use as the notification name when subscribing to Core Text Font Manager notifications. This notification is posted when fonts are added to the font registry. The client is responsible for registered with the distributed notification center to receive notifications for changes to the session or user scopes, and with a local notification center for changes to the process scope.

63.1.28 kCTFontSlantTrait as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Dictionary key to access the slant trait value.
Notes: Use this key to access the normalized slant angle from the font traits dictionary. The value returned is a number representing a float value between -1.0 and 1.0 for normalized slant angle. The value or 0.0 corresponds to 0 degree clockwise rotation from the vertical and 1.0 corresponds to 30 degrees clockwise rotation.

63.1.29 kCTFontSymbolicTrait as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Dictionary key to access the symbolic traits value.
Notes: Use this key to access the symbolic traits value from the font traits dictionary. The value is returned as a number.

63.1.30 kCTFontWeightTrait as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Dictionary key to access the weight trait value.
Notes: Use this key to access the normalized weight trait from the font traits dictionary. The value returned is a number representing a float value between -1.0 and 1.0 for normalized weight. The value of 0.0 corresponds to the regular or medium font weight.

63.1.31 kCTFontWidthTrait as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Dictionary key to access the width (condense/expand) trait value.
Notes: Use this key to access the normalized proportion trait from the font traits dictionary. This value corresponds to the relative inter-glyph spacing for a given font. The value returned is a number representing a float between -1.0 and 1.0. The value of 0.0 corresponds to regular glyph spacing while negative values represent condensed glyph spacing.

63.1.32 kCTForegroundColorAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The key for the foreground color..
Notes: Value must be a CGColorMBS. Default value is black.

63.1.33 kCTForegroundColorFromContextAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.
Notes: Never set a foreground color in the CGContext; use what is set as the context's fill color.

Value must be a boolean. Default is false. The reason why this exists is because an NSAttributedString defaults to a black color if no color attribute is set. This forces CoreText to set the color in the context. This will allow developers to sidestep this, making CoreText set nothing but font information in the CGContext. If set, this attribute also determines the color used by kCTUnderlineStyleAttributeName, in which case it overrides the foreground color.

63.1.34 kCTGlyphInfoAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.
Notes: Allows the use of unencoded glyphs.
Value must be a CTGlyphInfoMBS. The glyph specified by this CTGlyphInfo object is assigned to the entire attribute range, provided that its contents match the specified base string and that the specified glyph is available in the font specified by kCTFontAttributeName.

63.1.35 kCTKernAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.
Notes: A kerning adjustment.
Value must be a float. Default is standard kerning. The kerning attribute indicate how many points the following character should be shifted from its default offset as defined by the current character's font in points; a positive kern indicates a shift farther along and a negative kern indicates a shift closer to the current character. If this attribute is not present, standard kerning will be used. If this attribute is set to 0.0, no kerning will be done at all.

63.1.36 kCTLanguageAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.
Notes: Specifies text language.

Value must be a String containing a locale identifier. Default is unset. When this attribute is set to a valid identifier, it will be used to select localized glyphs (if supported by the font) and locale-specific line breaking rules.

63.1.37 kCTLigatureAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.
Notes: Controls ligature formation.

Value must be a number. Default is int value 1. The ligature attribute determines what kinds of ligatures should be used when displaying the string. A value of 0 indicates that only ligatures essential for proper rendering of text should be used, 1 indicates that standard ligatures should be used, and 2 indicates that all available ligatures should be used. Which ligatures are standard depends on the script and possibly the font. Arabic text, for example, requires ligatures for many character sequences, but has a rich set of additional ligatures that combine characters. English text has no essential ligatures, and typically has only two standard ligatures, those for "fi" and "fl" – all others being considered more advanced or fancy.

On iOS releases prior to 6.0 essential ligatures are applied if the font contains glyphs for any of U+FB00 through U+FB04 and the font lacks AAT or OpenType shaping tables, but as of 6.0 shaping tables (or the lack thereof) are treated as definitive. This character-based shaping will still be performed if this attribute is explicitly specified with the default value of 1.

63.1.38 kCTParagraphStyleAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.
Notes: A CTParagraphStyle object which is used to specify things like line alignment, tab rulers, writing direction, etc.
Value must be a CTParagraphStyleMBS. Default is an empty CTParagraphStyle object.

63.1.39 kCTRunDelegateAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.

Notes: Allows customization of certain aspects of a range of text's appearance.

Value must be a CTRunDelegateMBS. The values returned by the embedded object for an attribute range apply to each glyph resulting from the text in that range. Because an embedded object is only a display-time modification, care should be taken to avoid applying this attribute to a range of text with complex behavior, such as a change of writing direction, combining marks, etc. Consequently, it is recommended that this attribute be applied to a range containing the single character U+FFFC.

63.1.40 kCTStrokeColorAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.
Notes: The stroke color.
Value must be a CGColorMBS. Default is the foreground color.

63.1.41 kCTStrokeWidthAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.
Notes: The stroke width.
Value must be a number. Default value is 0.0, or no stroke. This attribute, interpreted as a percentage of font point size, controls the text drawing mode: positive values effect drawing with stroke only; negative values are for stroke and fill. A typical value for outlined text is 3.0.

63.1.42 kCTSuperscriptAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.
Notes: Controls vertical text positioning.
Value must be a number. Default is int value 0. If supported by the specified font, a value of 1 enables superscripting and a value of -1 enables subscripting.

63.1.43 kCTUnderlineColorAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.
Notes: The underline color.

Value must be a CGColorMBS. Default is the foreground color.

63.1.44 kCTUnderlineStyleAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.
Notes: Allows the setting of an underline to be applied at render time.

Value must be a number. Default is kCTUnderlineStyleNone. Set a value of something other than kCTUnderlineStyleNone to draw an underline. In addition, the CTUnderlineStyleModifiers can be used to modify the look of the underline. The underline color will be determined by the text's foreground color.

63.1.45 kCTVerticalFormsAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.
Notes: Controls glyph orientation.

Value must be a boolean. Default is false. A value of false indicates that horizontal glyph forms are to be used, true indicates that vertical glyph forms are to be used.

63.1.46 kCTWritingDirectionAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for font attributes.
Notes: Specifies a bidirectional override or embedding.

Value must be a CFArray of CFNumberRefs, each of which should have a value of either kCTWritingDirectionLeftToRight or kCTWritingDirectionRightToLeft, plus one of kCTWritingDirectionEmbedding or kCTWritingDirectionOverride. This array represents a sequence of nested bidirectional embeddings or overrides, in order from outermost to innermost, with (kCTWritingDirectionLeftToRight | kCTTextWritingDirectionEmbedding) corresponding to a LRE/PDF pair in plain text or in HTML, (kCTWritingDirectionRightToLeft | kCTTextWritingDirectionEmbedding) corresponding to a RLE/PDF pair in plain text or a in HTML, (kCTWritingDirectionLeftToRight | kCTTextWritingDirectionOverride) corresponding to a LRO/PDF pair in plain text or <bdo dir="ltr">in HTML, and (kCTWritingDirectionRightToLeft | kCTTextWritingDirectionOverride) corresponding to a RLO/PDF pair in plain text or <bdo dir="rtl">in HTML.

63.1.47 MatchFontDescriptorsWithProgressHandler(descriptors() as CTFontDescriptorMBS, mandatoryAttributes() as string, tag as Variant = nil) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Matches font descriptors in background.
Notes: This function returns immediately, but can potentially take long time to process. The progress is notified via progress evnet.

descriptors: An array of descriptors to process.
mandatoryAttributes: some mandatory attributes.
Returns false if it couldn't start the work.

63.1.48 RegisterFontsForFile(file as folderitem, scope as Integer, byref error as CFErrorMBS) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Registers fonts from the specified font URL with the Font Manager. Registered fonts are discoverable through font descriptor matching.
Notes: fontURL: The font URL.
scope: Scope constant defining the availability and lifetime of the registration. See "Font Registration Scope" for values to pass for this parameter.
error: a CFErrorMBS object which, in case of failed registration, contains error information.

Returns true if registration of the fonts was successful, otherwise false.

63.1.49 RegisterFontsForFiles(files() as folderitem, scope as Integer, errors() as CFErrorMBS) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Registers fonts from the specified array of font URLs with the Font Manager. Registered fonts are discoverable through font descriptor matching.
Notes: files: Array of font files.
scope: Scope constant defining the availability and lifetime of the registration. See "Font Registration Scope" for values to pass for this parameter.
errors: An array of CFErrorMBS objects which, in case of failed registration, contain error information. Each error contains a CFArrayMBS of font URLs corresponding to kCTFontManagerErrorFontURLsKey. These URLs represent the font files that caused the error and were not successfully registered. The array must be released by the caller. Can be nil.

Returns true if registration of all font URLs was successful, otherwise false.

63.1.50 RegisterFontsForURL(URL as string, scope as Integer, byref error as CFErrorMBS) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Registers fonts from the specified font URL with the Font Manager. Registered fonts are discoverable through font descriptor matching.
Notes: fontURL: The font URL.
scope: Scope constant defining the availability and lifetime of the registration. See "Font Registration Scope" for values to pass for this parameter.
error: a CFErrorMBS object which, in case of failed registration, contains error information.

Returns true if registration of the fonts was successful, otherwise false.
See also:

- 63.1.51 RegisterFontsForURL(URLs() as string, scope as Integer, errors() as CFErrorMBS) as boolean 11516

63.1.51 RegisterFontsForURL(URLs() as string, scope as Integer, errors() as CFErrorMBS) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Registers fonts from the specified array of font URLs with the Font Manager. Registered fonts are discoverable through font descriptor matching.
Notes: URLs: Array of font URLs.
scope: Scope constant defining the availability and lifetime of the registration. See "Font Registration Scope" for values to pass for this parameter.
errors: Array of CFErrorMBS objects which, in case of failed registration, contain error information. Each error contains a CFArrayMBS of font URLs corresponding to kCTFontManagerErrorFontURLsKey. These URLs represent the font files that caused the error and were not successfully registered. The array must be released by the caller. Can be nil.

Please pass in errors array empty as
Returns true if registration of all font URLs was successful, otherwise false.
See also:

- 63.1.50 RegisterFontsForURL(URL as string, scope as Integer, byref error as CFErrorMBS) as boolean 11516

63.1.52 RegisterGraphicsFont(font as CGFontMBS, byref error as CFErrorMBS) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Registers the specified graphics font with the font manager.
Notes: font: The graphics font to be registered.
error: Returns by indirection an error object in the case of failed registration.

Returns true if registration of the font was successful, otherwise false.

Registered fonts are discoverable through font descriptor matching. Any attempt to register a font that is either already registered or contains the same Postscript of an already registered font will fail. This behavior is useful for fonts that may be embedded in documents or constructed in memory. A graphics font is obtained by calling CGFontMBS.CreateWithDataProvider. Fonts that are backed by files should be registered using CoreTextMBS.RegisterFontsForURL.

63.1.53 RequestFonts(descriptors() as CTFontDescriptorMBS, tag as variant = nil)

MBS MacCG Plugin, Plugin Version: 25.0, Platform: macOS, Targets: iOS only.

Function: Resolves font descriptors specified on input.
Example:

```
ct = New MyCoreTextMBS // your subclass with the event
Var descriptors() As CTFontDescriptorMBS

descriptors.add CTFontDescriptorMBS.CreateWithNameAndSize("testing", 12)

ct.RequestFonts descriptors
```

Notes: descriptors: An array of font descriptors to make available to the process. The keys for describing the fonts may be a combination of kCTFontNameAttribute, kCTFontFamilyNameAttribute, or kCTFontRegistrationUserInfoAttribute.

On iOS, fonts registered by font provider apps in the CTFontManagerScope.persistent scope aren,Äôt automatically available to other apps. Other apps must call this function to make the fonts available for font descriptor matching.

On iOS, if the font descriptors can't be found, the system presents the user with a dialog that indicates which fonts couldn't be resolved. The system may provide the user with a way to resolve the missing fonts, if the font manager has a way to enable them.

63.1.54 UnregisterFontsForFile(file as folderitem, scope as Integer, byref error as CFErrorMBS) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Unregisters fonts from the specified font URL with the Font Manager. Unregistered fonts are no longer discoverable through font descriptor matching.
Notes: URL: The font URL.
scope: Scope constant defining the availability and lifetime of the registration. See "Font Registration Scope" for values to pass for this parameter.
error: A CFError object which, in case of failed registration, contains error information.

Returns true if unregistration of the fonts was successful, otherwise false.

63.1.55 UnregisterFontsForFiles(files() as folderitem, scope as Integer, errors() as CFErrorMBS) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Unregisters fonts from the specified array of font URLs with the Font Manager. Unregistered fonts are no longer discoverable through font descriptor matching.
Notes: files: Array of font folderitems.
scope: Scope constant defining the availability and lifetime of the registration. See "Font Registration Scope" for values to pass for this parameter.
errors: An array of CFError objects which, in case of failed registration, contain error information. Each error contains a CFArray of font URLs corresponding to kCTFontManagerErrorFontURLsKey. These URLs represent the font files that caused the error and were not successfully registered. The array must be released by the caller.

Returns true if unregistration of all font URLs was successful, otherwise false.

63.1.56 UnregisterFontsForURL(URL as string, scope as Integer, byref error as CFErrorMBS) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Unregisters fonts from the specified font URL with the Font Manager. Unregistered fonts are no longer discoverable through font descriptor matching.
Notes: URL: The font URL.
scope: Scope constant defining the availability and lifetime of the registration. See "Font Registration Scope" for values to pass for this parameter.
error: A CFError object which, in case of failed registration, contains error information.

Returns true if unregistration of the fonts was successful, otherwise false.

63.1.57 UnregisterFontsForURLs(URLs() as string, scope as Integer, errors() as CFErrorMBS) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Unregisters fonts from the specified array of font URLs with the Font Manager. Unregistered fonts are no longer discoverable through font descriptor matching.
Notes: URLs: Array of font URLs.
scope: Scope constant defining the availability and lifetime of the registration. See "Font Registration Scope" for values to pass for this parameter.
errors: An array of CFError objects which, in case of failed registration, contain error information. Each error contains a CFArray of font URLs corresponding to kCTFontManagerErrorFontURLsKey. These URLs represent the font files that caused the error and were not successfully registered. The array must be released by the caller.

Returns true if unregistration of all font URLs was successful, otherwise false.

63.1.58 UnregisterGraphicsFont(font as CGFontMBS, byref error as CFErrorMBS) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Unregisters the specified graphics font with the font manager.
Notes: font: The graphics font to be unregistered.
error: Returns by indirection an error object in the case of failed unregistration.

Returns true if unregistration of the font was successful, otherwise false.

Unregistered fonts are no longer discoverable through font descriptor matching. Fonts that are backed by files should be unregistered using CTFontManagerUnregisterFontsForURL.

63.1.59 Properties

63.1.60 AutoActivationSetting(BundleID as string) as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The auto-activation setting for the specified bundle identifier.
Notes: bundleID: The bundle identifier used to specify a particular application bundle. If "", the current

application bundle is used. If kCTFontManagerBundleIdentifier is specified, sets global auto-activation. (Read and Write computed property)

63.1.61 Events

63.1.62 FontCollectionSortDescriptors(first as CTFontDescriptorMBS, second as CTFontDescriptorMBS, tag as Variant) as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The event to sort font descriptors..
Notes: This callback can be specified to obtain the matching font descriptors of a collection in sorted order. Return the appropriate comparison result of first descriptor to second descriptor.

Return -1 if smaller, 0 if equal or 1 if bigger.

63.1.63 Progress(state as Integer, progressParameter as Dictionary, tag as Variant) as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Progress was made for a call to MatchFontDescriptorsWithProgressHandler.
Notes: Return true to continue, and return false to cancel the process.

63.1.64 RequestFontsCompleted(unresolvedFontDescriptors() as CTFontDescriptorMBS, tag as variant)

MBS MacCG Plugin, Plugin Version: 25.0, Platform: macOS, Targets: All.

Function: An event called after the request operation completes.
Notes: This event takes a unresolvedFontDescriptors parameter that contains an array of descriptors that couldn't be resolved or found. The array can be empty if all descriptors resolved.

63.1.65 Constants

Font Class Constants

Constant	Value	Description
kCTFontClassClarendonSerifs	&H040000000	Clarendon Serifs
kCTFontClassFreeformSerifs	&H070000000	Freeform Serifs
kCTFontClassMaskShift	28	The font class shift. This is used to shift the font class to the upper most 4 bits of the s traits.
kCTFontClassModernSerifs	&H030000000	Modern Serifs
kCTFontClassOldStyleSerifs	&H010000000	OldStyleSerifs
kCTFontClassOrnamentals	&H090000000	Ornamentals
kCTFontClassSansSerif	&H080000000	Sans Serif
kCTFontClassScripts	&H0A0000000	Scripts
kCTFontClassSlabSerifs	&H050000000	Slab Serifs
kCTFontClassSymbolic	&H0C0000000	Symbolic
kCTFontClassTransitionalSerifs	&H020000000	Transitional Serifs
kCTFontClassUnknown	&H000000000	Unknown

Font Auto-Activation Settings

Constant	Value	Description
kCTFontManagerAutoActivationDefault	0	Default auto-activation setting. When specified, the application us setting.
kCTFontManagerAutoActivationDisabled	1	Disables auto-activation.
kCTFontManagerAutoActivationEnabled	2	Enables auto-activation.
kCTFontManagerAutoActivationPromptUser	3	Requires user input for auto-activation. A dialog is presented to confirm auto-activation of the font.

Font Registration Errors

Constant	Value	Description
kCTFontManagerErrorAlreadyRegistered	105	The file has already been registered in the specified scope.
kCTFontManagerErrorFileNotFound	101	The file does not exist at the specified URL.
kCTFontManagerErrorInsufficientPermissions	102	Cannot access the file due to insufficient permissions.
kCTFontManagerErrorInvalidFontData	104	The file contains invalid font data that could cause system proble
kCTFontManagerErrorUnrecognizedFormat	103	The file is not a recognized or supported font file format.

Font Unregistration Errors

Constant	Value	Description
kCTFontManagerErrorInUse	202	The font file is actively in use and cannot be unregistered.
kCTFontManagerErrorNotRegistered	201	The file is not registered in the specified scope.
kCTFontManagerErrorSystemRequired	202	The file is required by the system and cannot be unregistered.

Font Registration Scope

Constant	Value	Description
kCTFontManagerScopeNone	0	No scope is defined.
kCTFontManagerScopeProcess	1	The font is available to the current process for the duration of the process unless directly unregistered.
kCTFontManagerScopeSession	3	The font is available to the current user session but will not be available in subsequent sessions.
kCTFontManagerScopeUser	2	The font is available to all processes for the current user session and will be available in subsequent sessions unless unregistered.

Font Traits

Constant	Value	Description
kCTFontTraitBold	2	Bold. Additional detail available via kCTFontWeightTrait
kCTFontTraitClassMask	4026531840	Mask for the font class
kCTFontTraitColorGlyphs	8192	Color bitmap glyphs are available.
kCTFontTraitComposite	16384	Composite The font is a CFR (Composite font reference), a cascade list is expected per font.
kCTFontTraitCondensed	64	Condensed Additional detail available via kCTFontWidthTrait
kCTFontTraitExpanded	32	Expanded Expanded and condensed traits are mutually exclusive
kCTFontTraitItalic	1	Italic Additional detail available via kCTFontSlantTrait
kCTFontTraitMonoSpace	1024	MonoSpace Use fixed-pitch glyphs if available. May have multiple glyph advances (most CJK glyphs may contain two spaces)
kCTFontTraitUIOptimized	4096	UI optimized Synthesize appropriate attributes for UI rendering such as control titles if necessary
kCTFontTraitVertical	2048	Vertical Use vertical glyph variants and metrics.

Underline Pattern

Constant	Value	Description
kCTUnderlinePatternDash	&h0200	Dash
kCTUnderlinePatternDashDot	&h0300	Dash Dot
kCTUnderlinePatternDashDotDot	&h0400	Dash Dot Dot
kCTUnderlinePatternDot	&h0100	Dot
kCTUnderlinePatternSolid	&h0000	Solid

Underline style specifiers.

Constant	Value	Description
kCTUnderlineStyleDouble	9	Double underlined.
kCTUnderlineStyleNone	0	Not underlined.
kCTUnderlineStyleSingle	1	Single underlined.
kCTUnderlineStyleThick	2	Thick underlined.

Version Constants

Constant	Value	Description
kCTVersionNumber10_5	&h00020000	Mac OS X 10.5
kCTVersionNumber10_5_2	&h00020001	Mac OS X 10.5.2
kCTVersionNumber10_5_3	&h00020002	Mac OS X 10.5.3
kCTVersionNumber10_5_5	&h00020003	Mac OS X 10.5.5
kCTVersionNumber10_6	&h00030000	Mac OS X 10.6
kCTVersionNumber10_7	&h00040000	Mac OS X 10.7
kCTVersionNumber10_8	&h00050000	Mac OS X 10.8
kCTVersionNumber10_9	&h00060000	Mac OS X 10.9

Writing Directions

Constant	Value	Description
kCTWritingDirectionEmbedding	0	
kCTWritingDirectionOverride	1	

63.2 class CTFontCollectionMBS

63.2.1 class CTFontCollectionMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The CTFontCollection opaque type represents a font collection, that is, a group of font descriptors taken together as a single object.
Example:

```
// count the installed fonts and list the first family names
Var collection As CTFontCollectionMBS = CTFontCollectionMBS.CreateFromAvailableFonts(Nil)
Var fonts() As CTFontDescriptorMBS = collection.MatchingFontDescriptors

Var families As New Dictionary
For Each font As CTFontDescriptorMBS In fonts
families.Value(font.FamilyName) = True
Next

MessageBox fonts.Count.ToString + " fonts in " + families.KeyCount.ToString + " families"
```

Notes: Font collections provide the capabilities of font enumeration, access to global and custom font collections, and access to the font descriptors comprising the collection.
Subclass of the CFObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- CoreText Completed

63.2.2 Methods

63.2.3 Available as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether this class is available.
Notes: Returns true in OS X v10.5 and later.

63.2.4 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

63.2.5 CopyWithFontDescriptors(queryDescriptors() as CTFontDescriptorMBS, options as dictionary) as CTFontCollectionMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a copy of the original collection augmented with the given new font descriptors.
Notes: queryDescriptors: An array of font descriptors to augment those of the original collection.
options: The options dictionary.

Returns a copy of the original font collection augmented by the new font descriptors and options.

The new font descriptors are merged with the existing descriptors to create a single set.
Available in OS X v10.5 and later.

63.2.6 CreateCopyWithFontDescriptors(original as CTFontCollectionMBS, queryDescriptors() as CTFontDescriptorMBS, options as dictionary) as CTFontCollectionMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a copy of the original collection augmented with the given new font descriptors.
Notes: queryDescriptors: An array of font descriptors to augment those of the original collection.
options: The options dictionary.

Returns a copy of the original font collection augmented by the new font descriptors and options.

The new font descriptors are merged with the existing descriptors to create a single set.
Available in OS X v10.5 and later.

63.2.7 CreateFromAvailableFonts(options as Dictionary) as CTFontCollectionMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a new font collection containing all available fonts.
Notes: options: The options dictionary.

Returns a new collection containing all fonts available to the current application.

63.2.8 CreateWithFontDescriptors(queryDescriptors() as CTFontDescriptorMBS, options as dictionary) as CTFontCollectionMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a new collection based on the array of font descriptors.
Notes: An array of font descriptors to use for matching.

options: The options dictionary. See constant option keys.
Returns this function creates a new collection based on the provided font descriptors. The contents of this collection is defined by matching the provided descriptors against all available font descriptors.

63.2.9 ExclusionDescriptors as CTFontDescriptorMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the array of descriptors to exclude from the match.

63.2.10 FontAttribute(attributeName as string, options as Integer) as Dictionary()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of font descriptor attribute values.
Notes: attributeName: The attribute to retrieve for each descriptor in the collection.
options: Options to alter the return value.

This function returns a retained reference to an array, or nil on error. The caller is responsible for releasing the array. The array contains one value for each descriptor, in the same order as the results from CreateMatchingDescriptors. When the kCTFontCollectionCopyUnique is set, duplicate values will be removed. When kCTFontCollectionCopyStandardSort is set, the values will be sorted in standard UI order.

- 63.2.11 FontAttribute(attributeNames() as string, options as Integer) as Dictionary() 11526

63.2.11 FontAttribute(attributeNames() as string, options as Integer) as Dictionary()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of dictionaries containing font descriptor attribute values.
Notes: This function returns a retained reference to a array, or nil on error. The caller is responsible

for releasing the array. The array contains one value for each descriptor, in the same order as the results from CreateMatchingDescriptors. When the kCTFontCollectionCopyUnique is set, duplicate values will be removed. When kCTFontCollectionCopyStandardSort is set, the values will be sorted in standard UI order.
See also:

- 63.2.10 FontAttribute(attributeName as string, options as Integer) as Dictionary() 11526

63.2.12 kCTFontCollectionDisallowAutoActivationOption as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the Collection Matching Options.
Notes: Option key to avoid auto-activating fonts.
Specify this option key in the options dictionary with a non-zero value to disallow searches for missing fonts (font descriptors returning no results).

63.2.13 kCTFontCollectionIncludeDisabledFontsOption as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the Collection Matching Options.
Notes: Specify this option key in the options dictionary with a non-zero value to enable matching of disabled fonts. You can pass font descriptors specifying disabled fonts to CTFontManagerEnableFontDescriptors, but you cannot use such a font descriptor to query font attributes from the system database or create a CTFontMBS.

63.2.14 kCTFontCollectionRemoveDuplicatesOption as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the Collection Matching Options.
Notes: Option key to specify filtering of duplicates.

63.2.15 MatchingFontDescriptors(options as dictionary = nil) as CTFontDescriptorMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of font descriptors matching the collection.

63.2.16 MatchingFontDescriptorsForFamily(familyName as string, options as dictionary = nil) as CTFontDescriptorMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of font descriptors matching the specified family, one descriptor for each style in the collection.

63.2.17 MatchingFontDescriptorsSorted(tag as Variant) as CTFontDescriptorMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the array of matching font descriptors sorted with the callback function.
Notes: This function returns an array of font descriptors matching the criteria of the collection and sorted by the results of the sorting callback function.

Calls FontCollectionSortDescriptors in CoreTextMBS class.

63.2.18 MutableCopy as CTMutableFontCollectionMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a mutable copy of the original collection.

63.2.19 QueryDescriptors as CTFontDescriptorMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the array of descriptors to match.

63.2.20 Constants

Bulk attribute access

Constant	Value	Description
kCTFontCollectionCopyDefaultOptions	0	Passing this option indicates that defaults are to be used. Available in OS X v10.7 and later.
kCTFontCollectionCopyStandardSort	2	Passing this option indicates that the return values should be sorted in st UI order, suitable for display to the user. This is the same sorting be used by NSFontPanel and Font Book. Available in OS X v10.7 and later.
kCTFontCollectionCopyUnique	1	Passing this option indicates that duplicate values should be removed fr results. Available in OS X v10.7 and later.

63.3 class CTFontDescriptorMBS

63.3.1 class CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The CTFontDescriptor opaque type represents a font descriptor, that is, a dictionary of attributes (such as name, point size, and variation) that can completely specify a font.
Example:

```
// list all installed styles of the Helvetica Neue font family
Var family As CTFontDescriptorMBS = CTFontDescriptorMBS.CreateWithNameAndSize("HelveticaNeue",
12)
Var mandatory() As String = Array(CTFontDescriptorMBS.kCTFontFamilyNameAttribute)

Var lines() As String
For Each font As CTFontDescriptorMBS In family.MatchingFontDescriptors(mandatory)
lines.Add font.FamilyName + " " + font.StyleName + " (" + font.Name + ")"
Next

MessageBox String.FromArray(lines, EndOfLine)
```

Notes: A font descriptor can be an incomplete specification, in which case the system chooses the most appropriate font to match the given attributes.
Subclass of the CFObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

63.3.2 Methods

63.3.3 AttributeValue(key as string) as Variant

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the value associated with an arbitrary attribute.
Notes: key: The requested attribute.

Returns a attribute value, or nil if the requested attribute is not present.

63.3.4 AttributeValues as Dictionary

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the attributes dictionary of the font descriptor.
Notes: The font descriptor attributes dictionary. This dictionary contains the minimum number of attributes to specify fully this particular font descriptor.

63.3.5 Available as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true in OS X v10.5 and later.

63.3.6 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The private constructor.

63.3.7 CopyWithAttributes(attributeValues as Dictionary) as CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates a copy of the original font descriptor with new attributes.
Notes: attributes: A dictionary containing arbitrary attributes.

Returns a new copy of the original font descriptor with attributes augmented by those specified. If there are conflicts between attributes, the new attributes replace existing ones.

63.3.8 CopyWithFamily(family as String) as CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a new font descriptor in the specified family based on the traits of the original descriptor.
Notes: family: The name of the desired family.

Returns a new font reference with the original traits in the given family, or nil if none found in the system.

63.3.9 CopyWithFeature(featureTypeIdentifier as Integer, featureSelectorIdentifier as Integer) as CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Copies a font descriptor with new feature settings.
Notes: featureTypeIdentifier: The feature type identifier.
featureSelectorIdentifier: The feature selector identifier.

Returns a copy of the original font descriptor modified with the given feature settings.
This is a convenience method to toggle more easily the state of individual features.

63.3.10 CopyWithSymbolicTraits(symTraitValue as Integer, symTraitMask as Integer) as CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a new font descriptor based on the original descriptor having the specified symbolic traits.
Notes: symTraitValue: The value of the symbolic traits. This bitfield is used to indicate the desired value for the traits specified by the symTraitMask parameter. Used in conjunction, they can allow for trait removal as well as addition.
symTraitMask: The mask bits of the symbolic traits. This bitfield is used to indicate the traits that should be changed.

Returns a new font descriptor reference in the same family with the given symbolic traits, or nil if none found in the system.

63.3.11 CopyWithVariation(variationIdentifier as Integer, variationValue as Double) as CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates a copy of the original font descriptor with a new variation instance.
Notes: variationIdentifier: The variation axis identifier. This is the four-character code of the variation axis as a number.
variationValue: The value corresponding with the variation instance.

Returns a copy of the original font descriptor with a new variation instance.

This is a convenience method for easily creating new variation font instances.

63.3.12 CreateCopyWithFamily(orignal as CTFontDescriptorMBS, family as String) as CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a new font descriptor in the specified family based on the traits of the original descriptor.
Notes: original: The original font descriptor reference.
family: The name of the desired family.

Returns a new font reference with the original traits in the given family, or nil if none found in the system.

63.3.13 CreateCopyWithSymbolicTraits(orignal as CTFontDescriptorMBS, symTraitValue as Integer, symTraitMask as Integer) as CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a new font descriptor based on the original descriptor having the specified symbolic traits.
Example:

```
// find PostScript names for a font
const nameOfAFont = "Arial"

Var FontName as string
Var FontFamilyName as string
Var FontPostscriptName as string
Var FontPostscriptNameBold as string
Var FontPostscriptNameItalic as string

Var f as CTFontMBS = CTFontMBS.CreateWithName(nameOfAFont, 13)

if f <>nil then
FontName = f.FullName
FontFamilyName = f.FamilyName
FontPostscriptName = f.PostScriptName

Var d as CTFontDescriptorMBS = f.FontDescriptor

Var db as CTFontDescriptorMBS = CTFontDescriptorMBS.CreateCopyWithSymbolicTraits(d, CoreTextMBS.kCT-
FontTraitBold, CoreTextMBS.kCTFontTraitBold)
Var di as CTFontDescriptorMBS = CTFontDescriptorMBS.CreateCopyWithSymbolicTraits(d, CoreTextMBS.kCT-
```

```
FontTraitItalic, CoreTextMBS.kCTFontTraitItalic)

Var fb as CTFontMBS = f.CreateCopyWithAttributes(f.Size, nil, db)
Var fi as CTFontMBS = f.CreateCopyWithAttributes(f.Size, nil, di)

FontPostscriptNameBold = fb.PostScriptName
FontPostscriptNameItalic = fi.PostScriptName

end if

Break // read names in debugger
```

Notes: original: The original font descriptor reference.
symTraitValue: The value of the symbolic traits. This bitfield is used to indicate the desired value for the traits specified by the symTraitMask parameter. Used in conjunction, they can allow for trait removal as well as addition.
symTraitMask: The mask bits of the symbolic traits. This bitfield is used to indicate the traits that should be changed.

Returns a new font descriptor reference in the same family with the given symbolic traits, or nil if none found in the system.

Requires Mac OS X 10.9 or newer.

63.3.14 CreateWithAttributes(attributeValues as Dictionary) as CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates a new font descriptor reference from a dictionary of attributes.
Notes: The provided attribute dictionary can contain arbitrary attributes that are preserved; however, unrecognized attributes are ignored on font creation and and may not be preserved over the round trip from descriptor to font and back to descriptor.

63.3.15 CreateWithNameAndSize(Name as string, Size as Double = 0.0) as CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates a new font descriptor with the provided PostScript name and size.
Example:

```
Var c as CTFontDescriptorMBS = CTFontDescriptorMBS.CreateWithNameAndSize("Times", 12)
```

MessageBox c.AttributeValue(c.kCTFontFamilyNameAttribute)

Notes: name: The PostScript name to be used for the font descriptor as a string.
size: The point size. If 0.0, the font size attribute (kCTFontSizeAttribute) is omitted from the returned font descriptor.

Return sa new font descriptor reference with the given PostScript name and point size.

63.3.16 kCTFontBaselineAdjustAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to specify or obtain the baseline adjustment for a font reference. This is primarily used when defining font descriptors for a cascade list to keep the baseline of all fonts even. The value associated with this is a float represented as a number.

63.3.17 kCTFontCascadeListAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to specify or obtain the cascade list used for a font reference. The cascade list is a array containing CTFontDescriptorMBS elements. If unspecified, the global cascade list is used.

63.3.18 kCTFontCharacterSetAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to specify or obtain the Unicode character coverage set for a font reference. The value for this key is a CharacterSetMBS object. If specified, this attribute can be used to restrict the font to a subset of its actual character set. If unspecified, this attribute is ignored and the actual character set is used.

63.3.19 kCTFontDescriptorMatchingCurrentAssetSize as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for progressParameter dictionary.
Notes: A number. Total downloaded byte size. Valid during Downloading state.

63.3.20 kCTFontDescriptorMatchingDescriptors as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for progressParameter dictionary.
Notes: Array of descriptors to be queried.
Valid while downloading or when state is kCTFontDescriptorMatchingWillBeginQuerying.

63.3.21 kCTFontDescriptorMatchingError as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for progressParameter dictionary.
Notes: A CFErrorMBS; Valid when state kCTFontDescriptorMatchingDidFailWithError.

63.3.22 kCTFontDescriptorMatchingPercentage as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for progressParameter dictionary.
Notes: A Number; Download progress in 0 - 100. Valid during Downloading state.

63.3.23 kCTFontDescriptorMatchingResult as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for progressParameter dictionary.
Notes: Array of matched font descriptors.
Valid when state is kCTFontDescriptorMatchingDidMatch or CTFontDescriptorMatchingEnd.

63.3.24 kCTFontDescriptorMatchingSourceDescriptor as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for progressParameter dictionary.
Notes: A CTFontDescriptorMBS; The current font descriptor.
Valid when state is kCTFontDescriptorMatchingDidMatch.

63.3.25 kCTFontDescriptorMatchingTotalAssetSize as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for progressParameter dictionary.
Notes: A Number; Total byte size to download.
Always valid, but may be Zero when information is not available.

63.3.26 kCTFontDescriptorMatchingTotalDownloadedSize as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys for progressParameter dictionary.
Notes: A Number; Total downloaded byte size. Valid during Downloading state.

63.3.27 kCTFontDisplayNameAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key for accessing the name used to display the font. Most commonly this is the full name. The value associated with this key is a string. If the value is unspecified, it defaults to Helvetica, and if that font is unavailable, it falls back to the global font cascade list.

63.3.28 kCTFontDownloadableAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: The font downloadable state.
The value associated with this key is a Boolean. If it is true, CoreText attempts to download a font if necessary when matching a descriptor.

63.3.29 kCTFontEnabledAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to obtain the font enabled state. The returned value is an integer represented as a number representing a Boolean value. Unregistered font descriptors return nil, which is equivalent to false.
Available in OS X v10.6 and later.

63.3.30 kCTFontFamilyNameAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key for accessing the font family name from the font descriptor. The value associated with this key is a string.

63.3.31 kCTFontFeaturesAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to specify or obtain the font features for a font reference. The value associated with this key is a array containing font feature dictionaries. This feature list contains the feature information from the 'feat' table of the font. For more information, see Features.
Available in OS X v10.5 and later.

63.3.32 kCTFontFeatureSettingsAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to specify or obtain the font features settings for a font reference. The value associated with this key is a CFArrayRef object containing font feature-setting dictionaries. A feature-setting dictionary contains a tuple of a kCTFontFeatureTypeIdentifierKey key-value pair and a kCTFontFeatureSelectorIdentifierKey key-value pair. Each setting dictionary indicates which setting should be turned on. In the case of duplicate or conflicting setting, the last setting in the list takes precedence. It is the caller's responsibility to handle exclusive and nonexclusive settings as necessary.
Available in OS X v10.5 and later.

63.3.33 kCTFontFixedAdvanceAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to specify a fixed advance to be used for a font reference. If present and specified, this attribute is used to specify a constant advance to override any font values. The value associated with this key is a float represented as a number.
Available in OS X v10.5 and later.

63.3.34 kCTFontFormatAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to specify or obtain the recognized format of the font. The value associated with this key is an integer represented as a number containing one of the constants in "Font Format Constants."
Available in OS X v10.6 and later.

63.3.35 kCTFontLanguagesAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to specify or obtain a list of covered languages for a font reference. The value for this key is an array containing string elements. If specified, this attribute restricts the search to matching fonts that support the specified languages. The language identifier string should conform to the RFC 3066bis standard. If unspecified, this attribute is ignored.
Available in OS X v10.5 and later.

63.3.36 kCTFontMacintoshEncodingsAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to specify or obtain the Macintosh encodings for a font reference. The value associated with this key is a number containing a bit field of the Macintosh encodings. This attribute is provided for legacy compatibility.
Available in OS X v10.5 and later.

63.3.37 kCTFontMatrixAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to specify the font transformation matrix when creating a font. If unspecified it defaults to the unit matrix. The value for this key is a Memoryblock object containing a CGAffineTransform.

63.3.38 kCTFontNameAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key for accessing the PostScript name from the font descriptor. The value associated with this key is a string. If the value is unspecified, it defaults to Helvetica, and if that font is unavailable, it falls back to the global font cascade list.

63.3.39 kCTFontOrientationAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to specify a particular orientation for the glyphs of the font. The value associated with this key is an integer represented as a number containing one of the constants in "Font Orientation Constants." If you want to receive vertical metrics from a font for vertical rendering, specify kCTFontVerticalOrientation. If unspecified, the font uses its native orientation.

63.3.40 kCTFontPriorityAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to specify or obtain the font priority used by font descriptors when resolving duplicates and sorting match results. The value associated with this key is an integer represented as a CFNumberRef object containing one of the values enumerated in "Font Priority Constants." The higher the value, the higher the priority of the font. Only registered fonts have a priority. Unregistered font descriptors return nil.
Available in OS X v10.6 and later.

63.3.41 kCTFontRegistrationScopeAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to specify or obtain the font descriptor's registration scope. The value associated with this key is an integer represented as a number containing one of the CTFontManagerScope enumerated values. A value of nil can be returned for font descriptors that are not registered.
Available in OS X v10.6 and later.

63.3.42 kCTFontSizeAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.

Notes: Key to obtain or specify the font point size. Creating a font with this unspecified will default to a point size of 12.0. The value for this key is represented as a number.

63.3.43 kCTFontStyleNameAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key for accessing the style name of the font. This name represents the designer's description of the font's style. The value associated with this key is a string.

63.3.44 kCTFontTraitsAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key for accessing the dictionary of font traits for stylistic information. See "Font Traits" for the list of font traits. The value associated with this key is a dictionary.

63.3.45 kCTFontURLAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key for accessing the font URL from the font descriptor. The value associated with this key is an URL string.
Available in OS X v10.6 and later.

63.3.46 kCTFontVariationAttribute as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants keys for accessing font attributes from a font descriptor.
Notes: Key to obtain the font variation dictionary instance as a dictionary object. If specified in a font descriptor, fonts with the specified axes are primary match candidates; if no such fonts exist, this attribute is ignored.

63.3.47 LocalizedAttributeValue(key as string, byref lang as string) as Variant

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a localized value for the requested attribute, if available.
Notes: key: The requested font attribute.
lang: On output, contains a reference to the matched language. The language identifier will conform to the RFC 3066bis standard.

Returns a localized attribute value based on the global language list.

This function passes back the matched language in language. If localization is not possible for the attribute, the behavior matches the value returned from AttributeValue. Generally, localization of attributes is applicable to name attributes of only a normalized font descriptor.

63.3.48 MatchingFontDescriptor(mandatoryAttributes() as String) as CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the single preferred matching font descriptor based on the original descriptor and system precedence.
Notes: mandatoryAttributes: A set of attribute keys which must be identically matched in any returned font descriptors.

Returns a normalized font descriptor matching the attributes present in descriptor.

The original descriptor may be returned in normalized form. In the context of font descriptors, normalized infers that the input values were matched up with actual existing fonts, and the descriptors for those existing fonts are the returned normalized descriptors.

63.3.49 MatchingFontDescriptors(mandatoryAttributes() as String) as CTFontDescriptorMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns an array of normalized font descriptors matching the provided descriptor.
Notes: mandatoryAttributes: A set of attribute keys that must be identically matched in any returned font descriptors.

Returns an array of normalized font descriptors matching the attributes present in descriptor.

If descriptor itself is normalized, then the array will contain only one item: the original descriptor. In the context of font descriptors, normalized infers that the input values were matched up with actual existing fonts, and the descriptors for those existing fonts are the returned normalized descriptors.

63.3.50 Properties

63.3.51 DisplayName as String

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The display name.
Example:

```
Var f as CTFontMBS = CTFontMBS.CreateWithName("Times")
Var d as CTFontDescriptorMBS = f.FontDescriptor
MessageBox d.DisplayName
```

Notes: (Read only property)

63.3.52 FamilyName as String

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The family name.
Example:

```
Var f as CTFontMBS = CTFontMBS.CreateWithName("Times")
Var d as CTFontDescriptorMBS = f.FontDescriptor
MessageBox d.FamilyName
```

Notes: (Read only property)

63.3.53 File as FolderItem

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The font file.
Example:

```
Var f as CTFontMBS = CTFontMBS.CreateWithName("Times")
Var d as CTFontDescriptorMBS = f.FontDescriptor
MessageBox d.file.NativePath
```

Notes: (Read only property)

63.3.54 FontSize as Double

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The font size.
Example:

```
Var f as CTFontMBS = CTFontMBS.CreateWithName("Times")
Var d as CTFontDescriptorMBS = f.FontDescriptor
MessageBox str(d.FontSize)
```

Notes: Can be zero if unknown.
(Read only property)

63.3.55 Name as String

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The PostScript name.
Example:

```
Var f as CTFontMBS = CTFontMBS.CreateWithName("Times")
Var d as CTFontDescriptorMBS = f.FontDescriptor
MessageBox d.Name
```

Notes: When matching, this is treated more generically: the system first tries to find fonts with this PostScript name. If none is found, the system tries to find fonts with this family name, and, finally, if still nothing, tries to find fonts with this display name.
(Read only property)

63.3.56 StyleName as String

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The style name.
Example:

```
Var f as CTFontMBS = CTFontMBS.CreateWithName("Times")
Var d as CTFontDescriptorMBS = f.FontDescriptor
MessageBox d.StyleName
```

Notes: This name represents the designer's description of the font's style.
Can be empty if unknown.
(Read only property)

63.3.57 URL as String

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The font URL.
Example:

```
Var f as CTFontMBS = CTFontMBS.CreateWithName("Times")
Var d as CTFontDescriptorMBS = f.FontDescriptor
MessageBox d.URL
```

Notes: (Read only property)

63.3.58 Constants

Font Matching State

Constant	Value	Description
kCTFontDescriptorMatchingDidBegin	0	called once at the beginning.
kCTFontDescriptorMatchingDidFailWithError	8	called when an error occurred. (may be called multiple tim
kCTFontDescriptorMatchingDidFinish	1	called once at the end.
kCTFontDescriptorMatchingDidFinishDownloading	6	Finished downloading a descriptor.
kCTFontDescriptorMatchingDidMatch	7	called when font descriptor is matched.
kCTFontDescriptorMatchingDownloading	5	Downloading a descriptor.
kCTFontDescriptorMatchingStalled	3	called when stalled. (e.g. while waiting for server response.
kCTFontDescriptorMatchingWillBeginDownloading	4	Starts downloading a descriptor. Downloading part may be skipped if all the assets are alrea
kCTFontDescriptorMatchingWillBeginQuerying	2	called once before talking to the server. Skipped if not nec

Formats

Constant	Value	Description
kCTFontFormatBitmap	5	The font is a bitmap only format.
kCTFontFormatOpenTypePostScript	1	The font is an OpenType format containing PostScript data
kCTFontFormatOpenTypeTrueType	2	The font is an OpenType format containing TrueType data.
kCTFontFormatPostScript	4	The font is a recognized PostScript format.
kCTFontFormatTrueType	3	The font is a recognized TrueType format.
kCTFontFormatUnrecognized	0	The font is not a recognized format

Orientations

Constant	Value	Description
kCTFontOrientationDefault	0	Default
kCTFontOrientationHorizontal	1	Horizontal
kCTFontOrientationVertical	2	Vertical

Priorities

Constant	Value	Description
kCTFontPriorityComputer	30000	Priority of computer local fonts (located in /Library/Fonts).
kCTFontPriorityDynamic	50000	Priority of fonts registered dynamically, not located in a standard location (either kCTFontManagerScopeUser, or kCTFontManagerScopeSession).
kCTFontPriorityNetwork	20000	Priority of network fonts (located in /Network/Library/Fonts).
kCTFontPriorityProcess	60000	Priority of fonts registered for the process (kCTFontManagerScopeProcess).
kCTFontPrioritySystem	10000	Priority of system fonts (located in /System/Library/Fonts).
kCTFontPriorityUser	40000	Priority of local fonts (located in user's Library/Fonts).

63.4 class CTFontMBS

63.4.1 class CTFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The CTFont opaque type represents a Core Text font object.
Example:

```
Var c as CTFontMBS = CTFontMBS.CreateWithName("times", 10)
MessageBox c.FullName
```

Notes: Font objects represent fonts to an application, providing access to characteristics of the font, such as point size, transform matrix, and other attributes. Fonts provide assistance in laying out glyphs relative to one another and are used to establish the current font when drawing in a graphics context.
Subclass of the CFObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

63.4.2 Methods

63.4.3 AdvancesForGlyphs(orientation as Integer, glyphs() as Integer) as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Calculates the advances for an array of glyphs and returns the summed advance.
Notes: font: The font reference.
orientation
The intended drawing orientation of the glyphs. Used to determined which glyph metrics to return.
glyphs: An array of count number of glyphs.
advances: An array of count number of CGSizeMBS objects to receive the computed glyph advances. Optional.

Returns the summed glyph advance of an array of glyphs.

Individual glyph advances are passed back via the advances parameter. These are the ideal metrics for each glyph scaled and transformed in font space.
See also:

- 63.4.4 AdvancesForGlyphs(orientation as Integer, glyphs() as Integer, boundingRects() as CGSizeMBS) as Double 11548

63.4.4 AdvancesForGlyphs(orientation as Integer, glyphs() as Integer, boundingRects() as CGSizeMBS) as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Calculates the advances for an array of glyphs and returns the summed advance.
Notes: font: The font reference.
orientation
The intended drawing orientation of the glyphs. Used to determined which glyph metrics to return.
glyphs: An array of count number of glyphs.
advances: An array of count number of CGSizeMBS objects to receive the computed glyph advances. Optional.

Returns the summed glyph advance of an array of glyphs.

Individual glyph advances are passed back via the advances parameter. These are the ideal metrics for each glyph scaled and transformed in font space.
See also:

- 63.4.3 AdvancesForGlyphs(orientation as Integer, glyphs() as Integer) as Double 11547

63.4.5 AttributeValue(key as string) as Variant

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the value associated with an arbitrary attribute of the given font.
Notes: key: The requested attribute.

Returns attribute value or nil if the requested attribute is not present.
Available in OS X v10.5 and later.

63.4.6 Available as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true in OS X v10.5 and later.

63.4.7 AvailableTables(options as Integer) as String()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns an array of font table tags.
Notes: options: The font table options.

Returns an array of Font Table Tag Constants values for the given font and the supplied options.
Available in OS X v10.5 and later.

63.4.8 BoundingRectsForGlyphs(orientation as Integer, glyphs() as Integer) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Calculates the bounding rects for an array of glyphs and returns the overall bounding rectangle for the glyph run.
Notes: font: The font reference.
orientation: The intended drawing orientation of the glyphs. Used to determined which glyph metrics to return.
glyphs: An array of count number of glyphs.
boundingRects: Optional. On output, the computed glyph rectangles in an array of count number of CGRect objects.

Returns the overall bounding rectangle for an array or run of glyphs. Returns CGRectNull on error.

The bounding rectangles of the individual glyphs are returned through the boundingRects parameter. These are the design metrics from the font transformed in font space.
See also:

- 63.4.9 BoundingRectsForGlyphs(orientation as Integer, glyphs() as Integer, boundingRects() as CGRectMBS) as CGRectMBS 11549

63.4.9 BoundingRectsForGlyphs(orientation as Integer, glyphs() as Integer, boundingRects() as CGRectMBS) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Calculates the bounding rects for an array of glyphs and returns the overall bounding rectangle for the glyph run.
Notes: font: The font reference.
orientation: The intended drawing orientation of the glyphs. Used to determined which glyph metrics to return.
glyphs: An array of count number of glyphs.
boundingRects: Optional. On output, the computed glyph rectangles in an array of count number of CGRect objects.

Returns the overall bounding rectangle for an array or run of glyphs. Returns CGRectNull on error.

The bounding rectangles of the individual glyphs are returned through the boundingRects parameter. These are the design metrics from the font transformed in font space.
See also:

- 63.4.8 BoundingRectsForGlyphs(orientation as Integer, glyphs() as Integer) as CGRectMBS 11549

63.4.10 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The private constructor.

63.4.11 CreateCopyWithAttributes(size as Double, Matrix as CGAffineTransformMBS, fontAttributes as CTFontDescriptorMBS) as CTFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a new font with additional attributes based on the original font.
Example:

```
// find PostScript names for a font
const nameOfAFont = "Arial"

Var FontName as string
Var FontFamilyName as string
Var FontPostscriptName as string
Var FontPostscriptNameBold as string
Var FontPostscriptNameItalic as string

Var f as CTFontMBS = CTFontMBS.CreateWithName(nameOfAFont, 13)

if f <>nil then
FontName = f.FullName
FontFamilyName = f.FamilyName
```

```
FontPostscriptName = f.PostScriptName

Var d as CTFontDescriptorMBS = f.FontDescriptor

Var db as CTFontDescriptorMBS = CTFontDescriptorMBS.CreateCopyWithSymbolicTraits(d, CoreTextMBS.kCT-
FontTraitBold, CoreTextMBS.kCTFontTraitBold)
Var di as CTFontDescriptorMBS = CTFontDescriptorMBS.CreateCopyWithSymbolicTraits(d, CoreTextMBS.kCT-
FontTraitItalic, CoreTextMBS.kCTFontTraitItalic)

Var fb as CTFontMBS = f.CreateCopyWithAttributes(f.Size, nil, db)
Var fi as CTFontMBS = f.CreateCopyWithAttributes(f.Size, nil, di)

FontPostscriptNameBold = fb.PostScriptName
FontPostscriptNameItalic = fi.PostScriptName

end if

Break // read names in debugger
```

Notes: size: The point size for the font reference. If 0.0 is specified, the original font,Äôs size is preserved.
matrix: The transformation matrix for the font. In most cases, set this parameter to be nil. If nil is specified, the original font's matrix is preserved.
fontAttributes: A font descriptor containing additional attributes that the new font should contain.

Returns a new font reference converted from the original with the specified attributes.

This function provides a mechanism to change attributes quickly on a given font reference in response to user actions. For instance, the size can be changed in response to a user manipulating a size slider.
Available in OS X v10.5 and later.

63.4.12 CreateForString(text as string, location as Integer, length as Integer) as CTFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a new font reference that can best map the given string range based on the current font.
Notes: string: A unicode string containing characters that cannot be encoded by the current font.
location and length: The range of the string that needs to be mapped.

Returns the best substitute font from the cascade list of the current font that can encode the specified string range. If the current font is capable of encoding the string range, then it is retained and returned.

63.4.13 CreatePathForGlyph(glyph as Integer, transform as CGAffineTransformMBS) as CGPathMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates a path for the specified glyph.
Notes: glyph: The glyph.
transform: An affine transform applied to the path. Can be nil. If nil, CGAffineTransformIdentity is used.

Returns a CGPath object containing the glyph outlines, nil on error. Must be released by caller.

Creates a path from the outlines of the glyph for the specified font. The path reflects the font point size, matrix, and transform parameter, applied in that order. The transform parameter is most commonly be used to provide a translation to the desired glyph origin.

63.4.14 CreateUIFontForLanguage(Type as Integer, size as Double = 0.0, language as string = "") as CTFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the special user-interface font for the given language and user-interface type.
Notes: Type: A constant specifying the intended user-interface use for the requested font reference. See Enumerations for possible values.
size: The point size for the font reference. If 0.0 is specified, the default size for the requested user-interface type is used.
language: Language specifier string to select a font for a particular localization. If "" is specified, the current system language is used. The format of the language identifier should conform to the RFC 3066bis standard.

Returns the correct font for various user-interface uses.
The only required parameter is the Type selector; the other parameters have default values.

63.4.15 CreateWithFamily(size as Double, Matrix as CGAffineTransformMBS, family as string) as CTFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a new font in the specified family based on the traits of the original font.
Notes: size: The point size for the font reference. If 0.0 is specified, the original font,Äôs size is preserved.
matrix: The transformation matrix for the font. In most cases, set this parameter to be nil. If nil is specified, the original font's matrix is preserved.
family: The name of the desired family.

Returns a new font reference with the original traits in the given family, or nil if none is found in the system. Available in OS X v10.5 and later.

63.4.16 CreateWithFontDescriptor(descriptor as CTFontDescriptorMBS, size as Double = 0.0, matrix as CGAffineTransformMBS = nil, options as Integer = 0) as CTFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a new font reference that best matches the given font descriptor.
Notes: descriptor: A font descriptor containing attributes that specify the requested font.
size: The point size for the font reference. If 0.0 is specified, the default font size of 12.0 is used. This parameter is optional.
matrix: The transformation matrix for the font. In most cases, set this parameter to be nil. If nil is specified, the identity matrix is used. This parameter is optional.

Returns a CTFontMBS that best matches the attributes provided with the font descriptor.

The size and matrix parameters override any specified in the font descriptor unless they are unspecified (0.0 for size and NULL for matrix). A best match font is always returned, and default values are used for any unspecified parameters.

63.4.17 CreateWithGraphicsFont(graphicsFont as CGFontMBS, size as Double = 0.0, matrix as CGAffineTransformMBS = nil, attributeValues as CTFontDescriptorMBS = nil) as CTFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates a new font reference from an existing Core Graphics font reference.
Notes: graphicsFont: A valid Core Graphics font reference.
size: The point size for the font reference. If 0.0 is specified the default font size of 12.0 is used.
matrix: The transformation matrix for the font. In most cases, set this parameter to be nil. If nil, the identity matrix is used. Optional.
attributes: Additional attributes that should be matched. Optional.

Returns a new font reference for an existing CGFontRef object with the specified size, matrix, and additional attributes.

63.4.18 CreateWithName(name as string, size as Double = 0.0, matrix as CGAffineTransformMBS = nil, options as Integer = 0) as CTFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a new font reference for the given name.
Example:

```
Var c as CTFontMBS = CTFontMBS.CreateWithName("Times", 12)
MessageBox c.FullName
```

Notes: name: The font name for which you wish to create a new font reference. A valid PostScript name is preferred, although other font name types are matched in a fallback manner.
size: The point size for the font reference. If 0.0 is specified, the default font size of 12.0 is used. This parameter is optional.
matrix: The transformation matrix for the font. In most cases, set this parameter to be nil. If nil is specified, the identity matrix is used. This parameter is optional.

Returns a CTFontRef that best matches the name provided with size and matrix attributes.

The name parameter is the only required parameter, and default values are used for unspecified parameters (0.0 for size and nil for matrix). If all parameters cannot be matched identically, a best match is found.

63.4.19 CreateWithPlatformFont(ATSFontHandle as Integer, size as Double = 0.0, matrix as CGAffineTransformMBS = nil, attributeValues as CTFontDescriptorMBS = nil) as CTFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new font reference from an ATS font reference.
Notes: ATSFontHandle: A valid ATSFontRef object.
size: The point size for the font reference. If 0.0 is specified the default font size of 12.0 is used.
matrix: The transformation matrix for the font. In most cases, set this parameter to be nil. If nil, the identity matrix is used. Optional.
attributes: A CTFontDescriptorMBS containing additional attributes that should be matched. Optional.

Returns a new font reference for an ATSFontRef with the specified size, matrix, and additional attributes.

63.4.20 CreateWithSymbolicTraits(size as Double, Matrix as CGAffineTransformMBS, symTraitValue as Integer, symTraitMask as Integer) as CTFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a new font in the same font family as the original with the specified symbolic traits.
Example:

```
Var helveticaBold as CTFontMBS = CTFontMBS.CreateWithName("Helvetica-Bold", 12)
MessageBox helveticaBold.FullName

// now create similar fonts with

Var Trait as Integer = CoreTextMBS.kCTFontTraitItalic
Var TraitMask as Integer = CoreTextMBS.kCTFontTraitItalic+CoreTextMBS.kCTFontTraitBold

Var helveticaItalic as CTFontMBS = helveticaBold.CreateWithSymbolicTraits(12, nil, Trait, TraitMask)
MessageBox helveticaItalic.FullName
```

Notes: size: The point size for the font reference. If 0.0 is specified, the original font,Äôs size is preserved.
matrix: The transformation matrix for the font. In most cases, set this parameter to be nil. If nil is specified, the original font's matrix is preserved.
symTraitValue: The value of the symbolic traits.
symTraitMask: The mask bits of the symbolic traits.

Returns a new font reference in the same family with the given symbolic traits. or nil if none is found in the system.

Available in OS X v10.5 and later.

63.4.21 DefaultCascadeListForLanguages(languagePrefList() as string) as String()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Return an ordered list of CTFontDescriptorMBS's for font fallback derived from the system default fallback region according to the given language preferences.
Notes: The style of the given is also matched as well as the weight and width of the font is not one of the system UI font, otherwise the UI font fallback is applied.

languagePrefList: The language preference list - ordered array of CFStringRef's of ISO language codes.

The ordered list of fallback fonts - ordered array of CTFontDescriptors.

63.4.22 Draw(glyphs() as Integer, positions() as CGPointMBS, context as CGContextMBS)

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Renders the given glyphs of a font at the specified positions in the supplied graphics context.
Notes: font: The font with glyphs to render. If the font has a size or matrix attribute, context is set with these values.
glyphs: The glyphs to be rendered. The glyphs should be the result of proper Unicode text layout operations (such as with CTLine). Functions such as CTFontMBS.GetGlyphsForCharacters do not perform any Unicode text layout.
positions: The positions (origins) for each glyph in glyphs. The positions are in user space. The number of positions passed in must match the number of glyphs (in glyphs).
context: The graphics context used to render the glyphs.

This function modifies graphics state including font, text size, and text matrix if these attributes are specified in font. These attributes are not restored.

Available in OS X v10.7 and later.

63.4.23 Features as Dictionary()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns an array of font features.
Notes: Returns an array of font feature dictionaries for the font reference.

63.4.24 FeatureSettings as Dictionary()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns an array of font feature-setting tuples.
Notes: Returns a normalized array of font feature-setting dictionaries. The array contains only the non-default settings that should be applied to the font, or nil if the default settings should be used.

A feature-setting dictionary is a tuple of a kCTFontFeatureTypeIdentifierKey key-value pair and a kCTFontFeatureSelectorIdentifierKey key-value pair. Each setting dictionary indicates which setting is enabled. It is the caller's responsibility to handle exclusive and nonexclusive settings as necessary.

The feature settings are verified against those that the font supports and any that do not apply are removed. Further, feature settings that represent a default setting for the font are also removed.

63.4.25 GlyphsForCharacters(characters() as Integer) as Integer()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Provides basic Unicode encoding for the given font, returning by reference an array of CGGlyph values corresponding to a given array of Unicode characters for the given font.
Notes: If a glyph could not be encoded, a value of 0 is passed back at the corresponding index in the glyphs array and the function returns False. It is the responsibility of the caller to handle the Unicode properties of the input characters.

63.4.26 GlyphWithName(name as string) as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the CGGlyph value for the specified glyph name in the given font.
Notes: Name: The glyph name as a CFString object.

Returns the glyph value for the named glyph as a CGGlyph object, or if the glyph name is not recognized, the .notdef glyph index value.
The returned CGGlyph object can be used with any of the subsequent glyph data accessors or directly with Core Graphics.

63.4.27 GraphicsFont(byref fontAttributes as CTFontDescriptorMBS) as CGFontMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a Core Graphics font reference and attributes.
Notes: attributes: On output, points to a font descriptor containing additional attributes from the font.

Returns a CGFontMBS object for the given font reference.

63.4.28 kCTBaselineClassHanging as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Key to reference the Hanging baseline class.
Notes: This key can be used with a baseline info dictionary to offset to the Hanging baseline as a float. It can also be used as the value for kCTBaselineClassAttributeName.

63.4.29 kCTBaselineClassIdeographicCentered as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Key to reference the Ideographic Centered baseline class.
Notes: This key can be used with a baseline info dictionary to offset to the Ideographic Centered baseline as a float. It can also be used as the value for kCTBaselineClassAttributeName.

63.4.30 kCTBaselineClassIdeographicHigh as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Key to reference the Ideographic High baseline class.
Notes: This key can be used with a baseline info dictionary to offset to the Ideographic High baseline as a float. It can also be used as the value for kCTBaselineClassAttributeName.

63.4.31 kCTBaselineClassIdeographicLow as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Key to reference the Ideographic Low baseline class.
Notes: This key can be used with a baseline info dictionary to offset to the Ideographic Low baseline as a float. It can also be used as the value for kCTBaselineClassAttributeName.

63.4.32 kCTBaselineClassMath as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Key to reference the Math baseline class.
Notes: This key can be used with a baseline info dictionary to offset to the Math baseline as a float. It can also be used as the value for kCTBaselineClassAttributeName.

63.4.33 kCTBaselineClassRoman as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Key to reference the Roman baseline class.
Notes: This key can be used with a baseline info dictionary to offset to the Roman baseline as a float. It can also be used as the value for kCTBaselineClassAttributeName.

63.4.34 kCTBaselineOriginalFont as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Use the original font for setting the reference baseline.
Notes: This constant can be used as the value for kCTBaselineReferenceFont to specify that the original font should be used for the reference baseline.

63.4.35 kCTBaselineReferenceFont as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Key to reference a font for the reference baseline.
Notes: This key can be used to specify a font for the reference baseline. The value is a CTFontMBS or the kCTBaselineOriginalFont constant.

63.4.36 kCTFontCopyrightNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the copyright name.

63.4.37 kCTFontDescriptionNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the description name.

63.4.38 kCTFontDesignerNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the designer name.

63.4.39 kCTFontDesignerURLNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the vendor URL name.

63.4.40 kCTFontFamilyNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the family name.

63.4.41 kCTFontFeatureSelectorDefaultKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys to font feature dictionary values.
Notes: Key to be used with a selector dictionary to get the default indicator for the selector. This value is a boolean, which if present and true, indicates that this selector is the default setting for the current feature type.

63.4.42 kCTFontFeatureSelectorIdentifierKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys to font feature dictionary values.
Notes: Key to be used with a selector dictionary corresponding to a feature type to obtain the selector identifier value as a number.

63.4.43 kCTFontFeatureSelectorNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys to font feature dictionary values.
Notes: Key to be used with a selector dictionary to get the localized name string for the selector as a string.

63.4.44 kCTFontFeatureSelectorSettingKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys to font feature dictionary values.
Notes: Key to be used with a selector dictionary to get or specify the current setting for the selector. This

value is a Boolean to indicate whether this selector is on or off. If this key is not present, the default setting is used.

63.4.45 kCTFontFeatureTypeExclusiveKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys to font feature dictionary values.
Notes: Key to get the font feature exclusive setting of the feature as a Boolean. The value associated with this key indicates whether the feature selectors associated with this type should be mutually exclusive.

63.4.46 kCTFontFeatureTypeIdentifierKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys to font feature dictionary values.
Notes: Key to get the font feature type value as a number.

63.4.47 kCTFontFeatureTypeNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys to font feature dictionary values.
Notes: Key to get the localized font feature type name as a string.

63.4.48 kCTFontFeatureTypeSelectorsKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys to font feature dictionary values.
Notes: Key to get the array of font feature selectors as an array. This is an array of selector dictionaries that contain the values for the font feature selector keys listed in this group.

63.4.49 kCTFontFullNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the full name.

63.4.50 kCTFontLicenseNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the license name.

63.4.51 kCTFontLicenseURLNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the license URL name.

63.4.52 kCTFontManufacturerNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the manufacturer name.

63.4.53 kCTFontPostScriptCIDNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the PostScript character identifier (CID) font name.

63.4.54 kCTFontPostScriptNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the PostScript name.

63.4.55 kCTFontSampleTextNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the sample text name string.

63.4.56 kCTFontStyleNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the style name.

63.4.57 kCTFontSubFamilyNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the subfamily name.

63.4.58 kCTFontTrademarkNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the trademark name.

63.4.59 kCTFontUniqueNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the unique name.

63.4.60 kCTFontVariationAxisDefaultValueKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys to font variation axis dictionary.
Notes: Key to get the variation axis default value as a number.

63.4.61 kCTFontVariationAxisIdentifierKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys to font variation axis dictionary.
Notes: Key to get the variation axis identifier value as a number.

63.4.62 kCTFontVariationAxisMaximumValueKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys to font variation axis dictionary.
Notes: Key to get the variation axis maximum value as a number.

63.4.63 kCTFontVariationAxisMinimumValueKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys to font variation axis dictionary.
Notes: Key to get the variation axis minimum value as a number.

63.4.64 kCTFontVariationAxisNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the keys to font variation axis dictionary.
Notes: Key to get the localized variation axis name string.

63.4.65 kCTFontVendorURLNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the vendor URL name.

63.4.66 kCTFontVersionNameKey as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the name specifier constants provide access to the different names associated with a font.
Notes: The name specifier for the version name.

63.4.67 LigatureCaretPositions(glyph as Integer) as Double()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns caret positions within a glyph.
Notes: glyph: A reference to the glyph.

This function is used to obtain caret positions for a specific glyph. The return value is the maximum number of positions possible, and the function will populate the caller's positions buffer with available positions if possible. This function might not be able to produce positions if the font does not have the appropriate data, in which case it will return 0.

63.4.68 Name(nameKey as string) as String

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a reference to the requested name of the given font.
Example:

```
Var c as CTFontMBS = CTFontMBS.CreateWithName("Times", 12)
MessageBox c.name(CTFontMBS.kCTFontFullNameKey)
```

Notes: nameKey: The name specifier. See Name Specifier Constants for possible values.

Returns The requested name for the font, or "" if the font does not have an entry for the requested name. The Unicode version of the name is preferred, otherwise the first available version is returned.
See also:

- 63.4.69 Name(nameKey as string, byref language as string) as String 11565

63.4.69 Name(nameKey as string, byref language as string) as String

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a reference to a localized name for the given font.
Example:

```
Var c as CTFontMBS = CTFontMBS.CreateWithName("Times", 12)
Var lang as string
MessageBox c.name(CTFontMBS.kCTFontFullNameKey, lang)+EndOfLine+lang
```

// shows name and "en" as language.

Notes: nameKey: The name specifier. See Name Specifier Constants for possible values.
language: On output, points to the language string of the returned name string. The format of the language identifier conforms to the RFC 3066bis standard.

Returns a specific localized name from the font reference or "" if the font does not have an entry for the requested name key.

The name is localized based on the user's global language preference precedence. That is, the user,Äôs language preference is a list of languages in order of precedence. So, for example, if the list had Japanese and English, in that order, then a font that did not have Japanese name strings but had English strings would return the English strings.

Available in OS X v10.5 and later.

- 63.4.68 Name(nameKey as string) as String 11565

63.4.70 OpticalBoundsForGlyphs(glyphs() as Integer, boundingRects() as CGRectMBS, options as Integer = 0) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Calculates the optical bounding rects for an array of glyphs and returns the overall optical bounding rect for the run.
Notes: Fonts may specify the optical edges of glyphs that can be used to make the edges of lines of text line up in a more visually pleasing way. This function returns bounding rects corresponding to this information if present in a font, otherwise it returns typographic bounding rects (composed of the font's ascent and descent and a glyph's advance width).

font: The font reference.
glyphs: An array of count number of glyphs.
boundingRects: An array of count number of CGRects to receive the computed glyph rects. Can be nil, in which case only the overall bounding rect is calculated.
options: Reserved, set to zero.

This function returns the overall bounding rectangle for an array or run of glyphs. The bounding rects of the individual glyphs are returned through the boundingRects parameter. These are the design metrics from the font transformed in font space.
See also:

- 63.4.71 OpticalBoundsForGlyphs(glyphs() as Integer, options as Integer = 0) as CGRectMBS 11567

63.4.71 OpticalBoundsForGlyphs(glyphs() as Integer, options as Integer = 0) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Calculates the optical bounding rects for an array of glyphs and returns the overall optical bounding rect for the run.
Notes: Fonts may specify the optical edges of glyphs that can be used to make the edges of lines of text line up in a more visually pleasing way. This function returns bounding rects corresponding to this information if present in a font, otherwise it returns typographic bounding rects (composed of the font's ascent and descent and a glyph's advance width).

font: The font reference.
glyphs: An array of count number of glyphs.
boundingRects: An array of count number of CGRects to receive the computed glyph rects. Can be nil, in which case only the overall bounding rect is calculated.
options: Reserved, set to zero.

This function returns the overall bounding rectangle for an array or run of glyphs. The bounding rects of the individual glyphs are returned through the boundingRects parameter. These are the design metrics from the font transformed in font space.
See also:

- 63.4.70 OpticalBoundsForGlyphs(glyphs() as Integer, boundingRects() as CGRectMBS, options as Integer = 0) as CGRectMBS 11566

63.4.72 PlatformFont(byref fontAttributes as CTFontDescriptorMBS) as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Returns an ATS font reference and attributes.

63.4.73 SupportedLanguages as String()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns an array of languages supported by the font.
Example:

```
Var c as CTFontMBS = CTFontMBS.CreateWithName("Times", 12)
MessageBox Join(c.SupportedLanguages,EndOfLine)
```

63.4.74 Table(table as string, options as Integer) as Memoryblock

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a reference to the font table data.
Notes: table: The font table identifier as a Font Table Tag Constants constant. See Font Table Tag Constants for possible values.
options: The font table options.

Returns a retained reference to the font table data as a Memoryblock.

63.4.75 VariationAxes as Dictionary()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns an array of variation axes.
Example:

```
Var c As CTFontMBS

c = CTFontMBS.CreateWithName("Noto Sans Syriac", 12)

Var axes() As Dictionary = c.VariationAxes
var first as Dictionary = axes(0)

Break
```

Notes: An array of variation axes dictionaries. Each variation axis dictionary contains the five variation axis keys listed in Font Variation Axis Dictionary Keys.

63.4.76 VerticalTranslationsForGlyphs(glyphs() as Integer) as CGSizeMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Calculates the offset from the default (horizontal) origin to the vertical origin for an array of glyphs.
Notes: glyphs: An array of count number of glyphs.
Returns the computed origin offsets in an array of count number of CGSizeMBS objects.

63.4.77 Properties

63.4.78 Ascent as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the scaled font-ascent metric of the given font.
Notes: The font-ascent metric scaled according to the point size and matrix of the font reference.
(Read only property)

63.4.79 BoundingBox as CGRectMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the scaled bounding box of the given font.
Notes: The design bounding box of the font, which is the rectangle defined by xMin, yMin, xMax, and yMax values for the font. Returns CGRectNull on error.
(Read only property)

63.4.80 CapHeight as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the cap-height metric of the given font.
Notes: The font cap-height metric scaled according to the point size and matrix of the font reference.
(Read only property)

63.4.81 CharacterSet as Variant

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the Unicode character set of the font.
Notes: Value is a CFCharacterSetMBS. We use variant to reduce dependency to other plugins.

The returned character set covers the nominal referenced by the font's Unicode 'cmap,Äô table.
(Read only property)

63.4.82 Descent as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the scaled font-descent metric of the given font.
Notes: The font-descent metric scaled according to the point size and matrix of the font reference.
(Read only property)

63.4.83 DisplayName as String

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the display name of the given font.
Example:

```
Var c as CTFontMBS = CTFontMBS.CreateWithName("Times", 12)
MessageBox c.DisplayName
```

Notes: (Read only property)

63.4.84 FamilyName as String

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the family name of the given font.
Example:

```
Var c as CTFontMBS = CTFontMBS.CreateWithName("Times", 12)
MessageBox c.FamilyName
```

Notes: (Read only property)

63.4.85 File as FolderItem

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The font file.
Example:

```
Var f as CTFontMBS = CTFontMBS.CreateWithName("Times")
MessageBox f.file.NativePath
```

Notes: (Read only property)

63.4.86 FontDescriptor as CTFontDescriptorMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the normalized font descriptor for the given font reference.
Notes: A normalized font descriptor for a font containing enough information to recreate this font at a later time.
(Read only property)

63.4.87 FullName as String

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the full name of the given font.
Example:

```
Var c as CTFontMBS = CTFontMBS.CreateWithName("Times", 12)
MessageBox c.FullName
```

Notes: (Read only property)

63.4.88 GlyphCount as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the number of glyphs of the given font.
Notes: (Read only property)

63.4.89 Leading as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the scaled font-leading metric of the given font.
Notes: The font-leading metric scaled according to the point size and matrix of the font reference.
(Read only property)

63.4.90 Matrix as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the transformation matrix of the given font.

Notes: The transformation matrix for the given font reference. This is the matrix that was provided when the font was created.
(Read only property)

63.4.91 PostScriptName as String

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the PostScript name of the given font.
Example:

```
Var c as CTFontMBS = CTFontMBS.CreateWithName("Times", 12)
MessageBox c.PostScriptName
```

Notes: (Read only property)

63.4.92 Size as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the point size of the given font.
Notes: This is the point size provided when the font was created.
(Read only property)

63.4.93 SlantAngle as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the slant angle of the given font.
Notes: The transformed slant angle of the font. This is equivalent to the italic or caret angle with any skew from the transformation matrix applied.
(Read only property)

63.4.94 StringEncoding as UInt32

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the best string encoding for legacy format support.
Notes: The best string encoding for the font.
(Read only property)

63.4.95 SymbolicTraits as UInt32

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the symbolic traits of the given font.
Notes: The symbolic traits of the font. This is equivalent to the kCTFontSymbolicTrait value of the traits dictionary.
(Read only property)

63.4.96 Traits as Dictionary

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the traits dictionary of the given font.
Notes: A retained reference to the font traits dictionary. Individual traits can be accessed with the trait key constants.
(Read only property)

63.4.97 UnderlinePosition as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the scaled underline position of the given font.
Notes: The font underline-position metric scaled according to the point size and matrix of the font reference.
(Read only property)

63.4.98 UnderlineThickness as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the scaled underline-thickness metric of the given font.
Notes: The font underline-thickness metric scaled according to the point size and matrix of the font reference.
(Read only property)

63.4.99 UnitsPerEm as UInt64

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the units-per-em metric of the given font.
Notes: (Read only property)

63.4.100 URL as String

MBS MacCG Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: The font URL.
Example:

```
Var f as CTFontMBS = CTFontMBS.CreateWithName("Times")
MessageBox f.URL
```

Notes: (Read only property)

63.4.101 Variation as Dictionary

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a variation dictionary from the font reference.
Notes: The keys for each variation correspond to the variation identifier obtained via kCTFontVariation-AxisIdentifierKey, which represents the four-character axis code as a number.
(Read only property)

63.4.102 XHeight as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the x-height metric of the given font.
Notes: The font x-height metric scaled according to the point size and matrix of the font reference.
(Read only property)

63.4.103 Constants

Font Option Constants

Constant	Value	Description
kCTFontOptionsDefault	0	Default options are used. Available in OS X v10.6 and later.
kCTFontOptionsPreferSystemFont	4	Font matching prefers to match Apple system fonts. Available in OS X v10.6 and later.
kCTFontOptionsPreventAutoActivation	1	Prevents automatic font activation. Available in OS X v10.6 and later.

Font Table Tag Constants

Constant	Value	Description
kCTFontTableAcnt	"acnt"	Font table tag for accent attachment.
kCTFontTableAnkr	"ankr"	Anchor points
kCTFontTableAvar	"avar"	Font table tag for axis variation.
kCTFontTableBASE	"BASE"	Font table tag for the font baseline.
kCTFontTableBdat	"bdat"	Font table tag for bitmap data.
kCTFontTableBhed	"bhed"	Font table tag for bitmap font header.
kCTFontTableBloc	"bloc"	Font table tag for bitmap location.
kCTFontTableBsln	"bsln"	Font table tag for baseline.
kCTFontTableCFF	"CFF "	Font table tag for a PostScript font program.
kCTFontTableCmap	"cmap"	Font table tag for character-to-glyph mapping.
kCTFontTableCvar	"cvar"	Font table tag for control value variation, or CVT variation.
kCTFontTableCvt	"cvt "	Font table tag for control value table.
kCTFontTableDSIG	"DSIG"	Font table tag for a digital signature.
kCTFontTableEBDT	"EBDT"	Font table tag for an embedded bitmap.
kCTFontTableEBLC	"EBLC"	Font table tag for the embedded bitmap location.
kCTFontTableEBSC	"EBSC"	Font table tag for embedded bitmap scaling.
kCTFontTableFdsc	"fdsc"	Font table tag for font descriptor.
kCTFontTableFeat	"feat"	Font table tag for layout feature.
kCTFontTableFmtx	"fmtx"	Font table tag for font metrics.
kCTFontTableFpgm	"fpgm"	Font table tag for font program.
kCTFontTableFvar	"fvar"	Font table tag for font variation.
kCTFontTableGasp	"gasp"	Font table tag for grid-fitting/scan-conversion.
kCTFontTableGDEF	"GDEF"	Font table tag for glyph definition.
kCTFontTableGlyf	"glyf"	Font table tag for glyph data.
kCTFontTableGPOS	"GPOS"	Font table tag for glyph positioning.
kCTFontTableGSUB	"GSUB"	Font table tag for glyph substitution.
kCTFontTableGvar	"gvar"	Font table tag for glyph variation.
kCTFontTableHdmx	"hdmx"	Font table tag for horizontal device metrics.
kCTFontTableHead	"head"	Font table tag for font header.
kCTFontTableHhea	"hhea"	Font table tag for horizontal header.
kCTFontTableHmtx	"hmtx"	Font table tag for horizontal metrics.
kCTFontTableHsty	"hsty"	Font table tag for horizontal style.
kCTFontTableJSTF	"JSTF"	Font table tag for justification.
kCTFontTableJust	"just"	Font table tag for justification.
kCTFontTableKern	"kern"	Font table tag for kerning.
kCTFontTableKerx	"kerx"	Font table tag for extended kerning.
kCTFontTableLcar	"lcar"	Font table tag for ligature caret.
kCTFontTableLoca	"loca"	Font table tag for index to location.
kCTFontTableLtag	"ltag"	Language tags
kCTFontTableLTSH	"LTSH"	Font table tag for linear threshold.
kCTFontTableMaxp	"maxp"	Font table tag for maximum profile.
kCTFontTableMort	"mort"	Font table tag for morph.
kCTFontTableMorx	"morx"	Font table tag for extended morph.
kCTFontTableName	"name"	Font table tag for naming table.
kCTFontTableOpbd	"opbd"	Font table tag for optical bounds.
kCTFontTableOS2	"OS/2"	Font table tag for OS/2 and Windows-specific metrics.
kCTFontTablePCLT	"PCLT"	Font table tag for PCL 5 data.
kCTFontTablePost	"post"	Font table tag for PostScript information.
kCTFontTablePrep	"prep"	Font table tag for control value program, 'prep' table.
kCTFontTableProp	"prop"	Font table tag for properties.
kCTFontTableSbit	"sbit"	Font table tag for bitmap data. Available in OS X v10.7 and later.
kCTFontTableSbix	"sbix"	Font table tag for extended bitmap data. Available in OS X v10.7 and later.
kCTFontTableTrak	"trak"	Font table tag for tracking.
kCTFontTableVDMX	"VDMX"	Font table tag for vertical device metrics.
kCTFontTableVhea	"vhea"	Font table tag for vertical header.
kCTFontTableVmtx	"vmtx"	Font table tag for vertical metrics.

Font Table Option Constants

Constant	Value	Description
kCTFontTableOptionExcludeSynthetic	1	The font table excludes synthetic font data. Available in OS X v10.5 and later. Deprecated in OS X v10.8.
kCTFontTableOptionNoOptions	0	No font table options are specified.

User Interface Type Constants

Constant	Value	Description
kCTFontUIFontAlertHeader	18	The font used for alert headers.
kCTFontUIFontApplication	9	The default font for text documents.
kCTFontUIFontControlContent	26	The font used for contents of user-interface controls.
kCTFontUIFontEmphasizedSystem	3	The system font used for emphasis in alerts.
kCTFontUIFontEmphasizedSystemDetail	20	The system font used for emphasis in details.
kCTFontUIFontLabel	10	The font used for labels and tick marks on full-size sliders.
kCTFontUIFontMenuItem	12	The font used for menu items.
kCTFontUIFontMenuItemCmdKey	14	The font used for menu-item command-key equivalents.
kCTFontUIFontMenuItemMark	13	The font used to draw menu item marks.
kCTFontUIFontMenuTitle	11	The font used for menu titles.
kCTFontUIFontMessage	23	The font used for standard interface items, such as button labels, mer and so on.
kCTFontUIFontMiniEmphasizedSystem	7	The small system font used for emphasis.
kCTFontUIFontMiniSystem	6	The standard small system font used for informative text in alerts, headings in lists, help tags, and small controls.
kCTFontUIFontNone	-1	The user-interface font type is not specified.
kCTFontUIFontPalette	24	The font used in tool palettes.
kCTFontUIFontPushButton	16	The font used for a push button (a rounded rectangular button wit label on it).
kCTFontUIFontSmallEmphasizedSystem	5	The system font used for emphasis in alerts.
kCTFontUIFontSmallSystem	4	The standard small system font used for informative text in alerts, headings in lists, help tags, and small controls.
kCTFontUIFontSmallToolbar	22	The small font used for labels of toolbar items.
kCTFontUIFontSystem	2	The system font used for standard user-interface items such as butto menu items, and so on.
kCTFontUIFontSystemDetail	19	The standard system font used for details.
kCTFontUIFontToolbar	21	The font used for labels of toolbar items.
kCTFontUIFontToolTip	25	The font used for tool tips.
kCTFontUIFontUser	0	The font used by default for documents and other text under the control (that is, text whose font the user can normally change).
kCTFontUIFontUserFixedPitch	1	The font used by default for documents and other text under the control when that font is fixed-pitch. Available in OS X v10.5 and later.
kCTFontUIFontUtilityWindowTitle	17	The font used for utility window titles.
kCTFontUIFontViews	8	The view font used as the default font of text in lists and tables.
kCTFontUIFontWindowTitle	15	The font used for utility window titles.

63.5 class CTFrameMBS

63.5.1 class CTFrameMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The CTFrame opaque type represents a frame containing multiple lines of text.
Example:

```
Var longText as string = "Lorem ipsum dolor sit amet..."

Var ct as new CFStringMBS(longText)
Var s as new CFAttributedStringMBS(ct, nil)

// layout master
Var framesetter as CTFramesetterMBS = CTFramesetterMBS.CreateWithAttributedString(s)

// a column
Var ColumnPath as new CGMutablePathMBS
Var Rect as new CGRectMBS(0, 0, g.Width, g.Height)
ColumnPath.AddRect nil, Rect

// context
#If XojoVersion >= 2019.02 Then
Var CGContextHandle As ptr = g.Handle(Graphics.HandleTypes.CGContextRef)
Var CGContext As CGContextMBS = CGContextMBS.contextWithCGContext(CGContextHandle)
#Else
Var CGContextHandle As Integer = g.Handle(g.HandleTypeCGContextRef)
Var CGContext As CGContextMBS = CGContextMBS.contextWithCGContext(CGContextHandle)
#EndIf

CGContext.SaveGState
// reset text matrix
Var a as CGAffineTransformMBS = CGAffineTransformMBS.Identity
CGContext.TextMatrix = a

Var Frame as CTFrameMBS = framesetter.CreateFrame(0, 0, ColumnPath, nil)

// draw
Frame.Draw(CGContext)

// cleanup
CGContext.RestoreGState
CGContext.Flush
```

Notes: The frame object is the output resulting from the text-framing process performed by a framesetter object.

You can draw the entire text frame directly into the current graphic context. The frame object contains an array of line objects that can be retrieved for individual rendering or to get glyph information.
Subclass of the CFObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- CoreText Completed

63.5.2 Methods

63.5.3 Available as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true in OS X v10.5 and later.

63.5.4 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The private constructor.

63.5.5 Draw(context as CGContextMBS)

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Draws an entire frame into a context.
Notes: context: The context in which to draw the frame.

If both the frame and the context are valid, the frame is drawn in the context. This call can leave the context in any state and does not flush it after the draw operation.

63.5.6 kCTFrameClippingPathsAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the attributes keys.
Notes: Specifies array of paths to clip frame.

The value must be a array containing dictionaries. Each dictionary should have a kCTFramePathClipping-PathAttributeName key-value pair, and can have a kCTFramePathFillRuleAttributeName key-value pair and kCTFramePathFillRuleAttributeName key-value pair as optional parameters.
Available in OS X v10.7 and later.

63.5.7 kCTFramePathClippingPathAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the attributes keys.
Notes: Specifies clipping path. This attribute is valid only in a dictionary contained in an array specified by kCTFrameClippingPathsAttributeName.

The value must be a CGPathMBS specifying a clipping pat. See kCTFrameClippingPathsAttributeName.
Available in OS X v10.7 and later.

63.5.8 kCTFramePathFillRuleAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The key used to specify the fill rule for a frame.
Notes: he value must be a CFNumberRef object containing a CTFramePathFillRule constant. See CT-FramePathFillRule Constants for more information. The default value is kCTFramePathFillEvenOdd.
Available in OS X v10.7 and later.

63.5.9 kCTFramePathWidthAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the attributes keys.
Notes: The key used to specify the frame width.
The value must be a number containing a value specifying the frame width. The default width value is zero.
Available in OS X v10.7 and later.

63.5.10 kCTFrameProgressionAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the attributes keys.
Notes: Specifies progression for a frame.
A number containing a CTFrameProgression constant. The default is kCTFrameProgressionTopToBottom.

Available in OS X v10.5 and later.

This value determines the line-stacking behavior for a frame and does not affect the appearance of the glyphs within that frame.

63.5.11 LineOrigins(location as Integer, length as Integer) as CGPointMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Copies a range of line origins for a frame.
Notes: location and length: The range of line origins you wish to copy. If the length of the range is 0, then the copy operation continues from the start index of the range to the last line origin.

Returns array with CGPoints. Empty array in case of errors.

Special Considerations
In versions of OS X prior to 10.7 and versions of iOS prior to 4.2, this function may function unpredictably if the frame is not rectangular.

63.5.12 Lines as CTLineMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns an array of lines stored in the frame.

63.5.13 Properties

63.5.14 FrameAttributes as Dictionary

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the frame attributes used to create the frame.
Notes: Returns a reference to a CFDictionary object containing the frame attributes that were used to create the frame, or, if the frame was created without any frame attributes, nil.

You can create a frame with an attributes dictionary to control various aspects of the framing process. These attributes are different from the ones used to create an attributed string.
(Read only property)

63.5.15 Path as CGPathMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the path used to create the frame.
Notes: (Read only property)

63.5.16 StringRangeLength as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the range of characters originally requested to fill the frame.
Notes: (Read only property)

63.5.17 StringRangeLocation as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the range of characters originally requested to fill the frame.
Notes: (Read only property)

63.5.18 VisibleStringRangeLength as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the range of characters that actually fit in the frame.
Notes: This function can be used to cascade frames, because it returns the range of characters that can be seen in the frame. The next frame would start where this frame ends.
(Read only property)

63.5.19 VisibleStringRangeLocation as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the range of characters that actually fit in the frame.
Notes: This function can be used to cascade frames, because it returns the range of characters that can be seen in the frame. The next frame would start where this frame ends.
(Read only property)

63.5.20 Constants

Fill rules

Constant	Value	Description
kCTFramePathFillEvenOdd	0	Text is filled in the area that would be painted if the path were given CGContextMBS.EOFillPath. Available in OS X v10.7 and later.
kCTFramePathFillWindingNumber	1	Text is fill in the area that would be painted if the path were given to CGC textMBS.FillPath. Available in OS X v10.7 and later.

Frame Progression Types

Constant	Value	Description
kCTFrameProgressionLeftToRight	2	Lines are stacked left to right for vertical text. The lines of text within a frame may be stacked for either horizontal or vert text. Values are enumerated for each stacking type supported by CTFra Frames created with a progression type specifying vertical text rotate lines degrees counterclockwise when drawing.
kCTFrameProgressionRightToLeft	1	Lines are stacked right to left for vertical text. The lines of text within a frame may be stacked for either horizontal or vert text. Values are enumerated for each stacking type supported by CTFra Frames created with a progression type specifying vertical text rotate lines degrees counterclockwise when drawing.
kCTFrameProgressionTopToBottom	0	Lines are stacked top to bottom for horizontal text. The lines of text within a frame may be stacked for either horizontal or vert text. Values are enumerated for each stacking type supported by CTFra Frames created with a progression type specifying vertical text rotate lines degrees counterclockwise when drawing.

63.6 class CTFramesetterMBS

63.6.1 class CTFramesetterMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The CTFramesetter opaque type is used to generate text frames. That is, CTFramesetter is an object factory for CTFrame objects.
Notes: The framesetter takes an attributed string object and a shape descriptor object and calls into the typesetter to create line objects that fill that shape. The output is a frame object containing an array of lines. The frame can then draw itself directly into the current graphic context.
Subclass of the CFObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- CoreText Completed

63.6.2 Methods

63.6.3 Available as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true in OS X v10.5 and later.

63.6.4 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The private constructor.

63.6.5 CreateFrame(location as Integer, length as Integer, path as CGPathMBS, frameAttributes as dictionary = nil) as CTFrameMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates an immutable frame using a framesetter.
Notes: location and length: The range, of the attributed string that was used to create the framesetter, that is to be typeset in lines fitted into the frame. If the length portion of the range is set to 0, then the framesetter continues to add lines until it runs out of text or space.
path: A CGPath object that specifies the shape of the frame. The path may be non-rectangular in versions of OS X v10.7 or later and versions of iOS 4.2 or later.

frameAttributes: Additional attributes that control the frame filling process can be specified here, or nil if there are no such attributes.

Returns a reference to a new CTFrame object if the call was successful; otherwise, nil.

This call creates a frame full of glyphs in the shape of the path provided by the path parameter. The framesetter continues to fill the frame until it either runs out of text or it finds that text no longer fits.

Special Considerations
In versions of OS X prior to 10.7 and versions of iOS prior to 4.2, this function returns NULL if the CGPath specified by the path parameter is not rectangular.

63.6.6 CreateWithAttributedString(s as CFAttributedStringMBS) as CTFramesetterMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates an immutable framesetter object from an attributed string.
Notes: s: The attributed string with which to construct the framesetter object.

Returns a reference to a CTFramesetter object if the call was successful; otherwise, NULL.
The resultant framesetter object can be used to create and fill text frames with the CreateFrame call.

63.6.7 SuggestFrameSizeWithConstraints(location as Integer, length as Integer, frameAttributes as dictionary, constraints as CGSizeMBS, byref fitRangeLocation as Integer, byref fitRangeLength as Integer) as CGSizeMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Determines the frame size needed for a string range.
Notes: location and length: The string range to which the frame size applies. The string range is a range over the string used to create the framesetter. If the length portion of the range is set to 0, then the framesetter continues to add lines until it runs out of text or space.
frameAttributes: Additional attributes that control the frame filling process, or NULL if there are no such attributes.
constraints: The width and height to which the frame size is constrained. A value of CGFLOAT_MAX for either dimension indicates that it should be treated as unconstrained.
fitRange: On return, contains the range of the string that actually fit in the constrained size.

Returns the actual dimensions for the given string range and constraints.

This function can be used to determine how much space is needed to display a string, optionally by constraining the space along either dimension.
Available in OS X v10.5 and later.

63.6.8 Properties

63.6.9 TypeSetter as CTTypesetterMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the typesetter object being used by the framesetter.
Notes: Return sa reference to a CTTypesetter object if the call was successful; otherwise, nil. The framesetter maintains a reference to the returned object, which should not be released by the caller.

Each framesetter uses a typesetter internally to perform line breaking and other contextual analysis based on the characters in a string; this function returns the typesetter being used by a particular framesetter in case the caller would like to perform other operations on that typesetter.

Available in OS X v10.5 and later.
(Read only property)

63.7 class CTGlyphInfoMBS

63.7.1 class CTGlyphInfoMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The CTGlyphInfo opaque type enables you to override a font's specified mapping from Unicode to the glyph ID.
Example:

```
// look up the name of a glyph in a font
Var font As CTFontMBS = CTFontMBS.CreateWithName("Helvetica", 24)
Var info As CTGlyphInfoMBS = CTGlyphInfoMBS.CreateWithGlyph(36, font, "A")
If info <>Nil Then MessageBox "Glyph name: " + info.GlyphName
```

Notes: Subclass of the CFObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- CoreText Completed

63.7.2 Methods

63.7.3 Available as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true in OS X v10.5 and later.

63.7.4 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The private constructor.

63.7.5 CreateWithCharacterIdentifier(cid as Integer, collection as Integer, baseString as string) as CTGlyphInfoMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates an immutable glyph info object with a character identifier.
Notes: cid: A character identifier.

collection: A character collection identifier.
baseString: The part of the string the returned object is intended to override.

Returns a valid reference to an immutable CTGlyphInfoMBS object if glyph info creation was successful; otherwise, nil.

This function creates an immutable glyph info object for a character identifier and a character collection.
Available in OS X v10.5 and later.

63.7.6 CreateWithGlyph(glyph as Integer, font as CTFontMBS, baseString as string) as CTGlyphInfoMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates an immutable glyph info object with a glyph index.
Notes: glyph: The index of the glyph.
font: The font to be associated with the returned CTGlyphInfoMBS object.
baseString: The part of the string the returned object is intended to override.

Returns a valid reference to an immutable CTGlyphInfoMBS object, If glyph info creation was successful; otherwise, nil.

This function creates an immutable glyph info object for a glyph index using a specified font.
Available in OS X v10.5 and later.

63.7.7 CreateWithGlyphName(glyphName as string, font as CTFontMBS, baseString as string) as CTGlyphInfoMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates an immutable glyph info object with a glyph name.
Notes: glyphName: The name of the glyph.
font: The font to be associated with the returned CTGlyphInfo object.
baseString: The part of the string the returned object is intended to override.

Returns a valid reference to an immutable CTGlyphInfo object if glyph info creation was successful; otherwise, nil.
This function creates an immutable glyph info object for a glyph name such as copyright using a specified font.
Available in OS X v10.5 and later.

63.7.8 Properties

63.7.9 CharacterCollection as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Gets the character collection for a glyph info object.
Notes: If the glyph info object was created with a glyph name or a glyph index, its character collection is kCTIdentityMappingCharacterCollection.
(Read only property)

63.7.10 CharacterIdentifier as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Gets the character identifier for a glyph info object.
Notes: (Read only property)

63.7.11 GlyphName as String

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Gets the glyph name for a glyph info object if that object exists.
Notes: (Read only property)

63.7.12 Constants

Character Collection

Constant	Value	Description
kCTAdobeCNS1CharacterCollection	1	The Adobe-CNS1 mapping.
kCTAdobeGB1CharacterCollection	2	The Adobe-GB1 mapping.
kCTAdobeJapan1CharacterCollection	3	The Adobe-Japan1 mapping.
kCTAdobeJapan2CharacterCollection	4	The Adobe-Japan2 mapping.
kCTAdobeKorea1CharacterCollection	5	The Adobe-Korea1 mapping.
kCTCharacterCollectionAdobeCNS1	1	The Adobe-CNS1 mapping.
kCTCharacterCollectionAdobeGB1	2	The Adobe-GB1 mapping.
kCTCharacterCollectionAdobeJapan1	3	The Adobe-Japan1 mapping.
kCTCharacterCollectionAdobeJapan2	4	The Adobe-Japan2 mapping.
kCTCharacterCollectionAdobeKorea1	5	The Adobe-Korea1 mapping.
kCTCharacterCollectionIdentityMapping	0	The character identifier is equal to the CGGlyph glyph index.
kCTIdentityMappingCharacterCollection	0	The character identifier is equal to the CGGlyph glyph index.

63.8 class CTLineMBS

63.8.1 class CTLineMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The CTLine opaque type represents a line of text.
Example:

```
Sub Paint(g As Graphics)
// inside paint event of a Canvas

// create a font, quasi systemFontWithSize:24.0
Var sysUIFont as CTFontMBS = CTFontMBS.CreateUIFontForLanguage(CTFontMBS.kCTFontUIFontSystem, 24.0)

// create a naked string
Var text as string = "Some Text."

// blue
Var cgColor as CGColorMBS = CGColorMBS.CreateGenericRGB(0.0, 0.0, 1.0)

// single underline
Var underline as Integer = CoreTextMBS.kCTUnderlineStyleSingle

// pack it into attributes dictionary
Var attributesDict as new Dictionary
attributesDict.Value(CoreTextMBS.kCTFontAttributeName) = sysUIFont
attributesDict.Value(CoreTextMBS.kCTForegroundColorAttributeName) = cgColor
attributesDict.Value(CoreTextMBS.kCTUnderlineStyleAttributeName) = underline

// make the attributed string
Var cfDic as new CFDictionaryMBS(attributesDict)
Var cfStr as new CFStringMBS(text)
Var stringToDraw as CFAttributedStringMBS = CFAttributedStringMBS.Create( cfStr, cfDic)

// now for the actual drawing

#If XojoVersion >= 2019.02 Then
Var CGContextHandle As ptr = g.Handle(Graphics.HandleTypes.CGContextRef)
Var CGContext As CGContextMBS = CGContextMBS.contextWithCGContext(CGContextHandle)
#Else
Var CGContextHandle As Integer = g.Handle(g.HandleTypeCGContextRef)
Var CGContext As CGContextMBS = CGContextMBS.contextWithCGContext(CGContextHandle)
#EndIf

CGContext.SaveGState
```

```
// reset text matrix
Var a as CGAffineTransformMBS = CGAffineTransformMBS.Identity
CGContext.TextMatrix = a

// draw
Var line as CTLineMBS = CTLineMBS.CreateWithAttributedString(stringToDraw)

Var x as Integer = 10
Var y as Integer = 10

// plus text height
y = y + 24

// swap y
y = g.Height - y

CGContext.TextPosition = new CGPointMBS(x, y)
line.Draw(CGContext)

CGContext.RestoreGState
CGContext.Flush
End Sub
```

Notes: A CTLine object contains an array of glyph runs. Line objects are created by the typesetter during a framesetting operation and can draw themselves directly into a graphics context.
Subclass of the CFObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- CoreText Completed

63.8.2 Methods

63.8.3 Available as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true in OS X v10.5 and later.

63.8.4 Bounds(options as Integer = 0) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Queries bounds.

63.8.5 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The private constructor.

63.8.6 CreateJustifiedLine(justificationFactor as Double, justificationWidth as Double) as CTLineMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates a justified line from an existing line.
Notes: line: The line from which to create a justified line.
justificationFactor: Full or partial justification. When set to 1.0 or greater, full justification is performed. If this parameter is set to less than 1.0, varying degrees of partial justification are performed. If it is set to 0 or less, no justification is performed.
justificationWidth: The width to which the resultant line is justified. If justificationWidth is less than the actual width of the line, then negative justification is performed (that is, glyphs are squeezed together).

Returns a reference to a justified CTLine object if the call was successful; otherwise, nil.
Available in OS X v10.5 and later.

63.8.7 CreateTruncatedLine(width as Double, truncationType as Integer, truncationToken as CTLineMBS = nil) as CTLineMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates a truncated line from an existing line.
Notes: line: The line from which to create a truncated line.
width: The width at which truncation begins. The line is truncated if its width is greater than the width passed in this parameter.
truncationType: The type of truncation to perform if needed. See constants for possible values.
truncationToken: This token is added at the point where truncation took place, to indicate that the line was truncated. Usually, the truncation token is the ellipsis character (U+2026). If this parameter is set to nil, then no truncation token is used and the line is simply cut off.

Returns a reference to a truncated CTLine object if the call was successful; otherwise, NULL.

The line specified in truncationToken should have a width less than the width specified by the width param-

eter. If the width of the line specified in truncationToken is greater than width and truncation is needed, the function returns nil.

Available in OS X v10.5 and later.

63.8.8 CreateWithAttributedString(s as CFAttributedStringMBS) as CTLineMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates a single immutable line object directly from an attributed string.
Notes: s: The string from which the line is created.

Returns a reference to a CTLine object if the call was successful; otherwise, nil.

This function allows clients who need very simple line generation to create a line without creating a typesetter object. The typesetting is done under the hood. Without a typesetter object, the line cannot be properly broken. However, for simple things like text labels, line breaking is not an issue.
Available in OS X v10.5 and later.

63.8.9 Draw(context as CGContextMBS)

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Draws a complete line.
Notes: context: The context into which the line is drawn.

This is a convenience function because the line could be drawn run-by-run by getting the glyph runs, getting the glyphs out of them, and calling a function such as CGContextMBS.ShowGlyphsAtPositions. This call can leave the graphics context in any state and does not flush the context after the draw operation.

Available in OS X v10.5 and later.

63.8.10 GlyphRuns as CTRunMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the array of glyph runs that make up the line object.
Notes: Returns an array containing the CTRunMBS objects that make up the line.
Available in OS X v10.5 and later.

63.8.11 ImageBounds(context as CGContextMBS) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Calculates the image bounds for a line.
Notes: context: The context for which the image bounds are calculated. This is required because the context could have settings in it that would cause changes in the image bounds.

Returns a rectangle that tightly encloses the paths of the line's glyphs, or, if the line or context is invalid, CGRectNull.
Available in OS X v10.5 and later.

63.8.12 OffsetForStringIndex(charIndex as Integer, byref secondaryOffset as Double) as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Determines the graphical offset or offsets for a string index.
Notes: charIndex: The string index corresponding to the desired position.
secondaryOffset: On output, the secondary offset along the baseline for charIndex. When a single caret is sufficient for a string index, this value will be the same as the primary offset, which is the return value of this function. May be NULL.

Returns the primary offset along the baseline for charIndex, or 0.0 if the line does not support string access.

This function returns the graphical offset or offsets corresponding to a string index, suitable for movement between adjacent lines or for drawing a custom caret. For moving between adjacent lines, the primary offset can be adjusted for any relative indentation of the two lines; a CGPoint constructed with the adjusted offset for its x value and 0.0 for its y value is suitable for passing to CTLineGetStringIndexForPosition. For drawing a custom caret, the returned primary offset corresponds to the portion of the caret that represents the visual insertion location for a character whose direction matches the line's writing direction.

Available in OS X v10.5 and later.

63.8.13 PenOffsetForFlush(flushFactor as Double, flushWidth as Double) as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Gets the pen offset required to draw flush text.
Notes: flushFactor: Determines the type of flushness. A flushFactor of 0 or less indicates left flush. A flushFactor of 1.0 or more indicates right flush. Flush factors between 0 and 1.0 indicate varying degrees of

center flush, with a value of 0.5 being totally center flush.
flushWidth: Specifies the width to which the flushness operation should apply.

Returns the offset from the current pen position for the flush operation.
Available in OS X v10.5 and later.

63.8.14 StringIndexForPosition(position as CGPointMBS) as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Performs hit testing.
Notes: position: The location of the mouse click relative to the line's origin.

Returns the string index for the position, or if the line does not support string access, kCFNotFound. Relative to the line's string range, this value can be no less than the first string index and no greater than the last string index plus 1.

This function can be used to determine the string index for a mouse click or other event. This string index corresponds to the character before which the next character should be inserted. This determination is made by analyzing the string from which a typesetter was created and the corresponding glyphs as embodied by a particular line.
Available in OS X v10.5 and later.

63.8.15 TypographicBounds(byref ascent as Double, byref descent as Double, byref leading as Double) as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Calculates the typographic bounds of a line.
Notes: ascent: On output, the ascent of the line.
descent: On output, the descent of the line.
leading: On output, the leading of the line.

Returns the typographic width of the line. If the line is invalid, this function returns 0.

63.8.16 Properties

63.8.17 GlyphCount as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the total glyph count for the line object.
Notes: The total glyph count is equal to the sum of all of the glyphs in the glyph runs forming the line.
(Read only property)

63.8.18 StringRangeLength as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Gets the range of characters that originally spawned the glyphs in the line.
Notes: (Read only property)

63.8.19 StringRangeLocation as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Gets the range of characters that originally spawned the glyphs in the line.
Notes: (Read only property)

63.8.20 TrailingWhitespaceWidth as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the trailing whitespace width for a line.
Notes: The width of the line's trailing whitespace. If the line is invalid, this function will always return zero.

Creating a line for a width can result in a line that is actually longer than the desired width due to trailing whitespace. Although this is typically not an issue due to whitespace being invisible, this function can be used to determine what amount of a line's width is due to trailing whitespace.
Available in OS X v10.5 and later.
(Read only property)

63.8.21 Constants

Line Bounds

Constant	Value	Description
kCTLineBoundsExcludeTypographicLeading	1	Pass this option to exclude typographic leading.
kCTLineBoundsExcludeTypographicShifts	2	Pass this option to ignore cross-stream shifts due to positioning (suc or baseline alignment).
kCTLineBoundsUseGlyphPathBounds	8	Pass this option to use glyph path bounds rather than the default bounds.
kCTLineBoundsUseHangingPunctuation	4	Normally line bounds include all glyphs; pass this option to tre punctuation hanging off either end of the line as fully hanging.
kCTLineBoundsUseOpticalBounds	16	Pass this option to use optical bounds. This option overrides kCT sUseGlyphPathBounds.

Truncate Types

Constant	Value	Description
kCTLineTruncationEnd	1	Truncate the end of the line, leaving the start portion visible.
kCTLineTruncationMiddle	2	Truncate the middle of the line, leaving both the start and the end portions visible.
kCTLineTruncationStart	0	Truncate the beginning of the line, leaving the end portion visible.

63.9 class CTMutableFontCollectionMBS

63.9.1 class CTMutableFontCollectionMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The mutable font collection class.
Notes: Subclass of the CTFontCollectionMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- CoreText Completed

63.9.2 Methods

63.9.3 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

63.9.4 SetExclusionDescriptors(descriptors() as CTFontDescriptorMBS)

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Replaces the array of descriptors to exclude from the match.

63.9.5 SetQueryDescriptors(descriptors() as CTFontDescriptorMBS)

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Replaces the array of descriptors to match.

63.10 class CTParagraphStyleMBS

63.10.1 class CTParagraphStyleMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The CTParagraphStyle opaque type represents paragraph or ruler attributes in an attributed string.
Example:

```
// create a centered paragraph style with extra spacing after each paragraph
Var settings() As CTParagraphStyleSettingMBS

Var alignment As New CTParagraphStyleSettingMBS
alignment.Spec = CTParagraphStyleMBS.kCTParagraphStyleSpecifierAlignment
alignment.intValue = CTParagraphStyleMBS.kCTTextAlignmentCenter
settings.Add alignment

Var spacing As New CTParagraphStyleSettingMBS
spacing.Spec = CTParagraphStyleMBS.kCTParagraphStyleSpecifierParagraphSpacing
spacing.doubleValue = 12.0
settings.Add spacing

Var style As CTParagraphStyleMBS = CTParagraphStyleMBS.Create(settings)
MessageBox "Alignment: " + style.Alignment.ToString + EndOfLine + _
"Paragraph spacing: " + style.ParagraphSpacing.ToString
```

Notes: A paragraph style object represents a complex attribute value in an attributed string, storing a number of subattributes that affect paragraph layout for the characters of the string. Among these subattributes are alignment, tab stops, writing direction, line-breaking mode, and indentation settings.
Subclass of the CFObjectMBS class.

- CoreText Completed

63.10.2 Methods

63.10.3 Available as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true in OS X v10.5 and later.

63.10.4 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates an immutable paragraph style.
Notes: Returns a valid reference to an immutable CTParagraphStyle object, If the paragraph style creation was successful; otherwise, nil.

Using this function is the easiest and most efficient way to create a paragraph style. Paragraph styles should be kept immutable for totally lock-free operation. If an invalid paragraph style setting specifier is passed into the settings parameter, nothing bad will happen, but you will be unable to query for this value. The reason is to allow backward compatibility with style setting specifiers that may be introduced in future versions.

Available in OS X v10.5 and later.

63.10.5 Create as CTParagraphStyleMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates an immutable paragraph style.
Notes: Returns a valid reference to an immutable CTParagraphStyle object, If the paragraph style creation was successful; otherwise, nil.

Using this function is the easiest and most efficient way to create a paragraph style. Paragraph styles should be kept immutable for totally lock-free operation. If an invalid paragraph style setting specifier is passed into the settings parameter, nothing bad will happen, but you will be unable to query for this value. The reason is to allow backward compatibility with style setting specifiers that may be introduced in future versions.

Available in OS X v10.5 and later.
See also:

- 63.10.6 Create(settings() as CTParagraphStyleSettingMBS) as CTParagraphStyleMBS 11599

63.10.6 Create(settings() as CTParagraphStyleSettingMBS) as CTParagraphStyleMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates an immutable paragraph style.
Notes: settings: The settings with which to preload the paragraph style.

Returns a valid reference to an immutable CTParagraphStyle object, If the paragraph style creation was successful; otherwise, nil.

Using this function is the easiest and most efficient way to create a paragraph style. Paragraph styles should be kept immutable for totally lock-free operation. If an invalid paragraph style setting specifier is passed into the settings parameter, nothing bad will happen, but you will be unable to query for this value. The reason is to allow backward compatibility with style setting specifiers that may be introduced in future versions.

Available in OS X v10.5 and later.
See also:

- 63.10.5 Create as CTParagraphStyleMBS 11599

63.10.7 CreateCopy as CTParagraphStyleMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates an immutable copy of a paragraph style.
Notes: A valid reference to an immutable CTParagraphStyle object that is a copy of the one passed into paragraphStyle, If the paragraphStyle reference is valid; otherwise nil, if any error occurred, including being supplied with an invalid reference.

63.10.8 CreateWithAlignment(Alignment as Integer) as CTParagraphStyleMBS

MBS MacCG Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Creates an immutable paragraph style.
Example:

```
Var a as Integer
Var t as CTParagraphStyleMBS

a = CTParagraphStyleMBS.kCTTextAlignmentRight
t = CTParagraphStyleMBS.CreateWithAlignment(a)

MessageBox str(T.Alignment) // shows 1
```

63.10.9 TabStops as CTTextTabMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The CTTextTab objects, sorted by location, that define the tab stops for the paragraph style.
Notes: Type: Array of CTTextTabMBS. Default: 12 left-aligned tabs, spaced by 28.0 points. Application: CTFramesetter, CTTypesetter.

63.10.10 Properties

63.10.11 Alignment as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The text alignment.
Notes: Natural text alignment is realized as left or right alignment, depending on the line sweep direction of the first script contained in the paragraph. Type: CTTextAlignment. Default: kCTNaturalTextAlignment. Application: CTFramesetter.
(Read only property)

63.10.12 BaseWritingDirection as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The base writing direction of the lines.
Notes: Type: CTWritingDirection. Default: kCTWritingDirectionNatural. Application: CTFramesetter, CTTypesetter.
(Read only property)

63.10.13 DefaultTabInterval as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The documentwide default tab interval.
Notes: Tabs after the last specified by kCTParagraphStyleSpecifierTabStops are placed at integer multiples of this distance (if positive). Type: CGFloat. Default: 0.0. Application: CTFramesetter, CTTypesetter.
(Read only property)

63.10.14 FirstLineHeadIndent as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The distance, in points, from the leading margin of a frame to the beginning of the paragraph's first line.
Notes: This value is always nonnegative. Type: CGFloat. Default: 0.0. Application: CTFramesetter.
(Read only property)

63.10.15 HeadIndent as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The distance, in points, from the leading margin of a text container to the beginning of lines other than the first.
Notes: This value is always nonnegative. Type: CGFloat Default: 0.0 Application: CTFramesetter
(Read only property)

63.10.16 LineBoundsOptions as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The options controlling the alignment of the line edges with the leading and trailing margins.
Notes: Type: CTLineBoundsOptions
Default: 0 (no options)
Application: CTTypesetter
(Read only property)

63.10.17 LineBreakMode as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The mode that should be used to break lines when laying out the paragraph's text.
Notes: Type: CTLineBreakMode. Default: kCTLineBreakByWordWrapping. Application: CTFramesetter
(Read only property)

63.10.18 LineHeightMultiple as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The line height multiple.
Notes: The natural line height of the receiver is multiplied by this factor (if positive) before being constrained by minimum and maximum line height. Type: CGFloat. Default: 0.0. Application: CTFramesetter.
(Read only property)

63.10.19 LineSpacingAdjustment as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The space in points added between lines within the paragraph (commonly known as leading).
Notes: Available in OS X v10.7 and later.
(Read only property)

63.10.20 MaximumLineHeight as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The maximum height that any line in the frame will occupy, regardless of the font size or size of any attached graphic.
Notes: Glyphs and graphics exceeding this height will overlap neighboring lines. A maximum height of 0 implies no line height limit. This value is always nonnegative. Type: CGFloat. Default: 0.0. Application: CTFramesetter.
(Read only property)

63.10.21 MaximumLineSpacing as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The maximum space in points between lines within the paragraph (commonly known as leading).
Notes: This value is always nonnegative.
Available in OS X v10.7 and later.
(Read only property)

63.10.22 MinimumLineHeight as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The minimum height that any line in the frame will occupy, regardless of the font size or size of any attached graphic.
Notes: This value is always nonnegative. Type: CGFloat. Default: 0.0. Application: CTFramesetter.
(Read only property)

63.10.23 MinimumLineSpacing as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The minimum space in points between lines within the paragraph (commonly known as leading).
Notes: This value is always nonnegative.
Available in OS X v10.7 and later.

(Read only property)

63.10.24 ParagraphSpacing as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The space added at the end of the paragraph to separate it from the following paragraph.
Notes: This value is always nonnegative and is determined by adding the previous paragraph's kCTParagraphStyleSpecifierParagraphSpacing setting and the current paragraph's kCTParagraphStyleSpecifierParagraphSpacingBefore setting. Type: CGFloat. Default: 0.0. Application: CTFramesetter.
(Read only property)

63.10.25 ParagraphSpacingBefore as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The distance between the paragraph's top and the beginning of its text content.
Notes: Type: CGFloat. Default: 0.0. Application: CTFramesetter.
(Read only property)

63.10.26 TailIndent as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The distance, in points, from the margin of a frame to the end of lines.
Notes: If positive, this value is the distance from the leading margin (for example, the left margin in left-to-right text). If 0 or negative, it's the distance from the trailing margin. Type: CGFloat. Default: 0.0. Application: CTFramesetter.
(Read only property)

63.10.27 Constants

Constants

Constant	Value	Description
kCTTextAlignmentCenter	2	One of the constants to specify text alignment. Text is visually center aligned.
kCTTextAlignmentJustified	3	One of the constants to specify text alignment. Text is fully justified. The last line in a paragraph is naturally aligned.
kCTTextAlignmentLeft	0	One of the constants to specify text alignment. Text is visually left aligned.
kCTTextAlignmentNatural	4	One of the constants to specify text alignment. Text uses the natural alignment of the text's script.
kCTTextAlignmentRight	1	One of the constants to specify text alignment. Text is visually right aligned.

Line Breaking

Constant	Value	Description
kCTLineBreakByCharWrapping	1	Wrapping occurs before the first character that doesn't fit.
kCTLineBreakByClipping	2	Lines are simply not drawn past the edge of the frame.
kCTLineBreakByTruncatingHead	3	Each line is displayed so that the end fits in the frame and the missing text indicated by an ellipsis glyph.
kCTLineBreakByTruncatingMiddle	5	Each line is displayed so that the beginning and end fit in the container a the missing text is indicated by an ellipsis glyph in the middle.
kCTLineBreakByTruncatingTail	4	Each line is displayed so that the beginning fits in the container and the missi text is indicated by an ellipsis glyph.
kCTLineBreakByWordWrapping	0	Wrapping occurs at word boundaries unless the word itself doesn't fit or single line.

Paragraph Styles

Constant	Value	Description
kCTParagraphStyleSpecifierAlignment	0	The text alignment. Natural text alignment is realized a ment, depending on the line sweep direction of the first sc paragraph. Type: CTTextAlignment. Default: kCTNa Application: CTFramesetter. Available in OS X v10.5 and later.
kCTParagraphStyleSpecifierBaseWritingDirection	13	The base writing direction of the lines. Type: CTWritin kCTWritingDirectionNatural. Application: CTFramesette
kCTParagraphStyleSpecifierDefaultTabInterval	5	The documentwide default tab interval. Tabs after the la ParagraphStyleSpecifierTabStops are placed at integer m tance (if positive). Type: CGFloat. Default: 0.0. Applic ter, CTTypesetter.
kCTParagraphStyleSpecifierFirstLineHeadIndent	1	The distance, in points, from the leading margin of a fram the paragraph's first line. This value is always nonnegati Default: 0.0. Application: CTFramesetter.
kCTParagraphStyleSpecifierHeadIndent	2	The distance, in points, from the leading margin of a te beginning of lines other than the first. This value is always CGFloat Default: 0.0 Application: CTFramesetter
kCTParagraphStyleSpecifierLineBoundsOptions	17	The options controlling the alignment of the line edges w trailing margins. Type: CTLineBoundsOptions Default: 0 (no options) Application: CTTypesetter
kCTParagraphStyleSpecifierLineBreakMode	6	The mode that should be used to break lines when laying text. Type: CTLineBreakMode. Default: kCTLineBrea Application: CTFramesetter
kCTParagraphStyleSpecifierLineHeightMultiple	7	The line height multiple. The natural line height of the r by this factor (if positive) before being constrained by mini line height. Type: CGFloat. Default: 0.0. Application: C
kCTParagraphStyleSpecifierLineSpacing	10	Deprecated. Use kCTParagraphStyleSpecifierMaximum ParagraphStyleSpecifierMinimumLineSpacing, and kCTP fierLineSpaceAdjustment to control space between lines. added between lines within the paragraph (commonly kno value is always nonnegative. Type: CGFloat. Default: 0. Framesetter.
kCTParagraphStyleSpecifierLineSpacingAdjustment	16	The space in points added between lines within the pa known as leading). Available in OS X v10.7 and later.
kCTParagraphStyleSpecifierMaximumLineHeight	8	The maximum height that any line in the frame will occu font size or size of any attached graphic. Glyphs and gra height will overlap neighboring lines. A maximum height height limit. This value is always nonnegative. Type: CG Application: CTFramesetter.
kCTParagraphStyleSpecifierMaximumLineSpacing	14	The maximum space in points between lines within the pa known as leading). This value is always nonnegative. Available in OS X v10.7 and later.
kCTParagraphStyleSpecifierMinimumLineHeight	9	The minimum height that any line in the frame will occu font size or size of any attached graphic. This value is Type: CGFloat. Default: 0.0. Application: CTFramesette
kCTParagraphStyleSpecifierMinimumLineSpacing	15	The minimum space in points between lines within the pa known as leading). This value is always nonnegative. Available in OS X v10.7 and later.
kCTParagraphStyleSpecifierParagraphSpacing	11	The space added at the end of the paragraph to separate i paragraph. This value is always nonnegative and is de the previous paragraph's kCTParagraphStyleSpecifierPa ting and the current paragraph's kCTParagraphStyleSpec ingBefore setting. Type: CGFloat. Default: 0.0. Applicati
kCTParagraphStyleSpecifierParagraphSpacingBefore	12	The distance between the paragraph's top and the beginnin Type: CGFloat. Default: 0.0. Application: CTFramesette

Writing Direction

Constant	Value	Description
kCTWritingDirectionLeftToRight	0	The writing direction is left to right.
kCTWritingDirectionNatural	-1	The writing direction is algorithmically determined using the Unicode Bidirectional Algorithm rules P2 and P3.
kCTWritingDirectionRightToLeft	1	The writing direction is right to left.

63.11 class CTParagraphStyleSettingMBS

63.11.1 class CTParagraphStyleSettingMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: This class is used to alter the paragraph style.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr11
- CoreText Completed

63.11.2 Methods

63.11.3 SetTextTabs(textTabs() as CTTextTabMBS)

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Sets the array of text tabs.
Notes: for use with kCTParagraphStyleSpecifierTabStops.

63.11.4 Properties

63.11.5 doubleValue as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The double value.
Notes: (Read and Write property)

63.11.6 intValue as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The integer value.
Notes: Also used for enumerations.
(Read and Write property)

63.11.7 Spec as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The specifier of the setting.
Notes: See CTParagraphStyleMBS for possible values.
(Read and Write property)

63.12 class CTRunDelegateMBS

63.12.1 class CTRunDelegateMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The class to get events for CTRun runs.
Notes: The CTRunDelegate opaque type represents a run delegate, which is assigned to a run (attribute range) to control typographic traits such glyph ascent, glyph descent, and glyph width.

The events defined for CTRunDelegate are used to modify glyph metrics during layout. The values returned by the delegate are applied to each glyph in the run or runs corresponding to the attribute with that delegate.
Subclass of the CFObjectMBS class.
Blog Entries

- CoreText Completed

63.12.2 Methods

63.12.3 Available as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true in OS X v10.5 and later.

63.12.4 Close

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Shuts down the delegate.
Notes: Please call this to explicit end the delegate and avoid memory leaks.
See also:

- 63.12.7 Close 11611

63.12.5 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates an immutable instance of a run delegate.
Notes: The run-delegate object can be used for reserving space in a line or for eliding the glyphs for a range of text altogether.

63.12.6 Events

63.12.7 Close

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Event called when item closes.
See also:

- 63.12.4 Close 11610

63.12.8 GetAscent as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Event that determines typographic ascent of glyphs in the run.
Notes: Returns the typographic ascent of glyphs in the run associated with the run delegate.

63.12.9 GetDescent as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Event that determines typographic descent of glyphs in the run.
Notes: Returns the typographic descent of glyphs in the run associated with the run delegate.

63.12.10 GetWidth as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Event that determines the typographic width of glyphs in the run.
Notes: Returns the typographic width of glyphs in the run associated with the run delegate. A value of 0.0 indicates that the glyphs should not be drawn.

63.13 class CTRunMBS

63.13.1 class CTRunMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The CTRun opaque type represents a glyph run, which is a set of consecutive glyphs sharing the same attributes and direction.
Notes: The typesetter creates glyph runs as it produces lines from character strings, attributes, and font objects. That is, a line is constructed of one or more glyphs runs. Glyph runs can draw themselves into a graphic context, if desired, although most users have no need to interact directly with glyph runs.
Subclass of the CFObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

63.13.2 Methods

63.13.3 Advances as CGSizeMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Copies a range of glyph advances into an array.
Notes: Changed in v22.2 to use copy function to get array instead Ptr function, if no pointer is available.

63.13.4 Available as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true in OS X v10.5 and later.

63.13.5 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The private constructor.

63.13.6 Draw(context as CGContextMBS, location as Integer, length as Integer = 0)

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Draws a complete run or part of one.
Notes: context: The context into which to draw the run.
range: The portion of the run to draw. If the length of the range is set to 0, then the draw operation continues from the start index of the range to the end of the run.

This is a convenience call, because the run could be drawn by accessing the glyphs. This call can leave the graphics context in any state and does not flush the context after the draw operation.

Available in OS X v10.5 and later.

63.13.7 Glyphs as Integer()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Copies a range of glyphs into an array.
Notes: Changed in v22.2 to use copy function to get array instead Ptr function, if no pointer is available.

63.13.8 ImageBounds(context as CGContextMBS, location as Integer, length as Integer) as CGRectMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Calculates the image bounds for a glyph range.
Notes: context: The context for the image bounds being calculated. This is required because the context could have settings in it that would cause changes in the image bounds.
range: The portion of the run to measure. If the length of the range is set to 0, then the measure operation continues from the start index of the range to the end of the run.

Returns a rectangle that tightly encloses the paths of the run's glyphs, or, if run, context, or range is invalid, CGRectNull.
Available in OS X v10.5 and later.

63.13.9 Positions as CGPointMBS()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Copies a range of glyph positions into an array.
Notes: Changed in v22.2 to use copy function to get array instead Ptr function, if no pointer is available.

63.13.10 StringIndices as Integer()

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Copies a range of string indices into an array.
Notes: The indices are the character indices that originally spawned the glyphs that make up the run. They can be used to map the glyphs in the run back to the characters in the backing store.

Changed in v22.2 to use copy function to get array instead Ptr function, if no pointer is available.

63.13.11 TypographicBounds(location as Integer, length as Integer, byref ascent as Double, byref descent as Double, byref leading as Double) as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Gets the typographic bounds of the run.
Notes: range: The portion of the run to measure. If the length of the range is set to 0, then the measure operation continues from the range's start index to the end of the run.
ascent: On output, the ascent of the run.
descent: On output, the descent of the run.
leading: On output, the leading of the run.

Returns the typographic width of the run, or if run or range is invalid, 0.
Available in OS X v10.5 and later.

63.13.12 Properties

63.13.13 AttributeValues as Dictionary

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the attribute dictionary that was used to create the glyph run.
Notes: Return a valid Dictionary or nil on error or if the run has no attributes.

The dictionary returned is either the same one that was set as an attribute dictionary on the original attributed string or a dictionary that has been manufactured by the layout engine. Attribute dictionaries can

be manufactured in the case of font substitution or if the run is missing critical attributes.
(Read only property)

63.13.14 GlyphCount as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Gets the glyph count for the run.
Notes: run: The run for which to return the glyph count.

Returns the number of glyphs that the run contains, or if there are no glyphs in this run, a value of 0.
Available in OS X v10.5 and later.
(Read only property)

63.13.15 Status as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the run's status.
Notes: Runs have status that can be used to expedite certain operations. Knowing the direction and ordering of a run's glyphs can aid in string index analysis, whereas knowing whether the positions reference the identity text matrix can avoid expensive comparisons. This status is provided as a convenience, because this information is not strictly necessary but can be helpful in some circumstances.
(Read only property)

63.13.16 StringRangeLength as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Gets the range of characters that originally spawned the glyphs in the run.
Notes: The range of characters that originally spawned the glyphs, of if run is invalid, an empty range.
(Read only property)

63.13.17 StringRangeLocation as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Gets the range of characters that originally spawned the glyphs in the run.
Notes: The range of characters that originally spawned the glyphs, of if run is invalid, an empty range.
(Read only property)

63.13.18 TextMatrix as CGAffineTransformMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the text matrix needed to draw this run.
Notes: To properly draw the glyphs in a run, the fields tx and ty of the CGAffineTransform returned by this function should be set to the current text position.
(Read only property)

63.13.19 Constants

Constants

Constant	Value	Description
kCTRunStatusHasNonIdentityMatrix	4	One of the possible values for the status bitfield. The run requires a specific text matrix to be set in the current Core Gra context for proper drawing. Use BitwiseAnd() to check if the status has a given value.
kCTRunStatusNonMonotonic	2	One of the possible values for the status bitfield. The run has been reordered in some way such that the string indices as ated with the glyphs are no longer strictly increasing (for left-to-right run decreasing (for right-to-left runs). Use BitwiseAnd() to check if the status has a given value.
kCTRunStatusNoStatus	0	One of the possible values for the status bitfield. The run has no special attributes.
kCTRunStatusRightToLeft	1	One of the possible values for the status bitfield. The run proceeds from right to left. Use BitwiseAnd() to check if the status has a given value.

63.14 class CTTextTabMBS

63.14.1 class CTTextTabMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The CTTextTab opaque type represents a tab in a paragraph style, storing an alignment type and location.
Example:

```
// create a paragraph style with a right aligned tab at 200 and a centered tab at 300 points
Var tabs() As CTTextTabMBS
tabs.Add CTTextTabMBS.Create(CTParagraphStyleMBS.kCTTextAlignmentRight, 200)
tabs.Add CTTextTabMBS.Create(CTParagraphStyleMBS.kCTTextAlignmentCenter, 300)

Var setting As New CTParagraphStyleSettingMBS
setting.Spec = CTParagraphStyleMBS.kCTParagraphStyleSpecifierTabStops
setting.SetTextTabs tabs

Var settings() As CTParagraphStyleSettingMBS
settings.Add setting
Var style As CTParagraphStyleMBS = CTParagraphStyleMBS.Create(settings)
MessageBox style.TabStops.Count.ToString + " tab stops"
```

Notes: Core Text supports four alignment types: left, center, right, and decimal. These alignment types are absolute, not based on the line sweep direction of text. For example, tabbed text is always positioned to the left of a right-aligned tab, whether the line sweep direction is left to right or right to left. A tab's location, on the other hand, is relative to the back margin. A tab set at 1.5 inches, for example, is at 1.5 inches from the right in right-to-left text.
Subclass of the CFObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.1pr7
- CoreText Completed

63.14.2 Methods

63.14.3 Available as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true in OS X v10.5 and later.

63.14.4 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The private constructor.

63.14.5 Create(alignment as Integer, location as Double, options as Dictionary = nil) as CTTextTabMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates and initializes a new text tab object.
Notes: alignment: The tab's alignment. This is used to determine the position of text inside the tab column. This parameter must be set to a valid CTTextAlignment value or this function returns nil.
location: The tab's ruler location, relative to the back margin.
options: Options to pass in when the tab is created. Currently, the only option available is kCTTabColumnTerminatorsAttributeName. This parameter is optional and can be set to nil if not needed.
Return a reference to a CTTextTab object if the call was successful; otherwise, nil.
Available in OS X v10.5 and later.

63.14.6 kCTTabColumnTerminatorsAttributeName as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the options keys.
Notes: Specifies the terminating character for a tab column.

The value associated with this attribute is a CFCharacterSet object. The character set is used to determine the terminating character for a tab column. The tab and newline characters are implied even if they don't exist in the character set. This attribute can be used to implement decimal tabs, for instance. This attribute is optional.

63.14.7 Properties

63.14.8 Alignment as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the text alignment of the tab.
Notes: (Read only property)

63.14.9 Location as Double

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the tab's ruler location.
Notes: The tab's ruler location relative to the back margin.
(Read only property)

63.14.10 Options as Dictionary

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns the dictionary of attributes associated with the tab.
Notes: The dictionary of attributes associated with the tab, or if no dictionary is present, nil.
(Read only property)

63.15 class CTTypesetterMBS

63.15.1 class CTTypesetterMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The CTTypesetter opaque type represents a typesetter, which performs line layout.
Example:

```
// split a text into lines of at most 200 points width
Var text As String = "Core Text breaks this long sentence into several lines that fit into the given width."
Var s As New CFAttributedStringMBS(New CFStringMBS(text))
Var typesetter As CTTypesetterMBS = CTTypesetterMBS.CreateWithAttributedString(s)

Var lines() As String
Var start As Integer = 0
While start <text.Length
Var count As Integer = typesetter.SuggestLineBreak(start, 200)
If count <= 0 Then Exit
lines.Add text.Middle(start, count)
start = start + count
Wend
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Line layout includes word wrapping, hyphenation, and line breaking in either vertical or horizontal rectangles. A typesetter object takes as input an attributed string and produces a line of typeset glyphs (composed into glyph runs) in a CTLine object. The typesetter performs character-to-glyph encoding, glyph ordering, and positional operations, such as kerning, tracking, and baseline adjustments. If multiline layout is needed, it is performed by a framesetter object, which calls into the typesetter to generate the typeset lines to fill the frame.

A framesetter encapsulates a typesetter and provides a reference to it as a convenience, but a caller may also choose to create a freestanding typesetter.
Subclass of the CFObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- CoreText Completed

63.15.2 Methods

63.15.3 Available as boolean

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Whether this class is available.

Notes: Returns true in OS X v10.5 and later.

63.15.4 Constructor

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: The private constructor.

63.15.5 CreateLine(location as Integer, length as Integer, offset as Double = 0.0) as CTLineMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates an immutable line from the typesetter at a specified line offset.
Notes: location and length: The string range on which the line is based. If the length portion of range is set to 0, then the typesetter continues to add glyphs to the line until it runs out of characters in the string. The location and length of the range must be within the bounds of the string, or the call will fail.
offset: The line position offset.

Returns a reference to a CTLine object if the call was successful; otherwise, nil.
The resultant line consists of glyphs in the correct visual order, ready to draw.
Available in OS X v10.6 and later.

63.15.6 CreateWithAttributedString(s as CFAttributedStringMBS) as CTTypesetterMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates an immutable typesetter object using an attributed string.
Notes: s: The attributed string to typeset. This parameter must be filled in with a valid CFAttributedString object.

Returns a reference to a CTTypesetter object if the call was successful; otherwise, nil.

The resultant typesetter can be used to create lines, perform line breaking, and do other contextual analysis based on the characters in the string.

Available in OS X v10.5 and later.
See also:

- 63.15.7 CreateWithAttributedString(s as CFAttributedStringMBS, options as dictionary) as CTTypesetterMBS 11622

63.15.7 CreateWithAttributedString(s as CFAttributedStringMBS, options as dictionary) as CTTypesetterMBS

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates an immutable typesetter object using an attributed string and a dictionary of options.
Notes: s: The attributed string to typeset. This parameter must be filled in with a valid CFAttributedString object.
options: A dictionary of typesetter options, or nil if there are none.

Returns a reference to a CTTypesetter object if the call was successful; otherwise, nil.

The resultant typesetter can be used to create lines, perform line breaking, and do other contextual analysis based on the characters in the string.
Available in OS X v10.5 and later.
See also:

- 63.15.6 CreateWithAttributedString(s as CFAttributedStringMBS) as CTTypesetterMBS 11621

63.15.8 kCTTypesetterOptionDisableBidiProcessing as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants to control aspects of the typesetter,Äôs bidirectional text processing.
Notes: Disables bidirectional processing. Value must be a CFBoolean object. Default value is false. Normally, typesetting applies the Unicode Bidirectional Algorithm as described in Unicode Standard Annex #9. If a typesetter is created with this option set to true, no directional reordering is performed, and any directional control characters are ignored.
Available in OS X v10.5 and later.
Deprecated in OS X v10.8.

63.15.9 kCTTypesetterOptionForcedEmbeddingLevel as string

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: One of the constants to control aspects of the typesetter,Äôs bidirectional text processing.
Notes: Specifies the embedding level. Value must be a CFNumberRef object. Default is unset. Normally, typesetting applies the Unicode Bidirectional Algorithm as described in Unicode Standard Annex #9. If present, this option specifies the embedding level, and any directional control characters are ignored.
Available in OS X v10.5 and later.

63.15.10 SuggestClusterBreak(startIndex as Integer, width as Double) as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Suggests a cluster line breakpoint based on the width provided.
Notes: startIndex: The starting point for the typographic cluster-break calculations. The break calculations include the character starting at startIndex.
width: The requested typographic cluster-break width.

Return a count of the characters from startIndex that would cause the cluster break. The value returned can be used to construct a character range for CTTypesetterCreateLine.

This cluster break is similar to a character break, except that it does not break apart linguistic clusters. No other contextual analysis is done. This can be used by the caller to implement a different line-breaking scheme, such as hyphenation. A typographic cluster break can also be triggered by a hard-break character in the stream. This function is equivalent to SuggestClusterBreakWithOffset with an offset of 0.0.

Available in OS X v10.5 and later.
See also:

- 63.15.11 SuggestClusterBreak(startIndex as Integer, width as Double, offset as Double) as Integer 11623

63.15.11 SuggestClusterBreak(startIndex as Integer, width as Double, offset as Double) as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Suggests a cluster line breakpoint based on the specified width and line offset.
Notes: startIndex: The starting point for the typographic cluster-break calculations. The break calculations include the character starting at startIndex.
width: The requested typographic cluster-break width.
offset: The line offset position.

Returns a count of the characters from startIndex that would cause the cluster break. The value returned can be used to construct a character range for CreateLine.

This cluster break is similar to a character break, except that it does not break apart linguistic clusters. No other contextual analysis is done. This can be used by the caller to implement a different line-breaking scheme, such as hyphenation. A typographic cluster break can also be triggered by a hard-break character in the stream.

Available in OS X v10.6 and later.

See also:

- 63.15.10 SuggestClusterBreak(startIndex as Integer, width as Double) as Integer 11623

63.15.12 SuggestLineBreak(startIndex as Integer, width as Double) as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Suggests a contextual line breakpoint based on the width provided.
Notes: startIndex: The starting point for the line-break calculations. The break calculations include the character starting at startIndex.
width: The requested line-break width.

Returns a count of the characters from startIndex that would cause the line break. The value returned can be used to construct a character range for CreateLine.

The line break can be triggered either by a hard-break character in the stream or by filling the specified width with characters. This function is equivalent to SuggestLineBreakWithOffset with an offset of 0.0.

Available in OS X v10.5 and later.
See also:

- 63.15.13 SuggestLineBreak(startIndex as Integer, width as Double, offset as Double) as Integer 11624

63.15.13 SuggestLineBreak(startIndex as Integer, width as Double, offset as Double) as Integer

MBS MacCG Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Suggests a contextual line breakpoint based on the width provided and the specified offset.
Notes: startIndex: The starting point for the line-break calculations. The break calculations include the character starting at startIndex.
width: The requested line-break width.
offset: The line position offset.

Returns a count of the characters from startIndex and offset that would cause the line break. The value returned can be used to construct a character range for CreateLine.

The line break can be triggered either by a hard-break character in the stream or by filling the specified width with characters.
Available in OS X v10.6 and later.
See also:

- 63.15.12 SuggestLineBreak(startIndex as Integer, width as Double) as Integer 11624

Chapter 64

CPUInfo

64.1 class CPUIDMBS

64.1.1 class CPUIDMBS

MBS Util Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A class around the CPUID command of x86 CPUs.
Example:

```
Var c as new CPUIDMBS
MessageBox c.BrandString
```

Notes: This class works only on x86 CPUs.
Values returned in the properties have very CPU vendor specific values.
So Intel and AMD use different meanings for a lot of values.

64.1.2 Methods

64.1.3 BrandString as String

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The brand string.
Notes: contains the brand string, e.g. "Intel(R) Xeon(TM) CPU 2.40GHz"
See also:

- 64.1.23 BrandString as String 11630

64.1.4 CodeName as String

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The brief and human-friendly CPU codename, which was recognized.

64.1.5 CPUID(Selector as Integer) as boolean

MBS Util Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls CPUID for the given selector.
Example:

```
Var c as new CPUIDMBS

if c.CPUID(0) then
MessageBox hex(c.EDX)
end if
```

Notes: Returns true on success and false on failure.
(always true on x86 CPUs and always false on PowerPC CPUs.)
Result values are stored in the four properties EAX, EBX, ECX and EDX.

64.1.6 ExtFamily as Integer

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: CPU extended family.

64.1.7 ExtModel as Integer

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: CPU extended model

64.1.8 Family as Integer

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: CPU family.
See also:

- 64.1.28 Family as Integer 11632

64.1.9 FeatureName(index as Integer) as String

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the short textual representation of a CPU flag.
Notes: A constant string like "fpu", "tsc", "sse2", etc.
See kFeature* constants.

64.1.10 Flags(index as Integer) as Boolean

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries whether a given feature is available.
Example:

```
Var c as new CPUIDMBS

if c.Flags(CPUIDMBS.kFeatureLM) then
MessageBox "64-bit CPU"
else
MessageBox "32-bit CPU"
```

end if

Notes: See kFeature* constants.

64.1.11 L1DataCache as Integer

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: L1 data cache size in KB.
Notes: Could be zero, if the CPU lacks cache.
If the size cannot be determined, it will be -1.

64.1.12 L1InstructionCache as Integer

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: L1 instruction cache size in KB.
Notes: Could be zero, if the CPU lacks cache. If the size cannot be determined, it will be -1.
On some Intel CPUs, whose instruction cache is in fact a trace cache, the size will be expressed in K uOps.

64.1.13 L2Cache as Integer

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: L2 cache size in KB.
Notes: Could be zero, if the CPU lacks L2 cache.
If the size of the cache could not be determined, it will be -1

64.1.14 L3Cache as Integer

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: L3 cache size in KB.
Notes: Zero on most systems.

64.1.15 Model as Integer

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: CPU model.
See also:

- 64.1.29 Model as Integer 11632

64.1.16 NumCores as Integer

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Number of CPU cores on the current processor.

64.1.17 NumLogicalCPUs as Integer

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Number of logical processors on the current processor.
Notes: Could be more than the number of physical cores, e.g. when the processor has HyperThreading.

64.1.18 Stepping as Integer

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: CPU stepping.
See also:

- 64.1.31 Stepping as Integer 11633

64.1.19 TotalLogicalCPUs as Integer

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The total number of logical processors.
Notes: This is num_logical_cpus * { total physical processors in the system }

If you're writing a multithreaded program and you want to run it on all CPUs, this is the number of threads you need.

64.1.20 Vendor as Integer

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The recognized CPU vendor.
Notes: See kVendor constants.

64.1.21 VendorName as String

MBS Util Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The vendor name.
Notes: contains the CPU vendor string, e.g. "GenuineIntel"

64.1.22 Properties

64.1.23 BrandString as String

MBS Util Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A string (47 characters maximum) with the brand name of the CPU.
Example:

```
Var c as new CPUIDMBS
MessageBox c.BrandString
```

Notes: Is "" if not supported.
(Read and Write property)
See also:

- 64.1.3 BrandString as String 11626

64.1.24 EAX as UInt32

MBS Util Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The EAX register value after a CPUID function call.
Example:

```
Var c as new CPUIDMBS
MessageBox str(c.EAX)
```

Notes: (Read and Write property)

64.1.25 EBX as UInt32

MBS Util Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The EBX register value after a CPUID function call.
Example:

```
Var c as new CPUIDMBS
MessageBox str(c.EBX)
```

Notes: (Read and Write property)

64.1.26 ECX as UInt32

MBS Util Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The ECX register value after a CPUID function call.
Example:

```
Var c as new CPUIDMBS
MessageBox str(c.ECX)
```

Notes: (Read and Write property)

64.1.27 EDX as UInt32

MBS Util Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The EDX register value after a CPUID function call.
Example:

```
Var c as new CPUIDMBS
```

MessageBox str(c.EDX)

Notes: (Read and Write property)

64.1.28 Family as Integer

MBS Util Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Family ID of the CPU.
Example:

Var c as new CPUIDMBS
MessageBox str(c.Family)

Notes: e.g. Family 6, Model 14 can be an Intel Core Duo CPU.
(Read and Write property)
See also:

- 64.1.8 Family as Integer 11627

64.1.29 Model as Integer

MBS Util Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Model ID of the CPU.
Example:

Var c as new CPUIDMBS
MessageBox str(c.Model)

Notes: Every CPU Family has several Models.
e.g. Family 6, Model 14 can be an Intel Core Duo CPU.
(Read and Write property)
See also:

- 64.1.15 Model as Integer 11629

64.1.30 ProcessorVendor as String

MBS Util Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Name of the Processor Vendor.
Example:

```
Var c as new CPUIDMBS
MessageBox c.ProcessorVendor
```

Notes: Possible values:

CPUID_VID_INTEL	"GenuineIntel"
CPUID_VID_UMC	"UMC UMC UMC "
CPUID_VID_AMD	"AuthenticAMD"
CPUID_VID_CYRIX	"CyrixInstead"
CPUID_VID_NEXGEN	"NexGenDriven"
CPUID_VID_CENTAUR	"CentaurHauls"
CPUID_VID_RISE	"RiseRiseRise"
CPUID_VID_SIS	"SiS SiS SiS "
CPUID_VID_TRANSMETA	"GenuineTMx86"
CPUID_VID_NSC	"Geode by NSC"

(Read and Write property)

64.1.31 Stepping as Integer

MBS Util Plugin, Plugin Version: 7.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The stepping ID of the CPU.
Example:

```
Var c as new CPUIDMBS
MessageBox str(c.Stepping)
```

Notes: Can be seen as a revision number of the processor.
(Read and Write property)
See also:

- 64.1.18 Stepping as Integer 11629

64.1.32 Constants

Features

Constant	Value	Description
kFeature100MHzSteps	80	100 MHz multiplier control
kFeature3DNOW	56	AMD 3DNow! instructions supported
kFeature3DNOWEXT	57	AMD 3DNow! extended instructions supported
kFeature3DNOWPrefetch	68	PREFETCH/PREFETCHW support
kFeatureABM	65	LZCNT instruction support
kFeatureACPI	20	ACPI support (power states)
kFeatureAES	51	AES* instructions supported
kFeatureAPERFMPERF	91	MPERF/APERF MSRs support
kFeatureAPIC	9	APIC support
kFeatureAVX	54	Advanced vector extensions supported
kFeatureCID	40	Context ID supported
kFeatureCLFLUSH	18	CLFLUSH instruction supported
kFeatureCMOV	14	CMOVxx instructions supported
kFeatureCMP_LEGACY	63	core multi-processing legacy mode
kFeatureConstantTSC	82	TSC ticks at constant rate
kFeatureCPB	90	Core performance boost
kFeatureCX16	41	CMPXCHG16B instruction supported
kFeatureCX8	8	CMPXCHG8B instruction supported
kFeatureDCA	44	Direct cache access supported
kFeatureDE	2	Debugging extension
kFeatureDS_CPL	34	CPL Qualified Debug Store
kFeatureDTS	19	Debug store supported
kFeatureDTS64	32	64-bit Debug store supported
kFeatureEST	37	Enhanced SpeedStep
kFeatureF16C	87	16-bit FP convert instruction support
kFeatureFID	75	Frequency ID control
kFeatureFMA3	84	The FMA3 instruction set
kFeatureFMA4	85	The FMA4 instruction set
kFeatureFPU	0	Floating point unit
kFeatureFXSR	22	FXSAVE / FXRSTOR supported
kFeatureFXSR_OPT	59	FFXSR: FXSAVE and FXRSTOR optimizations
kFeatureHT	26	Hyper-threading supported (but might be disabled)
kFeatureHWPState	81	Hardware P-state control
kFeatureIA64	28	IA64 supported (Itanium only)
kFeatureIBS	70	Instruction-based sampling
kFeatureLAHF_LM	62	LAHF/SAHF supported in 64-bit mode
kFeatureLM	61	Long mode (x86_64/EM64T) supported
kFeatureMCA	13	Machine check architecture
kFeatureMCE	7	Machine check exception
kFeatureMisalignSSE	66	Misaligned SSE supported
kFeatureMMX	21	MMX instruction set supported
kFeatureMMXEXT	55	AMD MMX-extended instructions supported
kFeatureMONITOR	33	MONITOR / MWAIT supported
kFeatureMOVBE	49	MOVBE instruction supported
kFeatureMSR	5	Model-specific regsisters, RDMSR/WRMSR supported
kFeatureMTRR	10	Memory type range registers
kFeatureNX	58	No-execute bit supported
kFeatureOSVW	69	OS Visible Workaround (AMD)
kFeatureOSXSAVE	53	non-privileged copy of OSXSAVE supported
kFeaturePA	93	Processor accumulator
kFeaturePAE	6	Physical address extension
kFeaturePAT	15	Page attribute table
kFeaturePBE	29	Pending-break enable
kFeaturePCLMUL	31	PCLMULQDQ instruction supported
kFeaturePDCM	43	Performance capabilities MSR supported
kFeaturePFI	92	Processor Feedback Interface support
kFeaturePGE	12	Page global enable
kFeaturePN	17	Processor serial # implemented (Intel P3 only)

Vendors

Constant	Value	Description
kVendorAMD	1	AMD CPU
kVendorCentaur	6	x86 CPU by IDT
kVendorCyrix	2	Cyrix CPU
kVendorIntel	0	Intel CPU
kVendorNexGen	3	NexGen CPU
kVendorNSC	9	x86 CPU by National Semiconductor
kVendorRISE	7	x86 CPU by Rise Technology
kVendorSiS	8	x86 CPU by SiS
kVendorTransmeta	4	Transmeta CPU
kVendorUMC	5	x86 CPU by UMC
kVendorUnknown	-1	Unknown

Chapter 65

CUPS

65.1 class CUPSDestinationMBS

65.1.1 class CUPSDestinationMBS

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: The class for a CUPS destination.
Example:

```
Var lines(-1) as string
for each c as CUPSDestinationMBS in CUPSMBS.GetDestinations
lines.Add c.Name
next

MessageBox Join(lines,EndOfLine)
```

Blog Entries

- About plug-in functions returning array

65.1.2 Methods

65.1.3 Options as CUPSOptionMBS()

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop only.

Function: Options values.

65.1.4 Properties

65.1.5 Instance as String

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Local instance name or "".
Notes: (Read and Write property)

65.1.6 isDefault as Boolean

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Is this printer the default?
Example:

```
for each c as CUPSDestinationMBS in CUPSMBS.GetDestinations
if c.isDefault then
MessageBox c.Name
end if
next
```

Notes: (Read and Write property)

65.1.7 Name as String

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: The name of the printer.
Example:

```
Var lines(-1) as string
for each c as CUPSDestinationMBS in CUPSMBS.GetDestinations
lines.Add c.Name
next

MessageBox Join(lines,EndOfLine)
```

Notes: (Read and Write property)

65.2 class CUPSErrorExceptionMBS

65.2.1 class CUPSErrorExceptionMBS

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: The error exception raised by some CUPS functions.
Notes: Subclass of the RuntimeException class.

65.3 class CUPSJobMBS

65.3.1 class CUPSJobMBS

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: The class for job details.
Example:

```
Var jobs() as CUPSJobMBS = CUPSMBS.GetJobs("", true, CUPSMBS.kWhichJobsActive)

if jobs.LastIndex<0 then
MessageBox "no job"
else

Var j as CUPSJobMBS = jobs(0)
Var lines(-1) as string

lines.Add "Title: "+j.Title
lines.Add "User: "+j.User
lines.Add "Format: "+j.Format
lines.Add "Dest: "+j.Dest
lines.Add "ID: "+str(j.ID)
lines.Add "Priority: "+str(j.Priority)
lines.Add "Size: "+str(j.Size)
lines.Add "State: "+str(j.State)

if j.CompletedTime<>nil then
lines.Add "CompletedTime: "+j.CompletedTime.AbbreviatedDate+" "+j.CompletedTime.longtime
else
lines.Add "CompletedTime: nil"
end if

if j.CreationTime<>nil then
lines.Add "CreationTime: "+j.CreationTime.AbbreviatedDate+" "+j.CreationTime.longtime
else
lines.Add "CreationTime: nil"
end if

if j.ProcessingTime<>nil then
lines.Add "ProcessingTime: "+j.ProcessingTime.AbbreviatedDate+" "+j.ProcessingTime.longtime
else
lines.Add "ProcessingTime: nil"
end if

MessageBox join(lines,EndOfLine)

end if
```

65.3.2 Properties

65.3.3 CompletedDateTime as DateTime

MBS Tools Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Time the job was completed.
Notes: Value is nil if the value is not set.
(Read and Write property)

65.3.4 CompletedTime as Date

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Time the job was completed.
Example:

```
Var jobs() as CUPSJobMBS = CUPSMBS.GetJobs("", false, CUPSMBS.kWhichJobsComplete)

if jobs.LastIndex<0 then
MessageBox "no job"
else
Var j as CUPSJobMBS = jobs(0)

MessageBox j.Title+" completed at "+j.CompletedTime.AbbreviatedDate+" "+j.CompletedTime.longtime
end if
```

Notes: Value is nil if the value is not set.
(Read and Write property)

65.3.5 CreationDateTime as DateTime

MBS Tools Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Time the job was created.
Notes: Value is nil if the value is not set.
(Read and Write property)

65.3.6 CreationTime as Date

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Time the job was created.
Example:

```
Var jobs() as CUPSJobMBS = CUPSMBS.GetJobs("", false, CUPSMBS.kWhichJobsComplete)

if jobs.LastIndex<0 then
MessageBox "no job"
else
Var j as CUPSJobMBS = jobs(0)

MessageBox j.Title+" completed at "+j.CreationTime.AbbreviatedDate+" "+j.CreationTime.longtime
end if
```

Notes: Value is nil if the value is not set.
(Read and Write property)

65.3.7 Dest as String

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Printer or class name.
Example:

```
Var jobs() as CUPSJobMBS = CUPSMBS.GetJobs("", false, CUPSMBS.kWhichJobsAll)
Var lines(-1) as string

for each j as CUPSJobMBS in jobs
lines.Add j.Dest
next

MessageBox Join(lines,EndOfLine)
```

Notes: (Read and Write property)

65.3.8 Format as String

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Document format.
Example:

```
Var jobs() as CUPSJobMBS = CUPSMBS.GetJobs("", true, CUPSMBS.kWhichJobsAll)
Var lines(-1) as string

for each j as CUPSJobMBS in jobs
lines.Add j.Format
next

MessageBox Join(lines,EndOfLine)
```

Notes: (Read and Write property)

65.3.9 ID as Integer

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: The job ID.
Example:

```
Var jobs(-1) as CUPSJobMBS = CUPSMBS.GetJobs("", false, CUPSMBS.kWhichJobsAll)
MessageBox jobs(0).Title+" has ID "+str(jobs(0).ID)
```

Notes: (Read and Write property)

65.3.10 Priority as Integer

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Priority (1-100).
Example:

```
Var jobs(-1) as CUPSJobMBS = CUPSMBS.GetJobs("", false, CUPSMBS.kWhichJobsAll)
MessageBox jobs(0).Title+" has priority "+str(jobs(0).Priority)
```

Notes: (Read and Write property)

65.3.11 ProcessingDateTime as DateTime

MBS Tools Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Time the job was processed.
Notes: Value is nil if the value is not set.

(Read and Write property)

65.3.12 ProcessingTime as Date

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Time the job was processed.
Example:

```
Var jobs() as CUPSJobMBS = CUPSMBS.GetJobs("", false, CUPSMBS.kWhichJobsComplete)

if jobs.LastIndex<0 then
MessageBox "no job"
else
Var j as CUPSJobMBS = jobs(0)

MessageBox j.Title+" completed at "+j.ProcessingTime.AbbreviatedDate+" "+j.ProcessingTime.longtime
end if
```

Notes: Value is nil if the value is not set.
(Read and Write property)

65.3.13 Size as Integer

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Size in kilobytes.
Example:

```
Var sum as Integer
Var jobs() as CUPSJobMBS = CUPSMBS.GetJobs("", false, CUPSMBS.kWhichJobsAll)

if jobs.LastIndex<0 then
MessageBox "no job"
else
for each j as CUPSJobMBS in jobs
sum=sum+j.Size
next

MessageBox "Total size of all print jobs: "+str(sum)+" KB"
end if
```

Notes: (Read and Write property)

65.3.14 State as Integer

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Job state.
Example:

```
Var jobs(-1) as CUPSJobMBS = CUPSMBS.GetJobs("", false, CUPSMBS.kWhichJobsAll)
Var state as Integer = jobs(0).State // check state of first job
Var s as string = "?"

Select case state
case CUPSMBS.kJobAborted
s = "Aborted"
case CUPSMBS.kJobCanceled
s = "Canceled"
case CUPSMBS.kJobCompleted
s = "Completed"
case CUPSMBS.kJobHeld
s = "Held"
case CUPSMBS.kJobStopped
s = "Stopped"
case CUPSMBS.kJobPending
s = "Pending"
case CUPSMBS.kJobProcessing
s = "Processing"
end Select

MessageBox str(State)+": "+s
```

Notes: (Read and Write property)

65.3.15 Title as String

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Title/job name.
Example:

```
Var jobs() as CUPSJobMBS = CUPSMBS.GetJobs("", false, CUPSMBS.kWhichJobsAll)
Var lines(-1) as string

for each j as CUPSJobMBS in jobs
lines.Add j.Title
next

MessageBox Join(lines,EndOfLine)
```

Notes: (Read and Write property)

65.3.16 User as String

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: User the submitted the job.
Example:

```
Var jobs() as CUPSJobMBS = CUPSMBS.GetJobs("", false, CUPSMBS.kWhichJobsAll)
Var lines(-1) as string

for each j as CUPSJobMBS in jobs
lines.Add j.User
next

MessageBox Join(lines,EndOfLine)
```

Notes: (Read and Write property)

65.4 module CUPSMBS

65.4.1 module CUPSMBS

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: All.

Function: The module to control the CUPS printing system.
Example:

```
// print a PDF on the default printer with CUPS
Var printerName As String
For Each d As CUPSDestinationMBS In CUPSMBS.GetDestinations
If d.isDefault Then printerName = d.Name
Next
If printerName = "" Then Return

Var job As Integer = CUPSMBS.PrintFile(printerName, SpecialFolder.Desktop.Child("test.pdf"), "Test print")
MessageBox If(job >0, "Job " + job.ToString + " sent to " + printerName, "Error " + CUPSMBS.LastError.ToString)
```

65.4.2 Methods

65.4.3 CancelJob(name as string, job as Int32)

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Cancel a print job on the default server.
Notes: name: Name of printer or class
job: Job ID, kJobIDCurrent for the current job, or kJobIDAll for all jobs

Pass kJobIDAll to cancel all jobs or kJobIDCurrent to cancel the current job on the named destination.

Raises exception on error.

65.4.4 GetDefault as string

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Get the default printer or class for the default server.
Example:

```
MessageBox CUPSMBS.GetDefault
```

65.4.5 GetDestinations as CUPSDestinationMBS()

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Get the list of destinations from the default server.
Example:

```
Var lines(-1) as string
for each c as CUPSDestinationMBS in CUPSMBS.GetDestinations
lines.Add c.Name
next

MessageBox Join(lines,EndOfLine)
```

Notes: Starting with CUPS 1.2, the returned list of destinations include the printer-info, printer-is-accepting-jobs, printer-is-shared, printer-make-and-model, printer-state, printer-state-change-time, printer-state-reasons, and printer-type attributes as options. CUPS 1.4 adds the marker-change-time, marker-colors, marker-high-levels, marker-levels, marker-low-levels, marker-message, marker-names, marker-types, and printer-commands attributes as well.

65.4.6 GetJobs(name as string, OnlyMyJobs as boolean, whichjobs as Integer) as CUPSJobMBS()

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Get the jobs from the default server.
Notes: name: "" = all destinations, otherwise show jobs for named destination
OnlyMyJobs: false = all users, true = mine
whichjobs: kWhichJobsAll, kWhichJobsActive, or kWhichJobsComplete

A "whichjobs" value of kWhichJobsAll returns all jobs regardless of state, while kWhichJobsActive returns jobs that are pending, processing, or held and kWhichJobsComplete returns jobs that are stopped, canceled, aborted, or completed.

65.4.7 GetPassword(prompt as string) as string

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Get a password from the user.
Notes: Returns "" if the user does not provide a password.

65.4.8 GetPPD(name as string) as string

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Get the PPD file for a printer on the default server.
Example:

```
for each c as CUPSDestinationMBS in CUPSMBS.GetDestinations
if c.isDefault then
MessageBox cupsmbs.GetPPD(c.Name)
end if
next
```

Notes: Returns Filename for PPD file.

For classes, cupsGetPPD returns the PPD file for the first printer in the class.

The returned filename is stored in a static buffer and is overwritten with each call to cupsGetPPD or cupsGetPPD2. The caller "owns" the file that is created and must unlink the returned filename.

65.4.9 LastError as Integer

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Return the last IPP status code.

65.4.10 LastErrorString as string

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Return the last IPP status-message.
Example:

```
MessageBox CUPSMBS.LastErrorString
```

Notes: Returns status-message text from last request.

65.4.11 PrintData(name as string, Data as String, Title as string) as Integer

MBS Tools Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Print a file to a printer or class on the default server.
Notes: Name: Destination name
Data: Data to print
Title: Title of job

Returns Job ID or 0 on error

65.4.12 PrintFile(name as string, file as folderitem, title as string) as Integer

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Print a file to a printer or class on the default server.
Example:

```
// Print file on default printer...
Var f as FolderItem = SpecialFolder.Desktop.Child("test.ps")

for each c as CUPSDestinationMBS in CUPSMBS.GetDestinations
if c.isDefault then

call CUPSMBS.PrintFile(c.Name, f, f.Name)

end if
next
```

Notes: name: Destination name
filename: File to print
title: Title of job

Returns Job ID or 0 on error
See also:

- 65.4.13 PrintFile(name as string, file as folderitem, title as string, options() as CUPSOptionMBS) as Integer

65.4.13 PrintFile(name as string, file as folderitem, title as string, options() as CUPSOptionMBS) as Integer

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Print a file to a printer or class on the default server.
Notes: name: Destination name
filename: File to print
title: Title of job
options: Options

Returns Job ID or 0 on error
See also:

- 65.4.12 PrintFile(name as string, file as folderitem, title as string) as Integer 11650

65.4.14 PrintFiles(name as string, files() as folderitem, title as string) as Integer

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Print files to a printer or class on the default server.
Notes: name: Destination name
filename: Files to print
title: Title of job

Returns Job ID or 0 on error
See also:

- 65.4.15 PrintFiles(name as string, files() as folderitem, title as string, options() as CUPSOptionMBS) as Integer 11651

65.4.15 PrintFiles(name as string, files() as folderitem, title as string, options() as CUPSOptionMBS) as Integer

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Print files to a printer or class on the default server.
Notes: name: Destination name
files: Files to print
title: Title of job
options: Options

Returns Job ID or 0 on error
See also:

• 65.4.14 PrintFiles(name as string, files() as folderitem, title as string) as Integer 11651

65.4.16 Server as string

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Return the hostname/address of the default server.
Example:

MessageBox CUPSMBS.Server

Notes: The returned value can be a fully-qualified hostname, a numeric IPv4 or IPv6 address, or a domain socket pathname.

65.4.17 SetDefaultPrinter(printer as string)

MBS Tools Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Sets the default printer.
Notes: Name must be one of CUPSDestinationMBS's name.

65.4.18 SetServer(server as string)

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Set the default server name.
Notes: server: Server name

The "server" string can be a fully-qualified hostname, a numeric IPv4 or IPv6 address, or a domain socket pathname. Pass "" to restore the default server name.

65.4.19 SetUser(user as string)

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Set the default user name.
Notes: user: User name

Pass "" to restore the default user name.

65.4.20 User as string

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Return the current user's name.
Example:

MessageBox CUPSMBS.User

65.4.21 Constants

Constants

Constant	Value	Description
kJobAborted	8	One of the constants for the job state. Job was aborted.
kJobCanceled	7	One of the constants for the job state. Job was canceled.
kJobCompleted	9	One of the constants for the job state. Job was completed.
kJobHeld	4	One of the constants for the job state. Job is held.
kJobIDAll	-1	A job constant for all jobs.
kJobIDCurrent	0	A job constant for the current job.
kJobPending	3	One of the constants for the job state. Job is pending
kJobProcessing	5	One of the constants for the job state. Job is processing.
kJobStopped	6	One of the constants for the job state. Job is stopped.
kPrinterAUTHENTICATED	&h400000	One of the printer type/capability bit constants. Printer requires authentication
kPrinterBIND	&h0400	One of the printer type/capability bit constants. Can bind output
kPrinterBW	&h0004	One of the printer type/capability bit constants. Can do B&W printing
kPrinterCLASS	&h0001	One of the printer type/capability bit constants. Printer class
kPrinterCOLLATE	&h0080	One of the printer type/capability bit constants. Can collage copies
kPrinterCOLOR	&h0008	One of the printer type/capability bit constants. Can do color printing
kPrinterCOMMANDS	&h800000	One of the printer type/capability bit constants. Printer supports maintenance commands
kPrinterCOPIES	&h0040	One of the printer type/capability bit constants. Can do copies
kPrinterCOVER	&h0200	One of the printer type/capability bit constants. Can cover output
kPrinterDEFAULT	&h20000	One of the printer type/capability bit constants. Default printer on network
kPrinterDELETE	&h100000	One of the printer type/capability bit constants. Delete printer
kPrinterDISCOVERED	&h1000000	One of the printer type/capability bit constants. Printer was automatically discovered and added.
kPrinterDUPLEX	&h0010	One of the printer type/capability bit constants. Can do duplexing
kPrinterFAX	&h40000	One of the printer type/capability bit constants. Fax queue
kPrinterIMPLICIT	&h10000	One of the printer type/capability bit constants. Implicit class
kPrinterLARGE	&h4000	One of the printer type/capability bit constants. Can do D/E/A1/A0
kPrinterLOCAL	&h0000	One of the printer type/capability bit constants. Local printer or class
kPrinterMEDIUM	&h2000	One of the printer type/capability bit constants. Can do Tabloid/B/C/A3/A2
kPrinterMFP	&h4000000	One of the printer type/capability bit constants. Printer with scanning capabilities
kPrinterNotShared	&h200000	One of the printer type/capability bit constants. Printer is not shared.
kPrinterOPTIONS	&h6fffc	One of the printer type/capability bit constants.
kPrinterPUNCH	&h0100	One of the printer type/capability bit constants.

65.5 class CUPSMissingFunctionExceptionMBS

65.5.1 class CUPSMissingFunctionExceptionMBS

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: The exception raised if a CUPS function is not found.
Notes: On Windows this method is raised for each function you call.
Subclass of the RuntimeException class.

65.6 class CUPSOptionMBS

65.6.1 class CUPSOptionMBS

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: The class for the options in CUPS.
Example:

```
Var options() as CUPSOptionMBS

Var o1 as new CUPSOptionMBS
o1.Name = "media"
o1.Value = "A4"
options.Add o1

Var o2 as new CUPSOptionMBS
o2.Name = "scaling"
o2.Value = "75"
options.Add o2

Var o3 as new CUPSOptionMBS
o3.Name = "Collate"
o3.Value = "True"
options.Add o3

Var o4 as new CUPSOptionMBS
o4.Name = "sides"
o4.Value = "two-sided-long-edge"
options.Add o4
```

65.6.2 Properties

65.6.3 Name as String

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Name of option.
Notes: (Read and Write property)

65.6.4 Value as String

MBS Tools Plugin, Plugin Version: 9.7, Platforms: macOS, Linux, Targets: Desktop, Console & Web.

Function: Value of option.
Notes: (Read and Write property)

Chapter 66

CURL

66.1 class CURLEmailMBS

66.1.1 class CURLEmailMBS

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Our plugin class to help building and sending emails.
Example:

```
Var e as new CURLEmailMBS

e.SetFrom "test@test.test", "christian M√ºller"
e.Subject = "Hello World ,òÔè"
e.SMTPPassword = "xxx"
e.SMTPUsername = "xxx"
e.SetServer "smtp.test.test", true
e.AddTo "test@test.test", "Test M√ºller"
e.PlainText = "Hello World," + EndOfLine + "Smilies: ,òÔè üòò üòÑ"

Var c as new CURLSMBS

if c.SetupEmail(e) then

Var er as Integer = c.Perform
if er = 0 then
MessageBox "Email sent"
end if
end if
```

Notes: Please make sure you set from, to, subject, plaintext to have a minimum email always.

If your email misses required fields, the email server may silently discard it.

66.1.2 Methods

66.1.3 AddAttachment(data as MemoryBlock, name as string, type as string = "", InlineID as string = "", ContentTypeMethod as String = "")

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an attachment to the email.
Notes: name: The name for the attachment.
type: Optional, the mime type to use. e.g. "application/pdf" for PDF files. If missing, we use "application/octet-stream".
data: The data to include.

For best results use attachment sizes below 50 MB.
The plugin will encode your data as Base64. If you want to attach a picture, you can use PictureToPNGStringMBS (mime type "image/png") or PictureToJPEGStringMBS (mime type "image/jpeg") to encode a picture.

Version 15.0 of MBS Plugin can encode file name for preserving non AScII characters. Still for compatibility it is recommended to use simply AScII names.

If InlineID is set, we include the attachment for inlining. Please pass content ID (cID).
Empty text or no parameter gives regular attachment.
You can use AddAttachment several times to add several attachments.

The optional ContentTypeMethod parameter allows to specify the method value for the content-type header. Currently only for sending calendar invitiations.
See also:

- 66.1.4 AddAttachment(data as string, name as string, type as string = "", InlineID as string = "", ContentTypeMethod as String = "") 11661
- 66.1.5 AddAttachment(file as FolderItem, name as string = "", type as string = "", InlineID as string = "", ContentTypeMethod as String = "") 11662

66.1.4 AddAttachment(data as string, name as string, type as string = "", InlineID as string = "", ContentTypeMethod as String = "")

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an attachment to the email.
Notes: name: The name for the attachment.
type: Optional, the mime type to use. e.g. "application/pdf" for PDF files. If missing, we use "application/octet-stream".
data: The data to include.

For best results use attachment sizes below 50 MB.
The plugin will encode your data as Base64. If you want to attach a picture, you can use PictureToPNGStringMBS (mime type "image/png") or PictureToJPEGStringMBS (mime type "image/jpeg") to encode a picture.

- 66.1.5 AddAttachment(file as FolderItem, name as string = """, type as string = """, InlineID as string = """, ContentTypeMethod as String = """) 11662

66.1.5 AddAttachment(file as FolderItem, name as string = """, type as string = """, InlineID as string = """, ContentTypeMethod as String = """)

MBS CURL Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an attachment to the email.
Notes: name: The name for the attachment. If empty, version 16.2 uses file name from folderitem.
type: Optional, the mime type to use. e.g. "application/pdf" for PDF files. If missing, we use "application/octet-stream".
file: The file to use. This file is read and content used for attachment.

For best results use attachment sizes below 50 MB.
The plugin will encode your data as Base64. If you want to attach a picture, you can use PictureToPNGStringMBS (mime type "image/png") or PictureToJPEGStringMBS (mime type "image/jpeg") to encode a picture.

Version 15.0 of MBS Plugin can encode file name for preserving non AScII characters. Still for compatibility it is recommended to use simply AScII names.

- 66.1.4 AddAttachment(data as string, name as string, type as string = """, InlineID as string = """, ContentTypeMethod as String = """) 11661

66.1.6 AddBcc(email as string, name as string)

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a blind copy recipient.
Example:

```
Var e as new CURLEmailMBS

e.AddBcc "test@monkeybreadsoftware.test", "Test M√ºller"

Var Bccs() as string = e.Bccs
MessageBox Bccs(0)
```

Notes: Please pass email and optionally name of recipient.
If this name contains special characters, it will be automatically encoded with UTF-8.

66.1.7 Addcc(email as string, name as string)

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a copy recipient.
Example:

```
Var e as new CURLEmailMBS

e.Addcc "test@monkeybreadsoftware.test", "Test M√ºller"

Var ccs() as string = e.ccs
MessageBox ccs(0)
```

Notes: Please pass email and optionally name of recipient.
If this name contains special characters, it will be automatically encoded with UTF-8.

66.1.8 AddHeader(header as string)

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a header entry.
Example:

```
Var e as new CURLEmailMBS

e.AddHeader "X-company: My company, Inc."

Var Headers() as string = e.Headers
MessageBox Headers(0)
```

Notes: This header is passed as is and not preprocessed.
You can use this function to pass custom headers for "X-Universally-Unique-Identifier:", "Date:", "X-Mailer:", "Message-Id:" and "Mime-Version:".

If you pass header without text following ":", the header is not included.

66.1.9 AddReplyTo(email as string, name as string)

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a recipient for a reply.
Example:

```
Var e as new CURLEmailMBS

e.AddReplyTo "test@monkeybreadsoftware.test", "Test M√ºller"

Var ReplyTos() as string = e.ReplyTOs
MessageBox ReplyTos(0)
```

Notes: Please pass email and optionally name of recipient.
If this name contains special characters, it will be automatically encoded with UTF-8.

66.1.10 AddTo(email as string, name as string)

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a recipient.
Example:

```
Var e as new CURLEmailMBS

e.AddTo "test@monkeybreadsoftware.test", "Test M√ºller"

Var TOs() as string = e.TOs
MessageBox TOs(0)
```

Notes: Please pass email and optionally name of recipient.
If this name contains special characters, it will be automatically encoded with UTF-8.

66.1.11 Bccs as String()

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of Bcc recipients.
Example:

```
Var e as new CURLEmailMBS

e.AddBcc "test@monkeybreadsoftware.test", "Test M√ºller"

Var Bccs() as string = e.Bccs
MessageBox Bccs(0)
```

Notes: Entries may be encoded if necessary.

66.1.12 ccs as String()

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of cc recipients.
Example:

```
Var e as new CURLEmailMBS

e.Addcc "test@monkeybreadsoftware.test", "Test M√ºller"

Var ccs() as string = e.ccs
MessageBox ccs(0)
```

Notes: Entries may be encoded if necessary.

66.1.13 clearAttachments

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all attachments from this email.
Notes: Useful in case you want to send same email with different attachments to another recipient.

66.1.14 ClearHeaders

MBS CURL Plugin, Plugin Version: 16.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears all headers from this email.
Notes: Useful in case you want to send same email with different headers to another recipient.

66.1.15 clearRecipients

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: clears all recipients.
Notes: Removes all TO, cc, Bcc and ReplyTO entries.
Useful in case you want to send same email to another recipient.

66.1.16 constructor(Encoding as string = "UTF-8")

MBS CURL Plugin, Plugin Version: 14.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Normally, ignore parameter and use UTF-8.
But alternative you can pass: UTF-8, AScII, MacRoman, Latin1 or Windows.

66.1.17 EmailSource as string

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the source code for the email.
Notes: This is more for debugging, than for real use.
You can write this into a EML file.

66.1.18 Headers as String()

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of extra header entries.
Example:

```
Var e as new CURLEmailMBS

e.AddHeader "X-company: My company, Inc."

Var Headers() as string = e.Headers
MessageBox Headers(0)
```

66.1.19 ReplyTOs as String()

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of ReplyTo recipients.
Example:

```
Var e as new CURLEmailMBS

e.AddReplyTo "test@monkeybreadsoftware.test", "Test M√ºller"

Var ReplyTos() as string = e.ReplyTOs
MessageBox ReplyTos(0)
```

Notes: Entries may be encoded if necessary.

66.1.20 SetFrom(email as string, name as string)

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the email from address.
Example:

```
Var e as new CURLEmailMBS

e.SetFrom "test@test.test", "christian M√ºller"
```

Notes: Please pass email and name of the recipient. If this name contains special characters, it will be automatically encoded with UTF-8.

66.1.21 SetServer(server as string, UseSSL as boolean = false)

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the server to use.
Example:

```
Var e as new CURLEmailMBS

e.SMTPPassword = "rGc3_mdyjR%k"
e.SMTPUsername = "sammler@monkeybreadsoftware.de"
e.SetServer "smtprelaypool.ispgateway.de", true
```

Notes: Sets which SMTP server to use.
There are a few combinations possible.
First you can use SetServer with SSL and pass true for UseURL parameter.

Or you pass false for no SSL. Still you can use CURL's OptionFTPSSL set to 3 to allow TLS for an upgrade of the unencrypted connection to SSL later.

Some servers don't support unencrypted, SSL or TLS, so only one may work.

And ports can be difficult, too. You can use CURL OptionPort to set a port explicit or include it in the server with double colon on the end. common ports are 25, 587 or 465.

Port 465 usually Requires UseSSL=true, but other ports need UseSSL=false.
Sets UseSSL property.

66.1.22 TOs as String()

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of TO recipients.
Example:

```
Var e as new CURLEmailMBS

e.AddTo "test@monkeybreadsoftware.test", "Test M√ºller"

Var TOs() as string = e.TOs
MessageBox TOs(0)
```

Notes: Entries may be encoded if necessary.

66.1.23 Properties

66.1.24 Attachmentcount as Integer

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns number of attachments.
Notes: (Read only property)

66.1.25 BoundaryName as String

MBS CURL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Optional name to use in boundaries for MIME parts.

Notes: by default MBS Plugin.
(Read and Write property)

66.1.26 EncodingName as String

MBS CURL Plugin, Plugin Version: 24.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The encoding used.
Notes: The property is there for you to inspect in debugger.
Set only via Constructor.
(Read only property)

66.1.27 FromEmail as String

MBS CURL Plugin, Plugin Version: 24.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The from address with name.
Example:

```
Var e As New CURLEmailMBS

e.SetFrom "test@yahoo.com", "Christian M√ºller"

// shows name encoded due to √º character
MessageBox e.FromEmail
```

Notes: The property is there for you to inspect in debugger.
(Read only property)

66.1.28 HeaderList as String

MBS CURL Plugin, Plugin Version: 24.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The list of header entries.
Notes: The property is there for you to inspect in debugger.
(Read only property)

66.1.29 HTMLText as String

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The HTML text of the email.
Example:

```
Var e As New CURLEmailMBS

e.HTMLText = "<html><body><p>Hello World</p></body></html>"
```

Notes: This text is encoded as quoted printable UTF-8 text.
(Read and Write property)

66.1.30 InReplyTo as String

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The in reply to message ID.
Notes: Here you can define the message ID of the email you reply to.
(Read and Write property)

66.1.31 MessageID as String

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a custom message ID.
Notes: The plugin normally creates one by default when setting from address.
(Read and Write property)

66.1.32 PlainText as String

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The plain text of the email.
Example:

```
Var e as new CURLEmailMBS
e.PlainText = "Hello World," + EndOfLine + "Smilies: ,òÔè üòò üòÑ"
```

Notes: This text is encoded as quoted printable UTF-8 text.
(Read and Write property)

66.1.33 RecipientsBCC as String

MBS CURL Plugin, Plugin Version: 24.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of Bcc recipients.
Notes: The property is there for you to inspect in debugger.
(Read only property)

66.1.34 RecipientsCC as String

MBS CURL Plugin, Plugin Version: 24.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of CC recipients.
Notes: The property is there for you to inspect in debugger.
(Read only property)

66.1.35 RecipientsReplyTo as String

MBS CURL Plugin, Plugin Version: 24.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of reply to entries.
Notes: The property is there for you to inspect in debugger.
(Read only property)

66.1.36 RecipientsTO as String

MBS CURL Plugin, Plugin Version: 24.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of TO recipients.
Notes: The property is there for you to inspect in debugger.
(Read only property)

66.1.37 RichText as String

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The enriched text of the email.
Example:

Var e As New CURLEmailMBS

e.RichText = "<bold>Hello, <italic>world!</italic></bold>"

Notes: This text is encoded as quoted printable UTF-8 text.
This is not to be confused with RTF file format. Enriched text is described here:
http://en.wikipedia.org/wiki/Enriched_text
Please note that most email clients do not support this nowadays.
(Read and Write property)

66.1.38 Server as String

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The effective server URL used.
Example:

```
Var e As New CURLEmailMBS

e.SetServer "smtp.mail.yahoo.com", True

MessageBox e.Server // shows smtp.mail.yahoo.com
```

Notes: Only for debugging.
(Read only property)

66.1.39 SMTPPassword as String

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The password for SMTP server authentication.
Example:

```
Var e as new CURLEmailMBS

e.SMTPPassword = "rGc3_mdyjR%k"
e.SMTPUsername = "sammler@monkeybreadsoftware.de"
e.SetServer "smtprelaypool.ispgateway.de", true
```

Notes: (Read and Write property)

66.1.40 SMTPServer as String

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The domain name of the SMTP Server to use.
Example:

```
Var e as new CURLEmailMBS

e.SMTPPassword = "rGc3_mdyjR%k"
e.SMTPUsername = "sammler@monkeybreadsoftware.de"
e.SMTPServer = "smtprelaypool.ispgateway.de"
e.UseSSL = true
```

Notes: (Read and Write property)

66.1.41 SMTPUsername as String

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The username for SMTP server authentication.
Example:

```
Var e as new CURLEmailMBS

e.SMTPPassword = "rGc3_mdyjR%k"
e.SMTPUsername = "sammler@monkeybreadsoftware.de"
e.SetServer "smtprelaypool.ispgateway.de", true
```

Notes: (Read and Write property)

66.1.42 Subject as String

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The subject line.
Example:

```
Var e as new CURLEmailMBS

e.Subject = "Hello World ,òÔè"
```

Notes: If subject lines contains special characters, it is automatically encoded as UTF-8.
(Read and Write property)

66.1.43 Use8BitMime as Boolean

MBS CURL Plugin, Plugin Version: 25.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether 8bit encoding is used.
Example:

```
Var e as new CURLEmailMBS

e.Use8BitMime = true
e.Subject = "Hello World ,òÔè"
```

Notes: (Read and Write property)

66.1.44 UseSSL as Boolean

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to use SSL or not.
Example:

```
Var e as new CURLEmailMBS

e.SMTPPassword = "rGc3_mdyjR%k"
e.SMTPUsername = "sammler@monkeybreadsoftware.de"
e.SMTPServer = "smtprelaypool.ispgateway.de"
e.UseSSL = true
```

Notes: When using SSL right, please also check cAInfo, cAPath, OptionSSLVerifyHost and OptionSSLVerifyPeer properties on the CURLSMBS class.

Pass false for TLS and later configure CURL for TLS.
Port 465 usually Requires UseSSL=true, but other ports need UseSSL=false.
(Read and Write property)

66.2 class CURLFileInfoMBS

66.2.1 class CURLFileInfoMBS

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSFileInfoMBS instead. **Function:** The class for file information.
Notes: Subclass of the CURLSFileInfoMBS class.

66.3 class CURLListMBS

66.3.1 class CURLListMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSListMBS instead.
Function: A class to hold a list of strings from the CURL library.
Notes: Subclass of the CURLSListMBS class.

66.4 class CURLMBS

66.4.1 class CURLMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSMBS instead.
Function: A class to wrap libCURL.
Notes: Subclass of the CURLSMBS class.

66.5 class CURLMimePartMBS

66.5.1 class CURLMimePartMBS

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSMimePartMBS instead. **Function:** The class for mime parts.
Notes: Subclass of the CURLSMimePartMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

66.6 class CURLMultiMBS

66.6.1 class CURLMultiMBS

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSMultiMBS instead.
Function: The class for multiple CURL transfers running in parallel.
Notes: Subclass of the CURLSMultiMBS class.

66.7 class CURLNFileInfoMBS

66.7.1 class CURLNFileInfoMBS

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSFileInfoMBS instead. **Function:** The class for file information.
Notes: Subclass of the CURLSFileInfoMBS class.

66.8 class CURLNListMBS

66.8.1 class CURLNListMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSListMBS instead.
Function: A class to hold a list of strings from the CURL library.
Notes: Subclass of the CURLSListMBS class.

66.9 class CURLNMBS

66.9.1 class CURLNMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSMBS instead.
Function: A class to wrap libCURL.
Notes: We used to have a CURL with native SSL backend for macOS or windows.
Please move to CURLSMBS class, which can switch to using windows SSL backend instead fo openssl.
Subclass of the CURLSMBS class.

66.12 class CURLNSSLBackendMBS

66.12.1 class CURLNSSLBackendMBS

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSSSLBackendMBS instead. **Function:** The class for a SSL backend.
Notes: Subclass of the CURLSSSLBackendMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

66.13 class CURLNURLMBS

66.13.1 class CURLNURLMBS

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSURLMBS instead.
Function: The class for CURL's URL parser.
Notes: Subclass of the CURLSURLMBS class.

66.14 class CURLNVersionMBS

66.14.1 class CURLNVersionMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSVersionMBS instead. **Function:** A class to hold version information from libCURL.
Notes: Subclass of the CURLSVersionMBS class.

66.16 class CURLSFileInfoMBS

66.16.1 class CURLSFileInfoMBS

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for file information.
Example:

```
// list the files in a folder on a FTP server with name, size and date
Var curl As New CURLSMBS
curl.OptionURL = "ftp://ftp.example.com/pub/*" // * = all files
curl.OptionUsername = "anonymous"
curl.OptionPassword = "guest"
curl.OptionWildCardMatch = True

Var result As Integer = curl.Perform
Var lines() As String
For Each info As CURLSFileInfoMBS In curl.FileInfos
If info.IsDirectory Then
lines.Add info.FileName + "/"
Else
lines.Add info.FileName + ", " + info.Size.ToString + " bytes, " + info.PermissionString
End If
Next
MessageBox "Result: " + result.ToString + EndOfLine + String.FromArray(lines, EndOfLine)
```

Notes: Content of this structure depends on information which is known and is achievable (e.g. by FTP LIST parsing).

66.16.2 Properties

66.16.3 Date as Date

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The timstamp as a date object.
Notes: As of plugin version 15.2 the CURL library does not parse the timestamp.
So for some timestamp formats we have code in our plugin to do the parsing from the TimeString property. But this is limited. No seconds and the year is a guess. Files newer in the year than today are from last year and other files from current year. The server doesn't provide year details.
(Read only property)

66.16.4 DateTime as DateTime

MBS CURL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The timstamp as a date object.
Notes: As of plugin version 20.5 the CURL library does not parse the timestamp.
So for some timestamp formats we have code in our plugin to do the parsing from the TimeString property. But this is limited. No seconds and the year is a guess. Files newer in the year than today are from last year and other files from current year. The server doesn't provide year details.
(Read only property)

66.16.5 FileName as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file name.
Notes: (Read only property)

66.16.6 FileType as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file type.
Notes: (Read only property)

66.16.7 Flags as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The flags.
Notes: Flags define which fields are set.
Also you can just use the Has properties for same information.
(Read only property)

66.16.8 GID as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The group ID.
Notes: (Read only property)

66.16.9 GroupString as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The group string.
Notes: (Read only property)

66.16.10 HardLinks as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The hard link count.
Notes: (Read only property)

66.16.11 HasFileName as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if filename property is valid.
Notes: (Read only property)

66.16.12 HasFileType as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if filetype property is valid.
Notes: (Read only property)

66.16.13 HasGID as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if GID property is valid.
Notes: (Read only property)

66.16.14 HasHardLinks as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if hardlinks property is valid.
Notes: (Read only property)

66.16.15 HasPermissions as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if permissions property is valid.
Notes: (Read only property)

66.16.16 HasSize as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if size property is valid.
Notes: (Read only property)

66.16.17 HasTime as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if time and date properties have values.
Notes: (Read only property)

66.16.18 HasUID as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if UID field has a value.
Notes: (Read only property)

66.16.19 IsDirectory as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if entry is a directory.
Notes: Same as FileType = FileTypeDirectory.
(Read only property)

66.16.20 IsFile as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if entry is a regular file.
Notes: Same as FileType = FileTypeFile.
(Read only property)

66.16.21 Permissions as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The permission value.
Notes: (Read only property)

66.16.22 PermissionString as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The permission string.
Notes: (Read only property)

66.16.23 Size as Int64

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file size.
Notes: (Read only property)

66.16.24 Target as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The target for a symlink.
Notes: (Read only property)

66.16.25 Time as Int64

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time value.
Notes: (Read only property)

66.16.26 TimeString as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time string parsed.
Notes: (Read only property)

66.16.27 UID as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The user ID.
Notes: (Read only property)

66.16.28 UserString as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The user ID as text.
Notes: (Read only property)

66.16.29 Constants

File Types

Constant	Value	Description
FileTypeDeviceBlock	3	Block Device
FileTypeDeviceChar	4	Character Device
FileTypeDirectory	1	Directory
FileTypeDoor	7	Door, is possible only on Sun Solaris now.
FileTypeFile	0	Regular file
FileTypeNamedPipe	5	Named Pipe
FileTypeSocket	6	Socket
FileTypeSymlink	2	Symbolic links
FileTypeUnknown	8	Unknown file type. Should never occur.

Flag Constants

Constant	Value	Description
FlagKnownFileName	1	Filename Known
FlagKnownFileType	2	File Type Known
FlagKnownGID	32	GID Known
FlagKnownHardLinks	128	Hardlink Count Known
FlagKnownPermissions	8	Permissions Known
FlagKnownSize	64	Size Known
FlagKnownTime	4	Time Known
FlagKnownUID	16	UID Known

66.17 class CURLSListMBS

66.17.1 class CURLSListMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to hold a list of strings from the CURL library.
Notes: Data is copied for this list, so you can just keep it around.

66.17.2 Methods

66.17.3 Item(index as Integer) as string

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the item with the given index.
Notes: Index is zero based.

66.17.4 List as String()

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts list to a string array.

66.17.5 Operator_Convert as String()

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts list to a string array.

66.17.6 Properties

66.17.7 Count as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of items in this list.
Notes: (Read only property)

66.18 class CURLSMBS

66.18.1 class CURLSMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to wrap libCURL.
Example:

```
Var d As New CURLSMBS

// download here
d.OptionURL = URL

// if you use SSL, maybe put in a certificate or disable verification?
d.OptionSSLVerifyHost = 0
d.OptionSSLVerifyPeer = 0

// run download
Var e as integer = d.Perform

// check result
Var data As String = d.OutputData
Var DebugMessage As String = d.DebugMessages // check in debugger on error

ResultText.text="Result: "+str(e) // 0 = Okay, others are error codes, so check debug messages
```

Notes: We have three variants:

CURLS* classes include a static CURL library with SSL and SSH.
CURLN* classes include a static CURL library with native SSL on Mac and Windows.
CURL* classes without S need you to supply your own CURL library.

All variants can load a custom CURL library or use the one from the system on Mac and Linux.
If no library is loaded or included, the plugin will try to load the system one in constructor.

from the website libCURL website:
https://curl.haxx.se/libcurl/

libCURL is a free and easy-to-use client-side URL transfer library, supporting FTP, FTPS, HTTP, HTTPS, SCP, SFTP, TFTP, TELNET, DICT, FILE and LDAP. libCURL supports SSL certificates, HTTP POST, HTTP PUT, FTP uploading, HTTP form based upload, proxies, cookies, user+password authentication (Basic, Digest, NTLM, Negotiate, Kerberos4), file transfer resume, http proxy tunneling and more!

libCURL is highly portable, it builds and works identically on numerous platforms, including Solaris, NetBSD, FreeBSD, OpenBSD, Darwin, HPUX, IRIX, AIX, Tru64, Linux, UnixWare, HURD, Windows, Amiga, OS/2, BeOs, Mac OS X, Ultrix, QNX, OpenVMS, RISC OS, Novell NetWare, DOS and more...

libCURL is free, thread-safe, IPv6 compatible, feature rich, well supported, fast, thoroughly documented and is already used by many known, big and successful companies and numerous applications.

On Linux you may need to install libraries like ldap: apt-get install libldap-2.4.2:i386

For macOS and iOS, your application may need to have the NSLocalNetworkUsageDescription in info.plist for local network access and your sandboxed application may need need the com.apple.security.network.client entitlement.

66.18.2 Methods

66.18.3 AddMimePart as CURLSMimePartMBS

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new blank mime part.
Notes: Returns mime object, so you can set properties.

66.18.4 AWSPresignURL(AWSAccessKeyId as String, AWSSecretAccessKey as String, Region as String, Service as String, Path as String, Domain as String, Verb as String = "GET", Expires as Integer = 86400, QueryParameters() as String = nil, Headers() as String = nil) as String

MBS CURL Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Query predigend URL for Amazon Webservices.
Example:

```
Var URL As String = CURLSMBS.AWSPresignURL( _
"AKIAIOSFODNN7EXAMPLE", _
"wJalrXUtnFEMI/K7MDENG/bPxRfiCYEXAMPLEKEY", _
"us-east-1", _
"s3", _
"/test.txt", _
"examplebucket.s3.amazonaws.com", _
"GET", _
86400 )

Break // see URL in debugger
```

Notes: This implements AWS4-HMAC-SHA256 pre-signature for credentials.

Works also for other compatible S3 services beside Amazon's like the one from Wasabi or Dell ECS.

Parameter	Description	Example
AWSAccessKeyId	Your access key for AWS.	
AWSSecretAccessKey	Your secret.	
Region	The region to use.	"eu-central-1"
Service	The service to use.	"s3"
Path	The path for the URL. Should always start with "/".	"/bucketname/test.jpg"
Domain	Optional the domain to use. By default we just build it from region and service.	"s3.eu-central-1.amazonaws.com" or "s3-ap-southeast-2.amazonaws.com"
Verb	The HTTP Operation to do. Can be POST, PUT, GET or DELETE. Default is GET.	"GET"
Expires	Expiration duration. Provides the time period, in seconds, for which the generated presigned URL is valid. For example, 86400 (24 hours). This value is an integer. The minimum value you can set is 1, and the maximum is 604800 (seven days). A presigned URL can be valid for a maximum of seven days because the signing key you use in signature calculation is valid for up to seven days. Default is 86400 for one day.	
QueryParameters	List of query parameters to include.	"text=abc"
Headers	Extra HTTP headers to include. Here you can specify various headers to include in signature and request.	

Returns the pre-signed URL. May raise an exception in case of error.

66.18.5 CipherNames as String()

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of all cipher algorithms.
Example:

```
// see hash and encryption algorithms available
Var CipherNames() as string = CURLSMBS.CipherNames
Var DigestNames() as string = CURLSMBS.DigestNames
Break
```

Notes: The list may not be the same for Mac, Windows and Linux.

66.18.6 ClearData

MBS CURL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears data properties.
Notes: Resets OutputData, DebugMessages and Headers.

66.18.7 CloseMTDebugOutputFile

MBS CURL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes the debug output file for PerformMT.
Notes: Call after PerformMT finished.
With 15.2 version of plugin, this also works with Perform.

66.18.8 CloseMTHeaderOutputFile

MBS CURL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes the header output file for PerformMT.
Notes: Call after PerformMT finished.

With 15.2 version of plugin, this also works with Perform.

66.18.9 CloseMTInputFile

MBS CURL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes the input file for PerformMT.
Notes: Call after PerformMT finished.
With 15.2 version of plugin, this also works with Perform.

66.18.10 CloseMTOutputFile

MBS CURL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes the output file for PerformMT.
Notes: Call after PerformMT finished.
With 15.2 version of plugin, this also works with Perform.

66.18.11 CreateMTDebugOutputFile(file as folderitem) as boolean

MBS CURL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a file where debug data is written to.
Notes: Returns true on success and false on failure (e.g. permission error).
With 15.2 version of plugin, this also works with Perform.

Must be called before Perform, so we can stream data to the file.
The file is closed automatically when Perform methods finish their work.
See also:

- 66.18.12 CreateMTDebugOutputFile(Path as String) as boolean 11701

66.18.12 CreateMTDebugOutputFile(Path as String) as boolean

MBS CURL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a file where debug data is written to.
Notes: Returns true on success and false on failure (e.g. permission error).

Must be called before Perform, so we can stream data to the file.
The file is closed automatically when Perform methods finish their work.

See also:

- 66.18.11 CreateMTDebugOutputFile(file as folderitem) as boolean 11701

66.18.13 CreateMTHeaderOutputFile(file as folderitem) as boolean

MBS CURL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a file where header data is written to.
Notes: Returns true on success and false on failure (e.g. permission error).
With 15.2 version of plugin, this also works with Perform.

Must be called before Perform, so we can stream data to the file.
The file is closed automatically when Perform methods finish their work.
See also:

- 66.18.14 CreateMTHeaderOutputFile(Path as String) as boolean 11702

66.18.14 CreateMTHeaderOutputFile(Path as String) as boolean

MBS CURL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a file where header data is written to.
Notes: Returns true on success and false on failure (e.g. permission error).

Must be called before Perform, so we can stream data to the file.
The file is closed automatically when Perform methods finish their work.
See also:

- 66.18.13 CreateMTHeaderOutputFile(file as folderitem) as boolean 11702

66.18.15 CreateMTOutputFile(file as folderitem) as boolean

MBS CURL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a file where output data is written to.
Notes: Returns true on success and false on failure (e.g. permission error).
With 15.2 version of plugin, this also works with Perform.

Must be called before Perform, so we can stream data to the file.
The file is closed automatically when Perform methods finish their work.

You can set CollectOutputData to false in order to disable dat being collected.
See also:

• 66.18.16 CreateMTOutputFile(Path as String) as boolean 11703

66.18.16 CreateMTOutputFile(Path as String) as boolean

MBS CURL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a file where output data is written to.
Notes: Returns true on success and false on failure (e.g. permission error).

Must be called before Perform, so we can stream data to the file.
The file is closed automatically when Perform methods finish their work.

You can set CollectOutputData to false in order to disable dat being collected.
See also:

• 66.18.15 CreateMTOutputFile(file as folderitem) as boolean 11702

66.18.17 DecodeIMAPFolderName(encodedName as String) as String

MBS CURL Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decodes text from IMAP UTF-7.
Example:

```
// test a few cases
Var t1 As String = "Entw&APw-rfe"
Var t2 As String = "Test&AOk-&-"
Var t3 As String = "
textasciitilde peter/mail/&ZeVnLIqe-/&U,BTFw-"

Var d1 As String = CURLSMBS.DecodeIMAPFolderName(t1)
// shows "Entw√ºrfe"
Var d2 As String = CURLSMBS.DecodeIMAPFolderName(t2)
// shows "Test√©&"
Var d3 As String = CURLSMBS.DecodeIMAPFolderName(t3)
// shows "
textasciitilde peter/mail/Êó•Êú¨Ë™ûû/Âè∞Âåó"

Break
```

Notes: Use this for IMAP folder names to decode the name and show to user.

See RFC 2060:
http://www.faqs.org/rfcs/rfc2060.html

You may do a directory listing for IMAP, then decode the names for display, but keep the original encoded names to later do a query for folder content.

66.18.18 DigestNames as String()

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of all digest algorithms.
Example:

```
// see hash and encryption algorithms available
Var CipherNames() as string = CURLSMBS.CipherNames
Var DigestNames() as string = CURLSMBS.DigestNames
Break
```

Notes: The list may not be the same for Mac, Windows and Linux.

66.18.19 FileInfos as CURLSFileInfoMBS()

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries array with file information.
Notes: If you use OptionWildcard, you find after the transfer all CURLSFileInfoMBS objects for all the files/folders found.

For MBS Plugin 19.0 or newer you can alternatively run a custom request "MLSD" and than get file infos, too.

66.18.20 FinishMime

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finishes mime data.
Example:

```
Var c as new CURLSMBS

// add mime
Var p as CURLSMimePartMBS = c.AddMimePart

p.name = "Text"
p.FileName = "test.txt"
p.MimeType = "text/plain"
p.DataString = "Hello World"
```

```
c.FinishMime
// now you can send...
```

Notes: Please call AddMimePart for each part you like to add and than finally FinishMime before calling perform.

66.18.21 FormAdd(FormOption1 as Integer, Text1 as string, FormOption2 as Integer, FormOptions() as Integer, Texts() as string)

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add a section to a multipart/formdata HTTP POST.
Example:

```
Var c as new CURLSMBS
Var file1 as string = "my-face.jpg"
Var file2 as string = "your-face.jpg"
Var formOptions(-1) as Integer
Var formValues(-1) as string

const CURLFORM_COPYNAME = 1
const CURLFORM_ARRAY = 8
const CURLFORM_FILE = 10

'/* Add two file section using CURLFORM_ARRAY */
formOptions.Add CURLFORM_FILE
formValues.Add file1
formOptions.Add CURLFORM_FILE
formValues.Add file2

'/* no option needed for the end marker */
c.FormAdd CURLFORM_COPYNAME, "pictures", CURLFORM_ARRAY, formOptions, formValues
```

Notes: Lasterror is set.
See other FormAdd methods for details.

66.18.27 FormAdd(FormOption1 as Integer, Text1 as string, FormOption2 as Integer, Text2 as string, FormOption3 as Integer, Text3 as string, FormOption4 as Integer, Number4 as Integer)

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add a section to a multipart/formdata HTTP POST.
Notes: Several FormAdd methods are there. Send a request to support if you need another parameter combination.

Lasterror is set.

FormAdd() is used to append sections when building a multipart/formdata HTTP POST (sometimes referred to as rfc1867-style posts). Append one section at a time until you've added all the sections you want included and then you call FormFinish.

Using POST with HTTP 1.1 implies the use of a "Expect: 100-continue" header. You can disable this header with CURLOPT_HTTPHEADER as usual.

First, there are some basics you need to understand about multipart/formdata posts. Each part consists of at least a NAME and a CONTENTS part. If the part is made for file upload, there are also a stored CONTENT-TYPE and a FILENAME. Below, we'll discuss what options you use to set these properties in the parts you want to add to your post.

The options listed first are for making normal parts. The options from CURLFORM_FILE through CURLFORM_BUFFERLENGTH are for file upload parts.

CURLFORM_COPYNAME:
followed by a string which provides the name of this part. libCURL copies the string so your application doesn't need to keep it around after this function call. If the name isn't null terminated, or if you'd like it to contain zero bytes, you must set its length with CURLFORM_NAMELENGTH.

CURLFORM_PTRNAME:
followed by a string which provides the name of this part. libCURL will use the string and refer to the data in your application, so you must make sure it remains until CURL no longer needs it. If the name isn't null terminated, or if you'd like it to contain zero bytes, you must set its length with CURLFORM_NAMELENGTH.

CURLFORM_COPYCONTENTS:
followed by a string to the contents of this part, the actual data to send away. libCURL copies the provided data, so your application doesn't need to keep it around after this function call. If the data isn't null terminated, or if you'd like it to contain zero bytes, you must set the length of the name with CURLFORM_CONTENTSLENGTH.

CURLFORM_PTRCONTENTS:
followed by a string to the contents of this part, the actual data to send away. libCURL will use the string and refer to the data in your application, so you must make sure it remains until CURL no longer needs it. If the data isn't null terminated, or if you'd like it to contain zero bytes, you must set its length with CURLFORM_CONTENTSLENGTH.

CURLFORM_CONTENTSLENGTH:
followed by a long giving the length of the contents.

CURLFORM_FILECONTENT:
followed by a filename, causes that file to be read and its contents used as data in this part. This part does not automatically become a file upload part simply because its data was read from a file.

CURLFORM_FILE:
followed by a filename, makes this part a file upload part. It sets the filename field to the basename of the provided filename, it reads the contents of the file and passes them as data and sets the content-type if the given file match one of the internally known file extensions. For CURLFORM_FILE the user may send one or more files in one part by providing multiple CURLFORM_FILE arguments each followed by the filename

(and each CURLFORM_FILE is allowed to have a CURLFORM_CONTENTTYPE).

CURLFORM_CONTENTTYPE:
is used in combination with CURLFORM_FILE. Followed a string which provides the content-type for this part, possibly instead of an internally chosen one.

CURLFORM_FILENAME:
is used in combination with CURLFORM_FILE. Followed a string, it tells libCURL to use the given string as the filename in the file upload part instead of the actual file name.

CURLFORM_BUFFER:
is used for custom file upload parts without use of CURLFORM_FILE. It tells libCURL that the file contents are already present in a buffer. The parameter is a string which provides the filename field in the content header.

CURLFORM_BUFFERPTR:
is used in combination with CURLFORM_BUFFER. The parameter is the string to be uploaded. You must also use CURLFORM_BUFFERLENGTH to set the number of bytes in the buffer. Keep the buffer variable alive till the upload is finished.

CURLFORM_BUFFERLENGTH:
is used in combination with CURLFORM_BUFFER. The parameter is a long which gives the length of the buffer.

CURLFORM_ARRAY:
Another possibility to send options to CURL_formadd() is the CURLFORM_ARRAY option, that passes an Integer Array and a String Array defining its value. Each element in the form is constructed using the option from the integer array and the value from the string array. All available options can be used in an array, except the CURLFORM_ARRAY option itself!

CURLFORM_CONTENTHEADER:
specifies extra headers for the form POST section. This takes a CURL_slist prepared in the usual way using CURL_slist_append and appends the list of headers to those libCURL automatically generates. The list must exist while the POST occurs, if you free it before the post completes you may experience problems.

PS: CURLFORM_FILE does not work in all CURL versions on all platforms due to a bug with integer numbers.

66.18.28 FormAdd(FormOption1 as integer, Text1 as string, FormOption2 as integer, Text2 as string, FormOption3 as integer, Text3 as string, FormOption4 as integer, Number4 as integer, FormOption5 as integer, Text5 as string)

MBS CURL Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add a section to a multipart/formdata HTTP POST.
Notes: Lasterror is set.
See other FormAdd methods for details.
See also:

- 66.18.21 FormAdd(FormOption1 as Integer, Text1 as string, FormOption2 as Integer, FormOptions() as Integer, Texts() as string) 11705

66.18.29 FormAddField(fieldName as String, fieldValue as String, ContentType as String = "")

MBS CURL Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add a section to a multipart/formdata HTTP POST.
Example:

```
Var d as new CURLSMBS
d.FormAddField("company", "Test, Inc.")
```

Notes: For fieldName and ContentType, we use UTF8 always. For fieldValue, we pass through whatever is in the string, so please make sure encoding is working.
ContentType is optional.

Please call FormFinish method later!

66.18.30 FormAddFile(fieldName as String, fileName as String, fileContent as string, ContentType as String = "")

MBS CURL Plugin, Plugin Version: 18.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add a section to a multipart/formdata HTTP POST.
Example:

```
// read content of some file
Var file as folderitem = specialFolder.desktop.Child("test.txt")
Var b as BinaryStream = binarystream.Open(file)
Var FileContent as String = b.read(b.length)

// init some curl object
Var d as new CURLSMBS

// add the file as part of a form
d.FormAddFile("FileAttachment", "test.txt", FileContent, "text/plain")

// later
d.FormFinish
```

Notes: For fieldName, fileName and ContentType, we use UTF8 always. For fieldValue, we pass through whatever is in the string, so please make sure encoding is working.

Filename is ignored, if empty.
ContentType is optional.

Please call FormFinish method later!

66.18.31 FormClear

MBS CURL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears current form data.
Notes: You usually don't need to call this as Perform clears form data when transfer is done.

66.18.32 FormData as String

MBS CURL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries current form data.
Notes: This is more for debugging as it builds form data as if we would send it.

66.18.33 FormFinish

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finishes constructing a form.
Example:

```
Var c as new CURLSMBS
Var namebuffer as string = "name buffer"
Var namelength as Integer = lenb(namebuffer)
Var buffer as string = "test buffer"
Var htmlbuffer as string = "<HTML>test buffer</HTML>"
Var htmlbufferlength as Integer = lenb(htmlbuffer)
Var file1 as string = "my-face.jpg"
Var file2 as string = "your-face.jpg"
Var formOptions(-1) as Integer
Var formValues(-1) as string
Var recordbuffer as string = "record buffer"
Var recordlength as Integer = lenb(recordbuffer)

const CURLFORM_NOTHING = 0
const CURLFORM_COPYNAME = 1
const CURLFORM_PTRNAME = 2
const CURLFORM_NAMELENGTH = 3
const CURLFORM_COPYCONTENTS = 4
const CURLFORM_PTRCONTENTS = 5
const CURLFORM_CONTENTSLENGTH = 6
```

```
const CURLFORM_FILECONTENT = 7
const CURLFORM_ARRAY = 8
const CURLFORM_FILE = 10
const CURLFORM_BUFFER = 11
const CURLFORM_BUFFERPTR = 12
const CURLFORM_BUFFERLENGTH = 13
const CURLFORM_CONTENTTYPE = 14
const CURLFORM_CONTENTHEADER = 15
const CURLFORM_FILENAME = 16

'/* Add simple name/content section */

c.FormAdd CURLFORM_COPYNAME, "name", CURLFORM_COPYCONTENTS, "content"

'
'/* Add simple name/content/contenttype section */

c.FormAdd CURLFORM_COPYNAME, "htmlcode", CURLFORM_COPYCONTENTS, "<HTML></HTML>",CURL-
FORM_CONTENTTYPE,"text/html"

'/* Add name/ptrcontent section */
c.FormAdd CURLFORM_COPYNAME, "name_for_ptrcontent", CURLFORM_PTRCONTENTS, buffer

'/* Add ptrname/ptrcontent section */
c.FormAdd CURLFORM_PTRNAME, namebuffer, CURLFORM_PTRCONTENTS, buffer, CURLFORM_NAME-
LENGTH, namelength

'/* Add name/ptrcontent/contenttype section */
c.FormAdd CURLFORM_COPYNAME, "html_code_with_hole", CURLFORM_PTRCONTENTS, html-
buffer, CURLFORM_CONTENTSLENGTH, htmlbufferlength, CURLFORM_CONTENTTYPE, "text/html"

'/* Add simple file section */
c.FormAdd CURLFORM_COPYNAME, "picture", CURLFORM_FILE, "my-face.jpg"

'/* Add file/contenttype section */
c.FormAdd CURLFORM_COPYNAME, "picture",CURLFORM_FILE, "my-face.jpg",CURLFORM_CONTENTTYPE,
"image/jpeg"

'/* Add two file section */
c.FormAdd CURLFORM_COPYNAME, "pictures",CURLFORM_FILE, "my-face.jpg",CURLFORM_FILE,
"your-face.jpg"

'/* Add two file section using CURLFORM_ARRAY */
formOptions.Add CURLFORM_FILE
formValues.Add file1
formOptions.Add CURLFORM_FILE
formValues.Add file2
```

```
'/* Add a buffer to upload */
c.FormAdd CURLFORM_COPYNAME, "name", CURLFORM_BUFFER, "data", CURLFORM_BUFFERPTR,
recordbuffer, CURLFORM_BUFFERLENGTH, recordlength

'/* no option needed for the end marker */
c.FormAdd CURLFORM_COPYNAME, "pictures", CURLFORM_ARRAY, formOptions, formValues

'/* Add the content of a file as a normal post text value */
c.FormAdd CURLFORM_COPYNAME, "filecontent", CURLFORM_FILECONTENT, ".bashrc"
'/* Set the form info */

c.FormFinish
```

Notes: Lasterror is set.
The form is assigned to the HTTPPost property.

66.18.34 GetInfoActiveSocket as integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Receive the active socket used by this curl session.
Notes: If the socket is no longer valid, -1 is returned. When you finish working with the socket, the Destructor closes the socket and cleanup other resources associated with the handle. This is typically used in combination with OptionConnectOnly.

This option was added as a replacement for GetInfoLastSocket since that one isn't working on all platforms.

66.18.35 GetInfoAppConnectTime as Double

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time stamp when app connected.

66.18.36 GetInfoCAInfo as string

MBS CURL Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries default CAInfo value.

66.18.37 GetInfoCAPath as string

MBS CURL Plugin, Plugin Version: 22.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries default CAPath value.

66.18.38 GetInfoCertInfo as CURLSListMBS()

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries information on the certificate chain.
Example:

```
Var c as new CURLSMBS

// do some transfer
c.OptionURL = "https://www.mbsplugins.de/"
c.OptionCertInfo = true
Var e as Integer = c.perform

// query certificate info
Var lists() as CURLSListMBS = c.GetInfoCertInfo

for each l as CURLSListMBS in lists
MessageBox Join(l, EndOfLine)
next

MessageBox c.DebugMessages
```

Notes: Please set OptionCertInfo first.

66.18.39 GetInfoConditionUnmet as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return if the time condition prevented the document to get transferred.

66.18.40 GetInfoConnectTime as Double

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time, in seconds, it took from the start until the connect to the remote host (or proxy) was completed.

Notes: The Lasterror property is set. 0 for success.

66.18.41 GetInfoContentLengthDownload as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content-length of the download.
Notes: The Lasterror property is set. 0 for success.
This is the value read from the Content-Length: field.

66.18.42 GetInfoContentLengthUpload as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The specified size of the upload.
Notes: The Lasterror property is set. 0 for success.

66.18.43 GetInfoContentType as string

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content-type of the downloaded object.
Notes: The Lasterror property is set. 0 for success.
This is the value read from the Content-Type: field. If you get "", it means that the server didn't send a valid Content-Type header or that the protocol used doesn't support this.

66.18.44 GetInfoCookieList as CURLSListMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A linked-list of all cookies CURL knows (expired ones, too).
Notes: The Lasterror property is set. 0 for success.
If there are no cookies (cookies for the handle have not been enabled or simply none have been received) the result is nil.

66.18.45 GetInfoEarlyDataSent as integer

MBS CURL Plugin, Plugin Version: 25.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the number of bytes sent as TLS early data.
Notes: TLS early data is only attempted when kSSLOptionEarlyData is set for the transfer. In addition, it is only used by libcurl when a TLS session exists that announces support.

The amount is negative when the sent data was rejected by the server. TLS allows a server that announces support for early data to reject any attempt to use it at its own discretion. When for example 127 bytes had been sent, but were rejected, it reports -127 as the amount "sent".

66.18.46 GetInfoEffectiveMethod as string

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the last used effective HTTP method.
Notes: In cases when you've asked libcurl to follow redirects, the method may very well not be the same method the first request would use.

66.18.47 GetInfoEffectiveURL as string

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last used effective URL.
Notes: The Lasterror property is set. 0 for success.

66.18.48 GetInfoFileTime as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: the remote time of the retrieved document (in number of seconds since 1 jan 1970 in the GMT/UTC time zone).
Example:

```
// init CURL with options
Var d as new CURLSMBS
d.OptionFileTime = true
d.OptionURL = "http://www.monkeybreadsoftware.de/images/mbs.jpg"

// run query
Var e as Integer = d.Perform

// calculate date object
Var da as new date(1970,1,1,0,0,0)
da.TotalSeconds = da.TotalSeconds + d.GetInfoFileTime
```

```
// show date
ResultText.text=str(d.GetInfoFileTime)+" "+da.ShortDate+" "+da.ShortTime
```

Notes: The Lasterror property is set. 0 for success.
If you get -1, it can be because of many reasons (unknown, the server hides it or the server doesn't support the command that tells document time etc) and the time of the document is unknown. Note that you must tell the server to collect this information before the transfer is made, by using the OptionFileTime option or you will unconditionally get a -1 back. (Added in 7.5)

66.18.49 GetInfoFTPEntryPath as string

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a string holding the path of the entry path.
Notes: That is the initial path libCURL ended up in when logging on to the remote FTP server.
Empty string if unknown.

66.18.50 GetInfoHeaderSize as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The total size of all the headers received.
Notes: The Lasterror property is set. 0 for success.

66.18.51 GetInfoHTTPAuthAvail as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A bitmask indicating the authentication method(s) available.
Notes: The Lasterror property is set. 0 for success.
The meaning of the bits is explained in the HTTPAuth option.

66.18.52 GetInfoHTTPConnectCode as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last received proxy response code to a CONNECT request.
Notes: The Lasterror property is set. 0 for success.

66.18.53 GetInfoHTTPVersion as integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the http version used in the connection.
Notes: The returned value will be kHTTP_VERSION_1_0, kHTTP_VERSION_1_1, or kHTTP_VERSION_2_0, or 0 if the version can't be determined.

66.18.54 GetInfoLastSocket as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use GetInfoActiveSocket instead. **Function:** Receive the last socket used by this CURL session.
Notes: If the socket is no longer valid, -1 is returned. When you finish working with the socket, the destructor will free the handle as usual and let libCURL close the socket and cleanup other resources associated with the handle. This is typically used in combination with OptionConnectOnly. (Added in 7.15.2)

NOTE: this API is not really working on win64, since the SOCKET type on win64 is 64 bit large while its 'long' is only 32 bits.

66.18.55 GetInfoLocalIP as string

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries local IP.
Example:

```
Var c as new CURLSMBS

// do some transfer
c.OptionURL = "http://www.mbsplugins.de/"
Var e as Integer = c.perform

// now check local IP
MessageBox c.GetInfoLocalIP
```

66.18.56 GetInfoLocalPort as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return the local port of the most recent (primary) connection.
Example:

```
Var c as new CURLSMBS

// do some transfer
c.OptionURL = "http://www.mbsplugins.de/"
Var e as Integer = c.perform

// now check local IP and port
MessageBox c.GetInfoLocalIP+":"+str(c.GetInfoLocalPort)
```

66.18.57 GetInfoNameLookupTime as Double

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time, in seconds, it took from the start until the name resolving was completed.
Notes: The Lasterror property is set. 0 for success.

66.18.58 GetInfoNumConnects as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: How many new connections libCURL had to create to achieve the previous transfer.
Notes: The Lasterror property is set. 0 for success.
(only the successful connects are counted)
Combined with RedirectCount you are able to know how many times libCURL successfully reused existing connection(s) or not. See the Connection Options to see how libCURL tries to make persistent connections to save time.

66.18.59 GetInfoOSErrno as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The errno variable from a connect failure.
Notes: The Lasterror property is set. 0 for success.

66.18.60 GetInfoPreTransferTime as Double

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time, in seconds, it took from the start until the file transfer is just about to begin.
Notes: The Lasterror property is set. 0 for success.

This includes all pre-transfer commands and negotiations that are specific to the particular protocol(s) involved.

66.18.61 GetInfoPrimaryIP as string

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return the ip address of the most recent (primary) connection.
Example:

```
Var c as new CURLSMBS

// do some transfer
c.OptionURL = "http://www.mbsplugins.de/"
Var e as Integer = c.perform

// now check primary IP and port
MessageBox c.GetInfoPrimaryIP+":"+str(c.GetInfoPrimaryport)
```

66.18.62 GetInfoPrimaryPort as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return the (remote) port of the most recent (primary) connection.
Example:

```
Var c as new CURLSMBS

// do some transfer
c.OptionURL = "http://www.mbsplugins.de/"
Var e as Integer = c.perform

// now check primary IP and port
MessageBox c.GetInfoPrimaryIP+":"+str(c.GetInfoPrimaryport)
```

66.18.63 GetInfoProtocol as integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Get the protocol used in the connection.
Notes: See kProtocol* constants.

66.18.64 GetInfoProxyAuthAvail as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A bitmask indicating the authentication method(s) available for your proxy authentication.
Notes: The Lasterror property is set. 0 for success.

66.18.65 GetInfoProxyError as integer

MBS CURL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries proxy error code.

66.18.66 GetInfoProxySSLVerifyResult as integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the result of the proxy certificate verification.
Notes: receive the result of the certificate verification that was requested (using the OptionProxySSLVerifyPeer option. This is only used for HTTPS proxies.

66.18.67 GetInfoRedirectCount as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The total number of redirections that were actually followed.
Notes: The Lasterror property is set. 0 for success.

66.18.68 GetInfoRedirectTime as Double

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: the total time, in seconds, it took for all redirection steps include name lookup, connect, pretransfer and transfer before final transaction was started.
Notes: The Lasterror property is set. 0 for success.
RedirectTime contains the complete execution time for multiple redirections. (Added in 7.9.7)

66.18.69 GetInfoRedirectURL as string

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The redirection URL.

66.18.70 GetInfoReferer as string

MBS CURL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries referrer text.

66.18.71 GetInfoRequestSize as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The total size of the issued requests.
Notes: The Lasterror property is set. 0 for success.
This is so far only for HTTP requests. Note that this may be more than one request if FOLLOWLOCATION is true.

66.18.72 GetInfoResponseCode as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last received HTTP or FTP code.
Notes: The Lasterror property is set. 0 for success.
This will be zero if no server response code has been received. Note that a proxy's CONNECT response should be read with GetInfoHTTPConnectCode and not this.

With HTTP transfer, a successful transfer reports 200 here. If the page is not found, you get 404. Or any other HTTP Response code.

66.18.73 GetInfoRetryAfter as integer

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the Retry-After retry delay.
Notes: Receive the number of seconds the HTTP server suggesets the client should wait until the next request is issued.
The information from the "Retry-After:" header.

While the HTTP header might contain a fixed date string, the RetryAfter will always return number of seconds to wait - or zero if there was no header or the header couldn't be parsed.

66.18.74 GetInfoRTSPClientCSEQ as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Query RTSP Client sequence counter.

66.18.75 GetInfoRTSPCSEQRecv as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Query RTSP sequence counter received.

66.18.76 GetInfoRTSPServerCSEQ as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Query RTSP Server sequence counter.

66.18.77 GetInfoRTSPSessionID as string

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Query RTSP session ID.

66.18.78 GetInfoScheme as string

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get the URL scheme (sometimes called protocol) used in the connection

66.18.79 GetInfoSizeDelivered as Integer

MBS CURL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of bytes delivered to the client.

66.18.80 GetInfoSizeDownload as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The total amount of bytes that were downloaded.
Notes: The Lasterror property is set. 0 for success.
The amount is only for the latest transfer and will be reset again for each new transfer.

66.18.81 GetInfoSizeUpload as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The total amount of bytes that were uploaded.
Notes: The Lasterror property is set. 0 for success.

66.18.82 GetInfoSpeedDownload as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The average download speed that CURL measured for the complete download.
Notes: The Lasterror property is set. 0 for success.

66.18.83 GetInfoSpeedUpload as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The average upload speed that CURL measured for the complete upload.
Notes: The Lasterror property is set. 0 for success.

66.18.84 GetInfoSSLEngines as CURLSListMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Receive a linked-list of OpenSSL crypto-engines supported.
Notes: The Lasterror property is set. 0 for success.
Note that engines are normally implemented in separate dynamic libraries. Hence not all the returned engines may be available at run-time.

66.18.85 GetInfoSSLVerifyResult as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: the result of the certification verification that was requested (using the SSLVerifyPeer option).
Notes: The Lasterror property is set. 0 for success.

66.18.86 GetInfoStartTransferTime as Double

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: the time, in seconds, it took from the start until the first byte is just about to be transferred.
Notes: The Lasterror property is set. 0 for success.
This includes the pretransfer time and also the time the server needs to calculate the result.

66.18.87 GetInfoTotalTime as Double

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The total time in seconds for the previous transfer, including name resolving, TCP connect etc.
Notes: The Lasterror property is set. 0 for success.

66.18.88 LoadAPI

MBS CURL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the default CURL library.
Notes: This method is called by the constructor. So you don't need this except you want to test explicit with APILoaded whether the loading worked before you use the CURLSMBS class.

Loads the "libCURL.dll" Windows library (with SSL support this one max require OpenSSL).
Loads on Mac OS X and Linux the libCURL file in /usr/lib.

66.18.89 LoadErrorString as string

MBS CURL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error string from the LoadLibrary function.

66.18.90 LoadLibrary(file as folderitem) as boolean

MBS CURL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the CURL library from the given path.
Notes: You only need to use this function if you have your own CURL Library.

Loads a Windows DLL, a Linux shared library or a Mac OS X shared library from the given path.

Returns true on success.
See also:

- 66.18.91 LoadLibrary(path as string) as boolean 11729

66.18.91 LoadLibrary(path as string) as boolean

MBS CURL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the CURL library from the given path.
Notes: You only need to use this function if you have your own CURL Library.

Loads a Windows DLL, a Linux shared library or a Mac OS X shared library from the given path.

Returns true on success.
See also:

- 66.18.90 LoadLibrary(file as folderitem) as boolean 11729

66.18.92 OpenMTInputFile(file as folderitem, Offset as Integer = 0) as boolean

MBS CURL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens input file for reading data while PerformMT runs.
Example:

```
Var c As New CURLSMBS
Var file As FolderItem = SpecialFolder.Desktop.Child("test.rtf")

If c.OpenMTInputFile(file) Then
// okay
Else
MessageBox "Failed to open file to upload."
Return
End If
```

```
// do a SFTP upload
c.OptionURL = "sftp://monkeybreadsoftware.de/folder/test.rtf"
c.OptionUpload = True
c.OptionUsername = "test"
c.OptionPassword = "test"
c.CollectOutputData = false

Var e As Integer = c.Perform

Var ErrorMessage As String = c.LasterrorMessage
Var ErrorLog As String = c.DebugMessages
Var ResultData As String = c.OutputData

Break
```

Notes: The read event is not called with PerformMT.
Offset is helpful for HTTP PUT requests with range, so you can start with an offset.
With 15.2 version of plugin, this also works with Perform.

Must be called before Perform or PerformMT, so we can stream data from the file.
The file is closed automatically when Perform methods finish their work.

The function returns false in case of an error, e.g. if file is already open by another application, the foleritem/path is invalid, the offset is negative or we can't determinate the file size.
It may be wise to have a fallback in your code to use a binarystream in that case (if that one can read the file) and then read all the data in a string and put into the InputData property.
See also:

- 66.18.93 OpenMTInputFile(Path as String, Offset as Integer = 0) as boolean 11730

66.18.93 OpenMTInputFile(Path as String, Offset as Integer = 0) as boolean

MBS CURL Plugin, Plugin Version: 19.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens input file for reading data while PerformMT runs.
Notes: The read event is not called with PerformMT.
Offset is helpful for HTTP PUT requests with range, so you can start with an offset.

Must be called before Perform or PerformMT, so we can stream data from the file.
The file is closed automatically when Perform methods finish their work.

The function returns false in case of an error, e.g. if file is already open by another application, the foleritem/path is invalid, the offset is negative or we can't determinate the file size.
It may be wise to have a fallback in your code to use a binarystream in that case (if that one can read the

file) and then read all the data in a string and put into the InputData property.
See also:

- 66.18.92 OpenMTInputFile(file as folderitem, Offset as Integer = 0) as boolean 11729

66.18.94 Perform as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a file transfer
Example:

```
// if you get a curl call like this

'curl -X PATCH "https://api.airtable.com/v0/ { baseId } / { tableIdOrName } / { recordId } " \
'-H "Authorization: Bearer YOUR_TOKEN" \
'-H "Content-Type: application/json" \
'–data ' {
'"fields": {
'"Address": "1 Ferry Building",
'"Name": "Ferry Building",
'"Visited": True
' }
' } '

// you translate it to this:

Var c As New CURLSMBS

Var Payload As String = _
" { "+_
"""fields"": { "+_
"""Address"": ""1 Ferry Building"","+_
"""Name"": ""Ferry Building"","+_
"""Visited"": True"+_
" } "+_
" } "

c.OptionCustomRequest = "PATCH"
c.OptionURL = "https://api.airtable.com/v0/ { baseId } / { tableIdOrName } / { recordId } "
c.SetOptionHTTPHeader Array("Content-Type: application/json", "Authorization: Bearer YOUR_TO-
KEN")
c.OptionPostFields = Payload

Var Error As Integer = c.Perform
Var ResponseCode As Integer = c.GetInfoResponseCode
Var DebugLog As String = c.DebugMessages
Var Output As String = c.OutputData
```

Break

Notes: This function is called after all the options are set, and will perform the transfer as described in the options.

You can do any amount of calls to Perform. If you intend to transfer more than one file, you are even encouraged to do so. libCURL will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use the option properties between the invokes to set options for the following Perform.

Typical error codes are 6 for a wrong domain name in the URL, 67 for wrong name/password combination, 60 for missing SSL settings, 1 for an unsupported protocol.

Possible values for the retun value:

The error value -1 is used from the plugin to report that something is missing like OpenSSL dlls on Windows.

With SFTP, you can get logged error "Upload failed: Operation failed (4/-31)" when upload uses path to folder instead of file in URL.

66.18.95 PerformMT as Integer

MBS CURL Plugin, Plugin Version: 11.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform a file transfer with preemptive multithreading.
Example:

```
Var c As New CURLSMBS
Var file As FolderItem = SpecialFolder.Desktop.Child("test.rtf")

If c.OpenMTInputFile(file) Then
// okay
Else
MessageBox "Failed to open file to upload."
Return
End If

// do a SFTP upload
c.OptionURL = "sftp://monkeybreadsoftware.de/folder/test.rtf"
c.OptionUpload = True
c.OptionUsername = "test"
c.OptionPassword = "test"
```

```
Var e As Integer = c.PerformMT

Var ErrorMessage As String = c.LasterrorMessage
Var ErrorLog As String = c.DebugMessages
Var ResultData As String = c.OutputData

Break
```

Notes: Same as Perform, but with additional multithreading.

As the actual transfer runs on a preemptive thread, the events Debug, Write, Header and Progress are called asynchrounously and run a few milliseconds later. You can return true in Progress event to stop transfer, but you will get more events before the transfer is stopped.

You can call CreateMTDebugOutputFile, CreateMTHeaderOutputFile and CreateMTOutputFile before PerformMT to have output data be written into files. Call OpenMTInputFile to let the plugin read input data (form post or upload) from an input file.

Do not call other CURL functions on this CURLSMBS instance while PerformMT is running!

Typical error codes are 6 for a wrong domain name in the URL, 67 for wrong name/password combination, 60 for missing SSL settings, 1 for an unsupported protocol.

To avoid trouble with app hanging on quit of application, be sure to set cancel property to true in window close event to cancel any pending transfer.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

66.18.96 ProcessRelativeURL(BaseURL as String, RelativeURL as String) as String

MBS CURL Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Processes an URL to come from relative URL to a new absolute URL.
Example:

```
Var baseURL As String = "https://monkeybreadsoftware.net/themes.shtml"
Var RelativeURL As String = "topic-curl.shtml"
```

```
Var URL As String = CURLSMBS.ProcessRelativeURL(baseURL, RelativeURL)
Break
```

Notes: Raises an UnsuppportedOperationException in case of failure.

66.18.97 ReceiveData(byref data as Memoryblock, BytesToRead as Int64) as Int64

MBS CURL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Receives raw data on a connection.
Notes: This function receives raw data from the established connection. You may use it together with SendData to implement custom protocols using libcurl. This functionality can be particularly useful if you use proxies and/or SSL encryption: libcurl will take care of proxy negotiation and connection set-up.

The data memoryblock is a reference to your variable that will get the received data. BytesToRead is the maximum amount of data you can get in that buffer. The function returns the number of received bytes.

To establish the connection, set OptionConnectOnly = true before calling Perform. Note that ReceiveData does not work on connections that were created without this option.

The call will return kError_AGAIN if there is no data to read - the socket is used in non-blocking mode internally. When kError_AGAIN is returned, wait for data to arrive.

Wait on the socket only if ReceiveData returns kError_AGAIN. The reason for this is libcurl or the SSL library may internally cache some data, therefore you should call ReceiveData until all data is read which would include any cached data.

Furthermore if you wait on the socket and it tells you there is data to read, ReceiveData may return CURLE_AGAIN if the only data that was read was for internal SSL processing, and no other data is available.

On success, sets lasterror to kError_OK (0), stores the received data into memory block, and returns the number of bytes it actually read.

On failure, returns zero and lasterror is set to the appropriate error code.

The function may return kError_AGAIN. In this case, use your operating system facilities to wait until data can be read, and retry.

Reading exactly 0 bytes indicates a closed connection.

If there's no socket available to use from the previous transfer, this function returns kError_UNSUPPORTED_PROTOCOL.

66.18.98 Reset

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Re-initializes all options previously set on a specified CURL handle to the default values.
Notes: It does not change the following information kept in the handle: live connections, the Session ID cache, the DNS cache, the cookies and shares.

66.18.99 SendData(data as Memoryblock) as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends raw data over a connection.
Notes: This function sends arbitrary data over the established connection. You may use it together with ReceiveData to implement custom protocols using libcurl. This functionality can be particularly useful if you use proxies and/or SSL encryption: libcurl will take care of proxy negotiation and connection set-up.

Provide the data to send via parameter. We return the number of bytes sent.

To establish the connection, set OptionConnectOnly = true option before calling Perform methods. Note that SendData will not work on connections that were created without this option.

The call will return kError_AGAIN if it's not possible to send data right now - the socket is used in non-blocking mode internally. When kError_AGAIN is returned, please wait.

Furthermore if you wait on the socket and it tells you it's writable, SendData may return kError_AGAIN if the only data that was sent was for internal SSL processing, and no other data could be sent.
See also:

- 66.18.100 SendData(data as string) as Integer 11735

66.18.100 SendData(data as string) as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sends raw data over a connection.
Notes: This function sends arbitrary data over the established connection. You may use it together with ReceiveData to implement custom protocols using libcurl. This functionality can be particularly useful if you use proxies and/or SSL encryption: libcurl will take care of proxy negotiation and connection set-up.

Provide the data to send via parameter. We return the number of bytes sent.

To establish the connection, set OptionConnectOnly = true option before calling Perform methods. Note that SendData will not work on connections that were created without this option.

The call will return kError_AGAIN if it's not possible to send data right now - the socket is used in non-blocking mode internally. When kError_AGAIN is returned, please wait.

Furthermore if you wait on the socket and it tells you it's writable, SendData may return kError_AGAIN if the only data that was sent was for internal SSL processing, and no other data could be sent.

- 66.18.99 SendData(data as Memoryblock) as Integer 11735

66.18.101 SetInputData(data as MemoryBlock)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the input data.
Notes: If you set input data, you do not need to use Read, RestartRead or Seek events.
The plugin will use the provided data for the upload.
Setting input data size, will also set the input file size (OptionInFileSizeLarge and OptionInFileSize).

Alternatively you can provide data in Read event or use OpenMTInputFile method to open a file on disk to upload.
See also:

- 66.18.102 SetInputData(data as string) 11736

66.18.102 SetInputData(data as string)

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the input data.
Example:

```
Var c As New CURLSMBS

c.SetInputData "Hello World"
```

```
// do a HTTP Upload with PUT
c.OptionUpload = True
c.OptionURL = "https://monkeybreadsoftware.de/filemaker/examples/echo.php"

// or do a FTP upload
'c.OptionURL = "ftp://monkeybreadsoftware.de/folder/file.txt"

Var e As Integer = c.Perform

Var ErrorMessage As String = c.LasterrorMessage
Var ErrorLog As String = c.DebugMessages
Var ResultData As String = c.OutputData

Break
```

Notes: If you set input data, you do not need to use Read, RestartRead or Seek events.
The plugin will use the provided data for the upload.
Setting input data size, will also set the input file size (OptionInFileSizeLarge and OptionInFileSize).

Alternatively you can provide data in Read event or use OpenMTInputFile method to open a file on disk to upload.

66.18.103 SetOptionConnectTo(list() as string)

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set list of host:port:connect-to-host:connect-to-port, overrides the URL's host:port (only for the network layer)

66.18.104 SetOptionEmptyPassword

MBS CURL Plugin, Plugin Version: 15.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an empty password.
Notes: Normally you have no password unless you set it.
But if you set a password with empty string, the plugin sets CURL to use no password.
This method is to use an empty password.

66.18.105 SetOptionHTTP200Aliases(list() as string)

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A linked list of aliases to be treated as valid HTTP 200 responses.
Notes: Some servers respond with a custom header response line. For example, IceCast servers respond with "ICY 200 OK". By including this string in your list of aliases, the response will be treated as a valid HTTP header line such as "HTTP/1.0 200 OK".

The alias itself is not parsed for any version strings. So if your alias is "MYHTTP/9.9", LibCURL will not treat the server as responding with HTTP version 9.9. Instead LibCURL will use the value set by option HTTPVersion.

The Lasterror property is set. 0 for success.

66.18.106 SetOptionHTTPHeader(list() as string)

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A linked list of HTTP headers to pass to the server in your HTTP request.
Example:

```
Var c as new CURLSMBS
c.SetOptionHTTPHeader array("Expect:", "Content-Type: text/xml", "SOAPAction: ""login""")
```

Notes: If you add a header that is otherwise generated and used by libCURL internally, your added one

will be used instead. If you add a header with no contents as in 'Accept:' (no data on the right side of the colon), the internally used header will get disabled. Thus, using this option you can add new headers, replace internal headers and remove internal headers. To add a header with no contents, make the contents be two quotes: "". The headers included in the linked list must not be CRLF-terminated, because CURL adds CRLF after each header item. Failure to comply with this will result in strange bugs because the server will most likely ignore part of the headers you specified.

The first line in a request (containing the method, usually a GET or POST) is not a header and cannot be replaced using this option. Only the lines following the request-line are headers. Adding this method line in this list of headers will only cause your request to send an invalid header.

Pass an empty array to this to reset back to no custom headers.

The Lasterror property is set. 0 for success.

66.18.107 SetOptionMailRecipients(list() as string)

MBS CURL Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the array of email recipient addresses.

66.18.108 SetOptionPostQuote(list() as string)

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pass an array to a list of FTP commands to pass to the server after your ftp transfer request.
Example:

```
Var d as CURLSMBS // your CURL object

Var ws() As String
ws.Add "RNFR Temp.txt"
ws.Add "RNTO MyFile.txt"
d.SetOptionPostQuote(ws)
```

Notes: Disable this operation again by using an empty array for this option.

The Lasterror property is set. 0 for success.
If you want to do a ftp operation instead of download/upload/directory listing, please use SetOptionQuote.

66.18.109 SetOptionPreQuote(list() as string)

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pass an array to a list of FTP commands to pass to the server after the transfer type is set.
Notes: Disable this operation again by using an empty array for this option. Before version 7.15.6, if you also set Nobody to true, this option didn't work.

The Lasterror property is set. 0 for success.

66.18.110 SetOptionProxyHeader(list() as string)

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set list of headers used for proxy requests only.

66.18.111 SetOptionQuote(list() as string)

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pass an array or a list of FTP commands to pass to the server prior to your ftp request.
Example:

```
Var curl as new CURLSMBS
curl.SetOptionQuote array("DELE filename.txt")
```

Notes: This will be done before any other FTP commands are issued (even before the CWD command).

Disable this operation again by using an empty array for this option.

The Lasterror property is set. 0 for success.

66.18.112 SetOptionResolve(list() as string)

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Send linked-list of name:port:address sets.

66.18.113 SetOptionTelnetOptions(list() as string)

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Provide an array of variables to pass to the telnet negotiations.
Notes: The variables should be in the format <option=value>. libCURL supports the options 'TTYPE', 'XDISPLOC' and 'NEW_ENV'. See the TELNET standard for details.

The Lasterror property is set. 0 for success.

66.18.114 SetPathCAInfo(path as folderitem)

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A path holding one or more certificates to verify the peer with.
Example:

```
Var cacert as FolderItem // your cacert.pem file
Var CURL as new CURLMBS
CURL.OptionSSLVerifyHost = 2 // verify server
CURL.OptionSSLVerifyPeer = 1 // proofs certificate is authentic
CURL.SetPathCAInfo cacert
```

Notes: This makes sense only when used in combination with the OptionSSLVerifyPeer option. If OptionSSLVerifyPeer is false, OptionCAINFO need not even indicate an accessible file.

Note that option is by default set to the system path where libCURL's cacert bundle is assumed to be stored, as established at build time.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

66.18.115 SetPathCAPath(path as folderitem)

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A path to the directory holding multiple CA certificates to verify the peer with.
Example:

```
Var c as new CURLSMBS

Var cacert As FolderItem = New FolderItem("cacert.pem")
c.SetPathCAPath cacert
```

Notes: The certificate directory must be prepared using the openssl c_rehash utility. This makes sense only when used in combination with the CURLOPT_SSL_VERIFYPEER option. If OptionSSLVerifyPeer is zero, OptionCAPath need not even indicate an accessible path. The OptionCAPath function apparently does not work in Windows due to some limitation in openssl. This option is OpenSSL-specific and does nothing if libCURL is built to use GnuTLS.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

66.18.116 SetPathCRLFile(path as folderitem)

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the path with the concatenation of CRL (in PEM format) to use in the certificate validation that occurs during the SSL exchange.
Notes: When CURL is built to use NSS or GnuTLS, there is no way to influence the use of CRL passed to help in the verification process. When libCURL is built with OpenSSL support, X509_V_FLAG_CRL_CHECK and X509_V_FLAG_CRL_CHECK_ALL are both set, requiring CRL check against all the elements of the certificate chain if a CRL file is passed.

This option makes sense only when used in combination with the OptionSSLVerifyPeer option.

A specific error code (CURLE_SSL_CRL_BADFILE) is defined with the option. It is returned when the SSL exchange fails because the CRL file cannot be loaded. Note that a failure in certificate verification due to a revocation information found in the CRL does not trigger this specific error. (Added in 7.19.0)

66.18.117 SetPathIssuerCert(path as folderitem)

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the path to a CA certificate in PEM format.
Notes: If the option is set, an additional check against the peer certificate is performed to verify the issuer is indeed the one associated with the certificate provided by the option. This additional check is useful in multi-level PKI where one needs to enforce that the peer certificate is from a specific branch of the tree.

This option makes sense only when used in combination with the OptionSSLVerifyPeer option. Otherwise, the result of the check is not considered as failure.

A specific error code (CURLE_SSL_ISSUER_ERROR) is defined with the option, which is returned if the setup of the SSL/TLS session has failed due to a mismatch with the issuer of peer certificate (OptionSS-

LVerifyPeer has to be set too for the check to fail). (Added in 7.19.0)

66.18.118 SetPathNetRCFile(path as folderitem)

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the path to the file you want libCURL to use as .netrc file.
Notes: If this option is omitted, and OptionNETRC is set, libCURL will attempt to find the a .netrc file in the current user's home directory. (Added in 7.10.9)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

66.18.119 SetPathProxyIssuerCert(path as folderitem)

MBS CURL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the proxy issuer SSL certificate filename.
Notes: Pass a string naming a file holding a CA certificate in PEM format. If the option is set, an additional check against the peer certificate is performed to verify the issuer of the HTTPS proxy is indeed the one associated with the certificate provided by the option. This additional check is useful in multi-level PKI where one needs to enforce that the peer certificate is from a specific branch of the tree.

This option makes sense only when used in combination with the OptionProxySSLVerifyPeer option. Otherwise, the result of the check is not considered as failure.

A specific error code (CURLE_SSL_ISSUER_ERROR) is defined with the option, which is returned if the setup of the SSL/TLS session has failed due to a mismatch with the issuer of peer certificate (OptionProxySSLVerifyPeer has to be set too for the check to fail).

66.18.120 SetupAWS(AWSAccessKeyId as String, AWSSecretAccessKey as String, Region as String, Service as String, Path as String, Domain as String, Verb as String, HashedPayload as String = """, Headers() as String = nil, queryParameters() as string = nil, NoSSL as boolean = false) as boolean

MBS CURL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Setup CURL to transfer to Amazon Webservices.
Notes: This implements AWS4-HMAC-SHA256 signature for credentials, sets authentication, URL, HTTP

Headers and other parameters.
For upload or post, please set input parameters first.

Parameter	Description	Example
AWSAccessKeyId	Your access key for AWS.	
AWSSecretAccessKey	Your secret.	
Region	The region to use.	"eu-central-1"
Service	The service to use.	"s3"
Path	The path for the URL. Should always start with "/".	"/test.jpg"
Domain	Optional the domain to use. By default we just build it from region and service.	"s3.eu-central-1.amazonaws.com" or "s3-ap-southeast-2.amazonaws.com"
Verb	The HTTP Operation to do. Can be POST, PUT, PATCH, GET or DELETE.	"PUT"
HashedPayload	The hashed payload. If empty, we calculate it automatically from input data or postfields. This is a lowercase hex SHA256.	
Headers	Optional extra HTTP headers to include.	"x-amz-acl: public-read"
queryParameters	Optional query parameter list with entries like "key=value", URL encoded.	

Returns true on success or false on failure.
Throws exceptions when parameters are insufficient (UnsupportedOperationException).

Works also for other compatible S3 services beside Amazon's like the one from Wasabi or Dell ECS.
Added PATCH as verb in version 23.0.

Please be aware that this function depends on a correct time and date set on the computer. If the time is not set correct, the authentication will fail.

66.18.121 SetupEmail(email as Variant) as boolean

MBS CURL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Setups existing CURL session for an email transfer.
Example:

```
Var e as new CURLEmailMBS

e.SetFrom "test@test.test", "Christian M√ºller"
e.Subject = "Hello World ,òÔè"
e.SMTPPassword = "xxx"
e.SMTPUsername = "xxx"
e.SetServer "smtp.test.test", true
e.AddTo "test@test.test", "Test M√ºller"
e.PlainText = "Hello World," + EndOfLine + "Smilies: ,òÔè üòò üòÑ"

Var c as new CURLSMBS

if c.SetupEmail(e) then

Var er as Integer = c.Perform
if er = 0 then
MessageBox "Email sent"
end if
end if
```

Notes: You can set your own settings like proxy after this function call.
If you like you can reuse the email and CURL objects after you sent an email, change values and send another email.
Returns true on success or false on failure.

66.18.122 SetupOAuth(ConsumerKey as String, ConsumerSecret as String, AccessToken as String, AccessTokenSecret as String, HTTPVerb as String, URL as String, Parameters() as String = nil, Headers() as String = nil, Datas() as String = nil, Nonce as String = """, Timestamp as String = """, HMAC as String = """, Verifier as String = """, Realm as String = """) as boolean

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Setups an OAuth signed transfer.
Notes: The plugin calculates the signature and adds headers for authorization to the CURL handle.
Sets URL with parameters and optionally data values for POST.

Parameter	Description	Example
ConsumerKey	The oauth consumer key.	"xvz1evFS4wEEPTGEFPHBog"
ConsumerSecret	The oauth consumer secret.	"kAcSOqF21Fu85e7zjz7ZN2U4ZRhfV3WpwPAoE3Z7kBw"
AccessToken	The oauth access token.	"370773112-GmHxMAgYyLbNEtIKZeRNFsMKPR9EyMZeS9weJAEb"
AccessTokenSecret	The oauth access token secret. Can be empty if not yet known.	"LswwdoUaIvS8ltyTt5jkRh4J50vUPVVHtR2YPi5kE"
HTTPVerb	The HTTP verb. e.g. POST, PUT, GET, DELETE. Default if empty is GET.	"POST"
URL	The URL to query without parameters.	"https://api.twitter.com/1.1/statuses/update.json"
Parameters	List of parameters. Can be empty. Please pass list with newline as delimiter. Values should be URL encoded already.	"include_entities=true"
Headers	List of additional header entries to include. Can be empty. We automatically set Authorization header.	"Accept: application/json¶Content-Type: application/json"
Datas	Data value list for POST.	"status=Hello¶others=123"
Nonce	The nonce value. If empty, we generate it automatically for you.	"kYjzVBB8Y0ZFabxSWbWovY3uYSQ2pTgmZeNu2VS4cg"
Timestamp	The timestamp to use for signature. If empty, we query current timestamp (same as you calling Time.UnixTimeStamp)	1318622958
HMAC	Which HMAC algorithm to use. Can be HMAC-SHA512, HMAC-SHA256 or HMAC-SHA1. Default is HMAC-SHA1 if parameter is missing or empty.	"HMAC-SHA1"
Verifier	The verifier. Usually an ID shown on a website after login to the service and authorization of an app.	"3456789"

Added Realm parameter for version 20.5.

66.18.123 UpKeep

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Perform any connection upkeep checks.
Notes: Perform any connection upkeep checks.
Some protocols have "connection upkeep" mechanisms. These mechanisms usually send some traffic on existing connections in order to keep them alive; this can prevent connections from being closed due to overzealous firewalls, for example.
Currently the only protocol with a connection upkeep mechanism is HTTP/2: when the connection upkeep interval is exceeded and Upkeep is called, an HTTP/2 PING frame is sent on the connection.
This function must be explicitly called in order to perform the upkeep work. The connection upkeep interval is set with OptionUpkeepIntervalMS.

66.18.124 UseSystemCertificates as Integer

MBS CURL Plugin, Plugin Version: 17.2, Platforms: macOS, Windows, Targets: All.

Function: Read certificate from system and installs them in CURL session,.
Notes: For macOS and Windows we load the available certificates from keychain or Windows Certificate Store and pass them to CURL. This is better than having no certificates at all.
Even better is normally to provide a cacert.pem file with only the expected certificates.

Returns number of certificates loaded.

No longer needed since MBS Plugin v16.0 with CURL 8.18 since CURL will query certificate storage in keychain automatically.

66.18.125 WebSocketMeta as CURLSWebSocketFrameMBS

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries last frame metadata.
Notes: Only useful if called in Write event.

66.18.126 WebSocketReceive(BufferSize as Integer = 65536) as CURLSWebSocketFrameMBS

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Receive WebSocket data.
Example:

```
Var curl as CURLSMBS // your curl handle

Var m as CURLSWebSocketFrameMBS = curl.WebSocketReceive

if m <>nil then
TextAreaLog.AddText "Received: "+m.Text
end if
```

Notes: Retrieves as much as possible of a received WebSocket data fragment into the buffer, but not more than BufferSize bytes. The bytesReceived property in CURLSWebSocketFrameMBS is set to the number of bytes actually stored.

If there is more fragment data to deliver than what fits in the provided buffer, CURL returns a full buffer and the application needs to call this function again to continue draining the buffer.

The returned CURLSWebSocketFrameMBS contains the data and the metadata about the received data.

Lasterror property is set.

66.18.127 WebSocketSend(Data as MemoryBlock, FrameSize as Integer = 0, SendFlags as Integer = 0) as Integer

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Send the specific message fragment over an established WebSocket connection.
Notes: The buffer holds the data to send.
Returns the number of payload bytes actually sent.

To send a (huge) fragment using multiple calls with partial content per invoke, set the kFlagOffset bit and the FrameSize argument as the total expected size for the first part, then set the kFlagOffset with a zero FrameSize for the following parts.

If not sending a partial fragment or if this is raw mode, FrameSize should be set to zero.

If kWebSocketRaw is enabled in WebSocketOptions, the flags argument should be set to 0.

Lasterror property is set.

66.18.128 Properties

66.18.129 APILoaded as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the CURL library was loaded.
Notes: The CURLSMBS constructor loads the library if it was not loaded before.
(Read only property)

66.18.130 Cancel as Boolean

MBS CURL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tells CURL instance to cancel transfer as soon as possible.

Notes: Especially when using PerformMT, you may see your app hang if user tries to quit application. To prevent the hang, please set Cancel = true in window close event. So when app quits and windows get destroyed, the PerformMT will see the Cancel being true and returns soon.
(Read and Write property)

66.18.131 CollectDebugData as Boolean

MBS CURL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CollectDebugMessages instead. **Function:** Whether to collect debug message data.
Notes: If you set this property to true, you can grab the data from the transfer in the DebugMessages Property instead of collecting the pieces yourself in the DebugMessage event. Of course this is optional and you can still process data in DebugMessage event.
Due to memory limitation, collecting data will not work right if your app is running low on memory.
(Read and Write property)

66.18.132 CollectDebugMessages as Boolean

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to collect debug message data.
Notes: If you set this property to true, you can grab the data from the transfer in the DebugMessages Property instead of collecting the pieces yourself in the DebugMessage event. Of course this is optional and you can still process data in DebugMessage event.
Due to memory limitation, collecting data will not work right if your app is running low on memory.
(Read and Write property)

66.18.133 CollectHeaderData as Boolean

MBS CURL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CollectHeaders instead.
Function: Whether to collect headers.
Notes: If you set this property to true, you can grab the data from the transfer in the Headers Property instead of collecting the pieces yourself in the header event. Of course this is optional and you can still process data in header event.
Due to memory limitation, collecting data will not work right if your app is running low on memory.

Renamed to CollectHeaders in v23.0.
(Read and Write property)

66.18.134 CollectHeaders as Boolean

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to collect headers.
Notes: If you set this property to true, you can grab the data from the transfer in the Headers Property instead of collecting the pieces yourself in the header event. Of course this is optional and you can still process data in header event.
Due to memory limitation, collecting data will not work right if your app is running low on memory.
(Read and Write property)

66.18.135 CollectOutputData as Boolean

MBS CURL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to collect output data.
Notes: If you set this property to true, you can grab the data from the transfer in the OutputData Property instead of collecting the pieces yourself in the write event. Of course this is optional and you can still process data in write event.
Due to memory limitation, collecting data will not work right if your app is running low on memory.
(Read and Write property)

66.18.136 DebugData as String

MBS CURL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use DebugMessages instead.
Function: The debug data from CURL.
Notes: If CollectDebugData property is true, the plugin puts the data received in debugMessage event also into this property, so you can grab it after the transfer.

Newer code should use DebugMessages property instead.
(Read only property)

66.18.137 DebugMessages as String

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The debug messages from CURL.
Notes: If CollectDebugMessage property is true, the plugin puts the data received in debugMessage event also into this property, so you can grab it after the transfer.
(Read only property)

66.18.138 DebugWithData as Boolean

MBS CURL Plugin, Plugin Version: 18.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to include data in debug messages.
Example:

```
Var c as new CURLSMBS
c.DebugWithData = true
c.OptionVerbose = true
c.CollectDebugMessages = true
```

Notes: (Read and Write property)

66.18.139 Handle as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal handle of the CURL object.
Notes: (Read and Write property)

66.18.140 HeaderData as String

MBS CURL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The headers from CURL.
Notes: If CollectHeaders property is true, the plugin puts the data received in header event also into this property, so you can grab it after the transfer.

Renamed to Headers in v23.0.
(Read only property)

66.18.141 Headers as String

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use Headers instead. **Function:** The headers from CURL.
Notes: If CollectHeaders property is true, the plugin puts the data received in header event also into this property, so you can grab it after the transfer.
(Read only property)

66.18.142 InputData as String

MBS CURL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The input data.
Notes: If you set input data, you do not need to use Read, RestartRead or Seek events.
The plugin will use the provided data for the upload.
Setting input data size, will also set the input file size (OptionInFileSizeLarge and OptionInFileSize).

Alternatively you can provide data in Read event or use OpenMTInputFile method to open a file on disk to upload.
(Read and Write property)

66.18.143 Lasterror as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The lasterror from the library.
Example:

```
Var d As New CURLSMBS

d.OptionSSLVersion = 123

Var LastError As Integer = d.LastError
// gives 43
Var LastErrorText As String = d.LastErrorText
// A libcurl function was given a bad argument

Break
```

Notes: Set in the constructor while doing initialization as well as by by various curl calls.
Check the kError* constants.
(Read and Write property)

66.18.144 LastErrorMessage as String

MBS CURL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error message.
Example:

```
Var d As New CURLSMBS
```

```
d.OptionURL = "http://192.168.2.53"
d.OptionConnectionTimeout = 5

Var ErrorCode As Integer = d.Perform

Var LastErrorMessage As String = d.LastErrorMessage
Var LastErrorText As String = d.LastErrorText

Break
```

Notes: The error message from the transfer.

e.g. Perform may report a timeout with code 28.
Then LasterrorText is "Timeout was reached" looked up for 28.

But LasterrorMessage would be something like "Failed to connect to x.x.x.x port 80 after 5000 ms: Timeout was reached".
(Read only property)

66.18.145 LasterrorText as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The text for the lasterror code.
Example:

```
Var d As New CURLSMBS

d.OptionURL = "http://192.168.2.53"
d.OptionConnectionTimeout = 5

Var ErrorCode As Integer = d.Perform

Var LastErrorMessage As String = d.LastErrorMessage
Var LastErrorText As String = d.LastErrorText

Break
```

Notes: Static string matched to the error code, so you have an idea what's wrong.

e.g. Perform may report a timeout with code 28.
Then LasterrorText is "Timeout was reached" looked up for 28.

But LasterrorMessage would be something like "Failed to connect to x.x.x.x port 80 after 5000 ms: Timeout was reached".
(Read and Write property)

66.18.146 LibraryUsed as String

MBS CURL Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Which library is in use.
Notes: This is for debugging only to see which library is in use.
(Read only property)

66.18.147 LibVersion as string

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a human readable string with the version number of libCURL and some of its important components (like OpenSSL version).
Notes: (Read only property)

66.18.148 OptionAbstractUnixSocket as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Path to an abstract Unix domain socket.
Notes: (Read and Write property)
See also ABSTRACT_UNIX_SOCKET option in CURL manual.

66.18.149 OptionAcceptEncoding as String

MBS CURL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the contents of the Accept-Encoding: header sent in a HTTP request, and enables decoding of a response when a Content-Encoding: header is received.
Example:

```
Var c as new CURLSMBS
c.OptionAcceptEncoding = "deflate"
```

Notes: Three encodings are supported: identity, which does nothing, deflate which requests the server to compress its response using the zlib algorithm, and gzip which requests the gzip algorithm. If a zero-length

string is set, then an Accept-Encoding: header containing all supported encodings is sent.

This is a request, not an order; the server may or may not do it. This option must be set (to any non-NULL value) or else any unsolicited encoding done by the server is ignored. See the special file README.encoding for details (included with CURL source code).
(Read and Write property)
See also ACCEPT_ENCODING option in CURL manual.

66.18.150 OptionAcceptTimeoutMS as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Time-out accept operations (currently for FTP only) after this amount of milliseconds.
Notes: (Read and Write property)
See also ACCEPTTIMEOUT_MS option in CURL manual.

66.18.151 OptionAddressScope as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pass an integer specifying the scope_id value to use when connecting to IPv6 link-local or site-local addresses.
Notes: (Added in CURL 7.19.0)
(Read and Write property)
See also ADDRESS_SCOPE option in CURL manual.

66.18.152 OptionAppend as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True tells the library to append to the remote file instead of overwrite it.
Notes: This is only useful when uploading to an ftp site.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also APPEND option in CURL manual.

66.18.153 OptionAutoReferer as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: When enabled, libCURL will automatically set the Referer: field in requests where it follows a Location: redirect.
Notes: The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also AUTOREFERER option in CURL manual.

66.18.154 OptionAWSSigV4 as String

MBS CURL Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Provides AWS V4 signature authentication on HTTP(S) header.
Notes: Pass a text that is the collection of specific arguments are used for creating outgoing authentication headers. The format of the param option is:

provider1 [:provider2 [:region [:service]]]

provider1, provider2:
The providers arguments are used for generating some authentication parameters such as "Algorithm", "date", "request type" and "signed headers".

region:
The argument is a geographic area of a resources collection. It is extracted from the host name specified in the URL if omitted.

service:
The argument is a function provided by a cloud. It is extracted from the host name specified in the URL if omitted.

Note: This call set CURLOPT_HTTPAUTH to CURLAUTH_AWS_SIGV4. Calling CURLOPT_HTTPAUTH with CURLAUTH_AWS_SIGV4 is the same as calling this with "aws:amz" in parameter.

Example with "Test:Try", when curl will do the algorithm, it will generate "TEST-HMAC-SHA256" for "Algorithm", "x-try-date" and "X-Try-Date" for "date", "test4_request" for "request type", "SignedHeaders=content-type;host;x-try-date" for "signed headers"
If you use just "test", instead of "test:try", test will be use for every strings generated

By default, the value of this parameter is empty. Calling CURLOPT_HTTPAUTH with CURLAUTH_AWS_SIGV4

is the same as calling this with "aws:amz" in parameter.
(Read and Write property)
See also AWS_SIGV4 option in CURL manual.

66.18.155 OptionBufferSize as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Your preferred size (in bytes) for the receive buffer in libCURL.
Notes: The main point of this would be that the write event gets called more often and with smaller chunks. This is just treated as a request, not an order. You cannot be guaranteed to actually get the given size. (Added in 7.10)

This size is by default set as big as possible (OptionMaxWriteSize), so it only makse sense to use this option if you want it smaller.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

For slow upload/downloads, it may be better to set buffer size to 1 MB with OptionUploadBufferSize or OptionBufferSize properties to make transfers faster.
(Read and Write property)
See also BUFFERSIZE option in CURL manual.

66.18.156 OptionCACacheTimeout as Integer

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the life-time for cached certificate stores.
Notes: Pass a number, this sets the timeout in seconds. This tells libcurl the maximum time any cached certificate store it has in memory may be kept and reused for new connections. Once the timeout has expired, a subsequent fetch requiring a certificate store will have to build a new one.
Building a certificate store from a CAINFO file (see OptionCAInfo) is a slow operation so curl may cache the generated certificate store internally to speed up future connections.
Set to zero to completely disable caching, or set to -1 to retain the cached store remain forever. By default, libcurl caches this info for 24 hours.
(Read and Write property)
See also CA_CACHE_TIMEOUT option in CURL manual.

66.18.157 OptionCAInfo as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string naming a file holding one or more certificates to verify the peer with.
Example:

```
// if you use SSL, maybe put in a certificate or disable verification?

Var d as CURLSMBS
// your CURL object

// disable
d.OptionSSLVerifyHost = 0
d.OptionSSLVerifyPeer = 0

// or better provide root certificates:

Var cacert As FolderItem = New FolderItem("cacert.pem")
d.OptionCAInfo = cacert.NativePath
d.OptionSSLVerifyHost = 2
d.OptionSSLVerifyPeer = 1
```

Notes: This makes sense only when used in combination with the OptionSSLVerifyPeer option. If OptionSSLVerifyPeer is false, OptionCAINFO need not even indicate an accessible file.

Note that option is by default set to the system path where libCURL's cacert bundle is assumed to be stored, as established at build time.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also CAINFO option in CURL manual.

66.18.158 OptionCAInfoBlob as String

MBS CURL Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The CAInfo as blob value.
Notes: Certificate Authority (CA) bundle in PEM format passed PEM encoded content holding one or more certificates to verify the HTTPS server with.

(Read and Write property)
See also CAINFO_BLOB option in CURL manual.

66.18.159 OptionCAPath as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string naming a directory holding multiple CA certificates to verify the peer with.
Example:

```
Var c as new CURLSMBS
c.OptionCAPath = "/etc/ssl/certs"
```

Notes: The certificate directory must be prepared using the openssl c_rehash utility. This makes sense only when used in combination with the CURLOPT_SSL_VERIFYPEER option. If OptionSSLVerifyPeer is zero, OptionCAPath need not even indicate an accessible path. The OptionCAPath function apparently does not work in Windows due to some limitation in openssl. This option is OpenSSL-specific and does nothing if libCURL is built to use GnuTLS.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.

For Linux you can use "/etc/ssl/certs" folder as the system puts certificates there.
(Read and Write property)
See also CAPATH option in CURL manual.

66.18.160 OptionCertInfo as boolean

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set to true to enable libCURL's certificate chain info gatherer.
Notes: With this enabled, libCURL (if built with OpenSSL) will extract lots of information and data about the certificates in the certificate chain used in the SSL connection. This data is then possible to extract after a transfer using GetInfoCertInfo. (Added in 7.19.1)
(Read and Write property)
See also CERTINFO option in CURL manual.

66.18.161 OptionConnectionTimeout as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum time in seconds that you allow the connection to the server to take.
Example:

```
// This example needs a window with TextArea1.
Var d as new CURLSMBS

d.OptionConnectionTimeOutMS = 5000
d.OptionConnectOnly = 1

// try this URL
d.OptionURL = URL

// try connection
Var e as integer = d.Perform

// check result
Var s as string = d.OutputData
TextArea1.text = FixText(S)

if e = 0 then
MessageBox "Connected"
else
MessageBox "Failed to connect"
end if
```

Notes: This only limits the connection phase, once it has connected, this option is of no more use. Set to zero to disable connection timeout (it will then only timeout on the system's internal timeouts). See also the OptionTimeout option.
(Read and Write property)
See also CONNECTTIMEOUT option in CURL manual.

66.18.162 OptionConnectionTimeOutMS as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum time in milli seconds that you allow the connection to the server to take.
Notes: This only limits the connection phase, once it has connected, this option is of no more use. Set to zero to disable connection timeout (it will then only timeout on the system's internal timeouts). See also the OptionTimeout option.
(Read and Write property)

66.18.163 OptionConnectOnly as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A true tells the library to perform any required proxy authentication and connection setup, but no data transfer.
Notes: This option is useful with the CURLSMBS.GetInfoLastSocket function. The library can set up the connection and then the application can obtain the most recently used socket for special data transfers. (Added in 7.15.2)

Type changed to integer in v23.0 to enable passing 2 for WebSockets.
(Read and Write property)
See also CONNECT_ONLY option in CURL manual.

66.18.164 OptionCookie as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: It will be used to set a cookie in the http request.
Notes: The format of the string should be NAME=CONTENTS, where NAME is the cookie name and CONTENTS is what the cookie should contain.

If you need to set multiple cookies, you need to set them all using a single option and thus you need to concatenate them all in one single string. Set multiple cookies in one string like this: "name1=content1; name2=content2;" etc.

Using this option multiple times will only make the latest string override the previously ones.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also COOKIE option in CURL manual.

66.18.165 OptionCookieFile as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The cookie file content.
Notes: It should contain the name of your file holding cookie data to read. The cookie data may be in Netscape / Mozilla cookie data format or just regular HTTP-style headers dumped to a file.

Given an empty or non-existing file or by passing the empty string (""), this option will enable cookies for

this CURL handle, making it understand and parse received cookies and then use matching cookies in future request.

If you use this option multiple times, you just add more files to read. Subsequent files will add more cookies.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also COOKIEFILE option in CURL manual.

66.18.166 OptionCookieJar as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: File path where to write the cookies to.
Example:

```
// Activate cookie engine without cookie file:
curl.OptionCookieJar = ""
```

Notes: This will make libCURL write all internally known cookies to the specified file, when the object is destroyed. If no cookies are known, no file will be created. Specify "-" to instead have the cookies written to stdout. Using this option also enables cookies for this session, so if you for example follow a location it will make matching cookies get sent accordingly.

If the cookie jar file can't be created or written to, libCURL will not and cannot report an error for this. Using OptionVerbose or DebugFunction event will get a warning to display, but that is the only visible feedback you get about this possibly lethal situation.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also COOKIEJAR option in CURL manual.

66.18.167 OptionCookieList as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The cookie string.
Notes: Cookie can be either in Netscape / Mozilla format or just regular HTTP-style header (Set-Cookie: ...) format. If CURL cookie engine was not enabled it will enable its cookie engine. Passing a magic string "ALL" will erase all cookies known by CURL. (Added in 7.14.1) Passing the special string "SESS" will only erase all session cookies known by CURL. (Added in 7.15.4)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also COOKIELIST option in CURL manual.

66.18.168 OptionCookieSession as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set to true to mark this as a new cookie "session".
Notes: It will force libCURL to ignore all cookies it is about to load that are "session cookies" from the previous session. By default, libCURL always stores and loads all cookies, independent if they are session cookies are not. Session cookies are cookies without expiry date and they are meant to be alive and existing for this "session" only.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also COOKIESESSION option in CURL manual.

66.18.169 OptionCRLF as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert Unix newlines to CRLF newlines on transfers.
Notes: The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also CRLF option in CURL manual.

66.18.170 OptionCRLFile as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string naming a file with the concatenation of CRL (in PEM format) to use in the certificate validation that occurs during the SSL exchange.
Notes: When CURL is built to use NSS or GnuTLS, there is no way to influence the use of CRL passed to help in the verification process. When libCURL is built with OpenSSL support, X509_V_FLAG_CRL_CHECK and X509_V_FLAG_CRL_CHECK_ALL are both set, requiring CRL check against all the elements of the certificate chain if a CRL file is passed.

This option makes sense only when used in combination with the OptionSSLVerifyPeer option.

A specific error code (CURLE_SSL_CRL_BADFILE) is defined with the option. It is returned when the SSL exchange fails because the CRL file cannot be loaded. Note that a failure in certificate verification due to a revocation information found in the CRL does not trigger this specific error. (Added in 7.19.0)
(Read and Write property)
See also CRLFILE option in CURL manual.

66.18.171 OptionCustomRequest as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: It will be user instead of GET or HEAD when doing an HTTP request, or instead of LIST or NLST when doing an ftp directory listing.
Example:

```
Var c as CURLSMBS // your CURL instance

c.URL = "ftp://..."
c.customRequest = "MLSD" // ftp advanced directory listing
```

Notes: This is useful for doing DELETE or other more or less obscure HTTP requests. Don't do this at will, make sure your server supports the command first.

Restore to the internal default by setting this to "".

Many people have wrongly used this option to replace the entire request with their own, including multiple headers and POST contents. While that might work in many cases, it will cause libCURL to send invalid requests and it could possibly confuse the remote server badly. Use CURLOPT_POST and OptionPostFields to set POST data. Use OptionHTTPHeader to replace or extend the set of headers sent by libCURL. Use OptionHTTPVersion to change HTTP version.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

For WebDAV, you can set this to "MKCOL" to create a folder at the given URL.
(Read and Write property)
See also CUSTOMREQUEST option in CURL manual.

66.18.172 OptionDefaultProtocol as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the protocol used when curl is given a URL without a protocol.
Notes: (Read and Write property)
See also DEFAULT_PROTOCOL option in CURL manual.

66.18.173 OptionDirListOnly as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: For FTP and SFTP based URLs a parameter set to true tells the library to list the names of files in a directory, rather than performing a full directory listing that would normally include file sizes, dates etc.
Notes: For POP3 a parameter of true tells the library to list the email message or messages on the POP3 server. This can be used to change the default behaviour of libCURL, when combined with a URL that contains a message ID, to perform a "scan listing" which can then be used to determine the size of an email.

Note: For FTP this causes a NLST command to be sent to the FTP server. Beware that some FTP servers list only files in their response to NLST; they might not include subdirectories and symbolic links.

Setting this option to true also implies a directory listing even if the URL doesn't end with a slash, which otherwise is necessary.

Do NOT use this option if you also use OptionWildCardMatch as it will effectively break that feature then.
(Read and Write property)
See also DIRLISTONLY option in CURL manual.

66.18.174 OptionDisableUserNameInURL as Boolean

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Disallow specifying username/login in URL.
Notes: The value true tells the library to not allow URLs that include an username.
(Read and Write property)

66.18.175 OptionDNSCacheTimeout as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The timeout in seconds.
Notes: Name resolves will be kept in memory for this number of seconds. Set to zero (0) to completely disable caching, or set to -1 to make the cached entries remain forever. By default, libCURL caches this info for 60 seconds.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also DNS_CACHE_TIMEOUT option in CURL manual.

66.18.176 OptionDNSInterface as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the name of the network interface that the DNS resolver should bind to.
Notes: This must be an interface name (not an address). Set this option to "" to use the default setting (don't bind to a specific interface).
(Read and Write property)
See also DNS_INTERFACE option in CURL manual.

66.18.177 OptionDNSLocalIPv4 as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the local IPv4 address that the resolver should bind to.
Notes: The argument should be of string and contain a single numerical IPv4 address as a string.
Set this option to "" to use the default setting (don't bind to a specific IP address).
(Read and Write property)
See also DNS_LOCAL_IP4 option in CURL manual.

66.18.178 OptionDNSLocalIPv6 as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the local IPv6 address that the resolver should bind to.
Notes: The argument should be of type string and contain a single IPv6 address as a string.
Set this option to "" to use the default setting (don't bind to a specific IP address).
(Read and Write property)
See also DNS_LOCAL_IP6 option in CURL manual.

66.18.179 OptionDNSServers as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the name servers to use for DNS resolution.
Notes: (Read and Write property)
See also DNS_SERVERS option in CURL manual.

66.18.180 OptionDNSShuffleAddresses as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to shuffle DNS addresses.
Notes: When a name is resolved and more than one IP address is returned, shuffle the order of all returned addresses so that they will be used in a random order. This is similar to the ordering behavior of gethostbyname which is no longer used on most platforms.

Addresses will not be reshuffled if a name resolution is completed using the DNS cache. DNSCacheTimeout property can be used together with this option to reduce DNS cache timeout or disable caching entirely if frequent reshuffling is needed.

Since the addresses returned will be reordered randomly, their order will not be in accordance with RFC 3484 or any other deterministic order that may be generated by the system's name resolution implementation. This may have performance impacts and may cause IPv4 to be used before IPv6 or vice versa.
Default is false.
(Read and Write property)
See also DNS_SHUFFLE_ADDRESSES option in CURL manual.

66.18.181 OptionDOHSSLVerifyHost as Integer

MBS CURL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to verify the host name in the DOH (DNS-over-HTTPS) SSL certificate.
Notes: Pass a 2 as asking curl to verify the DOH (DNS-over-HTTPS) server's certificate name fields against the host name.
This option is the DOH equivalent of OptionSSLVerifyPeer and only affects requests to the DOH server.
When OptionDOHSSLVerifyHost is 2, the SSL certificate provided by the DOH server must indicate that the server name is the same as the server name to which you meant to connect to, or the connection fails.
Curl considers the DOH server the intended one when the Common Name field or a Subject Alternate Name field in the certificate matches the host name in the DOH URL to which you told Curl to connect.
When the verify value is set to 1 it is treated the same as 2. However for consistency with the other VerifyHost options we suggest use 2 and not 1.
When the verify value is set to 0, the connection succeeds regardless of the names used in the certificate. Use that ability with caution!
(Read and Write property)
See also DOH_SSL_VERIFYHOST option in CURL manual.

66.18.182 OptionDOHSSLVerifyPeer as Integer

MBS CURL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to verify the DOH SSL certificate.
Notes: Pass 1 to enable or 0 to disable.
This option tells curl to verify the authenticity of the DOH (DNS-over-HTTPS) server's certificate. A value of 1 means curl verifies; 0 (zero) means it doesn't.
This option is the DOH equivalent of CURL.SetOptionSSLVerifyPeer and only affects requests to the DOH server.
When negotiating a TLS or SSL connection, the server sends a certificate indicating its identity. Curl verifies whether the certificate is authentic, i.e. that you can trust that the server is who the certificate says it is. This trust is based on a chain of digital signatures, rooted in certification authority (CA) certificates you supply. curl uses a default bundle of CA certificates (the path for that is determined at build time) and you can specify alternate certificates with the CURL.SetOptionCAInfo option or the CURL.SetOptionCAPath option.
When CURL.SetOptionDOHSSLVerifyPeer is enabled, and the verification fails to prove that the certificate is authentic, the connection fails. When the option is zero, the peer certificate verification succeeds regardless.
Authenticating the certificate is not enough to be sure about the server. You typically also want to ensure that the server is the server you mean to be talking to. Use CURL.SetOptionDOHSSLVerifyHost for that. The check that the host name in the certificate is valid for the host name you're connecting to is done independently of the CURL.SetOptionDOHSSLVerifyPeer option.

WARNING: disabling verification of the certificate allows bad guys to man-in-the-middle the communication without you knowing it. Disabling verification makes the communication insecure. Just having encryption on a transfer is not enough as you cannot be sure that you are communicating with the correct end-point.
(Read and Write property)
See also DOH_SSL_VERIFYPEER option in CURL manual.

66.18.183 OptionDOHSSLVerifyStatus as Integer

MBS CURL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to verify the DOH SSL certificate's status.
Notes: Pass 2 to ask curl to verify the DOH (DNS-over-HTTPS) server's certificate name fields against the host name.
This option is the DOH equivalent of OptionSSLVerifyHost and only affects requests to the DOH server.
When OptionDOHSSLVerifyHost is 2, the SSL certificate provided by the DOH server must indicate that the server name is the same as the server name to which you meant to connect to, or the connection fails.
Curl considers the DOH server the intended one when the Common Name field or a Subject Alternate Name field in the certificate matches the host name in the DOH URL to which you told Curl to connect.
When the verify value is set to 1L it is treated the same as 2L. However for consistency with the other VerifyHost options we suggest use 2 and not 1.
When the verify value is set to 0L, the connection succeeds regardless of the names used in the certificate. Use that ability with caution!

See also OptionDOHSSLVerifyPeer to verify the digital signature of the DOH server certificate. If libcurl is built against NSS and OptionDOHSSLVerifyPeer is zero, OptionDOHSSLVerifyHost is also set to zero and cannot be overridden.
(Read and Write property)
See also DOH_SSL_VERIFYSTATUS option in CURL manual.

66.18.184 OptionDOHURL as String

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Provides the DNS-over-HTTPS URL.
Notes: Pass in a string to a URL for the DOH server to use for name resolving. The parameter should be URL-encoded in the following format: "https://host:port/path". It MUST specify a HTTPS URL.

libcurl doesn't validate the syntax or use this variable until the transfer is issued. Even if you set a crazy value here, OptionDOHURL will still return CURLE_OK.

curl sends POST requests to the given DNS-over-HTTPS URL.

To find the DOH server itself, which might be specified using a name, libcurl will use the default name lookup function. You can bootstrap that by providing the address for the DOH server with OptionResolve.

Disable DOH use again by setting this option to "".
(Read and Write property)
See also DOH_URL option in CURL manual.

66.18.185 OptionEGDSocket as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** The path name to the Entropy Gathering Daemon socket.
Notes: It will be used to seed the random engine for SSL.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.186 OptionExpect100TimeoutMS as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets Expect 100 timeout.
Notes: Time to wait in milliseconds for a response to a HTTP request containing an Expect: 100-continue header before sending the data anyway.
(Read and Write property)
See also EXPECT_100_TIMEOUT_MS option in CURL manual.

66.18.187 OptionFailOnError as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: True tells the library to fail silently if the HTTP code returned is equal to or larger than 400. The default action would be to return the page normally, ignoring that code.
Notes: The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

This method is not fail-safe and there are occasions where non-succesful response codes will slip through, especially when authentication is involved (response codes 401 and 407).

You might get some amounts of headers transferred before this situation is detected, like for when a "100-continue" is received as a response to a POST/PUT and a 401 or 407 is received immediately afterwards.
(Read and Write property)
See also FAILONERROR option in CURL manual.

66.18.188 OptionFileTime as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether filetime should be querried.
Example:

```
// init CURL with options
Var d as new CURLSMBS
d.OptionFileTime = true
d.OptionURL = "http://www.monkeybreadsoftware.de/images/mbs.jpg"

// run query
Var e as Integer = d.Perform

// calculate date object
Var da as new date(1970,1,1,0,0,0)
da.TotalSeconds = da.TotalSeconds + d.GetInfoFileTime

// show date
ResultText.text=str(d.GetInfoFileTime)+" "+da.ShortDate+" "+da.ShortTime
```

Notes: If it is true, libCURL will attempt to get the modification date of the remote document in this operation. This requires that the remote server sends the time or replies to a time querying command.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FILETIME option in CURL manual.

66.18.189 OptionFollowLocation as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A boolean parameter tells the library to follow any Location: header that the server sends as part of an HTTP header.
Example:

```
Var c as new CURLSMBS

c.OptionFollowLocation = 1
c.OptionMaxRedirs = 3
```

Notes: This means that the library will re-send the same request on the new location and follow new Location: headers all the way until no more such headers are returned. OptionMaxRedirs can be used to limit

the number of redirects libCURL will follow.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

A combination of these flags:
1 generic follow redirects
2 Do not use the custom method in the follow-up request if the HTTP code instructs so (301, 302, 303).
4 Only use the custom method in the first request, always reset in the next

This property was changed from boolean to integer in April 2025 for 25.2 release.
(Read and Write property)
See also FOLLOWLOCATION option in CURL manual.

66.18.190 OptionForbidReuse as Boolean

MBS CURL Plugin, Plugin Version: 24.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set to true to make the next transfer explicitly close the connection when done.
Notes: Normally, libCURL keep all connections alive when done with one transfer in case there comes a succeeding one that can re-use them. This option should be used with caution and only if you understand what it does. Set to false to have libCURL keep the connection open for possibly later re-use (default behavior).

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FORBID_REUSE option in CURL manual.

66.18.191 OptionForbitReuse as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set to true to make the next transfer explicitly close the connection when done.
Notes: Normally, libCURL keep all connections alive when done with one transfer in case there comes a succeeding one that can re-use them. This option should be used with caution and only if you understand what it does. Set to false to have libCURL keep the connection open for possibly later re-use (default behavior).

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

(Read and Write property)

66.18.192 OptionFreshConnect as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set to true to make the next transfer use a new (fresh) connection by force.
Example:

```
Var c as new CURLSMBS

c.OptionFreshConnect=True
```

Notes: If the connection cache is full before this connection, one of the existing connections will be closed as according to the selected or default policy. This option should be used with caution and only if you understand what it does. Set this to 0 to have libCURL attempt re-using an existing connection (default behavior).

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FRESH_CONNECT option in CURL manual.

66.18.193 OptionFTPAccount as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The FTP account name to use.
Notes: When an FTP server asks for "account data" after user name and password has been provided, this data is sent off using the ACCT command.
(Read and Write property)
See also FTP_ACCOUNT option in CURL manual.

66.18.194 OptionFTPAlternativeToUser as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The alternative username.
Notes: Pass a string as parameter, pointing to a string which will be used to authenticate if the usual FTP "USER user" and "PASS password" negotiation fails. This is currently only known to be required when connecting to Tumbleweed's Secure Transport FTPS server using client certificates for authentication. (Added in 7.15.5)
(Read and Write property)

See also FTP_ALTERNATIVE_TO_USER option in CURL manual.

66.18.195 OptionFTPAppend as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionAppend instead.
Function: True tells the library to append to the remote file instead of overwrite it.
Notes: This is only useful when uploading to an ftp site.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.196 OptionFTPCreateMissingDirs as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: If the value is 1, CURL will attempt to create any remote directory that it fails to CWD into.
Notes: CWD is the command that changes working directory. (Added in 7.10.7)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
Newer CURL Library versions allow a value of 2 to do a CWD after the directory was created, so this property changed from boolean to integer.
(Read and Write property)
See also FTP_CREATE_MISSING_DIRS option in CURL manual.

66.18.197 OptionFTPFileMethod as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pass an integer that should have one of the following values.
Notes: This option controls what method libCURL should use to reach a file on a FTP(S) server. The argument should be one of the following alternatives:

URLFTPMETHOD_MULTICWD = 1

libCURL does a single CWD operation for each path part in the given URL. For deep hierarchies this means very many commands. This is how RFC1738 says it should be done. This is the default but the slowest

behavior.

CURLFTPMETHOD_NOCWD = 2

libCURL does no CWD at all. libCURL will do SIZE, RETR, STOR etc and give a full path to the server for all these commands. This is the fastest behavior.

CURLFTPMETHOD_SINGLECWD = 3

libCURL does one CWD with the full target directory and then operates on the file "normally" (like in the multicwd case). This is somewhat more standards compliant than 'nocwd' but without the full penalty of 'multicwd'.
(Read and Write property)
See also FTP_FILEMETHOD option in CURL manual.

66.18.198 OptionFTPListOnly as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionDirListOnly instead. **Function:** True tells the library to just list the names of an ftp directory, instead of doing a full directory listing that would include file sizes, dates etc.
Notes: This causes an FTP NLST command to be sent. Beware that some FTP servers list only files in their response to NLST; they might not include subdirectories and symbolic links.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.199 OptionFTPPort as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The port to use for ftp.
Notes: It will be used to get the IP address to use for the ftp PORT instruction. The PORT instruction tells the remote server to connect to our specified IP address. The string may be a plain IP address, a host name, an network interface name (under Unix) or just a '-' letter to let the library use your systems default IP address. Default FTP operations are passive, and thus won't use PORT.

You disable PORT again and go back to using the passive version by setting this option to "".

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FTPPORT option in CURL manual.

66.18.200 OptionFTPResponseTimeout as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionServerResponseTimeout instead. **Function:** Causes CURL to set a timeout period (in seconds) on the amount of time that the server is allowed to take in order to generate a response message for a command before the session is considered hung.
Notes: With v22.4 or newer, please use newer property name OptionServerResponseTimeout.

While CURL is waiting for a response, this value overrides OptionTimeout. It is recommended that if used in conjunction with OptionTimeout, you set OptionFTPResponseTimeout to a value smaller than OptionTimeout. (Added in 7.10.8)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.201 OptionFTPSkipPasvIP as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: If set to a non-zero value, it instructs libCURL to not use the IP address the server suggests in its 227-response to libCURL's PASV command when libCURL connects the data connection.
Notes: Instead libCURL will re-use the same IP address it already uses for the control connection. But it will use the port number from the 227-response. (Added in 7.14.2)

This option has no effect if PORT, EPRT or EPSV is used instead of PASV.
(Read and Write property)
See also FTP_SKIP_PASV_IP option in CURL manual.

66.18.202 OptionFTPSSL as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionUseSSL instead.

Function: Request using SSL / TLS for the transfer.
Example:

```
Var c as CURLSMBS
c.OptionUseSSL = c.kFTPSSL_ALL
c.OptionSSLVersion = c.kSSLVersionTLSv12
```

Notes: Set to an integer using one of the values from below, to make libCURL use your desired level of SSL for the transfer.
These are all protocols that start out plain text and get "upgraded" to SSL using the STARTTLS command. This is for enabling SSL/TLS when you use FTP, SMTP, POP3, IMAP etc.

CURLUSESSL_NONE	0	Don't attempt to use SSL.
CURLUSESSL_TRY	1	Try using SSL, proceed as normal otherwise.
CURLUSESSL_CONTROL	2	Require SSL for the control connection or fail with CURLE_USE_SSL_FAILED.
CURLUSESSL_ALL	3	Require SSL for all communication or fail with CURLE_USE_SSL_FAILED.

(Read and Write property)

66.18.203 OptionFTPSSLAuth as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: What kind of SSL authentication to use for FTP.
Notes: Pass an integer using one of the values from below, to alter how libCURL issues "AUTH TLS" or "AUTH SSL" when FTP over SSL is activated (see CURLOPT_FTP_SSL). (Added in 7.12.2)

kFTPAUTH_DEFAULT = 0

Allow libCURL to decide

kFTPAUTH_SSL = 1

Try "AUTH SSL" first, and only if that fails try "AUTH TLS"

kFTPAUTH_TLS = 2

Try "AUTH TLS" first, and only if that fails try "AUTH SSL"

The Lasterror property is set. 0 for success.

You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FTPSSLAUTH option in CURL manual.

66.18.204 OptionFTPSSLCCC as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: If enabled, this option makes libCURL use CCC (Clear Command Channel).
Notes: It shuts down the SSL/TLS layer after authenticating. The rest of the control channel communication will be unencrypted. This allows NAT routers to follow the FTP transaction. Pass a long using one of the values below. (Added in 7.16.1)

CURLFTPSSL_CCC_NONE	0	Don't attempt to use CCC.
CURLFTPSSL_CCC_PASSIVE	1	Do not initiate the shutdown, but wait for the server to do it. Do not send a reply.
CURLFTPSSL_CCC_ACTIVE	2	Initiate the shutdown and wait for a reply.

(Read and Write property)
See also FTP_SSL_CCC option in CURL manual.

66.18.205 OptionFTPUseEPRT as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: If the value is true, it tells CURL to use the EPRT (and LPRT) command when doing active FTP downloads (which is enabled by CURLOPT_FTPPORT).
Notes: Using EPRT means that it will first attempt to use EPRT and then LPRT before using PORT, but if you pass FALSE (zero) to this option, it will not try using EPRT or LPRT, only plain PORT. (Added in 7.10.5)

If the server is an IPv6 host, this option will have no effect as of 7.12.3.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FTP_USE_EPRT option in CURL manual.

66.18.206 OptionFTPUseEPSV as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: If the value is true, it tells CURL to use the EPSV command when doing passive FTP downloads (which it always does by default).
Notes: Using EPSV means that it will first attempt to use EPSV before using PASV, but if you pass FALSE (zero) to this option, it will not try using EPSV, only plain PASV.

If the server is an IPv6 host, this option will have no effect as of 7.12.3.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also FTP_USE_EPSV option in CURL manual.

66.18.207 OptionFTPusePret as Boolean

MBS CURL Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: If the value is true, it tells CURL to send a PRET command before PASV (and EPSV). Certain FTP servers, mainly drftpd, require this non-standard command for directory listings as well as up and downloads in PASV mode.
Notes: Has no effect when using the active FTP transfers mode. (Added in 7.20.0)
(Read and Write property)
See also FTP_USE_PRET option in CURL manual.

66.18.208 OptionGet as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: If the true, this forces the HTTP request to get back to GET.
Notes: usable if a POST, HEAD, PUT or a custom request have been used previously using the same CURL handle.

When setting OptionGet to a true value, it will automatically set OptionNoBody to true (since 7.14.1).

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.209 OptionGSSAPIDelegation as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allow GSSAPI credential delegation.
Notes: (Read and Write property)
See also GSSAPI_DELEGATION option in CURL manual.

66.18.210 OptionHappyEyeballsTimeOutMS as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The happy eyeballs timeout.
Notes: Head start in milliseconds to give happy eyeballs.
(Read and Write property)
See also HAPPY_EYEBALLS_TIMEOUT_MS option in CURL manual.

66.18.211 OptionHAProxyProtocol as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to send an HAProxy PROXY protocol header.
Notes: Set to true to tell the library to send an HAProxy PROXY protocol header at beginning of the connection. The default action is not to send this header.
This option is primarily useful when sending test requests to a service that expects this header.
Most applications do not need this option.
Default false, do not send HAProxy PROXY protocol header.
(Read and Write property)
See also HAPROXYPROTOCOL option in CURL manual.

66.18.212 OptionHeader as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: True tells the library to include the header in the body output.
Notes: The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

This is only relevant for protocols that actually have headers preceding the data (like HTTP).
(Read and Write property)
See also HEADER option in CURL manual.

66.18.213 OptionHeaderOptions as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pass in a bitmask of "header options".
Notes: (Read and Write property)
See also HEADEROPT option in CURL manual.

66.18.214 OptionHTTPAuth as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Which http authentication to use.
Notes: Pass an integer as parameter, which is set to a bitmask, to tell libCURL what authentication method(s) you want it to use. The available bits are listed below. If more than one bit is set, libCURL will first query the site to see what authentication methods it supports and then pick the best one you allow it to use. For some methods, this will induce an extra network round-trip. Set the actual name and password with the UserPassword option. (Added in 7.10.6)

kAuthBASIC = 1

HTTP Basic authentication. This is the default choice, and the only method that is in wide-spread use and supported virtually everywhere. This is sending the user name and password over the network in plain text, easily captured by others.

kAuthDIGEST = 2

HTTP Digest authentication. Digest authentication is defined in RFC2617 and is a more secure way to do authentication over public networks than the regular old-fashioned Basic method.

kAuthGSSNEGOTIATE = 4

HTTP GSS-Negotiate authentication. The GSS-Negotiate (also known as plain "Negotiate") method was designed by Microsoft and is used in their web applications. It is primarily meant as a support for Kerberos5 authentication but may be also used along with another authentication methods. For more information see IETF draft draft-brezak-spnego-http-04.txt.

You need to build libCURL with a suitable GSS-API library for this to work.

kAuthNTLM = 8

HTTP NTLM authentication. A proprietary protocol invented and used by Microsoft. It uses a challenge-response and hash concept similar to Digest, to prevent the password from being eavesdropped.

You need to build libCURL with OpenSSL support for this option to work, or build libCURL on Windows.

kAuthANY = &hFFFFFFFF

This is a convenience macro that sets all bits and thus makes libCURL pick any it finds suitable. libCURL

will automatically select the one it finds most secure.

kAuthANYSAFE = &hFFFFFFFE

This is a convenience macro that sets all bits except Basic and thus makes libCURL pick any it finds suitable. libCURL will automatically select the one it finds most secure.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also HTTPAUTH option in CURL manual.

66.18.215 OptionHTTPContentDecoding as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pass a long to tell libCURL how to act on content decoding.
Notes: If set to zero, content decoding will be disabled. If set to 1 it is enabled. Note however that libCURL has no default content decoding but requires you to use OptionEncoding for that. (added in 7.16.2)
(Read and Write property)
See also HTTP_CONTENT_DECODING option in CURL manual.

66.18.216 OptionHTTPProxyTunnel as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the parameter to true to get the library to tunnel all operations through a given HTTP proxy.
Notes: There is a big difference between using a proxy and to tunnel through it. If you don't know what this means, you probably don't want this tunneling option.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also HTTPPROXYTUNNEL option in CURL manual.

66.18.217 OptionHTTPTransferDecoding as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pass an integer to tell libCURL how to act on transfer decoding.
Notes: If set to zero, transfer decoding will be disabled, if set to 1 it is enabled (default). libCURL does chunked transfer decoding by default unless this option is set to zero. (added in 7.16.2)
(Read and Write property)
See also HTTP_TRANSFER_DECODING option in CURL manual.

66.18.218 OptionHTTPVersion as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set to one of the values described below.
Notes: They force libCURL to use the specific HTTP versions. This is not sensible to do unless you have a good reason.

kHTTP_VERSION_NONE = 0

We don't care about what version the library uses. libCURL will use whatever it thinks fit.

kHTTP_VERSION_1_0 = 1

Enforce HTTP 1.0 requests.

kHTTP_VERSION_1_1 = 2

Enforce HTTP 1.1 requests.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also HTTP_VERSION option in CURL manual.

66.18.219 OptionIgnoreContentLength as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to ignore the Content-Length header.
Notes: This is useful for Apache 1.x (and similar servers) which will report incorrect content length for files over 2 gigabytes. If this option is used, CURL will not be able to accurately report progress, and will simply stop the download when the server ends the connection. (added in 7.14.1)
(Read and Write property)

See also IGNORE_CONTENT_LENGTH option in CURL manual.

66.18.220 OptionInFileSize as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: When uploading a file to a remote site, this option should be used to tell libCURL what the expected size of the infile is.
Notes: Note that this option does not limit how much data libCURL will actually send, as that is controlled entirely by what the read event returns.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also INFILESIZE option in CURL manual.

66.18.221 OptionInFileSizeLarge as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionInFileSize instead.
Function: When uploading a file to a remote site, this option should be used to tell libCURL what the expected size of the infile is.
Notes: This value should be passed as a CURL_off_t. (Added in 7.11.0)

Note that this option does not limit how much data libCURL will actually send, as that is controlled entirely by what the read event returns.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.222 OptionInterface as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: This set the interface name to use as outgoing network interface.
Notes: The name can be an interface name, an IP address or a host name.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

(Read and Write property)
See also INTERFACE option in CURL manual.

66.18.223 OptionIPResolve as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allows an application to select what kind of IP addresses to use when resolving host names.
Example:

```
Var c as new CURLSMBS
c.OptionIPResolve = c.kIPRESOLVE_V4
```

Notes: This is only interesting when using host names that resolve addresses using more than one version of IP. The allowed values are:

kIPRESOLVE_WHATEVER = 0

Default, resolves addresses to all IP versions that your system allows.

kIPRESOLVE_V4 = 1

Resolve to ipv4 addresses.

kIPRESOLVE_V6 = 2

Resolve to ipv6 addresses.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also IPRESOLVE option in CURL manual.

66.18.224 OptionIssuerCert as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string naming a file holding a CA certificate in PEM format.
Notes: If the option is set, an additional check against the peer certificate is performed to verify the issuer is indeed the one associated with the certificate provided by the option. This additional check is use-

ful in multi-level PKI where one needs to enforce that the peer certificate is from a specific branch of the tree.

This option makes sense only when used in combination with the OptionSSLVerifyPeer option. Otherwise, the result of the check is not considered as failure.

A specific error code (CURLE_SSL_ISSUER_ERROR) is defined with the option, which is returned if the setup of the SSL/TLS session has failed due to a mismatch with the issuer of peer certificate (OptionSSLVerifyPeer has to be set too for the check to fail). (Added in 7.19.0)

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also ISSUERCERT option in CURL manual.

66.18.225 OptionIssuerCertBlob as String

MBS CURL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set issuer SSL certificate from memory blob.
Notes: Pass data, which contains binary data of a CA certificate in PEM format. If the option is set, an additional check against the peer certificate is performed to verify the issuer is indeed the one associated with the certificate provided by the option. This additional check is useful in multi-level PKI where one needs to enforce that the peer certificate is from a specific branch of the tree.

This option should be used in combination with the OptionSSLVerifyPeer option. Otherwise, the result of the check is not considered as failure.

A specific error code (CURLE_SSL_ISSUER_ERROR) is defined with the option, which is returned if the setup of the SSL/TLS session has failed due to a mismatch with the issuer of peer certificate (OptionSSLVerifyPeer has to be set too for the check to fail).

This option is an alternative to OptionIssuerCert which instead expects a file name as input.
(Read and Write property)
See also ISSUERCERT_BLOB option in CURL manual.

66.18.226 OptionKeepSendingOnError as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to keep sending on error.
Notes: Continue to send data if the server responds early with an HTTP status code >= 300

(Read and Write property)
See also KEEP_SENDING_ON_ERROR option in CURL manual.

66.18.227 OptionKeyPassword as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set passphrase to private key.
Notes: It will be used as the password required to use the OptionSSLKey or OptionSSHPrivateKeyfile private key. You never needed a pass phrase to load a certificate but you need one to load your private key.
(Read and Write property)
See also KEYPASSWD option in CURL manual.

66.18.228 OptionKRB4Level as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Set the krb4 security level, this also enables krb4 awareness.
Notes: This is a string, 'clear', 'safe', 'confidential' or 'private'. If the string is set but doesn't match one of these, 'private' will be used. Set the string to "" to disable kerberos4. The kerberos support only works for FTP.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.229 OptionKRBLevel as String

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** FTP kerberos security level.
Notes: Set the kerberos security level for FTP; this also enables kerberos awareness. This is a string that should match one of the following: 'clear', 'safe', 'confidential' or 'private'. If the string is set but doesn't match one of these, 'private' will be used. Set the string to NULL to disable kerberos support for FTP.
(Read and Write property)

66.18.230 OptionLocalPort as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: This sets the local port number of the socket used for connection.
Notes: This can be used in combination with OptionInterface and you are recommended to use OptionLocalPortRange as well when this is set. Note that port numbers are only valid 1 - 65535. (Added in 7.15.2)
(Read and Write property)
See also LOCALPORT option in CURL manual.

66.18.231 OptionLocalPortRange as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: This is the number of attempts libCURL should do to find a working local port number.
Notes: It starts with the given OptionLocalPort and adds one to the number for each retry. Setting this value to 1 or below will make libCURL do only one try for exact port number. Note that port numbers by nature is a scarce resource that will be busy at times so setting this value to something too low might cause unnecessary connection setup failures. (Added in 7.15.2)
(Read and Write property)
See also LOCALPORTRANGE option in CURL manual.

66.18.232 OptionLoginOptions as String

MBS CURL Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Login options string to use for the transfer.
Notes: For more information about the login options please see RFC 2384, RFC5092 and IETF draft draft-earhart-url-smtp-00.txt

CURLOPT_LOGIN_OPTIONS can be used to set protocol specific login options, such as the preferred authentication mechanism via "AUTH=NTLM" or "AUTH=*", and should be used in conjunction with the OptionUserName option.
Only IMAP, POP3 and SMTP support login options.
(Read and Write property)
See also LOGIN_OPTIONS option in CURL manual.

66.18.233 OptionLowSpeedLimit as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: This property contains the transfer speed in bytes per second that the transfer should be below during OptionLowSpeedTime seconds for the library to consider it too slow and abort.

Notes: The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also LOW_SPEED_LIMIT option in CURL manual.

66.18.234 OptionLowSpeedTime as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: This property contains the time in seconds that the transfer should be below the OptionLowSpeedLimit for the library to consider it too slow and abort.
Notes: The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also LOW_SPEED_TIME option in CURL manual.

66.18.235 OptionMailAuth as String

MBS CURL Plugin, Plugin Version: 12.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This string will be used to specify the authentication address (identity) of a submitted message that is being relayed to another server.
Notes: This optional parameter allows co-operating agents in a trusted environment to communicate the authentication of individual messages and should only be used by the application program, using libCURL, if the application is itself a mail server acting in such an environment. If the application is operating as such and the AUTH address is not known or is invalid, then an empty string should be used for this parameter.

Unlike OptionMailFrom and SetOptionMailRecipients, the address should not be specified within a pair of angled brackets (<>). However, if an empty string is used then a pair of brackets will be sent by libCURL as required by RFC 2554.
(Read and Write property)
See also MAIL_AUTH option in CURL manual.

66.18.236 OptionMailFrom as String

MBS CURL Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string that will be used to specify the sender address in a mail when sending an SMTP mail with libCURL.
Notes: (Read and Write property)
See also MAIL_FROM option in CURL manual.

66.18.237 OptionMaxAgeConn as Integer

MBS CURL Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum age the connection should have in seconds.
Notes: Older connections are not reused, but discarded.
(Read and Write property)
See also MAXAGE_CONN option in CURL manual.

66.18.238 OptionMaxConnects as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The set number will be the persistent connection cache size.
Notes: The set amount will be the maximum amount of simultaneously open connections that libCURL may cache. Default is 5, and there isn't much point in changing this value unless you are perfectly aware of how this work and changes libCURL's behaviour. This concerns connection using any of the protocols that support persistent connections.

When reaching the maximum limit, CURL closes the oldest one in the cache to prevent the number of open connections to increase.

If you already have performed transfers with this CURL handle, setting a smaller MAXCONNECTS than before may cause open connections to get closed unnecessarily.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also MAXCONNECTS option in CURL manual.

66.18.239 OptionMaxFileSize as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: This allows you to specify the maximum size (in bytes) of a file to download.
Notes: If the file requested is larger than this value, the transfer will not start and kError_FILESIZE_EXCEEDED will be returned.

The file size is not always known prior to download, and for such files this option has no effect even if the file transfer ends up being larger than this given limit. This concerns both FTP and HTTP transfers.

The Lasterror property is set. 0 for success.

You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also MAXFILESIZE option in CURL manual.

66.18.240 OptionMaxFileSizeLarge as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionMaxFileSize instead. **Function:** This allows you to specify the maximum size (in bytes) of a file to download.
Notes: If the file requested is larger than this value, the transfer will not start and kError_FILESIZE_EXCEEDED will be returned. (Added in 7.11.0)

The file size is not always known prior to download, and for such files this option has no effect even if the file transfer ends up being larger than this given limit. This concerns both FTP and HTTP transfers.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.241 OptionMaxLifeTimeConnection as Integer

MBS CURL Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets maximum lifetime (since creation) allowed for reusing a connection.
Notes: Pass a number as parameter containing maxlifetime - the maximum time in seconds, since the creation of the connection, that you allow an existing connection to have to be considered for reuse for this request.

libcurl features a connection cache that holds previously used connections. When a new request is to be done, it will consider any connection that matches for reuse. The MaxLifeTimeConnection limit prevents libcurl from trying too old connections for reuse. This can be used for client-side load balancing. If a connection is found in the cache that is older than this set maxlifetime, it will instead be closed once any in-progress transfers complete.

If set to 0, this behavior is disabled: all connections are eligible for reuse.
(Read and Write property)

66.18.242 OptionMaxRecvSpeed as Int64

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines the maximum download speed.
Notes: If a download exceeds this speed (counted in bytes per second) on cumulative average during the transfer, the transfer will pause to keep the average rate less than or equal to the parameter value. Defaults to unlimited speed. (Added in 7.15.5)
(Read and Write property)
See also MAX_RECV_SPEED option in CURL manual.

66.18.243 OptionMaxRecvSpeedLarge as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionMaxRecvSpeed instead. **Function:** Defines the maximum download speed.
Notes: If a download exceeds this speed (counted in bytes per second) on cumulative average during the transfer, the transfer will pause to keep the average rate less than or equal to the parameter value. Defaults to unlimited speed. (Added in 7.15.5)
(Read and Write property)

66.18.244 OptionMaxRedirs as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The set number will be the redirection limit.
Example:

```
Var c as new CURLSMBS

c.OptionFollowLocation = 1
c.OptionMaxRedirs = 3
```

Notes: If that many redirections have been followed, the next redirect will cause an error (kError_TOO_MANY_REDIRECTS). This option only makes sense if the CURLOPT_FOLLOWLOCATION is used at the same time.
Added in 7.15.1: Setting the limit to 0 will make libCURL refuse any redirect. Set it to -1 for an infinite number of redirects (which is the default)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also MAXREDIRS option in CURL manual.

66.18.245 OptionMaxSendSpeed as Int64

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Defines the maximum upload speed.
Notes: If an upload exceeds this speed on cumulative average during the transfer, the transfer will pause to keep the average rate less than or equal to the parameter value. Defaults to unlimited speed. (Added in 7.15.5)
Value is in bytes per second.
Useful if you have a limited pipe and you'd like your transfer not to use your entire bandwidth.
Slowing down the transfer speed is also useful for lowering CPU consumption during transfers.
(Read and Write property)
See also MAX_SEND_SPEED option in CURL manual.

66.18.246 OptionMaxSendSpeedLarge as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionMaxSendSpeed instead. **Function:** Defines the maximum upload speed.
Notes: If an upload exceeds this speed on cumulative average during the transfer, the transfer will pause to keep the average rate less than or equal to the parameter value. Defaults to unlimited speed. (Added in 7.15.5)
Value is in bytes per second.
Useful if you have a limited pipe and you'd like your transfer not to use your entire bandwidth.
Slowing down the transfer speed is also useful for lowering CPU consumption during transfers.
(Read and Write property)

66.18.247 OptionMimeOptions as Integer

MBS CURL Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set MIME option flags.
Notes: Pass a number that holds a bitmask of CURLMIMEOPT constants. Each bit is a Boolean flag used while encoding a MIME tree or multipart form data.

Available bits are:

CURLMIMEOPT_FORMESCAPE = 1

Tells libcurl to escape multipart form field and file names using the backslash-escaping algorithm rather than percent-encoding (HTTP only).

Backslash-escaping consists in preceding backslashes and double quotes with a backslash. Percent encoding maps all occurrences of double quote, carriage return and line feed to %22, %0D and %0A respectively.

Before version 7.81.0, percent-encoding was never applied.

HTTP browsers used to do backslash-escaping in the past but have over time transitioned to use percent-encoding. This option allows to address server-side applications that have not yet have been converted.

As an example, consider field or file name strange\name"kind. When the containing multipart form is sent, this is normally transmitted as strange\name%22kind. When this option is set, it is sent as strange\\name\"kind.
(Read and Write property)
See also MIME_OPTIONS option in CURL manual.

66.18.248 OptionNetRC as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Controls usage of netrc file.
Notes: This parameter controls the preference of libCURL between using user names and passwords from your
textasciitilde /.netrc file, relative to user names and passwords in the URL supplied with OptionURL.

libCURL uses a user name (and supplied or prompted password) supplied with OptionUsername and OptionPassword in preference to any of the options controlled by this parameter.

An integer, set to one of the values described below.

kNETRC_OPTIONAL = 1

The use of your
textasciitilde /.netrc file is optional, and information in the URL is to be preferred. The file will be scanned with the host and user name (to find the password only) or with the host only, to find the first user name and password after that machine, which ever information is not specified in the URL.

Undefined values of the option will have this effect.

kNETRC_IGNORED = 0

The library will ignore the file and use only the information in the URL.

This is the default.

kNETRC_REQUIRED = 2

This value tells the library that use of the file is required, to ignore the information in the URL, and to search the file with the host only.

Only machine name, user name and password are taken into account (init macros and similar things aren't supported).

libCURL does not verify that the file has the correct properties set (as the standard Unix ftp client does). It should only be readable by user.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also NETRC option in CURL manual.

66.18.249 OptionNetRCFile as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string containing the full path name to the file you want libCURL to use as .netrc file.
Notes: If this option is omitted, and OptionNETRC is set, libCURL will attempt to find the a .netrc file in the current user's home directory. (Added in 7.10.9)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also NETRC_FILE option in CURL manual.

66.18.250 OptionNewDirectoryPerms as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An integer, containing the value of the permissions that will be assigned to newly created directories on the remote server.

Notes: The default value is 0755, but any valid value can be used. The only protocols that can use this are sftp://, scp://, and file://. (Added in 7.16.4)
Value must be octal, so use &o prefix for number.
(Read and Write property)
See also NEW_DIRECTORY_PERMS option in CURL manual.

66.18.251 OptionNewFilePerms as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An integer, containing the value of the permissions that will be assigned to newly created files on the remote server.
Notes: The default value is &o0644, but any valid value can be used. The only protocols that can use this are sftp://, scp://, and file://. (Added in 7.16.4)
Be aware that you normally specify this in octal values. So use the &o prefix in Xojo.
(Read and Write property)
See also NEW_FILE_PERMS option in CURL manual.

66.18.252 OptionNoBody as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: True tells the library to not include the body-part in the output.
Notes: This is only relevant for protocols that have separate header and body parts. On HTTP(S) servers, this will make libCURL do a HEAD request.

To change request to GET, you should use OptionGet. Change request to POST with OptionPost etc.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also NOBODY option in CURL manual.

66.18.253 OptionNoProxy as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string with a comma- separated list of hosts which do not use a proxy, if one is specified.
Example:

```
// setup explicit proxy:
```

```
var c as new CURLSMBS
c.OptionProxy = "http://192.168.1.123"
c.OptionNoProxy = "localhost,192.168.0.0/16,.somename.com"
```

Notes: The only wildcard is a single * character, which matches all hosts, and effectively disables the proxy. Each name in this list is matched as either a domain which contains the hostname, or the hostname itself. For example, local.com would match local.com, local.com:80, and www.local.com, but not www.notlocal.com. (Added in 7.19.4)
(Read and Write property)
See also NOPROXY option in CURL manual.

66.18.254 OptionNoSignal as Integer

MBS CURL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to not use signals.
Notes: If it is true, libCURL will not use any functions that install signal handlers or any functions that cause signals to be sent to the process. This option is mainly here to allow multi-threaded unix applications to still set/use all timeout options etc, without risking getting signals. (Added in 7.10)

If this option is set and libCURL has been built with the standard name resolver, timeouts will not occur while the name resolve takes place. Consider building libCURL with c-ares support to enable asynchronous DNS lookups, which enables nice timeouts for name resolves without signals.

Setting OptionNoSignal to true makes libCURL NOT ask the system to ignore SIGPIPE signals, which otherwise are sent by the system when trying to send data to a socket which is closed in the other end. libCURL makes an effort to never cause such SIGPIPEs to trigger, but some operating systems have no way to avoid them and even on those that have there are some corner cases when they may still happen, contrary to our desire. In addition, using CURLAUTH_NTLM_WB authentication could cause a SIGCHLD signal to be raised.
(Read and Write property)
See also NOSIGNAL option in CURL manual.

66.18.255 OptionPassword as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The password to use for the transfer.
Notes: The OptionPassword option should be used in conjunction with the OptionUsername option.
(Read and Write property)
See also PASSWORD option in CURL manual.

66.18.256 OptionPathAsIs as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pass path as it is and do not resolve dots.
Notes: Do not squash dot-dot sequences.
(Read and Write property)
See also PATH_AS_IS option in CURL manual.

66.18.257 OptionPinnedPublicKey as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The public key in DER form used to validate the peer public key.
Notes: Native path to key file.
This option is used only if SSLVerifyPeer is true.
(Read and Write property)
See also PINNEDPUBLICKEY option in CURL manual.

66.18.258 OptionPipeWait as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Wait/don't wait for pipe/mutex to clarify.
Notes: (Read and Write property)
See also PIPEWAIT option in CURL manual.

66.18.259 OptionPort as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The remote port number to connect to, instead of the one specified in the URL or the default port for the used protocol.
Notes: The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also PORT option in CURL manual.

66.18.260 OptionPost as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A boolean parameter tells the library to do a regular HTTP post.
Notes: This will also make the library use the a "Content-Type: application/x-www-form-urlencoded" header. (This is by far the most commonly used POST method).

Use the OptionPostFields option to specify what data to post.

Optionally, you can provide data to POST using the Read event but then you must make sure to not set OptionPostFields to anything but "". When providing data with an event, you must transmit it using chunked transfer-encoding.

You can override the default POST Content-Type: header by setting your own with OptionHTTPHeader.

Using POST with HTTP 1.1 implies the use of a "Expect: 100-continue" header. You can disable this header with OptionHTTPHeader as usual.

If you use POST to a HTTP 1.1 server, you can send data without knowing the size before starting the POST if you use chunked encoding. You enable this by adding a header like "Transfer-Encoding: chunked" with OptionHTTPHeader. With HTTP 1.0 or without chunked transfer, you must specify the size in the request.

When setting CURLOPT_POST to a non-zero value, it will automatically set OptionNoBody to 0 (since 7.14.1).

If you issue a POST request and then want to make a HEAD or GET using the same re-used handle, you must explictly set the new request type using OptionNoBody or OptionGet or similar.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also POST option in CURL manual.

66.18.261 OptionPostFields as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string which should be the full data to post in an HTTP POST operation.
Example:

```
Var xml as string // XML or JSON to send as payload
Var c as new CURLSMBS

c.OptionFollowLocation = 1
```

```
c.OptionMaxRedirs = 3
c.OptionPostFields = xml
c.OptionUserAgent = "Test App"
c.OptionPost = true

// for SOAP use right content type
c.SetOptionHTTPHeader array("Content-Type: application/soap+xml; charset=utf-8")
```

Notes: You must make sure that the data is formatted the way you want the server to receive it. libCURL will not convert or encode it for you. Most web servers will assume this data to be url-encoded. Take note.

This POST is a normal application/x-www-form-urlencoded kind (and libCURL will set that Content-Type by default when this option is used), which is the most commonly used one by HTML forms. See also the OptionPost. Using OptionPostFields implies OptionPost.

Using POST with HTTP 1.1 implies the use of a "Expect: 100-continue" header. You can disable this header with CURLOPT_HTTPHEADER as usual.

To make multipart/formdata posts (aka rfc1867-posts), check out the OptionPost option.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also COPYPOSTFIELDS option in CURL manual.

66.18.262 OptionPostFieldSize as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of the post data.
Notes: Optional you can set the size of your post data.
If you specify a postfield string, this size will be set automatically.

If you specify a size and no postfield string, the Read event will request data.
(Read and Write property)
See also POSTFIELDSIZE option in CURL manual.

66.18.263 OptionPostFieldSizeLarge as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionPostFieldSize instead. **Function:** The size of the post data. (64 bit version)
Notes: Optional you can set the size of your post data.
If you specify a postfield string, this size will be set automatically.

If you specify a size and no postfield string, the Read event will request data.
(Read and Write property)

66.18.264 OptionPostRedir as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A bitmask to control how libCURL acts on redirects after POSTs that get a 301 or 302 response back.
Notes: A parameter with bit 0 set (value CURL_REDIR_POST_301=1) tells the library to respect RFC 2616/10.3.2 and not convert POST requests into GET requests when following a 301 redirection. Setting bit 1 (value CURL_REDIR_POST_302=2) makes libCURL maintain the request method after a 302 redirect. CURL_REDIR_POST_ALL is a convenience define that sets both bits.

The non-RFC behaviour is ubiquitous in web browsers, so the library does the conversion by default to maintain consistency. However, a server may require a POST to remain a POST after such a redirection. This option is meaningful only when setting OptionFollowLocation. (Added in 7.17.1) (This option was known as CURLOPT_POST301 up to 7.19.0 as it only supported the 301 way before then)
(Read and Write property)
See also POSTREDIR option in CURL manual.

66.18.265 OptionPreProxy as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Name of pre proxy to use.
Notes: (Read and Write property)
See also PRE_PROXY option in CURL manual.

66.18.266 OptionProtocols as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionProtocolsString instead. **Function:** A bitmask of kProtocol* constants.
Notes: If used, this bitmask limits what protocols libCURL may use in the transfer. This allows you to have a libCURL built to support a wide range of protocols but still limit specific transfers to only be allowed to use

a subset of them. By default libCURL will accept all protocols it supports. See also OptionRedirProtocols. (Added in 7.19.4)
(Read and Write property)

66.18.267 OptionProtocolsString as String

MBS CURL Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The protocols allowed-
Example:

```
Var c as new CURLSMBS
c.OptionProtocolsString = "http,tftp,sftp"
```

Notes: Pass a string that holds a comma-separated list of case insensitive protocol names (URL schemes) to allow in the transfer. This option allows applications to use libcurl built to support a wide range of protocols but still limit specific transfers to only be allowed to use a subset of them. By default, libcurl accepts all protocols it was built with support for. See also OptionReditProtocolsString.

If trying to set a non-existing protocol or if no matching protocol at all is set, it returns error.

These are the available protocols:

DICT, FILE, FTP, FTPS, GOPHER, GOPHERS, HTTP, HTTPS, IMAP, IMAPS, LDAP, LDAPS, POP3, POP3S, RTMP, RTMPE, RTMPS, RTMPT, RTMPTE, RTMPTS, RTSP, SCP, SFTP, SMB, SMBS, SMTP, SMTPS, TELNET, TFTP

You can set "ALL" as a short-cut to enable all protocols. Note that by setting all, you may enable protocols that were not supported the day you write this but are introduced in a future libcurl version.

CURLVersionMBS class can be used to get a list of all supported protocols in the current libcurl. GetInfoProtocol function is the recommended way to figure out the protocol used in a previous transfer.
(Read and Write property)

66.18.268 OptionProxy as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set HTTP proxy to use.
Example:

```
// setup explicit proxy:
```

```
var c as new CURLSMBS
c.OptionProxy = "http://192.168.1.123"
c.OptionNoProxy = "localhost,192.168.0.0/16,.somename.com"
```

Notes: The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

The parameter should be a string holding the host name or dotted IP address. To specify port number in this string, append : [port] to the end of the host name. The proxy string may be prefixed with [protocol] :// since any such prefix will be ignored. The proxy's port number may optionally be specified with the separate option ProxyHost.

When you tell the library to use an HTTP proxy, libCURL will transparently convert operations to HTTP even if you specify an FTP URL etc. This may have an impact on what other features of the library you can use, such as CURLOPT_QUOTE and similar FTP specifics that don't work unless you tunnel through the HTTP proxy. Such tunneling is activated with HTTPProxyTunnel.

libCURL respects the environment variables http_proxy, ftp_proxy, all_proxy etc, if any of those is set. The Proxy option does however override any possibly set environment variables.

Starting with 7.14.1, the proxy host string given in environment variables can be specified the exact same way as the proxy can be set with Proxy, include protocol prefix (http://) and embedded user + password.

You can use WinHTTPClientMBS class on Windows or CFProxyMBS on Mac to discover system proxy settings.
(Read and Write property)
See also PROXY option in CURL manual.

66.18.269 OptionProxyAuth as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Which proxy authentication to use.
Notes: Pass an integer as parameter, which is set to a bitmask, to tell libCURL what authentication method(s) you want it to use for your proxy authentication. If more than one bit is set, libCURL will first query the site to see what authentication methods it supports and then pick the best one you allow it to use. For some methods, this will induce an extra network round-trip. Set the actual name and password with the ProxyUserPassword option. The bitmask can be constructed by or'ing together the bits listed above for the HTTPAuth option. As of this writing, only Basic, Digest and NTLM work. (Added in 7.10.7)

The Lasterror property is set. 0 for success.

You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also PROXYAUTH option in CURL manual.

66.18.270 OptionProxyCAInfo as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The CApath or CAfile used to validate the proxy certificate.
Example:

```
// if you use SSL, maybe put in a certificate or disable verification?

Var d as CURLSMBS
// your CURL object

// disable
d.OptionProxySSLVerifyHost = 0
d.OptionProxySSLVerifyPeer = 0

// or better provide root certificates:

Var cacert As FolderItem = New FolderItem("cacert.pem")
d.OptionProxyCAInfo = cacert.NativePath
d.OptionProxySSLVerifyHost = 2
d.OptionProxySSLVerifyPeer = 1
```

Notes: Pass native file path.
This option is used only if CURLSMBS.OptionProxySSLVerifyPeer is true
(Read and Write property)
See also PROXY_CAINFO option in CURL manual.

66.18.271 OptionProxyCAInfoBlob as String

MBS CURL Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The CAInfo for proxy as blob value.
Notes: This option is for connecting to an HTTPS proxy, not an HTTPS server.
Certificate Authority (CA) bundle in PEM format passed PEM encoded content holding one or more certificates to verify the HTTPS server with.
(Read and Write property)
See also PROXY_CAINFO_BLOB option in CURL manual.

66.18.272 OptionProxyCAPath as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The CApath directory used to validate the proxy certificate.
Notes: Pass native file path.
This option is used only if CURLSMBS.OptionProxySSLVerifyPeer is true
(Read and Write property)
See also PROXY_CAPATH option in CURL manual.

66.18.273 OptionProxyCRLFile as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: CRL file for proxy.
Notes: Pass native file path.
(Read and Write property)
See also PROXY_CRLFILE option in CURL manual.

66.18.274 OptionProxyIssuerCert as String

MBS CURL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the proxy issuer SSL certificate filename.
Notes: Pass a string naming a file holding a CA certificate in PEM format. If the option is set, an additional check against the peer certificate is performed to verify the issuer of the HTTPS proxy is indeed the one associated with the certificate provided by the option. This additional check is useful in multi-level PKI where one needs to enforce that the peer certificate is from a specific branch of the tree.

This option makes sense only when used in combination with the OptionProxySSLVerifyPeer option. Otherwise, the result of the check is not considered as failure.

A specific error code (CURLE_SSL_ISSUER_ERROR) is defined with the option, which is returned if the setup of the SSL/TLS session has failed due to a mismatch with the issuer of peer certificate (OptionProxySSLVerifyPeer has to be set too for the check to fail).
(Read and Write property)
See also PROXY_ISSUERCERT option in CURL manual.

66.18.275 OptionProxyIssuerCertBlob as String

MBS CURL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set proxy issuer SSL certificate from memory blob.
Notes: Pass data, which contains binary data of a CA certificate in PEM format. If the option is set, an additional check against the peer certificate is performed to verify the issuer of the HTTPS proxy is indeed the one associated with the certificate provided by the option. This additional check is useful in multi-level PKI where one needs to enforce that the peer certificate is from a specific branch of the tree.

This option should be used in combination with the OptionProxySSLVerifyPeer option. Otherwise, the result of the check is not considered as failure.

A specific error code (CURLE_SSL_ISSUER_ERROR) is defined with the option, which is returned if the setup of the SSL/TLS session has failed due to a mismatch with the issuer of peer certificate (OptionProxySSLVerifyPeer has to be set too for the check to fail).

This option is an alternative to OptionProxyIssuerCert which instead expects a file name as input.
(Read and Write property)
See also PROXY_ISSUERCERT_BLOB option in CURL manual.

66.18.276 OptionProxyKeyPassword as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Password for the SSL private key for proxy.
Notes: (Read and Write property)
See also PROXY_KEYPASSWD option in CURL manual.

66.18.277 OptionProxyPassword as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string which should be pointing to the password to use for the transfer while connecting to Proxy.
Notes: The OptionProxyPassword option should be used in conjunction with the OptionProxyUsername option. (Added in 7.19.1)
(Read and Write property)
See also PROXYPASSWORD option in CURL manual.

66.18.278 OptionProxyPinnedPublicKey as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The public key in DER form used to validate the proxy public key.

Notes: This option is used only if CURLSMBS.OptionProxySSLVerifyPeer is true.
Please path native file path to key file.
(Read and Write property)
See also PROXY_PINNEDPUBLICKEY option in CURL manual.

66.18.279 OptionProxyPort as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The proxy port to connect to unless it is specified in the proxy string OptionProxy.
Notes: The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

You can use OptionProxy with port, e.g. "12.34.56.78:8080" or pass port here and proxy without port.
For some users it seems like the option with OptionProxy including port works better.
(Read and Write property)
See also PROXYPORT option in CURL manual.

66.18.280 OptionProxyServiceName as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Proxy Service Name.
Notes: (Read and Write property)
See also PROXY_SERVICE_NAME option in CURL manual.

66.18.281 OptionProxySSLCert as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Name of the file keeping your private SSL-certificate for proxy.
Notes: (Read and Write property)
See also PROXY_SSLCERT option in CURL manual.

66.18.282 OptionProxySSLCertBlob as String

MBS CURL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets private key for proxy cert from memory blob.
Notes: Pass data, which contains the private key for connecting to the HTTPS proxy. Compatible with OpenSSL. The format (like "PEM") must be specified with CURL.SetOptionProxySSLKeyType.

(Read and Write property)
See also PROXY_SSLCERT_BLOB option in CURL manual.

66.18.283 OptionProxySSLCertType as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Type of the file keeping your SSL-certificate for proxy.
Notes: Value can be "DER", "PEM" or "ENG".
(Read and Write property)
See also PROXY_SSLCERTTYPE option in CURL manual.

66.18.284 OptionProxySSLCipherList as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify which SSL ciphers to use for proxy.
Notes: (Read and Write property)
See also PROXY_SSL_CIPHER_LIST option in CURL manual.

66.18.285 OptionProxySSLKey as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Name of the file keeping your private SSL-key for proxy.
Notes: Pass native file path.
(Read and Write property)
See also PROXY_SSLKEY option in CURL manual.

66.18.286 OptionProxySSLKeyBlob as String

MBS CURL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set private key for proxy cert from memory blob.
Notes: Pass data, which contains a private key for connecting to the HTTPS proxy. Compatible with OpenSSL. The format (like "PEM") must be specified with OptionProxySSLKeyType.

This option is an alternative to OptionProxySSLKey which instead expects a file name as input.
(Read and Write property)
See also PROXY_SSLKEY_BLOB option in CURL manual.

66.18.287 OptionProxySSLKeyType as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets type of the file keeping your private SSL-key for proxy.
Notes: Value is DER, PEM or ENG.
(Read and Write property)
See also PROXY_SSLKEYTYPE option in CURL manual.

66.18.288 OptionProxySSLOptions as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable/disable specific SSL features with a bitmask for proxy.
Notes: (Read and Write property)
See also PROXY_SSL_OPTIONS option in CURL manual.

66.18.289 OptionProxySSLVerifyHost as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable SSL Host verification.
Example:

```
// if you use SSL, maybe put in a certificate or disable verification?

Var d as CURLSMBS
// your CURL object

// disable
d.OptionProxySSLVerifyHost = 0
d.OptionProxySSLVerifyPeer = 0

// or better provide root certificates:

Var cacert As FolderItem = New FolderItem("cacert.pem")
d.OptionProxyCAInfo = cacert.NativePath
d.OptionProxySSLVerifyHost = 2
d.OptionProxySSLVerifyPeer = 1
```

Notes: Set if we should verify the Common name from the proxy certificate in ssl handshake, set 1 to check existence, 2 to ensure that it matches the provided hostname.
(Read and Write property)
See also PROXY_SSL_VERIFYHOST option in CURL manual.

66.18.290 OptionProxySSLVerifyPeer as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set if we should verify the proxy in ssl handshake.
Example:

```
// if you use SSL, maybe put in a certificate or disable verification?

Var d as CURLSMBS
// your CURL object

// disable
d.OptionProxySSLVerifyHost = 0
d.OptionProxySSLVerifyPeer = 0

// or better provide root certificates:

Var cacert As FolderItem = New FolderItem("cacert.pem")
d.OptionProxyCAInfo = cacert.NativePath
d.OptionProxySSLVerifyHost = 2
d.OptionProxySSLVerifyPeer = 1
```

Notes: set 1 to verify.
(Read and Write property)
See also PROXY_SSL_VERIFYPEER option in CURL manual.

66.18.291 OptionProxySSLVersion as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: What version to specifically try to use for proxy.
Notes: The SSL and TLS versions have typically developed from the most insecure version to be more and more secure in this order through history: SSL v2, SSLv3, TLS v1.0, TLS v1.1, TLS v1.2 and the most recent TLS v1.3.

Use one of the available defines for this purpose. The available options are:

See also kSSLVersion* constants.

The maximum TLS version can be set by using one of the CURL_SSLVERSION_MAX_ macros below. It is also possible to OR one of the CURL_SSLVERSION_ macros with one of the CURL_SSLVERSION_MAX_ macros.

Default	0	The default acceptable version range. The minimum acceptable version is by default TLS v1.0 since 7.39.0 (unless the TLS library has a stricter rule).
TLSv1	1	TLS v1.0 or later
SSLv2	2	SSL v2 (but not SSLv3)
SSLv3	3	SSL v3 (but not SSLv2)
TLSv1.0	4	TLS v1.0 or later (Added in 7.34.0)
TLSv1.1	5	TLS v1.1 or later (Added in 7.34.0)
TLSv1.2	6	TLS v1.2 or later (Added in 7.34.0)
TLSv1.3	7	TLS v1.3 or later (Added in 7.52.0)

Default	&h10000	The flag defines the maximum supported TLS version by libcurl, or the default value from the SSL library is used. libcurl will use a sensible default maximum, which was TLS v1.2 up to before 7.61.0 and is TLS v1.3 since then - assuming the TLS library support it. (Added in 7.54.0)
Max TLSv1.0	&h40000	The flag defines maximum supported TLS version as TLS v1.0. (Added in 7.54.0)
Max TLSv1.1	&h50000	The flag defines maximum supported TLS version as TLS v1.1. (Added in 7.54.0)
Max TLSv1.2	&h60000	The flag defines maximum supported TLS version as TLS v1.2. (Added in 7.54.0)
Max TLSv1.3	&h70000	The flag defines maximum supported TLS version as TLS v1.3. (Added in 7.54.0)

Please note that MBS Plugin does not yet support TLS v1.3 now, but may in future.
(Read and Write property)
See also PROXY_SSLVERSION option in CURL manual.

66.18.292 OptionProxyTLS13Ciphers as String

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify which TLS 1.3 ciphers suites to use for proxy.
Notes: The list of cipher suites to use for the TLS 1.3 connection to a proxy. The list must be syntactically correct, it consists of one or more cipher suite strings separated by colons.

You'll find more details about cipher lists on this URL:

https://curl.haxx.se/docs/ssl-ciphers.html

The application does not have to keep the string around after setting this option.
(Read and Write property)

See also PROXY_TLS13_CIPHERS option in CURL manual.

66.18.293 OptionProxyTLSAuthPassword as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Password for authenticated TLS for proxy.
Notes: (Read and Write property)

66.18.294 OptionProxyTLSAuthType as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Set authentication type for authenticated TLS for proxy
Notes: (Read and Write property)

66.18.295 OptionProxyTLSAuthUsername as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Set a username for authenticated TLS for proxy.
Notes: (Read and Write property)

66.18.296 OptionProxyTransferMode as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: If this integer value is set to 1 (one), it tells libCURL to set the transfer mode (binary or ASCII) for FTP transfers done via an HTTP proxy, by appending ;type=a or ;type=i to the URL.
Notes: Without this setting, or it being set to 0 (zero, the default), OptionTransferText has no effect when doing FTP via a proxy. Beware that not all proxies support this feature. (Added in 7.18.0)
(Read and Write property)
See also PROXY_TRANSFER_MODE option in CURL manual.

66.18.297 OptionProxyType as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option is to set type of the proxy.
Notes: The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Available options for this are kPROXY_HTTP, kPROXY_SOCKS4 (added in 7.15.2) kPROXY_SOCKS5.
The HTTP type is default.
(Read and Write property)
See also PROXYTYPE option in CURL manual.

66.18.298 OptionProxyUsername as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string, which should be pointing to the user name to use for the transfer while connecting to Proxy.
Notes: In order to specify the password to be used in conjunction with the user name use the OptionProxyPassword option.
(Read and Write property)
See also PROXYUSERNAME option in CURL manual.

66.18.299 OptionPut as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionUpload instead.
Function: A non-zero parameter tells the library to use HTTP PUT to transfer data.
Notes: The data should be set with OptionInFileSize.

This option is deprecated and starting with version 7.12.1 you should instead use OptionUpload.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.300 OptionQuickExit as Integer

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to allow to exit quickly.
Notes: Pass a number as a parameter, 1 meaning that when recovering from a timeout, libcurl should skip lengthy cleanups that are intended to avoid all kinds of leaks (threads etc.), as the caller program is about to call exit() anyway. This allows for a swift termination after a DNS timeout for example, by canceling and/or forgetting about a resolver thread, at the expense of a possible (though short-lived) leak of associated resources.
(Read and Write property)
See also QUICK_EXIT option in CURL manual.

66.18.301 OptionRandomFile as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** A file name for the random file.
Notes: The file will be used to read from to seed the random engine for SSL. The more random the specified file is, the more secure the SSL connection will become.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)

66.18.302 OptionRange as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string which should contain the specified range you want.
Notes: It should be in the format "X-Y", where X or Y may be left out. HTTP transfers also support several intervals, separated with commas as in "X-Y,N-M". Using this kind of multiple intervals will cause the HTTP server to send the response document in pieces (using standard MIME separation techniques). Pass a NULL to this option to disable the use of ranges.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also RANGE option in CURL manual.

66.18.303 OptionRedirProtocols as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionRedirProtocolsString instead. **Function:** An integer that holds a bitmask of kProtocol* constants.
Notes: If used, this bitmask limits what protocols libCURL may use in a transfer that it follows to in a redirect when OptionFollowLocation is enabled. This allows you to limit specific transfers to only be allowed to use a subset of protocols in redirections. By default libCURL will allow all protocols except for FILE and SCP. This is a difference compared to pre-7.19.4 versions which unconditionally would follow to all protocols supported. (Added in 7.19.4)
(Read and Write property)

66.18.304 OptionReditProtocolsString as String

MBS CURL Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The protocols allowed to redirect to.
Example:

```
Var c as new CURLSMBS
c.OptionReditProtocolsString = "http,https"
```

Notes: Pass string that holds a comma-separated list of case insensitive protocol names (URL schemes). That list limits what protocols libcurl may use in a transfer that it follows to in a redirect when OptionFollowLocation is enabled. This option allows applications to limit specific transfers to only be allowed to use a subset of protocols in redirections.

Protocols denied by OptionProtocolsString are not overridden by this option.

By default libcurl will allow HTTP, HTTPS, FTP and FTPS on redirects (since 7.65.2). Older versions of libcurl allowed all protocols on redirect except several disabled for security reasons: Since 7.19.4 FILE and SCP are disabled, and since 7.40.0 SMB and SMBS are also disabled.

These are the available protocols:

DICT, FILE, FTP, FTPS, GOPHER, GOPHERS, HTTP, HTTPS, IMAP, IMAPS, LDAP, LDAPS, POP3, POP3S, RTMP, RTMPE, RTMPS, RTMPT, RTMPTE, RTMPTS, RTSP, SCP, SFTP, SMB, SMBS, SMTP, SMTPS, TELNET, TFTP

You can set "ALL" as a short-cut to enable all protocols. Note that by setting all, you may enable protocols that were not supported the day you write this but are introduced in a future libcurl version.

If trying to set a non-existing protocol or if no matching protocol at all is set, it returns error.

Default

HTTP, HTTPS, FTP and FTPS (Added in 7.65.2).

Older versions defaulted to all protocols except FILE, SCP and since 7.40.0 SMB and SMBS.
(Read and Write property)

66.18.305 OptionReferer as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The referer to pass to the server.
Notes: It will be used to set the Referer: header in the http request sent to the remote server. This can be used to fool servers or scripts. You can also set any custom header with OptionHTTPHeader.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also REFERER option in CURL manual.

66.18.306 OptionRequestTarget as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The request target, instead of extracted from the URL.
Notes: (Read and Write property)
See also REQUEST_TARGET option in CURL manual.

66.18.307 OptionResumeFrom as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: It contains the offset in number of bytes that you want the transfer to start from.
Notes: Set this option to 0 to make the transfer start from the beginning (effectively disabling resume). For FTP, set this option to -1 to make the transfer start from the end of the target file (useful to continue an interrupted upload).

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also RESUME_FROM option in CURL manual.

66.18.308 OptionResumeFromLarge as Int64

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionResumeFrom instead. **Function:** It contains the offset in number of bytes that you want the transfer to start from.
Notes: The Lasterror property is set. 0 for success.

You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.309 OptionRTSPClientCSEQ as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Manually initialize the client RTSP CSeq for this handle.
Notes: (Read and Write property)
See also RTSP_CLIENT_CSEQ option in CURL manual.

66.18.310 OptionRTSPRequest as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: RTSP request method (OPTIONS, SETUP, PLAY, etc...).
Notes: (Read and Write property)
See also RTSP_REQUEST option in CURL manual.

66.18.311 OptionRTSPServerCSEQ as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Manually initialize the server RTSP CSeq for this handle.
Notes: (Read and Write property)
See also RTSP_SERVER_CSEQ option in CURL manual.

66.18.312 OptionRTSPSessionID as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The RTSP session identifier.
Notes: (Read and Write property)
See also RTSP_SESSION_ID option in CURL manual.

66.18.313 OptionRTSPStreamURI as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The RTSP stream URI.
Notes: (Read and Write property)
See also RTSP_STREAM_URI option in CURL manual.

66.18.314 OptionRTSPTransport as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Transport: header to use in RTSP requests.
Notes: (Read and Write property)
See also RTSP_TRANSPORT option in CURL manual.

66.18.315 OptionSASLAuthZID as String

MBS CURL Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The authorisation identity (identity to act as).
Notes: Sets the authorisation identity (identity to act as).
Pass a text as parameter, which should be pointing to the authorisation identity (authzid) for the transfer. Only applicable to the PLAIN SASL authentication mechanism where it is optional.
When not specified only the authentication identity (authcid) as specified by the username will be sent to the server, along with the password. The server will derive a authzid from the authcid when not provided, which it will then uses internally.
When the authzid is specified, the use of which is server dependent, it can be used to access another user's inbox, that the user has been granted access to, or a shared mailbox for example.
(Read and Write property)
See also SASL_AUTHZID option in CURL manual.

66.18.316 OptionSASLIR as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable/disable SASL initial response.
Notes: (Read and Write property)
See also SASL_IR option in CURL manual.

66.18.317 OptionServerResponseTimeout as Integer

MBS CURL Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Causes libcurl to set a timeout period (in seconds) on the amount of time that the server is

allowed to take in order to send a response message for a command before the session is considered dead.
Notes: While libcurl is waiting for a response, this value overrides OptionTimeout. It is recommended that if used in conjunction with OptionTimeout, you set OptionServerResponseTimeout to a value smaller than OptionTimeout.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also SERVER_RESPONSE_TIMEOUT option in CURL manual.

66.18.318 OptionServiceName as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Service Name.
Notes: (Read and Write property)
See also SERVICE_NAME option in CURL manual.

66.18.319 OptionSocks5Auth as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Bitmask of allowed auth methods for connections to SOCKS5 proxies.
Notes: (Read and Write property)
See also SOCKS5_AUTH option in CURL manual.

66.18.320 OptionSocks5GSSAPINEC as Boolean

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to protect SOCKS5 connection is protected.
Notes: Set to true to enable or false to disable. As part of the gssapi negotiation a protection mode is negotiated. The rfc1961 says in section 4.3/4.4 it should be protected, but the NEC reference implementation does not. If enabled, this option allows the unprotected exchange of the protection mode negotiation. (Added in 7.19.4).
(Read and Write property)
See also SOCKS5_GSSAPI_NEC option in CURL manual.

66.18.321 OptionSocks5GSSAPIService as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** A string holding the name of the service.
Notes: The default service name for a SOCKS5 server is rcmd/server-fqdn. This option allows you to change it. (Added in 7.19.4)
(Read and Write property)

66.18.322 OptionSSHAuthTypes as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Define the SSH authorization types.
Example:

```
Var c as CURLSMBS // your instance

// only do password
c.OptionSSHAuthTypes = c.kSSHAuthKeyboard or c.kSSHAuthPassword
```

Notes: Pass a long set to a bitmask consisting of one or more of CURLSSH_AUTH_PUBLICKEY, CURLSSH_AUTH_PASSWORD, CURLSSH_AUTH_HOST, CURLSSH_AUTH_KEYBOARD. Set CURLSSH_AUTH_ to let libCURL pick one. (Added in 7.16.1)

See kSSHAuth* constants.
(Read and Write property)
See also SSH_AUTH_TYPES option in CURL manual.

66.18.323 OptionSSHCompression as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable/disable SSH compression.
Notes: (Read and Write property)
See also SSH_COMPRESSION option in CURL manual.

66.18.324 OptionSSHHostPublicKeyMD5 as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string containing 32 hexadecimal digits with the 128 bit MD5 checksum of the remote host's public key.
Notes: libCURL will reject the connection to the host unless the md5sums match. This option is only for SCP and SFTP transfers. (Added in 7.17.1)
(Read and Write property)
See also SSH_HOST_PUBLIC_KEY_MD5 option in CURL manual.

66.18.325 OptionSSHHostPublicKeySHA256 as String

MBS CURL Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SHA256 hash of SSH server public key.
Notes: Pass a string containing a Base64-encoded SHA256 hash of the remote host's public key. The transfer will fail if the given hash does not match the hash the remote host provides.
(Read and Write property)
See also SSH_HOST_PUBLIC_KEY_SHA256 option in CURL manual.

66.18.326 OptionSSHKnownhosts as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string holding the file name of the known_host file to use.
Notes: The known_hosts file should use the OpenSSH file format as supported by libssh2. If this file is specified, libCURL will only accept connections with hosts that are known and present in that file, with a matching public key. (Added in 7.19.6)
(Read and Write property)
See also SSH_KNOWNHOSTS option in CURL manual.

66.18.327 OptionSSHPrivateKeyfile as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pass a path pointing to a file name for your private key.
Example:

```
Var c As New CURLSMBS

c.OptionSSHPrivateKeyfile = "/Users/test/.ssh/id_rsa"
c.OptionSSHPublicKeyfile = "/Users/test/.ssh/id_rsa.pub"
c.OptionUsername = "test"
```

Notes: If not used, libCURL defaults to using
textasciitilde /.ssh/id_dsa. If the file is password-protected, set the password with OptionSSLKeyPassword.

(Added in 7.16.1)

For a SFTP transfer (= file transfer over SSH), you would tell the plugin your public and private keys, so the plugin can login.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also SSH_PRIVATE_KEYFILE option in CURL manual.

66.18.328 OptionSSHPublicKeyfile as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pass a path pointing to a file name for your public key.
Example:

```
Var c As New CURLSMBS

c.OptionSSHPrivateKeyfile = "/Users/test/.ssh/id_rsa"
c.OptionSSHPublicKeyfile = "/Users/test/.ssh/id_rsa.pub"
c.OptionUsername = "test"
```

Notes: If not used, libCURL defaults to using
textasciitilde /.ssh/id_dsa.pub. (Added in 7.16.1)

For a SFTP transfer (= file transfer over SSH), you would tell the plugin your public and private keys, so the plugin can login.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also SSH_PUBLIC_KEYFILE option in CURL manual.

66.18.329 OptionSSLCert as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The string should be the file name of your certificate.
Notes: The default format is "PEM" and can be changed with OptionSSLCERTTYPE.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also SSLCERT option in CURL manual.

66.18.330 OptionSSLCertBlob as String

MBS CURL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set SSL client certificate from memory blob.
Notes: Pass data, which contains a client certificate. The format must be "P12" on Secure Transport or Schannel. The format must be "P12" or "PEM" on OpenSSL. The string "P12" or "PEM" must be specified with OptionSSLCertType.

This option is an alternative to OptionSSLCert which instead expects a file name as input.
(Read and Write property)
See also SSLCERT_BLOB option in CURL manual.

66.18.331 OptionSSLCertPassword as String

MBS CURL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionKeyPassword instead. **Function:** The certificate password.
Notes: (Read and Write property)

66.18.332 OptionSSLCertType as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The string should be the format of your certificate.
Notes: Supported formats are "PEM" and "DER". (Added in 7.9.3)

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also SSLCERTTYPE option in CURL manual.

66.18.333 OptionSSLCipherList as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A string holding the list of ciphers to use for the SSL connection.
Example:

```
// allow lower secure ciphers
curl.OptionSSLCipherList = "DEFAULT@SECLEVEL=0"
```

Notes: The list must be syntactically correct, it consists of one or more cipher strings separated by colons. Commas or spaces are also acceptable separators but colons are normally used, !, - and + can be used as operators. Valid examples of cipher lists include 'RC4-SHA', 'SHA1+DES', 'TLSv1' and 'DEFAULT'. The default list is normally set when you compile OpenSSL.

You'll find more details about cipher lists on this URL:

http://www.openssl.org/docs/apps/ciphers.html

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also SSL_CIPHER_LIST option in CURL manual.

66.18.334 OptionSSLEnableALPN as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable/disable TLS ALPN extension (http2 over ssl might fail without).
Notes: (Read and Write property)
See also SSL_ENABLE_ALPN option in CURL manual.

66.18.335 OptionSSLEnableNPN as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Enable/disable TLS NPN extension (http2 over ssl might fail without)
Notes: (Read and Write property)

66.18.336 OptionSSLEngine as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** It will be used as the identifier for the crypto engine you want to use for your private key.
Notes: If the crypto device cannot be loaded, kError_SSL_ENGINE_NOTFOUND is returned.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also SSLENGINE option in CURL manual.

66.18.337 OptionSSLEngineDefault as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Sets the actual crypto engine as the default for (asymmetric) crypto operations.
Notes: If the crypto device cannot be set, kError_SSL_ENGINE_SETFAILED is returned.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also SSLENGINE_DEFAULT option in CURL manual.

66.18.338 OptionSSLFalseStart as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Set if we should enable TLS false start.
Notes: (Read and Write property)

66.18.339 OptionSSLKey as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The string should be the file name of your private key.
Notes: The default format is "PEM" and can be changed with OptionSSLKEYTYPE.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

Starting with version 18.0 the plugin will always use UTF-8 encoding for file path on Linux and macOS. For macOS we also do the unicode character normalization for file names for you.
(Read and Write property)
See also SSLKEY option in CURL manual.

66.18.340 OptionSSLKeyBlob as String

MBS CURL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set private key for client cert from memory blob.
Notes: Pass data, which contains a private key. Compatible with OpenSSL. The format (like "PEM") must be specified with OptionSSLKeyType.

This option is an alternative to OptionSSLKey which instead expects a file name as input.
(Read and Write property)
See also SSLKEY_BLOB option in CURL manual.

66.18.341 OptionSSLKeyPassword as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use OptionKeyPassword instead. **Function:** The password required to use the OptionSSLKEY private key.
Notes: The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.342 OptionSSLKeyType as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The string should be the format of your private key.
Notes: Supported formats are "PEM", "DER" and "ENG".

The format "ENG" enables you to load the private key from a crypto engine. In this case OptionSSLKEY is used as an identifier passed to the engine. You have to set the crypto engine with OptionSSLENGINE. "DER" format key file currently does not work because of a bug in OpenSSL.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also SSLKEYTYPE option in CURL manual.

66.18.343 OptionSSLOptions as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable/disable specific SSL features with a bitmask.
Notes: (Read and Write property)
See also SSL_OPTIONS option in CURL manual.

66.18.344 OptionSSLSessionIDCache as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to use the SSL session ID cache.
Notes: Pass false to disable libCURL's use of SSL session-ID caching. Set this to true to enable it. By default all transfers are done using the cache. Note that while nothing ever should get hurt by attempting to reuse SSL session-IDs, there seem to be broken SSL implementations in the wild that may require you to disable this in order for you to succeed. (Added in 7.16.0)
(Read and Write property)
See also SSL_SESSIONID_CACHE option in CURL manual.

66.18.345 OptionSSLSignatureAlgorithms as String

MBS CURL Plugin, Plugin Version: 25.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The TLS supported signature algorithms.
Notes: Specify colon-delimited list of signature scheme names.
e.g. "DSA+SHA256:rsa_pss_pss_sha256"
(Read and Write property)
See also SSL_SIGNATURE_ALGORITHMS option in CURL manual.

66.18.346 OptionSSLVerifyHost as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: This option determines whether libCURL verifies that the server cert is for the server it is known as.

Example:

```
// if you use SSL, maybe put in a certificate or disable verification?

Var d as CURLSMBS
// your CURL object

// disable
d.OptionSSLVerifyHost = 0
d.OptionSSLVerifyPeer = 0

// or better provide root certificates:

Var cacert As FolderItem = New FolderItem("cacert.pem")
d.OptionCAInfo = cacert.NativePath
d.OptionSSLVerifyHost = 2
d.OptionSSLVerifyPeer = 1
```

Notes: When negotiating an SSL connection, the server sends a certificate indicating its identity.

When OptionSSLVerifyHost is 2, that certificate must indicate that the server is the server to which you meant to connect, or the connection fails.

CURL considers the server the intended one when the Common Name field or a Subject Alternate Name field in the certificate matches the host name in the URL to which you told CURL to connect.

When the value is 1, the certificate must contain a Common Name field, but it doesn't matter what name it says. (This is not ordinarily a useful setting).

When the value is 0, the connection succeeds regardless of the names in the certificate.

The default, since 7.10, is 2.

The checking this option controls is of the identity that the server claims. The server could be lying. To control lying, see OptionSSLVerifyPeer.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

When you don't set the options for certificate path or load system certificates, the MBS Plugin will disable the verify step to let the transfer run.
(Read and Write property)
See also SSL_VERIFYHOST option in CURL manual.

66.18.347 OptionSSLVerifyPeer as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Configure whether this CURL instance will verify the SSL peer certificate.
Example:

```
// if you use SSL, maybe put in a certificate or disable verification?

Var d as CURLSMBS
// your CURL object

// disable
d.OptionSSLVerifyHost = 0
d.OptionSSLVerifyPeer = 0

// or better provide root certificates:

Var cacert As FolderItem = New FolderItem("cacert.pem")
d.OptionCAInfo = cacert.NativePath
d.OptionSSLVerifyHost = 2
d.OptionSSLVerifyPeer = 1
```

Notes: This option determines whether CURL verifies the authenticity of the peer's certificate. A value of 1 means CURL verifies; zero means it doesn't. The default is nonzero, but before 7.10, it was zero.

When negotiating an SSL connection, the server sends a certificate indicating its identity. CURL verifies whether the certificate is authentic, i.e. that you can trust that the server is who the certificate says it is. This trust is based on a chain of digital signatures, rooted in certification authority (CA) certificates you supply. As of 7.10, CURL installs a default bundle of CA certificates and you can specify alternate certificates with the OptionCAINFO option or the OptionCAPATH option.

When OptionSSLVerifyPeer is nonzero, and the verification fails to prove that the certificate is authentic, the connection fails. When the option is zero, the connection succeeds regardless.

Authenticating the certificate is not by itself very useful. You typically want to ensure that the server, as authentically identified by its certificate, is the server you mean to be talking to. Use OptionSSLVerifyHost to control that.

When you don't set the options for certificate path or load system certificates, the MBS Plugin will disable the verify step to let the transfer run.
(Read and Write property)
See also SSL_VERIFYPEER option in CURL manual.

66.18.348 OptionSSLVerifyStatus as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set if we should verify the certificate status.
Notes: (Read and Write property)
See also SSL_VERIFYSTATUS option in CURL manual.

66.18.349 OptionSSLVersion as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: What version of SSL/TLS to attempt to use.
Example:

```
Var c as CURLSMBS
c.OptionUseSSL = c.kFTPSSL_ALL
c.OptionSSLVersion = c.kSSLVersionTLSv12
```

Notes: The SSL and TLS versions have typically developed from the most insecure version to be more and more secure in this order through history: SSL v2, SSLv3, TLS v1.0, TLS v1.1, TLS v1.2 and the most recent TLS v1.3.

Use one of the available defines for this purpose. The available options are:

Default	0	The default acceptable version range. The minimum acceptable version is by default TLS v1.0 since 7.39.0 (unless the TLS library has a stricter rule).
TLSv1	1	TLS v1.0 or later
SSLv2	2	SSL v2 (but not SSLv3)
SSLv3	3	SSL v3 (but not SSLv2)
TLSv1.0	4	TLS v1.0 or later (Added in 7.34.0)
TLSv1.1	5	TLS v1.1 or later (Added in 7.34.0)
TLSv1.2	6	TLS v1.2 or later (Added in 7.34.0)
TLSv1.3	7	TLS v1.3 or later (Added in 7.52.0)

See also kSSLVersion* constants.

The maximum TLS version can be set by using one of the CURL_SSLVERSION_MAX_ macros below. It is also possible to OR one of the CURL_SSLVERSION_ macros with one of the CURL_SSLVER-

SION_MAX_ macros.

Default	&h10000	The flag defines the maximum supported TLS version by libcurl, or the default value from the SSL library is used. libcurl will use a sensible default maximum, which was TLS v1.2 up to before 7.61.0 and is TLS v1.3 since then - assuming the TLS library support it. (Added in 7.54.0)
Max TLSv1.0	&h40000	The flag defines maximum supported TLS version as TLS v1.0. (Added in 7.54.0)
Max TLSv1.1	&h50000	The flag defines maximum supported TLS version as TLS v1.1. (Added in 7.54.0)
Max TLSv1.2	&h60000	The flag defines maximum supported TLS version as TLS v1.2. (Added in 7.54.0)
Max TLSv1.3	&h70000	The flag defines maximum supported TLS version as TLS v1.3. (Added in 7.54.0)

Please note that MBS Plugin does not yet support TLS v1.3 now, but may in future.
(Read and Write property)
See also SSLVERSION option in CURL manual.

66.18.350 OptionStreamDepends as CURLSMBS

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Set stream dependency on another CURL handle.
Notes: (Read and Write property)

66.18.351 OptionStreamDependsE as CURLSMBS

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Set E-xclusive stream dependency on another CURL handle.
Notes: (Read and Write property)

66.18.352 OptionStreamWeight as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set stream weight, 1 - 256.
Notes: Default is 16.

(Read and Write property)
See also STREAM_WEIGHT option in CURL manual.

66.18.353 OptionSuppressConnectHeaders as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Suppress proxy CONNECT response headers from events.
Notes: (Read and Write property)
See also SUPPRESS_CONNECT_HEADERS option in CURL manual.

66.18.354 OptionTCPFastOpen as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set TCP Fast Open.
Notes: (Read and Write property)
See also TCP_FASTOPEN option in CURL manual.

66.18.355 OptionTCPKeepAlive as Boolean

MBS CURL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: If set to true, TCP keepalive probes will be sent.
Notes: The delay and frequency of these probes can be controlled by the OptionTCPKeepIdle and OptionTCPKeepInterval options, provided the operating system supports them. Set to false (default behavior) to disable keepalive probes (Added in 7.25.0).
(Read and Write property)
See also TCP_KEEPALIVE option in CURL manual.

66.18.356 OptionTCPKeepCount as Integer

MBS CURL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum number of TCP keep-alive probes.
Notes: Sets the number of probes to send before dropping the connection. Not all operating systems support this option. (Added in curl 8.9.0)

The maximum value this option accepts is INT_MAX or whatever your system allows. Any larger value is capped to this amount.

Default is 9.
(Read and Write property)

66.18.357 OptionTCPKeepIdle as Integer

MBS CURL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the delay, in seconds, that the operating system will wait while the connection is idle before sending keepalive probes.
Notes: Not all operating systems support this option. (Added in 7.25.0)
(Read and Write property)
See also TCP_KEEPIDLE option in CURL manual.

66.18.358 OptionTCPKeepInterval as Integer

MBS CURL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the interval, in seconds, that the operating system will wait between sending keepalive probes.
Notes: Not all operating systems support this option. (Added in 7.25.0)
(Read and Write property)
See also TCP_KEEPINTVL option in CURL manual.

66.18.359 OptionTCPNoDelay as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: An integer specifying whether the TCP_NODELAY option should be set or cleared (true = set, false = clear).
Notes: The option is cleared by default. This will have no effect after the connection has been established.

Setting this option will disable TCP's Nagle algorithm. The purpose of this algorithm is to try to minimize the number of small packets on the network (where "small packets" means TCP segments less than the Maximum Segment Size (MSS) for the network).

Maximizing the amount of data sent per TCP segment is good because it amortizes the overhead of the send. However, in some cases (most notably telnet or rlogin) small segments may need to be sent without delay. This is less efficient than sending larger amounts of data at a time, and can contribute to congestion on the network if overdone.

The Lasterror property is set. 0 for success.

You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also TCP_NODELAY option in CURL manual.

66.18.360 OptionTFTPBlockSize as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify block size to use for TFTP data transmission.
Notes: Valid range as per RFC 2348 is 8-65464 bytes. The default of 512 bytes will be used if this option is not specified. The specified block size will only be used pending support by the remote server. If the server does not return an option acknowledgement or returns an option acknowledgement with no blksize, the default of 512 bytes will be used. (added in 7.19.4)
(Read and Write property)
See also TFTP_BLKSIZE option in CURL manual.

66.18.361 OptionTFTPNoOptions as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether not send any tftp option requests to the server.
Notes: (Read and Write property)
See also TFTP_NO_OPTIONS option in CURL manual.

66.18.362 OptionTimeCondition as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Time condition option.
Notes: This defines how the OptionTimeValue time value is treated. You can set this parameter to kTimeConditionIfModifiedSince (1) or kTimeConditionIfUnModifiedSince (2). This feature applies to HTTP and FTP.

The last modification time of a file is not always known and in such instances this feature will have no effect even if the given time condition would have not been met.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also TIMECONDITION option in CURL manual.

66.18.363 OptionTimeOut as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum time in seconds that you allow the libCURL transfer operation to take.
Notes: Normally, name lookups can take a considerable time and limiting operations to less than a few minutes risk aborting perfectly normal operations. This option will cause CURL to use the SIGALRM to enable time-outing system calls.

In unix-like systems, this might cause signals to be used unless CURLOPT_NOSIGNAL is set.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also TIMEOUT option in CURL manual.

66.18.364 OptionTimeOutMS as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pass a long as parameter containing the maximum time in milli seconds that you allow the libCURL transfer operation to take.
Notes: Normally, name lookups can take a considerable time and limiting operations to less than a few minutes risk aborting perfectly normal operations. This option will cause CURL to use the SIGALRM to enable time-outing system calls.
(Read and Write property)
See also TIMEOUT_MS option in CURL manual.

66.18.365 OptionTimeValue as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: This should be the time in seconds since 1 jan 1970, and the time will be used in a condition as specified with OptionTimeCondition.
Notes: The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also TIMEVALUE option in CURL manual.

66.18.366 OptionTLS13Ciphers as String

MBS CURL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specify which TLS 1.3 ciphers suites to use.
Notes: string holding the list of cipher suites to use for the TLS 1.3 connection. The list must be syntactically correct, it consists of one or more cipher suite strings separated by colons.

You'll find more details about cipher lists on this URL:

https://curl.haxx.se/docs/ssl-ciphers.html

The application does not have to keep the string around after setting this option.
(Read and Write property)
See also TLS13_CIPHERS option in CURL manual.

66.18.367 OptionTLSAuthPassword as String

MBS CURL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Sets the TSL authentication password.
Notes: Please also set OptionTLSAuthType.
The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.368 OptionTLSAuthType as String

MBS CURL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Sets the TLS authentication type.
Notes: You can set this to "SRP" to use Secure Remote Password authentication.
Please also set username and password.
The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.369 OptionTLSAuthUsername as String

MBS CURL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Sets the TSL authentication user name.

Notes: Please also set OptionTLSAuthType.
The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)

66.18.370 OptionTransferEncoding as Boolean

MBS CURL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a request for compressed Transfer Encoding in the outgoing HTTP request.
Notes: If the server supports this and so desires, it can respond with the HTTP response sent using a compressed Transfer-Encoding that will be automatically uncompressed by libCURL on reception.

Transfer-Encoding differs slightly from the Content-Encoding you ask for with OptionAcceptEncoding in that a Transfer-Encoding is strictly meant to be for the transfer and thus MUST be decoded before the data arrives in the client. Traditionally, Transfer-Encoding has been much less used and supported by both HTTP clients and HTTP servers.
(Read and Write property)
See also TRANSFER_ENCODING option in CURL manual.

66.18.371 OptionTransferText as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: True tells the library to use ASCII mode for ftp transfers, instead of the default binary transfer.
Notes: For win32 systems it does not set the stdout to binary mode. This option can be usable when transferring text data between systems with different views on certain characters, such as newlines or similar.

libCURL does not do a complete ASCII conversion when doing ASCII transfers over FTP. This is a known limitation/flaw that nobody has rectified. libCURL simply sets the mode to ascii and performs a standard transfer.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also TRANSFERTEXT option in CURL manual.

66.18.372 OptionUnixSocketPath as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Path to Unix domain socket.
Notes: (Read and Write property)
See also UNIX_SOCKET_PATH option in CURL manual.

66.18.373 OptionUnrestrictedAuth as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A boolean parameter tells the library it can continue to send authentication (user+password) when following locations, even when hostname changed.
Notes: This option is meaningful only when setting FollowOption.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also UNRESTRICTED_AUTH option in CURL manual.

66.18.374 OptionUpkeepIntervalMS as Integer

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Connection upkeep interval.
Notes: Some protocols have "connection upkeep" mechanisms. These mechanisms usually send some traffic on existing connections in order to keep them alive; this can prevent connections from being closed due to overzealous firewalls, for example.

The user needs to explicitly call Upkeep in order to perform the upkeep work.

Currently the only protocol with a connection upkeep mechanism is HTTP/2: when the connection upkeep interval is exceeded and Upkeep is called, an HTTP/2 PING frame is sent on the connection.
(Read and Write property)
See also UPKEEP_INTERVAL_MS option in CURL manual.

66.18.375 OptionUpload as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: True tells the library to prepare for an upload.
Notes: The OptionInFileSize or OptionInFileSizeLarge options are also interesting for uploads. If the protocol is HTTP, uploading means using the PUT request unless you tell libCURL otherwise.

Using PUT with HTTP 1.1 implies the use of a "Expect: 100-continue" header. You can disable this header with OptionHTTPHeader as usual.

If you use PUT to a HTTP 1.1 server, you can upload data without knowing the size before starting the transfer if you use chunked encoding. You enable this by adding a header like "Transfer-Encoding: chunked" with OptionHTTPHeader. With HTTP 1.0 or without chunked transfer, you must specify the size.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also UPLOAD option in CURL manual.

66.18.376 OptionUploadBufferSize as Integer

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set preferred upload buffer size.
Notes: Pass a long specifying your preferred size (in bytes) for the upload buffer in libcurl. It makes libcurl uses a larger buffer that gets passed to the next layer in the stack to get sent off. In some setups and for some protocols, there's a huge performance benefit of having a larger upload buffer.

This is just treated as a request, not an order. You cannot be guaranteed to actually get the given size.

The upload buffer size is by default 64 kilobytes. The maximum buffer size allowed to be set is 2 megabytes. The minimum buffer size allowed to be set is 16 kilobytes.

Since curl 7.61.1 the upload buffer is allocated on-demand - so if the handle isn't used for upload, this buffer will not be allocated at all.

For slow upload/downloads, it may be better to set buffer size to 1 MB with OptionUploadBufferSize or OptionBufferSize properties to make transfers faster.
(Read and Write property)
See also UPLOAD_BUFFERSIZE option in CURL manual.

66.18.377 OptionUploadFlags as Integer

MBS CURL Plugin, Plugin Version: 25.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Which flags to send the server relating to uploaded files.
Notes: The current supported flags are Answered (1), which sets the Answered flag for IMAP uploads, Deleted (2), which sets the Deleted flag for IMAP uploads, Draft (4), which sets the Draft flag for IMAP

uploads, Flagged (8), which sets the Flagged flag for IMAP uploads, and Seen (16), which sets the Seen flag for IMAP uploads.

See kUploadFlag* constants.
(Read and Write property)
See also UPLOAD_FLAGS option in CURL manual.

66.18.378 OptionURL as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The actual URL to deal with.
Example:

```
Var c As New CURLSMBS

// this example sends a xml request to a server
c.OptionURL = "http://www.someserver.com/service"

// some XML for a SOAP request
Var request As String = "<?xml version=""1.0""?><methodCall><methodName>application.getValue</methodName><params><param><value>info</value></param></params></methodCall>"

c.OptionPostFields = request

Var header(-1) As String
header.Add "Content-Type: text/xml"
c.SetOptionHTTPHeader header

// this should be c.kError_OK if okay.
Var result As Integer = c.Perform

Var output As String = c.OutputData
Var debugLog As String = c.DebugMessages
Var HTTPStatus As Integer = c.GetInfoResponseCode

Break
```

Notes: If you need to pass username or password, please consider using the OptionUsername and OptionPassword properties. If you username or password contains characters like @ or :, you must use those properties.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.

The parameter should be a char * to a zero terminated string. The string must remain present until CURL no longer needs it, as it doesn't copy the string.

If the given URL lacks the protocol part ("http://" or "ftp://" etc), it will attempt to guess which protocol to use based on the given host name. If the given protocol of the set URL is not supported, libCURL will return on error (kError_UNSUPPORTED_PROTOCOL) when you call Perform. Use VersionInfo for detailed info on which protocols that are supported.

The string given to CURLOPT_URL must be url-encoded and following the RFC 2396:
http://CURL.haxx.se/rfc/rfc2396.txt

CURLOPT_URL is the only option that must be set before Perform is called.
For file uploads or downloads, please include the file name in the URL.

Please do never include username and passwords in URLs, as those get often written to log files and would reveal your credentials!
Instead use OptionUsername and OptionPassword.

If you miss the protocol in the URL, you may get an error about HTTP/0.9 being used and not allowed.
(Read and Write property)
See also URL option in CURL manual.

66.18.379 OptionUserAgent as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The user agent string to pass to the server.
Example:

```
Var c As New CURLSMBS

// setup request and any options you need
c.OptionURL = URL
c.OptionUserAgent = "MyDownloader 1.0"
```

Notes: It will be used to set the User-Agent: header in the http request sent to the remote server. This can be used to fool servers or scripts. You can also set any custom header with OptionHTTPHeader.

The Lasterror property is set. 0 for success.
You can set this value and later you can read it, but you cannot read the default value.
(Read and Write property)
See also USERAGENT option in CURL manual.

66.18.380 OptionUsername as String

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The user name to be used in protocol authentication
Notes: In order to specify the password to be used in conjunction with the user name use the OptionPassword option
(Read and Write property)
See also USERNAME option in CURL manual.

66.18.381 OptionUseSSL as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Request using SSL / TLS for the transfer.
Example:

```
Var c as CURLSMBS
c.OptionUseSSL = c.kFTPSSL_ALL
c.OptionSSLVersion = c.kSSLVersionTLSv12
```

Notes: Set to an integer using one of the values from below, to make libCURL use your desired level of SSL for the transfer.
These are all protocols that start out plain text and get "upgraded" to SSL using the STARTTLS command. This is for enabling SSL/TLS when you use FTP, SMTP, POP3, IMAP etc.

CURLUSESSL_NONE	0	Don't attempt to use SSL.
CURLUSESSL_TRY	1	Try using SSL, proceed as normal otherwise.
CURLUSESSL_CONTROL	2	Require SSL for the control connection or fail with CURLE_USE_SSL_FAILED.
CURLUSESSL_ALL	3	Require SSL for all communication or fail with CURLE_USE_SSL_FAILED.

(Read and Write property)
See also USE_SSL option in CURL manual.

66.18.382 OptionVerbose as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether debug messages are sent to the DebugMessage event.
Notes: Default is false.

You need to subclass the CURLSMBS class to add code in the DebugMessage event.
Or you set CollectDebugMessages = true and later query DebugMessages property.
Or you use CreateMTDebugOutputFile to stream them to a file.
(Read and Write property)
See also VERBOSE option in CURL manual.

66.18.383 OptionWildCardMatch as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enable wildcard matching.
Notes: Set onoff to true if you want to transfer multiple files according to a file name pattern. The pattern can be specified as part of the OptionURL option, using an fnmatch-like pattern (Shell Pattern Matching) in the last part of URL (file name).

By default, libCURL uses its internal wildcard matching implementation. You can provide your own matching function by the CURLSMBS.FileNameMatch event.

A brief introduction of its syntax follows:

- - ASTERISK

ftp://example.com/some/path/*.txt (for all txt's from the root directory)

? - QUESTION MARK

Question mark matches any (exactly one) character.

ftp://example.com/some/path/photo?.jpeg

[- BRACKET EXPRESSION

The left bracket opens a bracket expression. The question mark and asterisk have no special meaning in a bracket expression. Each bracket expression ends by the right bracket and matches exactly one character. Some examples follow:

[a-zA-Z0-9] or [f-gF-G] - character interval
[abc] - character enumeration
[^abc] or [!abc] - negation
[[:name:]] class expression. Supported classes are alnum,lower, space, alpha, digit, print, upper, blank,

graph, xdigit.
[ ] [-!^] - special case - matches only '-', '] ', ' [', '!' or '^'. These characters have no special purpose.
[\[\] \\] - escape syntax. Matches ' [', '] ' or '¬¥.

Using the rules above, a file name pattern can be constructed:

ftp://example.com/some/path/ [a-z [:upper:] \\] .jpeg

This feature is only supported for FTP download. Not for SFTP or HTTP.
(Read and Write property)
See also WILDCARDMATCH option in CURL manual.

66.18.384 OptionXOAuth2Bearer as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XOAUTH2 bearer token.
Notes: (Read and Write property)
See also XOAUTH2_BEARER option in CURL manual.

66.18.385 OutputData as String

MBS CURL Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The output data from CURL.
Example:

```
Var d As New CURLSMBS

// download here
d.OptionURL = URL

// if you use SSL, maybe put in a certificate or disable verification?
d.OptionSSLVerifyHost = 0
d.OptionSSLVerifyPeer = 0

// run download
Var e as integer = d.Perform

// check result
Var data As String = d.OutputData
Var DebugMessage As String = d.DebugMessages // check in debugger on error
```

ResultText.text="Result: "+str(e) // 0 = Okay, others are error codes, so check debug messages

Notes: If CollectOutputData property is true, the plugin puts the data received in write event also into this property, so you can grab it after the transfer. Use ClearData method to clear when reusing CURL object.

Limited to 2 GB. Please stream to file for bigger data with CreateMTOutputFile function.
(Read only property)

66.18.386 Paused as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether transfer is paused.
Notes: You can set it to true while transfer runs to pause it.
(Read and Write property)

66.18.387 ProgressDownloadCurrent as Int64

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Bytes downloaded so far.
Notes: (Read only property)

66.18.388 ProgressDownloadTotal as Int64

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Bytes to download in total.
Notes: (Read only property)

66.18.389 ProgressPercent as Double

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Current download/upload progress in percent.
Notes: Range from 0 to 100.
(Read only property)

66.18.390 ProgressUploadCurrent as Int64

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Bytes uploaded so far.
Notes: (Read only property)

66.18.391 ProgressUploadTotal as Int64

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Bytes to upload in total.
Notes: (Read only property)

66.18.392 Tag as Variant

MBS CURL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes: You can store whatever reference value you need.
(Read and Write property)

66.18.393 Version as CURLSVersionMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a version object to a filled with information about various run-time features in libCURL.
Notes: (Read only property)

66.18.394 WebSocketOptions as Integer

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: WebSocket behavior options.
Notes: Pass a bitmask to tell libcurl about specific WebSocket behaviors.

To detach a WebSocket connection and use the WebSocketSend and WebSocketReceive functions after the HTTP upgrade procedure, set the OptionConnectOnly option to 2.

Available bits in the bitmask:

kWebSocketRaw:
Deliver "raw" WebSocket traffic to the Write event.

In raw mode, libcurl does not handle pings or any other frame for the application.
(Read and Write property)

66.18.395 YieldTime as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether plugin should yield time.
Example:

```
Var curl as new CURLSMBS

curl.YieldTime = true
```

Notes: If set the plugin will yield time to Xojo back so threads and timers work while you download.

Seems like in RB 2009 this property only has effect if you run CURL in a thread.
(Read and Write property)

66.18.396 Events

66.18.397 ChunkBegin(FileInfo as CURLSFileInfoMBS, Remains as Integer) as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called on begin of a new chunk.
Notes: If splitting of data transfer is enabled, this event is called before download of an individual chunk started. Note that parameter "remains" works only for FTP wildcard downloading (for now), otherwise is not used.

66.18.398 ChunkEnd(FileInfo as CURLSFileInfoMBS, Remains as Integer) as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Download of a chunk ended.
Notes: If splitting of data transfer is enabled this event is called after download of an individual chunk finished.
This event is called for skipped or downloaded files.

66.18.399 DebugMessage(infotype as Integer, data as string, dataSize as Integer)

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A debug event to get data of ongoing process.
Notes: You may need to set OptionVerbose to true.

infotype constants:

kInfo_TEXT	0	The data is informational text.
kInfo_HEADER_IN	1	The data is header (or header-like) data received from the peer.
kInfo_HEADER_OUT	2	The data is header (or header-like) data sent to the peer.
kInfo_DATA_IN	3	The data is protocol data received from the peer.
kInfo_DATA_OUT	4	The data is protocol data sent to the peer.
kInfo_SSL_DATA_IN	5	The data is protocol data received from the peer.
kInfo_SSL_DATA_OUT	6	The data is protocol data sent to the peer.

If you set CollectDebugMessages, the plugin will collect the messages and provide them via the DebugMessages property. You can still use this event to write your own log instead of in addition.

66.18.400 FileNameMatch(Pattern as String, Name as String) as Integer

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Match a file against a pattern.
Notes: If you don't implement this event, you get the default implementation from CURL.
Return kFileNameMatchNoMatch, kFileNameMatchIsMatch or kFileNameMatchFailed.

66.18.401 Finished(Result as Integer)

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event called when transfer has finished.
Notes: For Perform and PerformMT it is called before Perform function returns, so in PerformMT this is called on the thread.

For use with CURLSMultiMBS, it is called after TransferFinished event and before TransfersFinished event. If you want to modify GUI and use PeformMT, you may need to start a timer to do so.

66.18.402 Header(data as string, dataSize as Integer) as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: New Header data was received.
Notes: You can get error 23 if you don't return lenb(data) in this event.
Or just leave it emtpy so RB will not include it in your application the plugin will return lenb(data) itself.

If you set CollectHeaderData to true, the plugin will collect the messages and provide them via the HeaderData property. You can still use this event to write your own log instead of in addition.

66.18.403 Progress(dltotal as Int64, dlnow as Int64, ultotal as Int64, ulnow as Int64, percent as Double) as boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: An event to report progress of ongoing transfers.
Notes: This function gets called by libCURL with a frequent interval during operation (roughly once per second) no matter if data is being transfered or not. Unknown/unused argument values passed to the event will be set to zero (like if you only download data, the upload size will remain 0).
Returning a true from this event will cause libCURL to abort the transfer and return kError_ABORTED_BY_CALLBACK.

You can run CURL from a thread to download several things at the same time or keep the GUI more responsive. For better GUI, you can even call a method like app.DoEvents to get the GUI updated more often.

When sending email, ultotal may be zero. In that case use OptionInFileSize to know size of email to upload.

66.18.404 Read(count as Integer) as string

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: This event gets called by libCURL as soon as it needs to read data in order to send it to the peer.
Notes: Return the number of bytes requested. Never return a string with lenb(string)>count. You can return 0 to inform about end of file.

If you stop the current transfer by returning 0 ”pre-maturely” (i.e before the server expected it, like when you've told you will upload N bytes and you upload less than N bytes), you may experience that the server ”hangs” waiting for the rest of the data that won't come.

The read event may return CURL_READFUNC_ABORT (&h10000000) to stop the current operation immediately, resulting in a kError_ABORTED_BY_CALLBACK error code from the transfer (Added in 7.12.1)

This event is not called when using PerformMT.

If you provide Input data via SetInputData or OpenMTInputFile method, this event is not called and data is taken from the data you provided.

66.18.405 RestartRead() as boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: An event to inform you that reading on the file needs to start at the beginning again.
Notes: Return true on success.
If you use a binarystream for reading you will have to set position to 0 in this event.

This event is not called when using PerformMT.

66.18.406 Seek(pos as Int64, whence as Integer) as Integer

MBS CURL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Called when CURL needs to perform a seek.
Notes: Normally only needed if you resume a download (Seek forward) or upload is reset (seek back).
Whence is kSeekOriginCurrent, kSeekOriginEnd or kSeekOriginSet.
Please return one of this constants: kSeekReturnCantSeek, kSeekReturnFail or kSeekReturnOk.

66.18.407 SSHKey(KnownKey as string, KnownKeyLength as Integer, KnownKeyType as Integer, FoundKey as string, FoundKeyLength as Integer, FoundKeyType as Integer, MatchStatus as Integer) as Integer

MBS CURL Plugin, Plugin Version: 10.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The event for known hosts event for SFTP and SCP.
Notes: KnownKey: The known key as string encoded with base64 if KnownKeyLength is zero, otherwise the "raw" data.
KnownKeyLength: The length of the key. Zero for base64 encoded key.
KnownKeyType: The type of the key. (0 = Unknown, 1 = RSA1, 2 = RSA, 3 = DSS)
FoundKey: The found key as string encoded with base64 if FoundKeyLength is zero, otherwise the "raw" data.
FoundKeyLength: The length of the key. Zero for base64 encoded key.
FoundKeyType: The type of the key. (0 = Unknown, 1 = RSA1, 2 = RSA, 3 = DSS)
MatchStatus: The status CURL found. (0 = OK, 1 = Mismatch, 2 = Missing)

Return one of the following values:

66.18.408 Write(data as string, dataSize as Integer) as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

CURLKHSTAT_FINE_ADD_TO_FILE	0	Fine and add to file
CURLKHSTAT_FINE	1	Fine
CURLKHSTAT_REJECT	2	reject the connection, return an error
CURLKHSTAT_DEFER	3	do not accept it, but we can't answer right now so this causes a CURLE_DEFER error but otherwise the connection will be left intact etc

Function: This event gets called by libCURL as soon as there is data received that needs to be saved.
Notes: Return the number of bytes actually taken care of. If that amount differs from the amount passed to your function, it'll signal an error to the library and it will abort the transfer and return kError_WRITE_ERROR.

This function may be called with zero bytes data if the transfered file is empty.

The event function will be passed as much data as possible in all invokes, but you cannot possibly make any assumptions. It may be one byte, it may be thousands. The maximum amount of data that can be passed to the write event is defined in the CURL.h header file: CURL_MAX_WRITE_SIZE (16384).

If you set CollectOutputData to true, the plugin will automatically collect the data and provide it to you after the transfer with the OutputData property. This collecting feature will only work right, if there is enough free memory. You can of course still process data yourself in this event instead of in addition.

66.18.409 Constants

Constants

Constant	Value	Description
kUpkeepIntervalDefault	50000	The default connection upkeep interval in milliseconds.

Authorization

Constant	Value	Description
kAUTH_ANY	&hFFFFFFEF	all types set
kAUTH_ANYSAFE	&hFFFFFFEE	
kAUTH_AWS_SIGV4	128	AWS Signature v4
kAUTH_BASIC	1	Basic (default)
kAUTH_Bearer	64	HTTP Bearer token authentication
kAUTH_DIGEST	2	Digest
kAUTH_DIGEST_IE	16	HTTP Digest authentication with an IE flavor. Digest authentication is de in RFC 2617 and is a more secure way to do authentication over public netw than the regular old-fashioned Basic method. The IE flavor is simply libCURL will use a special "quirk" that IE is known to have used before ve 7 and that some servers require the client to use.
kAUTH_GSSNEGOTIATE	4	GSS-Negotiate Please check SupportsGSSNEGOTIATE property in CURLSVersionMBS whether this is supported/implemented by your copy of the CURL librar
kAUTH_NEGOTIATE	4	HTTP Negotiate (SPNEGO) authentication. Negotiate authentication i fined in RFC 4559 and is the most secure way to perform authentication HTTP. You need to build libCURL with a suitable GSS-API library or SSPI on dows for this to work.
kAUTH_NONE	0	
kAUTH_NTLM	8	
kAUTH_Only	&h80000000	This is a meta symbol. OR this value together with a single specific auth to force libCURL to probe for un-restricted auth and if not, only that s auth algorithm is acceptable.

ChunkBegin result values

Constant	Value	Description
kChunkBeginFailed	1	Failed, so we exit downloads.
kChunkBeginOK	0	OK, download this file.
kChunkBeginSkip	2	Skip the file.

ChunkEnd result values

Constant	Value	Description
kChunkEndFailed	1	Failed, so we exit downloads.
kChunkEndOK	0	Download success.

Error Constants

Constant	Value	Description
kError_ABORTED_BY_CALLBACK	42	
kError_AGAIN	81	socket is not ready for send/recv, wait till it's ready and try ag CURL 7.18.2)
kError_Auth_Error	94	An authentication function returned an error.
kError_BAD_CONTENT_ENCODING	61	Unrecognized transfer encoding
kError_BAD_DOWNLOAD_RESUME	36	couldn't resume download
kError_BAD_FUNCTION_ARGUMENT	43	
kError_CHUNK_FAILED	88	Chunk event reported error.
kError_CONV_REQD	76	Not used with plugin.
kError_COULDNT_CONNECT	7	Could not connect. Proxy set? Firewall open?
kError_COULDNT_RESOLVE_HOST	6	
kError_COULDNT_RESOLVE_PROXY	5	
kError_FAILED_INIT	2	
kError_FILESIZE_EXCEEDED	63	Maximum file size exceeded
kError_FILE_COULDNT_READ_FILE	37	
kError_FTP_ACCEPT_FAILED	10	While waiting for the server to connect back when an active F used, an error code was sent over the control connection or simi
kError_FTP_ACCEPT_TIMEOUT	12	During an active FTP session while waiting for the server to OptionAcceptTimeoutMS (or the internal default) timeout expi
kError_FTP_BAD_FILE_LIST	87	Unable to parse FTP file list.
kError_FTP_CANT_GET_HOST	15	
kError_FTP_COULDNT_RETR_FILE	19	
kError_FTP_COULDNT_SET_TYPE	17	
kError_FTP_COULDNT_USE_REST	31	the REST command failed
kError_FTP_PORT_FAILED	30	FTP PORT operation failed
kError_FTP_PRET_FAILED	84	a PRET command failed
kError_FTP_WEIRD_227_FORMAT	14	
kError_FTP_WEIRD_PASS_REPLY	11	
kError_FTP_WEIRD_PASV_REPLY	13	
kError_FTP_WEIRD_SERVER_REPLY	8	The server sent data libcurl could not parse. This error code CURLE_FTP_WEIRD_SERVER_REPLY before 7.51.0.
kError_GOT_NOTHING	52	when this is a specific error
kError_HTTP2	16	A problem was detected in the HTTP2 framing layer. This is som and can be one out of several problems, see the error buffer for
kError_HTTP2_STREAM	92	stream error in HTTP/2 framing layer
kError_HTTP3	95	HTTP3 layer failed.
kError_HTTP_RETURNED_ERROR	22	
kError_INTERFACE_FAILED	45	
kError_LDAP_CANNOT_BIND	38	
kError_LDAP_INVALID_URL	62	Invalid LDAP URL
kError_LDAP_SEARCH_FAILED	39	
kError_LOGIN_DENIED	67	user, password or similar was not accepted and we failed to logi
kError_NOT_BUILT_IN	4	A requested feature, protocol or option was not found built-in in due to a build-time decision. This means that a feature or o enabled or explicitly disabled when libCURL was built and in o to function you have to get a rebuilt libCURL.
kError_NO_CONNECTION_AVAILABLE	89	For internal use only, will never be returned by libCURL. No connection available, the session will be queued. (added in 7
kError_OK	0	
kError_OPERATION_TIMEDOUT	28	
kError_OUT_OF_MEMORY	27	
kError_PARTIAL_FILE	18	
kError_PEER_FAILED_VERIFICATION	60	
kError_Proxy	96	Proxy handshake error.
kError_Quic_Connect_Error	96	Quic had a connect error.
kError_QUOTE_ERROR	21	
kError_RANGE_ERROR	33	
kError_READ_ERROR	26	could open/read from file

FileNameMatch Event Result Values

Constant	Value	Description
kFileNameMatchFailed	2	Failed.
kFileNameMatchIsMatch	0	Is Match.
kFileNameMatchNoMatch	1	No match.

Follow Location Modes

Constant	Value	Description
kFollowAll	1	Before 8.13.0 this bit had no name and 1L was just the value to enable this option. This makes a set custom method be used in all HTTP requests, even after redirects.
kFollowFirstOnly	3	When there is a custom request method set with OptionCustomRequest, that set method replaces what libcurl would otherwise use in the first outgoing request only. The second request is then done according to the redirect response code. If you prefer your custom method to remain in use after a 307/308 redirect, use kFollowObeyCode instead.
kFollowObeyCode	2	When there is a custom request method set with OptionCustomRequest, that set method replaces what libcurl would otherwise use. If a 301/302/303 response code is returned to signal a redirect, the method is changed from POST to GET. For 307/308, the custom method remains set and used. Note that only POST (or a custom post) is changed to GET on 301/302, its not change PUT etc - and therefore also not when libcurl issues a custom PUT. A 303 response makes it switch to GET independently of the original method (except for HEAD). To control for which of the 301/302/303 status codes libcurl should not switch back to GET for when doing a custom POST, and instead keep the custom method, use OptionPostRedir. If you prefer a custom POST method to be reset to exactly the method POST, use kFollowFirstOnly instead.

Form Constants

Constant	Value	Description
kFormArray	8	
kFormBuffer	11	
kFormBufferLength	13	
kFormBufferPtr	12	
kFormContentHeader	15	
kFormContentsLength	6	
kFormContentType	14	
kFormCopyContents	4	
kFormCopyName	1	
kFormEnd	17	
kFormFile	10	
kFormFileContent	7	
kFormFilename	16	
kFormNameLength	3	
kFormPtrContents	5	
kFormPtrName	2	

FTP Authorization

Constant	Value	Description
kFTPAUTH_DEFAULT	0	Allow libCURL to decide
kFTPAUTH_SSL	1	Try "AUTH SSL" first, and only if that fails try "AUTH TLS"
kFTPAUTH_TLS	2	Try "AUTH TLS" first, and only if that fails try "AUTH SSL"

FTP CWD method

Constant	Value	Description
kFTPMethodDefault	0	let libcurl pick
kFTPMethodMultiCWD	1	single CWD operation for each path part
kFTPMethodNoCWD	2	no CWD at all
kFTPMethodSingleCWD	3	one CWD to full dir, then work on file

FTP SSL Option

Constant	Value	Description
kFTPSSL_ALL	3	Require SSL for all communication or fail with kError_FTP_SSL_FAILED.
kFTPSSL_CONTROL	2	Require SSL for the control connection or fail with kError_FTP_SSL_FAILED.
kFTPSSL_NONE	0	Don't attempt to use SSL.
kFTPSSL_TRY	1	Try using SSL, proceed as normal otherwise.

GSS API delegation modes

Constant	Value	Description
kGSSAPIDelegationFlag	2	delegate always
kGSSAPIDelegationNone	0	no delegation (default)
kGSSAPIDelegationPolicyFlag	1	if permitted by policy

HTTP Versions

Constant	Value	Description
kHTTP_VERSION_1_0	1	Enforce HTTP 1.0 requests.
kHTTP_VERSION_1_1	2	Enforce HTTP 1.1 requests.
kHTTP_VERSION_2TLS	4	use version 2 for HTTPS, version 1.1 for HTTP
kHTTP_VERSION_2_0	3	please use HTTP 2 in the request
kHTTP_VERSION_2_PRIOR_KNOWLEDGE	5	please use HTTP 2 without HTTP/1.1 Upgrade
kHTTP_VERSION_3	30	please use HTTP 3 in the request
kHTTP_VERSION_3Only	31	Use HTTP/3 without fallback. For HTTPS only. For HTTP, t return error.
kHTTP_VERSION_NONE	0	We don't care about what version the library uses. libCURL it thinks fit.

Debug Message Info Types

Constant	Value	Description
kINFO_DATA_IN	3	The data is protocol data received from the peer.
kINFO_DATA_OUT	4	The data is protocol data sent to the peer.
kINFO_HEADER_IN	1	The data is header (or header-like) data received from the peer.
kINFO_HEADER_OUT	2	The data is header (or header-like) data sent to the peer.
kINFO_SSL_DATA_IN	5	The data is protocol data received from the peer.
kINFO_SSL_DATA_OUT	6	The data is protocol data sent to the peer.
kINFO_TEXT	0	The data is informational text.

IP Resolve Modes

Constant	Value	Description
kIPRESOLVE_V4	1	
kIPRESOLVE_V6	2	
kIPRESOLVE_WHATEVER	0	

NetRC Modes

Constant	Value	Description
kNETRC_IGNORED	0	The .netrc will never be read. This is the default.
kNETRC_OPTIONAL	1	A user:password in the URL will be preferred to one in the .netrc.
kNETRC_REQUIRED	2	A user:password in the URL will be ignored. Unless one is set programmatically, the .netrc will be queried.

Protocols

Constant	Value	Description
kProtocolAll	-1	Enable all protocols.
kProtocolDICT	&h200	DICT
kProtocolFILE	&h400	File
kProtocolFTP	4	FTP
kProtocolFTPS	8	FTPS
kProtocolGopher	&h2000000	Gopher
kProtocolGophers	&h20000000	
kProtocolHTTP	1	HTTP
kProtocolHTTPS	2	HTTPS
kProtocolIMAP	&h1000	IMAP
kProtocolIMAPS	&h2000	IMAPS
kProtocolLDAP	&h80	LDAP
kProtocolLDAPS	&h100	LDAPS
kProtocolMQTT	&h10000000	MQTT
kProtocolPOP3	&h4000	POP3
kProtocolPOP3S	&h8000	POP3S
kProtocolRTMP	&h80000	RTMP
kProtocolRTMPE	&h200000	RTMPE
kProtocolRTMPS	&h800000	RTMPS
kProtocolRTMPT	&h100000	RTMPT
kProtocolRTMPTE	&h400000	RTMPTE
kProtocolRTMPTS	&h1000000	RTMPTS
kProtocolRTSP	&h40000	RTSP
kProtocolSCP	&h10	SCP
kProtocolSFTP	&h20	SFTP
kProtocolSMB	&h4000000	SMB
kProtocolSMBS	&h8000000	SMBS
kProtocolSMTP	&h10000	SMTP
kProtocolSMTPS	&h20000	SMTPS
kProtocolTelnet	&h40	Telnet
kProtocolTFTP	&h800	TFTP

Proxy Types

Constant	Value	Description
kPROXY_HTTP	0	
kPROXY_HTTP10	1	Force to use CONNECT HTTP/1.0.
kPROXY_HTTP11	0	Connect using HTTP/1.1.
kPROXY_HTTPS3	8	HTTPS and attempt HTTP/3, added in CURL 8.21.0
kPROXY_SOCKS4	4	
kPROXY_SOCKS4A	6	Using SOCKS 4A.
kPROXY_SOCKS5	5	
kPROXY_SOCKS5_Hostname	7	Use the SOCKS5 protocol but pass along the host name rather than the IP address. added in 7.18.0

Seek Origin Constants

Constant	Value	Description
kSeekOriginCurrent	1	Seek relative to current file position.
kSeekOriginEnd	2	Seek relative to end of file.
kSeekOriginSet	0	Seek relative to start of file.

Seek Event Result Values

Constant	Value	Description
kSeekReturnCantSeek	3	Return this value if you can't seek as you are not using a file, but for example a stream.
kSeekReturnFail	2	Returns this value if your seek operation failed.
kSeekReturnOk	1	Returns this value if your seek operation succeeded.

SSH Authentication

Constant	Value	Description
kSSHAuthAgent	16	agent (ssh-agent, pageant...)
kSSHAuthAny	-1	Any allowed
kSSHAuthDefault	-1	Default: Any
kSSHAuthGSSAPI	32	gssapi (kerberos, ...)
kSSHAuthHost	4	host key files
kSSHAuthKeyboard	8	keyboard interactive
kSSHAuthNone	0	none allowed, silly but complete
kSSHAuthPassword	2	password
kSSHAuthPublicKey	1	public/private key files

SSL Option Flags

Constant	Value	Description
kSSLOptionAllowBeast	1	tells libcurl to allow the BEAST SSL vulnerability in the name of improving interoperability with older servers. Some SSL libraries have introduced work-arounds for this flaw but those work-arounds sometimes make the SSL communication fail. To regain functionality with those broken servers, a user can this way allow the vulnerability back.
kSSLOptionAutoClientCert	32	Tells libcurl to automatically locate and use a client certificate for authentication. (Schannel)
kSSLOptionEarlyData	64	Tell libcurl to try sending application data as TLS1.3 early data. This option is only supported for GnuTLS. This option works on a best effort basis, in cases when it wasn't possible to send early data the request is resent normally post-handshake. This option does not work when using QUIC. (Added in 8.11.0)
kSSLOptionNativeCA	16	tells libcurl to use standard certificate store of operating system. Currently implemented under MS-Windows.
kSSLOptionNoPartialChain	4	tells libcurl to *NOT* accept a partial certificate chain if possible. The OpenSSL backend has this ability.
kSSLOptionNoRevoke	2	tells libcurl to disable certificate revocation checks for those SSL backends where such behavior is present.
kSSLOptionRevokeBestEffort	8	tells libcurl to ignore certificate revocation offline checks and ignore missing revocation list for those SSL backends where such behavior is present.

SSL Versions

Constant	Value	Description
kSSLVersionDefault	0	The default acceptable version range. The minimum acceptable version is by default TLS v1.0 since 7.39.0 (unless the TLS library has a stricter rule).
kSSLVersionSSLv2	2	SSL v2 (but not SSLv3)
kSSLVersionSSLv3	3	SSL v3 (but not SSLv2)
kSSLVersionTLSv1	1	TLS v1.0 or later
kSSLVersionTLSv10	4	TLS v1.0 or later (Added in 7.34.0)
kSSLVersionTLSv11	5	TLS v1.1 or later (Added in 7.34.0)
kSSLVersionTLSv12	6	TLS v1.2 or later (Added in 7.34.0)
kSSLVersionTLSv13	7	TLS v1.3 or later (Added in 7.52.0)

Maximum SSL Versions

Constant	Value	Description
kSSLVersionMaxDefault	&h10000	The flag defines the maximum supported TLS version by libcurl, or the default value from the SSL library is used. libcurl uses a sensible default maximum, which was TLS v1.2 up to before 7.61.0 and is TLS v1.3 since then - assuming the TLS library support it.
kSSLVersionMaxNone	0	No maximum.
kSSLVersionMaxTLSv10	&h40000	The flag defines maximum supported TLS version as TLS v1.0.
kSSLVersionMaxTLSv11	&h50000	The flag defines maximum supported TLS version as TLS v1.1.
kSSLVersionMaxTLSv12	&h60000	The flag defines maximum supported TLS version as TLS v1.2.
kSSLVersionMaxTLSv13	&h70000	The flag defines maximum supported TLS version as TLS v1.3.

Time Conditions

Constant	Value	Description
kTimeConditionIfModifiedSince	1	
kTimeConditionIfUnModifiedSince	2	
kTimeConditionNone	0	No condition.

Upload Flags for IMAP

Constant	Value	Description
kUploadFlagAnswered	1	Mark email as answered.
kUploadFlagDeleted	2	Mark email to be deleted.
kUploadFlagDraft	4	Mark email as draft.
kUploadFlagFlagged	8	Mark email as flagged.
kUploadFlagSeen	16	Mark email as seen.

SSL Option

Constant	Value	Description
kUseSSLall	3	Require SSL for all communication or fail with kError_FTP_SSL_FAILED.
kUseSSLcontrol	2	Require SSL for the control connection or fail with kError_FTP_SSL_FAILED.
kUseSSLnone	0	Don't attempt to use SSL.
kUseSSLtry	1	Try using SSL, proceed as normal otherwise.

WebSocket Options

Constant	Value	Description
kWebSocketNoAutoPong	1	No Auto Pong.
kWebSocketRaw	1	RAW mode for WebSocketOptions.

66.19 class CURLSMimePartMBS

66.19.1 class CURLSMimePartMBS

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for mime parts.
Example:

```
// upload a file with a form field as multipart/form-data with CURL
Var curl As New CURLSMBS
curl.OptionURL = "https://www.example.com/upload.php"

Var field As CURLSMimePartMBS = curl.AddMimePart
field.Name = "title"
field.DataString = "Holiday photo"

Var upload As CURLSMimePartMBS = curl.AddMimePart
upload.Name = "file"
upload.File = SpecialFolder.Desktop.Child("photo.jpg")
upload.MimeType = "image/jpeg"
curl.FinishMime

Var result As Integer = curl.Perform
MessageBox "Result: " + result.ToString + EndOfLine + curl.OutputData
```

Notes: You can provide data via file path, folderitem, data in memoryblock or string.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Videos

- Presentation from Munich conference about MBS Plugins.
- Presentation from Xojo Developer Conference 2019 in Miami.

66.19.2 Methods

66.19.3 Constructor

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

66.19.4 Headers as String()

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries header.

66.19.5 SetHeaders(headers() as String)

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets header.

66.19.6 Properties

66.19.7 DataMemory as Memoryblock

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mime part data source from memory data.
Notes: (Read and Write property)

66.19.8 DataString as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mime part data source from memory data.
Example:

```
Var c as new CURLSMBS

// add mime
Var p as CURLSMimePartMBS = c.AddMimePart

p.name = "Text"
p.FileName = "test.txt"
p.MimeType = "text/plain"
p.DataString = "Hello World"

c.FinishMime
// now you can send...
```

Notes: (Read and Write property)

66.19.9 Encoding as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mime data transfer encoder.
Notes: If set to binary, 8bit, 7bit, base64 or quoted-printable, the matching encoding is applied.
(Read and Write property)

66.19.10 File as FolderItem

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file to stream.
Notes: When you set property, the plugin will open file and may raise IOException on failure.
(Read and Write property)

66.19.11 FileName as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mime part remote file name.
Notes: If mime type is not set, we pick extension from file name.
This includes gif, jpg, jpeg, png, svg, txt, htm, html, pdf and xml file extensions.
(Read and Write property)

66.19.12 FilePath as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mime part data source from named file.
Notes: (Read and Write property)

66.19.13 Lasterror as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

66.19.14 MimeType as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mime part type.
Notes: (Read and Write property)

66.19.15 Name as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mime/form part name.
Notes: (Read and Write property)

66.19.16 Parent as Variant

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes: (Read only property)

66.19.17 Constants

Encodings

Constant	Value	Description
kEncoding7bit	"7bit"	7bit
kEncoding8bit	"8bit"	8bit
kEncodingBase64	"base64"	Base64
kEncodingBinary	"binary"	Binary mode
kEncodingNone	""	No mode, so data is passed through and header has no encoding defin
kEncodingQuotedPrintable	"quoted-printable"	Quoted printable

Mime Types

Constant	Value	Description
kMimeTypeGIF	"image/gif"	GIF
kMimeTypeHTML	"text/html"	HTML
kMimeTypeJPEG	"image/jpeg"	JPEG
kMimeTypePDF	"application/pdf"	PDF
kMimeTypePNG	"image/png"	PNG
kMimeTypeSVG	"image/svg+xml"	SVG
kMimeTypeText	"text/plain"	Text
kMimeTypeXML	"application/xml"	XML

66.20 class CURLSMissingFunctionExceptionMBS

66.20.1 class CURLSMissingFunctionExceptionMBS

MBS CURL Plugin, Plugin Version: 13.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: An exception raised if a CURL library function is not loaded.
Notes: If you call load library before you use the CURLSMBS Constructor, you should never see this.
Subclass of the RuntimeException class.

66.21 class CURLSMultiMBS

66.21.1 class CURLSMultiMBS

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for multiple CURL transfers running in parallel.
Example:

```
// download three files at the same time
// MyMulti is a subclass of CURLSMultiMBS with the TransferFinished event implemented.
// Multi is a property of the window: Multi As MyMulti
Multi = New MyMulti

Var urls() As String = Array("https://www.monkeybreadsoftware.de/", "https://www.mbsplugins.de/",
"https://www.mbsplugins.eu/")
For Each url As String In urls
Var d As New CURLSMBS
d.OptionURL = url
d.OptionFollowLocation = 1
Call Multi.AddCURL(d)
Next

// in MyMulti:
Sub TransferFinished(CURL As CURLSMBS, result As Integer, RemainingFinishedTransfers As Integer)
Handles TransferFinished
System.DebugLog CURL.OptionURL + ": result " + result.ToString + ", HTTP " + CURL.GetInfoRe-
sponseCode.ToString + ", " + CURL.OutputData.Bytes.ToString + " bytes"
End Sub
```

66.21.2 Methods

66.21.3 AddCURL(curl as CURLSMBS, handler as CURLSTransferFinishedMBS = nil) as boolean

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Add a standard CURL handle to the multi stack.
Notes: Lasterror is set.

We added handler parameter for v23.2 to make it easier to run things asynchronously.

66.21.4 ClearSharedInstance

MBS CURL Plugin, Plugin Version: 24.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the shared instance.
Notes: This will remove the global reference to the shared instance and thus free the CURLSMultiMBS object.
Only needed to debug memory leaks.

66.21.5 CURLs as CURLSMBS()

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of current CURL instances.

66.21.6 ErrorString(ErrorCode as Integer) as String

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries text message for a given error code.

66.21.7 NetworkChanged

MBS CURL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Signal network changed.
Notes: Informs CURL about a network change, so it can discard connections or DNS cache entries.

This method can be called at any time and repeatedly. Each call only affects the currently cached connections and DNS information. Any connection created or DNS information added afterwards is cached the usual way again.

The call affects only the connection and DNS cache of the multi handle itself and not the ones owned by SHARE handles.

Tells libcurl to clear "everything" that could be associated with this network, including both connections and DNS data.
See also:

- 66.21.8 NetworkChanged(ClearConns as Boolean, ClearDNS as Boolean) 11872

66.21.8 NetworkChanged(ClearConns as Boolean, ClearDNS as Boolean)

MBS CURL Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Signal network changed.
Notes: Informs CURL about a network change, so it can discard connections or DNS cache entries.

This method can be called at any time and repeatedly. Each call only affects the currently cached connections and DNS information. Any connection created or DNS information added afterwards is cached the usual way again.

The call affects only the connection and DNS cache of the multi handle itself and not the ones owned by SHARE handles.

ClearConns: No longer reuse any existing connection in the multi handle's connection cache. This closes all connections that are not in use. Ongoing transfers continue on the connections they operate on.

ClearDNS: Clear the multi handle's DNS cache.
See also:

• 66.21.7 NetworkChanged 11872

66.21.9 Perform

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks for things to see.
Notes: When the app thinks there's data available for CURL it calls this function to read/write whatever there is right now. This returns as soon as the reads and writes are done. This function does not require that there actually is data available for reading or that data can be written, it can be called just in case.

Lasterror is set. This only provides errors etc regarding the whole multi stack. There might still have occurred problems on invidual transfers even when this returns OK.

Sets RunningTransfers property.

66.21.10 RemoveAll

MBS CURL Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all curl handles.
Notes: Same as looping over CURLs() array and calling RemoveCURL for each.
This effectively cancels all requests.

66.21.11 RemoveCURL(CURL as CURLSMBS) as boolean

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a CURL handle from the multi stack again.
Notes: Lasterror is set.
Plugin calls this automatically when TransferFinished event was called.

66.21.12 SharedInstance as CURLSMultiMBS

MBS CURL Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The shared instance.
Notes: Either you create a new CURLSMultiMBS object, which then takes this place.
Or you don't and the plugin creates an object for you to easily schedule transfers asynchronously.

66.21.13 Properties

66.21.14 AutoPerform as Boolean

MBS CURL Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to run a timer and run Perform automatically for you.
Notes: Set to true to run Perform automatically. For this the plugin manages a timer to call perform regularly.
We set this to true for the default shared instance, so it runs without you doing anything.
(Read and Write property)

66.21.15 ChunkLengthPenaltySize as Int64

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** A connection with a chunk length longer than this will not be considered for pipelining.
Notes: (Read and Write property)

66.21.16 ContentLengthPenaltySize as Int64

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** A connection with a content-length longer than this will not be considered for pipelining.
Notes: (Read and Write property)

66.21.17 Handle as Integer

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

66.21.18 Lasterror as Integer

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

66.21.19 MaxConcurrentStreams as Integer

MBS CURL Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum number of concurrent connections to a server.
Notes: Maximum number of concurrent streams to support on a connection.
(Read and Write property)

66.21.20 MaxConnects as Integer

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum number of entries in the connection cache.
Notes: If value is greater than 0, a fixed limit of the maximum number of entries we are allowed to grow the connection cache to.

Default is -1 for no limit.
(Read and Write property)

66.21.21 MaxHostConnections as Integer

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum number of (pipelining) connections to one host.
Notes: If value is greater than 0, a fixed limit of the maximum number of connections per host.
(Read and Write property)

66.21.22 MaxPipelineLength as Integer

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Maximum number of requests in a pipeline.
Notes: (Read and Write property)

66.21.23 MaxTotalConnections as Integer

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum number of open connections in total.
Notes: If value is greater than 0, a fixed limit of the maximum number of connections in total.
(Read and Write property)

66.21.24 Pipelining as Integer

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set to 1 to enable pipelining for this multi handle.
Notes: Only for HTTP protocol.
Used to be a boolean property for 15.0 to 18.1, but changed to integer for 18.2.
(Read and Write property)

66.21.25 QuickExit as Boolean

MBS CURL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to do a quick exit and not wait for DNS resolver threads.
Notes: Set to true for not joining threads when multi is cleaned up.
(Read and Write property)

66.21.26 ResolveThreadsMax as Integer

MBS CURL Plugin, Plugin Version: 26.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum number of threads used with threaded DNS resolver.
Notes: (Read and Write property)

66.21.27 RunningTransfers as Integer

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of running transfers.
Notes: Set by Perform method.
(Read only property)

66.21.28 Tag as Variant

MBS CURL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tag value.
Notes: You can store whatever reference value you need.
(Read and Write property)

66.21.29 TransfersAdded as UInt64

MBS CURL Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The cumulative number of all easy handles added to the multi, ever.
Notes: This includes internal handles added for tasks (like resolving via DoH, for example).

For the current number of easy handles managed by the multi, use TransfersCurrent.
(Read only property)

66.21.30 TransfersCurrent as UInt64

MBS CURL Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of easy handles currently added to the multi handle.
Notes: This does not include already removed handles. It does include internal handles that get added for tasks (like resolving via DoH, for example).

For the total number of easy handles ever added to the multi, see TransfersAdded.
(Read only property)

66.21.31 TransfersDone as UInt64

MBS CURL Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of easy handles currently finished, but not yet removed.
Notes: (Read only property)

66.21.32 TransfersPending as UInt64

MBS CURL Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of current easy handles waiting to start.
Notes: An added transfer might become pending for various reasons: a connection limit forces it to wait, resolving DNS is not finished or it is not clear if an existing, matching connection may allow multiplexing (HTTP/2 or HTTP/3).

(Read only property)

66.21.33 TransfersRunning as UInt64

MBS CURL Plugin, Plugin Version: 25.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of easy handles currently running, e.g. where the transfer has started but not finished yet.
Notes: (Read only property)

66.21.34 Events

66.21.35 TransferFinished(CURL as CURLSMBS, result as Integer, RemainingFinishedTransfers as Integer)

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: One transfer finished.
Notes: Query CURL object for details.
Result is the result of the transfer as returned by Perform method of CURL object.
RemainingFinishedTransfers is how many transfers are also finished and will be called right after this event.

This event fires always when the queue is empty.
You may want to turn off the timer calling Perform method when this event fires.
Later you can start timer again if you call Add method.

66.21.36 TransfersFinished

MBS CURL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: All pending transfers finished.

66.21.37 Constants

Error Codes

Constant	Value	Description
kErrorAddedAlready	7	An easy handle already added to a multi handle was attempted to get added - again.
kErrorBadEadyHandle	2	An easy handle was not good/valid.
kErrorBadFunctionArgument	10	A function was called with a bad parameter.
kErrorBadHandle	1	The passed-in handle is not a valid CURLM handle.
kErrorBadSocket	5	The passed in socket argument did not match.
kErrorCallPerform	-1	Please call Perform soon to do some tasks.
kErrorInternalError	4	This is a libCURL bug.
kErrorOK	0	Everything OK.
kErrorOutOfMemory	3	Running low on memory.
kErrorRecursiveAPICall	8	An api function was called from inside an event.
kErrorUnknownOption	6	Tried to set unsupported option.
kErrorWakeupFailure	9	Wakeup is unavailable or failed.

Pipeling options

Constant	Value	Description
kPipeHTTP1	1	Pipe with HTTP/1.1.
kPipeMultiPlex	2	Pipe with multiplex.
kPipeNothing	0	No piping.

66.21.38 Delegates

66.21.39 CURLSTransferFinishedMBS(curl as CURLSMBS, ErrorCode as Integer)

MBS CURL Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The delegate used to indicate a transfer finished.
Notes: ErrorCode is zero for a successful.
See kError* constants in CURLSMBS class.
Blog Entries

- Easier multi transfer for our Xojo CURL Plugin

66.22 class CURLSNotInitializedExceptionMBS

66.22.1 class CURLSNotInitializedExceptionMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: An exception raised if CURL library is not initialized.
Notes: If you call load library before you use the CURLMBS Constructor, you should never see this.
Subclass of the RuntimeException class.

66.23 class CURLSSLBackendMBS

66.23.1 class CURLSSLBackendMBS

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSSSLBackendMBS instead. **Function:** The class for a SSL backend.
Notes: Subclass of the CURLSSSLBackendMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

66.24 class CURLSSSLBackendMBS

66.24.1 class CURLSSSLBackendMBS

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a SSL backend.
Example:

```
Var list() As CURLSSSLBackendMBS = CURLSSSLBackendMBS.List

Var names() As String
For Each l As CURLSSSLBackendMBS In list
names.Add l.name
Next

MessageBox "Available backends: " + string.FromArray(names, ", ")
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- 21.1, page 9: News

66.24.2 Methods

66.24.3 Constructor

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

66.24.4 List as CURLSSSLBackendMBS()

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Lists the backends.
Example:

```
Var list() as CURLSSSLBackendMBS = CURLSSSLBackendMBS.List

for each l as CURLSSSLBackendMBS in list
MessageBox l.name
next
```

Notes: The list may not be available if called too late.

66.24.5 SetSSLBackend(id as Integer) as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the SSL backend.
Example:

```
Var error As Integer = CURLSSSLBackendMBS.SetSSLBackend(CURLSSSLBackendMBS.kSSLBackend-
SChannel)
Select Case error
Case CURLSSSLBackendMBS.kErrorOK
MessageBox "Backend set."
Case CURLSSSLBackendMBS.kErrorNoBackends
MessageBox "No Backends"
Case CURLSSSLBackendMBS.kErrorTooLate
MessageBox "Too late. Please set before using CURL."
Case CURLSSSLBackendMBS.kErrorUnknownBackend
MessageBox "Unknown backend name."
End Select
```

Notes: When built with multiple SSL backends, SetSSLBackend() allows to choose one. This function can only be called once, and it must be called *before* CURL constructor().

The backend can be identified by the id (e.g. CURLSSLBACKEND_OPENSSL). The backend can also be specified via the name parameter (passing -1 as id). If both id and name are specified, the name will be ignored. If neither id nor name are specified, the function will fail with CURLSSLSET_UNKNOWN_BACKEND and set the "avail" pointer to the NULL-terminated list of available backends.

Upon success, the function returns kErrorOK.
If the specified SSL backend is not available, the function returns kErrorUnknownBackend.

The SSL backend can be set only once. If it has already been set, a subsequent attempt to change it will result in a kErrorTooLate.

Returns nil, if there are no backends to choose.

- 66.24.6 SetSSLBackend(name as string) as Integer 11884

66.24.6 SetSSLBackend(name as string) as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the SSL backend.
Example:

```
Var error As Integer = CURLSSSLBackendMBS.SetSSLBackend("openssl")
Select Case error
Case CURLSSSLBackendMBS.kErrorOK
MessageBox "Backend set."
Case CURLSSSLBackendMBS.kErrorNoBackends
MessageBox "No Backends"
Case CURLSSSLBackendMBS.kErrorTooLate
MessageBox "Too late. Please set before using CURL."
Case CURLSSSLBackendMBS.kErrorUnknownBackend
MessageBox "Unknown backend name."
End Select
```

Notes: When built with multiple SSL backends, SetSSLBackend() allows to choose one. This function can only be called once, and it must be called *before* CURL constructor().

The backend can be identified by the id (e.g. CURLSSLBACKEND_OPENSSL). The backend can also be specified via the name parameter (passing -1 as id). If both id and name are specified, the name will be ignored. If neither id nor name are specified, the function will fail with CURLSSLSET_UNKNOWN_BACKEND and set the "avail" pointer to the NULL-terminated list of available backends.

Upon success, the function returns kErrorOK.
If the specified SSL backend is not available, the function returns kErrorUnknownBackend.

The SSL backend can be set only once. If it has already been set, a subsequent attempt to change it will

result in a kErrorTooLate.

Returns nil, if there are no backends to choose.

66.24.7 Properties

66.24.8 ID as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The ID of this SSL backend.
Notes: (Read only property)

66.24.9 Name as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of this SSL backend.
Notes: (Read only property)

66.24.10 Constants

Error codes

Constant	Value	Description
kErrorNoBackends	3	libcurl was built without any SSL support
kErrorOK	0	OK
kErrorTooLate	2	You can't set SSL backend after SSL initialization.
kErrorUnknownBackend	1	Unknown backend name or ID.

SSL Backend IDs

Constant	Value	Description
kSSLBackendDarwinSSL	9	DarwinSSL
kSSLBackendGNUTLS	2	GNUTLS
kSSLBackendGSKIT	5	GSKIT
kSSLBackendMBEDTLS	11	MBEDTLS
kSSLBackendNone	0	
kSSLBackendNSS	3	NSS
kSSLBackendOpenSSL	1	OpenSSL or BoringSSL
kSSLBackendSChannel	8	SChannel
kSSLBackendSecureTransport	9	DarwinSSL
kSSLBackendWolfSSL	7	WolfSSL

66.25 class CURLSURLMBS

66.25.1 class CURLSURLMBS

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for CURL's URL parser.
Example:

```
Var c as new CURLSURLMBS

c.URL = "www.test.de/Hello World test.pdf"

// setting URL will repair the spaces
c.path = c.Path

MessageBox c.URL
```

Xojo Developer Magazine

- 17.5, page 38: What's New in the MBS Plugins, With the Plugins growing every year, here are new capabilities you may have missed by Stefanie Juchmes

66.25.2 Methods

66.25.3 Clone as CURLSURLMBS

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Duplicates the object.

66.25.4 Constructor

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new URL object.

66.25.5 Properties

66.25.6 Flags as Integer

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The flags to use.
Notes: Our default is combination of:

- kFlagsNoDefaultPort
- kFlagsNonSupportScheme
- kFlagsURLDecode
- kFlagsURLEncode
- kFlagsGuessScheme
- kFlagsDefaultScheme

(Read and Write property)

66.25.7 Fragment as String

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set fragment part of URL.
Notes: Sets lasterror property.
(Read and Write property)

66.25.8 Handle as Integer

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Internal object reference.
Notes: (Read and Write property)

66.25.9 Host as String

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set host part of URL.
Notes: Sets lasterror property.
(Read and Write property)

66.25.10 Lasterror as Integer

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code reported by one of the functions.
Notes: This changes while using debugger because getting or setting properties also sets this property.
(Read and Write property)

66.25.11 Options as String

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set options part of URL.
Notes: Sets lasterror property.
(Read and Write property)

66.25.12 Password as String

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set password part of URL.
Notes: Sets lasterror property.
(Read and Write property)

66.25.13 Path as String

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set path part of URL.
Notes: Sets lasterror property.
(Read and Write property)

66.25.14 Port as String

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set port part of URL.
Notes: Sets lasterror property.
(Read and Write property)

66.25.15 Query as String

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set query part of URL.
Notes: Sets lasterror property.
(Read and Write property)

66.25.16 Scheme as String

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set scheme part of URL.
Notes: Sets lasterror property.
(Read and Write property)

66.25.17 URL as String

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set full URL.
Example:

```
Var c As New CURLSURLMBS

// load absolute URL
c.URL = "http://domain.com/folder/page1.htm"

// load relative URL
c.URL = "page2.htm"

// get final URL
MessageBox c.URL
```

Notes: Sets lasterror property.

(Read and Write property)

66.25.18 User as String

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get/Set user part of URL.
Notes: Sets lasterror property.
(Read and Write property)

66.25.19 ZoneID as String

MBS CURL Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The zone ID.
Notes: (Read and Write property)

66.25.20 Constants

Constants

Constant	Value	Description
kFlagsNoAuthority	1024	Allow URLs without authority. Allow empty authority when the scheme is unknown.
kFlagsNoGuessScheme	32768	One of the flags. For get, do not accept a guess.

Error Constants

Constant	Value	Description
kErrorBadFileURL	19	The file:// URL is invalid.
kErrorBadFragment	20	The fragment part of the URL contained bad or invalid characters.
kErrorBadHostname	21	The hostname contained bad or invalid characters.
kErrorBadIPv6	22	The IPv6 address hostname contained bad or invalid characters.
kErrorBadLogin	23	The login part of the URL contained bad or invalid characters.
kErrorBadPassword	24	The password part of the URL contained bad or invalid characters.
kErrorBadPath	25	The path part of the URL contained bad or invalid characters.
kErrorBadQuery	26	The query part of the URL contained bad or invalid characters.
kErrorBadScheme	27	The scheme part of the URL contained bad or invalid characters.
kErrorBadSlashes	28	The URL contained an invalid number of slashes.
kErrorBadUser	29	The user part of the URL contained bad or invalid characters.
kErrorNoZoneID	18	There is no zoneid set in the URL.

Error Codes

Constant	Value	Description
kErrorBadHandle	1	An argument that should be a CURLU pointer was passed in as a NULL. Should never happen with plugin as you would get exception.
kErrorBadPartpointer	2	A NULL pointer was passed to the 'part' argument of curl_url_get. Should never happen with plugin as you would get exception.
kErrorBadPortNumber	4	The port number was not a decimal number between 0 and 65535.
kErrorLacksIDN	30	IDN missing.
kErrorMalformedInput	3	A malformed input was passed to a URL API function.
kErrorNoFragment	17	There is no fragment part in the URL.
kErrorNoHost	14	There is no host part in the URL.
kErrorNoOptions	13	There is no options part in the URL.
kErrorNoPassword	12	There is no password part in the URL.
kErrorNoPort	15	There is no port part in the URL.
kErrorNoQuery	16	There is no query part in the URL.
kErrorNoScheme	10	There is no scheme part in the URL.
kErrorNoUser	11	There is no user part in the URL.
kErrorOk	0	No error.
kErrorOutOfMemory	7	A memory function failed.
kErrorUnknownPart	9	An unknown part ID was passed to a URL API function.
kErrorUnsupportedScheme	5	This libcurl build doesn't support the given URL scheme.
kErrorUrlDecode	6	
kErrorUserNotAllowed	8	Credentials was passed in the URL when prohibited.

Flags

Constant	Value	Description
kFlagsAllowSpace	2048	Whether to allow space character in URLs.
kFlagsAppendQuery	256	Append a form style part.
kFlagsDefaultPort	1	Return default port number.
kFlagsDefaultScheme	4	Return default scheme if missing.
kFlagsDisallowUser	32	No user+password allowed.
kFlagsGetEmpty	16384	Allow empty queries and fragments when extracting the URL or the components.
kFlagsGuessScheme	512	Legacy curl-style guessing.
kFlagsNoDefaultPort	2	Act as if no port number was set, if the port number matches the default for the scheme.
kFlagsNonSupportScheme	8	Allow non-supported scheme.
kFlagsPathAsIs	16	Leave dot sequences.
kFlagsPuny2IDN	8192	Whether to do punycode to IDN conversion
kFlagsPunyCode	4096	get the host name in pynycode
kFlagsURLDecode	64	URL decode on get.
kFlagsURLEncode	128	URL encode on set.

66.26 class CURLSVersionMBS

66.26.1 class CURLSVersionMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class to hold version information from libCURL.
Example:

```
// show which libCURL version and features the plugin uses
Var v As CURLSVersionMBS = CURLSMBS.Version
MessageBox "CURL " + v.Version + EndOfLine + _
"SSL: " + v.SSLVersion + EndOfLine + _
"HTTP/2: " + v.nghttp2Version + EndOfLine + _
"IPv6: " + v.SupportsIPV6.ToString + ", compression: " + v.SupportsLIBZ.ToString
```

- 21.2, page 9: News

66.26.2 Methods

66.26.3 Constructor

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

66.26.4 FeatureNames as String()

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries the feature names.
Example:

```
Var v as new CURLSVersionMBS
Var features() as string = v.FeatureNames
Var Names as string = string.FromArray(features)
MessageBox Names
```

Notes: Values are e.g. alt-svc AsynchDNS HSTS HTTPS-proxy IPv6 Largefile libz NTLM NTLM_WB SSL threadsafe TLS-SRP UnixSockets zstd

66.26.5 Protocol(index as Integer) as string

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: An array containing the names protocols that libCURL supports (using lowercase letters).
Notes: The protocol names are the same as would be used in URLs.
Index is zero based.

66.26.6 Protocols as String()

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: An array containing the names protocols that libCURL supports (using lowercase letters).
Example:

```
Var v as new CURLSVersionMBS
Var Protocols() as string = v.Protocols
Var Names as string = string.FromArray(Protocols)
MessageBox Names
```

Notes: The protocol names are the same as would be used in URLs.

66.26.7 Properties

66.26.8 brotliVersion as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Brotli library version string.
Notes: Empty if library is not used in the CURL library you use.
(Read only property)

66.26.9 brotliVersionNumber as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Version of brotli version.
Notes: (Read only property)

66.26.10 CAInfo as String

MBS CURL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The built-in default CURLOPT_CAINFO.
Notes: Should be empty within plugin.
(Read only property)

66.26.11 CAPath as String

MBS CURL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The built-in default CURLOPT_CAPATH.
Example:

```
Var version As New CURLSVersionMBS
MessageBox "Default CAPath: " + version.CAPath
```

Notes: Should be empty within plugin.
(Read only property)

66.26.12 Features as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Bits which define what features libCURL can and can't.
Notes: Use the Supports Boolean properties instead.
Additional feature bits may be found in the libCURL documentation.
(Read only property)

66.26.13 gsaslVersion as String

MBS CURL Plugin, Plugin Version: 21.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version string of the GNU SASL Library version.
Notes: (Read only property)

66.26.14 Host as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: An ascii string showing what host information that this libCURL was built for.
Notes: As discovered by a configure script or set by the build environment.
e.g. "powerpc-apple-darwin8.0"
(Read only property)

66.26.15 hyperVersion as String

MBS CURL Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Human readable string.
Notes: (Read only property)

66.26.16 iconvVersionNumber as Integer

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Version number of iconv library.
Notes: (Read only property)

66.26.17 libidnVersion as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Version of LibIDN used.
Example:

```
Var version As New CURLSVersionMBS
MessageBox "libIDN Version: " + version.libidnVersion
```

Notes: Empty if library is not used in the CURL library you use.

(Read only property)

66.26.18 libsshVersion as String

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Version of LibSSH2 used.
Example:

```
Var version As New CURLSVersionMBS
MessageBox "LibSSH Version: " + version.libsshVersion
```

Notes: Empty if library is not used in the CURL library you use.
(Read only property)

66.26.19 LibZVersion as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: An ascii string (there is no numerical version).
Example:

```
Var version As New CURLSVersionMBS
MessageBox "LibZ Version: " + version.LibZVersion
```

Notes: If libCURL has no libz support, this is "".
e.g. "1.2.3"
(Read only property)

66.26.20 nghttp2Version as String

MBS CURL Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version string for nghttp2 library.
Notes: (Read only property)

66.26.21 nghttp2VersionNumber as Integer

MBS CURL Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version number for nghttp2.
Notes: Numeric nghttp2 version: (MAJOR * 65536) + (MINOR * 256) + PATCH
(Read only property)

66.26.22 ProtocolCount as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of entries in the Protocol array.
Notes: (Read only property)

66.26.23 quicVersion as String

MBS CURL Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of quic version.
Notes: human readable quic (+ HTTP/3) library version.
(Read only property)

66.26.24 SSLVersion as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: An ascii string for the OpenSSL version used.
Example:

```
Var version As New CURLSVersionMBS
MessageBox "SSL Version: " + version.SSLVersion
```

Notes: If libCURL has no SSL support, this is "".
e.g. " OpenSSL/0.9.7l"
(Read only property)

66.26.25 SupportsASYNCHDNS as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether libCURL was built with support for asynchronous name lookups, which allows more exact timeouts (even on Windows) and less blocking when using the multi interface.
Notes: (added in 7.10.7)

(Read only property)

66.26.26 SupportsBrotli as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Brotli features are present.
Notes: (Read only property)

66.26.27 SupportsConv as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Character conversions supported.
Notes: (Read only property)

66.26.28 SupportsGSSAPI as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Built against a GSS-API library.
Notes: (Read only property)

66.26.29 SupportsGSSNEGOTIATE as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether libCURL supports HTTP GSS-Negotiate
Notes: (added in 7.10.6)
(Read only property)

66.26.30 SupportsHTTP2 as Boolean

MBS CURL Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether currently used CURL library supports HTTP2.
Example:

```
Var c as new CURLSMBS
Var v as CURLSVersionMBS = c.version
```

```
if v.SupportsHTTP2 then
MessageBox "HTTP2 is supported"
else
MessageBox "HTTP2 is not supported"
end if
```

Notes: While our CURL Plugin with CURLSMBS plugin may not support this currently, you could use LoadLibrary function to load a CURL library supporting it.
(Read only property)

66.26.31 SupportsHTTP3 as Boolean

MBS CURL Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether HTTP3 features are present.
Example:

```
Var version As New CURLSVersionMBS
MessageBox "Supports HTTP/3: " + version.SupportsHTTP3.ToString
```

Notes: (Read only property)

66.26.32 SupportsHTTPSProxy as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: HTTPS-proxy support built-in.
Notes: (Read only property)

66.26.33 SupportsIDN as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether libCURL was built with support for IDNA, domain names with international letters.
Example:

```
Var version As New CURLSVersionMBS
MessageBox "Supports IDN: " + version.SupportsIDN.ToString
```

Notes: (Added in 7.12.0)
(Read only property)

66.26.34 SupportsIPV6 as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether libCURL supports IPv6
Example:

```
Var version As New CURLSVersionMBS
MessageBox "Supports IPv6: " + version.SupportsIPV6.ToString
```

Notes: (Read only property)

66.26.35 SupportsKERBEROS4 as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether libCURL supports kerberos4 (when using FTP).
Notes: (Read only property)

66.26.36 SupportsKerberos5 as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Kerberos V5 auth is supported.
Notes: (Read only property)

66.26.37 SupportsLARGEFILE as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether libCURL was built with support for large files.
Example:

```
Var version As New CURLSVersionMBS
MessageBox "Supports large file: " + version.SupportsLARGEFILE.ToString
```

Notes: (Added in 7.11.1)
(Read only property)

66.26.38 SupportsLIBZ as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether libCURL supports HTTP deflate using libz
Example:

```
Var version As New CURLSVersionMBS
MessageBox "Supports libz: " + version.SupportsLIBZ.ToString
```

Notes: (Added in 7.10)
(Read only property)

66.26.39 SupportsMultiSSL as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiple SSL backends available.
Example:

```
Var version As New CURLSVersionMBS
MessageBox "Supports MultiSSL: " + version.SupportsMultiSSL.ToString
```

Notes: (Read only property)

66.26.40 SupportsNTLM as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether libCURL supports HTTP NTLM
Example:

```
Var c as new CURLSMBS
Var v as CURLSVersionMBS = c.Version

MessageBox "SupportsNTLM: "+str(v.SupportsNTLM)
```

Notes: (added in 7.10.6)
(Read only property)

66.26.41 SupportsNTLMWB as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: NTLM delegation to winbind helper is supported.
Notes: (Read only property)

66.26.42 SupportsPSL as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mozilla's Public Suffix List, used for cookie domain verification.
Notes: (Read only property)

66.26.43 SupportsSPNEGO as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether libCURL was built with support for SPNEGO authentication
Notes: (Simple and Protected GSS-API Negotiation Mechanism, defined in RFC 2478.) (added in 7.10.8)
(Read only property)

66.26.44 SupportsSSL as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether libCURL supports SSL (HTTPS/FTPS)
Notes: (Added in 7.10)
(Read only property)

66.26.45 SupportsSSPI as Boolean

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether libCURL was built with support for SSPI.
Notes: This is only available on Windows and makes libCURL use Windows-provided functions for NTLM authentication. It also allows libCURL to use the current user and the current user's password without the app having to pass them on. (Added in 7.13.2)
(Read only property)

66.26.46 SupportsTLSAUTHSRP as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: TLS-SRP auth is supported.
Notes: (Read only property)

66.26.47 SupportsUnicode as Boolean

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether unicode for Windows is enabled.
Notes: libcurl was built with Unicode support on Windows. This makes non-ASCII characters work in filenames and options passed to libcurl. (Added in 7.72.0)
(Read only property)

66.26.48 SupportsUnixSockets as Boolean

MBS CURL Plugin, Plugin Version: 18.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unix domain sockets support.
Notes: (Read only property)

66.26.49 SupportsZSTD as Boolean

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Supports HTTP zstd content encoding using zstd library.
Notes: Added in CURL 7.72.0
(Read only property)

66.26.50 Version as String

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: An ascii string for the libCURL version.
Example:

```
Var version As New CURLSVersionMBS
MessageBox "Version: " + version.Version
```

Notes: e.g. "7.13.1"
(Read only property)

66.26.51 VersionNumber as Integer

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of libCURL as number.
Notes: a 24 bit number created like this:
<8 bits major number>| <8 bits minor number>| <8 bits patch number>.
Version 7.9.8 is therefore returned as 0x070908.
(Read only property)

66.26.52 zstdVersion as String

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Human readable string version for zstd library.
Notes: (Read only property)

66.26.53 zstdVersionNumber as Integer

MBS CURL Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Numeric Zstd version.
Notes: Major 8 bits, minor 12 bits, Patch 12 bits.
(Read only property)

66.27 class CURLSWebSocketFrameMBS

66.27.1 class CURLSWebSocketFrameMBS

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a WebSocket frame.
Example:

```
// connect to a WebSocket server with CURL, send a text and read the answer
Var curl As New CURLSMBS
curl.OptionURL = "wss://echo.websocket.org"
curl.OptionConnectOnly = 2 // keep the connection for WebSocketSend/WebSocketReceive
Var result As Integer = curl.Perform
If result <>0 Then
MessageBox "Connect failed: " + result.ToString
Return
End If

Var message As MemoryBlock = "Hello"
Call curl.WebSocketSend(message, 0, CURLSWebSocketFrameMBS.kFlagText)

For i As Integer = 1 To 50 // poll a few times for the answer
Var frame As CURLSWebSocketFrameMBS = curl.WebSocketReceive
If frame <>Nil And frame.FlagText Then
MessageBox "Received: " + frame.Text
Exit
End If
Next
```

Notes: Var curl as CURLSMBS // your curl handle

Var m as CURLSWebSocketFrameMBS = curl.WebSocketReceive

if m <>nil then
TextAreaLog.AddText "Received: "+m.Text
end if

66.27.2 Properties

66.27.3 BytesLeft as Int64

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Number of pending bytes left of the payload.
Notes: (Read only property)

66.27.4 BytesReceived as Int64

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of bytes received.
Notes: (Read only property)

66.27.5 Data as MemoryBlock

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The data read.
Notes: (Read only property)

66.27.6 FlagBinary as Boolean

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This is binary data.
Notes: (Read only property)

66.27.7 FlagClose as Boolean

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Close this transfer.
Notes: (Read only property)

66.27.8 FlagContinue as Boolean

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This is not the final fragment of the message, which implies that there will be another fragment coming as part of the same message where this bit is not set.
Notes: (Read only property)

66.27.9 FlagOffset as Boolean

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This is a partial fragment.
Notes: The provided data is only a partial fragment and there will be more in a following call to WebSocketSend(). When sending only a piece of the fragment like this, the fragsize must be provided with the total expected fragment size in the first call and it needs to be zero in subsequent calls.
(Read only property)

66.27.10 FlagPing as Boolean

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This as a ping.

66.27.12 Flags as Integer

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Flags for this packet.
Notes: See kFlag* contants.
(Read only property)

66.27.13 FlagText as Boolean

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The buffer contains text data.
Notes: Note that this makes a difference to WebSocket but CURL itself will not make any verification of the content or precautions that you actually send valid UTF-8 content.
(Read only property)

66.27.14 Offset as Int64

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The offset of this data into the frame.
Notes: (Read only property)

66.27.15 Text as String

MBS CURL Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The data read as text.
Notes: If this is not a binary transfer, we put the text here.
(Read only property)

66.27.16 Constants

Flags

Constant	Value	Description
kFlagBinary	2	This is binary data.
kFlagClose	8	Close this transfer.
kFlagContinue	4	This is not the final fragment of the message, which implies that there will be another fragment coming as part of the same message where this bit is not set.
kFlagOffset	32	This is a partial fragment. The provided data is only a partial fragment and there will be more in a following call to WebSocketSend(). When sending only a piece of the fragment like this, the fragsize must be provided with the total expected fragment size in the first call and it needs to be zero in subsequent calls.
kFlagPing	16	This as a ping.
kFlagPong	64	This is a pong.
kFlagText	1	The buffer contains text data. Note that this makes a difference to WebSocket but CURL itself will not make any verification of the content or precautions that you actually send valid UTF-8 content.

66.28 class CURLURLMBS

66.28.1 class CURLURLMBS

MBS CURL Plugin, Plugin Version: 18.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSURLMBS instead.
Function: The class for CURL's URL parser.
Notes: Subclass of the CURLSURLMBS class.

66.29 class CURLVersionMBS

66.29.1 class CURLVersionMBS

MBS CURL Plugin, Plugin Version: 9.8, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use CURLSVersionMBS instead. **Function:** A class to hold version information from libCURL.
Notes: Subclass of the CURLSVersionMBS class.

66.31 Globals

66.31.1 FileExtensionToMimeTypeMBS(FileExtension as String) as string

MBS CURL Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds a mime type for a file extension.
Example:

```
Var FileExtension as string = MimeTypeToFileExtensionMBS("application/pdf")
Var MimeType as string = FileExtensionToMimeTypeMBS("pdf")
Break
```

Notes: Please report any missing mime type in our lookup table, so we can add more.
See also MimeTypeToFileExtensionMBS.
Returns empty string if not found.

66.31.2 MimeTypeToFileExtensionMBS(MimeType as String) as string

MBS CURL Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns file extension for given mime type.
Example:

```
Var FileExtension as string = MimeTypeToFileExtensionMBS("application/pdf")
Var MimeType as string = FileExtensionToMimeTypeMBS("pdf")
Break
```

Notes: Extension is returned with dot prefix.
Please report any missing file extensions in our lookup table, so we can add more.
See also FileExtensionToMimeTypeMBS.
Returns empty string if not found.

Currency, Date and Time Format

67.1 Globals

67.1.1 CDblMBS(text as string, byref value as Double, locale as string = "") as boolean

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses a double value from a text with given locale.
Example:

```
Var value as Double
if CDblMBS("12,345", value, "de_DE") then
MessageBox str(value)
end if
```

Notes: Returns true on success and false on failure.
Value is set to the value detected.
Raises exception on invalid locale.

67.1.2 FormatDateMBS(format as string, value as date, locale as string = "") as string

MBS Util Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Formats a date with C time formatting functions.
Example:

```
// for Mac, Windows and Linux we usually have different locale names
Var fr as string
#if TargetMacOS then
fr = "fr_FR"
#elseif TargetWin32 then
fr = "fra"
#elseif TargetLinux
fr = "fr_FR.UTF8"
#else
?
#endif

Var d as new date
MessageBox FormatDateMBS("%x %X", d, fr)
```

Notes: Please use FormatDateTimeMBS function for iOS.

locale is the name of the locale to use. You can pass empty string to use default/current locale.
Format is a format string like for strftime command in C.

The format specification is a string and may contain special character sequences called conversion specifications, each of which is introduced by a '%' character and terminated by some other character known as a conversion specifier character. All other character sequences are ordinary character sequences.

The characters of ordinary character sequences (including the null byte) are copied verbatim from format to s. However, the characters of conversion specifications are replaced as follows:

Some conversion specifications can be modified by preceding the conversion specifier character by the E or O modifier to indicate that an alternative format should be used. If the alternative format or specification does not exist for the current locale, the behavior will be as if the unmodified conversion specification were used. (SU) The Single UNIX Specification mentions %Ec, %EC, %Ex, %EX, %Ey, %EY, %Od, %Oe, %OH, %OI, %Om, %OM, %OS, %Ou, %OU, %OV, %Ow, %OW, %Oy, where the effect of the O modifier is to use alternative numeric symbols (say, roman numerals), and that of the E modifier is to use a locale-dependent alternative representation.

67.1.3 FormatDateTimeMBS(format as string, value as dateTime, locale as string = "") as string

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Formats a date with C time formatting functions.
Example:

```
// format a date with strftime style placeholders and a locale
Var d As DateTime = DateTime.Now
MessageBox FormatDateTimeMBS("%A, %d. %B %Y %H:%M", d, "de_DE") + EndOfLine + _
FormatDateTimeMBS("%Y-%m-%dT%H:%M:%S", d)
```

Notes: Same as FormatDateMBS, but using DateTime class instead.

67.1.4 FormatMBS(format as string, value as Double, locale as string = "") as string

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Formats a double value.
Example:

```
MessageBox FormatMBS("%1.2f", 12.345, "de_DE")
```

Notes: locale is the name of the locale to use. You can pass empty string to use default/current locale. Format is a format string like for printf command in C.

The FormatMBS formats the value under control of the format. The format is a character string which contains three types of objects: plain characters, which are simply copied to standard output, character escape sequences which are converted and copied to the standard output, and format specifications, each of which causes printing of the next successive argument.

Character escape sequences are in backslash notation as defined in the ANSI X3.159-1989 ("ANSI C89"), with extensions. The characters and their meanings are as follows:

Each format specification is introduced by the percent character ("%"). The remainder of the format specification includes, in the following order:

Zero or more of the following flags:

Field Width:
An optional digit string specifying a field width; if the output string has fewer characters than the field width it will be blank-padded on the left (or right, if the left-adjustment indicator has been given) to make up the field width (note that a leading zero is a flag, but an embedded zero is part of a field width);

Precision:
An optional period, '.', followed by an optional digit string giving a precision which specifies the number of digits to appear after the decimal point, for e and f formats, or the maximum number of characters to be printed from a string; if the digit string is missing, the precision is treated as zero;

Format:
A character which indicates the type of format to use (one of fFeEgG). The uppercase formats differ from their lowercase counterparts only in that the output of the former is entirely in uppercase. The floating-point format specifiers (fFeEgGaA) may be prefixed by an L to request that additional precision be used, if available.

A field width or precision may be '*' instead of a digit string. In this case an argument supplies the field width or precision.

The format characters and their meanings are:

The decimal point character is defined depending on the locale you pass.
In no case does a non-existent or small field width cause truncation of a field; padding takes place only if the specified field width exceeds the actual width.

The plugin function returns the formatted number string. Maximum length is 100 characters and text encoding is ASCII.
Invalid format string or locale causes an exception.

67.1.5 ParseDateMBS(format as string, text as string, byref value as date, locale as string = "") as boolean

MBS Util Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Parses a date.
Example:

```
Var s as string = "2013-11-12 18:31:01"
Var f as string = "%Y-%m-%d %H:%M:%S"
Var d as date

if ParseDateMBS(f, s, d) then
MessageBox d.LongDate + " "+ d.LongTime
end if
```

Notes: Please use ParseDateTimeMBS function for iOS.

locale is the name of the locale to use. You can pass empty string to use default/current locale.
Format is a format string like for strftime command in C.

On success returns true. But even for half parsed dates you can find values in date.
Locale not supported on Windows.
The plugin does not support parsing time zones.

The ParseDateMBS function is the converse function to FormateDateMBS and converts the character string pointed to by s to values which are stored in the date, using the format specified by format. Here format is a character string that consists of field descriptors and text characters, reminiscent of scanf (in C++). Each field descriptor consists of a % character followed by another character that specifies the replacement for the field descriptor. All other characters in the format string must have a matching character in the input string, except for whitespace, which matches zero or more whitespace characters in the input string. There should be whitespace or other alphanumeric characters between any two field descriptors.

The ParseDateMBS function processes the input string from left to right. Each of the three possible input elements (whitespace, literal, or format) are handled one after the other. If the input cannot be matched to the format string the function stops. The remainder of the format and input strings are not processed.

The supported input field descriptors are listed below. In case a text string (such as a weekday or month name) is to be matched, the comparison is case insensitive. In case a number is to be matched, leading zeros are permitted but not required.

Some field descriptors can be modified by the E or O modifier characters to indicate that an alternative format or specification should be used. If the alternative format or specification does not exist in the current locale, the unmodified field descriptor is used.
The E modifier specifies that the input string may contain alternative locale-dependent versions of the date and time representation:

Returns true on success. If the functions fails to match all of the format string and therefore an error occurred the function returns false.

Before libc 5.4.13 whitespace (and the 'n' and 't' specifications) was not handled, no 'E' and 'O' locale modifier characters were accepted, and the 'C' specification was a synonym for the 'c' specification.

The 'y' (year in century) specification is taken to specify a year in the 20th century by libc4 and libc5. It is taken to be a year in the range 1950-2049 by glibc 2.0. It is taken to be a year in 1969-2068 since glibc 2.1.

For reasons of symmetry, glibc tries to support for ParseDateMBS the same format characters as for FormatDateMBS. (In most cases the corresponding fields are parsed, but no field in tm is changed.) This leads to

Similarly, because of GNU extensions to FormatDateMBS, %k is accepted as a synonym for %H, and %l should be accepted as a synonym for %I, and %P is accepted as a synonym for %p.

The glibc implementation does not require whitespace between two field descriptors.

67.1.6 ParseDateTimeMBS(format as string, text as string, byref value as dateTime, locale as string = "") as boolean

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Parses a date.
Example:

```
// parse a date in a fixed format
Var d As DateTime
If ParseDateTimeMBS("%d.%m.%Y %H:%M", "24.12.2026 18:30", d) Then
MessageBox d.SQLDateTime
Else
MessageBox "Can't parse the date."
End If
```

Notes: Same as ParseDateMBS, but using DateTime class instead.

67.2 class LocaleMBS

67.2.1 class LocaleMBS

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The plugin class which provides parameters for formatting numbers, especially currency values.
Example:

```
Var l as LocaleMBS = LocaleMBS.Locale("de_DE")
MessageBox l.CurrencySymbol
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

67.2.2 Methods

67.2.3 Constructor

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

67.2.4 Locale(Locale as string = "") as LocaleMBS

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries C locale for the given locale name.
Example:

```
Var l as LocaleMBS = LocaleMBS.Locale("de_DE")
MessageBox l.CurrencySymbol
```

Notes: Returns nil if no locale for that name was found.

If name is empty, you get current locale. If you use locale name "C", you get the default C locale.
The locale name depends on the OS. For Mac and Linux you can see available locales in /usr/share/locale directory.
For Windows, please take a look here:
http://msdn.microsoft.com/en-us/library/hzz3tw78(v=vs.71).aspx

67.2.5 Properties

67.2.6 CurrencySymbol as String

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The local currency symbol.
Example:

```
Var l as LocaleMBS = LocaleMBS.Locale("de_DE")
MessageBox l.CurrencySymbol
```

Notes: (Read only property)

67.2.7 DecimalPoint as String

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The decimal point character, except for currency values, cannot be an empty string.
Notes: (Read only property)

67.2.8 FracDigits as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of digits after the decimal point in the local style for currency values.
Notes: (Read only property)

67.2.9 Grouping as String

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sizes of the groups of digits, except for currency values.
Notes: This is a string where the asc value gives the actual value, representing group size from low order digit groups to high order (right to left). The list may be terminated with 0 or CHAR_MAX. If the list is terminated with 0, the last group size before the 0 is repeated to account for all the digits. If the list is terminated with CHAR_MAX, no more grouping is performed.

See example project for a function to decode.
(Read only property)

67.2.10 IntCurrSymbol as String

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The standardized international currency symbol.
Notes: (Read only property)

67.2.11 IntFracDigits as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of digits after the decimal point in an international-style currency value.
Notes: (Read only property)

67.2.12 IntNegCSPrecedes as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the currency symbol precedes the currency value for negative values, false if it follows.
Notes: For internationally formatted monetary quantities.
(Read only property)

67.2.13 IntNegSepBySpace as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if a space is inserted between the currency symbol and the currency value for negative values, false otherwise.
Notes: For internationally formatted monetary quantities.
(Read only property)

67.2.14 IntNegSignPosition as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the NegativeSign with respect to a negative quantity and the CurrencySymbol.
Notes: For internationally formatted monetary quantities.

Possible values:

(Read only property)

67.2.15 IntPosCSPrecedes as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the currency symbol precedes the currency value for nonnegative values, false if it follows.
Notes: For internationally formatted monetary quantities.
(Read only property)

67.2.16 IntPosSepBySpace as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if a space is inserted between the currency symbol and the currency value for nonnegative values, false otherwise.
Notes: For internationally formatted monetary quantities.
(Read only property)

67.2.17 IntPosSignPosition as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the PositiveSign with respect to a nonnegative quantity and the CurrencySymbol.
Notes: For internationally formatted monetary quantities.

Possible values:

(Read only property)

67.2.18 monDecimalPoint as String

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The decimal point character for currency values.
Notes: (Read only property)

67.2.19 monGrouping as String

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Like grouping but for currency values.
Notes: (Read only property)

67.2.20 monThousandsSep as String

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The separator for digit groups in currency values.
Notes: (Read only property)

67.2.21 Name as String

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the locale.
Notes: The name may be different to the one you asked for as some locales are mapped to others internally. (Read only property)

67.2.22 NegativeSign as String

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The character used to denote negative currency values, usually a minus sign.
Notes: (Read only property)

67.2.23 NegCSPrecedes as Boolean

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the currency symbol precedes the currency value for negative values, false if it follows.
Notes: (Read only property)

67.2.24 NegSepBySpace as Boolean

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if a space is inserted between the currency symbol and the currency value for negative values, false otherwise.
Notes: (Read only property)

67.2.25 NegSignPosition as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the NegativeSign with respect to a negative quantity and the CurrencySymbol.
Notes: Possible values:

(Read only property)

67.2.26 PosCSPrecedes as Boolean

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the currency symbol precedes the currency value for nonnegative values, false if it follows.
Notes: (Read only property)

67.2.27 PositiveSign as String

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The character used to denote nonnegative currency values, usually the empty string.
Notes: (Read only property)

67.2.28 PosSepBySpace as Boolean

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if a space is inserted between the currency symbol and the currency value for nonnegative values, false otherwise.
Notes: (Read only property)

67.2.29 PosSignPosition as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The location of the PositiveSign with respect to a nonnegative quantity and the CurrencySymbol.
Notes: Possible values:

(Read only property)

67.2.30 ThousandsSep as String

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The separator between groups of digits before the decimal point, except for currency values.
Notes: (Read only property)

%a The abbreviated weekday name according to the current locale.

%A The full weekday name according to the current locale.

%b The abbreviated month name according to the current locale.

%B The full month name according to the current locale.

%c The preferred date and time representation for the current locale.

%C The century number (year/100) as a 2-digit integer. (SU)

%d The day of the month as a decimal number (range 01 to 31).

%D Equivalent to %m/%d/%y. (Yecch-for Americans only. Americans should note that in other countries %d/%m/%y is rather common. This means that in international context this format is ambiguous and should not be used.) (SU)

%e Like %d, the day of the month as a decimal number, but a leading zero is replaced by a space. (SU)

%E Modifier: use alternative format, see below. (SU)

%F Equivalent to %Y-%m-%d (the ISO 8601 date format). (C99)

%G The ISO 8601 week-based year (see NOTES) with century as a decimal number. The 4-digit year corresponding to the ISO week number (see %V). This has the same format and value as %Y, except that if the ISO week number belongs to the previous or next year, that year is used instead. (TZ)

%g Like %G, but without century, that is, with a 2-digit year (00-99). (TZ)

%h Equivalent to %b. (SU)

%H The hour as a decimal number using a 24-hour clock (range 00 to 23).

%I The hour as a decimal number using a 12-hour clock (range 01 to 12).

%j The day of the year as a decimal number (range 001 to 366).

%k The hour (24-hour clock) as a decimal number (range 0 to 23); single digits are preceded by a blank. (See also %H.) (TZ)

%l The hour (12-hour clock) as a decimal number (range 1 to 12); single digits are preceded by a blank. (See also %I.) (TZ)

%m The month as a decimal number (range 01 to 12).

%M The minute as a decimal number (range 00 to 59).

%n A newline character. (SU)

%O Modifier: use alternative format, see below. (SU)

%p Either "AM" or "PM" according to the given time value, or the corresponding strings for the current locale. Noon is treated as "PM" and midnight as "AM".

%P Like %p but in lowercase: "am" or "pm" or a corresponding string for the current locale. (GNU)

%r The time in a.m. or p.m. notation. In the POSIX locale this is equivalent to %I:%M:%S %p. (SU)

%R The time in 24-hour notation (%H:%M). (SU) For a version including the seconds, see %T below.

%s The number of seconds since the Epoch, 1970-01-01 00:00:00 +0000 (UTC). (TZ)

%S The second as a decimal number (range 00 to 60). (The range is up to 60 to allow for occasional leap seconds.)

%t A tab character. (SU)

%T The time in 24-hour notation (%H:%M:%S). (SU)

%u The day of the week as a decimal, range 1 to 7, Monday being 1. See also %w. (SU)

%U The week number of the current year as a decimal number, range 00 to 53, starting with the first Sunday as the first day of week 01. See also %V and

\a	Write a <bell>character.
\b	Write a <backspace>character.
\c	Ignore remaining characters in this string.
\f	Write a <form-feed>character.
\n	Write a <new-line>character.
\r	Write a <carriage return>character.
\t	Write a <tab>character.
\v	Write a <vertical tab>character.
\'	Write a <single quote>character.
\\	Write a backslash character.
\num or \0num	Write an 8-bit character whose ASCII value is the 1-, 2-, or 3-digit octal number num.

#	A '#' character specifying that the value should be printed in an "alternate form". For e, E, f, g, and G, formats, the result will always contain a decimal point, even if no digits follow the point (normally, a decimal point only appears in the results of those formats if a digit follows the decimal point). For g and G formats, trailing zeros are not removed from the result as they would otherwise be;
-	A minus sign '-' which specifies left adjustment of the output in the indicated field;
+	A '+' character specifying that there should always be a sign placed before the number when using signed formats.
space	A space specifying that a blank should be left before a positive number for a signed format. A '+' overrides a space if both are used;
0	A zero '0' character indicating that zero-padding should be used rather than blank-padding. A '-' overrides a '0' if both are used;

fF The argument is printed in the style ' [-] ddd.ddd' where the number of d's after the decimal point is equal to the precision specification for the argument. If the precision is missing, 6 digits are given; if the precision is explicitly 0, no digits and no decimal point are printed. The values infinity and NaN are printed as 'inf' and 'nan', respectively.

eE The argument is printed in the style e ' [-d.ddd+-dd] ' where there is one digit before the decimal point and the number after is equal to the precision specification for the argument; when the precision is missing, 6 digits are produced. The values infinity and NaN are printed as 'inf' and 'nan', respectively.

gG The argument is printed in style f (F) or in style e (E) whichever gives full precision in minimum space.

aA The argument is printed in style ' [-h.hhh+-pd] ' where there is one digit before the hexadecimal point and the number after is equal to the precision specification for the argument; when the precision is missing, enough digits are produced to convey the argument's exact double-precision floating-point representation. The values infinity and NaN are printed as 'inf' and 'nan', respectively.

% Print a '%'; no argument is used.

%%	The % character.
%a or %A	The weekday name according to the current locale, in abbreviated form or the full name.
%b or %B or %h	The month name according to the current locale, in abbreviated form or the full name.
%c	The date and time representation for the current locale.
%C	The century number (0-99).
%d or %e	The day of month (1-31).
%D	Equivalent to %m/%d/%y. (This is the American style date, very confusing to non-Americans, especially since %d/%m/%y is widely used in Europe. The ISO 8601 standard format is %Y-%m-%d.)
%H	The hour (0-23).
%I	The hour on a 12-hour clock (1-12).
%j	The day number in the year (1-366).
%m	The month number (1-12).
%M	The minute (0-59).
%n	Arbitrary whitespace.
%p	The locale's equivalent of AM or PM. (Note: there may be none.)
%r	The 12-hour clock time (using the locale's AM or PM). In the POSIX locale equivalent to %I:%M:%S %p. If t_fmt_ampm is empty in the LC_TIME part of the current locale then the behavior is undefined.
%R	Equivalent to %H:%M.
%S	The second (0-60; 60 may occur for leap seconds; earlier also 61 was allowed).
%t	Arbitrary whitespace.
%T	Equivalent to %H:%M:%S.
%U	The week number with Sunday the first day of the week (0-53). The first Sunday of January is the first day of week 1.
%w	The weekday number (0-6) with Sunday = 0.
%W	The week number with Monday the first day of the week (0-53). The first Monday of January is the first day of week 1.
%x	The date, using the locale's date format.
%X	The time, using the locale's time format.
%y	The year within century (0-99). When a century is not otherwise specified, values in the range 69-99 refer to years in the twentieth century (1969-1999); values in the range 00-68 refer to years in the twenty-first century (2000-2068).
%Y	The year, including century (for example, 1991).

%Ec	The locale's alternative date and time representation.
%EC	The name of the base year (period) in the locale's alternative representation.
%Ex	The locale's alternative date representation.
%EX	The locale's alternative time representation.
%Ey	The offset from %EC (year only) in the locale's alternative representation.
%EY	The full alternative year representation. The O modifier specifies that the numerical input may be in an alternative locale-dependent format:
%Od or %Oe	The day of the month using the locale's alternative numeric symbols; leading zeros are permitted but not required.
%OH	The hour (24-hour clock) using the locale's alternative numeric symbols.
%OI	The hour (12-hour clock) using the locale's alternative numeric symbols.
%Om	The month using the locale's alternative numeric symbols.
%OM	The minutes using the locale's alternative numeric symbols.
%OS	The seconds using the locale's alternative numeric symbols.
%OU	The week number of the year (Sunday as the first day of the week) using the locale's alternative numeric symbols.
%Ow	The number of the weekday (Sunday=0) using the locale's alternative numeric symbols.
%OW	The week number of the year (Monday as the first day of the week) using the locale's alternative numeric symbols.
%Oy	The year (offset from %C) using the locale's alternative numeric symbols.

%F	Equivalent to %Y-%m-%d, the ISO 8601 date format.
%g	The year corresponding to the ISO week number, but without the century (0-99).
%G	The year corresponding to the ISO week number. (For example, 1991.)
%u	The day of the week as a decimal number (1-7, where Monday = 1).
%V	The ISO 8601:1988 week number as a decimal number (1-53). If the week (starting on Monday) containing 1 January has four or more days in the new year, then it is considered week 1. Otherwise, it is the last week of the previous year, and the next week is week 1.
%z	An RFC-822/ISO 8601 standard timezone specification.
%Z	The timezone name.
%s	The number of seconds since the Epoch, 1970-01-01 00:00:00 +0000 (UTC). Leap seconds are not counted unless leap second support is available.

67.3 class NSLocaleDateMBS

67.3.1 class NSLocaleDateMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: A class for a date format.
Example:

```
// list month and weekday names in German
Var locale As New NSLocaleMBS("de_DE")
Var info As New NSLocaleDateMBS(locale)

MessageBox "Months: " + String.FromArray(info.monthSymbols, ", ") + EndOfLine + _
"Short weekdays: " + String.FromArray(info.shortWeekdaySymbols, ", ") + EndOfLine + _
"AM/PM: " + info.AMSymbol + " / " + info.PMSymbol
```

Notes: Should be used with the NSLocaleMBS class, but can be used on its own, too.
Blog Entries

- MBS Xojo Plugins, version 22.2pr1
- MBS Xojo / Real Studio Plugins, version 13.5pr4

67.3.2 Methods

67.3.3 Constructor

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The default constructor.
Notes: Creates a different object than the once you get by the NSLocaleMBS class. But this date information you get than works on Mac OS X 10.0. The NSLocaleMBS class is Mac OS X 10.4 only.
See also:

- 67.3.4 Constructor(locale as NSLocaleMBS) 11934

67.3.4 Constructor(locale as NSLocaleMBS)

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The constructor.
Example:

```
Var n1 as new NSLocaleDateMBS
Var n2 as new NSLocaleDateMBS(NSLocaleMBS.currentLocale)
```

```
Var n3 as new NSLocaleDateMBS(NSLocaleMBS.systemLocale)

break // see differences in debugger
```

Notes: Initializes the object for a given locale.
See also:

- 67.3.3 Constructor 11934

67.3.5 eraSymbols as string()

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the array of era symbols.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.eraSymbols

MessageBox join(s,", ")

// shows for example "v. Chr., n. Chr." (in Germany)
// shows for example "BC, AD" (in USA)
// shows for example "av. J.-C., ap. J.-C." (in France)
```

Notes: for example, "BCE", "CE" in the USA.
On error returns an empty array.

67.3.6 longEraSymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the long era symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.longEraSymbols

MessageBox join(s,", ")

// shows for example "v. Chr., n. Chr." (in Germany)
// shows for example "Before Christ, Anno Domini" (in USA)
// shows for example "avant J√©sus-Christ, apr√®s J√©sus-Christ" (in France)
```

Notes: An array containing strings representing the era symbols for the receiver (for example, { "Before Common Era", "Common Era" }).
Available in Mac OS X v10.5 and later.

67.3.7 monthSymbols as string()

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the month symbols.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.monthSymbols

MessageBox join(s,", ")

// shows for example "Januar, Februar, M√§rz, April, Mai, Juni, Juli, August, September, Oktober, November, Dezember" (in Germany)
// shows for example "January, February, March, April, May, June, July, August, September, October, November, December" (in USA)
// shows for example "janvier, f√©vrier, mars, avril, mai, juin, juillet, ao√ªt, septembre, octobre, novembre, d√©cembre" (in France)
```

Notes: On error returns an empty array.

67.3.8 quarterSymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the quarter symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.quarterSymbols

MessageBox join(s,", ")

// shows for example "1. Quartal, 2. Quartal, 3. Quartal, 4. Quartal" (in Germany)
// shows for example "1st quarter, 2nd quarter, 3rd quarter, 4th quarter" (in USA)
// shows for example "1er trimestre, 2e trimestre, 3e trimestre, 4e trimestre" (in France)
```

Notes: Available in Mac OS X v10.5 and later.

67.3.9 shortMonthSymbols as string()

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the array of short month.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.shortMonthSymbols

MessageBox join(s,", ")

// shows for example "Jan, Feb, Mrz, Apr, Mai, Jun, Jul, Aug, Sep, Okt, Nov, Dez" (in Germany)
// shows for example "Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec" (in USA)
// shows for example "janv., f√©vr., mars, avr., mai, juin, juil., ao√ªt, sept., oct., nov., d√©c." (in France)
```

Notes: On error returns an empty array.

67.3.10 shortQuarterSymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the short quarter symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.shortQuarterSymbols

MessageBox join(s,", ")

// shows for example "Q1, Q2, Q3, Q4" (in Germany)
// shows for example "Q1, Q2, Q3, Q4" (in USA)
// shows for example "T1, T2, T3, T4" (in France)
```

Notes: Available in Mac OS X v10.5 and later.

67.3.11 shortStandaloneMonthSymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the short standalone month symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.shortStandaloneMonthSymbols

MessageBox join(s,", ")

// shows for example "Jan, Feb, M√§r, Apr, Mai, Jun, Jul, Aug, Sep, Okt, Nov, Dez" (in Germany)
// shows for example "Jan, Feb, Mar, Apr, May, Jun, Jul, Aug, Sep, Oct, Nov, Dec" (in USA)
// shows for example "janv., f√©vr., mars, avr., mai, juin, juil., ao√ªt, sept., oct., nov., d√©c." (in France)
```

Notes: Available in Mac OS X v10.5 and later.

67.3.12 shortStandaloneQuarterSymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the short standalone quarter symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.shortStandaloneQuarterSymbols

MessageBox join(s,", ")

// shows for example "Q1, Q2, Q3, Q4" (in Germany)
// shows for example "Q1, Q2, Q3, Q4" (in USA)
// shows for example "T1, T2, T3, T4" (in France)
```

Notes: Available in Mac OS X v10.5 and later.

67.3.13 shortStandaloneWeekdaySymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the array of short standalone weekday symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.shortStandaloneWeekdaySymbols

MessageBox join(s,", ")

// shows for example "So., Mo., Di., Mi., Do., Fr., Sa." (in Germany)
// shows for example "Sun, Mon, Tue, Wed, Thu, Fri, Sat" (in USA)
// shows for example "dim., lun., mar., mer., jeu., ven., sam." (in France)
```

Notes: Available in Mac OS X v10.5 and later.

67.3.14 shortWeekdaySymbols as string()

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Sets the short weekday symbols.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.shortWeekdaySymbols

MessageBox join(s,", ")

// shows for example "So., Mo., Di., Mi., Do., Fr., Sa." (in Germany)
// shows for example "Sun, Mon, Tue, Wed, Thu, Fri, Sat" (in USA)
// shows for example "dim., lun., mar., mer., jeu., ven., sam." (in France)
```

Notes: On error returns an empty array.

67.3.15 standaloneMonthSymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the standalone month symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.standaloneMonthSymbols

MessageBox join(s,", ")
```

// shows for example "Januar, Februar, M√§rz, April, Mai, Juni, Juli, August, September, Oktober, November, Dezember" (in Germany)
// shows for example "January, February, March, April, May, June, July, August, September, October, November, December" (in USA)
// shows for example "janvier, f√©vrier, mars, avril, mai, juin, juillet, ao√ªt, septembre, octobre, novembre, d√©cembre" (in France)

Notes: Available in Mac OS X v10.5 and later.

67.3.16 standaloneQuarterSymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the standalone quarter symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.standaloneQuarterSymbols

MessageBox join(s,", ")

// shows for example "1. Quartal, 2. Quartal, 3. Quartal, 4. Quartal" (in Germany)
// shows for example "1st quarter, 2nd quarter, 3rd quarter, 4th quarter" (in USA)
// shows for example "1er trimestre, 2e trimestre, 3e trimestre, 4e trimestre" (in France)
```

Notes: Available in Mac OS X v10.5 and later.

67.3.17 standaloneWeekdaySymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the array of standalone weekday symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.standaloneWeekdaySymbols

MessageBox join(s,", ")

// shows for example "Sonntag, Montag, Dienstag, Mittwoch, Donnerstag, Freitag, Samstag" (in Germany)
// shows for example "Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday" (in USA)
// shows for example "dimanche, lundi, mardi, mercredi, jeudi, vendredi, samedi" (in France)
```

Notes: Available in Mac OS X v10.5 and later.

67.3.18 verySHortMonthSymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the very short month symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.verySHortMonthSymbols

MessageBox join(s,", ")

// shows for example "J, F, M, A, M, J, J, A, S, O, N, D" (in Germany)
// shows for example "J, F, M, A, M, J, J, A, S, O, N, D" (in USA)
// shows for example "J, F, M, A, M, J, J, A, S, O, N, D" (in France)
```

Notes: Available in Mac OS X v10.5 and later.

67.3.19 verySHortStandaloneMonthSymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the very short month symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.verySHortStandaloneMonthSymbols

MessageBox join(s,", ")

// shows for example "J, F, M, A, M, J, J, A, S, O, N, D" (in Germany)
// shows for example "J, F, M, A, M, J, J, A, S, O, N, D" (in USA)
// shows for example "J, F, M, A, M, J, J, A, S, O, N, D" (in France)
```

Notes: Available in Mac OS X v10.5 and later.

67.3.20 veryShortStandaloneWeekdaySymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the array of very short standalone weekday symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.veryShortStandaloneWeekdaySymbols

MessageBox join(s,", ")

// shows for example "S, M, D, M, D, F, S" (in Germany)
// shows for example "S, M, T, W, T, F, S" (in USA)
// shows for example "D, L, M, M, J, V, S" (in France)
```

Notes: Available in Mac OS X v10.5 and later.

67.3.21 veryShortWeekdaySymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the array of very short weekday symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.veryShortWeekdaySymbols

MessageBox join(s,", ")

// shows for example "S, M, D, M, D, F, S" (in Germany)
// shows for example "S, M, T, W, T, F, S" (in USA)
// shows for example "D, L, M, M, J, V, S" (in France)
```

Notes: Available in Mac OS X v10.5 and later.

67.3.22 weekdaySymbols as string()

MBS MacBase Plugin, Plugin Version: 10.0, Platform: macOS, Targets: All.

Function: Returns the array of weekday symbols for the receiver.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong
Var s(-1) as string = n.weekdaySymbols

MessageBox join(s,", ")

// shows for example "Sonntag, Montag, Dienstag, Mittwoch, Donnerstag, Freitag, Samstag" (in Germany)
// shows for example "Sunday, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday" (in USA)
// shows for example "dimanche, lundi, mardi, mercredi, jeudi, vendredi, samedi" (in France)
```

Notes: Available in Mac OS X v10.4 and later.

67.3.23 Properties

67.3.24 AMSymbol as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the AM symbol.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong

MessageBox n.AMSymbol // shows for example "vorm." (in Germany)
```

Notes: (Read only property)

67.3.25 dateFormat as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the date format string,
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong

MessageBox n.dateFormat // shows for example: "d. MMMM yyyy" (in Germany)
```

Notes: Format of this string (if object was made with new):
http://developer.apple.com/documentation/Cocoa/Conceptual/DataFormatting/Articles/dfDateFormatterSyntax.html#//apple_ref/doc/uid/20000194

If you got this object from NSLocale, it uses a different format.
(Read only property)

67.3.26 PMSymbol as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the PM symbol.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleDateMBS = l.DateLong

MessageBox n.PMSymbol // shows for example "nachm." (in Germany)
```

Notes: (Read only property)

67.4 class NSLocaleMBS

67.4.1 class NSLocaleMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The class for Cocoas localization data.
Example:

Var n as NSLocaleMBS

n=NSLocaleMBS.currentLocale

MessageBox n.CountryCode

Notes: Available in Mac OS X v10.4 and later.

67.4.2 Methods

67.4.3 autoupdatingCurrentLocale as NSLocaleMBS

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Returns the current logical locale for the current user.
Notes: The current logical locale for the current user. The locale is formed from the settings for the current user's chosen system locale overlaid with any custom settings the user has specified in System Preferences.

The object always reflects the current state of the current user's locale settings.

Settings you get from this locale do change as the user's settings change (contrast with currentLocale).

Note that if you cache values based on the locale or related information, those caches will of course not be automatically updated by the updating of the locale object.

Available in Mac OS X v10.5 and later.

67.4.4 availableLocaleIdentifiers as string()

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns an array of strings, each of which identifies a locale available on the system.
Example:

```
MessageBox join(NSLocaleMBS.availableLocaleIdentifiers,", ")

// shows "zh_Hans_CN, sq_AL, he_IL, uz_Latn, en_CA, zh, kk_Cyrl, sr_Cyrl,
// fr_CA, sr_Cyrl_RS, fr_LU, bg_BG, es_ES, da_DK, el_CY, ja_JP, kok_IN,
// mt_MT, ar_JO, de_LU, uz_Cyrl, pt_PT, af, ms_MY, nl_BE, es_US, en_PH,
// es_HN, be, sr_Latn_BA, es_CR, ca, vi_VN, zh_Hant_HK, bg, gu_IN, si_LK,
// am, or_IN, en_ZA, ar_YE, da, uk_UA, ar_OM, es_PE, cs_CZ, kk_Cyrl_KZ,
// de_AT, lv_LV, en_NZ, ar_BH, ar, en_AU, az_Cyrl, de, as, bn, zh_Hans_SG,
// es_PY, es_EC, ne_IN, pa_Guru_IN, fa, sw_KE, es_AR, az, fr_FR,
// en_US_POSIX, sr_Cyrl_BA, cs, zh_Hans, eu_ES, ga, en_PK, ar_LB, el,
// zh_Hant_TW, et_EE, fi, en, uz_Arab_AF, sw_TZ, it_CH, en_ZW, ha, eo,
// ar_SA, cy, th_TH, bn_BD, te_IN, ml_IN, he, es, fo, en_IN, et, om_KE,
// haw, eu, gl, ta_IN, zh_Hans_MO, id, fr, hi, ja, es_SV, hu_HU, en_SG,
// nn_NO, az_Latn, ii, id_ID, es_DO, fr_CH, ka, es_UY, en_MT, ar_QA, ar_TN,
// gu, de_CH, gv, sk_SK, hr, kn_IN, de_LI, ar_EG, el_GR, ar_SD, hu, af_NA,
// zh_Hant, ti_ER, ar_LY, is, ka_GE, it, om_ET, hy, ii_CN, hr_HR, ps_AF,
// pa_Arab_PK, es_NI, en_TT, pa_Guru, kk, kl, be_BY, km, zh_Hans_HK, kn,
// sv_SE, es_BO, ko, nb, ne_NP, pa_Arab, fr_MC, is_IS, ne, ar_SY, mk,
// uz_Arab, so_KE, ml, it_IT, hy_AM, sl_SI, ti_ET, uz_Latn_UZ, ar_AE,
// lt_LT, kw, pa, lt, nl, lv, so_SO, mr, nn, ru_RU, ms, ga_IE, fo_FO, mt,
// om, ar_MA, ms_BN, pl, ha_Latn, kok, mk_MK, or, uz_Cyrl_UZ, so_ET, de_DE,
// gl_ES, en_BW, en_JM, ar_IQ, ps, az_Latn_AZ, ta, pt, so_DJ, nl_NL, af_ZA,
// nb_NO, en_HK, fr_SN, si, km_KH, te, ro, ko_KR, mr_IN, sk, en_BE, en_MH,
// sl, th, ti, fr_BE, es_CL, pt_BR, en_VI, es_VE, sr_Latn_ME, so, hi_IN,
//as_IN, ru, de_BE, sq, en_GB, sr, fa_AF, es_MX, kw_GB, es_PR, ro_RO, uk,
// cy_GB, en_NA, fi_FI, ca_ES, az_Cyrl_AZ, en_IE, gv_GB, sv, tr, sw, vi,
// en_BZ, en_US, hy_AM_REVISED, ru_UA, ur_PK, ur, sr_Latn_RS, am_ET, bn_IN,
// ar_KW, haw_US, sr_Cyrl_ME, es_PA, es_CO, kl_GL, sr_Latn, uz, ur_IN,
// zh_Hant_MO, ha_Latn_NG, es_GT, tr_TR, fa_IR, pl_PL, sv_FI, ar_DZ"
```

Notes: Available in Mac OS X v10.4 and later.

67.4.5 canonicalLanguageIdentifierFromString(s as string) as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a canonical language identifier by mapping an arbitrary locale identification string to the canonical identifier.
Notes: s: A string representation of an arbitrary locale identifier.
Returns a string that represents the canonical language identifier for the specified arbitrary locale identifier.
Available in Mac OS X v10.6 and later.

67.4.6 canonicalLocaleIdentifierFromString(s as string) as string

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the canonical identifier for a given locale identification string.
Notes: Available in Mac OS X v10.4 and later.

67.4.7 characterDirectionForLanguage(isoLangCode as string) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the character direction for the specified ISO language code.
Notes: Returns the character direction for the language. See constants for possible values. If the appropriate direction can't be determined NSLocaleLanguageDirectionUnknown is returned.

Available in Mac OS X v10.6 and later.

67.4.8 commonISOCurrencyCodes as string()

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns an array of common ISO currency codes.
Example:

```
MessageBox join(NSLocaleMBS.commonISOCurrencyCodes,", ")

// shows "AED, AFN, ALL, AMD, ANG, AOA, ARS, AUD, AWG, AZN,
// BAM, BBD, BDT, BGN, BHD, BIF, BMD, BND, BOB, BRL, BSD, BTN,
// BWP, BYR, BZD, CAD, CDF, CHF, CLP, CNY, COP, CRC, CUP, CVE,
// CZK, DJF, DKK, DOP, DZD, EEK, EGP, ERN, ETB, EUR, FJD, FKP,
// GBP, GEL, GHS, GIP, GMD, GNF, GTQ, GWP, GYD, HKD, HNL, HRK,
// HTG, HUF, IDR, ILS, INR, IQD, IRR, ISK, JMD, JOD, JPY, KES,
// KGS, KHR, KMF, KPW, KRW, KWD, KYD, KZT, LAK, LBP, LKR, LRD,
```

```
// LSL, LTL, LVL, LYD, MAD, MDL, MGA, MKD, MMK, MNT, MOP, MRO,
// MUR, MVR, MWK, MXN, MYR, MZE, MZN, NAD, NGN, NIO, NOK, NPR,
// NZD, OMR, PAB, PEN, PGK, PHP, PKR, PLN, PYG, QAR, RON, RSD,
// RUB, RWF, SAR, SBD, SCR, SDG, SEK, SGD, SHP, SKK, SLL, SOS,
// SRD, STD, SVC, SYP, SZL, THB, TJS, TMM, TND, TOP, TRY, TTD,
// TWD, TZS, UAH, UGX, USD, UYU, UZS, VEF, VND, VUV, WST, XAF,
// XCD, XOF, XPF, YER, ZAR, ZMK, ZWD"
```

Notes: Common codes may include, for example, AED, AUD, BZD, DKK, EUR, GBP, JPY, KES, MXN, OMR, STD, USD, XCD, and ZWD.
Available in Mac OS X v10.5 and later.

67.4.9 Constructor

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The default constructor.
Notes: Available in Mac OS X v10.4 and later.
Loads the same values for this object as if you just take the object from NSLocaleMBS.currentLocale.
See also:

- 67.4.10 Constructor(Identifier as string) 11948

67.4.10 Constructor(Identifier as string)

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: The constructor.
Example:

```
Var a(-1) as string = NSLocalembs.availableLocaleIdentifiers

// show all identifiers:
Var s(-1) as string
s.Add "All available Locale Identifiers:"

Var c as Integer = a.LastIndex

for i as Integer=0 to c
Var identifier as string=a(i)
s.Add identifier
next

MessageBox Join(s)
```

```
// now show the currency symbols:

redim s(-1)
s.Add "All Currency symbols:"

c = a.LastIndex
for i as Integer=0 to c
Var identifier as string=a(i)
Var n as new NSLocaleMBS(identifier)
s.Add n.CurrencySymbol
next

MessageBox Join(s)
```

Notes: Available in Mac OS X v10.4 and later.
Pass in the country identifier which you get with the availableLocaleIdentifiers function.
See also:

- 67.4.9 Constructor 11948

67.4.11 currentLocale as NSLocaleMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the logical locale for the current user.
Notes: Available in Mac OS X v10.4 and later.

The logical locale for the current user. The locale is formed from the settings for the current user's chosen system locale overlaid with any custom settings the user has specified in System Preferences.

This method may return a retained cached object.

Discussion:
Settings you get from this locale do not change as System Preferences are changed so that your operations are consistent. Typically you perform some operations on the returned object and then allow it to be disposed of. Moreover, since the returned object may be cached, you do not need to hold on to it indefinitely.

67.4.12 displayName(key as string, value as string) as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Returns the display name for the given value.
Example:

```
Var displayNameString as string

// The first uses the fr_FR locale.

Var frLocale as new NSLocaleMBS("fr_FR")

displayNameString = frLocale.displayName(frLocale.NSLocaleIdentifier, "fr_FR")
MessageBox "display name for fr_FR in fr_FR: "+displayNameString
// shows: "display name for fr_FR in fr_FR: fran√ßais (France)"

displayNameString = frLocale.displayName(frLocale.NSLocaleIdentifier, "en_US")
MessageBox "display name for en_US in fr_FR: "+displayNameString
// shows: "display name for en_US in fr_FR: anglais (√âtats-Unis)"

// The following example uses the en_GB locale.

Var gbLocale as new NSLocaleMBS("en_US")

displayNameString = gbLocale.displayName(frLocale.NSLocaleIdentifier, "fr_FR")
MessageBox "display name for fr_FR in en_US: "+displayNameString
// shows: "display name for fr_FR in en_US: French (France)"

displayNameString = gbLocale.displayName(frLocale.NSLocaleIdentifier, "en_US")
MessageBox "display name for en_US in en_US: "+displayNameString
// shows: "display name for en_US in en_US: English (United States)"
```

Notes: Not all locale property keys have values with display name values.

You can use the NSLocaleIdentifier key to get the name of a locale in the language of another locale, as illustrated in the example code above.

67.4.13 ExemplarCharacterSet as Variant

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The exemplar character set for the locale.
Example:

```
Var n as NSLocaleMBS = NSLocaleMBS.currentLocale

MessageBox n.ExemplarCharacterSet.StringValue
// shows "ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz√Ñ√ñ√ú√ü√§√√º" in Germany
```

Notes: Returns a NSCharacterSetMBS object.
Available in Mac OS X v10.4 and later.

67.4.14 GetString(key as string) as string

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns a string for one of the NSLocate keys.
Notes: Available in Mac OS X v10.4 and later.
This keys can be found int he NSLocale reference from Apple.

67.4.15 ISOCountryCodes as string()

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns an array of strings that represents all known legal country codes.
Example:

```
MessageBox join(NSLocaleMBS.ISOCountryCodes,", ")

// shows "AD, AE, AF, AG, AI, AL, AM, AN, AO, AQ, AR, AS, AT, AU,
// AW, AX, AZ, BA, BB, BD, BE, BF, BG, BH, BI, BJ, BL, BM, BN, BO,
// BR, BS, BT, BV, BW, BY, BZ, CA, CC, CD, CF, CG, CH, CI, CK, CL,
// CM, CN, CO, CR, CU, CV, CX, CY, CZ, DE, DJ, DK, DM, DO, DZ, EC,
// EE, EG, EH, ER, ES, ET, FI, FJ, FK, FM, FO, FR, GA, GB, GD, GE,
// GF, GG, GH, GI, GL, GM, GN, GP, GQ, GR, GS, GT, GU, GW, GY, HK,
// HM, HN, HR, HT, HU, ID, IE, IL, IM, IN, IO, IQ, IR, IS, IT, JE,
// JM, JO, JP, KE, KG, KH, KI, KM, KN, KP, KR, KW, KY, KZ, LA, LB,
// LC, LI, LK, LR, LS, LT, LU, LV, LY, MA, MC, MD, ME, MF, MG, MH,
// MK, ML, MM, MN, MO, MP, MQ, MR, MS, MT, MU, MV, MW, MX, MY, MZ,
// NA, NC, NE, NF, NG, NI, NL, false, NP, NR, NU, NZ, OM, PA, PE, PF,
// PG, PH, PK, PL, PM, PN, PR, PS, PT, PW, PY, QA, RE, RO, RS, RU,
// RW, SA, SB, SC, SD, SE, SG, SH, SI, SJ, SK, SL, SM, SN, SO, SR,
// ST, SV, SY, SZ, TC, TD, TF, TG, TH, TJ, TK, TL, TM, TN, TO, TR,
// TT, TV, TW, TZ, UA, UG, UM, US, UY, UZ, VA, VC, VE, VG, VI, VN,
// VU, WF, WS, YE, YT, ZA, ZM, ZW"
```

Notes: Available in Mac OS X v10.4 and later.
Note that many of country codes do not have any supporting locale data in Mac OS X.

67.4.16 ISOCurrencyCodes as string()

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns an array of strings that represents all known legal ISO currency codes.
Example:

```
MessageBox join(NSLocaleMBS.ISOCurrencyCodes,", ")

// shows "ADP, AED, AFA, AFN, ALK, ALL, AMD, ANG, AOA, AOK, AON, AOR,
// ARA, ARP, ARS, ATS, AUD, AWG, AZM, AZN, BAD, BAM, BBD, BDT, BEC,
// BEF, BEL, BGL, BGM, BGN, BHD, BIF, BMD, BND, BOB, BOP, BOV, BRB,
// BRC, BRE, BRL, BRN, BRR, BSD, BTN, BUK, BWP, BYB, BYR, BZD, CAD,
// CDF, CHE, CHF, CHW, CLF, CLP, CNX, CNY, COP, COU, CRC, CSD, CSK,
// CUP, CVE, CYP, CZK, DDM, DEM, DJF, DKK, DOP, DZD, ECS, ECV, EEK,
// EGP, EQE, ERN, ESA, ESB, ESP, ETB, EUR, FIM, FJD, FKP, FRF, GBP,
// GEK, GEL, GHC, GHS, GIP, GMD, GNF, GNS, GQE, GRD, GTQ, GWE, GWP,
// GYD, HKD, HNL, HRD, HRK, HTG, HUF, IDR, IEP, ILP, ILS, INR, IQD,
// IRR, ISK, ITL, JMD, JOD, JPY, KES, KGS, KHR, KMF, KPW, KRW, KWD,
// KYD, KZT, LAK, LBP, LKR, LRD, LSL, LSM, LTL, LTT, LUC, LUF, LUL,
// LVL, LVR, LYD, MAD, MAF, MDL, MGA, MGF, MKD, MLF, MMK, MNT, MOP,
// MRO, MTL, MTP, MUR, MVR, MWK, MXN, MXP, MXV, MYR, MZE, MZM, MZN,
// NAD, NGN, NIC, NIO, NLG, NOK, NPR, NZD, OMR, PAB, PEI, PEN, PES,
// PGK, PHP, PKR, PLN, PLZ, PTE, PYG, QAR, RHD, ROL, RON, RSD, RUB,
// RUR, RWF, SAR, SBD, SCR, SDD, SDG, SDP, SEK, SGD, SHP, SIT, SKK,
// SLL, SOS, SRD, SRG, STD, SUR, SVC, SYP, SZL, THB, TJR, TJS, TMM,
// TND, TOP, TPE, TRL, TRY, TTD, TWD, TZS, UAH, UAK, UGS, UGX, USD,
// USN, USS, UYP, UYI, UYU, UZS, VEB, VEF, VND, VUV, WST, XAF, XAG,
// XAU, XBA, XBB, XBC, XBD, XCD, XDR, XEU, XFO, XFU, XOF, XPD, XPF,
// XPT, XRE, XTS, XXX, YDD, YER, YUD, YUM, YUN, ZAL, ZAR, ZMK, ZRN,
// ZRZ, ZWD"
```

Notes: Available in Mac OS X v10.4 and later.

Note that some of the currency codes may not have any supporting locale data in Mac OS X.

67.4.17 ISOLanguageCodes as string()

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns an array of strings that represents all known legal ISO language codes.
Example:

```
MessageBox join(NSLocaleMBS.ISOLanguageCodes,", ")

// shows "aa, ab, ace, ach, ada, ady, ae, af, afa, afh, ain, ak, akk,
```

// ale, alg, alt, am, an, ang, anp, apa, ar, arc, arn, arp, art, arw,
// as, ast, ath, aus, av, awa, ay, az, ba, bad, bai, bal, ban, bas,
// bat, be, bej, bem, ber, bg, bh, bho, bi, bik, bin, bla, bm, bn, bnt,
// bo, br, bra, bs, btk, bua, bug, byn, ca, cad, cai, car, cau, cch,
// ce, ceb, cel, ch, chb, chg, chk, chm, chn, cho, chp, chr, chy, cmc,
// co, cop, cpe, cpf, cpp, cr, crh, crp, cs, csb, cu, cus, cv, cy, da,
// dak, dar, day, de, del, den, dgr, din, doi, dra, dsb, dua, dum, dv,
// dyu, dz, ee, efi, egy, eka, el, elx, en, enm, eo, es, et, eu, ewo,
// fa, fan, fat, ff, fi, fil, fiu, fj, fo, fon, fr, frm, fro, frr, frs,
// fur, fy, ga, gaa, gay, gba, gd, gem, gez, gil, gl, gmh, gn, goh,
// gon, gor, got, grb, grc, gsw, gu, gv, gwi, ha, hai, haw, he, hi,
// hil, him, hit, hmn, ho, hr, hsb, ht, hu, hup, hy, hz, ia, iba, id,
// ie, ig, ii, ijo, ik, ilo, inc, ine, inh, io, ira, iro, is, it, iu,
// ja, jbo, jpr, jrb, jv, ka, kaa, kab, kac, kaj, kam, kar, kaw, kbd,
// kcg, kfo, kg, kha, khi, kho, ki, kj, kk, kl, km, kmb, kn, ko, kok,
// kos, kpe, kr, krc, krl, kro, kru, ks, ku, kum, kut, kv, kw, ky, la,
// lad, lah, lam, lb, lez, lg, li, ln, lo, lol, loz, lt, lu, lua, lui,
// lun, luo, lus, lv, mad, mag, mai, mak, man, map, mas, mdf, mdr, men,
// mg, mga, mh, mi, mic, min, mis, mk, mkh, ml, mn, mnc, mni, mno, mo,
// moh, mos, mr, ms, mt, mul, mun, mus, mwl, mwr, my, myn, myv, na,
// nah, nai, nap, nb, nd, nds, ne, new, ng, nia, nic, niu, nl, nn, no,
// nog, non, nqo, nr, nso, nub, nv, nwc, ny, nym, nyn, nyo, nzi, oc,
// oj, om, or, os, osa, ota, oto, pa, paa, pag, pal, pam, pap, pau,
// peo, phi, phn, pi, pl, pon, pra, pro, ps, pt, qu, raj, rap, rar, rm,
// rn, ro, roa, rom, ru, rup, rw, sa, sad, sah, sai, sal, sam, sas,
// sat, sc, scn, sco, sd, se, sel, sem, sg, sga, sgn, shn, si, sid,
// sio, sit, sk, sl, sla, sm, sma, smi, smj, smn, sms, sn, snk, so,
// sog, son, sq, sr, srn, srr, ss, ssa, st, su, suk, sus, sux, sv, sw,
// syc, syr, ta, tai, te, tem, ter, tet, tg, th, ti, tig, tiv, tk, tkl,
// tl, tlh, tli, tmh, tn, to, tog, tpi, tr, ts, tsi, tt, tum, tup, tut,
// tvl, tw, ty, tyv, udm, ug, uga, uk, umb, und, ur, uz, vai, ve, vi,
// vo, vot, wa, wak, wal, war, was, wen, wo, xal, xh, yao, yap, yi, yo,
// ypk, za, zap, zbl, zen, zh, znd, zu, zun, zxx, zza"

Notes: Available in Mac OS X v10.4 and later.

Note that many of the language codes will not have any supporting locale data in Mac OS X.

67.4.18 lineDirectionForLanguage(isoLangCode as string) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the line direction for the specified ISO language code.
Notes: Returns the line direction for the language. See constants for possible values. If the appropriate direction can't be determined NSLocaleLanguageDirectionUnknown is returned.

Available in Mac OS X v10.6 and later.

67.4.19 localeIdentifierFromWindowsLocaleCode(code as Integer) as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a locale identifier from a Windows locale code.
Notes: Available in Mac OS X v10.6 and later.

67.4.20 localeWithLocaleIdentifier(LocaleIdentifier as String) as NSLocaleMBS

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: Returns a locale initialized using the given locale identifier.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.localeWithLocaleIdentifier("en_US")
MessageBox l.localeIdentifier+": "+l.localizedStringForLocaleIdentifier(l.localeIdentifier)
```

67.4.21 localizedStringForCalendarIdentifier(CalendarIdentifier as String) as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: Returns the localized string for the specified calendar identifier.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.currentLocale
MessageBox l.localizedStringForCalendarIdentifier(l.calendarIdentifier)
```

Notes: calendarIdentifier: The calendar identifier indicating the calendar whose name you want. Use one of the values listed in Calendar Identifiers.

Returns a human readable string suitable for display to the user corresponding to the given calendar.

For example, on an American English (en_US) locale, passing NSCalendarIdentifierGregorian as the identifier, produces the string "Gregorian Calendar".

67.4.22 localizedStringForCollationIdentifier(CollationIdentifier as String) as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: Returns the localized string for the specified variant code.
Notes: variantCode: The variant code whose name you want.

Returns the localized name of the variant.

For example, calling this method on an American English (en_US) locale, passing "POSIX" for variantCode, produces the string "Computer".
This method is equivalent to calling the displayNameForKey() method passing the NSLocaleVariantCode key and variantCode value.

67.4.23 localizedStringForCollatorIdentifier(CollatorIdentifier as String) as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: Returns the localized string for the specified collator identifier.
Notes: collatorIdentifier: The identifier for the collator whose name you want.

Returns the localized name of the collator.

This method is equivalent to calling the displayNameForKey method passing the NSLocaleCollatorIdentifier key and collatorIdentifier value.

67.4.24 localizedStringForCountryCode(CountryCode as String) as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: Returns the localized string for a country or region code.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.currentLocale
MessageBox l.countryCode + ": " + l.localizedStringForCountryCode(l.countryCode)
```

Notes: countryCode: The code of the country or region that indicates the name you want.

Returns the localized name of the country or region.

For example, calling this method on an American English (en_US) locale, passing "GB" for countryCode,

produces the string "United Kingdom".
This method is equivalent to calling the displayNameForKey() method passing the NSLocaleCountryCode key and countryCode value.

67.4.25 localizedStringForCurrencyCode(CurrencyCode as String) as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: Returns the localized string for the specified currency code.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.currentLocale
MessageBox l.currencyCode + ": " + l.localizedStringForCurrencyCode(l.currencyCode)
```

Notes: currencyCode: The code for the currency whose name you want.

Returns the localized name of the currency.

For example, calling this method on an American English (en_US) locale, passing "JPY" for currencyCode, produces the string "Japanese Yen".
This method is equivalent to calling the displayNameForKey() method passing the NSLocaleCurrencyCode key and currencyCode value.

67.4.26 localizedStringForLanguageCode(LanguageCode as String) as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: Returns the localized string for the specified language code.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.currentLocale
MessageBox l.languageCode + ": " + l.localizedStringForLanguageCode(l.languageCode)
```

Notes: languageCode: The language code indicating the language whose name you want.

Returns the localized name of the language.

For example, calling this method on an American English (en_US) locale, passing "zh" for languageCode, produces the string "Chinese".
This method is equivalent to calling the displayNameForKey() method passing the NSLocaleLanguageCode key and languageCode value.

67.4.27 localizedStringForLocaleIdentifier(LocaleIdentifier as String) as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: Returns the localized string for the specified locale identifier.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.currentLocale
MessageBox l.localeIdentifier + ": " + l.localizedStringForLocaleIdentifier(l.localeIdentifier)
```

Notes: localeIdentifier: The identifier for which you want the localized name.

Returns the localized name of the locale.

For example, calling this method on an American English (en_US) locale, passing "fr_FR" for localeIdentifier, produces the string "French (France)".
This method is equivalent to calling the displayNameForKey() method passing the NSLocaleIdentifier key and localeIdentifier value.

67.4.28 localizedStringForScriptCode(ScriptCode as String) as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: Returns the localized string for the specified script code.
Notes: scriptCode: The script code for the script whose name you want.

Returns the localized name of the script.

For example, calling this method on an American English (en_US) locale, passing "Hant" for scriptCode, produces the string "Traditional Han".
This method is equivalent to calling the displayNameForKey() method passing the NSLocaleScriptCode key and scriptCode value.

67.4.29 localizedStringForVariantCode(VariantCode as String) as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: Returns the localized string for the specified variant code.
Notes: variantCode: The variant code whose name you want.

Returns the localized name of the variant.

For example, calling this method on an American English (en_US) locale, passing "POSIX" for variantCode, produces the string "Computer".
This method is equivalent to calling the displayNameForKey() method passing the NSLocaleVariantCode key and variantCode value.

67.4.30 NSBuddhistCalendar as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the calendar indentifiers.
Notes: Identifier for the Buddhist calendar.
Available in Mac OS X v10.4 and later.

67.4.31 NSChineseCalendar as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the calendar indentifiers.
Notes: Identifier for the Chinese calendar (unsupported).

Note that the Chinese calendar is not supported in Mac OS X v10.4-10.5. Although you can create a calendar using this constant, the object will not function correctly.

Available in Mac OS X v10.4 and later.

67.4.32 NSCurrentLocaleDidChangeNotification as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: A notification that indicates that the user,Äôs locale changed.
Notes: Register for this notification if your app displays content (dates, times, numbers, and so on) that is affected by the locale. Use the notification to trigger updates to your app's interface.

67.4.33 NSGregorianCalendar as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the calendar indentifiers.
Notes: Identifier for the Gregorian calendar.

Available in Mac OS X v10.4 and later.

67.4.34 NSHebrewCalendar as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the calendar indentifiers.
Notes: Identifier for the Hebrew calendar.

Available in Mac OS X v10.4 and later.

67.4.35 NSIndianCalendar as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the calendar indentifiers.
Notes: Identifier for the Indian calendar

Available in Mac OS X v10.6 and later.

67.4.36 NSIslamicCalendar as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the calendar indentifiers.
Notes: Identifier for the Islamic calendar.

Available in Mac OS X v10.4 and later.

67.4.37 NSIslamicCivilCalendar as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the calendar indentifiers.
Notes: Identifier for the Islamic civil calendar.

Available in Mac OS X v10.4 and later.

67.4.38 NSISO8601Calendar as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the calendar indentifiers.
Notes: Identifier for the ISO8601. The ISO8601 calendar is not yet implemented.

Available in Mac OS X v10.6 and later.

67.4.39 NSJapaneseCalendar as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the calendar indentifiers.
Notes: Identifier for the Japanese calendar.
Available in Mac OS X v10.4 and later.

67.4.40 NSLocaleAlternateQuotationBeginDelimiterKey as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.
Notes: The key for the alternating begin quotation symbol associated with the locale. In some locales, when quotations are nested, the quotation characters alternate. Thus, NSLocaleQuotationBeginDelimiterKey, then NSLocaleAlternateQuotationBeginDelimiterKey, etc.

The corresponding value is a string.
Available in Mac OS X v10.6 and later.

67.4.41 NSLocaleAlternateQuotationEndDelimiterKey as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.
Notes: The key for the alternating enda quotation symbol associated with the locale. In some locales, when quotations are nested, the quotation characters alternate. Thus, NSLocaleQuotationEndDelimiterKey, then NSLocaleAlternateQuotationEndDelimiterKey, etc.

The corresponding value is a string.

Available in Mac OS X v10.6 and later.

67.4.42 NSLocaleCalendar as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the calendar indentifiers.

67.4.43 NSLocaleCollationIdentifier as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.

67.4.44 NSLocaleCollatorIdentifier as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.
Notes: The key for the collation identifier for the locale.
The corresponding value is a string. If unknown, "" is returned.
Available in Mac OS X v10.6 and later.

67.4.45 NSLocaleCountryCode as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.

67.4.46 NSLocaleCurrencyCode as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.

67.4.47 NSLocaleCurrencySymbol as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.

67.4.48 NSLocaleDecimalSeparator as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.

67.4.49 NSLocaleExemplarCharacterSet as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.

67.4.50 NSLocaleGroupingSeparator as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.

67.4.51 NSLocaleIdentifier as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.
Example:

```
Var n as new NSLocaleMBS("de")

MessageBox n.displayName(n.NSLocaleIdentifier, "en")
```

67.4.52 NSLocaleLanguageCode as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.

67.4.53 NSLocaleMeasurementSystem as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.

67.4.54 NSLocaleQuotationBeginDelimiterKey as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.
Notes: The key for the begin quotation symbol associated with the locale.
The corresponding value is a string.
Available in Mac OS X v10.6 and later.

67.4.55 NSLocaleQuotationEndDelimiterKey as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.
Notes: The key for the begin quotation symbol associated with the locale.
The corresponding value is string.
Available in Mac OS X v10.6 and later.

67.4.56 NSLocaleScriptCode as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.

67.4.57 NSLocaleUsesMetricSystem as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.

67.4.58 NSLocaleVariantCode as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: One of the constants for the displayName and GetString functions.

67.4.59 NSPersianCalendar as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the calendar indentifiers.
Notes: Identifier for the Persian calendar.
Available in Mac OS X v10.6 and later.

67.4.60 NSRepublicOfChinaCalendar as string

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: One of the calendar indentifiers.
Notes: Identifier for the Republic of China (Taiwan) calendar.

A Chinese calendar can be created, and one can do calendrical calculations with it, but it should not be used for formatting as the necessary underlying functionality is not functioning correctly yet.

Available in Mac OS X v10.6 and later.

67.4.61 preferredLanguages as string()

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the user's language preference order as an array of strings.
Example:

```
MessageBox join(NSLocaleMBS.preferredLanguages,", ")

// shows "de, en, fr, es, it, pt, pt-PT, nl, sv, nb, da, fi, ru, pl, zh-Hans, ja, zh-Hant, ko"
```

Notes: The user's language preference order as an array of String objects, each of which is a canonicalized IETF BCP 47 language identifier.

Available in Mac OS X v10.5 and later.
This is the language the user prefers. To get the country linked to the number and date formats, use the CountryCode property.

67.4.62 systemLocale as NSLocaleMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the "root", canonical locale, that contains fixed "backstop" settings that provide values for otherwise undefined keys.
Notes: Available in Mac OS X v10.4 and later.

67.4.63 windowsLocaleCodeFromLocaleIdentifier(s as string) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns a Window locale code from the locale identifier.
Notes: Available in Mac OS X v10.6 and later.

67.4.64 Properties

67.4.65 alternateQuotationBeginDelimiter as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: The alternate begin quotation symbol for the locale.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.currentLocale
MessageBox l.alternateQuotationBeginDelimiter+" "+l.alternateQuotationEndDelimiter
```

Notes: Examples of alternate begin quotation symbols include ",Äò", ",Ä", and "„Äé".
(Read only property)

67.4.66 alternateQuotationEndDelimiter as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: The alternate end quotation symbol for the locale.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.currentLocale
MessageBox l.alternateQuotationBeginDelimiter+" "+l.alternateQuotationEndDelimiter
```

Notes: Examples of alternate end quotation symbols include ",Äô", ",Ä", and "„Äè".
(Read only property)

67.4.67 calendarIdentifier as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: The calendar identifier for the locale.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.currentLocale
MessageBox l.calendarIdentifier
```

Notes: Possible values are listed in Calendar Identifiers.
Use localizedStringForCalendarIdentifier() to obtain a version of the value suitable for display to the user.
(Read only property)

67.4.68 CollationIdentifier as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The collation associated with the locale.
Example:

```
Var n as new NSLocaleMBS

MessageBox n.CollationIdentifier // shows "" in Germany
```

Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.69 collatorIdentifier as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: The collator identifier for the locale.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.currentLocale
MessageBox l.collatorIdentifier+EndOfLine+l.collationIdentifier
```

Notes: An example collator identifier is "en".
Use localizedStringForCollatorIdentifier() to obtain a version of the value suitable for display to the user.
(Read only property)

67.4.70 CountryCode as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The country code.
Example:

```
Var n as new NSLocaleMBS

MessageBox n.CountryCode // shows "DE" in Germany
```

Notes: An example value might be "ES".
Available in Mac OS X v10.4 and later.

This code here is the country where the number and date settings belong to. This is not the language the user has. To get the languages, check the preferredLanguages array.
(Read only property)

67.4.71 CurrencyCode as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The currency code associated with the locale.
Example:

```
Var n as new NSLocaleMBS

MessageBox n.CurrencyCode // shows "EUR" in Germany
```

Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.72 CurrencySymbol as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The currency symbol associated with the locale.
Example:

```
Var n as new NSLocaleMBS

MessageBox n.CurrencySymbol // shows ",Ç¨" in Germany
```

Notes: Available in Mac OS X v10.4 and later.

(Read only property)

67.4.73 DateFull as NSLocaleDateMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The full date format.
Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.74 DateLong as NSLocaleDateMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The long date format.
Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.75 DateMedium as NSLocaleDateMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The medium date format.
Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.76 DateShort as NSLocaleDateMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The short date format.
Example:

```
MessageBox NSLocaleMBS.currentLocale.DateShort.dateFormat
// in Germany: "dd.MM.yy"
```

Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.77 DecimalSeparator as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The decimal separator associated with the locale.
Example:

```
Var n as new NSLocaleMBS

MessageBox n.DecimalSeparator // shows "," in Germany
```

Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.78 GroupingSeparator as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The numeric grouping separator associated with the locale.
Example:

```
Var n as new NSLocaleMBS

MessageBox n.GroupingSeparator // shows "." in Germany
```

Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.79 Identifier as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The locale identifier.
Example:

```
Var n as new NSLocaleMBS

MessageBox n.Identifier // shows "de_DE" in Germany
```

Notes: An example value might be "es_ES_PREEURO".
Available in Mac OS X v10.4 and later.
(Read only property)

67.4.80 LanguageCode as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The language code.
Example:

```
Var n as new NSLocaleMBS

MessageBox n.LanguageCode // shows "de" in Germany
```

Notes: An example value might be "es".
Available in Mac OS X v10.4 and later.
(Read only property)

67.4.81 languageIdentifier as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: Returns the identifier for the language part of the locale.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.currentLocale
MessageBox l.languageIdentifier+EndOfLine+l.languageCode
```

Notes: For example, returns "en-US" for "en_US@rg=gbzzzz" locale.
(Read only property)

67.4.82 localeIdentifier as string

MBS MacBase Plugin, Plugin Version: 9.1, Platform: macOS, Targets: All.

Function: Returns the identifier for the receiver.
Notes: The identifier for the receiver. This may not be the same string that the locale was created with, since NSLocale may canonicalize it.

Available in Mac OS X v10.4 and later.

Examples of locale identifiers include "en_GB", "es_ES_PREEURO", and "zh-Hant_HK_POSIX@collation=pinyin;currenc
(Read only property)

67.4.83 MeasurementSystem as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The measurement system associated with the locale.
Example:

```
Var n as new NSLocaleMBS

MessageBox n.MeasurementSystem // shows "Metric" in Germany
```

Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.84 NumberCurrency as NSLocaleNumberMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The currency style for number formatting.
Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.85 NumberDecimal as NSLocaleNumberMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Specifies a decimal style for numbers.
Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.86 NumberPercent as NSLocaleNumberMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The percent style for number formatting.
Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.87 NumberScientific as NSLocaleNumberMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Specifies a scientific style for numbers.
Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.88 NumberSpellOut as NSLocaleNumberMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Specifies a spell-out format; for numbers, ”23” becomes ”twenty-three”.
Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.89 quotationBeginDelimiter as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: The begin quotation symbol associated with the locale.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.currentLocale
MessageBox l.quotationBeginDelimiter+” ”+l.quotationEndDelimiter
```

Notes: The corresponding value is an NSString object; for example, ”,Äú”, ”,Äû”, ”¬´”, or ”„Äå”.
(Read only property)

67.4.90 quotationEndDelimiter as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: The end quotation symbol associated with the locale.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.currentLocale
MessageBox l.quotationBeginDelimiter+” ”+l.quotationEndDelimiter
```

Notes: The corresponding value is an NSString object; for example, ”,Äù”, ”,Äú”, ”¬ª”, or ”„Äç”.
(Read only property)

67.4.91 regionCode as String

MBS MacBase Plugin, Plugin Version: 24.3, Platform: macOS, Targets: All.

Function: Returns the region code of the locale.
Example:

```
Var l As NSLocaleMBS = NSLocaleMBS.currentLocale
MessageBox l.regionCode
```

Notes: If the 'rg' subtag is present, the value of the subtag will be used. For example, returns "GB" for "en_US@rg=gbzzzz" locale.
If the 'localeIdentifier' doesn,Äôt contain a region, returns empty string.
(Read only property)

67.4.92 ScriptCode as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The locale script code.
Example:

```
Var n as new NSLocaleMBS

MessageBox n.ScriptCode // shows "" in Germany
```

Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.93 UsesMetricSystem as Boolean

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The flag that indicates whether the locale uses the metric system.
Example:

```
Var n as new NSLocaleMBS
Var v as Variant

v=n.UsesMetricSystem
MessageBox v // shows "True" in Germany
```

Notes: Available in Mac OS X v10.4 and later.
(Read only property)

67.4.94 VariantCode as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The locale variant code.
Example:

```
Var n as new NSLocaleMBS

MessageBox n.VariantCode // shows "" in Germany
```

Notes: An example value might be "PREEURO".
Available in Mac OS X v10.4 and later.
(Read only property)

67.4.95 Constants

Constants

Constant	Value	Description
NSLocaleLanguageDirectionBottomToTop	4	One of the constants describing the text direction for a language. The language direction is from bottom to top. Available in Mac OS X v10.6 and later.
NSLocaleLanguageDirectionLeftToRight	1	One of the constants describing the text direction for a language. The language direction is from left to right. Available in Mac OS X v10.6 and later.
NSLocaleLanguageDirectionRightToLeft	2	One of the constants describing the text direction for a language. The language direction is from right to left. Available in Mac OS X v10.6 and later.
NSLocaleLanguageDirectionTopToBottom	3	One of the constants describing the text direction for a language. The language direction is from top to bottom. Available in Mac OS X v10.6 and later.
NSLocaleLanguageDirectionUnknown	0	One of the constants describing the text direction for a language. The direction of the language is unknown. Available in Mac OS X v10.6 and later.

67.5 class NSLocaleNumberMBS

67.5.1 class NSLocaleNumberMBS

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: A class for a number format.
Example:

```
// show the number and currency symbols for Switzerland
Var locale As New NSLocaleMBS("de_CH")
Var info As New NSLocaleNumberMBS(locale)

MessageBox "Decimal separator: " + info.decimalSeparator + EndOfLine + _
"Grouping separator: " + info.groupingSeparator + EndOfLine + _
"Currency: " + info.currencySymbol + " (" + info.currencyCode + ")" + EndOfLine + _
"Percent: " + info.percentSymbol
```

Notes: Should be used with the NSLocaleMBS class, but can be used on its own, too.

67.5.2 Methods

67.5.3 Constructor

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: The constructor.
Notes: Loads values.
No the same values as if you get when using this class with NSLocaleMBS.
See also:

- 67.5.4 Constructor(locale as NSLocaleMBS) 11975

67.5.4 Constructor(locale as NSLocaleMBS)

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: All.

Function: The constructor.
Example:

```
Var n1 as new NSLocaleNumberMBS
Var n2 as new NSLocaleNumberMBS(NSLocaleMBS.currentLocale)
Var n3 as new NSLocaleNumberMBS(NSLocaleMBS.systemLocale)

break // see differences in debugger
```

Notes: Initializes the object for a given locale.
See also:

- 67.5.3 Constructor 11975

67.5.5 Properties

67.5.6 alwaysShowsDecimalSeparator as Boolean

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the receiver always shows a decimal separator, even if the number is an integer.
Notes: (Read and Write property)

67.5.7 currencyCode as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the currency code.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.currencycode
// shows for example: e.g "EUR" (in Germany)
```

Notes: A currency code is a three-letter code that is, in most cases, composed of a country's two-character Internet country code plus an extra character to denote the currency unit. For example, the currency code for the Australian dollar is "AUD". Currency codes are based on the ISO 4217 standard.

Available in Mac OS X v10.4 and later.
(Read and Write property)

67.5.8 currencyDecimalSeparator as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the currency decimal separator as a string.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.currencyDecimalSeparator
// shows for example: e.g "," (in Germany)
```

Notes: (Read and Write property)

67.5.9 currencyGroupingSeparator as String

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The currency grouping separator for the receiver.
Notes: Available in Mac OS X v10.5 and later.
(Read and Write property)

67.5.10 currencySymbol as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the local currency symbol.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.currencycode
// shows for example: e.g ",Ç¨" (in Germany)
```

Notes: (Read and Write property)

67.5.11 decimalSeparator as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns a string containing the character to represent decimal separators.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.decimalSeparator
// shows for example: e.g "," (in Germany)
```

Notes: (Read and Write property)

67.5.12 exponentSymbol as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the string used as an exponent symbol.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.exponentSymbol
// shows for example: e.g "E" (in Germany)
```

Notes: The exponent symbol is the "E" or "e" in the scientific notation of numbers, as in 1.0e+56.
(Read and Write property)

67.5.13 format as String

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The format used by the receiver.
Notes: (Read and Write property)

67.5.14 groupingSeparator as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns a string containing the grouping separator.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency
```

```
MessageBox n.groupingSeparator
// shows for example: e.g "." (in Germany)
```

Notes: For example, the grouping separator used in the United States is the comma ("10,000") whereas in France it is the period ("10.000").
(Read and Write property)

67.5.15 hasThousandSeparators as Boolean

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the receiver's format includes thousand separators.
Notes: (Read and Write property)

67.5.16 internationalCurrencySymbol as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the international currency symbol.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.internationalCurrencySymbol
// shows for example: e.g "EUR" (in Germany)
```

Notes: A country typically has a local currency symbol and an international currency symbol. The local symbol is used within the country, while the international currency symbol is used in international contexts to specify that country's currency unambiguously. The international currency symbol is often represented by a Unicode code point.
(Read and Write property)

67.5.17 Lenient as Boolean

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the receiver uses heuristics to guess at the date which is intended by a string.
Notes: (Read and Write property)

67.5.18 localizesFormat as Boolean

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the receiver localizes formats.
Notes: (Read and Write property)

67.5.19 minusSign as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the string used to represent the minus sign.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.minusSign
// shows for example: e.g "-" (in Germany)
```

Notes: (Read and Write property)

67.5.20 negativeFormat as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the format used to display negative numbers.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.negativeFormat
// shows for example: e.g "#,##0.00 ¬§" (in Germany)
```

Notes: (Read and Write property)

67.5.21 negativeInfinitySymbol as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the symbol used to represent negative infinity.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.negativeInfinitySymbol
// shows for example: e.g "" (in Germany)
```

Notes: (Read only property)

67.5.22 negativePrefix as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the string which is inserted as a prefix to negative values.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.negativePrefix
// shows for example: e.g "-" (in Germany)
```

Notes: (Read and Write property)

67.5.23 negativeSuffix as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the string which adds as a suffix to negative values.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.negativeSuffix
// shows for example: e.g ",Ç¨" (in Germany)
```

Notes: (Read and Write property)

67.5.24 nilSymbol as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the string used to represent a nil value.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.nilSymbol
// shows for example: e.g "" (in Germany)
```

Notes: (Read only property)

67.5.25 notANumberSymbol as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the symbol used to represent NaN ("not a number") when it converts values.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.notANumberSymbol
// shows for example: e.g "NaN" (in Germany)
```

Notes: (Read only property)

67.5.26 paddingCharacter as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns a string containing the padding character.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.paddingCharacter
// shows for example: e.g "*" (in Germany)
```

Notes: (Read and Write property)

67.5.27 PartialStringValidationEnabled as Boolean

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether partial string validation is enabled.
Notes: (Read and Write property)

67.5.28 percentSymbol as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the string that is used to represent the percent symbol.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.percentSymbol
// shows for example: e.g "%" (in Germany)
```

Notes: (Read and Write property)

67.5.29 perMillSymbol as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the string that is used for the per-thousands symbol.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.perMillSymbol
// shows for example: e.g ",Ä∞" (in Germany)
```

Notes: (Read and Write property)

67.5.30 plusSign as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the string used for the plus sign.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.plusSign
// shows for example: e.g "+" (in Germany)
```

Notes: (Read and Write property)

67.5.31 positiveFormat as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the format used to display positive numbers.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.negativeFormat
// shows for example: e.g "#,##0.00 ¬§" (in Germany)
```

Notes: (Read and Write property)

67.5.32 positiveInfinitySymbol as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the string used for the positive infinity symbol.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.positiveInfinitySymbol
// shows for example: e.g "" (in Germany)
```

Notes: (Read only property)

67.5.33 positivePrefix as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the string used as the prefix for positive values.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.positivePrefix
// shows for example: e.g "" (in Germany)
```

Notes: (Read and Write property)

67.5.34 positiveSuffix as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the string used as the suffix for positive values.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.positiveSuffix
// shows for example: e.g " ,Ç¨" (in Germany)
```

Notes: (Read and Write property)

67.5.35 thousandSeparator as String

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the receiver's format includes thousand separators.
Notes: (Read and Write property)

67.5.36 usesGroupingSeparator as Boolean

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the receiver uses the grouping separator.
Notes: (Read and Write property)

67.5.37 usesSignificantDigits as Boolean

MBS MacBase Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the receiver uses significant digits.
Notes: (Read and Write property)

67.5.38 zeroSymbol as String

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: All.

Function: Returns the string used as the zero symbol.
Example:

```
Var l as new NSLocaleMBS
Var n as NSLocaleNumberMBS = l.NumberCurrency

MessageBox n.zeroSymbol
// shows for example: e.g "0" (in Germany)
```

Notes: (Read and Write property)

67.6 class WinLocalizationMBS

67.6.1 class WinLocalizationMBS

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for details about the current localization
Example:

Var l as WinLocalizationMBS
l=new WinLocalizationMBS

Notes: This class has a constructor to specify whether you want unicode or not.

You may write yourself functions to acquire the details you need in your application from the Windows and from the Mac classes.
Also you may consider to update your values as the user may change them while your application is running.

67.6.2 Methods

67.6.3 AbbreviatedDayName(index as Integer) as string

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The localized name of the day.
Notes: Index from 0 to 6.
e.g. on a German Windows XP system: AbbreviatedDayName(0)="Mo"

67.6.4 AbbreviatedMonthName(index as Integer) as string

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The localized month name.
Notes: Index from 0 to 12. 0=January, 11=December, 12=13th month if exists.
e.g. on a German Windows XP system: AbbreviatedMonthName(0)="Jan"

67.6.5 Constructor

MBS Win Plugin, Plugin Version: 5.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor to get the values for the current locale.
Notes: There are four constructors:

- You can pass nothing to get the current locale.
- You can pass a Locale Identifier.
- You can pass a LanguageID and a SortID.
- You can pass a PrimaryLanguageID and a SubLanguageID combined with a SortID.

Use the LANG_* constants for the PrimaryLanguageID, the SUBLANG_* constants for the SubLanguageID and the SORT_* constants for the SortID.
See also:

- 67.6.6 Constructor(LanguageID as Integer, SortID as Integer) 11988
- 67.6.7 Constructor(LCID as Integer) 11989
- 67.6.8 Constructor(PrimaryLanguage as Integer, SubLanguage as Integer, SortID as Integer) 11989

67.6.6 Constructor(LanguageID as Integer, SortID as Integer)

MBS Win Plugin, Plugin Version: 9.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor to query values for a given language.
Notes: There are four constructors:

- You can pass nothing to get the current locale.
- You can pass a Locale Identifier.
- You can pass a LanguageID and a SortID.
- You can pass a PrimaryLanguageID and a SubLanguageID combined with a SortID.

Use the LANG_* constants for the PrimaryLanguageID, the SUBLANG_* constants for the SubLanguageID and the SORT_* constants for the SortID.
See also:

- 67.6.5 Constructor 11988
- 67.6.7 Constructor(LCID as Integer) 11989
- 67.6.8 Constructor(PrimaryLanguage as Integer, SubLanguage as Integer, SortID as Integer) 11989

67.6.7 Constructor(LCID as Integer)

MBS Win Plugin, Plugin Version: 9.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor to query values for a given language.
Notes: There are four constructors:

- You can pass nothing to get the current locale.
- You can pass a Locale Identifier.
- You can pass a LanguageID and a SortID.
- You can pass a PrimaryLanguageID and a SubLanguageID combined with a SortID.

Use the LANG_* constants for the PrimaryLanguageID, the SUBLANG_* constants for the SubLanguageID and the SORT_* constants for the SortID.
See also:

- 67.6.5 Constructor 11988
- 67.6.6 Constructor(LanguageID as Integer, SortID as Integer) 11988
- 67.6.8 Constructor(PrimaryLanguage as Integer, SubLanguage as Integer, SortID as Integer) 11989

67.6.8 Constructor(PrimaryLanguage as Integer, SubLanguage as Integer, SortID as Integer)

MBS Win Plugin, Plugin Version: 9.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor to query values for a given language.
Notes: There are four constructors:

- You can pass nothing to get the current locale.
- You can pass a Locale Identifier.
- You can pass a LanguageID and a SortID.
- You can pass a PrimaryLanguageID and a SubLanguageID combined with a SortID.

Use the LANG_* constants for the PrimaryLanguageID, the SUBLANG_* constants for the SubLanguageID and the SORT_* constants for the SortID.
See also:

- 67.6.5 Constructor 11988
- 67.6.6 Constructor(LanguageID as Integer, SortID as Integer) 11988
- 67.6.7 Constructor(LCID as Integer) 11989

67.6.9 LongDayName(index as Integer) as string

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The localized name of the day.
Notes: Index from 0 to 6.
e.g. on a German Windows XP system: LongDayName(0)="Montag"

67.6.10 LongMonthName(index as Integer) as string

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The localized month name.
Notes: Index from 0 to 12. 0=January, 11=December, 12=13th month if exists.
e.g. on a German Windows XP system: LongMonthName(0)="Januar"

67.6.11 Properties

67.6.12 CalendarTypeSpecifier as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Current calendar type.
Notes: This type can be one of these values:

Value	Meaning
1	Gregorian (as in United States)
2	Gregorian (English strings always)
3	Era: Year of the Emperor (Japan)
4	Era: Year of Taiwan Region
5	Tangun Era (Korea)

e.g. on a German Windows XP system: "1"
(Read only property)

67.6.13 CalendarTypeSpecifier2 as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Additional calendar types.
Notes: This can be a zero-separated list of one or more of these calendars type values:

Value	Meaning
0	No additional types valid
1	Gregorian (as in United States)
2	Gregorian (English strings always)
3	Era: Year of the Emperor (Japan)
4	Era: Year of Taiwan Region
5	Tangun Era (Korea)

e.g. on a German Windows XP system: ""
(Read only property)

67.6.14 CountryCode as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Country code, based on international phone codes, also referred to as IBM country codes.
Notes: The maximum number of characters allowed for this string is 6.
e.g. on a German Windows XP system: "49"
(Read only property)

67.6.15 CountryNameAbbreviated as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Abbreviated name of the country from the ISO Standard 3166.
Notes: e.g. on a German Windows XP system: "DEU"
(Read only property)

67.6.16 CountryNameAbbreviatedISO as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: ISO abbreviated country name.
Notes: e.g. on a German Windows XP system: "DE"
(Read only property)

67.6.17 CountryNameEnglish as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Full English name of the country.
Notes: This is always restricted to characters mappable into the ASCII 127-character subset.
e.g. on a German Windows XP system: "English"
(Read only property)

67.6.18 CountryNameLocalized as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Full localized name of the country.
Notes: e.g. on a German Windows XP system: "Deutschland"
(Read only property)

67.6.19 CountryNameNative as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Native name of the country.
Notes: e.g. on a German Windows XP system: "Deutschland"
(Read only property)

67.6.20 CurrencyDecimalSeparator as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Character(s) used as the monetary decimal separator.
Notes: e.g. on a German Windows XP system: ","
(Read only property)

67.6.21 CurrencyDigitsInternational as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of fractional digits for the international monetary format.
Notes: The maximum number of characters allowed for this string is 3.
e.g. on a German Windows XP system: "2"
(Read only property)

67.6.22 CurrencyDigitsLocalized as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of fractional digits for the local monetary format.
Notes: The maximum number of characters allowed for this string is 3.
e.g. on a German Windows XP system: "2"
(Read only property)

67.6.23 CurrencyGroupingMode as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sizes for each group of monetary digits to the left of the decimal.
Notes: An explicit size is needed for each group; sizes are separated by semicolons. If the last value is zero, the preceding value is repeated. To group thousands, specify 3;0, for example.
e.g. on a German Windows XP system: "3;0"
(Read only property)

67.6.24 CurrencyNameEnglish as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The full English name of the currency associated with the locale.
Notes: e.g. on a German Windows XP system: "Euro"
Introduced with Windows 2000.
(Read only property)

67.6.25 CurrencyNameNative as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The native name of the currency associated with the locale.
Notes: e.g. on a German Windows XP system: "Euro"
Introduced with Windows 2000.
(Read only property)

67.6.26 CurrencyNegativeMode as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Negative currency mode.
Notes: The maximum number of characters allowed for this string is 3. The mode can be one of the following values:

Value	Example
0	($ 1.1)
1	–$ 1.1
2	$ –1.1
3	$ 1.1–
4	(1.1$)
5	–1.1$
6	1.1–$
7	1.1$ –
8	–1.1 $ (space before $)
9	–$ 1.1 (space after $)
10	1.1 $ –(space before $)
11	$ 1.1–(space after $)
12	$ –1.1 (space after $)
13	1.1–$ (space before $)
14	($ 1.1) (space after $)
15	(1.1 $) (space before $)

e.g. on a German Windows XP system: "8"
(Read only property)

67.6.27 CurrencyPositiveMode as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Positive currency mode.
Notes: The maximum number of characters allowed for this string is 2. The mode can be one of the following values:

e.g. on a German Windows XP system: "3"
(Read only property)

Value	Meaning
0	Prefix, no separation
1	Suffix, no separation
2	Prefix, 1-char. separation
3	Suffix, 1-char. separation

67.6.28 CurrencySymbolInternational as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Three characters of the international monetary symbol specified in ISO 4217, "Codes for the Representation of Currencies and Funds," followed by the character separating this string from the amount.
Example:

```
Var WinLoc As WinLocalizationMBS
Var s as string

WinLoc=New WinLocalizationMBS

s=WinLoc.CurrencySymbolLocalized
MessageBox str(lenb(s))+" "+str(len(s))+" "+s
s=WinLoc.CurrencySymbolInternational
MessageBox str(lenb(s))+" "+str(len(s))+" "+s
```

Notes: e.g. on a German Windows XP system: "EUR"
(Read only property)

67.6.29 CurrencySymbolLocalized as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: String used as the local monetary symbol.
Example:

```
Var WinLoc As WinLocalizationMBS
Var s as string

WinLoc=New WinLocalizationMBS

s=WinLoc.CurrencySymbolLocalized
MessageBox str(lenb(s))+" "+str(len(s))+" "+s
s=WinLoc.CurrencySymbolInternational
MessageBox str(lenb(s))+" "+str(len(s))+" "+s
```

Notes: e.g. on a German Windows XP system: ",Ç¨"
(Read only property)

67.6.30 CurrencyThousandSeparator as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Character(s) used as the monetary separator between groups of digits to the left of the decimal.
Notes: e.g. on a German Windows XP system: "."
(Read only property)

67.6.31 DateLeadingZerosDay as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifier for leading zeros in day fields.
Notes: The maximum number of characters allowed for this string is 2. The specifier can be one of the following values:

Value	Meaning
0	No leading zeros for days
1	Leading zeros for days

e.g. on a German Windows XP system: "1"
(Read only property)

67.6.32 DateLeadingZerosMonth as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifier for leading zeros in month fields.
Notes: The maximum number of characters allowed for this string is 2. The specifier can be one of the following values:

Value	Meaning
0	No leading zeros for months
1	Leading zeros for months

e.g. on a German Windows XP system: "1"
(Read only property)

67.6.33 DateLongFormatOrdering as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Long date format-ordering specifier.
Notes: The maximum number of characters allowed for this string is 2. The specifier can be one of the following values:

Value	Meaning
0	Month-Day-Year
1	Day-Month-Year
2	Year-Month-Day

e.g. on a German Windows XP system: "1"
(Read only property)

67.6.34 DateLongFormatString as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Long date formatting string for this locale.
Notes: The string can consist of a combination of day, month, and year format pictures defined in the Day, Month, Year, and Era Format Pictures table in National Language Support Constants and any string of characters enclosed in single quotes. Characters in single quotes remain as given.
e.g. on a German Windows XP system: "dddd, d. MMMM yyyy"
(Read only property)

67.6.35 DateSeparator as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Character(s) for the date separator.
Notes: e.g. on a German Windows XP system: "."
(Read only property)

67.6.36 DateShortFormatOrdering as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Short date format-ordering specifier.
Notes: The maximum number of characters allowed for this string is 2. The specifier can be one of the following values:

Value	Meaning
0	Month-Day-Year
1	Day-Month-Year
2	Year-Month-Day

e.g. on a German Windows XP system: "1"
(Read only property)

67.6.37 DateShortFormatString as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Short date formatting string for this locale.
Example:

```
Var w as new WinLocalizationMBS

MessageBox w.DateShortFormatString
```

Notes: The string can consist of a combination of day, month, and year format pictures defined in Day, Month, Year, and Era Format Pictures table in National Language Support Constants.
e.g. on a German Windows XP system: "dd.MM.yyyy"
(Read only property)

67.6.38 DateShortYearMonth as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Year/Month formatting string for the locale.
Notes: This string shows the proper format for a date string that contains only the year and the month.
e.g. on a German Windows XP system: "MMMM yyyy"
Introduced with Windows 2000.
(Read only property)

67.6.39 DecimalSeparator as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Character(s) used as the decimal separator.
Notes: e.g. on a German Windows XP system: ","
(Read only property)

67.6.40 DefaultCodePageANSI as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: American National Standards Institute (ANSI) code page associated with this locale.
Notes: The maximum number of characters allowed for this string is 6.
e.g. on a German Windows XP system: "1252"
(Read only property)

67.6.41 DefaultCodePageEBCDIC as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Default EBCDIC code page associated with the locale.
Notes: The maximum number of characters allowed for this string is 6.
e.g. on a German Windows XP system: "20273"
Introduced with Windows 2000.
(Read only property)

67.6.42 DefaultCodePageMac as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Original equipment manufacturer (OEM) code page associated with the country.
Notes: The maximum number of characters allowed for this string is 6.
e.g. on a German Windows XP system: "10000"
(Read only property)

67.6.43 DefaultCodePageOEM as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Original equipment manufacturer (OEM) code page associated with the locale.
Notes: The maximum number of characters allowed for this string is 6.

e.g. on a German Windows XP system: ”850”
(Read only property)

67.6.44 DefaultCountryCode as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Country code for the principal country in this locale.
Notes: This is provided so that partially specified locales can be completed with default values. The maximum number of characters allowed for this string is 6.
e.g. on a German Windows XP system: ”49”
(Read only property)

67.6.45 DefaultLanguageID as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Language identifier for the principal language spoken in this locale.
Notes: This is provided so that partially specified locales can be completed with default values. The maximum number of characters allowed for this string is 5.
e.g. on a German Windows XP system: ”0407”
(Read only property)

67.6.46 DigitGrouping as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sizes for each group of digits to the left of the decimal.
Notes: An explicit size is needed for each group; sizes are separated by semicolons. If the last value is zero, the preceding value is repeated. To group thousands, specify 3;0, for example.
e.g. on a German Windows XP system: ”3;0”
(Read only property)

67.6.47 DigitSubstitution as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Unkown.
Notes: 0 = context, 1 = none, 2 = national
e.g. on a German Windows XP system: ”1”
Introduced with Windows 2000.

(Read only property)

67.6.48 FirstDayOfWeek as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifier for the first day in a week.
Notes: Value from 0 to 6.
e.g. on a German Windows XP system: "0"
(Read only property)

67.6.49 FirstWeekOfYear as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifier for the first week of the year.
Notes: The specifier can be one of these values:

Value	Meaning
0	Week containing 1/1 is the first week of that year.
1	First full week following 1/1 is the first week of that year.
2	First week containing at least 4 days is the first week of that year.

e.g. on a German Windows XP system: "2"
(Read only property)

67.6.50 LanguageID as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Language identifier indicating the language.
Notes: The maximum number of characters allowed for this string is 5.
e.g. on a German Windows XP system: "0407"
(Read only property)

67.6.51 LanguageNameAbbreviated as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Abbreviated name of the language, created by taking the 2-letter language abbreviation from the ISO Standard 639 and adding a third letter, as appropriate, to indicate the sublanguage.
Notes: e.g. on a German Windows XP system: "DEU"
(Read only property)

67.6.52 LanguageNameAbbreviatedISO as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: ISO abbreviated language name.
Notes: e.g. on a German Windows XP system: "de"
(Read only property)

67.6.53 LanguageNameEnglish as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Full English name of the language from the International Organization for Standardization (ISO) Standard 639.
Notes: This is always restricted to characters mappable into the ASCII 127-character subset.
e.g. on a German Windows XP system: "German"
(Read only property)

67.6.54 LanguageNameLocalized as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Full localized name of the language.
Notes: e.g. on a German Windows XP system: "Deutsch (Deutschland)"
(Read only property)

67.6.55 LanguageNameNativ as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Native name of the language.
Notes: e.g. on a German Windows XP system: "Deutsch"
(Read only property)

67.6.56 LeadingZeros as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifier for leading zeros in decimal fields.
Notes: The maximum number of characters allowed for this string is 2. The specifier can be one of the following values:

Value	Meaning
0	No leading zeros
1	Leading zeros

e.g. on a German Windows XP system: "1"
(Read only property)

67.6.57 ListItemSeparator as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Character(s) used to separate list items.
Notes: For example, a comma is used in many locales.
e.g. on a German Windows XP system: ";"
(Read only property)

67.6.58 MeasureSystem as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: System of measurement.
Notes: This value is 0 if the metric system (Syst√©me International d'Unit√©s, or S.I.) is used and 1 if the U.S. system is used. The maximum number of characters allowed for this string is 2.
e.g. on a German Windows XP system: "0"
(Read only property)

67.6.59 NativeASCII0to9 as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Native equivalents to ASCII 0 through 9.
Notes: e.g. on a German Windows XP system: "0123456789"

(Read only property)

67.6.60 NegativeNumberMode as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Negative number mode.
Notes: The mode can be one of these values:

Value	Meaning
0	(1.1)
1	–1.1
2	–1.1
3	1.1–
4	1.1 –

e.g. on a German Windows XP system: "1"
(Read only property)

67.6.61 NegSepBySpace as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Separation of monetary symbol in a negative monetary value.
Notes: This value is 1 if the monetary symbol is separated by a space from the negative amount, 0 if it is not. The maximum number of characters allowed for this string is 2.
e.g. on a German Windows XP system: "1"
(Read only property)

67.6.62 NegSymPrecedes as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Position of monetary symbol in a negative monetary value.
Notes: This value is 1 if the monetary symbol precedes the negative amount, 0 if it follows it. The maximum number of characters allowed for this string is 2.
e.g. on a German Windows XP system: "0"
(Read only property)

67.6.63 NumberOfFraction as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of fractional digits.
Notes: The maximum number of characters allowed for this string is 3.
e.g. on a German Windows XP system: "2"
(Read only property)

67.6.64 Papersize as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Default paper size associated with the locale.
Notes: Possible values:

1	Letter
5	Legal
8	DIN A3
9	DIN A4

e.g. on a German Windows XP system: "9"
Introduced with Windows 2000.
(Read only property)

67.6.65 PosSepBySpace as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Separation of monetary symbol in a positive monetary value.
Notes: This value is 1 if the monetary symbol is separated by a space from a positive amount, 0 if it is not.
The maximum number of characters allowed for this string is 2.
e.g. on a German Windows XP system: "1"
(Read only property)

67.6.66 PosSymPrecedes as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Position of monetary symbol in a positive monetary value.
Notes: This value is 1 if the monetary symbol precedes the positive amount, 0 if it follows it. The maximum number of characters allowed for this string is 2.
e.g. on a German Windows XP system: "0"
(Read only property)

67.6.67 SignNegative as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: String value for the negative sign.
Notes: e.g. on a German Windows XP system: "-"
(Read only property)

67.6.68 SignNegativePosition as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Formatting index for negative values.
Notes: This index uses the same values as SignPositivePosition. The maximum number of characters allowed for this string is 2.
e.g. on a German Windows XP system: "1"
(Read only property)

67.6.69 SignPositive as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: String value for the positive sign.
Notes: e.g. on a German Windows XP system: ""
(Read only property)

67.6.70 SignPositivePosition as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Formatting index for positive values.
Notes: The maximum number of characters allowed for this string is 2. The index can be one of the following values:

Value	Meaning
0	Parentheses surround the amount and the monetary symbol.
1	The sign string precedes the amount and the monetary symbol.
2	The sign string succeeds the amount and the monetary symbol.
3	The sign string immediately precedes the monetary symbol.
4	The sign string immediately succeeds the monetary symbol.

e.g. on a German Windows XP system: "1"
(Read only property)

67.6.71 Sortname as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The full localized name of the sort for the given locale ID.
Notes: e.g. on a German Windows XP system: "W√rterbuch"
Introduced with Windows 2000.
(Read only property)

67.6.72 ThousandSeparator as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Character(s) used to separate groups of digits to the left of the decimal.
Notes: e.g. on a German Windows XP system: "."
(Read only property)

67.6.73 TimeAM as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: String for the AM designator.
Notes: e.g. on a German Windows XP system: ""
(Read only property)

67.6.74 TimeCenturyFormatSpecifier as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifier for full 4-digit century.
Notes: The maximum number of characters allowed for this string is 2. The specifier can be one of the following values:

Value	Meaning
0	Abbreviated 2-digit century
1	Full 4-digit century

e.g. on a German Windows XP system: "1"
(Read only property)

67.6.75 TimeFormatSpecifier as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Time format specifier.
Notes: The maximum number of characters allowed for this string is 2. The specifier can be one of the following values:

Value	Meaning
0	AM / PM 12-hour format
1	24-hour format

e.g. on a German Windows XP system: "1"
(Read only property)

67.6.76 TimeLeadingZeros as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifier for leading zeros in time fields.
Notes: The maximum number of characters allowed for this string is 2. The specifier can be one of the following values:

e.g. on a German Windows XP system: "1"
(Read only property)

Value	Meaning
0	No leading zeros for hours
1	Leading zeros for hours

67.6.77 TimeMarkerPosition as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Unkown.
Notes: e.g. on a German Windows XP system: "0"
(Read only property)

67.6.78 TimePM as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: String for the PM designator.
Notes: e.g. on a German Windows XP system: ""
(Read only property)

67.6.79 TimeSeparator as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Character(s) for the time separator.
Notes: e.g. on a German Windows XP system: ":"
(Read only property)

67.6.80 TimeShortFormatString as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Time formatting strings for this locale.
Notes: The string can consist of a combination of the hour, minute, and second format pictures defined in the Hour, Minute, and Second Format Pictures table in National Language Support Constants.
e.g. on a German Windows XP system: "HH:mm:ss"
(Read only property)

67.6.81 Constants

Constants

Constant	Value	Description
LANG_AFRIKAANS	&h36	One of the constants for the LanguageID.
LANG_ALBANIAN	&h1c	One of the constants for the LanguageID.
LANG_ARABIC	1	One of the constants for the LanguageID.
LANG_ARMENIAN	&h2b	One of the constants for the LanguageID.
LANG_ASSAMESE	&h4d	One of the constants for the LanguageID.
LANG_AZERI	&h2c	One of the constants for the LanguageID.
LANG_BASQUE	&h2d	One of the constants for the LanguageID.
LANG_BELARUSIAN	&h23	One of the constants for the LanguageID.
LANG_BENGALI	&h45	One of the constants for the LanguageID.
LANG_BULGARIAN	2	One of the constants for the LanguageID.
LANG_CATALAN	3	One of the constants for the LanguageID.
LANG_CHINESE	4	One of the constants for the LanguageID.
LANG_CROATIAN	&h1a	One of the constants for the LanguageID.
LANG_CZECH	5	One of the constants for the LanguageID.
LANG_DANISH	6	One of the constants for the LanguageID.
LANG_DUTCH	&h13	One of the constants for the LanguageID.
LANG_ENGLISH	9	One of the constants for the LanguageID.
LANG_ESTONIAN	&h25	One of the constants for the LanguageID.
LANG_FAEROESE	&h38	One of the constants for the LanguageID.
LANG_FARSI	&h29	One of the constants for the LanguageID.
LANG_FINNISH	&h0b	One of the constants for the LanguageID.
LANG_FRENCH	&h0c	One of the constants for the LanguageID.
LANG_GEORGIAN	&h37	One of the constants for the LanguageID.
LANG_GERMAN	7	One of the constants for the LanguageID.
LANG_GREEK	8	One of the constants for the LanguageID.
LANG_GUJARATI	&h47	One of the constants for the LanguageID.
LANG_HEBREW	&h0d	One of the constants for the LanguageID.
LANG_HINDI	&h39	One of the constants for the LanguageID.
LANG_HUNGARIAN	&h0e	One of the constants for the LanguageID.
LANG_ICELANDIC	&h0f	One of the constants for the LanguageID.
LANG_INDONESIAN	&h21	One of the constants for the LanguageID.
LANG_ITALIAN	&h10	One of the constants for the LanguageID.
LANG_JAPANESE	&h11	One of the constants for the LanguageID.
LANG_KANNADA	&h4b	One of the constants for the LanguageID.
LANG_KASHMIRI	&h60	One of the constants for the LanguageID.
LANG_KAZAK	&h3f	One of the constants for the LanguageID.
LANG_KONKANI	&h57	One of the constants for the LanguageID.
LANG_KOREAN	&h12	One of the constants for the LanguageID.
LANG_LATVIAN	&h26	One of the constants for the LanguageID.
LANG_LITHUANIAN	&h27	One of the constants for the LanguageID.
LANG_MACEDONIAN	&h2f	One of the constants for the LanguageID.
LANG_MALAY	&h3e	One of the constants for the LanguageID.
LANG_MALAYALAM	&h4c	One of the constants for the LanguageID.
LANG_MANIPURI	&h58	One of the constants for the LanguageID.
LANG_MARATHI	&h4e	One of the constants for the LanguageID.
LANG_NEPALI	&h61	One of the constants for the LanguageID.
LANG_NEUTRAL	0	One of the constants for the LanguageID.
LANG_NORWEGIAN	&h14	One of the constants for the LanguageID.
LANG_ORIYA	&h48	One of the constants for the LanguageID.
LANG_POLISH	&h15	One of the constants for the LanguageID.
LANG_PORTUGUESE	&h16	One of the constants for the LanguageID.
LANG_PUNJABI	&h46	One of the constants for the LanguageID.
LANG_ROMANIAN	&h18	One of the constants for the LanguageID.
LANG_RUSSIAN	&h19	One of the constants for the LanguageID.
LANG_SANSKRIT	&h4f	One of the constants for the LanguageID.
LANG_SERBIAN	&h1a	One of the constants for the LanguageID.
LANG_SINDHI	&h59	One of the constants for the LanguageID.
LANG_SLOVAK	&h1b	One of the constants for the LanguageID.

Chapter 68

Data Types

68.1 class ComplexDoubleMBS

68.1.1 class ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for complex numbers.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
Var d as new ComplexDoubleMBS(4,7)

Var sum as ComplexDoubleMBS = c+d

MessageBox sum.str
```

Blog Entries

- MBS REALbasic Plugins, version 10.4pr4

68.1.2 Methods

68.1.3 abs as Double

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The absolute value of the complex number.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
MessageBox str(c.abs)
```

68.1.4 Add(c as ComplexDoubleMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the given value to this complex number.
See also:

- 68.1.5 Add(x as Double) 12014

68.1.5 Add(x as Double)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the given value to this complex number.
See also:

- 68.1.4 Add(c as ComplexDoubleMBS) 12014

68.1.6 arg as Double

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return phase angle of complex.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
MessageBox str(c.arg)
```

68.1.7 conj as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns complex conjugate.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
Var e as ComplexDoubleMBS = c.conj
MessageBox e.str
```

68.1.8 Constructor(other as ComplexDoubleMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new complex number with the values from the given one.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
Var d as new ComplexDoubleMBS(c)

d.Add 1 // modify second object
MessageBox "d: "+d.str+", c: "+c.str
```

See also:

- 68.1.9 Constructor(x as Double = 0.0, y as Double = 0.0) 12015

68.1.9 Constructor(x as Double = 0.0, y as Double = 0.0)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new complex number with the given values.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
MessageBox str(c.Real)+" "+str(c.Imag)
```

See also:

- 68.1.8 Constructor(other as ComplexDoubleMBS) 12015

68.1.10 cos as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return cosine of complex.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
MessageBox c.cos.str
```

68.1.11 cosh as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return hyperbolic cosine of complex.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
MessageBox c.cosh.str
```

68.1.12 Divide(c as ComplexDoubleMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides this complex number by the given complex number.
See also:

- 68.1.13 Divide(x as Double) 12016

68.1.13 Divide(x as Double)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides this complex number by the given value.
See also:

- 68.1.12 Divide(c as ComplexDoubleMBS) 12016

68.1.14 exp as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return exponential of complex.
Notes: Var c as new ComplexDoubleMBS(1,2)
MessageBox c.exp.str

68.1.15 log as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return natural logarith of complex.
Example:

```
Var c as new ComplexDoubleMBS(10,10)
MessageBox c.log.str
```

68.1.16 log10 as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return common logarithm of complex.
Example:

```
Var c as new ComplexDoubleMBS(10,0)
MessageBox c.log10.str
```

68.1.17 Multiply(c as ComplexDoubleMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mulitplies this complex number with the given value.
See also:

- 68.1.18 Multiply(x as Double) 12017

68.1.18 Multiply(x as Double)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies this complex number with the given value.
See also:

- 68.1.17 Multiply(c as ComplexDoubleMBS) 12017

68.1.19 norm as Double

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return norm of complex number.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
MessageBox str(c.norm)
```

68.1.20 Operator_Add(c as ComplexDoubleMBS) as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to add two complex numbers.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
Var d as new ComplexDoubleMBS(3,4)
Var e as ComplexDoubleMBS = c+d
MessageBox e.str
```

See also:

- 68.1.21 Operator_Add(x as Double) as ComplexDoubleMBS 12018

68.1.21 Operator_Add(x as Double) as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to add a value to this complex number.
Example:

```
Var c as new ComplexDoubleMBS(3,4)
Var e as ComplexDoubleMBS = c+2
MessageBox e.str
```

See also:

- 68.1.20 Operator_Add(c as ComplexDoubleMBS) as ComplexDoubleMBS 12017

68.1.22 Operator_Compare(c as ComplexDoubleMBS) as Integer

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two complex numbers.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
Var d as new ComplexDoubleMBS(1,2)

if c = d then
MessageBox "equal"
else
MessageBox "not equal"
end if
```

68.1.23 Operator_Divide(c as ComplexDoubleMBS) as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to divide one complex number by another.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
Var d as new ComplexDoubleMBS(3,4)
Var e as ComplexDoubleMBS = c/d
MessageBox e.str
```

See also:

- 68.1.24 Operator_Divide(x as Double) as ComplexDoubleMBS 12019

68.1.24 Operator_Divide(x as Double) as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to divide a complex number by the given value.
Example:

```
Var c as new ComplexDoubleMBS(3,4)
Var e as ComplexDoubleMBS = c/2
MessageBox e.str
```

See also:

- 68.1.23 Operator_Divide(c as ComplexDoubleMBS) as ComplexDoubleMBS 12018

68.1.25 Operator_Multiply(c as ComplexDoubleMBS) as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to multiply two complex numbers.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
Var d as new ComplexDoubleMBS(3,4)
Var e as ComplexDoubleMBS = c*d
MessageBox e.str
```

See also:

- 68.1.26 Operator_Multiply(x as Double) as ComplexDoubleMBS 12020

68.1.26 Operator_Multiply(x as Double) as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to multiply a double to a complex number.
Example:

```
Var c as new ComplexDoubleMBS(3,4)
Var e as ComplexDoubleMBS = c*2
MessageBox e.str
```

See also:

- 68.1.25 Operator_Multiply(c as ComplexDoubleMBS) as ComplexDoubleMBS 12019

68.1.27 Operator_Power(x as ComplexDoubleMBS) as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to calculate the power of two complex numbers.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
Var d as new ComplexDoubleMBS(3,4)
Var e as ComplexDoubleMBS = c^d
MessageBox e.str
```

68.1.28 Operator_Subtract(c as ComplexDoubleMBS) as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to subtract one complex number from another.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
Var d as new ComplexDoubleMBS(3,4)
Var e as ComplexDoubleMBS = c-d
MessageBox e.str
```

See also:

- 68.1.29 Operator_Subtract(x as Double) as ComplexDoubleMBS 12021

68.1.29 Operator_Subtract(x as Double) as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to subtract the given value from this complex number.
Example:

```
Var c as new ComplexDoubleMBS(3,4)
Var e as ComplexDoubleMBS = c-2
MessageBox e.str
```

See also:

- 68.1.28 Operator_Subtract(c as ComplexDoubleMBS) as ComplexDoubleMBS 12020

68.1.30 PI as Double

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PI constant.
Example:

```
MessageBox str(ComplexDoubleMBS.PI)
```

68.1.31 polar(rho as Double, theta as Double) as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new complex number with the given polar coordinate.
Example:

```
MessageBox ComplexDoubleMBS.polar(10, 0.5).str
```

68.1.32 pow(x as ComplexDoubleMBS) as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return complex power.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
Var d as new ComplexDoubleMBS(2,0)
Var m as ComplexDoubleMBS = c.pow(d)
```

```
MessageBox "c: "+c.str+EndOfLine+"d: "+d.str+EndOfLine+"c^d: "+m.str
```

See also:

- 68.1.33 pow(x as Double) as ComplexDoubleMBS 12022
- 68.1.34 pow(x as Double, y as ComplexDoubleMBS) as ComplexDoubleMBS 12022

68.1.33 pow(x as Double) as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return complex power.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
Var m as ComplexDoubleMBS = c.pow(2)

MessageBox "c: "+c.str+EndOfLine+"c^2: "+m.str
```

See also:

- 68.1.32 pow(x as ComplexDoubleMBS) as ComplexDoubleMBS 12021
- 68.1.34 pow(x as Double, y as ComplexDoubleMBS) as ComplexDoubleMBS 12022

68.1.34 pow(x as Double, y as ComplexDoubleMBS) as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the power of the given values.
Example:

```
Var x as new ComplexDoubleMBS(2,3)
Var c as ComplexDoubleMBS = ComplexDoubleMBS.pow(2, x)

MessageBox c.str
```

See also:

- 68.1.32 pow(x as ComplexDoubleMBS) as ComplexDoubleMBS 12021
- 68.1.33 pow(x as Double) as ComplexDoubleMBS 12022

68.1.35 sin as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return sine of complex.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
MessageBox c.sin.str
```

68.1.36 sinh as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return hyperbolic sine of complex.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
MessageBox c.sinh.str
```

68.1.37 sqrt as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return square root of complex.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
Var r as ComplexDoubleMBS = c.sqrt
Var m as ComplexDoubleMBS = r*r

MessageBox "number: "+c.str+EndOfLine+"root: "+r.str+EndOfLine+"back: "+m.str
```

68.1.38 str as string

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shows the number in an human readable format.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
MessageBox c.str
```

Notes: The actual format can change.

68.1.39 Subtract(c as ComplexDoubleMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts the given complex number from this complex number.
See also:

- 68.1.40 Subtract(x as Double) 12024

68.1.40 Subtract(x as Double)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts the given value from this complex number.
See also:

- 68.1.39 Subtract(c as ComplexDoubleMBS) 12024

68.1.41 tan as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return tangent of complex.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
MessageBox c.tan.str
```

68.1.42 tanh as ComplexDoubleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return hyperbolic tangent of complex.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
MessageBox c.tanh.str
```

68.1.43 Properties

68.1.44 Imag as Double

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set the imaginary part of the complex number.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
MessageBox str(c.Imag)
```

Notes: (Read and Write property)

68.1.45 Real as Double

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set the real part of the complex number.
Example:

```
Var c as new ComplexDoubleMBS(1,2)
MessageBox str(c.Real)
```

Notes: (Read and Write property)

68.2 class ComplexSingleMBS

68.2.1 class ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for complex numbers.
Example:

```
Var c as new ComplexSingleMBS(1,2)
Var d as new ComplexSingleMBS(4,7)

Var sum as ComplexSingleMBS = c+d

MessageBox sum.str
```

68.2.2 Methods

68.2.3 abs as single

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The absolute value of the complex number.
Example:

```
Var c as new ComplexSingleMBS(1,2)
MessageBox str(c.abs)
```

68.2.4 Add(c as ComplexSingleMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the given value to this complex number.
See also:

- 68.2.5 Add(x as single)

68.2.5 Add(x as single)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the given value to this complex number.
See also:

- 68.2.4 Add(c as ComplexSingleMBS) 12026

68.2.6 arg as single

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return phase angle of complex.
Example:

```
Var c as new ComplexSingleMBS(1,2)
MessageBox str(c.arg)
```

68.2.7 conj as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns complex conjugate.
Example:

```
Var c as new ComplexSingleMBS(1,2)
Var e as ComplexSingleMBS = c.conj
MessageBox e.str
```

68.2.8 Constructor(other as ComplexSingleMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new complex number with the values from the given one.
Example:

```
Var c as new ComplexSingleMBS(1,2)
Var d as new ComplexSingleMBS(c)

d.Add 1 // modify second object
MessageBox "d: "+d.str+", c: "+c.str
```

See also:

- 68.2.9 Constructor(x as single = 0.0, y as single = 0.0) 12028

68.2.9 Constructor(x as single = 0.0, y as single = 0.0)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new complex number with the given values.
Example:

```
Var c as new ComplexSingleMBS(1,2)
MessageBox str(c.Real)+" "+str(c.Imag)
```

See also:

- 68.2.8 Constructor(other as ComplexSingleMBS) 12027

68.2.10 cos as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return cosine of complex.
Example:

```
Var c as new ComplexSingleMBS(1,2)
MessageBox c.cos.str
```

68.2.11 cosh as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return hyperbolic cosine of complex.
Example:

```
Var c as new ComplexSingleMBS(1,2)
MessageBox c.cosh.str
```

68.2.12 Divide(c as ComplexSingleMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides this complex number by the given complex number.
See also:

- 68.2.13 Divide(x as single) 12029

68.2.13 Divide(x as single)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Divides this complex number by the given value.
See also:

- 68.2.12 Divide(c as ComplexSingleMBS) 12028

68.2.14 exp as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return exponential of complex.
Notes: Var c as new ComplexSingleMBS(1,2)
MessageBox c.exp.str

68.2.15 log as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return natural logarith of complex.
Example:

```
Var c as new ComplexSingleMBS(10,10)
MessageBox c.log.str
```

68.2.16 log10 as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return common logarithm of complex.
Example:

```
Var c as new ComplexSingleMBS(10,0)
MessageBox c.log10.str
```

68.2.17 Multiply(c as ComplexSingleMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mulitplies this complex number with the given value.
See also:

• 68.2.18 Multiply(x as single) 12030

68.2.18 Multiply(x as single)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Multiplies this complex number with the given value.
See also:

• 68.2.17 Multiply(c as ComplexSingleMBS) 12029

68.2.19 norm as single

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return norm of complex number.
Example:

```
Var c as new ComplexSingleMBS(1,2)
MessageBox str(c.norm)
```

68.2.20 Operator_Add(c as ComplexSingleMBS) as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to add two complex numbers.
Example:

```
Var c as new ComplexSingleMBS(1,2)
Var d as new ComplexSingleMBS(3,4)
Var e as ComplexSingleMBS = c+d
MessageBox e.str
```

See also:

• 68.2.21 Operator_Add(x as single) as ComplexSingleMBS 12030

68.2.21 Operator_Add(x as single) as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to add a value to this complex number.
Example:

```
Var c as new ComplexSingleMBS(3,4)
Var e as ComplexSingleMBS = c+2
MessageBox e.str
```

See also:

- 68.2.20 Operator_Add(c as ComplexSingleMBS) as ComplexSingleMBS 12030

68.2.22 Operator_Compare(c as ComplexSingleMBS) as Integer

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares two complex numbers.
Example:

```
Var c as new ComplexSingleMBS(1,2)
Var d as new ComplexSingleMBS(1,2)

if c = d then
MessageBox "equal"
else
MessageBox "not equal"
end if
```

68.2.23 Operator_Divide(c as ComplexSingleMBS) as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to divide one complex number by another.
Example:

```
Var c as new ComplexSingleMBS(1,2)
Var d as new ComplexSingleMBS(3,4)
Var e as ComplexSingleMBS = c/d
MessageBox e.str
```

See also:

- 68.2.24 Operator_Divide(x as single) as ComplexSingleMBS 12031

68.2.24 Operator_Divide(x as single) as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to divide a complex number by the given value.
Example:

```
Var c as new ComplexSingleMBS(3,4)
Var e as ComplexSingleMBS = c/2
MessageBox e.str
```

See also:

- 68.2.23 Operator_Divide(c as ComplexSingleMBS) as ComplexSingleMBS 12031

68.2.25 Operator_Multiply(c as ComplexSingleMBS) as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to multiply two complex numbers.
Example:

```
Var c as new ComplexSingleMBS(1,2)
Var d as new ComplexSingleMBS(3,4)
Var e as ComplexSingleMBS = c*d
MessageBox e.str
```

See also:

- 68.2.26 Operator_Multiply(x as single) as ComplexSingleMBS 12032

68.2.26 Operator_Multiply(x as single) as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to multiply a single to a complex number.
Example:

```
Var c as new ComplexSingleMBS(3,4)
Var e as ComplexSingleMBS = c*2
MessageBox e.str
```

See also:

- 68.2.25 Operator_Multiply(c as ComplexSingleMBS) as ComplexSingleMBS 12032

68.2.27 Operator_Power(x as ComplexSingleMBS) as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to calculate the power of two complex numbers.
Example:

```
Var c as new ComplexSingleMBS(1,2)
Var d as new ComplexSingleMBS(3,4)
Var e as ComplexSingleMBS = c^d
MessageBox e.str
```

68.2.28 Operator_Subtract(c as ComplexSingleMBS) as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to subtract one complex number from another.
Example:

```
Var c as new ComplexSingleMBS(1,2)
Var d as new ComplexSingleMBS(3,4)
Var e as ComplexSingleMBS = c-d
MessageBox e.str
```

See also:

- 68.2.29 Operator_Subtract(x as single) as ComplexSingleMBS 12033

68.2.29 Operator_Subtract(x as single) as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This method is called by Xojo in order to subtract the given value from this complex number.
Example:

```
Var c as new ComplexSingleMBS(3,4)
Var e as ComplexSingleMBS = c-2
MessageBox e.str
```

See also:

- 68.2.28 Operator_Subtract(c as ComplexSingleMBS) as ComplexSingleMBS 12033

68.2.30 PI as Double

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The PI constant.
Example:

MessageBox str(ComplexSingleMBS.PI)

68.2.31 polar(rho as single, theta as single) as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new complex number with the given polar coordinate.
Example:

```
MessageBox ComplexSingleMBS.polar(10, 0.5).str
```

68.2.32 pow(x as ComplexSingleMBS) as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return complex power.
Example:

```
Var c as new ComplexSingleMBS(1,2)
Var d as new ComplexSingleMBS(2,0)
Var m as ComplexSingleMBS = c.pow(d)

MessageBox "c: "+c.str+EndOfLine+"d: "+d.str+EndOfLine+"c^d: "+m.str
```

See also:

- 68.2.33 pow(x as single) as ComplexSingleMBS 12034
- 68.2.34 pow(x as single, y as ComplexSingleMBS) as ComplexSingleMBS 12035

68.2.33 pow(x as single) as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return complex power.
Example:

```
Var c as new ComplexSingleMBS(1,2)
Var m as ComplexSingleMBS = c.pow(2)

MessageBox "c: "+c.str+EndOfLine+"c^2: "+m.str
```

See also:

- 68.2.32 pow(x as ComplexSingleMBS) as ComplexSingleMBS 12034
- 68.2.34 pow(x as single, y as ComplexSingleMBS) as ComplexSingleMBS 12035

68.2.34 pow(x as single, y as ComplexSingleMBS) as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calculates the power of the given values.
Example:

```
Var x as new ComplexSingleMBS(2,3)
Var c as ComplexSingleMBS = ComplexSingleMBS.pow(2, x)

MessageBox c.str
```

See also:

- 68.2.32 pow(x as ComplexSingleMBS) as ComplexSingleMBS 12034
- 68.2.33 pow(x as single) as ComplexSingleMBS 12034

68.2.35 sin as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return sine of complex.
Example:

```
Var c as new ComplexSingleMBS(1,2)
MessageBox c.sin.str
```

68.2.36 sinh as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return hyperbolic sine of complex.
Example:

```
Var c as new ComplexSingleMBS(1,2)
MessageBox c.sinh.str
```

68.2.37 sqrt as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return square root of complex.
Example:

```
Var c as new ComplexSingleMBS(1,2)
Var r as ComplexSingleMBS = c.sqrt
Var m as ComplexSingleMBS = r*r

MessageBox "number: "+c.str+EndOfLine+"root: "+r.str+EndOfLine+"back: "+m.str
```

68.2.38 str as string

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shows the number in an human readable format.
Example:

```
Var c as new ComplexSingleMBS(1,2)
MessageBox c.str
```

Notes: The actual format can change.

68.2.39 Subtract(c as ComplexSingleMBS)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts the given complex number from this complex number.
See also:

- 68.2.40 Subtract(x as single) 12036

68.2.40 Subtract(x as single)

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Subtracts the given value from this complex number.
See also:

- 68.2.39 Subtract(c as ComplexSingleMBS) 12036

68.2.41 tan as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return tangent of complex.
Example:

```
Var c as new ComplexSingleMBS(1,2)
MessageBox c.tan.str
```

68.2.42 tanh as ComplexSingleMBS

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Return hyperbolic tangent of complex.
Example:

```
Var c as new ComplexSingleMBS(1,2)
MessageBox c.tanh.str
```

68.2.43 Properties

68.2.44 Imag as single

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set the imaginary part of the complex number.
Example:

```
Var c as new ComplexSingleMBS(1,2)
MessageBox str(c.Imag)
```

Notes: (Read and Write property)

68.2.45 Real as single

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Get or set the real part of the complex number.
Example:

```
Var c as new ComplexSingleMBS(1,2)
MessageBox str(c.Real)
```

Notes: (Read and Write property)

68.3 Globals

68.3.1 FFTDoubleAbsMBS(x as MemoryBlock, N as Integer = -1) as Double()

MBS DataTypes Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a Fast Fourier Transformation and applies abs operation on result.
Example:

```
// FFT of Double values stored in a MemoryBlock, e.g. audio data from a file
Var n As Integer = 128
Var m As New MemoryBlock(n * 8)
For i As Integer = 0 To n - 1
m.DoubleValue(i * 8) = Sin(2 * 3.14159265 * 5 * i / n)
Next
Var magnitudes() As Double = FFTDoubleAbsMBS(m)
MessageBox "Bin 5: " + Format(magnitudes(5), "0.0")
```

Notes: Memoryblock contains DoubleValue values (8 byte each).
If N is not provided, the plugin chooses a value.
See also:

- 68.3.2 FFTDoubleAbsMBS(x() as ComplexDoubleMBS, N as Integer = -1) as Double() 12038
- 68.3.3 FFTDoubleAbsMBS(x() as Double, N as Integer = -1) as Double() 12039

68.3.2 FFTDoubleAbsMBS(x() as ComplexDoubleMBS, N as Integer = -1) as Double()

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a Fast Fourier Transformation and applies abs operation on result.
Example:

```
// get the magnitude spectrum of complex input values
Var values() As ComplexDoubleMBS
For i As Integer = 0 To 63
values.Add New ComplexDoubleMBS(Sin(2 * 3.14159265 * 10 * i / 64), 0)
Next
Var magnitudes() As Double = FFTDoubleAbsMBS(values)
MessageBox "Bin 10: " + Format(magnitudes(10), "0.0")
```

Notes: If N is not provided, the plugin chooses a value.
See also:

- 68.3.1 FFTDoubleAbsMBS(x as MemoryBlock, N as Integer = -1) as Double() 12038

- 68.3.3 FFTDoubleAbsMBS(x() as Double, N as Integer = -1) as Double() 12039

68.3.3 FFTDoubleAbsMBS(x() as Double, N as Integer = -1) as Double()

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a Fast Fourier Transformation and applies abs operation on result.
Example:

```
// find the strongest frequency in a signal with a FFT
Var samples() As Double
For i As Integer = 0 To 1023
samples.Add Sin(2 * 3.14159265 * 50 * i / 1024) // 50 cycles in 1024 samples
Next
Var spectrum() As Double = FFTDoubleAbsMBS(samples)

Var best As Integer
For i As Integer = 1 To spectrum.LastIndex \2
If spectrum(i) >spectrum(best) Then best = i
Next
MessageBox "Peak at bin " + best.ToString // 50
```

Notes: If N is not provided, the plugin chooses a value.

- MBS REALbasic Plugins, version 10.4pr11

See also:

- 68.3.1 FFTDoubleAbsMBS(x as MemoryBlock, N as Integer = -1) as Double() 12038
- 68.3.2 FFTDoubleAbsMBS(x() as ComplexDoubleMBS, N as Integer = -1) as Double() 12038

68.3.4 FFTDoubleMBS(x() as ComplexDoubleMBS, N as Integer = -1) as ComplexDoubleMBS()

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a Fast Fourier Transformation.
Example:

```
// run a FFT on complex input values
Var values() As ComplexDoubleMBS
For i As Integer = 0 To 63
values.Add New ComplexDoubleMBS(Sin(2 * 3.14159265 * 4 * i / 64), 0)
```

```
Next
Var result() As ComplexDoubleMBS = FFTDoubleMBS(values)
MessageBox result.Count.ToString + " values, bin 4 magnitude " + Format(result(4).abs, "0.0")
```

Notes: If N is not provided, the plugin chooses a value.
See also:

- 68.3.5 FFTDoubleMBS(x() as Double, N as Integer = -1) as ComplexDoubleMBS() 12040

68.3.5 FFTDoubleMBS(x() as Double, N as Integer = -1) as ComplexDoubleMBS()

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a Fast Fourier Transformation.
Example:

```
// get real and imaginary parts of the spectrum of a signal
Var samples() As Double
For i As Integer = 0 To 255
samples.Add Cos(2 * 3.14159265 * 8 * i / 256) // 8 cycles
Next
Var spectrum() As ComplexDoubleMBS = FFTDoubleMBS(samples)
MessageBox "Bin 8: " + Format(spectrum(8).Real, "0.0") + " + " + Format(spectrum(8).Imag, "0.0") +
"i, abs " + Format(spectrum(8).abs, "0.0")
```

Notes: If N is not provided, the plugin chooses a value.

68.3.6 FFTSingleAbsMBS(x as MemoryBlock, N as Integer = -1) as single()

MBS DataTypes Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a Fast Fourier Transformation and applies abs operation on result.
Example:

```
// magnitude spectrum of Single values stored in a MemoryBlock
Var n As Integer = 256
Var m As New MemoryBlock(n * 4)
For i As Integer = 0 To n - 1
m.SingleValue(i * 4) = Sin(2 * 3.14159265 * 12 * i / n)
Next
Var magnitudes() As Single = FFTSingleAbsMBS(m)
MessageBox "Bin 12: " + Format(magnitudes(12), "0.0")
```

Notes: Memoryblock contains SingleValue values (4 byte each).
If N is not provided, the plugin chooses a value.
See also:

- 68.3.7 FFTSingleAbsMBS(x() as ComplexSingleMBS, N as Integer = -1) as single() 12041
- 68.3.8 FFTSingleAbsMBS(x() as single, N as Integer = -1) as single() 12041

68.3.7 FFTSingleAbsMBS(x() as ComplexSingleMBS, N as Integer = -1) as single()

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a Fast Fourier Transformation and applies abs operation on result.
Example:

```
// magnitude spectrum of complex Single values
Var values() As ComplexSingleMBS
For i As Integer = 0 To 63
values.Add New ComplexSingleMBS(Sin(2 * 3.14159265 * 6 * i / 64), 0)
Next
Var magnitudes() As Single = FFTSingleAbsMBS(values)
MessageBox "Bin 6: " + Format(magnitudes(6), "0.0")
```

Notes: If N is not provided, the plugin chooses a value.
See also:

- 68.3.6 FFTSingleAbsMBS(x as MemoryBlock, N as Integer = -1) as single() 12040
- 68.3.8 FFTSingleAbsMBS(x() as single, N as Integer = -1) as single() 12041

68.3.8 FFTSingleAbsMBS(x() as single, N as Integer = -1) as single()

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a Fast Fourier Transformation and applies abs operation on result.
Example:

```
// find the dominant frequency in Single samples
Var samples() As Single
For i As Integer = 0 To 511
samples.Add Sin(2 * 3.14159265 * 30 * i / 512)
Next
Var magnitudes() As Single = FFTSingleAbsMBS(samples)
Var best As Integer
For i As Integer = 1 To magnitudes.LastIndex \2
If magnitudes(i) >magnitudes(best) Then best = i
Next
MessageBox "Peak at bin " + best.ToString // 30
```

Notes: If N is not provided, the plugin chooses a value.

68.3.9 FFTSingleMBS(x() as ComplexSingleMBS, N as Integer = -1) as ComplexSingleMBS()

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a Fast Fourier Transformation.
Example:

```
// FFT on complex Single values
Var values() As ComplexSingleMBS
For i As Integer = 0 To 63
values.Add New ComplexSingleMBS(Cos(2 * 3.14159265 * 3 * i / 64), 0)
Next
Var result() As ComplexSingleMBS = FFTSingleMBS(values)
MessageBox "Bin 3: " + Format(result(3).Real, "0.0")
```

68.3.10 FFTSingleMBS(x() as single, N as Integer = -1) as ComplexSingleMBS()

MBS DataTypes Plugin, Plugin Version: 10.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs a Fast Fourier Transformation.
Example:

```
// FFT with Single precision, which is faster and uses less memory
Var samples() As Single
For i As Integer = 0 To 255
samples.Add Sin(2 * 3.14159265 * 20 * i / 256)
Next
Var spectrum() As ComplexSingleMBS = FFTSingleMBS(samples)
MessageBox "Bin 20 magnitude: " + Format(spectrum(20).abs, "0.0")
```

Notes: If N is not provided, the plugin chooses a value.

68.4 class IntegerHashSetIteratorMBS

68.4.1 class IntegerHashSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the IntegerHashSet class.
Example:

```
// Create a map
Var m as new IntegerHashSetMBS

m.insert(1)
m.insert(2)
m.insert(3)

// get iterators pointing to first and after last element
Var i as IntegerHashSetIteratorMBS = m.first
Var e as IntegerHashSetIteratorMBS = m.last
```

```
// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)
i.MoveNext
wend
```

68.4.2 Methods

68.4.3 isEqual(other as IntegerHashSetIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new IntegerHashSetMBS

m.insert(1)
m.insert(2)
m.insert(3)

// get iterators pointing to first and after last element
Var i as IntegerHashSetIteratorMBS = m.first
Var e as IntegerHashSetIteratorMBS = m.last

// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)
i.MoveNext
wend
```

68.4.4 isNotEqual(other as IntegerHashSetIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new IntegerHashSetMBS

m.insert(1)
m.insert(2)
```

```
m.insert(3)

// get iterators pointing to first and after last element
Var i as IntegerHashSetIteratorMBS = m.first
Var e as IntegerHashSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)
i.MoveNext
wend
```

68.4.5 Key as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.4.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
Var m as new IntegerHashSetMBS

m.insert(1)
m.insert(2)
m.insert(3)

// get iterators pointing to first and after last element
Var i as IntegerHashSetIteratorMBS = m.first
Var e as IntegerHashSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)
i.MoveNext
wend
```

68.5 class IntegerHashSetMBS

68.5.1 class IntegerHashSetMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for a hash set with integers.
Example:

```
Var s as new IntegerHashSetMBS

s.insert 1
s.insert 2

MessageBox str(s.Count) // shows 2
```

Notes: You can choose whether you want to keep the set ordered using the OrderedSet class or whether you prefer a higher speed with the HashSet class.

68.5.2 Methods

68.5.3 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.5.4 Constructor

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
See also:

- 68.5.5 Constructor(Keys() as Integer) 12046

68.5.5 Constructor(Keys() as Integer)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new set from the values in the array.
Notes: If the array has duplicates, the later elements overwrite the earlier keys.
See also:

• 68.5.4 Constructor 12046

68.5.6 CountKey(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this set.

68.5.7 find(key as Integer) as IntegerHashSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.5.8 first as IntegerHashSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the set.
Example:

```
// Create a map
Var m as new IntegerHashSetMBS

m.insert(1)
m.insert(2)
m.insert(3)

// get iterators pointing to first and after last element
Var i as IntegerHashSetIteratorMBS = m.first
Var e as IntegerHashSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)
i.MoveNext
wend
```

68.5.9 insert(key as Integer)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a value to the set.

68.5.10 Key(index as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.5.11 Keys as Integer()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new IntegerHashSetMBS

m.insert(1)
m.insert(2)

for each v as Integer in m.Keys
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.5.12 last as IntegerHashSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the set.
Example:

```
// Create a map
Var m as new IntegerHashSetMBS

m.insert(1)
m.insert(2)
m.insert(3)
```

```
// get iterators pointing to first and after last element
Var i as IntegerHashSetIteratorMBS = m.first
Var e as IntegerHashSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)
i.MoveNext
wend
```

68.5.13 lookup(key as Integer) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether an element with the given key exists in this set.
Example:

```
Var set as new IntegerHashSetMBS

set.insert 1
set.insert 2

MessageBox str(set.lookup(3)) // shows false as value is missing
MessageBox str(set.lookup(1)) // shows true as value is found
```

Notes: Returns true if yes and false if no.

68.5.14 Remove(first as IntegerHashSetIteratorMBS, last as IntegerHashSetIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.5.15 Remove(key as Integer) as Integer 12049
- 68.5.16 Remove(pos as IntegerHashSetIteratorMBS) 12050

68.5.15 Remove(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.5.14 Remove(first as IntegerHashSetIteratorMBS, last as IntegerHashSetIteratorMBS) 12049
- 68.5.16 Remove(pos as IntegerHashSetIteratorMBS) 12050

68.5.16 Remove(pos as IntegerHashSetIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.5.14 Remove(first as IntegerHashSetIteratorMBS, last as IntegerHashSetIteratorMBS) 12049
- 68.5.15 Remove(key as Integer) as Integer 12049

68.5.17 Properties

68.5.18 BinCount as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bins the hash table uses.
Example:

```
Var v as new IntegerHashSetMBS

v.insert 1
v.insert 5

MessageBox str(v.BinCount)
```

Notes: This is a measure of the hash table size, independent of the number of items the Dictionary contains. (Read only property)

68.5.19 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this set.
Example:

```
Var set as new IntegerHashSetMBS
```

```
set.insert 1
set.insert 2

MessageBox str(set.Count)
```

Notes: (Read only property)

68.5.20 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.5.21 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this set.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.6 class IntegerOrderedSetIteratorMBS

68.6.1 class IntegerOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the IntegerOrderedSet class.
Example:

```
// Create a map
Var m as new IntegerOrderedSetMBS

m.insert(1)
m.insert(2)
m.insert(3)

// get iterators pointing to first and after last element
Var i as IntegerOrderedSetIteratorMBS = m.first
Var e as IntegerOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)
i.MoveNext
wend
```

68.6.2 Methods

68.6.3 isEqual(other as IntegerOrderedSetIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new IntegerOrderedSetMBS

m.insert(1)
m.insert(2)
m.insert(3)

// get iterators pointing to first and after last element
Var i as IntegerOrderedSetIteratorMBS = m.first
Var e as IntegerOrderedSetIteratorMBS = m.last
```

```
// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)
i.MoveNext
wend
```

68.6.4 isNotEqual(other as IntegerOrderedSetIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new IntegerOrderedSetMBS

m.insert(1)
m.insert(2)
m.insert(3)

// get iterators pointing to first and after last element
Var i as IntegerOrderedSetIteratorMBS = m.first
Var e as IntegerOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)
i.MoveNext
wend
```

68.6.5 Key as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.6.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
```

```
Var m as new IntegerOrderedSetMBS

m.insert(1)
m.insert(2)
m.insert(3)

// get iterators pointing to first and after last element
Var i as IntegerOrderedSetIteratorMBS = m.first
Var e as IntegerOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)
i.MoveNext
wend
```

68.6.7 MovePrev

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the previous item.

68.7 class IntegerOrderedSetMBS

68.7.1 class IntegerOrderedSetMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for an ordered set with integers.
Example:

```
Var s as new IntegerOrderedSetMBS

s.insert 1
s.insert 2

MessageBox str(s.Count) // shows 2
```

Notes: You can choose whether you want to keep the set ordered using the OrderedSet class or whether you prefer a higher speed with the HashSet class.

68.7.2 Methods

68.7.3 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.7.4 Constructor

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
See also:

- 68.7.5 Constructor(Keys() as Integer) 12055

68.7.5 Constructor(Keys() as Integer)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new set from the values in the array.
Notes: If the array has duplicates, the later elements overwrite the earlier keys.
See also:

- 68.7.4 Constructor 12055

68.7.6 CountKey(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this set.

68.7.7 find(key as Integer) as IntegerOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.7.8 first as IntegerOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the set.
Example:

```
// Create a map
Var m as new IntegerOrderedSetMBS

m.insert(1)
m.insert(2)
m.insert(3)

// get iterators pointing to first and after last element
Var i as IntegerOrderedSetIteratorMBS = m.first
Var e as IntegerOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)
i.MoveNext
wend
```

68.7.9 insert(key as Integer)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a value to the set.

68.7.10 Key(index as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.7.11 Keys as Integer()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new IntegerOrderedSetMBS

m.insert(1)
m.insert(2)

for each v as Integer in m.Keys
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.7.12 last as IntegerOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the set.
Example:

```
// Create a map
Var m as new IntegerOrderedSetMBS

m.insert(1)
m.insert(2)
m.insert(3)
```

```
// get iterators pointing to first and after last element
Var i as IntegerOrderedSetIteratorMBS = m.first
Var e as IntegerOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)
i.MoveNext
wend
```

68.7.13 lookup(key as Integer) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether an element with the given key exists in this set.
Example:

```
Var set as new IntegerOrderedSetMBS

set.insert 1
set.insert 2

MessageBox str(set.lookup(3)) // shows false as value is missing
MessageBox str(set.lookup(1)) // shows true as value is found
```

Notes: Returns true if yes and false if no.

68.7.14 LowerBound(key as Integer) as IntegerOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is not less than k.

68.7.15 Remove(first as IntegerOrderedSetIteratorMBS, last as IntegerOrderedSetIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.7.16 Remove(key as Integer) as Integer

• 68.7.17 Remove(pos as IntegerOrderedSetIteratorMBS) 12059

68.7.16 Remove(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

• 68.7.15 Remove(first as IntegerOrderedSetIteratorMBS, last as IntegerOrderedSetIteratorMBS) 12058

• 68.7.17 Remove(pos as IntegerOrderedSetIteratorMBS) 12059

68.7.17 Remove(pos as IntegerOrderedSetIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

• 68.7.15 Remove(first as IntegerOrderedSetIteratorMBS, last as IntegerOrderedSetIteratorMBS) 12058

• 68.7.16 Remove(key as Integer) as Integer 12059

68.7.18 UpperBound(key as Integer) as IntegerOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is greater than k.

68.7.19 Properties

68.7.20 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this set.
Example:

```
Var set as new IntegerOrderedSetMBS

set.insert 1
set.insert 2
```

MessageBox str(set.Count)

Notes: (Read only property)

68.7.21 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.7.22 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this set.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.8 class IntegerToIntegerHashMapIteratorMBS

68.8.1 class IntegerToIntegerHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the IntegerToIntegerHashMap class.
Example:

```
// Create a map
Var m as new IntegerToIntegerHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToIntegerHashMapIteratorMBS = m.first
Var e as IntegerToIntegerHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.8.2 Methods

68.8.3 isEqual(other as IntegerToIntegerHashMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new IntegerToIntegerHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToIntegerHashMapIteratorMBS = m.first
Var e as IntegerToIntegerHashMapIteratorMBS = m.last
```

```
// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.8.4 isNotEqual(other as IntegerToIntegerHashMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new IntegerToIntegerHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToIntegerHashMapIteratorMBS = m.first
Var e as IntegerToIntegerHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.8.5 Key as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.8.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
```

```
Var m as new IntegerToIntegerHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToIntegerHashMapIteratorMBS = m.first
Var e as IntegerToIntegerHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.8.7 Properties

68.8.8 Value as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the current item in the iterator.
Notes: (Read and Write computed property)

68.9 class IntegerToIntegerHashMapMBS

68.9.1 class IntegerToIntegerHashMapMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for a hash map with integers as keys and values.
Example:

```
Var s as new IntegerToIntegerHashMapMBS

s.Value(1)=3
s.Value(2)=4

MessageBox str(s.Count) // shows 2

MessageBox str(s.Value(1)+s.Value(2)) // shows 7
```

Notes: You can choose whether you want to keep the map ordered using the OrderedMap class or whether you prefer a higher speed with the HashMap class.

68.9.2 Methods

68.9.3 AddKeys(targetArray() as Integer)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to keys, but adds keys to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.9.4 AddValues(targetArray() as Integer)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to values, but adds values to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.9.5 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.9.6 Clone as IntegerToIntegerHashMapMBS

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map.

68.9.7 CloneDictionary as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map as a dictionary.

68.9.8 Constructor

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
See also:

- 68.9.9 Constructor(dic as dictionary) 12065
- 68.9.10 Constructor(other as IntegerToIntegerHashMapMBS) 12065

68.9.9 Constructor(dic as dictionary)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the dictionary.
See also:

- 68.9.8 Constructor 12065
- 68.9.10 Constructor(other as IntegerToIntegerHashMapMBS) 12065

68.9.10 Constructor(other as IntegerToIntegerHashMapMBS)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the existing map.
See also:

- 68.9.8 Constructor 12065
- 68.9.9 Constructor(dic as dictionary) 12065

68.9.11 CountKey(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this map.

68.9.12 find(key as Integer) as IntegerToIntegerHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.9.13 first as IntegerToIntegerHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the map.
Example:

```
// Create a map
Var m as new IntegerToIntegerHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToIntegerHashMapIteratorMBS = m.first
Var e as IntegerToIntegerHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.9.14 hasKey(key as Integer) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if Key is in the map and False if it is not. Returns a Boolean.

68.9.15 Key(index as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.9.16 Keys as Integer()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new IntegerToIntegerHashMapMBS

m.Value(1)=5
m.Value(2)=7

for each v as Integer in m.keys
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.9.17 last as IntegerToIntegerHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the map.
Example:

```
// Create a map
Var m as new IntegerToIntegerHashMapMBS
```

```
m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToIntegerHashMapIteratorMBS = m.first
Var e as IntegerToIntegerHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.9.18 lookup(key as Integer, defaultvalue as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the passed value of Key.
Example:

```
Var map as new IntegerToIntegerHashMapMBS

map.value(10)=1
map.value(100)=2
map.value(1000)=3

MessageBox str(map.lookup(5,0)) // shows 0 as value is missing
MessageBox str(map.lookup(10,0)) // shows 1 as value is found
```

Notes: If Key is found, it returns the corresponding value. If Key is not found, it returns the passed defaultValue.

68.9.19 Operator_Convert as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the map as dictionary.

68.9.20 Remove(first as IntegerToIntegerHashMapIteratorMBS, last as IntegerToIntegerHashMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.9.21 Remove(key as Integer) as Integer 12069
- 68.9.22 Remove(pos as IntegerToIntegerHashMapIteratorMBS) 12069

68.9.21 Remove(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.9.20 Remove(first as IntegerToIntegerHashMapIteratorMBS, last as IntegerToIntegerHashMapIteratorMBS) 12069
- 68.9.22 Remove(pos as IntegerToIntegerHashMapIteratorMBS) 12069

68.9.22 Remove(pos as IntegerToIntegerHashMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.9.20 Remove(first as IntegerToIntegerHashMapIteratorMBS, last as IntegerToIntegerHashMapIteratorMBS) 12069
- 68.9.21 Remove(key as Integer) as Integer 12069

68.9.23 ValueAtIndex(index as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value with the given index.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.9.24 Values as Integer()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the values as an array
Example:

```
Var m as new IntegerToIntegerHashMapMBS

m.Value(1)=5
m.Value(2)=7

for each v as Integer in m.Values
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by Keys at least until the Map is modified. Use this method with For Each to loop through all the values.

68.9.25 Properties

68.9.26 BinCount as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bins the hash table uses.
Example:

```
Var v as new IntegerToIntegerHashMapMBS

v.value(1)=10
v.value(2)=20

MessageBox str(v.BinCount)
```

Notes: This is a measure of the hash table size, independent of the number of items the Dictionary contains. (Read only property)

68.9.27 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this map.
Example:

Var map as new IntegerToIntegerHashMapMBS

map.Value(1)=3
map.Value(2)=4

MessageBox str(map.Count)

Notes: (Read only property)

68.9.28 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.9.29 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this map.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.9.30 value(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value associated with the given key.
Notes: If you query for a key which does not exist, a KeyNotFoundException is raised.
(Read and Write computed property)

68.10 class IntegerToIntegerOrderedMapIteratorMBS

68.10.1 class IntegerToIntegerOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the IntegerToIntegerOrderedMap class.
Example:

```
// Create a map
Var m as new IntegerToIntegerOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToIntegerOrderedMapIteratorMBS = m.first
Var e as IntegerToIntegerOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.10.2 Methods

68.10.3 isEqual(other as IntegerToIntegerOrderedMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new IntegerToIntegerOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToIntegerOrderedMapIteratorMBS = m.first
Var e as IntegerToIntegerOrderedMapIteratorMBS = m.last
```

```
// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.10.4 isNotEqual(other as IntegerToIntegerOrderedMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new IntegerToIntegerOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToIntegerOrderedMapIteratorMBS = m.first
Var e as IntegerToIntegerOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.10.5 Key as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.10.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
```

```
Var m as new IntegerToIntegerOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToIntegerOrderedMapIteratorMBS = m.first
Var e as IntegerToIntegerOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.10.7 MovePrev

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the previous item.

68.10.8 Properties

68.10.9 Value as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the current item in the iterator.
Notes: (Read and Write computed property)

68.11 class IntegerToIntegerOrderedMapMBS

68.11.1 class IntegerToIntegerOrderedMapMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for an ordered map for integers for keys and values.
Example:

```
Var s as new IntegerToIntegerHashMapMBS

s.Value(1)=3
s.Value(2)=4

MessageBox str(s.Count) // shows 2

MessageBox str(s.Value(1)+s.Value(2)) // shows 7
```

Notes: You can choose whether you want to keep the map ordered using the OrderedMap class or whether you prefer a higher speed with the HashMap class.

68.11.2 Methods

68.11.3 AddKeys(targetArray() as Integer)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to keys, but adds keys to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.11.4 AddValues(targetArray() as Integer)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to values, but adds values to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.11.5 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.11.6 Clone as IntegerToIntegerOrderedMapMBS

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map.

68.11.7 CloneDictionary as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map as a dictionary.

68.11.8 Constructor

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
See also:

- 68.11.9 Constructor(dic as dictionary) 12076
- 68.11.10 Constructor(other as IntegerToIntegerOrderedMapMBS) 12076

68.11.9 Constructor(dic as dictionary)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the dictionary.
See also:

- 68.11.8 Constructor 12076
- 68.11.10 Constructor(other as IntegerToIntegerOrderedMapMBS) 12076

68.11.10 Constructor(other as IntegerToIntegerOrderedMapMBS)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the existing map.
See also:

- 68.11.8 Constructor 12076
- 68.11.9 Constructor(dic as dictionary) 12076

68.11.11 CountKey(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this map.

68.11.12 find(key as Integer) as IntegerToIntegerOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.11.13 first as IntegerToIntegerOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the map.
Example:

```
// Create a map
Var m as new IntegerToIntegerOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToIntegerOrderedMapIteratorMBS = m.first
Var e as IntegerToIntegerOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.11.14 hasKey(key as Integer) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if Key is in the map and False if it is not. Returns a Boolean.

68.11.15 Key(index as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.11.16 Keys as Integer()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new IntegerToIntegerOrderedMapMBS

m.Value(1)=5
m.Value(2)=7

for each v as Integer in m.keys
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.11.17 last as IntegerToIntegerOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the map.
Example:

```
// Create a map
Var m as new IntegerToIntegerOrderedMapMBS
```

```
m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToIntegerOrderedMapIteratorMBS = m.first
Var e as IntegerToIntegerOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.11.18 lookup(key as Integer, defaultvalue as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the passed value of Key.
Example:

```
Var map as new IntegerToIntegerOrderedMapMBS

map.value(10)=1
map.value(100)=2
map.value(1000)=3

MessageBox str(map.lookup(5,0)) // shows 0 as value is missing
MessageBox str(map.lookup(10,0)) // shows 1 as value is found
```

Notes: If Key is found, it returns the corresponding value. If Key is not found, it returns the passed defaultValue.

68.11.19 LowerBound(key as Integer) as IntegerToIntegerOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is not less than k.

68.11.20 Operator_Convert as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the map as dictionary.

68.11.21 Remove(first as IntegerToIntegerOrderedMapIteratorMBS, last as IntegerToIntegerOrderedMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.11.22 Remove(key as Integer) as Integer 12080
- 68.11.23 Remove(pos as IntegerToIntegerOrderedMapIteratorMBS) 12080

68.11.22 Remove(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.11.21 Remove(first as IntegerToIntegerOrderedMapIteratorMBS, last as IntegerToIntegerOrderedMapIteratorMBS) 12080
- 68.11.23 Remove(pos as IntegerToIntegerOrderedMapIteratorMBS) 12080

68.11.23 Remove(pos as IntegerToIntegerOrderedMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.11.21 Remove(first as IntegerToIntegerOrderedMapIteratorMBS, last as IntegerToIntegerOrderedMapIteratorMBS) 12080
- 68.11.22 Remove(key as Integer) as Integer 12080

68.11.24 UpperBound(key as Integer) as IntegerToIntegerOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is greater than k.

68.11.25 ValueAtIndex(index as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value with the given index.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.11.26 Values as Integer()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the values as an array
Example:

```
Var m as new IntegerToIntegerOrderedMapMBS

m.Value(1)=5
m.Value(2)=7

for each v as Integer in m.Values
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by Keys at least until the Map is modified. Use this method with For Each to loop through all the values.

68.11.27 Properties

68.11.28 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this map.
Example:

```
Var map as new IntegerToIntegerOrderedMapMBS

map.Value(1)=3
map.Value(2)=4

MessageBox str(map.Count)
```

Notes: (Read only property)

68.11.29 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.11.30 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this map.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.11.31 value(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value associated with the given key.
Notes: If you query for a key which does not exist, a KeyNotFoundException is raised.
(Read and Write computed property)

68.12 class IntegerToStringHashMapIteratorMBS

68.12.1 class IntegerToStringHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the IntegerToStringHashMap class.
Example:

```
// Create a map
Var m as new IntegerToStringHashMapMBS

m.value(1)="Hello"
m.value(2)="World"
m.value(3)="!"

// get iterators pointing to first and after last element
Var i as IntegerToStringHashMapIteratorMBS = m.first
Var e as IntegerToStringHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.12.2 Methods

68.12.3 isEqual(other as IntegerToStringHashMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new IntegerToStringHashMapMBS

m.value(1)="Hello"
m.value(2)="World"
m.value(3)="!"

// get iterators pointing to first and after last element
Var i as IntegerToStringHashMapIteratorMBS = m.first
Var e as IntegerToStringHashMapIteratorMBS = m.last
```

```
// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.12.4 isNotEqual(other as IntegerToStringHashMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new IntegerToStringHashMapMBS

m.value(1)="Hello"
m.value(2)="World"
m.value(3)="!"

// get iterators pointing to first and after last element
Var i as IntegerToStringHashMapIteratorMBS = m.first
Var e as IntegerToStringHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.12.5 Key as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.12.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
```

```
Var m as new IntegerToStringHashMapMBS

m.value(1)="Hello"
m.value(2)="World"
m.value(3)="!"

// get iterators pointing to first and after last element
Var i as IntegerToStringHashMapIteratorMBS = m.first
Var e as IntegerToStringHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.12.7 Properties

68.12.8 Value as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the current item in the iterator.
Notes: (Read and Write computed property)

68.13 class IntegerToStringHashMapMBS

68.13.1 class IntegerToStringHashMapMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for a hash map with integers as keys and strings as values.
Example:

```
Var s as new IntegerToStringHashMapMBS

s.Value(1)="Hello"
s.Value(2)="World"

MessageBox str(s.Count) // shows 2

MessageBox s.Value(1)+" "+s.Value(2) // shows "Hello World"
```

Notes: You can choose whether you want to keep the map ordered using the OrderedMap class or whether you prefer a higher speed with the HashMap class.

68.13.2 Methods

68.13.3 AddKeys(targetArray() as Integer)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to keys, but adds keys to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.13.4 AddValues(targetArray() as string)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to values, but adds values to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.13.5 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.13.6 Clone as IntegerToStringHashMapMBS

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map.

68.13.7 CloneDictionary as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map as a dictionary.

68.13.8 Constructor

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
See also:

- 68.13.9 Constructor(dic as dictionary) 12087
- 68.13.10 Constructor(other as IntegerToStringHashMapMBS) 12087

68.13.9 Constructor(dic as dictionary)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the dictionary.
See also:

- 68.13.8 Constructor 12087
- 68.13.10 Constructor(other as IntegerToStringHashMapMBS) 12087

68.13.10 Constructor(other as IntegerToStringHashMapMBS)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the existing map.
See also:

- 68.13.8 Constructor 12087
- 68.13.9 Constructor(dic as dictionary) 12087

68.13.11 CountKey(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this map.

68.13.12 find(key as Integer) as IntegerToStringHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.13.13 first as IntegerToStringHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the map.
Example:

```
// Create a map
Var m as new IntegerToStringHashMapMBS

m.value(1)="Hello"
m.value(2)="World"
m.value(3)="!"

// get iterators pointing to first and after last element
Var i as IntegerToStringHashMapIteratorMBS = m.first
Var e as IntegerToStringHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.13.14 hasKey(key as Integer) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if Key is in the map and False if it is not. Returns a Boolean.

68.13.15 Key(index as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.13.16 Keys as Integer()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new IntegerToStringHashMapMBS

m.Value(1)="Hello"
m.Value(2)="World"

for each v as Integer in m.keys
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.13.17 last as IntegerToStringHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the map.
Example:

```
// Create a map
Var m as new IntegerToStringHashMapMBS
```

```
m.value(1)="Hello"
m.value(2)="World"
m.value(3)="!"

// get iterators pointing to first and after last element
Var i as IntegerToStringHashMapIteratorMBS = m.first
Var e as IntegerToStringHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.13.18 lookup(key as Integer, defaultvalue as string) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the passed value of Key.
Example:

```
Var map as new IntegerToStringOrderedMapMBS

map.value(10)="Hello"
map.value(100)="World"
map.value(1000)="!"

MessageBox str(map.lookup(5,"?")) // shows "?" as value is missing
MessageBox str(map.lookup(10,"?")) // shows "Hello" as value is found
```

Notes: If Key is found, it returns the corresponding value. If Key is not found, it returns the passed defaultValue.

68.13.19 Operator_Convert as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the map as dictionary.

68.13.20 Remove(first as IntegerToStringHashMapIteratorMBS, last as IntegerToStringHashMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.13.21 Remove(key as Integer) as Integer 12091
- 68.13.22 Remove(pos as IntegerToStringHashMapIteratorMBS) 12091

68.13.21 Remove(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.13.20 Remove(first as IntegerToStringHashMapIteratorMBS, last as IntegerToStringHashMapIteratorMBS) 12091
- 68.13.22 Remove(pos as IntegerToStringHashMapIteratorMBS) 12091

68.13.22 Remove(pos as IntegerToStringHashMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.13.20 Remove(first as IntegerToStringHashMapIteratorMBS, last as IntegerToStringHashMapIteratorMBS) 12091
- 68.13.21 Remove(key as Integer) as Integer 12091

68.13.23 ValueAtIndex(index as Integer) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value with the given index.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.13.24 Values as string()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the values as an array
Example:

```
Var m as new IntegerToStringHashMapMBS

m.Value(1)="Hello"
m.Value(2)="World"

for each v as string in m.Values
MessageBox v
next
```

Notes: The order is stable and matches the order returned by Keys at least until the Map is modified. Use this method with For Each to loop through all the values.

68.13.25 Properties

68.13.26 BinCount as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bins the hash table uses.
Example:

```
Var v as new IntegerToStringHashMapMBS

v.value(1)="Hello"
v.value(2)="World"

MessageBox str(v.BinCount)
```

Notes: This is a measure of the hash table size, independent of the number of items the Dictionary contains. (Read only property)

68.13.27 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this map.
Example:

```
Var map as new IntegerToStringHashMapMBS

map.Value(1)="Hello"
map.Value(2)="World"

MessageBox str(map.Count)
```

Notes: (Read only property)

68.13.28 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.13.29 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this map.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.13.30 value(key as Integer) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value associated with the given key.
Notes: If you query for a key which does not exist, a KeyNotFoundException is raised.
(Read and Write computed property)

68.14 class IntegerToStringOrderedMapIteratorMBS

68.14.1 class IntegerToStringOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the IntegerToStringOrderedMap class.
Example:

```
// Create a map
Var m as new IntegerToStringOrderedMapMBS

m.value(1)="Hello"
m.value(2)="World"
m.value(3)="!"

// get iterators pointing to first and after last element
Var i as IntegerToStringOrderedMapIteratorMBS = m.first
Var e as IntegerToStringOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.14.2 Methods

68.14.3 isEqual(other as IntegerToStringOrderedMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new IntegerToStringOrderedMapMBS

m.value(1)="Hello"
m.value(2)="World"
m.value(3)="!"

// get iterators pointing to first and after last element
Var i as IntegerToStringOrderedMapIteratorMBS = m.first
Var e as IntegerToStringOrderedMapIteratorMBS = m.last
```

```
// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.14.4 isNotEqual(other as IntegerToStringOrderedMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new IntegerToStringOrderedMapMBS

m.value(1)="Hello"
m.value(2)="World"
m.value(3)="!"

// get iterators pointing to first and after last element
Var i as IntegerToStringOrderedMapIteratorMBS = m.first
Var e as IntegerToStringOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.14.5 Key as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.14.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
```

```
Var m as new IntegerToStringOrderedMapMBS

m.value(1)="Hello"
m.value(2)="World"
m.value(3)="!"

// get iterators pointing to first and after last element
Var i as IntegerToStringOrderedMapIteratorMBS = m.first
Var e as IntegerToStringOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.14.7 MovePrev

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the previous item.

68.14.8 Properties

68.14.9 Value as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the current item in the iterator.
Notes: (Read and Write computed property)

68.15 class IntegerToStringOrderedMapMBS

68.15.1 class IntegerToStringOrderedMapMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for an ordered map with integer keys and string values.
Example:

```
Var s as new IntegerToStringOrderedMapMBS

s.Value(1)="Hello"
s.Value(2)="World"

MessageBox str(s.Count) // shows 2

MessageBox s.Value(1)+" "+s.Value(2) // shows "Hello World"
```

Notes: You can choose whether you want to keep the map ordered using the OrderedMap class or whether you prefer a higher speed with the HashMap class.

68.15.2 Methods

68.15.3 AddKeys(targetArray() as Integer)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to keys, but adds keys to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.15.4 AddValues(targetArray() as string)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to values, but adds values to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.15.5 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.15.6 Clone as IntegerToStringOrderedMapMBS

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map.

68.15.7 CloneDictionary as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map as a dictionary.

68.15.8 Constructor

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
See also:

- 68.15.9 Constructor(dic as dictionary) 12098
- 68.15.10 Constructor(other as IntegerToStringOrderedMapMBS) 12098

68.15.9 Constructor(dic as dictionary)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the dictionary.
See also:

- 68.15.8 Constructor 12098
- 68.15.10 Constructor(other as IntegerToStringOrderedMapMBS) 12098

68.15.10 Constructor(other as IntegerToStringOrderedMapMBS)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the existing map.
See also:

- 68.15.8 Constructor 12098
- 68.15.9 Constructor(dic as dictionary) 12098

68.15.11 CountKey(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this map.

68.15.12 find(key as Integer) as IntegerToStringOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.15.13 first as IntegerToStringOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the map.
Example:

```
// Create a map
Var m as new IntegerToStringOrderedMapMBS

m.value(1)="Hello"
m.value(2)="World"
m.value(3)="!"

// get iterators pointing to first and after last element
Var i as IntegerToStringOrderedMapIteratorMBS = m.first
Var e as IntegerToStringOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.15.14 hasKey(key as Integer) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if Key is in the map and False if it is not. Returns a Boolean.

68.15.15 Key(index as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.15.16 Keys as Integer()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new IntegerToStringOrderedMapMBS

m.Value(1)="Hello"
m.Value(2)="World"

for each v as Integer in m.keys
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.15.17 last as IntegerToStringOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the map.
Example:

```
// Create a map
Var m as new IntegerToStringOrderedMapMBS
```

```
m.value(1)="Hello"
m.value(2)="World"
m.value(3)="!"

// get iterators pointing to first and after last element
Var i as IntegerToStringOrderedMapIteratorMBS = m.first
Var e as IntegerToStringOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.15.18 lookup(key as Integer, defaultvalue as string) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the passed value of Key.
Example:

```
Var map as new IntegerToStringOrderedMapMBS

map.value(10)="Hello"
map.value(100)="World"
map.value(1000)="!"

MessageBox str(map.lookup(5,"?")) // shows "?" as value is missing
MessageBox str(map.lookup(10,"?")) // shows "Hello" as value is found
```

Notes: If Key is found, it returns the corresponding value. If Key is not found, it returns the passed defaultValue.

68.15.19 LowerBound(key as Integer) as IntegerToStringOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is not less than k.

68.15.20 Operator_Convert as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the map as dictionary.

68.15.21 Remove(first as IntegerToStringOrderedMapIteratorMBS, last as IntegerToStringOrderedMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.15.22 Remove(key as Integer) as Integer 12102
- 68.15.23 Remove(pos as IntegerToStringOrderedMapIteratorMBS) 12102

68.15.22 Remove(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.15.21 Remove(first as IntegerToStringOrderedMapIteratorMBS, last as IntegerToStringOrderedMapIteratorMBS) 12102
- 68.15.23 Remove(pos as IntegerToStringOrderedMapIteratorMBS) 12102

68.15.23 Remove(pos as IntegerToStringOrderedMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.15.21 Remove(first as IntegerToStringOrderedMapIteratorMBS, last as IntegerToStringOrderedMapIteratorMBS) 12102
- 68.15.22 Remove(key as Integer) as Integer 12102

68.15.24 UpperBound(key as Integer) as IntegerToStringOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is greater than k.

68.15.25 ValueAtIndex(index as Integer) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value with the given index.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.15.26 Values as string()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the values as an array
Example:

```
Var m as new IntegerToStringOrderedMapMBS

m.Value(1)="Hello"
m.Value(2)="World"

for each v as string in m.Values
MessageBox v
next
```

Notes: The order is stable and matches the order returned by Keys at least until the Map is modified. Use this method with For Each to loop through all the values.

68.15.27 Properties

68.15.28 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this map.
Example:

```
Var map as new IntegerToStringOrderedMapMBS

map.Value(1)="Hello"
map.Value(2)="World"

MessageBox str(map.Count)
```

Notes: (Read only property)

68.15.29 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.15.30 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this map.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.15.31 value(key as Integer) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value associated with the given key.
Notes: If you query for a key which does not exist, a KeyNotFoundException is raised.
(Read and Write computed property)

68.16 class IntegerToVariantHashMapIteratorMBS

68.16.1 class IntegerToVariantHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the IntegerToVariantHashMap class.
Example:

```
// Create a map
Var m as new IntegerToVariantHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToVariantHashMapIteratorMBS = m.first
Var e as IntegerToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.16.2 Methods

68.16.3 isEqual(other as IntegerToVariantHashMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new IntegerToVariantHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToVariantHashMapIteratorMBS = m.first
Var e as IntegerToVariantHashMapIteratorMBS = m.last
```

```
// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.16.4 isNotEqual(other as IntegerToVariantHashMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new IntegerToVariantHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToVariantHashMapIteratorMBS = m.first
Var e as IntegerToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.16.5 Key as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.16.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
```

```
Var m as new IntegerToVariantHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToVariantHashMapIteratorMBS = m.first
Var e as IntegerToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.16.7 Properties

68.16.8 Value as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the current item in the iterator.
Notes: (Read and Write computed property)

68.17 class IntegerToVariantHashMapMBS

68.17.1 class IntegerToVariantHashMapMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for a hash map with integers as keys and variants as values.
Example:

```
Var s as new IntegerToVariantHashMapMBS

s.Value(1)="Hello"
s.Value(2)="World"

MessageBox str(s.Count) // shows 2

MessageBox s.Value(1)+" "+s.Value(2) // shows "Hello World"
```

Notes: You can choose whether you want to keep the map ordered using the OrderedMap class or whether you prefer a higher speed with the HashMap class.

68.17.2 Methods

68.17.3 AddKeys(targetArray() as Integer)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to keys, but adds keys to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.17.4 AddValues(targetArray() as Variant)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to values, but adds values to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.17.5 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.17.6 Clone as IntegerToVariantHashMapMBS

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map.

68.17.7 CloneDictionary as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map as a dictionary.

68.17.8 Constructor

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
See also:

- 68.17.9 Constructor(dic as dictionary) 12109
- 68.17.10 Constructor(other as IntegerToVariantHashMapMBS) 12109

68.17.9 Constructor(dic as dictionary)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the dictionary.
See also:

- 68.17.8 Constructor 12109
- 68.17.10 Constructor(other as IntegerToVariantHashMapMBS) 12109

68.17.10 Constructor(other as IntegerToVariantHashMapMBS)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the existing map.
See also:

- 68.17.8 Constructor 12109
- 68.17.9 Constructor(dic as dictionary) 12109

68.17.11 CountKey(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this map.

68.17.12 find(key as Integer) as IntegerToVariantHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.17.13 first as IntegerToVariantHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the map.
Example:

```
// Create a map
Var m as new IntegerToVariantHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToVariantHashMapIteratorMBS = m.first
Var e as IntegerToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.17.14 hasKey(key as Integer) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if Key is in the map and False if it is not. Returns a Boolean.

68.17.15 Key(index as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.17.16 Keys as Integer()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new IntegerToVariantHashMapMBS

m.Value(1)="Hello"
m.Value(2)="World"

for each v as Integer in m.keys
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.17.17 last as IntegerToVariantHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the map.
Example:

```
// Create a map
Var m as new IntegerToVariantHashMapMBS
```

```
m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToVariantHashMapIteratorMBS = m.first
Var e as IntegerToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.17.18 lookup(key as Integer, defaultvalue as Variant) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the passed value of Key.
Example:

```
Var map as new IntegerToVariantHashMapMBS

map.value(10)=1
map.value(100)=2
map.value(1000)=3

MessageBox str(map.lookup(5,0)) // shows 0 as value is missing
MessageBox str(map.lookup(10,0)) // shows 1 as value is found
```

Notes: If Key is found, it returns the corresponding value. If Key is not found, it returns the passed defaultValue.

68.17.19 Operator_Convert as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the map as dictionary.

68.17.20 Remove(first as IntegerToVariantHashMapIteratorMBS, last as IntegerToVariantHashMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.17.21 Remove(key as Integer) as Integer 12113
- 68.17.22 Remove(pos as IntegerToVariantHashMapIteratorMBS) 12113

68.17.21 Remove(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.17.20 Remove(first as IntegerToVariantHashMapIteratorMBS, last as IntegerToVariantHashMapIteratorMBS) 12113
- 68.17.22 Remove(pos as IntegerToVariantHashMapIteratorMBS) 12113

68.17.22 Remove(pos as IntegerToVariantHashMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.17.20 Remove(first as IntegerToVariantHashMapIteratorMBS, last as IntegerToVariantHashMapIteratorMBS) 12113
- 68.17.21 Remove(key as Integer) as Integer 12113

68.17.23 ValueAtIndex(index as Integer) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value with the given index.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.17.24 Values as Variant()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the values as an array
Example:

```
// Create a map
Var m as new IntegerToVariantHashMapMBS

m.Value(1)="Hello"
m.Value(2)="World"

for each v as Variant in m.Keys
MessageBox v
next
```

Notes: The order is stable and matches the order returned by Keys at least until the Map is modified. Use this method with For Each to loop through all the values.

68.17.25 Properties

68.17.26 BinCount as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bins the hash table uses.
Example:

```
Var v as new IntegerToVariantHashMapMBS

v.value(1)="Hello"
v.value(2)="World"

MessageBox str(v.BinCount)
```

Notes: This is a measure of the hash table size, independent of the number of items the Dictionary contains. (Read only property)

68.17.27 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this map.

Example:

```
Var map as new IntegerToVariantHashMapMBS

map.Value(1)=3
map.Value(2)=4

MessageBox str(map.Count)
```

Notes: (Read only property)

68.17.28 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.17.29 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this map.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.17.30 value(key as Integer) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value associated with the given key.
Notes: If you query for a key which does not exist, a KeyNotFoundException is raised.
(Read and Write computed property)

68.18 class IntegerToVariantOrderedMapIteratorMBS

68.18.1 class IntegerToVariantOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the IntegerToVariantOrderedMap class.
Example:

```
// Create a map
Var m as new IntegerToVariantOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToVariantOrderedMapIteratorMBS = m.first
Var e as IntegerToVariantOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.18.2 Methods

68.18.3 isEqual(other as IntegerToVariantOrderedMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new IntegerToVariantOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToVariantOrderedMapIteratorMBS = m.first
Var e as IntegerToVariantOrderedMapIteratorMBS = m.last
```

```
// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.18.4 isNotEqual(other as IntegerToVariantOrderedMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new IntegerToVariantOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToVariantOrderedMapIteratorMBS = m.first
Var e as IntegerToVariantOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.18.5 Key as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.18.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
```

```
Var m as new IntegerToVariantOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToVariantOrderedMapIteratorMBS = m.first
Var e as IntegerToVariantOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.18.7 MovePrev

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the previous item.

68.18.8 Properties

68.18.9 Value as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the current item in the iterator.
Notes: (Read and Write computed property)

68.19 class IntegerToVariantOrderedMapMBS

68.19.1 class IntegerToVariantOrderedMapMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for an ordered map with integers as keys and variants as values.
Example:

```
Var s as new IntegerToVariantOrderedMapMBS

s.Value(1)="Hello"
s.Value(2)="World"

MessageBox str(s.Count) // shows 2

MessageBox s.Value(1)+" "+s.Value(2) // shows "Hello World"
```

Notes: You can choose whether you want to keep the map ordered using the OrderedMap class or whether you prefer a higher speed with the HashMap class.

68.19.2 Methods

68.19.3 AddKeys(targetArray() as Integer)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to keys, but adds keys to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.19.4 AddValues(targetArray() as Variant)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to values, but adds values to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.19.5 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.19.6 Clone as IntegerToVariantOrderedMapMBS

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map.

68.19.7 CloneDictionary as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map as a dictionary.

68.19.8 Constructor

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
See also:

- 68.19.9 Constructor(dic as dictionary) 12120
- 68.19.10 Constructor(other as IntegerToVariantOrderedMapMBS) 12120

68.19.9 Constructor(dic as dictionary)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the dictionary.
See also:

- 68.19.8 Constructor 12120
- 68.19.10 Constructor(other as IntegerToVariantOrderedMapMBS) 12120

68.19.10 Constructor(other as IntegerToVariantOrderedMapMBS)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the existing map.
See also:

- 68.19.8 Constructor 12120
- 68.19.9 Constructor(dic as dictionary) 12120

68.19.11 CountKey(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this map.

68.19.12 find(key as Integer) as IntegerToVariantOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.19.13 first as IntegerToVariantOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the map.
Example:

```
// Create a map
Var m as new IntegerToVariantOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToVariantOrderedMapIteratorMBS = m.first
Var e as IntegerToVariantOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.19.14 hasKey(key as Integer) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if Key is in the map and False if it is not. Returns a Boolean.

68.19.15 Key(index as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.19.16 Keys as Integer()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new IntegerToVariantOrderedMapMBS

m.Value(1)="Hello"
m.Value(2)="World"

for each v as Integer in m.keys
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.19.17 last as IntegerToVariantOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the map.
Example:

```
// Create a map
Var m as new IntegerToVariantOrderedMapMBS
```

```
m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as IntegerToVariantOrderedMapIteratorMBS = m.first
Var e as IntegerToVariantOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.19.18 lookup(key as Integer, defaultvalue as Variant) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the passed value of Key.
Example:

```
Var map as new IntegerToVariantOrderedMapMBS

map.value(10)=1
map.value(100)=2
map.value(1000)=3

MessageBox str(map.lookup(5,0)) // shows 0 as value is missing
MessageBox str(map.lookup(10,0)) // shows 1 as value is found
```

Notes: If Key is found, it returns the corresponding value. If Key is not found, it returns the passed defaultValue.

68.19.19 LowerBound(key as Integer) as IntegerToVariantOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is not less than k.

68.19.20 Operator_Convert as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the map as dictionary.

68.19.21 Remove(first as IntegerToVariantOrderedMapIteratorMBS, last as IntegerToVariantOrderedMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.19.22 Remove(key as Integer) as Integer 12124
- 68.19.23 Remove(pos as IntegerToVariantOrderedMapIteratorMBS) 12124

68.19.22 Remove(key as Integer) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.19.21 Remove(first as IntegerToVariantOrderedMapIteratorMBS, last as IntegerToVariantOrderedMapIteratorMBS) 12124
- 68.19.23 Remove(pos as IntegerToVariantOrderedMapIteratorMBS) 12124

68.19.23 Remove(pos as IntegerToVariantOrderedMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.19.21 Remove(first as IntegerToVariantOrderedMapIteratorMBS, last as IntegerToVariantOrderedMapIteratorMBS) 12124
- 68.19.22 Remove(key as Integer) as Integer 12124

68.19.24 UpperBound(key as Integer) as IntegerToVariantOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is greater than k.

68.19.25 ValueAtIndex(index as Integer) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value with the given index.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.19.26 Values as Variant()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the values as an array
Example:

```
// Create a map
Var m as new IntegerToVariantOrderedMapMBS

m.Value(1)="Hello"
m.Value(2)="World"

for each v as Variant in m.Keys
MessageBox v
next
```

Notes: The order is stable and matches the order returned by Keys at least until the Map is modified. Use this method with For Each to loop through all the values.

68.19.27 Properties

68.19.28 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this map.
Example:

```
Var map as new IntegerToVariantOrderedMapMBS

map.Value(1)=3
map.Value(2)=4

MessageBox str(map.Count)
```

Notes: (Read only property)

68.19.29 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.19.30 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this map.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.19.31 value(key as Integer) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value associated with the given key.
Notes: If you query for a key which does not exist, a KeyNotFoundException is raised.
(Read and Write computed property)

68.20 class StackDoubleMBS

68.20.1 class StackDoubleMBS

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a stack of doubles.
Example:

```
Var s as new StackDoubleMBS
call s.Push 5
MessageBox str(s.Top)
```

68.20.2 Methods

68.20.3 Bottom as Double

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the bottom item of the stack and returns the value.
Example:

```
Var s as new StackDoubleMBS
call s.Push 5
MessageBox str(s.Bottom)
```

68.20.4 clear

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the stack.
Example:

```
Var s as new StackDoubleMBS

call s.Push 5

s.Clear

if s.IsEmpty then
MessageBox "OK"
end if
```

68.20.5 close

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

68.20.6 Contains(o as Double) as boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if one of the items on the stack is equal to the given double value.
Example:

```
Var s as new StackDoubleMBS

call s.Push 5

if s.Contains(5) then
MessageBox "found. OK"
else
MessageBox "not found. Failed"
end if
```

68.20.7 Deep as Integer

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how much items are on the stack.
Example:

```
Var s as new StackDoubleMBS

MessageBox str(s.Deep)

call s.Push 5

MessageBox str(s.Deep)
```

68.20.8 Pop as Double

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the top item of the stack and returns the value.
Example:

```
Var s as new StackDoubleMBS
call s.Push 5
MessageBox str(s.pop)
```

Notes: Returns 0 on any error.

68.20.9 PopBottom as Double

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the bottom item of the stack and returns the value.
Example:

```
Var s as new StackDoubleMBS
call s.Push 5
MessageBox str(s.PopBottom)
```

68.20.10 Push(o as Double) as boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pushs a value on the stack.
Example:

```
Var s as new StackDoubleMBS

call s.Push 5
```

Notes: Returns true if successful.
May fail on low memory.

68.20.11 Top as Double

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of the top item on the stack.
Example:

```
Var s as new StackDoubleMBS
call s.Push 5
```

```
MessageBox str(s.Top)
```

Notes: Returns 0 on any error.

68.20.12 Properties

68.20.13 IsEmpty as Boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the stack is empty.
Example:

```
Var s as new StackDoubleMBS

if s.IsEmpty then
MessageBox "IsEmpty ok"
else
MessageBox "IsEmpty failed"
end if

call s.Push 5

if s.IsEmpty then
MessageBox "IsEmpty failed"
else
MessageBox "IsEmpty ok"
end if
```

Notes: (Read only property)

68.21 class StackIntegerMBS

68.21.1 class StackIntegerMBS

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a stack of integers.
Example:

```
Var s as new StackIntegerMBS

call s.Push 5

MessageBox str(S.Top)
```

68.21.2 Methods

68.21.3 Bottom as Integer

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the bottom item of the stack and returns the value.
Example:

```
Var s as new StackIntegerMBS

call s.Push 5

MessageBox str(s.Bottom)
```

68.21.4 clear

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the stack.
Example:

```
Var s as new StackIntegerMBS

call s.Push 5

s.Clear

if s.IsEmpty then
MessageBox "OK"
```

```
end if
```

68.21.5 close

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

68.21.6 Contains(o as Integer) as boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if one of the items on the stack is equal to the given integer value.
Example:

```
Var s as new StackIntegerMBS

call s.Push 5

if s.Contains(5) then
MessageBox "found. OK"
else
MessageBox "not found. Failed"
end if
```

68.21.7 Deep as Integer

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how much items are on the stack.
Example:

```
Var s as new StackIntegerMBS

MessageBox str(s.Deep)

call s.Push 5

MessageBox str(s.Deep)
```

68.21.8 Pop as Integer

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the top item of the stack and returns the value.
Example:

```
Var s as new StackIntegerMBS

call s.Push 5

MessageBox str(s.pop)
```

Notes: Returns 0 on any error.

68.21.9 PopBottom as Integer

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the bottom item of the stack and returns the value.
Example:

```
Var s as new StackIntegerMBS

call s.Push 5

MessageBox str(s.PopBottom)
```

68.21.10 Push(o as Integer) as boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pushs a value on the stack.
Example:

```
Var s as new StackIntegerMBS
call s.Push 5
```

Notes: Returns true if successful.
May fail on low memory.

68.21.11 Top as Integer

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of the top item on the stack.
Example:

```
Var s as new StackIntegerMBS

call s.Push 5

MessageBox str(S.Top)
```

Notes: Returns 0 on any error.

68.21.12 Properties

68.21.13 IsEmpty as Boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the stack is empty.
Example:

```
Var s as new StackIntegerMBS

if s.IsEmpty then
MessageBox "IsEmpty ok"
else
MessageBox "IsEmpty failed"
end if

call s.Push 5

if s.IsEmpty then
MessageBox "IsEmpty failed"
else
MessageBox "IsEmpty ok"
end if
```

Notes: (Read only property)

68.22 class StackObjectMBS

68.22.1 class StackObjectMBS

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a stack of objects.
Example:

```
Var s as new StackObjectMBS
call s.Push Window1
MessageBox window(s.top).title
```

68.22.2 Methods

68.22.3 Bottom as object

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the bottom item of the stack and returns the value.
Example:

```
Var s as new StackObjectMBS
call s.Push Window1
MessageBox window(s.Bottom).title
```

68.22.4 clear

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the stack.
Example:

```
Var s as new StackObjectMBS

call s.Push Window1

s.Clear

if s.IsEmpty then
MessageBox "OK"
end if
```

68.22.5 close

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

68.22.6 Contains(o as object) as boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if one of the object references on the stack is equal to the given object reference.
Example:

```
Var s as new StackObjectMBS

call s.Push Window1

if s.Contains(Window1) then
MessageBox "found. OK"
else
MessageBox "not found. Failed"
end if
```

68.22.7 Deep as Integer

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how much items are on the stack.
Example:

```
Var s as new StackObjectMBS

MessageBox str(s.Deep)

call s.Push Window1

MessageBox str(s.Deep)
```

68.22.8 Pop as object

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the top item of the stack and returns the value.
Example:

```
Var s as new StackObjectMBS
call s.Push Window1
MessageBox window(s.pop).title
```

Notes: Returns nil on any error.

68.22.9 PopBottom as object

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the bottom item of the stack and returns the value.
Example:

```
Var s as new StackObjectMBS
call s.Push Window1
MessageBox window(s.PopBottom).title
```

68.22.10 Push(o as object) as boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pushs a value on the stack.
Example:

```
Var s as new StackObjectMBS
call s.Push Window1
```

Notes: Returns true if successful.
May fail on low memory.
Does not push nil.

68.22.11 Top as object

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of the top item on the stack.
Example:

```
Var s as new StackObjectMBS
call s.Push Window1
```

MessageBox window(s.top).title

Notes: Returns nil on any error.

68.22.12 Properties

68.22.13 IsEmpty as Boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the stack is empty.
Example:

```
Var s as new StackObjectMBS

if s.IsEmpty then
MessageBox "IsEmpty ok"
else
MessageBox "IsEmpty failed"
end if

call s.Push Window1

if s.IsEmpty then
MessageBox "IsEmpty failed"
else
MessageBox "IsEmpty ok"
end if
```

Notes: (Read only property)

68.23 class StackSingleMBS

68.23.1 class StackSingleMBS

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a stack of singles.
Example:

```
Var s as new StackSingleMBS

call s.Push 5

MessageBox str(S.Top)
```

68.23.2 Methods

68.23.3 Bottom as single

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the bottom item of the stack and returns the value.
Example:

```
Var s as new StackSingleMBS

call s.Push 5

MessageBox str(s.Bottom)
```

68.23.4 clear

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the stack.
Example:

```
Var s as new StackSingleMBS

call s.Push 5

s.Clear

if s.IsEmpty then
MessageBox "OK"
```

```
end if
```

68.23.5 close

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

68.23.6 Contains(o as single) as boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if one of the items on the stack is equal to the given single value.
Example:

```
Var s as new StackSingleMBS

call s.Push 5

if s.Contains(5) then
MessageBox "found. OK"
else
MessageBox "not found. Failed"
end if
```

68.23.7 Deep as Integer

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how much items are on the stack.
Example:

```
Var s as new StackSingleMBS

MessageBox str(s.Deep)

call s.Push 5

MessageBox str(s.Deep)
```

68.23.8 Pop as single

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the top item of the stack and returns the value.
Example:

```
Var s as new StackSingleMBS

call s.Push 5

MessageBox str(s.Pop)
```

Notes: Returns 0 on any error.

68.23.9 PopBottom as single

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the bottom item of the stack and returns the value.
Example:

```
Var s as new StackSingleMBS

call s.Push 5

MessageBox str(S.PopBottom)
```

68.23.10 Push(o as single) as boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pushs a value on the stack.
Example:

```
Var s as new StackSingleMBS
call s.Push 5
```

Notes: Returns true if successful.
May fail on low memory.

68.23.11 Top as single

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of the top item on the stack.
Example:

```
Var s as new StackSingleMBS

call s.Push 5

MessageBox str(S.Top)
```

Notes: Returns 0 on any error.

68.23.12 Properties

68.23.13 IsEmpty as Boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the stack is empty.
Example:

```
Var s as new StackSingleMBS

if s.IsEmpty then
MessageBox "IsEmpty ok"
else
MessageBox "IsEmpty failed"
end if

call s.Push 5

if s.IsEmpty then
MessageBox "IsEmpty failed"
else
MessageBox "IsEmpty ok"
end if
```

Notes: (Read only property)

68.24 class StackStringMBS

68.24.1 class StackStringMBS

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a stack of strings.
Example:

```
Var s as new StackStringMBS
call s.Push "Hello"
MessageBox s.pop
```

68.24.2 Methods

68.24.3 Bottom as string

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the bottom item of the stack and returns the value.
Example:

```
Var s as new StackStringMBS
call s.Push "Hello"
MessageBox s.bottom
```

68.24.4 clear

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the stack.
Example:

```
Var s as new StackStringMBS

call s.Push "abc"

s.Clear

if s.IsEmpty then
MessageBox "OK"
end if
```

68.24.5 close

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

68.24.6 Contains(o as string) as boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if one of the string references on the stack is equal to the given double reference.
Example:

```
Var s as new StackStringMBS

call s.Push "Hello"

if s.Contains("Hello") then
MessageBox "found. OK"
else
MessageBox "not found. Failed"
end if
```

68.24.7 Deep as Integer

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how much items are on the stack.
Example:

```
Var s as new StackStringMBS

MessageBox str(s.Deep)

call s.Push "Hello"

MessageBox str(s.Deep)
```

68.24.8 Pop as string

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the top item of the stack and returns the value.
Example:

```
Var s as new StackStringMBS
call s.Push "Hello"
MessageBox s.pop
```

Notes: Returns "" on any error.

68.24.9 PopBottom as string

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the bottom item of the stack and returns the value.
Example:

```
Var s as new StackStringMBS
call s.Push "Hello"
MessageBox s.PopBottom
```

68.24.10 Push(o as string) as boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pushs a value on the stack.
Example:

```
Var s as new StackStringMBS
call s.Push "Hello"
```

Notes: Returns true if successful.
May fail on low memory.

68.24.11 Top as string

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of the top item on the stack.
Example:

```
Var s as new StackStringMBS
call s.Push "Hello"
MessageBox s.Top
```

Notes: Returns "" on any error.

68.24.12 Properties

68.24.13 IsEmpty as Boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the stack is empty.
Example:

```
Var s as new StackStringMBS

if s.IsEmpty then
MessageBox "IsEmpty ok"
else
MessageBox "IsEmpty failed"
end if

call s.Push "Hello"

if s.IsEmpty then
MessageBox "IsEmpty failed"
else
MessageBox "IsEmpty ok"
end if
```

Notes: (Read only property)

68.25 class StackVariantMBS

68.25.1 class StackVariantMBS

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for a stack of variants.
Example:

```
Var s as new StackVariantMBS

call s.Push 5

MessageBox s.PopBottom
```

68.25.2 Methods

68.25.3 Bottom as Variant

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the bottom item of the stack and returns the value.
Example:

```
Var s as new StackVariantMBS

call s.Push 5

MessageBox s.Bottom
```

68.25.4 clear

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the stack.
Example:

```
Var s as new StackVariantMBS

call s.Push 5

s.Clear

if s.IsEmpty then
MessageBox "OK"
```

```
end if
```

68.25.5 close

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

68.25.6 Contains(o as Variant) as boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if one of the variant references on the stack is equal to the given variant reference.
Example:

```
Var s as new StackObjectMBS

call s.Push Window1

if s.Contains(Window1) then
MessageBox "found. OK"
else
MessageBox "not found. Failed"
end if
```

68.25.7 Deep as Integer

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how much items are on the stack.
Example:

```
Var s as new StackVariantMBS

MessageBox str(s.Deep)

call s.Push Window1

MessageBox str(s.Deep)
```

68.25.8 Pop as Variant

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the top item of the stack and returns the value.
Example:

```
Var s as new StackVariantMBS

call s.Push 5

MessageBox s.pop
```

Notes: Returns nil on any error.

68.25.9 PopBottom as Variant

MBS DataTypes Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the bottom item of the stack and returns the value.
Example:

```
Var s as new StackVariantMBS

call s.Push 5

MessageBox s.PopBottom
```

68.25.10 Push(o as Variant) as boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pushs a value on the stack.
Example:

```
Var s as new StackVariantMBS
call s.Push 5
```

Notes: Returns true if successful.
May fail on low memory.

68.25.11 Top as Variant

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of the top item on the stack.
Example:

```
Var s as new StackVariantMBS

call s.Push 5

MessageBox s.top
```

Notes: Returns nil on any error.

68.25.12 Properties

68.25.13 IsEmpty as Boolean

MBS DataTypes Plugin, Plugin Version: 3.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the stack is empty.
Example:

```
Var s as new StackVariantMBS

if s.IsEmpty then
MessageBox "IsEmpty ok"
else
MessageBox "IsEmpty failed"
end if

call s.Push 5

if s.IsEmpty then
MessageBox "IsEmpty failed"
else
MessageBox "IsEmpty ok"
end if
```

Notes: (Read only property)

68.26 class StringHashSetIteratorMBS

68.26.1 class StringHashSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the StringHashSet class.
Example:

```
// Create a map
Var m as new StringHashSetMBS

m.insert("1")
m.insert("2")
m.insert("3")

// get iterators pointing to first and after last element
Var i as StringHashSetIteratorMBS = m.first
Var e as StringHashSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.26.2 Methods

68.26.3 isEqual(other as StringHashSetIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new StringHashSetMBS

m.insert("1")
m.insert("2")
m.insert("3")

// get iterators pointing to first and after last element
Var i as StringHashSetIteratorMBS = m.first
Var e as StringHashSetIteratorMBS = m.last
```

```
// Show all keys and values
while i.isEqual(e) = false
MessageBox i.Key
i.MoveNext
wend
```

68.26.4 isNotEqual(other as StringHashSetIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new StringHashSetMBS

m.insert("1")
m.insert("2")
m.insert("3")

// get iterators pointing to first and after last element
Var i as StringHashSetIteratorMBS = m.first
Var e as StringHashSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.26.5 Key as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.26.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
```

```
Var m as new StringHashSetMBS

m.insert("1")
m.insert("2")
m.insert("3")

// get iterators pointing to first and after last element
Var i as StringHashSetIteratorMBS = m.first
Var e as StringHashSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.27 class StringHashSetMBS

68.27.1 class StringHashSetMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for a hash set with strings.
Example:

```
Var s as new StringHashSetMBS

s.insert "test"
s.insert "Test"

MessageBox str(s.Count) // shows 2
```

Notes: All text comparison is done either case sensitive or insensitive. Defined in constructor.
You can choose whether you want to keep the set ordered using the OrderedSet class or whether you prefer a higher speed with the HashSet class.

68.27.2 Methods

68.27.3 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.27.4 Constructor(CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
Notes: If CaseSensitive is true, the comparison of texts or strings is case sensitive.
See also:

- 68.27.5 Constructor(Keys() as string) 12154

68.27.5 Constructor(Keys() as string)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new set from the values in the array.
Example:

```
Var s() as string = array("Hello", "World", "test")

Var set as new StringHashSetMBS(s)

MessageBox str(set.Count)+" entries: "+Join(set.keys,", ")
```

Notes: If the array has duplicates, the later elements overwrite the earlier keys.
See also:

- 68.27.4 Constructor(CaseSensitive as Boolean = true) 12154

68.27.6 CountKey(key as string) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this set.

68.27.7 find(key as string) as StringHashSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.27.8 first as StringHashSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the set.
Example:

```
// Create a map
Var m as new StringHashSetMBS

m.insert("1")
m.insert("2")
m.insert("3")

// get iterators pointing to first and after last element
Var i as StringHashSetIteratorMBS = m.first
Var e as StringHashSetIteratorMBS = m.last
```

```
// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.27.9 insert(key as string)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a value to the set.

68.27.10 Key(index as Integer) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.27.11 Keys as string()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new StringHashSetMBS

m.insert("1")
m.insert("2")

for each v as string in m.Keys
MessageBox v
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.27.12 last as StringHashSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the set.
Example:

```
// Create a map
Var m as new StringHashSetMBS

m.insert("1")
m.insert("2")
m.insert("3")

// get iterators pointing to first and after last element
Var i as StringHashSetIteratorMBS = m.first
Var e as StringHashSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.27.13 lookup(key as string) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether an element with the given key exists in this set.
Example:

```
Var set as new StringHashSetMBS

set.insert "Hello"
set.insert "World"

MessageBox str(set.lookup("missed")) // shows false as value is missing
MessageBox str(set.lookup("Hello")) // shows true as value is found
```

Notes: Returns true if yes and false if no.

68.27.14 Remove(first as StringHashSetIteratorMBS, last as StringHashSetIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.27.15 Remove(key as string) as Integer 12158
- 68.27.16 Remove(pos as StringHashSetIteratorMBS) 12158

68.27.15 Remove(key as string) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.27.14 Remove(first as StringHashSetIteratorMBS, last as StringHashSetIteratorMBS) 12157
- 68.27.16 Remove(pos as StringHashSetIteratorMBS) 12158

68.27.16 Remove(pos as StringHashSetIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.27.14 Remove(first as StringHashSetIteratorMBS, last as StringHashSetIteratorMBS) 12157
- 68.27.15 Remove(key as string) as Integer 12158

68.27.17 Properties

68.27.18 BinCount as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bins the hash table uses.
Example:

```
Var v as new StringHashSetMBS

v.insert "1"
v.insert "Hello"

MessageBox str(v.BinCount)
```

Notes: This is a measure of the hash table size, independent of the number of items the Dictionary contains. (Read only property)

68.27.19 CaseSensitive as Boolean

MBS DataTypes Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether text/string comparison is case sensitive.
Example:

```
Var s1 as new StringHashSetMBS(true)
Var s2 as new StringHashSetMBS(false)

s1.insert "a"
s1.insert "A"

s2.insert "a"
s2.insert "A"

MessageBox str(s1.Count)+" "+str(s2.Count)
```

Notes: (Read only property)

68.27.20 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this set.
Example:

```
Var set as new StringHashSetMBS

set.insert "a"
set.insert "b"

MessageBox str(set.Count)
```

Notes: (Read only property)

68.27.21 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.27.22 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this set.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.28 class StringOrderedSetIteratorMBS

68.28.1 class StringOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the StringOrderedSet class.
Example:

```
// Create a map
Var m as new StringOrderedSetMBS

m.insert("1")
m.insert("2")
m.insert("3")

// get iterators pointing to first and after last element
Var i as StringOrderedSetIteratorMBS = m.first
Var e as StringOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.28.2 Methods

68.28.3 isEqual(other as StringOrderedSetIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new StringOrderedSetMBS

m.insert("1")
m.insert("2")
m.insert("3")

// get iterators pointing to first and after last element
Var i as StringOrderedSetIteratorMBS = m.first
Var e as StringOrderedSetIteratorMBS = m.last
```

```
// Show all keys and values
while i.isEqual(e) = false
MessageBox i.Key
i.MoveNext
wend
```

68.28.4 isNotEqual(other as StringOrderedSetIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new StringOrderedSetMBS

m.insert("1")
m.insert("2")
m.insert("3")

// get iterators pointing to first and after last element
Var i as StringOrderedSetIteratorMBS = m.first
Var e as StringOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.28.5 Key as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.28.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
```

```
Var m as new StringOrderedSetMBS

m.insert("1")
m.insert("2")
m.insert("3")

// get iterators pointing to first and after last element
Var i as StringOrderedSetIteratorMBS = m.first
Var e as StringOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.28.7 MovePrev

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the previous item.

68.29 class StringOrderedSetMBS

68.29.1 class StringOrderedSetMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for an ordered set of strings.
Example:

```
Var s as new StringOrderedSetMBS

s.insert "test"
s.insert "Test"

MessageBox str(s.Count) // shows 2
```

Notes: All text comparison is done either case sensitive or insensitive. Defined in constructor.
You can choose whether you want to keep the set ordered using the OrderedSet class or whether you prefer a higher speed with the HashSet class.

68.29.2 Methods

68.29.3 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.29.4 Constructor(CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
Notes: If CaseSensitive is true, the comparison of texts or strings is case sensitive.
See also:

- 68.29.5 Constructor(Keys() as string) 12164

68.29.5 Constructor(Keys() as string)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new set from the values in the array.
Example:

```
Var s() as string = array("Hello", "World", "test")

Var set as new StringOrderedSetMBS(s)

MessageBox str(set.Count)+" entries: "+Join(set.keys,", ")
```

Notes: If the array has duplicates, the later elements overwrite the earlier keys.
See also:

- 68.29.4 Constructor(CaseSensitive as Boolean = true) 12164

68.29.6 CountKey(key as string) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this set.

68.29.7 find(key as string) as StringOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.29.8 first as StringOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the set.
Example:

```
// Create a map
Var m as new StringOrderedSetMBS

m.insert("1")
m.insert("2")
m.insert("3")

// get iterators pointing to first and after last element
Var i as StringOrderedSetIteratorMBS = m.first
Var e as StringOrderedSetIteratorMBS = m.last
```

```
// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.29.9 insert(key as string)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a value to the set.

68.29.10 Key(index as Integer) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.29.11 Keys as string()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new StringOrderedSetMBS

m.insert("1")
m.insert("2")

for each v as string in m.Keys
MessageBox v
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.29.12 last as StringOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the set.
Example:

```
// Create a map
Var m as new StringOrderedSetMBS

m.insert("1")
m.insert("2")
m.insert("3")

// get iterators pointing to first and after last element
Var i as StringOrderedSetIteratorMBS = m.first
Var e as StringOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.29.13 lookup(key as string) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether an element with the given key exists in this set.
Example:

```
Var set as new StringOrderedSetMBS

set.insert "Hello"
set.insert "World"

MessageBox str(set.lookup("missed")) // shows false as value is missing
MessageBox str(set.lookup("Hello")) // shows true as value is found
```

Notes: Returns true if yes and false if no.

68.29.14 LowerBound(key as string) as StringOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is not less than k.

68.29.15 Remove(first as StringOrderedSetIteratorMBS, last as StringOrderedSetIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.29.16 Remove(key as string) as Integer 12168
- 68.29.17 Remove(pos as StringOrderedSetIteratorMBS) 12168

68.29.16 Remove(key as string) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.29.15 Remove(first as StringOrderedSetIteratorMBS, last as StringOrderedSetIteratorMBS) 12168
- 68.29.17 Remove(pos as StringOrderedSetIteratorMBS) 12168

68.29.17 Remove(pos as StringOrderedSetIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.29.15 Remove(first as StringOrderedSetIteratorMBS, last as StringOrderedSetIteratorMBS) 12168
- 68.29.16 Remove(key as string) as Integer 12168

68.29.18 UpperBound(key as string) as StringOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is greater than k.

68.29.19 Properties

68.29.20 CaseSensitive as Boolean

MBS DataTypes Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether text/string comparison is case sensitive.
Example:

```
Var s1 as new StringOrderedSetMBS(true)
Var s2 as new StringOrderedSetMBS(false)

s1.insert "a"
s1.insert "A"

s2.insert "a"
s2.insert "A"

MessageBox str(s1.Count)+" "+str(s2.Count)
```

Notes: (Read only property)

68.29.21 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this set.
Example:

```
Var set as new StringOrderedSetMBS

set.insert "a"
set.insert "b"

MessageBox str(set.Count)
```

Notes: (Read only property)

68.29.22 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.29.23 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this set.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.30 class StringToStringHashMapIteratorMBS

68.30.1 class StringToStringHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the StringToStringHashMap class.
Example:

```
// Create a map
Var m as new StringToStringHashMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToStringHashMapIteratorMBS = m.first
Var e as StringToStringHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.30.2 Methods

68.30.3 isEqual(other as StringToStringHashMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new StringToStringHashMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
```

```
Var i as StringToStringHashMapIteratorMBS = m.first
Var e as StringToStringHashMapIteratorMBS = m.last

// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.30.4 isNotEqual(other as StringToStringHashMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new StringToStringHashMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToStringHashMapIteratorMBS = m.first
Var e as StringToStringHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.30.5 Key as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.30.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
Var m as new StringToStringHashMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToStringHashMapIteratorMBS = m.first
Var e as StringToStringHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.30.7 Properties

68.30.8 Value as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the current item in the iterator.
Notes: (Read and Write computed property)

68.31 class StringToStringHashMapMBS

68.31.1 class StringToStringHashMapMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for a hash map with strings as keys and values.
Example:

```
Var s as new StringToStringHashMapMBS

s.Value("Test")="Hello"
s.Value("test")="World"

MessageBox str(s.Count) // shows 2

s.Value(ConvertEncoding("test",encodings.UTF16))="Just a"
s.Value(ConvertEncoding("Test",encodings.UTF16))="test"

MessageBox str(s.Count) // shows 4
```

Notes: All text comparison is done either case sensitive or insensitive. Defined in constructor.
You can choose whether you want to keep the map ordered using the OrderedMap class or whether you prefer a higher speed with the HashMap class.
Blog Entries

- MonkeyBread Software Releases the MBS Plugins 8.2

68.31.2 Methods

68.31.3 AddKeys(targetArray() as string)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to keys, but adds keys to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.31.4 AddValues(targetArray() as string)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to values, but adds values to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys

function returns always nil.

68.31.5 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.31.6 Clone as StringToStringHashMapMBS

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map.

68.31.7 CloneDictionary as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map as a dictionary.
Example:

```
Var d as new Dictionary
d.Value("Hello") = "World"

// convert o map
Var m as new StringToStringHashMapMBS(d)
MessageBox str(m.Count)

// convert back
Var o as Dictionary = m.CloneDictionary
MessageBox o.Value("Hello")
```

68.31.8 Constructor(CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
Notes: If CaseSensitive is true, the comparison of texts or strings is case sensitive.
See also:

- 68.31.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true) 12176

- 68.31.10 Constructor(other as StringToStringHashMapMBS) 12176

68.31.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the dictionary.
Example:

```
Var d as new Dictionary
d.Value("Hello") = "World"

// convert o map
Var m as new StringToStringHashMapMBS(d)
MessageBox str(m.Count)

// convert back
Var o as Dictionary = m.CloneDictionary
MessageBox o.Value("Hello")
```

See also:

- 68.31.8 Constructor(CaseSensitive as Boolean = true) 12175
- 68.31.10 Constructor(other as StringToStringHashMapMBS) 12176

68.31.10 Constructor(other as StringToStringHashMapMBS)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the existing map.
Example:

```
Var d as new Dictionary
d.Value("Hello") = "World"

// convert o map
Var m as new StringToStringHashMapMBS(d)
MessageBox str(m.Count)

// convert back
Var o as StringToStringHashMapMBS = m.Clone
MessageBox o.Value("Hello")
```

See also:

- 68.31.8 Constructor(CaseSensitive as Boolean = true) 12175

• 68.31.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true) 12176

68.31.11 CountKey(key as string) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this map.

68.31.12 find(key as string) as StringToStringHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.31.13 first as StringToStringHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the map.
Example:

```
// Create a map
Var m as new StringToStringHashMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToStringHashMapIteratorMBS = m.first
Var e as StringToStringHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.31.14 hasKey(key as string) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if Key is in the map and False if it is not. Returns a Boolean.

68.31.15 Key(index as Integer) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.31.16 Keys as string()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new StringToStringHashMapMBS

m.Value("1")="Hello"
m.Value("2")="World"

for each v as string in m.Keys
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.31.17 last as StringToStringHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the map.
Example:

```
// Create a map
Var m as new StringToStringHashMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"
```

```
// get iterators pointing to first and after last element
Var i as StringToStringHashMapIteratorMBS = m.first
Var e as StringToStringHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.31.18 lookup(key as string, defaultvalue as string) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the passed value of Key.
Example:

```
Var map as new StringToStringHashMapMBS

map.value("a")="Hello"
map.value("b")="World"
map.value("c")="!"

MessageBox str(map.lookup("d","?")) // shows "?" as value is missing
MessageBox str(map.lookup("a","?")) // shows "Hello" as value is found
```

Notes: If Key is found, it returns the corresponding value. If Key is not found, it returns the passed defaultValue.

68.31.19 Operator_Convert as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the map as dictionary.
Example:

```
Var d as new Dictionary
d.Value("Hello") = "World"

// convert o map
Var m as StringToStringHashMapMBS = d
MessageBox str(m.Count)

// convert back
Var o as Dictionary = m
```

MessageBox o.Value("Hello")

68.31.20 Remove(first as StringToStringHashMapIteratorMBS, last as StringToStringHashMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.31.21 Remove(key as string) as Integer 12180
- 68.31.22 Remove(pos as StringToStringHashMapIteratorMBS) 12180

68.31.21 Remove(key as string) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.31.20 Remove(first as StringToStringHashMapIteratorMBS, last as StringToStringHashMapIteratorMBS) 12180
- 68.31.22 Remove(pos as StringToStringHashMapIteratorMBS) 12180

68.31.22 Remove(pos as StringToStringHashMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.31.20 Remove(first as StringToStringHashMapIteratorMBS, last as StringToStringHashMapIteratorMBS) 12180
- 68.31.21 Remove(key as string) as Integer 12180

68.31.23 ValueAtIndex(index as Integer) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value with the given index.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.31.24 Values as string()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the values as an array
Example:

```
Var m as new StringToStringHashMapMBS

m.Value("1")="Hello"
m.Value("2")="World"

for each v as string in m.Values
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by Keys at least until the Map is modified. Use this method with For Each to loop through all the values.

68.31.25 Properties

68.31.26 BinCount as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bins the hash table uses.
Example:

```
Var v as new StringToStringHashMapMBS

v.value("1")="Hello"
v.value("2")="World"

MessageBox str(v.BinCount)
```

Notes: This is a measure of the hash table size, independent of the number of items the Dictionary contains. (Read only property)

68.31.27 CaseSensitive as Boolean

MBS DataTypes Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether text/string comparison is case sensitive.
Example:

```
Var s1 as new StringToStringHashMapMBS(true)
Var s2 as new StringToStringHashMapMBS(false)

s1.value("a") = "1"
s1.value("A") = "2"

s2.value("a") = "1"
s2.value("A") = "2"

MessageBox str(s1.Count)+" "+str(s2.Count)
```

Notes: (Read only property)

68.31.28 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this map.
Example:

```
Var map as new StringToStringHashMapMBS

map.Value("?")="?"
map.Value("Hello")="World"

MessageBox str(map.Count)
```

Notes: (Read only property)

68.31.29 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.31.30 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this map.
Notes: Value is -1 if no limit is defined.

(Read only property)

68.31.31 value(key as string) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value associated with the given key.
Notes: If you query for a key which does not exist, a KeyNotFoundException is raised.
(Read and Write computed property)

68.32 class StringToStringOrderedMapIteratorMBS

68.32.1 class StringToStringOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the StringToStringOrderedMap class.
Example:

```
// Create a map
Var m as new StringToStringOrderedMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToStringOrderedMapIteratorMBS = m.first
Var e as StringToStringOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

- MonkeyBread Software Releases the MBS Plugins 8.2

68.32.2 Methods

68.32.3 isEqual(other as StringToStringOrderedMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new StringToStringOrderedMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
```

```
Var i as StringToStringOrderedMapIteratorMBS = m.first
Var e as StringToStringOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.32.4 isNotEqual(other as StringToStringOrderedMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new StringToStringOrderedMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToStringOrderedMapIteratorMBS = m.first
Var e as StringToStringOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e) = false
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.32.5 Key as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.32.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
Var m as new StringToStringOrderedMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToStringOrderedMapIteratorMBS = m.first
Var e as StringToStringOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.32.7 MovePrev

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the previous item.

68.32.8 Properties

68.32.9 Value as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the current item in the iterator.
Notes: (Read and Write computed property)

68.33 class StringToStringOrderedMapMBS

68.33.1 class StringToStringOrderedMapMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for an ordered map with strings for keys and values.
Example:

```
Var s as new StringToStringOrderedMapMBS

s.Value("Test")="Hello"
s.Value("test")="World"

MessageBox str(s.Count) // shows 2

s.Value(ConvertEncoding("test",encodings.UTF16))="Just a"
s.Value(ConvertEncoding("Test",encodings.UTF16))="test"

MessageBox str(s.Count) // shows 4
```

Notes: All text comparison is done either case sensitive or insensitive. Defined in constructor.
You can choose whether you want to keep the map ordered using the OrderedMap class or whether you prefer a higher speed with the HashMap class.

- MonkeyBread Software Releases the MBS Plugins 8.2

68.33.2 Methods

68.33.3 AddKeys(targetArray() as string)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to keys, but adds keys to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.33.4 AddValues(targetArray() as string)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to values, but adds values to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys

function returns always nil.

68.33.5 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.33.6 Clone as StringToStringOrderedMapMBS

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map.

68.33.7 CloneDictionary as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map as a dictionary.

68.33.8 Constructor(CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
Notes: If CaseSensitive is true, the comparison of texts or strings is case sensitive.
See also:

- 68.33.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true) 12188
- 68.33.10 Constructor(other as StringToStringOrderedMapMBS) 12189

68.33.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the dictionary.
See also:

- 68.33.8 Constructor(CaseSensitive as Boolean = true) 12188
- 68.33.10 Constructor(other as StringToStringOrderedMapMBS) 12189

68.33.10 Constructor(other as StringToStringOrderedMapMBS)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the existing map.
See also:

- 68.33.8 Constructor(CaseSensitive as Boolean = true) 12188
- 68.33.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true) 12188

68.33.11 CountKey(key as string) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this map.

68.33.12 find(key as string) as StringToStringOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.33.13 first as StringToStringOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the map.
Example:

```
// Create a map
Var m as new StringToStringOrderedMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToStringOrderedMapIteratorMBS = m.first
Var e as StringToStringOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
```

```
i.MoveNext
wend
```

68.33.14 hasKey(key as string) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if Key is in the map and False if it is not. Returns a Boolean.

68.33.15 Key(index as Integer) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.33.16 Keys as string()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new StringToStringOrderedMapMBS

m.Value("1")="Hello"
m.Value("2")="World"

for each v as string in m.Keys
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.33.17 last as StringToStringOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the map.
Example:

```
// Create a map
Var m as new StringToStringOrderedMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToStringOrderedMapIteratorMBS = m.first
Var e as StringToStringOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.33.18 lookup(key as string, defaultvalue as string) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the passed value of Key.
Example:

```
Var map as new StringToStringOrderedMapMBS

map.value("a")="Hello"
map.value("b")="World"
map.value("c")="!"

MessageBox str(map.lookup("d","?")) // shows "?" as value is missing
MessageBox str(map.lookup("a","?")) // shows "Hello" as value is found
```

Notes: If Key is found, it returns the corresponding value. If Key is not found, it returns the passed defaultValue.

68.33.19 LowerBound(key as string) as StringToStringOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is not less than k.

68.33.20 Operator_Convert as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the map as dictionary.

68.33.21 Remove(first as StringToStringOrderedMapIteratorMBS, last as StringToStringOrderedMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.33.22 Remove(key as string) as Integer 12192
- 68.33.23 Remove(pos as StringToStringOrderedMapIteratorMBS) 12192

68.33.22 Remove(key as string) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.33.21 Remove(first as StringToStringOrderedMapIteratorMBS, last as StringToStringOrderedMapIteratorMBS) 12192
- 68.33.23 Remove(pos as StringToStringOrderedMapIteratorMBS) 12192

68.33.23 Remove(pos as StringToStringOrderedMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.33.21 Remove(first as StringToStringOrderedMapIteratorMBS, last as StringToStringOrderedMapIteratorMBS) 12192
- 68.33.22 Remove(key as string) as Integer 12192

68.33.24 UpperBound(key as string) as StringToStringOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is greater than k.

68.33.25 ValueAtIndex(index as Integer) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value with the given index.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.33.26 Values as string()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the values as an array
Example:

```
Var m as new StringToStringOrderedMapMBS

m.Value("1")="Hello"
m.Value("2")="World"

for each v as string in m.Values
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by Keys at least until the Map is modified. Use this method with For Each to loop through all the values.

68.33.27 Properties

68.33.28 CaseSensitive as Boolean

MBS DataTypes Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether text/string comparison is case sensitive.
Example:

```
Var s1 as new StringToStringOrderedMapMBS(true)
Var s2 as new StringToStringOrderedMapMBS(false)

s1.value("a") = "1"
s1.value("A") = "2"
```

```
s2.value("a") = "1"
s2.value("A") = "2"

MessageBox str(s1.Count)+" "+str(s2.Count)
```

Notes: (Read only property)

68.33.29 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this map.
Example:

```
Var map as new StringToStringOrderedMapMBS

map.Value("?")="?"
map.Value("Hello")="World"

MessageBox str(map.Count)
```

Notes: (Read only property)

68.33.30 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.33.31 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this map.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.33.32 value(key as string) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value associated with the given key.
Notes: If you query for a key which does not exist, a KeyNotFoundException is raised.
(Read and Write computed property)

68.34 class StringToVariantHashMapIteratorMBS

68.34.1 class StringToVariantHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the StringToVariantHashMap class.
Example:

```
// Create a map
Var m as new StringToVariantHashMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToVariantHashMapIteratorMBS = m.first
Var e as StringToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

Blog Entries

- MonkeyBread Software Releases the MBS Plugins 8.2

68.34.2 Methods

68.34.3 isEqual(other as StringToVariantHashMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new StringToVariantHashMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
```

```
Var i as StringToVariantHashMapIteratorMBS = m.first
Var e as StringToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.34.4 isNotEqual(other as StringToVariantHashMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new StringToVariantHashMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToVariantHashMapIteratorMBS = m.first
Var e as StringToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.34.5 Key as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.34.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
Var m as new StringToVariantHashMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToVariantHashMapIteratorMBS = m.first
Var e as StringToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.34.7 Properties

68.34.8 Value as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the current item in the iterator.
Notes: (Read and Write computed property)

68.35 class StringToVariantHashMapMBS

68.35.1 class StringToVariantHashMapMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for a hash map with strings as keys and variants as values.
Example:

```
Var s as new StringToVariantHashMapMBS

s.Value("Test")="Hello"
s.Value("test")="World"

MessageBox str(s.Count) // shows 2

s.Value(ConvertEncoding("test",encodings.UTF16))="Just a"
s.Value(ConvertEncoding("Test",encodings.UTF16))="test"

MessageBox str(s.Count) // shows 4
```

Notes: All text comparison is done either case sensitive or insensitive. Defined in constructor.
You can choose whether you want to keep the map ordered using the OrderedMap class or whether you prefer a higher speed with the HashMap class.

- MBS Real Studio Plugins, version 12.5pr10
- MonkeyBread Software Releases the MBS Plugins 8.2

68.35.2 Methods

68.35.3 AddKeys(targetArray() as string)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to keys, but adds keys to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.35.4 AddValues(targetArray() as Variant)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to values, but adds values to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.35.5 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.35.6 Clone as StringToVariantHashMapMBS

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map.

68.35.7 CloneDictionary as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map as a dictionary.

68.35.8 Constructor(CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
Notes: If CaseSensitive is true, the comparison of texts or strings is case sensitive.
See also:

- 68.35.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true) 12200
- 68.35.10 Constructor(other as StringToVariantHashMapMBS) 12201

68.35.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the dictionary.
See also:

- 68.35.8 Constructor(CaseSensitive as Boolean = true) 12200
- 68.35.10 Constructor(other as StringToVariantHashMapMBS) 12201

68.35.10 Constructor(other as StringToVariantHashMapMBS)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the existing map.
See also:

- 68.35.8 Constructor(CaseSensitive as Boolean = true) 12200
- 68.35.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true) 12200

68.35.11 CountKey(key as string) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this map.

68.35.12 find(key as string) as StringToVariantHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.35.13 first as StringToVariantHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the map.
Example:

```
// Create a map
Var m as new StringToVariantHashMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToVariantHashMapIteratorMBS = m.first
```

```
Var e as StringToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.35.14 hasKey(key as string) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if Key is in the map and False if it is not. Returns a Boolean.

68.35.15 Key(index as Integer) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Example:

```
Var v as new StringToVariantHashMapMBS
v.Value("Hello") = "World"
MessageBox v.Key(0)+": "+v.ValueAtIndex(0)
```

Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.35.16 Keys as string()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new StringToVariantHashMapMBS

m.Value("1")="Hello"
m.Value("2")="World"

for each v as string in m.Keys
MessageBox str(v)
```

next

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.35.17 last as StringToVariantHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the map.
Example:

```
// Create a map
Var m as new StringToVariantHashMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToVariantHashMapIteratorMBS = m.first
Var e as StringToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.35.18 lookup(key as string, defaultvalue as Variant) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the passed value of Key.
Example:

```
Var map as new StringToVariantHashMapMBS

map.value("a")="Hello"
map.value("b")="World"
map.value("c")="!"

MessageBox str(map.lookup("d","?")) // shows "?" as value is missing
MessageBox str(map.lookup("a","?")) // shows "Hello" as value is found
```

Notes: If Key is found, it returns the corresponding value. If Key is not found, it returns the passed defaultValue.

68.35.19 Operator_Convert as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the map as dictionary.

68.35.20 Remove(first as StringToVariantHashMapIteratorMBS, last as StringToVariantHashMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.35.21 Remove(key as string) as Integer 12204
- 68.35.22 Remove(pos as StringToVariantHashMapIteratorMBS) 12204

68.35.21 Remove(key as string) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.35.20 Remove(first as StringToVariantHashMapIteratorMBS, last as StringToVariantHashMapIteratorMBS) 12204
- 68.35.22 Remove(pos as StringToVariantHashMapIteratorMBS) 12204

68.35.22 Remove(pos as StringToVariantHashMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.35.20 Remove(first as StringToVariantHashMapIteratorMBS, last as StringToVariantHashMapIteratorMBS) 12204
- 68.35.21 Remove(key as string) as Integer 12204

68.35.23 ValueAtIndex(index as Integer) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value with the given index.
Example:

```
Var v as new StringToVariantHashMapMBS
v.Value("Hello") = "World"
MessageBox v.Key(0)+": "+v.ValueAtIndex(0)
```

Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.35.24 Values as Variant()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the values as an array
Example:

```
Var m as new StringToVariantHashMapMBS

m.Value("1")="Hello"
m.Value("2")="World"

for each v as string in m.Values
MessageBox str(v)
next
```

Notes: The order is stable and matches the order returned by Keys at least until the Map is modified. Use this method with For Each to loop through all the values.

68.35.25 Properties

68.35.26 BinCount as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bins the hash table uses.
Example:

```
Var v as new StringToVariantHashMapMBS

v.value("1")="Hello"
```

```
v.value("2")="World"

MessageBox str(v.BinCount)
```

Notes: This is a measure of the hash table size, independent of the number of items the Dictionary contains. (Read only property)

68.35.27 CaseSensitive as Boolean

MBS DataTypes Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether text/string comparison is case sensitive.
Example:

```
Var s1 as new StringToVariantHashMapMBS(true)
Var s2 as new StringToVariantHashMapMBS(false)

s1.value("a") = "1"
s1.value("A") = "2"

s2.value("a") = "1"
s2.value("A") = "2"

MessageBox str(s1.Count)+" "+str(s2.Count)
```

Notes: (Read only property)

68.35.28 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this map.
Example:

```
Var map as new StringToVariantHashMapMBS

map.Value("?")="?"
map.Value("Hello")="World"

MessageBox str(map.Count)
```

Notes: (Read only property)

68.35.29 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.35.30 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this map.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.35.31 value(key as string) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value associated with the given key.
Example:

```
Var v as new StringToVariantHashMapMBS
v.Value("Hello") = "World"
MessageBox v.Key(0)+": "+v.ValueAtIndex(0)
```

Notes: If you query for a key which does not exist, a KeyNotFoundException is raised.
(Read and Write computed property)

68.36 class StringToVariantOrderedMapIteratorMBS

68.36.1 class StringToVariantOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the StringToVariantOrderedMap class.
Example:

```
// Create a map
Var m as new StringToVariantOrderedMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToVariantOrderedMapIteratorMBS = m.first
Var e as StringToVariantOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

- MonkeyBread Software Releases the MBS Plugins 8.2

68.36.2 Methods

68.36.3 isEqual(other as StringToVariantOrderedMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new StringToVariantOrderedMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
```

```
Var i as StringToVariantOrderedMapIteratorMBS = m.first
Var e as StringToVariantOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.36.4 isNotEqual(other as StringToVariantOrderedMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new StringToVariantOrderedMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToVariantOrderedMapIteratorMBS = m.first
Var e as StringToVariantOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.36.5 Key as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.36.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
Var m as new StringToVariantOrderedMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToVariantOrderedMapIteratorMBS = m.first
Var e as StringToVariantOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.36.7 MovePrev

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the previous item.

68.36.8 Properties

68.36.9 Value as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the current item in the iterator.
Notes: (Read and Write computed property)

68.37 class StringToVariantOrderedMapMBS

68.37.1 class StringToVariantOrderedMapMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for an ordered map with strings as keys and variants as values.
Example:

```
Var s as new StringToVariantOrderedMapMBS

s.Value("Test")="Hello"
s.Value("test")="World"

MessageBox str(s.Count) // shows 2

s.Value(ConvertEncoding("test",encodings.UTF16))="Just a"
s.Value(ConvertEncoding("Test",encodings.UTF16))="test"

MessageBox str(s.Count) // shows 4
```

Notes: All text comparison is done either case sensitive or insensitive. Defined in constructor.
You can choose whether you want to keep the map ordered using the OrderedMap class or whether you prefer a higher speed with the HashMap class.
Blog Entries

- MonkeyBread Software Releases the MBS Plugins 8.2

68.37.2 Methods

68.37.3 AddKeys(targetArray() as string)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to keys, but adds keys to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.37.4 AddValues(targetArray() as Variant)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to values, but adds values to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys

function returns always nil.

68.37.5 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.37.6 Clone as StringToVariantOrderedMapMBS

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map.

68.37.7 CloneDictionary as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map as a dictionary.

68.37.8 Constructor(CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
Notes: If CaseSensitive is true, the comparison of texts or strings is case sensitive.
See also:

- 68.37.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true) 12212
- 68.37.10 Constructor(other as StringToVariantOrderedMapMBS) 12213

68.37.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the dictionary.
See also:

- 68.37.8 Constructor(CaseSensitive as Boolean = true) 12212
- 68.37.10 Constructor(other as StringToVariantOrderedMapMBS) 12213

68.37.10 Constructor(other as StringToVariantOrderedMapMBS)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the existing map.
See also:

- 68.37.8 Constructor(CaseSensitive as Boolean = true) 12212
- 68.37.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true) 12212

68.37.11 CountKey(key as string) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this map.

68.37.12 find(key as string) as StringToVariantOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.37.13 first as StringToVariantOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the map.
Example:

```
// Create a map
Var m as new StringToVariantOrderedMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToVariantOrderedMapIteratorMBS = m.first
Var e as StringToVariantOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
```

```
i.MoveNext
wend
```

68.37.14 hasKey(key as string) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if Key is in the map and False if it is not. Returns a Boolean.

68.37.15 Key(index as Integer) as string

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.37.16 Keys as string()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new StringToVariantOrderedMapMBS

m.Value("1")="Hello"
m.Value("2")="World"

for each v as string in m.Keys
MessageBox v
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.37.17 last as StringToVariantOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the map.
Example:

```
// Create a map
Var m as new StringToVariantOrderedMapMBS

m.value("1")="Hello"
m.value("2")="World"
m.value("3")="!"

// get iterators pointing to first and after last element
Var i as StringToVariantOrderedMapIteratorMBS = m.first
Var e as StringToVariantOrderedMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+i.Value
i.MoveNext
wend
```

68.37.18 lookup(key as string, defaultvalue as Variant) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the passed value of Key.
Example:

```
Var map as new StringToVariantOrderedMapMBS

map.value("a")="Hello"
map.value("b")="World"
map.value("c")="!"

MessageBox str(map.lookup("d","?")) // shows "?" as value is missing
MessageBox str(map.lookup("a","?")) // shows "Hello" as value is found
```

Notes: If Key is found, it returns the corresponding value. If Key is not found, it returns the passed defaultValue.

68.37.19 LowerBound(key as string) as StringToVariantOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is not less than k.

68.37.20 Operator_Convert as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the map as dictionary.

68.37.21 Remove(first as StringToVariantOrderedMapIteratorMBS, last as StringToVariantOrderedMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.37.22 Remove(key as string) as Integer 12216
- 68.37.23 Remove(pos as StringToVariantOrderedMapIteratorMBS) 12216

68.37.22 Remove(key as string) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.37.21 Remove(first as StringToVariantOrderedMapIteratorMBS, last as StringToVariantOrderedMapIteratorMBS) 12216
- 68.37.23 Remove(pos as StringToVariantOrderedMapIteratorMBS) 12216

68.37.23 Remove(pos as StringToVariantOrderedMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.37.21 Remove(first as StringToVariantOrderedMapIteratorMBS, last as StringToVariantOrderedMapIteratorMBS) 12216
- 68.37.22 Remove(key as string) as Integer 12216

68.37.24 UpperBound(key as string) as StringToVariantOrderedMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is greater than k.

68.37.25 ValueAtIndex(index as Integer) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value with the given index.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.37.26 Values as Variant()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the values as an array
Example:

```
Var m as new StringToVariantOrderedMapMBS

m.Value("1")="Hello"
m.Value("2")="World"

for each v as string in m.Values
MessageBox v
next
```

Notes: The order is stable and matches the order returned by Keys at least until the Map is modified. Use this method with For Each to loop through all the values.

68.37.27 Properties

68.37.28 CaseSensitive as Boolean

MBS DataTypes Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether text/string comparison is case sensitive.
Example:

```
Var s1 as new StringToVariantOrderedMapMBS(true)
Var s2 as new StringToVariantOrderedMapMBS(false)

s1.value("a") = "1"
s1.value("A") = "2"
```

```
s2.value("a") = "1"
s2.value("A") = "2"

MessageBox str(s1.Count)+" "+str(s2.Count)
```

Notes: (Read only property)

68.37.29 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this map.
Example:

```
Var map as new StringToVariantOrderedMapMBS

map.Value("?")="?"
map.Value("Hello")="World"

MessageBox str(map.Count)
```

Notes: (Read only property)

68.37.30 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.37.31 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this map.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.37.32 value(key as string) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value associated with the given key.
Notes: If you query for a key which does not exist, a KeyNotFoundException is raised.
(Read and Write computed property)

68.38 class VariantHashSetIteratorMBS

68.38.1 class VariantHashSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the VariantHashSet class.
Example:

```
// Create a map
Var m as new VariantHashSetMBS

m.insert(1.0) // double
m.insert("Hello") // string
m.insert(3) // integer

// get iterators pointing to first and after last element
Var i as VariantHashSetIteratorMBS = m.first
Var e as VariantHashSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.38.2 Methods

68.38.3 isEqual(other as VariantHashSetIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new VariantHashSetMBS

m.insert(1.0) // double
m.insert("Hello") // string
m.insert(3) // integer

// get iterators pointing to first and after last element
Var i as VariantHashSetIteratorMBS = m.first
Var e as VariantHashSetIteratorMBS = m.last
```

```
// Show all keys and values
while i.isEqual(e) = false
MessageBox i.Key
i.MoveNext
wend
```

68.38.4 isNotEqual(other as VariantHashSetIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new VariantHashSetMBS

m.insert(1.0) // double
m.insert("Hello") // string
m.insert(3) // integer

// get iterators pointing to first and after last element
Var i as VariantHashSetIteratorMBS = m.first
Var e as VariantHashSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.38.5 Key as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.38.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
```

```
Var m as new VariantHashSetMBS

m.insert(1.0) // double
m.insert("Hello") // string
m.insert(3) // integer

// get iterators pointing to first and after last element
Var i as VariantHashSetIteratorMBS = m.first
Var e as VariantHashSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.39 class VariantHashSetMBS

68.39.1 class VariantHashSetMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for a hash set with variants.
Example:

```
Var s as new VariantHashSetMBS

s.insert "test"
s.insert "Test"

MessageBox str(s.Count) // shows 2

s.insert ConvertEncoding("test",encodings.UTF16)
s.insert ConvertEncoding("Test",encodings.UTF16)

MessageBox str(s.Count) // shows 4
```

Notes: When using variants for keys, you may get better results if all keys used have the same data type to improve comparison.
All text comparison is done either case sensitive or insensitive. Defined in constructor.
You can choose whether you want to keep the set ordered using the OrderedSet class or whether you prefer a higher speed with the HashSet class.

68.39.2 Methods

68.39.3 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.39.4 Constructor(CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
Notes: If CaseSensitive is true, the comparison of texts or strings is case sensitive.
See also:

- 68.39.5 Constructor(Keys() as string) 12224

- 68.39.6 Constructor(Keys() as Variant) 12224

68.39.5 Constructor(Keys() as string)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new set from the values in the array.
Notes: If the array has duplicates, the later elements overwrite the earlier keys.
See also:

- 68.39.4 Constructor(CaseSensitive as Boolean = true) 12223
- 68.39.6 Constructor(Keys() as Variant) 12224

68.39.6 Constructor(Keys() as Variant)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new set from the values in the array.
Notes: If the array has duplicates, the later elements overwrite the earlier keys.
See also:

- 68.39.4 Constructor(CaseSensitive as Boolean = true) 12223
- 68.39.5 Constructor(Keys() as string) 12224

68.39.7 CountKey(key as Variant) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this set.

68.39.8 find(key as Variant) as VariantHashSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.39.9 first as VariantHashSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the set.
Example:

```
// Create a map
Var m as new VariantHashSetMBS

m.insert(1.0) // double
m.insert("Hello") // string
m.insert(3) // integer

// get iterators pointing to first and after last element
Var i as VariantHashSetIteratorMBS = m.first
Var e as VariantHashSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.39.10 insert(key as Variant)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a value to the set.

68.39.11 Key(index as Integer) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.39.12 Keys as Variant()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new VariantHashSetMBS

m.insert("1")
```

```
m.insert("2")

for each v as Variant in m.Keys
MessageBox v
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.39.13 last as VariantHashSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the set.
Example:

```
// Create a map
Var m as new VariantHashSetMBS

m.insert(1.0) // double
m.insert("Hello") // string
m.insert(3) // integer

// get iterators pointing to first and after last element
Var i as VariantHashSetIteratorMBS = m.first
Var e as VariantHashSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.39.14 lookup(key as Variant) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether an element with the given key exists in this set.
Example:

```
Var set as new VariantHashSetMBS

set.insert "Hello"
set.insert "World"
```

```
MessageBox str(set.lookup("missed")) // shows false as value is missing
MessageBox str(set.lookup("Hello")) // shows true as value is found
```

Notes: Returns true if yes and false if no.

68.39.15 Remove(first as VariantHashSetIteratorMBS, last as VariantHashSetIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.39.16 Remove(key as Variant) as Integer 12227
- 68.39.17 Remove(pos as VariantHashSetIteratorMBS) 12227

68.39.16 Remove(key as Variant) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.39.15 Remove(first as VariantHashSetIteratorMBS, last as VariantHashSetIteratorMBS) 12227
- 68.39.17 Remove(pos as VariantHashSetIteratorMBS) 12227

68.39.17 Remove(pos as VariantHashSetIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.39.15 Remove(first as VariantHashSetIteratorMBS, last as VariantHashSetIteratorMBS) 12227
- 68.39.16 Remove(key as Variant) as Integer 12227

68.39.18 Properties

68.39.19 BinCount as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bins the hash table uses.
Example:

```
Var v as new VariantHashSetMBS

v.insert "1"
v.insert "Hello"

MessageBox str(v.BinCount)
```

Notes: This is a measure of the hash table size, independent of the number of items the Dictionary contains. (Read only property)

68.39.20 CaseSensitive as Boolean

MBS DataTypes Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether text/string comparison is case sensitive.
Example:

```
Var s1 as new VariantHashSetMBS(true)
Var s2 as new VariantHashSetMBS(false)

s1.insert("a")
s1.insert("A")

s2.insert("a")
s2.insert("A")

MessageBox str(s1.Count)+" "+str(s2.Count)
```

Notes: (Read only property)

68.39.21 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this set.
Example:

```
Var set as new VariantHashSetMBS

set.insert 1
set.insert 2
```

MessageBox str(set.Count)

Notes: (Read only property)

68.39.22 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.39.23 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this set.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.40 class VariantOrderedSetIteratorMBS

68.40.1 class VariantOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the VariantOrderedSet class.
Example:

```
// Create a map
Var m as new VariantOrderedSetMBS

m.insert(1.0) // double
m.insert("Hello") // string
m.insert(3) // integer

// get iterators pointing to first and after last element
Var i as VariantOrderedSetIteratorMBS = m.first
Var e as VariantOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.40.2 Methods

68.40.3 isEqual(other as VariantOrderedSetIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new VariantOrderedSetMBS

m.insert(1.0) // double
m.insert("Hello") // string
m.insert(3) // integer

// get iterators pointing to first and after last element
Var i as VariantOrderedSetIteratorMBS = m.first
Var e as VariantOrderedSetIteratorMBS = m.last
```

```
// Show all keys and values
while i.isEqual(e) = false
MessageBox i.Key
i.MoveNext
wend
```

68.40.4 isNotEqual(other as VariantOrderedSetIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new VariantOrderedSetMBS

m.insert(1.0) // double
m.insert("Hello") // string
m.insert(3) // integer

// get iterators pointing to first and after last element
Var i as VariantOrderedSetIteratorMBS = m.first
Var e as VariantOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.40.5 Key as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.40.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
```

```
Var m as new VariantOrderedSetMBS

m.insert(1.0) // double
m.insert("Hello") // string
m.insert(3) // integer

// get iterators pointing to first and after last element
Var i as VariantOrderedSetIteratorMBS = m.first
Var e as VariantOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.40.7 MovePrev

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the previous item.

68.41 class VariantOrderedSetMBS

68.41.1 class VariantOrderedSetMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for an ordered set with variants.
Example:

```
Var s as new VariantOrderedSetMBS

s.insert "test"
s.insert "Test"

MessageBox str(s.Count) // shows 2

s.insert ConvertEncoding("test",encodings.UTF16)
s.insert ConvertEncoding("Test",encodings.UTF16)

MessageBox str(s.Count) // shows 4
```

Notes: When using variants for keys, you may get better results if all keys used have the same data type to improve comparison.
All text comparison is done either case sensitive or insensitive. Defined in constructor.
You can choose whether you want to keep the set ordered using the OrderedSet class or whether you prefer a higher speed with the HashSet class.

68.41.2 Methods

68.41.3 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.41.4 Constructor(CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
Notes: If CaseSensitive is true, the comparison of texts or strings is case sensitive.
See also:

- 68.41.5 Constructor(Keys() as string) 12234

- 68.41.6 Constructor(Keys() as Variant) 12234

68.41.5 Constructor(Keys() as string)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new set from the values in the array.
Notes: If the array has duplicates, the later elements overwrite the earlier keys.
See also:

- 68.41.4 Constructor(CaseSensitive as Boolean = true) 12233
- 68.41.6 Constructor(Keys() as Variant) 12234

68.41.6 Constructor(Keys() as Variant)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new set from the values in the array.
Notes: If the array has duplicates, the later elements overwrite the earlier keys.
See also:

- 68.41.4 Constructor(CaseSensitive as Boolean = true) 12233
- 68.41.5 Constructor(Keys() as string) 12234

68.41.7 CountKey(key as Variant) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this set.

68.41.8 find(key as Variant) as VariantOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.41.9 first as VariantOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the set.
Example:

```
// Create a map
Var m as new VariantOrderedSetMBS

m.insert(1.0) // double
m.insert("Hello") // string
m.insert(3) // integer

// get iterators pointing to first and after last element
Var i as VariantOrderedSetIteratorMBS = m.first
Var e as VariantOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.41.10 insert(key as Variant)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a value to the set.

68.41.11 Key(index as Integer) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.41.12 Keys as Variant()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
Var m as new VariantOrderedSetMBS

m.insert("1")
```

```
m.insert("2")

for each v as Variant in m.Keys
MessageBox v
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.41.13 last as VariantOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the set.
Example:

```
// Create a map
Var m as new VariantOrderedSetMBS

m.insert(1.0) // double
m.insert("Hello") // string
m.insert(3) // integer

// get iterators pointing to first and after last element
Var i as VariantOrderedSetIteratorMBS = m.first
Var e as VariantOrderedSetIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox i.Key
i.MoveNext
wend
```

68.41.14 lookup(key as Variant) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks whether an element with the given key exists in this set.
Example:

```
Var set as new VariantOrderedSetMBS

set.insert "Hello"
set.insert "World"
```

```
MessageBox str(set.lookup("missed")) // shows false as value is missing
MessageBox str(set.lookup("Hello")) // shows true as value is found
```

Notes: Returns true if yes and false if no.

68.41.15 LowerBound(key as Variant) as VariantOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is not less than k.

68.41.16 Remove(first as VariantOrderedSetIteratorMBS, last as VariantOrderedSetIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.41.17 Remove(key as Variant) as Integer 12237
- 68.41.18 Remove(pos as VariantOrderedSetIteratorMBS) 12237

68.41.17 Remove(key as Variant) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.41.16 Remove(first as VariantOrderedSetIteratorMBS, last as VariantOrderedSetIteratorMBS) 12237
- 68.41.18 Remove(pos as VariantOrderedSetIteratorMBS) 12237

68.41.18 Remove(pos as VariantOrderedSetIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.41.16 Remove(first as VariantOrderedSetIteratorMBS, last as VariantOrderedSetIteratorMBS) 12237
- 68.41.17 Remove(key as Variant) as Integer 12237

68.41.19 UpperBound(key as Variant) as VariantOrderedSetIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is greater than k.

68.41.20 Properties

68.41.21 CaseSensitive as Boolean

MBS DataTypes Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether text/string comparison is case sensitive.
Example:

```
Var s1 as new VariantOrderedSetMBS(true)
Var s2 as new VariantOrderedSetMBS(false)

s1.insert("a")
s1.insert("A")

s2.insert("a")
s2.insert("A")

MessageBox str(s1.Count)+" "+str(s2.Count)
```

Notes: (Read only property)

68.41.22 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this set.
Example:

```
Var set as new VariantOrderedSetMBS

set.insert 1
set.insert 2

MessageBox str(set.Count)
```

Notes: (Read only property)

68.41.23 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.41.24 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this set.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.42 class VariantToVariantHashMapIteratorMBS

68.42.1 class VariantToVariantHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the VariantToVariantHashMap class.
Example:

```
// Create a map
Var m as new VariantToVariantHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as VariantToVariantHashMapIteratorMBS = m.first
Var e as VariantToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

- MonkeyBread Software Releases the MBS Plugins 8.2

68.42.2 Methods

68.42.3 isEqual(other as VariantToVariantHashMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new VariantToVariantHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
```

```
Var i as VariantToVariantHashMapIteratorMBS = m.first
Var e as VariantToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.42.4 isNotEqual(other as VariantToVariantHashMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new VariantToVariantHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as VariantToVariantHashMapIteratorMBS = m.first
Var e as VariantToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.42.5 Key as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.42.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
Var m as new VariantToVariantHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as VariantToVariantHashMapIteratorMBS = m.first
Var e as VariantToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.42.7 Properties

68.42.8 Value as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the current item in the iterator.
Notes: (Read and Write computed property)

68.43 class VariantToVariantHashMapMBS

68.43.1 class VariantToVariantHashMapMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for an hash map with variants and keys and values.
Example:

```
Var s as new VariantToVariantHashMapMBS

s.Value("Test")="Hello"
s.Value("test")="World"

MessageBox str(s.Count) // shows 2

s.Value(ConvertEncoding("test",encodings.UTF16))="Just a"
s.Value(ConvertEncoding("Test",encodings.UTF16))="test"

MessageBox str(s.Count) // shows 4
```

Notes: Think of this class like the reimplementation for dictionary class with being case sensitive.

When using variants for keys, you may get better results if all keys used have the same data type to improve comparison.
All text comparison is done either case sensitive or insensitive. Defined in constructor.
You can choose whether you want to keep the map ordered using the OrderedMap class or whether you prefer a higher speed with the HashMap class.

- MonkeyBread Software Releases the MBS Plugins 8.2

68.43.2 Methods

68.43.3 AddKeys(targetArray() as Variant)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to keys, but adds keys to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.43.4 AddValues(targetArray() as Variant)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to values, but adds values to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.43.5 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.43.6 Clone as VariantToVariantHashMapMBS

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map.

68.43.7 CloneDictionary as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map as a dictionary.

68.43.8 Constructor(CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
Notes: If CaseSensitive is true, the comparison of texts or strings is case sensitive.
See also:

- 68.43.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true) 12244
- 68.43.10 Constructor(other as VariantToVariantHashMapMBS) 12245

68.43.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the dictionary.
See also:

- 68.43.8 Constructor(CaseSensitive as Boolean = true) 12244
- 68.43.10 Constructor(other as VariantToVariantHashMapMBS) 12245

68.43.10 Constructor(other as VariantToVariantHashMapMBS)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the existing map.
See also:

- 68.43.8 Constructor(CaseSensitive as Boolean = true) 12244
- 68.43.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true) 12244

68.43.11 CountKey(key as Variant) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this map.

68.43.12 find(key as Variant) as VariantToVariantHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.43.13 first as VariantToVariantHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the map.
Example:

```
// Create a map
Var m as new VariantToVariantHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8
```

```
// get iterators pointing to first and after last element
Var i as VariantToVariantHashMapIteratorMBS = m.first
Var e as VariantToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.43.14 hasKey(key as Variant) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if Key is in the map and False if it is not. Returns a Boolean.

68.43.15 Key(index as Integer) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.43.16 Keys as Variant()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
// Create a map
Var m as new VariantToVariantHashMapMBS

m.Value(1)="Hello"
m.Value(2)="World"

for each v as Variant in m.Keys
MessageBox v
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.43.17 last as VariantToVariantHashMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the map.
Example:

```
// Create a map
Var m as new VariantToVariantHashMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as VariantToVariantHashMapIteratorMBS = m.first
Var e as VariantToVariantHashMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.43.18 lookup(key as Variant, defaultvalue as Variant) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the passed value of Key.
Example:

```
Var map as new VariantToVariantHashMapMBS

map.value("a")="Hello"
map.value("b")="World"
map.value("c")="!"

MessageBox str(map.lookup("d","?")) // shows "?" as value is missing
MessageBox str(map.lookup("a","?")) // shows "Hello" as value is found
```

Notes: If Key is found, it returns the corresponding value. If Key is not found, it returns the passed defaultValue.

68.43.19 Operator_Convert as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the map as dictionary.

68.43.20 Remove(first as VariantToVariantHashMapIteratorMBS, last as VariantToVariantHashMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.43.21 Remove(key as Variant) as Integer 12248
- 68.43.22 Remove(pos as VariantToVariantHashMapIteratorMBS) 12248

68.43.21 Remove(key as Variant) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.43.20 Remove(first as VariantToVariantHashMapIteratorMBS, last as VariantToVariantHashMapIteratorMBS) 12248
- 68.43.22 Remove(pos as VariantToVariantHashMapIteratorMBS) 12248

68.43.22 Remove(pos as VariantToVariantHashMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.43.20 Remove(first as VariantToVariantHashMapIteratorMBS, last as VariantToVariantHashMapIteratorMBS) 12248
- 68.43.21 Remove(key as Variant) as Integer 12248

68.43.23 ValueAtIndex(index as Integer) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value with the given index.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.43.24 Values as Variant()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the values as an array
Example:

```
// Create a map
Var m as new VariantToVariantHashMapMBS

m.Value(1)="Hello"
m.Value(2)="World"

for each v as Variant in m.Values
MessageBox v
next
```

Notes: The order is stable and matches the order returned by Keys at least until the Map is modified. Use this method with For Each to loop through all the values.

68.43.25 Properties

68.43.26 BinCount as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of bins the hash table uses.
Example:

```
Var v as new VariantToVariantHashMapMBS

v.value(1)="Hello"
v.value(2)="World"

MessageBox str(v.BinCount)
```

Notes: This is a measure of the hash table size, independent of the number of items the Dictionary contains. (Read only property)

68.43.27 CaseSensitive as Boolean

MBS DataTypes Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether text/string comparison is case sensitive.
Example:

```
Var s1 as new VariantToVariantHashMapMBS(true)
Var s2 as new VariantToVariantHashMapMBS(false)

s1.value("a") = "1"
s1.value("A") = "2"

s2.value("a") = "1"
s2.value("A") = "2"

MessageBox str(s1.Count)+" "+str(s2.Count)
```

Notes: (Read only property)

68.43.28 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this map.
Example:

```
Var map as new VariantToVariantHashMapMBS

map.Value(1)=true
map.Value("Hello")="World"

MessageBox str(map.Count)
```

Notes: (Read only property)

68.43.29 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.43.30 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this map.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.43.31 value(key as Variant) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value associated with the given key.
Notes: If you query for a key which does not exist, a KeyNotFoundException is raised.
(Read and Write computed property)

68.44 class VariantToVariantMapIteratorMBS

68.44.1 class VariantToVariantMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The iterator for the VariantToVariantMap class.
Example:

```
// Create a map
Var m as new VariantToVariantOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as VariantToVariantMapIteratorMBS = m.first
Var e as VariantToVariantMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.44.2 Methods

68.44.3 isEqual(other as VariantToVariantMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are equal.
Example:

```
// Create a map
Var m as new VariantToVariantOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as VariantToVariantMapIteratorMBS = m.first
Var e as VariantToVariantMapIteratorMBS = m.last
```

```
// Show all keys and values
while i.isEqual(e) = false
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.44.4 isNotEqual(other as VariantToVariantMapIteratorMBS) as boolean

MBS DataTypes Plugin, Plugin Version: 10.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if both iterators are not equal.
Example:

```
// Create a map
Var m as new VariantToVariantOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as VariantToVariantMapIteratorMBS = m.first
Var e as VariantToVariantMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.44.5 Key as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the current key.

68.44.6 MoveNext

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the next item.
Example:

```
// Create a map
```

```
Var m as new VariantToVariantOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as VariantToVariantMapIteratorMBS = m.first
Var e as VariantToVariantMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.44.7 MovePrev

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Moves the iterator to the previous item.

68.44.8 Properties

68.44.9 Value as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the current item in the iterator.
Notes: (Read and Write computed property)

68.45 class VariantToVariantOrderedMapMBS

68.45.1 class VariantToVariantOrderedMapMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An alternative dictionary class for an ordered map with variants as keys and values.
Example:

```
Var s as new VariantToVariantOrderedMapMBS

s.Value("Test")="Hello"
s.Value("test")="World"

MessageBox str(s.Count) // shows 2

s.Value(ConvertEncoding("test",encodings.UTF16))="Just a"
s.Value(ConvertEncoding("Test",encodings.UTF16))="test"

MessageBox str(s.Count) // shows 4
```

Notes: Think of this class like the reimplementation for dictionary class with being case sensitive and with storing items ordered.

When using variants for keys, you may get better results if all keys used have the same data type to improve comparison.
All text comparison is done either case sensitive or insensitive. Defined in constructor.
You can choose whether you want to keep the map ordered using the OrderedMap class or whether you prefer a higher speed with the HashMap class.
Blog Entries

- MonkeyBread Software Releases the MBS Plugins 8.2

68.45.2 Methods

68.45.3 AddKeys(targetArray() as Variant)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to keys, but adds keys to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.45.4 AddValues(targetArray() as Variant)

MBS DataTypes Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Similar to values, but adds values to the given array.
Notes: For older Xojo version 2007/2008 where the plugin can't create an array, so the values and keys function returns always nil.

68.45.5 Clear

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all of the elements.

68.45.6 Clone as VariantToVariantOrderedMapMBS

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map.

68.45.7 CloneDictionary as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this map as a dictionary.

68.45.8 Constructor(CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default constructor.
Notes: If CaseSensitive is true, the comparison of texts or strings is case sensitive.
See also:

- 68.45.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true) 12256
- 68.45.10 Constructor(other as VariantToVariantOrderedMapMBS) 12257

68.45.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the dictionary.
See also:

- 68.45.8 Constructor(CaseSensitive as Boolean = true) 12256
- 68.45.10 Constructor(other as VariantToVariantOrderedMapMBS) 12257

68.45.10 Constructor(other as VariantToVariantOrderedMapMBS)

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new map with the keys and values from the existing map.
See also:

- 68.45.8 Constructor(CaseSensitive as Boolean = true) 12256
- 68.45.9 Constructor(dic as dictionary, CaseSensitive as Boolean = true) 12256

68.45.11 CountKey(key as Variant) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts how often a key is used in this map.

68.45.12 find(key as Variant) as VariantToVariantMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds the key and returns an interator.
Notes: Returns the same value as the last method if the item was not found.

68.45.13 first as VariantToVariantMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the beginning of the map.
Example:

```
// Create a map
Var m as new VariantToVariantOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8
```

```
// get iterators pointing to first and after last element
Var i as VariantToVariantMapIteratorMBS = m.first
Var e as VariantToVariantMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.45.14 hasKey(key as Variant) as boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if Key is in the map and False if it is not. Returns a Boolean.

68.45.15 Key(index as Integer) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value of key for the Indexth sequential item.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.45.16 Keys as Variant()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the keys as an array.
Example:

```
// Create a map
Var m as new VariantToVariantOrderedMapMBS

m.Value(1)="Hello"
m.Value(2)="World"

for each v as Variant in m.Keys
MessageBox v
next
```

Notes: The order is stable and matches the order returned by the Values method at least until the Dictionary is modified. Use this method with For Each to loop through all the keys.

68.45.17 last as VariantToVariantMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator pointing to the end of the map.
Example:

```
// Create a map
Var m as new VariantToVariantOrderedMapMBS

m.value(1)=2
m.value(2)=4
m.value(3)=8

// get iterators pointing to first and after last element
Var i as VariantToVariantMapIteratorMBS = m.first
Var e as VariantToVariantMapIteratorMBS = m.last

// Show all keys and values
while i.isNotEqual(e)
MessageBox str(i.Key)+" ->"+str(i.Value)
i.MoveNext
wend
```

68.45.18 lookup(key as Variant, defaultvalue as Variant) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Looks up the passed value of Key.
Example:

```
Var map as new VariantToVariantOrderedMapMBS

map.value("a")="Hello"
map.value("b")="World"
map.value("c")="!"

MessageBox str(map.lookup("d","?")) // shows "?" as value is missing
MessageBox str(map.lookup("a","?")) // shows "Hello" as value is found
```

Notes: If Key is found, it returns the corresponding value. If Key is not found, it returns the passed defaultValue.

68.45.19 LowerBound(key as Variant) as VariantToVariantMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is not less than k.

68.45.20 Operator_Convert as Dictionary

MBS DataTypes Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the map as dictionary.

68.45.21 Remove(first as VariantToVariantMapIteratorMBS, last as VariantToVariantMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases all elements in a range.
See also:

- 68.45.22 Remove(key as Variant) as Integer 12260
- 68.45.23 Remove(pos as VariantToVariantMapIteratorMBS) 12260

68.45.22 Remove(key as Variant) as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element with the given key.
See also:

- 68.45.21 Remove(first as VariantToVariantMapIteratorMBS, last as VariantToVariantMapIteratorMBS) 12260
- 68.45.23 Remove(pos as VariantToVariantMapIteratorMBS) 12260

68.45.23 Remove(pos as VariantToVariantMapIteratorMBS)

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Erases the element pointed to by the pos iterator.
See also:

- 68.45.21 Remove(first as VariantToVariantMapIteratorMBS, last as VariantToVariantMapIteratorMBS) 12260
- 68.45.22 Remove(key as Variant) as Integer 12260

68.45.24 UpperBound(key as Variant) as VariantToVariantMapIteratorMBS

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an iterator for the first element whose key is greater than k.

68.45.25 ValueAtIndex(index as Integer) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the value with the given index.
Notes: If there is no Indexth item in the map, a call generates an OutOfBoundsException error. The first item has the index zero.

68.45.26 Values as Variant()

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the values as an array
Example:

```
// Create a map
Var m as new VariantToVariantOrderedMapMBS

m.Value(1)="Hello"
m.Value(2)="World"

for each v as Variant in m.Values
MessageBox v
next
```

Notes: The order is stable and matches the order returned by Keys at least until the Map is modified. Use this method with For Each to loop through all the values.

68.45.27 Properties

68.45.28 CaseSensitive as Boolean

MBS DataTypes Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether text/string comparison is case sensitive.
Example:

```
Var s1 as new VariantToVariantOrderedMapMBS(true)
Var s2 as new VariantToVariantOrderedMapMBS(false)

s1.value("a") = "1"
s1.value("A") = "2"

s2.value("a") = "1"
s2.value("A") = "2"

MessageBox str(s1.Count)+" "+str(s2.Count)
```

Notes: (Read only property)

68.45.29 Count as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items in this map.
Example:

```
Var map as new VariantToVariantOrderedMapMBS

map.Value(1)=true
map.Value("Hello")="World"

MessageBox str(map.Count)
```

Notes: (Read only property)

68.45.30 Empty as Boolean

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the size is zero.
Notes: (Read only property)

68.45.31 MaxSize as Integer

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the largest possible size for this map.
Notes: Value is -1 if no limit is defined.
(Read only property)

68.45.32 value(key as Variant) as Variant

MBS DataTypes Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value associated with the given key.
Notes: If you query for a key which does not exist, a KeyNotFoundException is raised.
(Read and Write computed property)

Chapter 69

DDE

69.1 class DDEBinaryDataMBS

69.1.1 class DDEBinaryDataMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Binary Data for DDEMBS conversation.
Notes: Be carefully: This objects for data received inside a DDEMBS Event are read only. Passing an object to a function normally destroys it.

69.1.2 Methods

69.1.3 Mem as memoryblock

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the data as a memoryblock.

69.1.4 size as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the size of this data object.

69.1.5 Str as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the data as a string.

69.1.6 Properties

69.1.7 Handle as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle for this data.
Notes: (Read and Write property)

69.1.8 Release as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: whether the destructor will release the data handle or not.
Notes: (Read and Write property)

69.2 class DDEContextInfoMBS

69.2.1 class DDEContextInfoMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Details for a connection.

69.2.2 Properties

69.2.3 Ansi as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: whether the other side works with Ansi strings (the normal ones).
Notes: Currently this DDEMBS Classes are only tested for ANSI Systems. And I'm not sure if Xojo itself does handle Unicode correctly on Windows.
(Read and Write property)

69.2.4 CountryID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The country ID for this connection.
Notes: Some Windows country constants:

(Read and Write property)

69.2.5 Flags as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Flags for this connection.
Notes: Currently not used by Windows.
(Read and Write property)

69.2.6 LangID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The language ID for this connection.
Notes: Some Windows language constants:

(Read and Write property)

69.2.7 Security as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A user defined security code.
Notes: A security value, which may be anything you need.
Maybe a code to verify that it is your app or the encryption code?
(Read and Write property)

69.2.8 Unicode as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: whether the other side works with Unicode strings.
Notes: Currently this DDEMBS Classes are only tested for ANSI Systems. And I'm not sure if Xojo itself does handle Unicode correctly on Windows.
(Read and Write property)

69.3 class DDEMBS

69.3.1 class DDEMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives access to Windows DDE functions.
Notes: DDE on Windows is like AppleEvents on Mac OS, but not so comfortable.
Blog Entries

- MBS Xojo Plugins, version 25.6pr7

69.3.2 Methods

69.3.3 clientTransaction(type as Integer,topic as DDEStringMBS) as DDEBinaryDataMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Runs a Transaction with the server.
Notes: Short version of ClientTransaction with datatype=CF_TEXT and data=nil.
See also:

- 69.3.4 clientTransaction(type as Integer,topic as DDEStringMBS, data as DDEBinaryDataMBS) as DDEBinaryDataMBS 12271
- 69.3.5 clientTransaction(type as Integer,topic as DDEStringMBS, data as DDEBinaryDataMBS, datatype as Integer) as DDEBinaryDataMBS 12272

69.3.4 clientTransaction(type as Integer,topic as DDEStringMBS, data as DDEBinaryDataMBS) as DDEBinaryDataMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Runs a Transaction with the server.
Notes: Shortversion of ClientTransaction with datatype=CF_TEXT.
See also:

- 69.3.3 clientTransaction(type as Integer,topic as DDEStringMBS) as DDEBinaryDataMBS 12271
- 69.3.5 clientTransaction(type as Integer,topic as DDEStringMBS, data as DDEBinaryDataMBS, datatype as Integer) as DDEBinaryDataMBS 12272

69.3.5 clientTransaction(type as Integer,topic as DDEStringMBS, data as DDEBinaryDataMBS, datatype as Integer) as DDEBinaryDataMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Runs a Transaction with the server.
Example:

```
// List all Excel Topics

Var d as DDEMBS
Var s,topic as DDEStringMBS
Var g as DDEStringMBS
Var m as DDEBinaryDataMBS
Var t,enter,z as string
Var i,c as Integer

list.deleteAllRows
d=new DDEMBS
if d.InitClient then
s=d.newDDEString("Excel")
topic=d.newDDEString("System")
if topic<>nil and s<>nil and d.ConnectToServer(s,topic) then
g=d.newDDEString("Topics")
if g<>nil then
m=d.ClientTransaction(d.XTYP_REQUEST,g)
if m<>nil then
t=m.str
t=left(t,len(t)-1) // remove chr(0) at end
enter=chr(9)
c=countfields(t,Enter)
for i=1 to c
z=nthfield(t,enter,i)

list.addRow z
next
list.listindex=0
else
MessageBox "Failed to transfer."
end if
else
MessageBox "Fail to create second string."
end if
g=nil // must be released before close
else
MessageBox "Fail to create connect."
end if
s=nil // must be released before close
```

```
d.close
else
MessageBox "Fail to init for Client."
end if
```

Notes: Use this ClientTransaction if the application returns a value or ClientTransactionBoolean if it returns a boolean.
Data and Datatype are optional. If no datatype is set, the datatype is set to the value of CF_TEXT.
See also:

- 69.3.3 clientTransaction(type as Integer,topic as DDEStringMBS) as DDEBinaryDataMBS 12271
- 69.3.4 clientTransaction(type as Integer,topic as DDEStringMBS, data as DDEBinaryDataMBS) as DDEBinaryDataMBS 12271

69.3.6 clientTransactionBoolean(type as Integer,topic as DDEStringMBS) as Boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Runs a Transaction with the server.
Notes: Short version of ClientTransactionBoolean with datatype=CF_TEXT and data=nil.
See also:

- 69.3.7 clientTransactionBoolean(type as Integer,topic as DDEStringMBS, data as DDEBinaryDataMBS) as Boolean 12273
- 69.3.8 clientTransactionBoolean(type as Integer,topic as DDEStringMBS, data as DDEBinaryDataMBS, datatype as Integer) as Boolean 12274

69.3.7 clientTransactionBoolean(type as Integer,topic as DDEStringMBS, data as DDEBinaryDataMBS) as Boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Runs a Transaction with the server.
Notes: Short version of ClientTransactionBoolean with Datatype=CF_TEXT.
See also:

- 69.3.6 clientTransactionBoolean(type as Integer,topic as DDEStringMBS) as Boolean 12273
- 69.3.8 clientTransactionBoolean(type as Integer,topic as DDEStringMBS, data as DDEBinaryDataMBS, datatype as Integer) as Boolean 12274

69.3.8 clientTransactionBoolean(type as Integer,topic as DDEStringMBS, data as DDEBinaryDataMBS, datatype as Integer) as Boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Runs a Transaction with the server.
Notes: Use this ClientTransaction if the application returns a value or ClientTransactionBoolean if it returns a boolean.
Data and Datatype are optional. If no datatype is set, the datatype is set to the value of CF_TEXT.
See also:

- 69.3.6 clientTransactionBoolean(type as Integer,topic as DDEStringMBS) as Boolean 12273
- 69.3.7 clientTransactionBoolean(type as Integer,topic as DDEStringMBS, data as DDEBinaryDataMBS) as Boolean 12273

69.3.9 close

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Closes the running connection.
Example:

```
Var d as DDEMBS
// work with dde object

if d<>nil then
d.close
d=nil
end if
```

Notes: RB seems to crash, if the object is not destroyed before application is quit.

69.3.10 ConnectToServer(appname as DDEStringMBS, topic as DDEStringMBS) as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Connects to the application for the given topic.
Example:

```
Var a,b as DDEStringMBS
Var d as DDEMBS

d=new DDEMBS
if d.InitClient then
```

```
a=d.newDDEString("servicename")
b=d.newDDEString("topicname")
if a<>nil and b<>nil then
if d.ConnectToServer(a,b) then
MessageBox "Connected."
return // ok, so leave before closing.
else
MessageBox "Failed to connect."
end if
else
MessageBox "Unable to make DDE Strings."
end if
d.close // failed

else
MessageBox "Failed to initClient."
end if
```

Notes: Using nil for appname or topic you can try to connect to anyone who accepts.
Renamed in v4.3 to ConnectToServer from Connect for better RB 6 compatibility.

69.3.11 InitClient as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Starts DDE, but only for Client stuff.
Notes: With plugin version 6.1pr4 and newer you can have eight DDE objects in your application.
With older plugin versions you can only have one instance of the DDEMBS class at all!

69.3.12 InitServer as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Starts DDE for client and server stuff.
Notes: With plugin version 6.1pr4 and newer you can have eight DDE objects in your application.
With older plugin versions you can only have one instance of the DDEMBS class at all!

69.3.13 NewDDEBinaryData(name as DDEStringMBS,data as memoryblock,offset as Integer,length as Integer,dataformat as Integer) as DDEBinaryDataMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new binary data object.
See also:

- 69.3.14 NewDDEBinaryData(name as DDEStringMBS,data as string) as DDEBinaryDataMBS 12276
- 69.3.15 NewDDEBinaryData(name as DDEStringMBS,data as string,offset as Integer,length as Integer) as DDEBinaryDataMBS 12276

69.3.14 NewDDEBinaryData(name as DDEStringMBS,data as string) as DDEBinaryDataMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new binary data object.
Notes: A short version of NewDDEBinaryData which takes the whole string.
See also:

- 69.3.13 NewDDEBinaryData(name as DDEStringMBS,data as memoryblock,offset as Integer,length as Integer,dataformat as Integer) as DDEBinaryDataMBS 12275
- 69.3.15 NewDDEBinaryData(name as DDEStringMBS,data as string,offset as Integer,length as Integer) as DDEBinaryDataMBS 12276

69.3.15 NewDDEBinaryData(name as DDEStringMBS,data as string,offset as Integer,length as Integer) as DDEBinaryDataMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new binary data object.
Notes: The offset and length is optional.
See also:

- 69.3.13 NewDDEBinaryData(name as DDEStringMBS,data as memoryblock,offset as Integer,length as Integer,dataformat as Integer) as DDEBinaryDataMBS 12275
- 69.3.14 NewDDEBinaryData(name as DDEStringMBS,data as string) as DDEBinaryDataMBS 12276

69.3.16 NewDDEString(ansistring as string) as DDEStringMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new ANSI DDE string.
Example:

```
Var d as DDEMBS // your DDE object
Var a as DDEStringMBS
```

```
a=d.newDDEString("servicename")
```

Notes: ANSI is the normal string encoding on Windows.

69.3.17 NewDDEStringUnicode(unicodestring as string) as DDEStringMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new Unicode DDE string.
Example:

```
Var d as DDEMBS // your DDE object
Var a as DDEStringMBS
a=d.NewDDEStringUnicode("servicename")
```

Notes: Currently this DDE Classes are only tested for ANSI Systems. And I'm not sure if Xojo itself does handle Unicode correctly on Windows.

69.3.18 RegisterService(name as DDEStringMBS) as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a service name.
Example:

```
Var d as DDEMBS // your dde object
Var s as DDEStringMBS

if d<>nil then
s=d.newDDEString(editfield1.text)

if s<>nil then
if d.registerService(s) then
MessageBox "Registered."
else
MessageBox "Register fails."
end if
else
MessageBox "Failed on NewDDEString"
end if
else
MessageBox "No DDE object!?"
end if
```

69.3.19 UnRegisterService(name as DDEStringMBS) as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Unregisters a service name.
Example:

```
Var d as DDEMBS // your dde object
Var s as DDEStringMBS

if d<>nil then
s=d.newDDEString(editfield1.text)

if s<>nil then
if d.UnRegisterService(s) then
MessageBox "Unregistered."
else
MessageBox "Unregister fails."
end if
else
MessageBox "Failed on NewDDEString"
end if
else
MessageBox "No DDE object!?"
end if
```

69.3.20 Properties

69.3.21 LastError as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read only property)

69.3.22 Timeout as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Timeout in milliseconds.
Example:

```
Var d as DDEMBS // your DDE object
d.timeout=10000 // 10 Seconds
```

Notes: Default is 1000.
(Read and Write property)

69.3.23 Events

69.3.24 AdviceData(topic as DDEStringMBS, item as DDEStringMBS, dataformat as Integer,data as DDEBinaryDataMBS) as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: A dynamic data exchange (DDE) client receives the AdviceData event after establishing an advise loop with a server. This transaction informs the client that the value of the data item has changed.

Return Values:
A DDE callback function should return DDE_FACK if it processes this transaction, DDE_FBUSY if it is too busy to process this transaction, or DDE_FNOTPROCESSED if it rejects this transaction.

Remarks:
An application must copy the data associated with the DDEBinaryDataMBS object if the application must process the data after the callback function returns.

69.3.25 AdviceRequest(topic as DDEStringMBS, item as DDEStringMBS, dataformat as Integer,remaincount as Integer) as DDEBinaryDataMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: The system sends the AdviceRequest event to a server after the server calls the DdePostAdvise function. This transaction informs the server that an advise transaction is outstanding on the specified topic name and item name pair and that data corresponding to the topic name and item name pair has changed.

Return Values:
The server should first call the NewDDEBinaryData function to create a data object that identifies the changed data and then return this object. The server should return nil if it is unable to complete the transaction.

69.3.26 AdviceStart(topic as DDEStringMBS, item as DDEStringMBS, dataformat as Integer) as Boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: A client uses this event to establish an advise loop with a server.

69.3.27 AdviceStop(topic as DDEStringMBS, item as DDEStringMBS, dataformat as Integer)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: A client uses this event to end an advise loop with a server.

69.3.28 ConfirmConnect(topic as DDEStringMBS, service as DDEStringMBS, myself as Boolean)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: Your connection was accepted.

69.3.29 Connect(topic as DDEStringMBS, service as DDEStringMBS, myself as Boolean,info as DDEContextInfoMBS) as Boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: Return true if you accept this connection.

69.3.30 Disconnect(myself as Boolean)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: The connection was closed.

69.3.31 Error(errorcode as Integer)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: A dynamic data exchange (DDE) object receives the Error event when a critical error occurs.

Possible errors:

DMLERR_ADVACKTIMEOUT	&h4000	
DMLERR_BUSY	&h4001	
DMLERR_DATAACKTIMEOUT	&h4002	
DMLERR_DLL_NOT_INITIALIZED	&h4003	
DMLERR_DLL_USAGE	&h4004	
DMLERR_EXECACKTIMEOUT	&h4005	
DMLERR_INVALIDPARAMETER	&h4006	
DMLERR_LOW_MEMORY	&h4007	Memory is low; advise, poke, or execute data may be lost, or the system may fail.
DMLERR_MEMORY_ERROR	&h4008	
DMLERR_NOTPROCESSED	&h4009	
DMLERR_NO_CONV_ESTABLISHED	&h400a	
DMLERR_POKEACKTIMEOUT	&h400b	
DMLERR_POSTMSG_FAILED	&h400c	
DMLERR_REENTRANCY	&h400d	
DMLERR_SERVER_DIED	&h400e	
DMLERR_SYS_ERROR	&h400f	
DMLERR_UNADVACKTIMEOUT	&h4010	
DMLERR_UNFOUND_QUEUE_ID	&h4011	

69.3.32 Execute(topic as DDEStringMBS,data as DDEBinaryDataMBS) as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: A dynamic data exchange (DDE) server object receives the Execute event when a client specifies XTYP_EXECUTE in the ClientTransaction function. A client uses this transaction to send a command string to the server.

Return Values:
A server should return DDE_FACK if it processes this transaction, DDE_FBUSY if it is too busy to process this transaction, or DDE_FNOTPROCESSED if it rejects this transaction.

The data property is only valid while inside the event.

69.3.33 Poke(topic as DDEStringMBS,item as DDEStringMBS,data as DDEBinaryDataMBS) as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: Return Values:
A server should return DDE_FACK if it processes this transaction, DDE_FBUSY if it is too busy to process this transaction, or DDE_FNOTPROCESSED if it rejects this transaction.

69.3.34 Register(application as DDEStringMBS,service as DDEStringMBS)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: A service is registered. You may add it to your own list.

69.3.35 Request(topic as DDEStringMBS,item as DDEStringMBS,dataformat as Integer) as DDEBinaryDataMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: The server should create a DDEBinaryDataMBS object that identifies the data and then return this object. The server should return nil if it is unable to complete the transaction. If the server returns nil, the client will receive a DDE_FNOTPROCESSED flag.

69.3.36 UnRegister(application as DDEStringMBS,service as DDEStringMBS)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: A service was unregistered.

69.3.37 WildConnect(topic as DDEStringMBS,service as DDEStringMBS, myself as boolean,info as DDEContextInfoMBS) as DDEStringPairListMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DDE events.
Notes: A connection is tried to all available servers. Return true if you accept.

69.3.38 Constants

Constants

Constant	Value	Description
CF_BITMAP	2	A constant for the format parameter. Specifies a Windows bitmap format
CF_DIB	8	A constant for the format parameter. Specifies the Windows Device Independent Bitmap (DIB) format.
CF_DIBV5	17	A constant for the format parameter. Specifies the Windows Device Independent Bitmap (DIB) format of Windows 2000 and newer.
CF_DIF	5	A constant for the format parameter. Specifies the Windows data interchange format.
CF_ENHMETAFILE	14	A constant for the format parameter. Specifies the Windows enhanced metafile format.
CF_HDROP	15	A constant for the format parameter. Specifies the Windows file drop format.
CF_LOCALE	16	A constant for the format parameter. Specifies the Windows locale format.
CF_METAFILEPICT	3	A constant for the format parameter. Specifies the Windows metafile format.
CF_OEMTEXT	7	A constant for the format parameter. Specifies the standard Windows original equipment manufacturer (OEM) text format.
CF_PALETTE	9	A constant for the format parameter. Specifies the Windows Palette format.
CF_PENDATA	10	A constant for the format parameter. Specifies the Windows pen data format.
CF_RIFF	11	A constant for the format parameter. Specifies the Resource Interchange File Format (RIFF) audio format.
CF_SYLK	4	A constant for the format parameter. Specifies the Windows symbolic link format.
CF_TEXT	1	A constant for the format parameter. Specifies the standard American National Standards Institute (ANSI) text format.
CF_TIFF	6	A constant for the format parameter. Specifies the Tagged Image File Format (TIFF).
CF_UNICODETEXT	13	A constant for the format parameter. Specifies the standard Windows Unicode text format.
CF_WAVE	12	A constant for the format parameter. Specifies the wave audio format.
DDE_FACK	&h8000	A constant for the return parameter of some events. Return DDE_FACK if everything was handled well.
DDE_FBUSY	&h4000	A constant for the return parameter of some events. Return DDE_FBUSY if your application is busy and can't currently handle the request.
DDE_FNOTPROCESSED	0	A constant for the return parameter of some events. Return DDE_FNOTPROCESSED if something went wrong will processing this event.
XTYP_EXECUTE	&h4050	A constant for the type parameter of ClientTransaction and ClientTransactionBoolean.
XTYP_POKE	&h4090	A constant for the type parameter of ClientTransaction and ClientTransactionBoolean.
XTYP_REQUEST	&h20B0	A constant for the type parameter of ClientTransaction and ClientTransactionBoolean.

69.4 class DDEStringMBS

69.4.1 class DDEStringMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string for DDEMBS conversation.
Notes: Be carefully: This objects for data received inside a DDEMBS Event are read only. Passing an object to a function normally destroys it.

69.4.2 Methods

69.4.3 Len as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the length of this string.

69.4.4 Mem as memoryblock

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the content of this DDEMBS String as Xojo Memoryblock.

69.4.5 Str as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the content of this DDEMBS String as Xojo string.

69.4.6 Properties

69.4.7 Handle as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle for this data.
Notes: (Read and Write property)

69.4.8 Release as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: whether the destructor will release the data handle or not.
Notes: (Read and Write property)

69.5 class DDEStringPairListMBS

69.5.1 class DDEStringPairListMBS

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A list of DDE string pairs.
Notes: Used for the wild connect event.

69.5.2 Methods

69.5.3 Append(item as DDEStringPairMBS)

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds another item to the list.

69.5.4 Count as Integer

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Counts the number of items in the list.

69.5.5 Item(index as Integer) as DDEStringPairMBS

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns an item from this list.
Notes: Returns nil on any error.
Index is from 0 to count-1.

69.6 class DDEStringPairMBS

69.6.1 class DDEStringPairMBS

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A pair of topic and service DDEString objects.
Notes: Used for the wild connect event.

69.6.2 Properties

69.6.3 Service as DDEStringMBS

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The service of this pair.
Notes: (Read and Write property)

69.6.4 Topic as DDEStringMBS

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The topic of this pair.
Notes: (Read and Write property)

Chapter 70

Declare

70.1 class BlockMBS

70.1.1 class BlockMBS

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: A class to use blocks on Mac OS X with declares.
Blog Entries

- Three new controls for iOS in Xojo
- MBS Xojo / Real Studio plug-ins version 16.2
- MBS Xojo / Real Studio Plugins, version 16.2pr6

Xojo Developer Magazine

- 14.4, page 10: News

70.1.2 Methods

70.1.3 Close

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Releases all blocks.

70.1.4 GetBlockB(tag as Variant = nil) as Integer

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns the address of a block to pass to a declare.
Notes: Tag is passed to the event.
Later when the block is invoked, the BlockB event is called. If the block is invoked on the main thread, we call the event directly. Else we schedule to call the event as soon as possible on the main thread. With running the event later, we can of course not return the event result to the block caller, but only the value in the AsyncBoolResult property.

70.1.5 GetBlockBI(tag as Variant = nil) as Integer

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns the address of a block to pass to a declare.
Notes: Tag is passed to the event.
Later when the block is invoked, the BlockBI event is called. If the block is invoked on the main thread, we call the event directly. Else we schedule to call the event as soon as possible on the main thread. With running the event later, we can of course not return the event result to the block caller, but only the value in the AsyncBoolResult property.

70.1.6 GetBlockBII(tag as Variant = nil) as Integer

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns the address of a block to pass to a declare.
Notes: Tag is passed to the event.
Later when the block is invoked, the BlockBII event is called. If the block is invoked on the main thread, we call the event directly. Else we schedule to call the event as soon as possible on the main thread. With running the event later, we can of course not return the event result to the block caller, but only the value in the AsyncBoolResult property.

70.1.7 GetBlockBIII(tag as Variant = nil) as Integer

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns the address of a block to pass to a declare.
Notes: Tag is passed to the event.
Later when the block is invoked, the BlockBIII event is called. If the block is invoked on the main thread, we call the event directly. Else we schedule to call the event as soon as possible on the main thread. With running the event later, we can of course not return the event result to the block caller, but only the value

in the AsyncBoolResult property.

70.1.8 GetBlockBIIII(tag as Variant = nil) as Integer

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns the address of a block to pass to a declare.
Notes: Tag is passed to the event.
Later when the block is invoked, the BlockBIIII event is called. If the block is invoked on the main thread, we call the event directly. Else we schedule to call the event as soon as possible on the main thread. With running the event later, we can of course not return the event result to the block caller, but only the value in the AsyncBoolResult property.

70.1.9 GetBlockV(tag as Variant = nil) as Integer

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns the address of a block to pass to a declare.
Notes: Tag is passed to the event.
Later when the block is invoked, the BlockV event is called. If the block is invoked on the main thread, we call the event directly. Else we schedule to call the event as soon as possible on the main thread.

70.1.10 GetBlockVI(tag as Variant = nil) as Integer

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns the address of a block to pass to a declare.
Notes: Tag is passed to the event.
Later when the block is invoked, the BlockVI event is called. If the block is invoked on the main thread, we call the event directly. Else we schedule to call the event as soon as possible on the main thread.

70.1.11 GetBlockVII(tag as Variant = nil) as Integer

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns the address of a block to pass to a declare.
Notes: Tag is passed to the event.
Later when the block is invoked, the BlockVII event is called. If the block is invoked on the main thread, we call the event directly. Else we schedule to call the event as soon as possible on the main thread.

70.1.12 GetBlockVIII(tag as Variant = nil) as Integer

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns the address of a block to pass to a declare.
Notes: Tag is passed to the event.
Later when the block is invoked, the BlockVIII event is called. If the block is invoked on the main thread, we call the event directly. Else we schedule to call the event as soon as possible on the main thread.

70.1.13 GetBlockVIIII(tag as Variant = nil) as Integer

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns the address of a block to pass to a declare.
Notes: Tag is passed to the event.
Later when the block is invoked, the BlockVIIII event is called. If the block is invoked on the main thread, we call the event directly. Else we schedule to call the event as soon as possible on the main thread.

70.1.14 Properties

70.1.15 AsyncBoolResult as Boolean

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: The result for a boolean block called on a non main thread.
Notes: If you use one of the BlockB methods to get a block and it's called on another thread but the main thread, we return the value of this property instead of the actual event result.
(Read only property)

70.1.16 Synchronous as Boolean

MBS Util Plugin, Plugin Version: 16.2, Platform: macOS, Targets: All.

Function: Whether to call events synchronously.
Notes: If the block is called on another thread, the plugin calls the event on the main thread.
If Synchronous is true, we call the main thread synchronously, else asynchronously.
Default is asynchronously to avoid dead locks.
(Read and Write property)

70.1.17 Events

70.1.18 BlockB(Async_ as boolean, tag as Variant) as boolean

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Called when block is invoked.
Notes: Async: False if block is invoked directly on main thread. Else true so invoked later on main thread.
Tag: The tag value passed on block creation.
If you return a boolean, we pass it to the caller if async=false. For Async = true, the plugin already passed back AsyncBoolResult for you before this event is called.

70.1.19 BlockBI(Async_ as boolean, tag as Variant, value as Integer) as boolean

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Called when block is invoked.
Notes: Async: False if block is invoked directly on main thread. Else true so invoked later on main thread.
Tag: The tag value passed on block creation.
Value properties give the actual values. You may need to cast to Ptr, Boolean or whatever data type you expect.
If you return a boolean, we pass it to the caller if async=false. For Async = true, the plugin already passed back AsyncBoolResult for you before this event is called.

70.1.20 BlockBII(Async_ as boolean, tag as Variant, value1 as Integer, value2 as Integer) as boolean

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Called when block is invoked.
Notes: Async: False if block is invoked directly on main thread. Else true so invoked later on main thread.
Tag: The tag value passed on block creation.
Value properties give the actual values. You may need to cast to Ptr, Boolean or whatever data type you expect.
If you return a boolean, we pass it to the caller if async=false. For Async = true, the plugin already passed back AsyncBoolResult for you before this event is called.

70.1.21 BlockBIII(Async_ as boolean, tag as Variant, value1 as Integer, value2 as Integer, value3 as Integer) as boolean

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Called when block is invoked.
Notes: Async: False if block is invoked directly on main thread. Else true so invoked later on main thread.
Tag: The tag value passed on block creation.
Value properties give the actual values. You may need to cast to Ptr, Boolean or whatever data type you expect.
If you return a boolean, we pass it to the caller if async=false. For Async = true, the plugin already passed back AsyncBoolResult for you before this event is called.

70.1.22 BlockBIIII(Async_ as boolean, tag as Variant, value1 as Integer, value2 as Integer, value3 as Integer, value4 as Integer) as boolean

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Called when block is invoked.
Notes: Async: False if block is invoked directly on main thread. Else true so invoked later on main thread.
Tag: The tag value passed on block creation.
Value properties give the actual values. You may need to cast to Ptr, Boolean or whatever data type you expect.
If you return a boolean, we pass it to the caller if async=false. For Async = true, the plugin already passed back AsyncBoolResult for you before this event is called.

70.1.23 BlockV(Async_ as boolean, tag as Variant)

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Called when block is invoked.
Notes: Async: False if block is invoked directly on main thread. Else true so invoked later on main thread.
Tag: The tag value passed on block creation.

70.1.24 BlockVI(Async_ as boolean, tag as Variant, value as Integer)

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Called when block is invoked.
Notes: Async: False if block is invoked directly on main thread. Else true so invoked later on main thread.
Tag: The tag value passed on block creation.
Value properties give the actual values. You may need to cast to Ptr, Boolean or whatever data type you expect.

70.1.25 BlockVII(Async_ as boolean, tag as Variant, value1 as Integer, value2 as Integer)

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Called when block is invoked.
Notes: Async: False if block is invoked directly on main thread. Else true so invoked later on main thread.
Tag: The tag value passed on block creation.
Value properties give the actual values. You may need to cast to Ptr, Boolean or whatever data type you expect.

70.1.26 BlockVIII(Async_ as boolean, tag as Variant, value1 as Integer, value2 as Integer, value3 as Integer)

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Called when block is invoked.
Notes: Async: False if block is invoked directly on main thread. Else true so invoked later on main thread.
Tag: The tag value passed on block creation.
Value properties give the actual values. You may need to cast to Ptr, Boolean or whatever data type you expect.

70.1.27 BlockVIIII(Async_ as boolean, tag as Variant, value1 as Integer, value2 as Integer, value3 as Integer, value4 as Integer)

MBS Util Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Called when block is invoked.
Notes: Async: False if block is invoked directly on main thread. Else true so invoked later on main thread.
Tag: The tag value passed on block creation.
Value properties give the actual values. You may need to cast to Ptr, Boolean or whatever data type you expect.

70.2 class SoftDeclareMBS

70.2.1 class SoftDeclareMBS

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: A way to do soft linking to libraries.
Example:

```
// Load the Stuffit Bundle on Mac OS X:
Var f as FolderItem
Var s as SoftDeclareMBS

f=FrameworksFolderMBS(-32765).Child("StuffIt.framework")
s=new SoftDeclareMBS

if s.LoadFrameworkFile(f) then
MessageBox "ok"
end if
```

Notes: Deprecated. Please move to newer DeclareLibraryMBS and DeclareFunctionMBS classes.

You can make a declare like this:

Declare Function SpeakString lib "SpeechLib" (SpeakString as pstring) as Integer

But what if the SpeechLib is not installed?
Simple, but your application won't even launch on this machine.
Now you can of course use this MBS Plugin using the SpeechMBS functions, which are all week linked.
But you can also use this class to weak link to the SpeechMBS library like this:

```
Var b as boolean, m,p as memoryblock, c as SoftDeclareMBS

c=new SoftDeclareMBS
p=newmemoryBlock(256) // make the string for the first parameter
p.pstring(0)="Hello World!"

m=newmemoryBlock(4) // make the memoryblock for the parameters
m.long(0)=p.Address(0) // set the first parameter to the address of the string buffer

if c.loadlibrary("SpeechLib") then // Load librarys
if c.loadfunction("SpeakString") then // Load function
b=c.Call(1,m)
end if
end if
```

This way your application will be loaded, you can call the function, but people who don't have the SpeechLib will also here it.

70.2.2 Methods

70.2.3 CallFunction(param as string,data as memoryblock) as boolean

MBS Util Plugin, Plugin Version: 7.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a function.
Example:

```
Var c as SoftDeclareMBS
Var m,p,b as memoryBlock
Var f as folderItem
Var path as string

f=ApplicationsFolderMBS(-32766) // get a folder...
path=f.NativePath

MessageBox path

b=newmemoryBlock(1024)
b.long(0)=0 // make empty C string

p=newmemoryBlock(lenb(path)+3)
p.cstring(0)=path

m=newmemoryBlock(12+10)
m.long(0)=p.AddressMBS(0)
m.long(4)=b.AddressMBS(0)
m.long(8)=1023

c=new SoftDeclareMBS
if c.LoadDLL("KERNEL32") then
if c.loadfunction("GetShortPathNameA") then
c.CallingMode=0
```

```
MessageBox "found function"
if c.CallFunction("iii",m) then
MessageBox "Short path is: "+b.cstring(0)
else
MessageBox "Failed to call function."
end if
else
MessageBox "Loading of function "+c.FunctionName+" failed."
end if
else
MessageBox "Loading of Kernel32 failed."
end if
```

Notes: The param string is a combination of the characters "i" for integer, "l" for 64bit integer, "f" for single (float) and "d" for double.
Use "i" for booleans, shorts and pointers.

the memoryblock must match exactly the parameters you specified.
Returns true on success.
See also:

- 70.2.4 CallFunction(paramcount as Integer,data as memoryblock) as boolean 12298

70.2.4 CallFunction(paramcount as Integer,data as memoryblock) as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a function.
Example:

```
Var c as SoftDeclareMBS
Var m,p,b as memoryBlock
Var f as folderItem
Var path as string

f=ApplicationsFolderMBS(-32766) // get a folder...
path=f.NativePath

MessageBox path

b=newmemoryBlock(1024)
b.long(0)=0 // make empty C string

p=newmemoryBlock(lenb(path)+3)
p.cstring(0)=path
```

```
m=newmemoryBlock(12+10)
m.long(0)=p.AddressMBS(0)
m.long(4)=b.AddressMBS(0)
m.long(8)=1023

c=new SoftDeclareMBS
if c.LoadDLL("KERNEL32") then
if c.loadfunction("GetShortPathNameA") then
c.CallingMode=0
MessageBox "found function"
if c.CallFunction(3,m) then
MessageBox "Short path is: "+b.cstring(0)
else
MessageBox "Failed to call function."
end if
else
MessageBox "Loading of function "+c.FunctionName+" failed."
end if
else
MessageBox "Loading of Kernel32 failed."
end if
```

Notes: If paramcount is 0, the memoryblock is ignored.
The size of the memoryblock must be minimum 4*paramcount.
Each parameter is set using m.long(n*4) where n=0 is the first parameter.
A parameter may be any integer value or an address of a memoryblock. The address can be read using memoryblock.addressMBS which is part of the plugin. You can even use only one memoryblock for all 3 parameters in the example like this:

```
m=newmemoryBlock(2100)
m.cstring(1024)=path
m.long(0)=m.address(20)
m.long(4)=m.address(1024)
m.long(8)=1024
```

First 12 bytes for the parameter table, the next 1000 bytes for the result buffer and finally a thousand bytes for the input string.

Before RB 3.1 this function was named "Call", but RB5 requires that the word "Call" is no longer valid for a function name.

Softdeclare is limited to only 6 parameters for plugin version 3.2. Plugin version 3.3 extends this to 8 parameters.
See also:

- 70.2.3 CallFunction(param as string,data as memoryblock) as boolean 12297

70.2.5 CallFunctionDouble(param as string,data as memoryblock) as boolean

MBS Util Plugin, Plugin Version: 7.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a function which returns a double value.
Notes: The param string is a combination of the characters "i" for integer, "l" for 64bit integer, "f" for single (float) and "d" for double.
Use "i" for booleans, shorts and pointers.

the memoryblock must match exactly the parameters you specified.
Returns true on success.
See also:

- 70.2.6 CallFunctionDouble(paramcount as Integer,data as memoryblock) as boolean 12300

70.2.6 CallFunctionDouble(paramcount as Integer,data as memoryblock) as boolean

MBS Util Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a function which returns a double value.
Notes: Fills the ResultDouble property.

If paramcount is 0, the memoryblock is ignored.
The size of the memoryblock must be minimum 4*paramcount.
Each parameter is set using m.long(n*4) where n=0 is the first parameter.
A parameter may be any integer value or an address of a memoryblock. The address can be read using memoryblock.addressMBS which is part of the plugin.
Only 10 parameters can currently be used.
See also:

- 70.2.5 CallFunctionDouble(param as string,data as memoryblock) as boolean 12300

70.2.7 CallFunctionInteger64(param as string,data as memoryblock) as boolean

MBS Util Plugin, Plugin Version: 7.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a function which returns an integer value.
Notes: The param string is a combination of the characters "i" for integer, "l" for 64bit integer, "f" for single (float) and "d" for double.
Use "i" for booleans, shorts and pointers.

the memoryblock must match exactly the parameters you specified.
Returns true on success.
See also:

• 70.2.8 CallFunctionInteger64(paramcount as Integer,data as memoryblock) as boolean 12301

70.2.8 CallFunctionInteger64(paramcount as Integer,data as memoryblock) as boolean

MBS Util Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a function which returns an integer value.
Notes: Fills the ResultInt64 property.

If paramcount is 0, the memoryblock is ignored.
The size of the memoryblock must be minimum 4*paramcount.
Each parameter is set using m.long(n*4) where n=0 is the first parameter.
A parameter may be any integer value or an address of a memoryblock. The address can be read using memoryblock.addressMBS which is part of the plugin.
Only 10 parameters can currently be used.
See also:

• 70.2.7 CallFunctionInteger64(param as string,data as memoryblock) as boolean 12300

70.2.9 CallMethod(param as string,data as memoryblock) as boolean

MBS Util Plugin, Plugin Version: 7.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a function which returns no value.
Notes: The param string is a combination of the characters "i" for integer, "l" for 64bit integer, "f" for single (float) and "d" for double.
Use "i" for booleans, shorts and pointers.

the memoryblock must match exactly the parameters you specified.
Returns true on success.
See also:

• 70.2.10 CallMethod(paramcount as Integer,data as memoryblock) as boolean 12301

70.2.10 CallMethod(paramcount as Integer,data as memoryblock) as boolean

MBS Util Plugin, Plugin Version: 7.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Calls a function which returns no value.
Notes: If paramcount is 0, the memoryblock is ignored.
The size of the memoryblock must be minimum 4*paramcount.
Each parameter is set using m.long(n*4) where n=0 is the first parameter.
A parameter may be any integer value or an address of a memoryblock. The address can be read using

memoryblock.addressMBS which is part of the plugin.
Only 10 parameters can currently be used.
Returns true on success.
See also:

- 70.2.9 CallMethod(param as string,data as memoryblock) as boolean 12301

70.2.11 CopyLibrary(byref target as SoftDeclareMBS)

MBS Util Plugin, Plugin Version: 7.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the library handle to another softdeclare object.
Notes: if target is nil, a new object is created.
The library handle in the target object is set to point to the same library as the original object.

70.2.12 FreeLibrary as boolean

MBS Util Plugin, Plugin Version: 5.4, Platform: Windows, Targets: All.

Function: Releases the library.
Notes: Only for Windows currently this function releases the handles and unloads the library. Windows internally has a reference counter for the library so memory is only released when the last reference is freed. Lasterror is set.

70.2.13 LoadConstant(constname as string) as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a constant from inside the library.
Example:

```
Var c as SoftDeclareMBS
Var s as CFStringMBS
Var m as MemoryBlock
Var handle as Integer

// Test Mac OS X
// Load the constant kABFirstNameProperty from the Addressbook framework

c=new SoftDeclareMBS

if c.LoadFramework("Addressbook.framework") then
MessageBox "Loaded "+c.libname+" to "+format(c.libhandle,"-0")+"."
if c.LoadConstant("kABFirstNameProperty") then
```

```
MessageBox "Loaded constant "+c.ConstantName+" to "+format(c.ConstantPointer,"-0")+"."

m=NewMemoryBlockFromPtrMBS(c.ConstantPointer) // I hope it's not nil!

handle=m.Long(0)
if handle<>0 then
s=new CFStringMBS
s.Handle=handle

MessageBox "Got value: "+s.str
end if
else
MessageBox "Loading of constant "+c.ConstantName+" failed."
end if
else
MessageBox "Loading of Addressbook.framework failed."
end if
```

Notes: Lasterror is set.

70.2.14 LoadDLL(libname as string) as boolean

MBS Util Plugin, Plugin Version: 5.4, Platform: Windows, Targets: All.

Function: Loads a Windows DLL.
Notes: Lasterror is set.
libname can be name (e.g. "KERNEL32"), filename (e.g. "KERNEL32.DLL") or path (e.g. "C:\WINDOWS\KERNEL32.DLL").

70.2.15 LoadDylib(path as string) as boolean

MBS Util Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: Loads a library in Mac OS X dylib format.
Notes: Lasterror and Liberror are set.

70.2.16 LoadFramework(frameworkfilename as string) as boolean

MBS Util Plugin, Plugin Version: 5.4, Platform: macOS, Targets: All.

Function: Loads a framework in Mac OS X.
Example:

```
// A user's question:
// I am trying to call this to Carbon.framework using the softdeclare function:

// UInt32 SwapQDTextFlags(UInt32 newFlags);

// flags are OR'd

// kQDUseDefaultTextRendering = 0
// kQDUseTrueTypeScalerGlyphs = (1 «0)
// kQDUseCGTextRendering = (1 «1)
// kQDUseCGTextMetrics = (1 «2)
// kQDDontChangeFlags = 0xFFFFFFFF

// The call is to make the system use Quartz rendering for QuickDraw text (like the text in my WASTE-Field). How should I call this?

// The solution code:

Var s as SoftDeclareMBS
Var m as MemoryBlock

const flags=-1 // = 0xFFFFFFFF

s=new SoftDeclareMBS
m=NewMemoryBlock(10)
m.Long(0)=flags

if s.LoadFramework("Carbon.Framework") then
if s.LoadFunction("SwapQDTextFlags") then
if s.CallFunction(1,m) then
MessageBox str(s.Result) // returns 7 for me (using Silk)
end if
end if
end if

// Without any error checking!
```

Notes: frameworkfilename is e.g. "Carbon.framework"
Lasterror is set.

70.2.17 LoadFrameworkFile(frameworkpath as folderitem) as boolean

MBS Util Plugin, Plugin Version: 3.2, Platform: macOS, Targets: All.

Function: Loads on Mac OS X a framework from the given file specification.
Example:

```
Var f as FolderItem
Var s as SoftDeclareMBS

f=SpecialFolder.Desktop.Child("spellcheck.bundle")
s=new SoftDeclareMBS

if s.LoadFrameworkFile(f) then
MessageBox "OK"
end if
```

Notes: Returns true if successful.
Lasterror is set.

70.2.18 LoadFunction(funcname as string) as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a function from inside the library.
Example:

```
Var s as SoftDeclareMBS
Var m as MemoryBlock

const flags=-1 // = 0xFFFFFFFF

s=new SoftDeclareMBS
m=NewMemoryBlock(10)
m.Long(0)=flags

if s.LoadLibrary("Carbon.Framework") then
if s.LoadFunction("SwapQDTextFlags") then
if s.CallFunction(1,m) then
MessageBox str(s.Result) // returns 7 for me (using Silk)
end if
end if
end if
```

Notes: A user's question:
I am trying to call this to Carbon.framework using the softdeclare function:

UInt32 SwapQDTextFlags(UInt32 newFlags);

flags are OR'd

kQDUseDefaultTextRendering = 0
kQDUseTrueTypeScalerGlyphs = (1 «0)
kQDUseCGTextRendering = (1 «1)
kQDUseCGTextMetrics = (1 «2)
kQDDontChangeFlags = 0xFFFFFFFF

The call is to make the system use Quartz rendering for QuickDraw text (like the text in my WASTEField). How should I call this?

The solution code is above without any error checking!

Lasterror is set.

70.2.19 LoadLibrary(libname as string) as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a library.
Notes: On Mac OS X e.g. "Carbon.framework" or "System.framework".
On Mac OS Carbon inside Classic e.g. "CarbonLib".
On Windows e.g. "KERNEL32" or "USER32".

Lasterror is set.

70.2.20 ParametersSupported(param as string) as boolean

MBS Util Plugin, Plugin Version: 7.7, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tests whether plugin supports the given parameter string.
Notes: The param string is a combination of the characters "i" for integer, "l" for 64bit integer, "f" for single (float) and "d" for double.
Use "i" for booleans, shorts and pointers.

Any new parameter string can be added. Please send an email to support to get a new combination added.

70.2.21 Properties

70.2.22 CallingMode as Integer

MBS Util Plugin, Plugin Version: 7.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: What calling mode to use.
Notes: 0 = Pascal (default)
1 = C

The Windows API works with Pascal, but calls to QuickTime DLL use C.
(Read and Write property)

70.2.23 ConstantFound as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Was the constant loaded?
Notes: Set by the LoadConstant function.
(Read and Write property)

70.2.24 ConstantName as string

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the constant to load.
Notes: Set by the LoadConstant function.
(Read and Write property)

70.2.25 ConstantPointer as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The pointer of the constant loaded.
Notes: Set by the LoadConstant function.
(Read and Write property)

70.2.26 FunctionFound as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Was the function loaded?
Notes: Set by the LoadFunction function.
(Read only property)

70.2.27 FunctionName as string

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the function to load.
Notes: Set by the LoadFunction function.
(Read and Write property)

70.2.28 FunctionPointer as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The pointer of the function loaded.
Notes: Set by the LoadFunction function.
(Read and Write property)

70.2.29 Lasterror as Integer

MBS Util Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: LoadLibraryFile, LoadLibrary, LoadFunction, LoadConstant and FreeLibrary set this property.
(Read and Write property)

70.2.30 Liberror as string

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: An error message from loadlibrary.
Notes: Set by the LoadLibrary function.
(Read and Write property)

70.2.31 Libfound as boolean

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Was the library loaded?
Notes: Set by the LoadLibrary function.
(Read only property)

70.2.32 Libhandle as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle of the library loaded.
Notes: Set by the LoadLibrary function.
On Mac OS Classic a CFragConnectionID.
On Mac OS X a CFBundleRef.
On Windows a HINSTANCE.
(Read and Write property)

70.2.33 Libname as string

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the library to load.
Notes: Set by the LoadLibrary function.
(Read and Write property)

70.2.34 Result as Integer

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: The result of the call function.
Notes: Set by the Call function.
(Read and Write property)

70.2.35 ResultDouble as Double

MBS Util Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The result of the call function CallFunctionDouble.
Notes: (Read and Write property)

70.2.36 ResultInt64 as MemoryBlock

MBS Util Plugin, Plugin Version: 3.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The result of the call function CallFunctionInteger64.
Example:

```
Var s as SoftDeclareMBS
Var m as MemoryBlock

s=new SoftDeclareMBS
if s.LoadDLL("test64bit.dll") then
if s.LoadFunction("Get64bitNumber") then
if s.CallFunctionInteger64(0,nil) then
MessageBox hex(s.ResultInt64.long(4))+hex(s.ResultInt64.long(0))
end if
end if
end if

' DLL was created with a function like this:
' IMPEXP long long Get64bitNumber()
' {
' return 0x1122334455667788;
' }
```

Notes: (Read and Write property)

Chapter 71

DirectShow

71.1 class DirectShowAMCameraControlMBS

71.1.1 class DirectShowAMCameraControlMBS

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This interface provides local or remote control over a camera.
Example:

```
Var srcFilter as DirectShowBaseFilterMBS // your device
Var a as DirectShowAMCameraControlMBS = srcFilter.AMCameraControl

// query range for zoom
Var ZoomMin as integer
Var ZoomMax as integer
Var ZoomStep as integer
Var ZoomDefault as Integer
Var ZoomFlags as integer
a.GetRange(a.kPropertyZoom, ZoomMin, ZoomMax, ZoomStep, ZoomDefault, ZoomFlags)
Var ErrorCode as integer = a.Lasterror
Var ErrorText as string = a.LasterrorMessage

Break // check in debugger

// set a minimum value
a.Set(a.kPropertyZoom, (ZoomMax-ZoomMin)/2, 0)
ErrorCode = a.Lasterror
ErrorText = a.LasterrorMessage

Break // check in debugger
```

Notes: Applications can use this interface to control camera settings such as zoom, pan, aperture adjustment, or shutter speed. To obtain this interface, query the filter that controls the camera.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 12.4pr9

71.1.2 Methods

71.1.3 Constructor

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.1.4 Get(PropertySelector as Integer, byref Value as Integer, byref Flags as Integer)

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This method retrieves the current setting of a camera property.
Notes: PropertySelector: A long value that specifies the property to retrieve, see kProperty* constants.
Value: receives the value of the property.
Flags: Receives a member of the CameraControlFlags enumeration. The returned value indicates whether the setting is controlled manually or automatically.

Lasterror is set.

71.1.5 GetRange(PropertySelector as Integer, byref MinValue as Integer, byref MaxValue as Integer, byref SteppingDelta as Integer, byref DefaultValue as Integer, byref CapsFlags as Integer)

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This method retrieves the range and default value of a specified camera property.
Example:

```
Var srcFilter as DirectShowBaseFilterMBS // your device
Var a as DirectShowAMCameraControlMBS = srcFilter.AMCameraControl

// query range for zoom
```

```
Var ZoomMin as integer
Var ZoomMax as integer
Var ZoomStep as integer
Var ZoomDefault as Integer
Var ZoomFlags as integer
a.GetRange(a.kPropertyZoom, ZoomMin, ZoomMax, ZoomStep, ZoomDefault, ZoomFlags)
Var ErrorCode as integer = a.Lasterror
Var ErrorText as string = a.LasterrorMessage

Break // check in debugger
```

Notes: PropertySelector: A long value that specifies the property to query, see kProperty* constants.
MinValue: Receives the minimum value of the property.
MaxValue: Receives the maximum value of the property.
SteppingDelta: Receives the step size for the property. The step size is the smallest increment by which the property can change.
DefaultValue: Receives the default value of the property.
CapsFlags: Receives an element of the CameraControlFlags enumeration, indicating whether the property is controlled automatically or manually.

Lasterror is set.

71.1.6 Set(PropertySelector as Integer, Value as Integer, Flags as Integer = 0)

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This method sets a specified property on the camera.
Notes: PropertySelector: A long value that specifies the property to set, see kProperty* constants.
Value: A long value that specifes the new value of the property.
Flags: A long value that specifies the desired control setting. See kFlags* constants.

Lasterror is set.

71.1.7 ShowPropertyDialog(parent as DesktopWindow, x as integer = 0, y as integer = 0, title as string = "")

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Shows properties dialog.
Notes: Parent: the parent window for the dialog.
X/Y: The offset of the dialog relative to the parent window.
Title: optional title for the dialog.

Sets lasterror property.
See also:

- 71.1.8 ShowPropertyDialog(parent as window = nil, x as integer = 0, y as integer = 0, title as string = "") 12314

71.1.8 ShowPropertyDialog(parent as window = nil, x as integer = 0, y as integer = 0, title as string = "")

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop only.

Function: Shows properties dialog.
Notes: Parent: the parent window for the dialog.
X/Y: The offset of the dialog relative to the parent window.
Title: optional title for the dialog.

Sets lasterror property.
See also:

- 71.1.7 ShowPropertyDialog(parent as DesktopWindow, x as integer = 0, y as integer = 0, title as string = "") 12313

71.1.9 Properties

71.1.10 Handle as Integer

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IAMCameraControl interface.
(Read and Write property)

71.1.11 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.1.12 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.1.13 Constants

Flags

Constant	Value	Description
kFlagsAuto	1	The setting is controlled automatically.
kFlagsManual	2	The setting is controlled manually.

Properties

Constant	Value	Description
kPropertyExposure	4	Identifies the exposure setting, in log base 2 seconds. In other words, for values less than zero, the exposure time is 1/2n seconds, and for values zero or above, the exposure time is 2n seconds. For example: Value Seconds -3 1/8 -2 1/4 -1 1/2 0 1 1 2 2 4
kPropertyFocus	6	Specifies the camera's focus setting, as the distance to the optimally focused target, in millimeters. The range and default value are specific to the device.
kPropertyIris	5	Specifies the camera's iris setting, in units of fstop * 10.
kPropertyPan	0	Identifies the camera's pan setting, in degrees. Values range from –180 to +180, with the default set to zero. Positive values are clockwise from the origin (the camera rotates clockwise when viewed from above), and negative values are counterclockwise from the origin.
kPropertyRoll	2	Identifies the camera's roll setting, in degrees. Values range from –180 to +180, with the default set to zero. Positive values cause a clockwise rotation of the camera along the image-viewing axis, and negative values cause a counterclockwise rotation of the camera.
kPropertyTilt	1	Identifies the camera's tilt setting, in degrees. Values range from –180 to +180, with the default set to zero. Positive values point the imaging plane up, and negative values point the imaging plane down.
kPropertyZoom	3	Identifies the camera's zoom setting, in millimeters. Values range from 10 to 600, and the default is specific to the device.

71.2 class DirectShowAMCrossbarMBS

71.2.1 class DirectShowAMCrossbarMBS

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IAMCrossbar interface routes signals from an analog or digital source to a video capture filter.
Notes: This interface is implemented by the Analog Video Crossbar Filter. The Analog Video Crossbar filter is modeled after a general switching matrix, with n inputs and m outputs. For example, a video card might have two external connectors: a coaxial connector for TV, and an S-video input. These would be represented as input pins on the filter. To select one of the inputs, an application would use the IAMCrossbar interface to "route" an input pin to the filter's output pin, by calling the Route method.

71.2.2 Methods

71.2.3 BaseFilter as DirectShowBaseFilterMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the base filter for the crossbar.
Notes: See also:
http://msdn.microsoft.com/en-us/library/windows/desktop/dd390991(v=vs.85).aspx

71.2.4 CanRoute(OutputPinIndex as Integer, InputPinIndex as Integer) as boolean

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CanRoute method queries whether a specified input pin can be routed to a specified output pin.
Notes: OutputPinIndex: Specifies the index of the output pin.
InputPinIndex: Specifies the index of input pin.
Lasterror is set.

Returns true if two pins can be routed.

To route the pins, call the Route method. Output pins and input pins are both indexed from zero. To determine the number of output and input pins, call the getPinCounts method.

71.2.5 Constructor

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.2.6 GetCrossbarPinInfo(IsInputPin as boolean, PinIndex as Integer, byref PinIndexRelated as Integer, byref PhysicalType as Integer)

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The getCrossbarPinInfo method retrieves information about a specified pin.
Notes: IsInputPin: Specifies the direction of the pin. Use one of the following values.

Value	Meaning
True	Input pin
False	Output pin

PinIndex: Specifies the index of the pin.
PinIndexRelated: Variable that receives the index of the related pin, or –1 if no pin is related to this pin. The related pin is a pin on the same filter, with the same direction; it typically represents the same physical jack or connector. For example, a video tuner and an audio tuner might be related pins. Typically, if two pins are related, you should route them together.
PhysicalType: Variable that receives a member of the PhysicalConnectorType enumeration, indicating the pin's physical type.

Lasterror is set.
Output pins and input pins are both indexed from zero. To determine the number of output and input pins, call the getPinCounts method.

71.2.7 GetPinCounts(byref OutputPinCount as Integer, byref InputPinCount as Integer)

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The getPinCounts method retrieves the number of input and output pins on the crossbar filter.
Notes: OutputPinCount: Variable that receives the number of output pins.
InputPinCount: Variable that receives the number of input pins.

Lasterror is set.

The other IAMCrossbar methods take parameters that specify pins by index number. For these methods, output pins and input pins are both indexed from zero. Use the getPinCounts method to determine the upper bounds for each.

71.2.8 IsRoutedTo(InputPinIndex as Integer) as Integer

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IsRoutedTo method retrieves the input pin that is currently routed to the specified output pin.
Notes: OutputPinIndex: Specifies the index of the output pin.
InputPinIndex: Variable that receives the index of the input pin, or -1 if no input pin is routed to this output pin.

Output pins and input pins are both indexed from zero. To determine the number of output and input pins, call the getPinCounts method.
Lasterror is set.

71.2.9 PhysicalPinName(type as Integer) as string

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the name for a given type.
Notes: Just a convenience method to return english names for types.

71.2.10 Route(OutputPinIndex as Integer, InputPinIndex as Integer)

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Route method routes an input pin to an output pin.
Notes: OutputPinIndex: Specifies the index of the output pin.
InputPinIndex: Specifies the index of the input pin.

Lasterror is set.

Routing two pins causes the output pin to deliver data from that input pin. Only one input pin at a time can be routed to a given output pin.
Output pins and input pins are both indexed from zero. To determine the number of output and input pins, call the getPinCounts method.

71.2.11 ShowPropertyDialog(parent as DesktopWindow, x as integer = 0, y as integer = 0, title as string = "")

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Shows property dialog.
Notes: Parent: the parent window for the dialog.
X/Y: The offset of the dialog relative to the parent window.
Title: optional title for the dialog.

Sets lasterror property.
See also:

- 71.2.12 ShowPropertyDialog(parent as window = nil, x as integer = 0, y as integer = 0, title as string = "") 12319

71.2.12 ShowPropertyDialog(parent as window = nil, x as integer = 0, y as integer = 0, title as string = "")

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop only.

Function: Shows property dialog.
Example:

```
Var Capture as DirectShowCaptureGraphBuilderMBS // your capture graph
Var srcfilter as DirectShowBaseFilterMBS // your source filter

Var AMCrossbar As DirectShowAMCrossbarMBS = srcfilter.AMCrossbar
If AMCrossbar <>Nil Then
AMCrossbar.ShowPropertyDialog
MessageBox "Result: "+Str(AMCrossbar.Lasterror)+": "+AMCrossbar.LasterrorMessage
Else
MessageBox "No AMCrossbar."
End If
```

Notes: Parent: the parent window for the dialog.
X/Y: The offset of the dialog relative to the parent window.
Title: optional title for the dialog.

Sets lasterror property.
See also:

- 71.2.11 ShowPropertyDialog(parent as DesktopWindow, x as integer = 0, y as integer = 0, title as string = "") 12319

71.2.13 Properties

71.2.14 Handle as Integer

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IAMCrossbar interface.
(Read and Write property)

71.2.15 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.2.16 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.2.17 Constants

Physical Type Constants

Constant	Value	Description
PhysConn_Audio_1394	4103	Specifies an IEEE 1394 pin for audio.
PhysConn_Audio_AESDigital	4099	Specifies an AES/EBU (Audio Engineering Society/European Broadcas Union) digital pin for audio.
PhysConn_Audio_AudioDecoder	4105	Specifies an audio decoder pin.
PhysConn_Audio_AUX	4102	Specifies an AUX pin for audio.
PhysConn_Audio_Line	4097	Specifies a line pin for audio.
PhysConn_Audio_Mic	4098	Specifies a microphone pin.
PhysConn_Audio_SCSI	4101	Specifies a SCSI pin for audio.
PhysConn_Audio_SPDIFDigital	4100	Specifies an S/PDIF (Sony/Philips Digital Interface Format) digital pin fo audio.
PhysConn_Audio_Tuner	4096	Specifies a tuner pin for audio.
PhysConn_Audio_USB	4104	Specifies a USB pin for audio.
PhysConn_Video_1394	10	Specifies an IEEE 1394 pin for video.
PhysConn_Video_AUX	9	Specifies an AUX (auxiliary) pin for video.
PhysConn_Video_Black	15	Not used.
PhysConn_Video_Composite	2	Specifies a composite pin for video.
PhysConn_Video_ParallelDigital	7	Specifies a parallel digital pin for video.
PhysConn_Video_RGB	4	Specifies an RGB pin for video.
PhysConn_Video_SCART	14	Specifies a SCART (Peritel) pin for video.
PhysConn_Video_SCSI	8	Specifies a SCSI (Small Computer System Interface) pin for video.
PhysConn_Video_SerialDigital	6	Specifies a serial digital pin for video.
PhysConn_Video_SVideo	3	Specifies an S-Video (Y/C video) pin.
PhysConn_Video_Tuner	1	Specifies a tuner pin for video.
PhysConn_Video_USB	11	Specifies a USB (Universal Serial Bus) pin for video.
PhysConn_Video_VideoDecoder	12	Specifies a video decoder pin.
PhysConn_Video_VideoEncoder	13	Specifies a video encoder pin.
PhysConn_Video_YRYBY	5	Specifies a YRYBY (Y, R–Y, B–Y) pin for video.

71.3 class DirectShowAMStreamConfigMBS

71.3.1 class DirectShowAMStreamConfigMBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IAMStreamConfig interface sets the output format on certain capture and compression filters, for both audio and video.
Notes: Applications can use this interface to set format properties, such as the output dimensions and frame rate (for video) or the sample rate and number of channels (for audio).
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

71.3.2 Methods

71.3.3 AudioCaps as DirectShowAudioStreamConfigCapsMBS()

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the audio capabilities.
Notes: Lasterror is set.
Returns empty array for video streams.

71.3.4 Constructor

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.3.5 MediaTypes as DirectShowMediaTypeMBS()

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries media types.
Notes: Lasterror is set.
see also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd319787(v=vs.85).aspx

71.3.6 NumberOfCapabilities as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the number of format capabilities that this pin supports.
Notes: Lasterror is set.

71.3.7 ShowPropertyDialog(parent as DesktopWindow, x as integer = 0, y as integer = 0, title as string = "")

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Shows property dialog.
Notes: Parent: the parent window for the dialog.
X/Y: The offset of the dialog relative to the parent window.
Title: optional title for the dialog.

Sets lasterror property.
See also:

- 71.3.8 ShowPropertyDialog(parent as window = nil, x as integer = 0, y as integer = 0, title as string = "") 12323

71.3.8 ShowPropertyDialog(parent as window = nil, x as integer = 0, y as integer = 0, title as string = "")

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop only.

Function: Shows property dialog.
Example:

```
Var Capture as DirectShowCaptureGraphBuilderMBS // your capture graph
Var srcfilter as DirectShowBaseFilterMBS // your source filter

Var AMStreamConfig2 As DirectShowAMStreamConfigMBS = capture.GetStreamConfig(False, srcfilter)
If AMStreamConfig2 <>Nil Then
AMStreamConfig2.ShowPropertyDialog

MessageBox "Result: "+Str(AMStreamConfig2.Lasterror)+": "+AMStreamConfig2.LasterrorMessage
Else
MessageBox "No AMStreamConfig with srcfilter."
End If
```

Notes: Parent: the parent window for the dialog.
X/Y: The offset of the dialog relative to the parent window.

Title: optional title for the dialog.

Sets lasterror property.
See also:

- 71.3.7 ShowPropertyDialog(parent as DesktopWindow, x as integer = 0, y as integer = 0, title as string = "") 12323

71.3.9 VideoCaps as DirectShowVideoStreamConfigCapsMBS()

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the video capabilities.
Notes: Lasterror is set.
Returns empty array for audio streams.

71.3.10 Properties

71.3.11 Handle as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

71.3.12 Lasterror as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.3.13 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.3.14 Format as DirectShowMediaTypeMBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Get or set the preferred output format.
Notes: Lasterror is set.

http://msdn.microsoft.com/en-us/library/windows/desktop/dd319785(v=vs.85).aspx
http://msdn.microsoft.com/en-us/library/windows/desktop/dd319788(v=vs.85).aspx
(Read and Write computed property)

71.4 class DirectShowAMVideoCompressionMBS

71.4.1 class DirectShowAMVideoCompressionMBS

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IAMVideoCompression interface sets and retrieves video compression properties.
Notes: It is supported by some video compression filters, and also by some video capture filters that output compressed video. Filters that support this interface expose it through their output pins.
An application can use this interface to control how video is compressed, including characteristics such as the key-frame rate or the compression quality.
A filter that supports this interface might not support every method. Use the Capabilities property to determine which methods the filter supports.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 19.1
- MBS Xojo Plugins, version 19.1pr4

Xojo Developer Magazine

- 17.5, page 43: What's New in the MBS Plugins, With the Plugins growing every year, here are new capabilities you may have missed by Stefanie Juchmes

71.4.2 Methods

71.4.3 BaseFilter as DirectShowBaseFilterMBS

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the base filter.
Notes: Lasterror and LastErrorMessage are set.

71.4.4 Constructor

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.4.5 OverrideFrameSize(FrameNumber as Integer, Size as Integer)

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The frame size of a specified frame.
Notes: The first frame that the filter delivers is numbered zero.
If the filter supports this method, the CompressionCaps_CanCrunch flag is in the Capabilities property. However, this flag can also indicate that the filter supports setting the bit rate, so it does not guarantee that the OverrideFrameSize method is supported.

Lasterror and LastErrorMessage are set.

71.4.6 OverrideKeyFrame(FrameNumber as Integer)

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The filter to compress a particular frame as a key frame.
Notes: The first frame that the filter delivers is numbered zero.
If the filter supports this method, you can use it to override the normal key-frame distribution for a particular frame. After the filter creates a key frame, it might reset its count to determine when the next key frame should occur. For example, if the key-frame rate is 10, and an application uses this method to force frame 5 as a key frame, the filter might wait another 10 frames (until frame 15) before it creates the next key frame.

Lasterror and LastErrorMessage are set.

71.4.7 ShowPropertyDialog(parent as DesktopWindow, x as integer = 0, y as integer = 0, title as string = "")

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Shows property dialog.
Notes: Parent: the parent window for the dialog.
X/Y: The offset of the dialog relative to the parent window.
Title: optional title for the dialog.

Sets lasterror property.
See also:

- 71.4.8 ShowPropertyDialog(parent as window = nil, x as integer = 0, y as integer = 0, title as string = "")

71.4.8 ShowPropertyDialog(parent as window = nil, x as integer = 0, y as integer = 0, title as string = "")

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop only.

Function: Shows property dialog.
Example:

```
Var Capture as DirectShowCaptureGraphBuilderMBS // your capture graph
Var encoder as DirectShowBaseFilterMBS // your encoder filter

Var AMVideoCompression As DirectShowAMVideoCompressionMBS = encoder.AMVideoCompression
If AMVideoCompression <>Nil Then
AMVideoCompression.ShowPropertyDialog
MessageBox "Result: "+Str(AMVideoCompression.Lasterror)+": "+AMVideoCompression.LasterrorMes-
sage
Else
MessageBox "No AMVideoCompression."
end if
```

Notes: Parent: the parent window for the dialog.
X/Y: The offset of the dialog relative to the parent window.
Title: optional title for the dialog.

Sets lasterror property.
See also:

- 71.4.7 ShowPropertyDialog(parent as DesktopWindow, x as integer = 0, y as integer = 0, title as string = "") 12327

71.4.9 Properties

71.4.10 Capabilities as Integer

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Receives the compression capabilities, as a bitwise combination of zero or more CompressionCaps flags.
Notes: Lasterror and LastErrorMessage are set.
(Read only property)

71.4.11 DefaultKeyFrameRate as Integer

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Receives the default key-frame rate.
Notes: Lasterror and LastErrorMessage are set.
(Read only property)

71.4.12 DefaultPFramesPerKey as Integer

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Receives the default rate of predicted (P) frames per key frame.
Notes: Lasterror and LastErrorMessage are set.
(Read only property)

71.4.13 DefaultQuality as Double

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Receives the default quality.
Notes: Lasterror and LastErrorMessage are set.
(Read only property)

71.4.14 Description as String

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Receives a description string, such as "My Video Compressor."
Notes: Lasterror and LastErrorMessage are set.
(Read only property)

71.4.15 Handle as Integer

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

71.4.16 KeyFrameRate as Integer

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The key-frame rate.
Notes: If the value is negative, the filter will use the default key-frame rate. If the value is zero, only the first frame will be a key frame.

To determine if the filter supports this method, call the Capabilities property and check for the CompressionCaps_CanKeyFrame flag.

Lasterror and LastErrorMessage are set.
(Read and Write property)

71.4.17 Lasterror as Integer

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.4.18 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.4.19 PFramesPerKeyFrame as Integer

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The rate of predicted (P) frames per key frame.
Notes: If the value is negative, the filter will use the default rate.
To determine if the filter supports this method, check for the CompressionCaps_CanBFrame flag in the Capabilities property.

Lasterror and LastErrorMessage are set.
(Read and Write property)

71.4.20 Quality as Double

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The compression quality.
Notes: Specifies the quality as a value between 0.0 and 1.0, where 1.0 indicates the best quality and 0.0 indicates the worst quality. If the value is negative, the filter will use the default quality.
To determine if the filter supports this method, check for the CompressionCaps_CanQuality flag in the Capabilities property.

Lasterror and LastErrorMessage are set.
(Read and Write property)

71.4.21 Version as String

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Receives a version string, such as "Version 2.1.0."
Notes: Lasterror and LastErrorMessage are set.
(Read only property)

71.4.22 WindowSize as UInt64

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of frames over which the compressor must maintain an average data rate.
Notes: For example, assuming a data rate of 100K/sec and a frame rate of 10 frames per second, if the window size is 1, then every frame will be 10K or less. If the window size is 5, then every five consecutive frames must average 10K per frame, but individual frames may exceed this size.
The window size, expressed as a number of frames.

Lasterror and LastErrorMessage are set.
(Read and Write property)

71.4.23 Constants

Compression Capabilities

Constant	Value	Description
CompressionCapsCanBFrame	&h08	Video compressor supports the PFramesPerKeyFrame properties.
CompressionCapsCanCrunch	&h02	Video compressor can compress video to a specified data rate. If the compressor has this capability then the output pins media type will contain the data rate in the VIDEOINFOHEADER structure's BitRate member. The only way to set the data rate is to set BitRate.
CompressionCapsCanKeyFrame	&h04	Video compressor supports the KeyFrameRate properties.
CompressionCapsCanQuality	&h01	Video compressor supports the Quality property.
CompressionCapsCanWindow	&h10	Video compressor supports the WindowSize properties.

71.5 class DirectShowAMVideoControlMBS

71.5.1 class DirectShowAMVideoControlMBS

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IAMVideoControl interface controls certain video capture operations such as enumerating available frame rates and image orientation.
Notes: For Windows Driver Model (WDM) devices, the WDM Video Capture Filter automatically exposes this interface if the WDM driver supports the PROPSETID_VIDCAP_VIDEOCONTROL property set. For more information, see the Windows Driver Kit (WDK) documentation.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

71.5.2 Methods

71.5.3 Caps(pin as DirectShowPinMBS) as Integer

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetCaps method retrieves the capabilities of the underlying hardware.
Notes: Result is a combination of the flags from the VideoControl Flags, which specify the video control mode.

Possible capabilities include one or more of the following: flipping the picture horizontally, flipping the picture vertically, enabling external triggers, and simulating external triggers.

71.5.4 Constructor

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.5.5 CurrentActualFrameRate(pin as DirectShowPinMBS) as Int64

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetCurrentActualFrameRate method retrieves the actual frame rate, expressed as a frame duration in 100-nanosecond units. USB (Universal Serial Bus) and IEEE 1394 cameras may provide lower frame rates than requested because of bandwidth availability. This is only available during video streaming.
Notes: Pin: the pin to retrieve the frame rate from.

Lasterror is set.

71.5.6 FrameRateList(pin as DirectShowPinMBS, Index as Integer, Width as Integer, Height as Integer) as Int64()

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetFrameRateList method retrieves a list of available frame rates.
Notes: Pin: The pin to query for the list of frame rates.
Index: Index of the format to query for frame rates. This index corresponds to the order in which formats are enumerated by DirectShowVideoStreamConfigCapsMBS structures returned by DirectShowAMStreamConfigMBS.NumberOfCapabilities) minus one.
Width and Height: Frame image size (width and height) in pixels.

Returns an array of frame rates in 100-nanosecond units.

Lasterror is set.

71.5.7 MaxAvailableFrameRate(pin as DirectShowPinMBS, Index as Integer, Width as Integer, Height as Integer) as Int64

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetMaxAvailableFrameRate method retrieves the maximum frame rate currently available, based on bus bandwidth usage for connections, such as USB and IEEE 1394, where the maximum frame rate may be limited by bandwidth availability.
Notes: Pin: The pin to retrieve the maximum frame rate from.
Index: Index of the format to query for maximum frame rate. This index corresponds to the order in which formats are enumerated by GetStreamCaps. The value must range between zero and the number of supported DirectShowVideoStreamConfigCapsMBS returned by DirectShowAMStreamConfigMBS.NumberOfCapabilities) minus one.
Width and Height: Frame image size (width and height) in pixels.
MaxAvailableFrameRate: Pointer to the maximum available frame rate. The frame rate is expressed as frame duration in 100-nanosecond units.

Lasterror is set.

71.5.8 Mode(pin as DirectShowPinMBS) as Integer

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetMode method retrieves the video control mode of operation.
Notes: Possible modes of operation include one or more of the following: flipping the picture horizontally, flipping the picture vertically, enabling external triggers, and simulating external triggers.

Lasterror is set.

71.5.9 SetMode(pin as DirectShowPinMBS, mode as Integer)

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The SetMode method sets the video control mode of operation.
Example:

```
Var pin as DirectShowPinMBS // your till image pin
Var filter as DirectShowBaseFilterMBS

Var vc as DirectShowAMVideoControlMBS = filter.AMVideoControl
vc.SetMode(pin, vc.FlagExternalTriggerEnable + vc.FlagTrigger)
```

Notes: Value specifying a combination of the flags from the VideoControl Flags to set the video control mode.

Possible modes of operation include one or more of the following: flipping the picture horizontally, flipping the picture vertically, enabling external triggers, and simulating external triggers.

Lasterror is set.

71.5.10 Properties

71.5.11 Handle as Integer

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IAMVideoControl interface.
(Read and Write property)

71.5.12 Lasterror as Integer

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.5.13 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.5.14 Constants

Capabilities Flags

Constant	Value	Description
FlagExternalTriggerEnable	2	Sets up a stream to capture a trigger from an external source, for example, a push button on a camera. Buffers can be queued to the driver but will not be passed up from the WDM capture driver (for compression, display, or writing to a file) until the external event happens.
FlagFlipHorizontal	0	Specifies that the picture is flipped horizontally.
FlagFlipVertical	1	Specifies that the picture is flipped vertically.
FlagTrigger	3	In software, simulates an external trigger when the stream has the VideoControlFlag_ExternalTriggerEnable flag set.

71.6 class DirectShowAMVideoProcAmpMBS

71.6.1 class DirectShowAMVideoProcAmpMBS

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The AMVideoProcAmp interface adjusts the qualities of an incoming video signal, such as brightness, contrast, hue, saturation, gamma, and sharpness.
Notes: The WDM Video Capture filter exposes this interface if the hardware supports image adjustment.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 12.4pr9

71.6.2 Methods

71.6.3 Constructor

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.6.4 Get(PropertySelector as Integer, byref Value as Integer, byref Flags as Integer)

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets video quality for a specified property.
Notes: PropertySelector: Specifies the property to retrieve, as a value from the kProperty* constants.
Value: Receives the value of the property.
Flags: Receives the flags. The returned value indicates whether the setting is controlled manually or automatically.
Lasterror is set.

71.6.5 GetRange(PropertySelector as Integer, byref MinValue as Integer, byref MaxValue as Integer, byref SteppingDelta as Integer, byref DefaultValue as Integer, byref CapsFlags as Integer)

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the minimum, maximum, and default values for setting properties.
Notes: PropertySelector: Specifies the property to retrieve, as a value from the kProperty* constants.
MinValue: Receives the minimum value of the property.

MaxValue: Receives the maximum value of the property.
SteppingDelta: Receives the step size for the property. The step size is the smallest increment by which the property can change.
DefaultValue: Receives the default value of the property.
CapsFlags: Receives a member of the VideoProcAmpFlags enumeration, indicating whether the property is controlled automatically or manually.
Lasterror is set.

71.6.6 Set(PropertySelector as Integer, Value as Integer, Flags as Integer = 0)

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets video quality for a specified property.
Notes: PropertySelector: Specifies the property to retrieve, as a value from the kProperty* constants.
Value: The new value of the property.
Flags: The desired control setting. See kFlags* constants.

Lasterror is set.

71.6.7 Properties

71.6.8 Handle as Integer

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IAMVideoProcAmp interface.
(Read and Write property)

71.6.9 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.6.10 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.6.11 Constants

Flags

Constant	Value	Description
kFlagsAuto	1	The setting is controlled automatically.
kFlagsManual	2	The setting is controlled manually.

Properties

Constant	Value	Description
kPropertyBacklightCompensation	8	Specifies the backlight compensation setting. Possible values are 0 (off) and (on).
kPropertyBrightness	0	Specifies the brightness, also called the black level. For NTSC, the value i expressed in IRE units * 100. For non-NTSC sources, the units are arbitrary with zero representing blanking and 10,000 representing pure white. Value range from –10,000 to 10,000.
kPropertyColorEnable	6	Specifies the color enable setting. The possible values are 0 (off) and 1 (on).
kPropertyContrast	1	Specifies the contrast, expressed as gain factor * 100. Values range from zer to 10,000.
kPropertyGain	9	Specifies the gain adjustment. Zero is normal. Positive values are brighter an negative values are darker. The range of values depends on the device.
kPropertyGamma	5	Specifies the gamma, as gamma * 100. Values range from 1 to 500.
kPropertyHue	2	Specifies the hue, in degrees * 100. Values range from -180,000 to 180,000 (-18 to +180 degrees).
kPropertySaturation	3	Specifies the saturation. Values range from 0 to 10,000.
kPropertySharpness	4	Specifies the sharpness. Values range from 0 to 100.
kPropertyWhiteBalance	7	Specifies the white balance, as a color temperature in degrees Kelvin. Th range of values depends on the device.

71.7 class DirectShowAudioStreamConfigCapsMBS

71.7.1 class DirectShowAudioStreamConfigCapsMBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Describes a range of audio formats.
Notes: Audio compression and capture filters use this structure to describe the formats they can produce. This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.4pr7

71.7.2 Methods

71.7.3 Constructor

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.7.4 Properties

71.7.5 BitsPerSampleGranularity as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Granularity of the bits per sample.
Notes: For example, the filter might specify 8 bits per sample through 32 bits per sample, in steps of 8.
(Read only property)

71.7.6 ChannelsGranularity as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Granularity of the channels.
Notes: For example, the filter might specify channels 2 through 4, in steps of 2.
(Read only property)

71.7.7 MaximumBitsPerSample as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Maximum sample frequency.
Notes: (Read only property)

71.7.8 MaximumChannels as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Maximum number of channels.
Notes: (Read only property)

71.7.9 MaximumSampleFrequency as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Maximum sample frequency.
Notes: (Read only property)

71.7.10 MinimumBitsPerSample as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Minimum bits per sample.
Notes: (Read only property)

71.7.11 MinimumChannels as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Minimum number of channels.
Notes: (Read only property)

71.7.12 MinimumSampleFrequency as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Minimum sample frequency.
Notes: (Read only property)

71.7.13 SampleFrequencyGranularity as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Granularity of the frequency.
Notes: For example, the filter might specify 11025 Hz to 44100 Hz, in steps of 11025 Hz.
(Read only property)

71.8 class DirectShowBaseFilterMBS

71.8.1 class DirectShowBaseFilterMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The BaseFilter interface is the primary interface for DirectShow filters.
Notes: All DirectShow filters must expose this interface. The Filter Graph Manager uses this interface to control filters. Applications can use this interface to enumerate pins and query for filter information, but should not use it to change the state of a filter. Instead, use the MediaControl interface on the Filter Graph Manager.
Subclass of the DirectShowMediaFilterMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- News from the MBS Xojo Plugins Version 21.1
- MBS Xojo Plugins, version 19.1pr4

71.8.2 Methods

71.8.3 AMCameraControl as DirectShowAMCameraControlMBS

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries camera control object.
Example:

```
Var srcfilter as DirectShowBaseFilterMBS // your basefilter
Var value, flags as Integer
Var c as DirectShowAMCameraControlMBS = srcfilter.AMCameraControl
if c<>nil then

c.Get(c.kPropertyZoom, value, flags)
if c.Lasterror = 0 then
MessageBox "Zoom: "+str(value)
else
MessageBox "Zoom: "+c.LasterrorMessage
end if

c.Get(c.kPropertyFocus, value, flags)
if c.Lasterror = 0 then
MessageBox "Focus: "+str(value)
else
MessageBox "Focus: "+c.LasterrorMessage
end if
```

```
c.Get(c.kPropertyExposure, value, flags)
if c.Lasterror = 0 then
MessageBox "Exposure: "+str(value)
else
MessageBox "Exposure: "+c.LasterrorMessage
end if

end if
```

Notes: Returns object when this filter represents a device supporting this interface.
Else returns nil on any error.
Also sets lasterror property.

71.8.4 AMCrossbar as DirectShowAMCrossbarMBS

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the IAMCrossbar interface for this filter.
Notes: Returns nil if no such interface exists.

71.8.5 AMVideoCompression as DirectShowAMVideoCompressionMBS

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries video compression settings for the filter.

71.8.6 AMVideoControl as DirectShowAMVideoControlMBS

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the video controls for this filter.
Notes: Should work for capture filters.
Lasterror is set.

71.8.7 AMVideoProcAmp as DirectShowAMVideoProcAmpMBS

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries video properties object.
Example:

```
Var srcfilter as DirectShowBaseFilterMBS // your basefilter
Var value, flags as Integer
Var v as DirectShowAMVideoProcAmpMBS = srcfilter.AMVideoProcAmp
if v<>nil then
v.Get(v.kPropertyHue, value, flags)
if v.Lasterror = 0 then
MessageBox "Hue: "+str(value)
else
MessageBox "Hue: "+v.LasterrorMessage
end if

v.Get(v.kPropertyBrightness, value, flags)
if v.Lasterror = 0 then
MessageBox "Brightness: "+str(value)
else
MessageBox "Brightness: "+v.LasterrorMessage
end if

end if
```

Notes: Returns object when this filter represents a device supporting this interface.
Else returns nil on any error.
Also sets lasterror property.

71.8.8 ConfigAviMux as DirectShowConfigAviMuxMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the config avimux object.
Notes: Lasterror is set.
Works only with filters which support this interface.

71.8.9 ConfigInterleaving as DirectShowConfigInterleavingMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the config interleaving object.
Notes: Lasterror is set.
Works only with filters which support this interface.

71.8.10 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.8.11 EnumPins as DirectShowEnumPinsMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The EnumPins method enumerates the pins on this filter.
Example:

```
Var filter as DirectShowBaseFilterMBS // your device filter

Var pn as DirectShowEnumPinsMBS = srcfilter.EnumPins

// loop over them and show names of pins
Var p as DirectShowPinMBS = pn.NextObject
while p <>nil
Var name as string = p.Name

MessageBox name

p = pn.NextObject
wend
```

Notes: Lasterror is set.

71.8.12 FindPin(name as string) as DirectShowPinMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The FindPin method retrieves the pin with the specified identifier.
Notes: name: string that identifies the pin.

Returns the pin object.
Lasterror is set.

This method supports graph persistence. Use the DirectShowPinMBS.QueryId method to save a pin's state, and use this method to restore the state. The pin's identifier string is defined by the filter implementation. The identifier must be unique within the filter.

71.8.13 Info as DirectShowFilterInfoMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves information about the filter.
Notes: Lasterror is set.
Returns nil on error.

71.8.14 ShowPropertyDialog(parent as DesktopWindow, x as integer = 0, y as integer = 0, title as string = "")

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Shows properties dialog for the filter.
Notes: Parent: the parent window for the dialog.
X/Y: The offset of the dialog relative to the parent window.
Title: optional title for the dialog.

Sets lasterror property.
See also:

- 71.8.15 ShowPropertyDialog(parent as window = nil, x as integer = 0, y as integer = 0, title as string = "") 12347

71.8.15 ShowPropertyDialog(parent as window = nil, x as integer = 0, y as integer = 0, title as string = "")

MBS Win Plugin, Plugin Version: 19.1, Platform: Windows, Targets: Desktop only.

Function: Shows properties dialog for the filter.
Example:

```
Var srcfilter as DirectShowBaseFilterMBS // your filter

srcfilter.ShowPropertyDialog
MessageBox "Result: "+Str(srcfilter.Lasterror)+": "+srcfilter.LasterrorMessage
```

Notes: Parent: the parent window for the dialog.
X/Y: The offset of the dialog relative to the parent window.
Title: optional title for the dialog.

Sets lasterror property.
See also:

- 71.8.14 ShowPropertyDialog(parent as DesktopWindow, x as integer = 0, y as integer = 0, title as string = "") 12347

71.8.16 VendorInfo as string

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a string containing vendor information.
Notes: Lasterror is set.
This method is optional; filters are not required to support it.

71.9 class DirectShowBindContextMBS

71.9.1 class DirectShowBindContextMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides access to a bind context, which is an object that stores information about a particular moniker binding operation.
Blog Entries

- MBS Real Studio Plugins, version 12.1pr2

71.9.2 Methods

71.9.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor to create a new bind context.

71.9.4 Properties

71.9.5 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IConfigAviMux interface.
(Read and Write property)

71.9.6 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.9.7 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.10 class DirectShowCaptureGraphBuilderMBS

71.10.1 class DirectShowCaptureGraphBuilderMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Builds capture graphs and other custom filter graphs.
Notes: see also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd376359(v=vs.85).aspx

- 19.3, page 10: News

71.10.2 Methods

71.10.3 AllocCapFile(FilePath as string, Size as UInt64)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The AllocCapFile method preallocates a capture file to a specified size. For best results, always capture to a defragmented, preallocated capture file that is larger than the size of the capture data.
Notes: FilePath: a string that contains the name of the file to create or resize.
Size: Size of the file to allocate, in bytes.

Lasterror is set.

This method fails if the file is read-only.
It is best to allocate as much space as possible—ideally, more than needed. However, this can result in a very large file that contains relatively little data. For example, a 1-gigabyte (GB) capture file might contain a few megabytes of captured video. Use the CopyCaptureFile method to copy the data into a new file. That method copies only the data and ignores the empty portion of the original file.
If you use this method to preallocate the file, call SetMode on the file-writer filter with the value zero. If the filter is set to AM_FILE_OVERWRITE, it will delete the preallocated file. Note that some file-writer filters do not support mode 0.

71.10.4 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

71.10.5 Crossbar(filter as DirectShowBaseFilterMBS) as DirectShowAMCrossbarMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Finds a crossbar in the graph.
Notes: See also:
http://msdn.microsoft.com/en-us/library/windows/desktop/dd390991(v=vs.85).aspx

This function implements the FindInterface call with LOOK_UPSTREAM_ONLY and the filter you provide.

71.10.6 FindPin(Source as DirectShowBaseFilterMBS, PinDirection as Integer, Category as DirectShowGUIDMBS = nil, Type as DirectShowGUIDMBS = nil, Unconnected as boolean = false, Num as Integer = 0) as DirectShowPinMBS

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The FindPin method retrieves a particular pin on a filter, or determines whether a given pin matches the specified criteria.
Notes: Source: an interface on a filter, or to an interface on a pin.
PinDirection: Specifies the pin direction (input or output). See constants in DirectShowPinMBS class.
Category: A GUID that specifies one of the pin categories listed in Pin Property Set. To match any pin, regardless of category, set this parameter to nil.
Type: A major type GUID that specifies the media type. Use nil to match any media type.
Unconnected: Boolean value that specifies whether the pin must be unconnected. If true, the pin must be unconnected. If false, the pin can be connected or unconnected.
num: Zero-based index of the pin to retrieve, from the set of matching pins. If Source is a filter, and more than one pin matches the search criteria, this parameter specifies which pin to retrieve. If Source is a pin, this parameter is ignored.

Returns the pin object.
Lasterror is set.

If Source is a filter, the method searches for the nth pin on that filter that matches the search criteria, where

n is given by the num parameter. If the method finds a matching pin, it returns the pin.
If Source is a pin, the method tests that pin against the search criteria. If the pin matches the criteria, the method returns the pin. Otherwise, it returns nil.

Typically, an application will not need to use this method. It is provided for unusually complex tasks, when the RenderStream method cannot build the filter graph. Use this method to retrieve a desired pin from a capture filter, and then build the rest of the graph manually.
See also:

- 71.10.7 FindPin(Source as DirectShowPinMBS, PinDirection as Integer, Category as DirectShowGUIDMBS = nil, Type as DirectShowGUIDMBS = nil, Unconnected as boolean = false, Num as Integer = 0) as DirectShowPinMBS 12353

71.10.7 FindPin(Source as DirectShowPinMBS, PinDirection as Integer, Category as DirectShowGUIDMBS = nil, Type as DirectShowGUIDMBS = nil, Unconnected as boolean = false, Num as Integer = 0) as DirectShowPinMBS

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The FindPin method retrieves a particular pin on a filter, or determines whether a given pin matches the specified criteria.
Notes: Source: an interface on a filter, or to an interface on a pin.
PinDirection: Specifies the pin direction (input or output). See constants in DirectShowPinMBS class.
Category: A GUID that specifies one of the pin categories listed in Pin Property Set. To match any pin, regardless of category, set this parameter to nil.
Type: A major type GUID that specifies the media type. Use nil to match any media type.
Unconnected: Boolean value that specifies whether the pin must be unconnected. If true, the pin must be unconnected. If false, the pin can be connected or unconnected.
num: Zero-based index of the pin to retrieve, from the set of matching pins. If Source is a filter, and more than one pin matches the search criteria, this parameter specifies which pin to retrieve. If Source is a pin, this parameter is ignored.

Returns the pin object.
Lasterror is set.

If Source is a filter, the method searches for the nth pin on that filter that matches the search criteria, where n is given by the num parameter. If the method finds a matching pin, it returns the pin.
If Source is a pin, the method tests that pin against the search criteria. If the pin matches the criteria, the method returns the pin. Otherwise, it returns nil.

Typically, an application will not need to use this method. It is provided for unusually complex tasks, when the RenderStream method cannot build the filter graph. Use this method to retrieve a desired pin from a capture filter, and then build the rest of the graph manually.

- 71.10.6 FindPin(Source as DirectShowBaseFilterMBS, PinDirection as Integer, Category as DirectShowGUIDMBS = nil, Type as DirectShowGUIDMBS = nil, Unconnected as boolean = false, Num as Integer = 0) as DirectShowPinMBS 12352

71.10.8 GetFiltergraph as DirectShowGraphBuilderMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the filter graph that the builder is using.
Notes: Sets lasterror.

71.10.9 GetStreamConfig(Category as DirectShowGUIDMBS, filter as DirectShowBaseFilterMBS) as DirectShowAMStreamConfigMBS

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the stream config object for this graph.
Example:

```
Var graph as DirectShowCaptureGraphBuilderMBS // your graph
Var filter as DirectShowBaseFilterMBS // your filter

Var StreamConfig as DirectShowAMStreamConfigMBS
StreamConfig = g.GetStreamConfig(DirectShowPinMBS.PIN_CATEGORY_STILL, filter)
```

Notes: Lasterror is set.
e.g. pass PIN_CATEGORY_CAPTURE or PIN_CATEGORY_PREVIEW for category, as defined in PinMBS class.
See also:

- 71.10.10 GetStreamConfig(preview as boolean, filter as DirectShowBaseFilterMBS) as DirectShowAMStreamConfigMBS 12354

71.10.10 GetStreamConfig(preview as boolean, filter as DirectShowBaseFilterMBS) as DirectShowAMStreamConfigMBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the stream config object for this graph.
Notes: Lasterror is set.

Preview: Pass true to get the preview pin or pass false for the capture pin instead.
See also:

- 71.10.9 GetStreamConfig(Category as DirectShowGUIDMBS, filter as DirectShowBaseFilterMBS) as DirectShowAMStreamConfigMBS 12354

71.10.11 MEDIATYPE_Audio as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the media type GUIDs.
Notes: Audio.

71.10.12 MEDIATYPE_AUXLine21Data as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the media type GUIDs.
Notes: Line 21 data. Used by closed captions.

71.10.13 MEDIATYPE_Interleaved as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the media type GUIDs.
Notes: Interleaved audio and video. Used for Digital Video (DV).

71.10.14 MEDIATYPE_Midi as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the media type GUIDs.
Notes: MIDI format.

71.10.15 MEDIATYPE_ScriptCommand as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the media type GUIDs.
Notes: Data is a script command, used by closed captions.

71.10.16 MEDIATYPE_Stream as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the media type GUIDs.
Notes: Byte stream with no time stamps.

71.10.17 MEDIATYPE_Text as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the media type GUIDs.
Notes: Text.

71.10.18 MEDIATYPE_Timecode as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the media type GUIDs.
Notes: Timecode data. Note: DirectShow does not provide any filters that support this media type.

71.10.19 MEDIATYPE_Video as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the media type GUIDs.
Notes: Video.

71.10.20 RenderStream(category as DirectShowGUIDMBS, Type as DirectShowGUIDMBS, Source as DirectShowBaseFilterMBS, Intermediate as DirectShowBaseFilterMBS = nil, Sink as DirectShowBaseFilterMBS = nil)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The RenderStream method connects an output pin on a source filter to a sink filter, optionally through an intermediate filter.
Notes: Lasterror is set:

Category: A GUID that specifies one of the pin categories listed in Pin Property Set. To match any pin, regardless of category, set this parameter to nil. Typical values include the following. PIN_CATE-

GORY_CAPTURE, PIN_CATEGORY_PREVIEW, PIN_CATEGORY_CC.
Type: A major-type GUID that specifies the media type of the output pin; or nil to use any pin, regardless of media type.
Source: Specifies a pointer to the starting filter for the connection, or to an output pin.
Intermediate: BaseFilter interface of an intermediate filter, such as a compression filter. Can be nil.
Sink: BaseFilter interface of a sink filter, such as a renderer or mux filter. If the value is nil, the method uses a default renderer (see Remarks).

http://msdn.microsoft.com/en-us/library/windows/desktop/dd311924(v=vs.85).aspx
See also:

- 71.10.21 RenderStream(category as DirectShowGUIDMBS, Type as DirectShowGUIDMBS, Source as DirectShowPinMBS, Intermediate as DirectShowBaseFilterMBS = nil, Sink as DirectShowBaseFilterMBS = nil) 12357

71.10.21 RenderStream(category as DirectShowGUIDMBS, Type as DirectShowGUIDMBS, Source as DirectShowPinMBS, Intermediate as DirectShowBaseFilterMBS = nil, Sink as DirectShowBaseFilterMBS = nil)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The RenderStream method connects an output pin on a source filter to a sink filter, optionally through an intermediate filter.
Notes: Lasterror is set:

Category: A GUID that specifies one of the pin categories listed in Pin Property Set. To match any pin, regardless of category, set this parameter to nil. Typical values include the following. PIN_CATEGORY_CAPTURE, PIN_CATEGORY_PREVIEW, PIN_CATEGORY_CC.
Type: A major-type GUID that specifies the media type of the output pin; or nil to use any pin, regardless of media type.
Source: Specifies a pointer to the starting filter for the connection, or to an output pin.
Intermediate: BaseFilter interface of an intermediate filter, such as a compression filter. Can be nil.
Sink: BaseFilter interface of a sink filter, such as a renderer or mux filter. If the value is nil, the method uses a default renderer (see Remarks).

see also:
http://msdn.microsoft.com/en-us/library/windows/desktop/dd311924(v=vs.85).aspx
See also:

- 71.10.20 RenderStream(category as DirectShowGUIDMBS, Type as DirectShowGUIDMBS, Source as DirectShowBaseFilterMBS, Intermediate as DirectShowBaseFilterMBS = nil, Sink as DirectShowBaseFilterMBS = nil) 12356

71.10.22 SetFiltergraph(graph as DirectShowGraphBuilderMBS)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Tells the graph builder object which filter graph to use.
Notes: Lasterror is set.

graph: specifies the filter graph to use for subsequent calls to the AddFilter method.

The graph builder will automatically create a filter graph if you don't call this method. If you call this method after the graph builder has created its own filter graph, the call will fail.

71.10.23 SetOutputFileName(Type as DirectShowGUIDMBS, FilePath as string)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates the rendering section of the filter graph, which will save bits to disk with the specified file name.
Notes: Lasterror is set.

Type: GUID representing the media subtype. Must be MEDIASUBTYPE_Avi.
FilePath: string containing the output file name.
filter: Optional, a filter representing the multiplexer filter.
Sink: Optional, a FileSinkFilter object representing the file writer.

This method inserts the multiplexer and the file writer into the filter graph and calls SetFileName to set the output file name.
See also:

- 71.10.24 SetOutputFileName(Type as DirectShowGUIDMBS, FilePath as string, byref filter as DirectShowBaseFilterMBS, byref sink as DirectShowFileSinkFilterMBS) 12358

71.10.24 SetOutputFileName(Type as DirectShowGUIDMBS, FilePath as string, byref filter as DirectShowBaseFilterMBS, byref sink as DirectShowFileSinkFilterMBS)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates the rendering section of the filter graph, which will save bits to disk with the specified file name.
Notes: Lasterror is set.

Type: GUID representing the media subtype. Must be MEDIASUBTYPE_Avi.
FilePath: string containing the output file name.
filter: Optional, a filter representing the multiplexer filter.
Sink: Optional, a FileSinkFilter object representing the file writer.

This method inserts the multiplexer and the file writer into the filter graph and calls SetFileName to set the output file name.
See also:

- 71.10.23 SetOutputFileName(Type as DirectShowGUIDMBS, FilePath as string) 12358

71.10.25 SetupHighestResolution(videoInputFilter as DirectShowBaseFilterMBS, preview as boolean = false)

MBS Win Plugin, Plugin Version: 18.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Convenience function to query stream config and select the one with highest resolution.
Notes: Queries internally GetStreamConfig, walks over all VideoCaps, picks best and sets it as format.

71.10.26 Properties

71.10.27 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an ICaptureGraphBuilder interface.
(Read and Write property)

71.10.28 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.10.29 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.11 class DirectShowConfigAviMuxMBS

71.11.1 class DirectShowConfigAviMuxMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class configures the AVI Mux filter.
Notes: Applications can use this class to set the master stream and to create an AVI 1.0 index.

DirectShowConfigAviMuxMBS provides backward compatibility with older Video for Windows (VFW) Audio-Video Interleaved (AVI) index formats (idx1) as well as extended AVI 2.0 index formats (indx) to allow for file sizes greater than 1 gigabyte (GB). Set and retrieve the compatibility indexes by using the OutputCompatibilityIndex property.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

71.11.2 Methods

71.11.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.11.4 Properties

71.11.5 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IConfigAviMux interface.
(Read and Write property)

71.11.6 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.

(Read and Write property)

71.11.7 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.11.8 MasterStream as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the master stream that will be used to synchronize the other streams in the file.
Notes: Specifies the index of the stream, or –1 to indicate no master stream. The AVI Mux writes one stream for each connected input pin. Stream numbers are indexed from zero.
Lasterror is set.

If you are capturing audio and video from two different sources, use this method to synchronize the streams. Streams coming from separate capture sources may be captured at slightly different rates. If you specify a master stream, the AVI Mux adjusts the playback rates for the other streams, to compensate for any drift that might occur.
It is recommended to use the audio stream as the master stream, because minor adjustments to the video playback rate are less noticeable than changes to the audio playback rate. Also, modifying the audio playback rate will cause the audio to be resampled by the audio driver.
This method works by adjusting the dwScale and dwRate values in the AVISTREAMHEADER structure.
(Read and Write computed property)

71.11.9 OutputCompatibilityIndex as Boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Get or set the AVI index format.
Notes: Lasterror is set.
True: Create an AVI 1.0 index, as well as an AVI 2.0 index.
False: Create an AVI 2.0 index, but not an AVI 1.0 index.

The AVI Mux filter always creates an AVI 2.0 index ('indx' format). If the value given in fOldIndex is TRUE, the AVI Mux also creates an AVI 1.0 index ('idx1' format), for backward compatibility with Video for Windows.
The AVI 2.0 index format allows for larger files, incremental growth of files, and minimized disk seeks.

(Read and Write computed property)

71.12 class DirectShowConfigInterleavingMBS

71.12.1 class DirectShowConfigInterleavingMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ConfigInterleaving interface controls how the AVI Mux filter interleaves audio and video samples.
Notes: Video-authoring applications that handle capturing should use this interface when they need to control how audio samples and video frames will be saved on a disk.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

71.12.2 Methods

71.12.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.12.4 Properties

71.12.5 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IConfigInterleaving interface.
(Read and Write property)

71.12.6 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.12.7 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.12.8 Mode as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The interleaving quality setting.
Notes: Lasterror is set.
See kInterleaving* constants.
(Read and Write computed property)

71.12.9 Constants

Interleaving Mode Constants

Constant	Value	Description
kInterleaveBuffered	3	Noninterleaved. This mode is equivalent to kInterleaveNone but uses less file space and system overhead.
kInterleaveCapture	1	Approximate interleaving with less overhead than kInterleaveFull. This mode is suitable for video capture. The AVI Mux attempts to use unbuffered, overlapped write operations. Unless the interleaving parameters are configured properly, however, frames may be dropped if one stream blocks while it waits for data from another stream. In particular, audio buffers should be less than .5 second, or else the video stream will block for excessive periods of time.
kInterleaveFull	2	Full, precise interleaving of audio samples and video frames. Streams will block indefinitely, waiting for equal amounts of data before interleaving. This mode is suitable for authoring and playback.
kInterleaveNone	0	Noninterleaved. Frames are written in the order they arrive. Files must be interleaved for playback at a later time. In this mode, the AVI Mux filter attempts to use unbuffered, overlapped write operations, to increase throughput.

71.13 class DirectShowDVInfoMBS

71.13.1 class DirectShowDVInfoMBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Describes the format of a digital video (DV) stream.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo / Real Studio Plugins, version 13.4pr7

71.13.2 Methods

71.13.3 Constructor

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.13.4 Properties

71.13.5 DVAAuxCtl as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the AAUX source control Pack for the first audio block.
Notes: (Read and Write property)

71.13.6 DVAAuxCtl1 as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the AAUX source control pack for the second audio block.
Notes: (Read and Write property)

71.13.7 DVAAuxSrc as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the audio auxiliary (AAUX) source pack for the first audio block.
Notes: (Read and Write property)

71.13.8 DVAAuxSrc1 as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the AAUX source pack for the second audio block.
Notes: (Read and Write property)

71.13.9 DVVAuxCtl as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the VAUX source control pack.
Notes: (Read and Write property)

71.13.10 DVVAuxSrc as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the video auxiliary (VAUX) source pack.
Notes: (Read and Write property)

71.14 class DirectShowEnumMonikerMBS

71.14.1 class DirectShowEnumMonikerMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enumerates the monikers in a table of monikers.
Blog Entries

- MBS Xojo Plugins, version 21.5pr2

71.14.2 Methods

71.14.3 Clone as DirectShowEnumMonikerMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new enumerator that contains the same enumeration state as the current one.
Notes: This method makes it possible to record a particular point in the enumeration sequence and then return to that point at a later time. The caller must release this new enumerator separately from the first enumerator.

Returns nil on any error.
Lasterror is set.

71.14.4 CLSID_AudioCompressorCategory as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow filter categories.
Notes: Audio Compressors

71.14.5 CLSID_AudioInputDeviceCategory as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow filter categories.
Notes: Audio Capture Sources

71.14.6 CLSID_AudioRendererCategory as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow filter categories.
Notes: Audio Renderers

71.14.7 CLSID_DeviceControlCategory as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow filter categories.
Notes: Device Control Filters

71.14.8 CLSID_DVDHWDecodersCategory as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow filter categories.
Notes: WDM Stream Decompression Devices
This category contains hardware DVD decoders.

71.14.9 CLSID_LegacyAmFilterCategory as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow filter categories.
Notes: DirectShow Filters

71.14.10 CLSID_MidiRendererCategory as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow filter categories.
Notes: Midi Renderers

71.14.11 CLSID_TransmitCategory as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow filter categories.
Notes: External Renderers

71.14.12 CLSID_VideoCompressorCategory as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow filter categories.
Notes: Video Compressors

71.14.13 CLSID_VideoInputDeviceCategory as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow filter categories.
Notes: Video Capture Sources

71.14.14 Constructor

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor to find filters.
Notes: Uses IFilterMapper2::EnumMatchingFilters to find installed filters in the registry.
Lasterror is set on failure.
See also:

- 71.14.15 Constructor(clsidDeviceClass as DirectShowGUIDMBS) 12370

71.14.15 Constructor(clsidDeviceClass as DirectShowGUIDMBS)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates an enumerator for a specified device category.
Notes: This method makes it possible to record a particular point in the enumeration sequence and then return to that point at a later time. The caller must release this new enumerator separately from the first enumerator.

Lasterror is set.
See also:

- 71.14.14 Constructor 12370

71.14.16 Destructor

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

71.14.17 NextObject as DirectShowMonikerMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the next item in the enumeration sequence.
Notes: Returns nil on any error.
Lasterror is set.

71.14.18 Reset

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resets the enumeration sequence to the beginning.
Notes: Lasterror is set.
There is no guarantee that the same set of objects will be enumerated after the reset operation has completed. A static collection is reset to the beginning, but it can be too expensive for some collections, such as files in a directory, to guarantee this condition.

71.14.19 Skip(n as Integer)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Skips over the specified number of items in the enumeration sequence.
Notes: Lasterror is set.

71.14.20 Properties

71.14.21 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IEnumMoniker interface.
(Read and Write property)

71.14.22 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.14.23 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.15 class DirectShowEnumPinsMBS

71.15.1 class DirectShowEnumPinsMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enumerates pins on a filter.
Notes: The BaseFilterMBS.EnumPins method returns this interface. It is based on the standard Component Object Model (COM) enumerators.
The filter graph manager uses this interface when it connects filters. Applications can use it to retrieve pins on a filter. For more information, see Enumerating Objects in a Filter Graph.
If the number of pins on the filter changes, some methods on this interface return VFW_E_ENUM_OUT_OF_SYNC. Call the Reset method to resynchronize the enumerator.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

71.15.2 Methods

71.15.3 Clone as DirectShowEnumPinsMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Clone method makes a copy of the enumerator with the same enumeration state.
Notes: Lasterror is set. Returns nil on any error.

If the number of pins changes, the enumerator is no longer consistent with the filter, and the method returns VFW_E_ENUM_OUT_OF_SYNC. Discard any data obtained from previous calls to the enumerator, because it might be invalid. Update the enumerator by calling the IEnumPins::Reset method. You can then call the Clone method safely.

71.15.4 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.15.5 NextObject as DirectShowPinMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Next method retrieves the next pin in the enumeration sequence.
Notes: Lasterror is set. Returns nil on any error.

If the number of pins changes, the enumerator is no longer consistent with the filter, and the method returns VFW_E_ENUM_OUT_OF_SYNC. Discard any data obtained from previous calls to the enumerator, because it might be invalid. Update the enumerator by calling the IEnumPins::Reset method. You can then call the Next method safely.

71.15.6 Reset

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Reset method resets the enumeration sequence to the beginning.
Notes: Lasterror is set.

71.15.7 Skip(n as Integer)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Skip method skips over a specified number of pins.
Notes: n: Number of pins to skip.

Lasterror is set.

If the number of pins changes, the enumerator is no longer consistent with the filter, and the method returns VFW_E_ENUM_OUT_OF_SYNC. Discard any data obtained from previous calls to the enumerator, because it might be invalid. Update the enumerator by calling the IEnumPins::Reset method. You can then call the Skip method safely.

71.15.8 Properties

71.15.9 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IEnumPins interface.
(Read and Write property)

71.15.10 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.15.11 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.16 class DirectShowFileSinkFilterMBS

71.16.1 class DirectShowFileSinkFilterMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The FileSinkFilter interface is implemented on filters that write media streams to a file.
Notes: A file sink filter in a video capture filter graph, for instance, writes the output of the video compression filter to a file. Typically, the application running this filter graph should enable the user to enter the name of the file to be written to. This interface enables the communication of this information.
If a filter needs the name of an output file, it should expose this interface to allow an application to set the file name. Note that there is currently no base class implementation of this interface.
Any application that must set the name of the file into which the file sink filter will write should use this interface to get and set the file name.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

71.16.2 Methods

71.16.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.16.4 MEDIASUBTYPE_Asf as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The media sub type for ASF video files.

71.16.5 MEDIASUBTYPE_Avi as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The media sub type for AVI video files.

71.16.6 Properties

71.16.7 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IFileSinkFilter interface.
(Read and Write property)

71.16.8 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.16.9 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.17 class DirectShowFilterGraphMBS

71.17.1 class DirectShowFilterGraphMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class provides methods for building a filter graph.
Notes: An application can use it to add filters to the graph, connect or disconnect filters, remove filters, and perform other basic operations. However, the DirectShowGraphBuilderMBS interface inherits from this interface and provides additional methods that are more sophisticated. Therefore, applications should use DirectShowGraphBuilderMBS rather than using DirectShowFilterGraphMBS directly.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

71.17.2 Methods

71.17.3 AddFilter(SourceFilter as DirectShowBaseFilterMBS, Name as string = "")

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds a filter to the graph.
Notes: Filter: The filter to add.
Name: name for filter.

Lasterror is set.

The name of the filter can be "", in which case the Filter Graph Manager generates a name. If the name is not "" and is not unique, this method will modify the name in an attempt to generate a new unique name. If this is successful, this method sets lasterror to VFW_S_DUPLICATE_NAME. If it cannot generate a unique name, it sets lasterror to VFW_E_DUPLICATE_NAME.
AddFilter calls the filter's JoinFilterGraph method to inform the filter that it has been added. AddFilter must be called before attempting to use the Connect, ConnectDirect, or Render method to connect or render pins belonging to the added filter.
The Filter Graph Manager holds a reference count on the filter until the filter is removed from the graph or the Filter Graph Manager is released.

71.17.4 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.17.5 SetDefaultSyncSource

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the reference clock to the default clock.
Notes: Lasterror is set.

This method instructs the Filter Graph Manager to choose a reference clock using its default algorithm. For more information about the algorithm that it uses, see Reference Clocks.
Usually you do not need to call this method, because the Filter Graph Manager automatically selects a clock. However, if you call SetSyncSource to override the clock, you can use SetDefaultSyncSource to restore the default clock.
This method fails if the filter graph is running or paused.

71.17.6 Properties

71.17.7 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IFilterGraph interface.
(Read and Write property)

71.17.8 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.17.9 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.18 class DirectShowFilterInfoMBS

71.18.1 class DirectShowFilterInfoMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for information about a filter.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

71.18.2 Methods

71.18.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.18.4 Properties

71.18.5 Graph as DirectShowFilterGraphMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns filter graph.
Notes: If the filter is member of a filter graph, this is a reference to the filter graph's FilterGraph interface. If the filter is not a member of a filter graph, this value of this member is nil.
(Read and Write property)

71.18.6 Name as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the filter.
Notes: (Read and Write property)

71.19 class DirectShowGraphBuilderMBS

71.19.1 class DirectShowGraphBuilderMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class provides methods that enable an application to build a filter graph.
Notes: The GraphBuilder interface inherits from the FilterGraph interface. FilterGraph provides basic operations, such as adding a filter to the graph or connecting two pins. GraphBuilder adds further methods that construct graphs from partial information. For example, the RenderFile method builds a graph for file playback, given the name of the file. The Render method renders data from an output pin by connecting new filters to the pin.

Using these methods, an application does not need to specify every filter and pin connection in the graph. Instead, the Filter Graph Manager selects filters that are registered on the user's system, adds them to the graph, and connects them.

- MBS Real Studio Plugins, version 12.3pr8

71.19.2 Methods

71.19.3 Abort

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Abort method requests the Filter Graph Manager to halt its current task as quickly as possible.
Notes: The current task may or may not fail to complete. Possibly the fastest option for the Filter Graph Manager is to complete the task.

Lasterror is set.

71.19.4 AddSourceFilter(FileName as string, FilterName as string) as DirectShowBaseFilterMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds a source filter for a specified file to the filter graph.

Notes: FileName: the name of the file to load.
FilterName: name for the source filter.

Lasterror is set.

This method searches for an installed filter that can read the specified file. If it finds one, the method adds it to the filter graph and returns a pointer to the filter's IBaseFilter interface. To determine the media type and compression scheme of the file, the Filter Graph Manager reads the first few bytes of the file, looking for specific patterns of bytes, as documented in the article Registering a Custom File Type.

The application is responsible for building the rest of the filter graph. To do so, call EnumPins to enumerate the output pins on the source filter. Then use either the Connect method or the Render method.

If the method succeeds, the BaseFilter interface has an outstanding reference count. The caller must release the interface.

To render a file for default playback, use the RenderFile method.

The Filter Graph Manager holds a reference count on the filter until the filter is removed from the graph or the Filter Graph Manager is released.

71.19.5 Connect(pinOut as DirectShowPinMBS, pinIn as DirectShowPinMBS)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Connects the two pins, using intermediates if necessary.
Notes: pinOut: the output pin.
pinIn: the input pin.

Lasterror is set.

This method connects two pins directly or indirectly, adding intermediate filters if necessary. The method starts by attempting a direct connection. If that fails, it tries to use any filters that are already in the filter graph and have unconnected input pins. (It enumerates these in an arbitrary order.) If that fails, it searches for filters in the registry, and tries them in order of merit.

During the connection process, the Filter Graph Manager ignores pins on intermediate filters if the pin name begins with a tilde (
textasciitilde).

71.19.6 ConnectFilters(pinOut as DirectShowPinMBS, dest as DirectShowBaseFilterMBS)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Convenience function to connect an output pin to a filter.
Notes: Lasterror is set.
See also:

- 71.19.7 ConnectFilters(source as DirectShowBaseFilterMBS, dest as DirectShowBaseFilterMBS) 12383
- 71.19.8 ConnectFilters(source as DirectShowBaseFilterMBS, pinIn as DirectShowPinMBS) 12383

71.19.7 ConnectFilters(source as DirectShowBaseFilterMBS, dest as DirectShowBaseFilterMBS)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Convenience function to connect two filters.
Notes: Lasterror is set.
See also:

- 71.19.6 ConnectFilters(pinOut as DirectShowPinMBS, dest as DirectShowBaseFilterMBS) 12383
- 71.19.8 ConnectFilters(source as DirectShowBaseFilterMBS, pinIn as DirectShowPinMBS) 12383

71.19.8 ConnectFilters(source as DirectShowBaseFilterMBS, pinIn as DirectShowPinMBS)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Convenience function to connect a filter to an input pin.
Notes: Lasterror is set.
See also:

- 71.19.6 ConnectFilters(pinOut as DirectShowPinMBS, dest as DirectShowBaseFilterMBS) 12383
- 71.19.7 ConnectFilters(source as DirectShowBaseFilterMBS, dest as DirectShowBaseFilterMBS) 12383

71.19.9 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

71.19.10 MediaControl as DirectShowMediaControlMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries related media control object.
Notes: Lasterror is set.

71.19.11 MediaEventEx as DirectShowMediaEventExMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries related media event object.
Notes: Lasterror is set.

71.19.12 Render(pinOut as DirectShowPinMBS)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Render method builds a filter graph that renders the data from a specified output pin.
Notes: pinOut: an output pin.
Lasterror is set.

This method renders the data from a specified output pin, adding new filters to the graph as needed. Filters are tried in the same order as for the Connect method. For more information, see Intelligent Connect.
During the connection process, the Filter Graph Manager ignores pins on intermediate filters if the pin name begins with a tilde (
textasciitilde).

71.19.13 RenderFile(FilePath as string)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Builds a filter graph that renders the specified file.
Notes: FilePath: string that contains the name of a media file.

Lasterror is set.

If the FilePath parameter specifies a media file, the method builds a filter graph for default playback. First it adds a source filter that can read the file, using the same process as the AddSourceFilter method. Then it renders the output pins on the source filter, adding intermediate filters if necessary. It tries filters in the same order as the Connect method.
During the connection process, the Filter Graph Manager ignores pins on intermediate filters if the pin name begins with a tilde (
textasciitilde).
Note that the RenderFile method does not remove any filters from the graph. If you call RenderFile twice, the second call simply adds more filters to the graph. When you run the graph, both sources will play at the same time.

71.19.14 SetLogFile(FilePath as string)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The SetLogFile method sets the file for logging actions taken when attempting to perform an operation.
Notes: This method is for use in debugging; it is intended to help you determine the cause of any failure to automatically build a filter graph.
Lasterror is set.

71.19.15 VideoWindow as DirectShowVideoWindowMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the video window related to this graph builder.
Notes: Lasterror is set.

71.20 class DirectShowGUIDMBS

71.20.1 class DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a Windows unique ID.
Notes: If you need to validate a GUID or UUID, please check the IsGUID function in our FAQ.

71.20.2 Methods

71.20.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a GUID with only zeros.
Example:

```
Var g as new DirectShowGUIDMBS

MessageBox g.DisplayString
```

See also:

- 71.20.4 Constructor(Value as String) 12386

71.20.4 Constructor(Value as String)

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates GUID based on a text string.
Notes: Raises exception if text has wrong format.
See also:

- 71.20.3 Constructor 12386
- 71.20.5 Constructor(value1 as Integer, value2 as Integer, value3 as Integer, value4 as Integer, value5 as Integer, value6 as Integer, value7 as Integer, value8 as Integer, value9 as Integer, value10 as Integer, value11 as Integer, value12 as Integer, value13 as Integer, value14 as Integer, value15 as Integer, value16 as Integer) 12387

71.20.5 Constructor(value1 as Integer, value2 as Integer, value3 as Integer, value4 as Integer, value5 as Integer, value6 as Integer, value7 as Integer, value8 as Integer, value9 as Integer, value10 as Integer, value11 as Integer, value12 as Integer, value13 as Integer, value14 as Integer, value15 as Integer, value16 as Integer)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new GUID with the given byte values.
Example:

```
Var g as new DirectShowGUIDMBS(&h14, &h3e, &h4e, &h83, &h64, &h97, &h11, &hd2, &ha2, &h31, &h00, &hc0, &h4f, &ha3, &h18, &h09)

MessageBox g.DisplayString
```

71.20.6 Equal(other as DirectShowGUIDMBS) as boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Checks whether two GUIDs are equal.
Notes: Returns true if both items are equals.

71.20.7 Operator_Convert as String

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Converts GUID to text.
Notes: Same as DisplayName.
See also:

- 71.20.8 Operator_Convert(text as String) 12388

71.20.8 Operator_Convert(text as String)

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Converts text to GUID.
Notes: Same as Constructor.
Raises exception if text has wrong format.
See also:

- 71.20.7 Operator_Convert as String 12387

71.20.9 Parse(GUID as String) as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 18.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Parses GUID string into a GUID object.

71.20.10 Properties

71.20.11 Data as string

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The UID as binary string.
Notes: (Read and Write property)

71.20.12 DisplayString as string

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ID well formatted.
Notes: (Read only property)

71.20.13 Memory as MemoryBlock

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Get or set GUID with memory block.
Notes: (Read and Write property)

71.20.14 Ptr as Ptr

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Pointer to raw GUID data.
Notes: (Read only property)

71.20.15 Byte(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Read or write the byte value.
Example:

```
Var g as new DirectShowGUIDMBS

g.Byte(1) = 65

MessageBox str(g.Byte(1)) // shows 65
```

Notes: (Read and Write computed property)

71.21 class DirectShowMediaControlMBS

71.21.1 class DirectShowMediaControlMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides methods for controlling the flow of data through the filter graph.
Notes: It includes methods for running, pausing, and stopping the graph. The Filter Graph Manager implements this interface.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

71.21.2 Methods

71.21.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.21.4 GetState(msTimeout as Integer = -1) as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the state of the filter graph—paused, running, or stopped.
Notes: msTimeout: Duration of the time-out, in milliseconds, or INFINITE (-1) to specify an infinite time-out.

State transitions are not necessarily synchronous. Therefore, when you call this method, the filter graph might be in transition to a new state. In that case, the method blocks until the transition completes or until the specified time-out elapses.

Lasterror is set.

Applications can use this method to determine whether playback has started after a call to Run. Generally, applications should have their own mechanism for tracking which state they have put the filter graph into. Applications typically use the current state to determine which user interface controls are enabled or disabled. For example, once the graph goes into the running state, the application might disable a "Play" button and enable "Stop" and "Pause" buttons.
If the filter graph is in a transition to a new state, the returned state is the new state, not the previous state.
This method returns an error if there is a call on another thread to change the state while this method is blocked.
Avoid specifying a time-out of INFINITE, because threads cannot process messages while waiting in Get-

State. If you call GetState from the thread that processes Windows messages, specify small wait times on the call in order to remain responsive to user input. This is especially important when the source is streaming over a network or from the Internet because state transitions in these environments can take significantly more time to complete.

71.21.5 Pause

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Pauses all the filters in the filter graph.
Notes: Lasterror is set.

Pausing the filter graph cues the graph for immediate rendering when the graph is next run. While the graph is paused, filters process data but do not render it. Data is pushed through the graph and processed by transform filters as far as buffering permits, but renderer filters do not render the data. However, video renderers display a static poster frame of the first sample.

If the method returns S_FALSE, call the GetState method to wait for the state transition to complete, or to check if the transition has completed. When you call Pause to display the first frame of a video file, always follow it immediately with a call to GetState to ensure that the state transition has completed. Failure to do this can result in the video rectangle being painted black.
If the method fails, it stops the graph before returning.

71.21.6 RenderFile(FilePath as string)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Builds a filter graph that renders the specified file.
Notes: Lasterror is set.

filePath: Specifies the name of the file to load.

71.21.7 Run

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Runs all the filters in the filter graph.
Notes: While the graph is running, data moves through the graph and is rendered.
Lasterror is set.

If the filter graph is stopped, this method pauses the graph before running. If the graph is already running, the method returns S_OK but has no effect.
The graph runs until the application calls the Pause or Stop method. When playback reaches the end of the stream, the graph continues to run, but the filters do not stream any more data. At that point, the application can pause or stop the graph. For information about the end-of-stream event, see Pause and EC_COMPLETE.
This method does not seek to the beginning of the stream. Therefore, if you run the graph, pause it, and then run it again, playback resumes from the paused position. If you run the graph after it has reached the end of the stream, nothing is rendered. To seek the graph, use the MediaSeeking interface.
If method returns S_FALSE, it means that the method returned before all of the filters switched to a running state. The filters will complete the transition after the method returns. Optionally, you can wait for the transition to complete by calling the GetState method with a timeout value. However, this is not required.
If the Run method returns an error code, it means that one or more filters failed to run. However, some filters might be in a running state. In a multistream graph, entire streams might be playing successfully. Typically the application would tear down the graph and report an error in this case.

71.21.8 Stop

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stops all the filters in the graph.
Notes: Lasterror is set.

If the graph is running, this method pauses the graph before stopping it. While paused, video renderers can copy the current frame to display as a poster frame.

This method does not seek to the beginning of the stream. If you call this method and then call the Run method, playback resumes from the stopped position. To seek, use the IMediaSeeking interface.

The Filter Graph Manager pauses all the filters in the graph, and then calls the Stop method on all filters, without waiting for the pause operations to complete. Therefore, some filters might have their Stop method called before they complete their pause operation. If you develop a custom rendering filter, you might need to handle this case by pausing the filter if it receives a stop command while in a running state. However, most filters do not need to take any special action in this regard.

71.21.9 StopWhenReady

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Pauses the filter graph, allowing filters to queue data, and then stops the filter graph.
Notes: Lasterror is set.

This method is useful if you want to seek the filter graph while the graph is stopped. As long as the filter graph is stopped, changes in the current position do not repaint the video window with a new frame. Therefore, calling SetPositions does not update the video window. To update the window after the seek operation, call StopWhenReady. This method transitions the graph to a paused state, waits for the pause operation to complete, and then transitions the graph back to stopped. The pause operation queues data in the graph, so that the video renderer receives and displays the new frame.

This method is asynchronous. It waits on a separate thread for the pause to complete. The calling thread does not block, which enables the application to respond to user input. When the method returns, the logical state of the graph is stopped, even before the pause operation completes. If you call the GetState method at this point, it returns State_Stopped.

If the application issues another state-change command (such as pause, run, or seek) before the pause operation completes, the new command cancels the pending stop command. The pause operation completes, but the graph does not stop.

71.21.10 Properties

71.21.11 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IMediaControl interface.
(Read and Write property)

71.21.12 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.21.13 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.21.14 Constants

State Constants

Constant	Value	Description
kStatePaused	1	Paused
kStateRunning	2	Running
kStateStopped	0	Stopped.

71.22 class DirectShowMediaEventExMBS

71.22.1 class DirectShowMediaEventExMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for extended options for media event handling.
Notes: The DirectShowMediaEventExMBS interface inherits the DirectShowMediaEventMBS interface, which contains methods for retrieving event notifications and for overriding the filter graph's default handling of events. MediaEventEx adds methods that enable an application window to receive messages when events occur.
Subclass of the DirectShowMediaEventMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

71.22.2 Methods

71.22.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.22.4 Properties

71.22.5 NotifyFlags as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enables or disables event notifications.
Notes: Value indicating whether to enable or disable event notifications. Must be one of the following values: 0 = Enable event notifications or AM_MEDIAEVENT_NONOTIFY = Disable event notifications.

Lasterror is set.

By default, the Filter Graph Manager posts event notifications for the application. If the NotifyFlags parameter is AM_MEDIAEVENT_NONOTIFY, the Filter Graph Manager clears any pending event notifications from the queue, and does not post any new ones.
If event notifications are disabled, the handle returned by the GetEventHandle method is signaled at the end of each stream—that is, whenever the Filter Graph Manager receives an EC_COMPLETE event.
(Read and Write computed property)

71.22.6 Constants

Constants

Constant	Value	Description
AM_MEDIAEVENT_NONOTIFY	1	One of the notify flags constant. Pass this value to NotifyFlags to disable event notification.

71.23 class DirectShowMediaEventMBS

71.23.1 class DirectShowMediaEventMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for media event handling.
Notes: The MediaEvent interface contains methods for retrieving event notifications and for overriding the Filter Graph Manager's default handling of events. The MediaEventEx interface inherits this interface and extends it.

The Filter Graph Manager implements this interface. Applications can use it to respond to events that occur in the filter graph, such as the end of a stream or a rendering error. Filters post events to the filter graph using the IMediaEventSink interface.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

71.23.2 Methods

71.23.3 CancelDefaultHandling(eventCode as Integer)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Cancels the Filter Graph Manager's default handling for a specified event.
Notes: The event notification is passed to the application.
Lasterror is set.

To restore the default handling for an event, call the RestoreDefaultHandling method with the event code.

71.23.4 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.23.5 FreeEventParams(eventCode as Integer, Param1 as Integer, Param2 as Integer)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Frees resources associated with the parameters of an event.
Notes: EventCode: Event code.

Param1: First event parameter.
Param2: Second event parameter.

Lasterror is set.
After you call the GetEvent method to retrieve an event notification, you must call FreeEventParams. This method frees any resources that were allocated for the event parameters. Pass in the same variables used for the GetEvent call.

71.23.6 RestoreDefaultHandling(eventCode as Integer)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Restores the Filter Graph Manager's default handling for a specified event.
Notes: Lasterror is set.
By default, the Filter Graph Manager handles some events (such as EC_REPAINT) without passing them to the application. If you call the CancelDefaultHandling method to override the default handling for an event, you can restore the default behavior by calling RestoreDefaultHandling with the same event code.

71.23.7 Properties

71.23.8 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IMediaEvent interface.
(Read and Write property)

71.23.9 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.23.10 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.23.11 Constants

Constants

Constant	Value	Description
AM_MEDIAEVENT_NONOTIFY	1	One of the notify flags constant. Pass this value to NotifyFlags to disable event notification.

71.24 class DirectShowMediaFilterMBS

71.24.1 class DirectShowMediaFilterMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The MediaFilter interface controls the streaming state of a filter.
Notes: All DirectShow filters implement this interface. It provides methods for switching the filter between states (stopped, paused, and running); for retrieving the filter's current state; and for setting a reference clock. Applications should not call MediaFilter methods on filters.

The Filter Graph Manager also exposes this interface. Applications can use the SetSyncSource method to set the graph reference clock, and GetSyncSource to retrieve the clock. Applications should not call the other methods on this interface. Instead, use the corresponding methods on the MediaControl interface.
The BaseFilter interface inherits from MediaFilter.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

71.24.2 Methods

71.24.3 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.24.4 Pause

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Pause method pauses the filter.
Notes: Lasterror is set.

When a filter is paused, it can receive, process, and deliver samples. However, a renderer filter will only accept one sample while paused. Therefore, when the filter graph is paused, samples move through the graph until the first sample reaches the renderer. At that point, streaming is paused until the Run method is called. Video renderers display the first sample as a still frame.

Live capture filters do not deliver any samples while paused, only while running.

The state transition might be asynchronous. If the method returns before the transition completes, the lasterror value is 1. A renderer filter does not complete the transition to paused until either (1) it receives one sample, or (2) it receives an end-of-stream notification. While the state transition is pending, State gives

lasterror VFW_S_STATE_INTERMEDIATE.

71.24.5 Run(StartTime as Int64)

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Run method runs the filter.
Notes: StartTime: Reference time corresponding to stream time 0.
Lasterror is set.

When a filter is running, it can receive, process, and deliver samples. Source filters generate new samples, and renderer filters render them.
The state transition might be asynchronous. If the method returns before the transition completes, the lasterror value is 1.
Stream time is calculated as the current reference time minus StartTime. To calculate when a media sample should be rendered, the renderer compares the time stamp with the current stream time. Thus, a media sample with a time stamp of zero should be rendered at time StartTime. For more information, see Time and Clocks in DirectShow.
When an application calls the Run method, the Filter Graph Manager calls Run on each filter. It sets the value of StartTime slightly in the future, to account for graph latency.

71.24.6 Stop

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Stop method stops the filter.
Notes: Lasterror is set.
When a filter is stopped, it does not process or deliver any samples, and it rejects samples from upstream filters.
The state transition might be asynchronous. If the method returns before the transition completes, the lasterror value is 1.
This method always sets the filter's state to kStateStopped, even if the method returns an error code.

71.24.7 Properties

71.24.8 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IMediaFilter interface.

(Read and Write property)

71.24.9 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.24.10 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.24.11 Constants

Filter State Constants

Constant	Value	Description
kStatePaused	1	Paused. The filter is processing data, but not rendering it.
kStateRunning	2	Running. The filter is processing and rendering data.
kStateStopped	0	Stopped. The filter is not processing data.

71.25 class DirectShowMediaTypeMBS

71.25.1 class DirectShowMediaTypeMBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Describes the format of a media sample.
Notes: see also
http://msdn.microsoft.com/en-us/library/windows/desktop/dd373477(v=vs.85).aspx
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.4pr7

71.25.2 Methods

71.25.3 Constructor

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.25.4 SetHeight(value as integer) as boolean

MBS Win Plugin, Plugin Version: 18.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets height of video info header.
Notes: Convenience function which works with VideoInfoHeader and VideoInfoHeader2 to set the value.

71.25.5 SetWidth(value as integer) as boolean

MBS Win Plugin, Plugin Version: 18.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets width of video info header.
Notes: Convenience function which works with VideoInfoHeader and VideoInfoHeader2 to set the value.

71.25.6 Properties

71.25.7 DVINFO as DirectShowDVInfoMBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries format data as DVInfo.
Notes: Returns nil if format is not a DVInfo.
(Read only property)

71.25.8 FixedSizeSamples as Boolean

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: If true, samples are of a fixed size.
Notes: This field is informational only. For audio, it is generally set to true. For video, it is usually true for uncompressed video and false for compressed video.
(Read and Write property)

71.25.9 FormatType as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: GUID that specifies the structure used for the format block.
Notes: (Read and Write property)

71.25.10 Handle as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

71.25.11 Height as Integer

MBS Win Plugin, Plugin Version: 18.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries height of video info header.
Notes: Convenience function which works with VideoInfoHeader and VideoInfoHeader2 to query the value.
(Read only property)

71.25.12 MajorType as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Globally unique identifier (GUID) that specifies the major type of the media sample. F
Notes: or a list of possible major types, see Media Types.
http://msdn.microsoft.com/en-us/library/windows/desktop/dd390670(v=vs.85).aspx
(Read and Write property)

71.25.13 SampleSize as Integer

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Size of the sample in bytes. For compressed data, the value can be zero.
Notes: (Read and Write property)

71.25.14 SubType as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: GUID that specifies the subtype of the media sample.
Notes: For a list of possible subtypes, see Media Types. For some formats, the value might be MEDIA-SUBTYPE_None, which means the format does not require a subtype.
http://msdn.microsoft.com/en-us/library/windows/desktop/dd390670(v=vs.85).aspx
(Read and Write property)

71.25.15 TemporalCompression as Boolean

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: If true, samples are compressed using temporal (interframe) compression.
Notes: A value of true indicates that not all frames are key frames. This field is informational only.
(Read and Write property)

71.25.16 VideoInfoHeader as DirectShowVideoInfoHeaderMBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries format data as VideoInfoHeader.
Notes: Returns nil if format is not a VideoInfoHeader.
(Read only property)

71.25.17 VideoInfoHeader2 as DirectShowVideoInfoHeader2MBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries format data as VideoInfoHeader2.
Notes: Returns nil if format is not a VideoInfoHeader2.
(Read only property)

71.25.18 WaveFormat as DirectShowWaveFormatMBS

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries format data as WaveFormat.
Notes: Returns nil if format is not a WaveFormat.
(Read only property)

71.25.19 Width as Integer

MBS Win Plugin, Plugin Version: 18.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries width of video info header.
Notes: Convenience function which works with VideoInfoHeader and VideoInfoHeader2 to query the value.
(Read only property)

71.26 class DirectShowMonikerMBS

71.26.1 class DirectShowMonikerMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The moniker class to query information about devices.
Notes: In this plugin we use monikers to enumerate filters and devices in order to connect with BindBaseFilter method.

Enables you to use a moniker object, which contains information that uniquely identifies a COM object. An object that has a pointer to the moniker object's IMoniker interface can locate, activate, and get access to the identified object without having any other specific information on where the object is actually located in a distributed system.
Monikers are used as the basis for linking in COM. A linked object contains a moniker that identifies its source. When the user activates the linked object to edit it, the moniker is bound; this loads the link source into memory.

http://msdn.microsoft.com/en-us/library/windows/desktop/ms679705(v=vs.85).aspx
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 12.1pr2

71.26.2 Methods

71.26.3 BindBaseFilter as DirectShowBaseFilterMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Binds moniker to a base filter.
Notes: Lasterror is set.

This implements the primary function of a moniker, which is to locate the object identified by the moniker and return a pointer to one of its interfaces.

see also
http://msdn.microsoft.com/en-us/library/windows/desktop/ms691433(v=vs.85).aspx

71.26.4 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.26.5 DisplayName(BindContext as DirectShowBindContextMBS = nil) as string

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the display name for the moniker.
Notes: BindContext: The DirectShowBindContextMBS interface on the bind context to be used in this operation. The bind context caches objects bound during the binding process, contains parameters that apply to all operations using the bind context, and provides the means by which the moniker implementation should retrieve information about its environment. If you provide nil, the plugin creates a temporary context.

GetDisplayName provides a string that is a displayable representation of the moniker. A display name is not a complete representation of a moniker's internal state; it is simply a form that can be read by users. As a result, it is possible (though rare) for two different monikers to have the same display name.

This is not a text to show to user.

71.26.6 EnumMonikers(forward as boolean) as DirectShowEnumMonikerMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves enumerator for the components of a composite moniker.
Notes: Lasterror is set.

71.26.7 Hash as UInt32

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a hash value using the internal state of the moniker.
Notes: Lasterror is set.

71.26.8 IsEqual(other as DirectShowMonikerMBS) as Boolean

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Determines whether this moniker is identical to the specified moniker.
Notes: Returns true if both are identical.
Lasterror is set.

71.26.9 Properties(BindContext as DirectShowBindContextMBS = nil) as DirectShowPropertyBagMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates property bag with properties of the moniker.
Notes: Lasterror is set.

71.26.10 Properties

71.26.11 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IMoniker interface.
(Read and Write property)

71.26.12 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.26.13 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.27 class DirectShowNullRendererMBS

71.27.1 class DirectShowNullRendererMBS

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The null renderer filter.
Notes: The Null Renderer filter is a renderer that discards every sample it receives, without displaying or rendering the sample data.

Use this filter when an output pin in the graph requires a downstream connection, but you do not wish to render the data from that pin. By connecting the output pin to the Null Renderer, you complete the connection without rendering the data.
Subclass of the DirectShowBaseFilterMBS class.

- MBS Real Studio Plugins, version 12.3pr8

71.27.2 Methods

71.27.3 Constructor

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new Null filter.
Notes: On success the handle property is not zero.

71.28 class DirectShowPinMBS

71.28.1 class DirectShowPinMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This interface is exposed by all input and output pins.
Notes: The filter graph manager uses this interface to connect pins and perform flushing operations. Applications can use this interface to query the pin for information.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

71.28.2 Methods

71.28.3 Accept(Type as DirectShowMediaTypeMBS) as Boolean

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Accept method determines whether the pin accepts a specified media type.
Notes: Lasterror is set.

A return value of true indicates that the pin will accept the media type, either on the next sample, or after a pin reconnection. The implementation should take into account the current state of the filter, including connections on other pins, and any properties that can be set on the filter.

Any other return value, including false, means that the pin rejects the media type. Therefore, test for true explicitly.

If the filter is running, a return value of true is ambiguous. The pin might accept a format change on the next media sample, without reconnecting; or it might need to reconnect. If the pin supports the IPinConnection interface, call the IPinConnection::DynamicQueryAccept method, which specifically tests whether the pin can accept the new type without reconnecting.

71.28.4 BaseFilter as DirectShowBaseFilterMBS

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries base filter.
Notes: Lasterror is set.

71.28.5 ConnectedTo as DirectShowPinMBS

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ConnectedTo method retrieves a pointer to the connected pin, if any.
Notes: Lasterror is set.

71.28.6 ConnectionMediaType as DirectShowMediaTypeMBS

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ConnectionMediaType method retrieves the media type for the current pin connection, if any.
Notes: Lasterror is set.
Returns nil if not connected.

71.28.7 Constructor

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

71.28.8 Direction as Integer

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The QueryDirection method gets the direction of the pin (input or output).
Notes: Lasterror is set.

71.28.9 Disconnect

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Disconnect method breaks the current pin connection.
Notes: The Filter Graph Manager calls this method when it disconnects two filters. Applications and filters should not call this method. Instead, call the DirectShowFilterGraphMBS.Disconnect method on the Filter Graph Manager.
Sets lasterror.

This method fails if the filter is paused or running. If the pin supports the PinConnection interface, call PinConnection DynamicDisconnect to disconnect the pin when the filter is paused or running.
This method does not disconnect the other pin in the pin connection.

71.28.10 Id as String

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Id method retrieves an identifier for the pin.
Notes: Returns a string containing the pin identifier.
Lasterror is set.

71.28.11 MediaTypes as DirectShowMediaTypeMBS()

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enumerates the pin's preferred media types.
Notes: Lasterror is set.

71.28.12 Name as String

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries name of the pin.
Notes: Lasterror is set.

71.28.13 PIN_CATEGORY_ANALOGVIDEOIN as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow pin categories.
Notes: Input pin of the capture filter that takes analog and digitizes it.

71.28.14 PIN_CATEGORY_CAPTURE as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow pin categories.
Notes: Capture pin.

71.28.15 PIN_CATEGORY_CC as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow pin categories.
Notes: Pin providing closed captioning data from Line 21.

71.28.16 PIN_CATEGORY_EDS as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow pin categories.
Notes: Pin providing Extended Data Services (Line 21, even fields).

71.28.17 PIN_CATEGORY_NABTS as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow pin categories.
Notes: Pin providing North American Videotext Standard data.

71.28.18 PIN_CATEGORY_PREVIEW as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow pin categories.
Notes: Preview pin.

71.28.19 PIN_CATEGORY_STILL as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow pin categories.
Notes: Pin that provides a still image. The filter's capture pin must be connected before the still-image pin is connected.

71.28.20 PIN_CATEGORY_TELETEXT as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow pin categories.
Notes: Pin providing teletext (a closed captioning variant).

71.28.21 PIN_CATEGORY_TIMECODE as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow pin categories.
Notes: Pin providing timecode data.

71.28.22 PIN_CATEGORY_VBI as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow pin categories.
Notes: Pin to be connected to the VBI Surface Allocator, the VBI surface allocator filter that is needed to allocate the correct video memory for things like closed captioning overlays in scenarios where a video port is being used. PCI, IEEE 1394, and USB scenarios do not use this filter.

71.28.23 PIN_CATEGORY_VIDEOPORT as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow pin categories.
Notes: Video output pin to be connected to input pin zero on the Overlay Mixer.

71.28.24 PIN_CATEGORY_VIDEOPORT_VBI as DirectShowGUIDMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the DirectShow pin categories.
Notes: Pin providing vertical blanking interval data.

71.28.25 Properties

71.28.26 Handle as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: Points to an IPin interface.
(Read and Write property)

71.28.27 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: Please check function documentation and also LastErrorMessage property for a human readable error message.
(Read and Write property)

71.28.28 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The formatted error message for the last error.
Notes: (Read and Write property)

71.28.29 Constants

Pin Direction

Constant	Value	Description
kPinDirectionInput	0	Input
kPinDirectionOutput	1	Output

71.29 class DirectShowPropertyBagMBS

71.29.1 class DirectShowPropertyBagMBS

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.
