This function is used to allow access to origins that would otherwise violate the same-origin policy. Scripts hosted underneath the fully qualified SourceOrigin URL (like http://www.example.com) will be allowed access to all resources hosted on the specified TargetProtocol and TargetDomain.
If TargetDomain is non-empty and AllowTargetSubdomains if false only exact domain matches will be allowed. If TargetDomain contains a top-level domain component (like "example.com") and AllowTargetSubdomains is true (1) sub-domain matches will be allowed. If TargetDomain is empty and AllowTargetSubdomains if true (1) all domains and IP addresses will be allowed.

This function cannot be used to bypass the restrictions on local or display isolated schemes. See the comments on CefRegisterCustomScheme for more information.

This function may be called on any thread. Returns true on success or false if SourceOrigin is invalid or the whitelist cannot be accessed.

96.1.4 CanGoBack as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns true if the browser can navigate backwards.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MessageBox str(m.CanGoBack)
```

96.1.5 CanGoForward as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns true if the browser can navigate forwards.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MessageBox str(m.CanGoForward)
```

96.1.6 ClearCrossOriginWhitelist as Boolean

MBS Win Plugin, Plugin Version: 21.3, Platform: Windows, Targets: Desktop only.

Function: Remove all entries from the cross-origin access whitelist.
Example:

```
Var r as Boolean = ChromiumBrowserMBS.ClearCrossOriginWhitelist
```

Notes: Returns true on success or false if the whitelist cannot be accessed.

96.1.7 ClearFocus

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: Clears focus.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.ClearFocus
```

96.1.8 ClearHistory

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Clear the back/forward browsing history.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.ClearHistory
```

Notes: Only supported for Chromium 2.x, but not 3.x.

96.1.9 CloseDevTools

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Explicitly close the developer tools window if one exists for this browser instance.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.CloseDevTools
```

96.1.10 Constructor

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

96.1.11 Destructor

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: The destructor.

96.1.12 ExecuteJavaScript(jsCode as string, scriptUrl as string = """, startLine as Integer = 0)

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop only.

Function: Execute a string of JavaScript code in this frame.
Example:

```
// This example needs a window with HTMLViewer1.
// go back to last page via javascript
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b.ExecuteJavaScript "window.history.back();"
```

Notes: The scriptUrl parameter is the URL where the script in question can be found, if any. The renderer may request this URL to show the developer the source of the error. The startLine parameter is the base line number to use for error reporting.

96.1.13 Find(identifier as Integer, searchText as string, forward as boolean, MatchCase as boolean, FindNext as boolean)

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Search for searchText.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.Find 1, "Hello", true, false, false

// later
m.Find 1, "Hello", true, false, true
```

Notes: Identifier can be used to have multiple searches running simultaniously. forward indicates whether to search forward or backward within the page. matchCase indicates whether the search should be case-sensitive. findNext indicates whether this is the first request or a follow-up.

96.1.14 Frame(ID as Int64) as ChromiumFrameMBS

MBS Win Plugin, Plugin Version: 17.2, Platform: Windows, Targets: Desktop only.

Function: Returns the frame with the specified identifier, or nil if not found.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
```

```
if b<>Nil then
Var idn() as Int64= b.FrameIdentifiers
Var ids() as string
for each n as Int64 in idn
Var f as ChromiumFrameMBS = b.Frame(n)

ids.Add str(n)+" "+f.Name
next
MessageBox "FrameIdentifiers: "+EndOfLine+EndOfLine+Join(ids, EndOfLine)
end if
```

See also:

- 96.1.15 Frame(name as string) as ChromiumFrameMBS 15312

96.1.15 Frame(name as string) as ChromiumFrameMBS

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns the frame with the specified name, or nil if not found.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var f as ChromiumFrameMBS = b.Frame("TopFrame")
Var s as string = f.Name
MessageBox s
```

See also:

- 96.1.14 Frame(ID as Int64) as ChromiumFrameMBS 15311

96.1.16 FrameIdentifiers as Int64()

MBS Win Plugin, Plugin Version: 17.2, Platform: Windows, Targets: Desktop only.

Function: Queries list of frame identifiers.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
if b<>Nil then
Var idn() as Int64= b.FrameIdentifiers
Var ids() as string
for each n as Int64 in idn
Var f as ChromiumFrameMBS = b.Frame(n)
```

```
ids.Add str(n)+" "+f.Name
next
MessageBox "FrameIdentifiers: "+EndOfLine+EndOfLine+Join(ids, EndOfLine)
end if
```

96.1.17 FrameNames as String()

MBS Win Plugin, Plugin Version: 17.2, Platform: Windows, Targets: Desktop only.

Function: Queries list of frame names.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
if b<>Nil then
Var Names() as string = b.FrameNames
MessageBox "FrameNames: "+EndOfLine+EndOfLine+Join(Names, EndOfLine)
end if
```

Notes: Often frames are unnamed, so named is generic.

96.1.18 GoBack

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Navigate backwards.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.GoBack
```

96.1.19 GoForward

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Navigate forwards.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.GoForward
```

96.1.20 HidePopup

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Hide the currently visible popup, if any.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.HidePopup
```

Notes: Only supported for Chromium 2.x, but not 3.x.

96.1.21 Image(width as Integer, height as Integer) as Picture

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Get the raw image data contained in the specified element without performing validation.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var p as picture = m.Image(600, 800)
Window1.backdrop = p
```

Notes: The specified width and height dimensions must match the current element size.

Only supported for Chromium 2.x, but not 3.x.

96.1.22 invalidate(x as Integer, y as Integer, width as Integer, height as Integer)

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Invalidate the rectangle region of the view.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.invalidate 0, 0, 600, 800
```

Notes: This function is only used when window rendering is disabled and will result in a call to Handle-

Paint().

96.1.23 IsLoading as boolean

MBS Win Plugin, Plugin Version: 17.1, Platform: Windows, Targets: Desktop only.

Function: Checks loading state.
Notes: Returns true while page is loading.
Only available for Xojo 2017 and newer.

96.1.24 LibVersion as Integer

MBS Win Plugin, Plugin Version: 14.3, Platform: Windows, Targets: Desktop only.

Function: Returns revision number of the Chromium library.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MessageBox str(b.LibVersion)
```

Notes: up to Xojo 2014r1 this is 607.
Xojo 2014r2 uses 1562.

96.1.25 RegisterExtension(ExtensionName as String, javascriptCode as String) as Boolean

MBS Win Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Register a new V8 extension with the specified JavaScript extension code.
Notes: Returns true on success.

96.1.26 Release

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop only.

Function: Releases the browser object.
Notes: You don't need this normally.
This method can be used for working around Feedback case 33565.

96.1.27 Reload

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Reload the current page.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.Reload
```

96.1.28 ReloadIgnoreCache

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Reload the current page ignoring any cached data.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.ReloadIgnoreCache
```

96.1.29 RemoveCrossOriginWhitelist(SourceOrigin as String, TargetProtocol as String, TargetDomain as String, AllowTargetSubdomains as Boolean) as Boolean

MBS Win Plugin, Plugin Version: 21.3, Platform: Windows, Targets: Desktop only.

Function: Remove an entry from the cross-origin access whitelist.
Example:

```
Var r as Boolean = ChromiumBrowserMBS.AddCrossOriginWhitelist("http://side1.mydomain.com", "http",
"side2.mydomain.com", false)
```

Notes: Returns true on success or false if SourceOrigin is invalid or the whitelist cannot be accessed.

96.1.30 Retain

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop only.

Function: Retains the browser object.
Notes: You don't need this normally.

96.1.31 SetFocus(enableFocus as boolean = true)

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Set focus for the browser window.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.SetFocus
```

Notes: If enable is true focus will be set to the window. Otherwise, focus will be removed.

96.1.32 setSize(width as Integer, height as Integer)

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Set the size of the specified element.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.setSize 600, 800
```

Notes: Only supported for Chromium 2.x, but not 3.x.

96.1.33 ShowDevTools

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Open developer tools in its own window.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.ShowDevTools
```

96.1.34 StopFinding(clearSelection as boolean)

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Cancel all searches that are currently going on.

96.1.35 StopLoad

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Stop loading the page.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
m.StopLoad
```

96.1.36 Properties

96.1.37 FocusedFrame as ChromiumFrameMBS

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns the focused frame for the browser window.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var f as ChromiumFrameMBS = b.FocusedFrame
Var s as string = f.URL
MessageBox s
```

Notes: (Read only property)

96.1.38 FrameCount as Integer

MBS Win Plugin, Plugin Version: 17.1, Platform: Windows, Targets: Desktop only.

Function: Queries frame count.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
if b<>Nil then
MessageBox "FrameCount: "+str(b.FrameCount)
end if
```

Notes: Only available in Xojo 2017 and newer.
(Read only property)

96.1.39 Handle as Integer

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

96.1.40 HasDocument as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns true if a document has been loaded in the browser.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MessageBox str(m.HasDocument)
```

Notes: (Read only property)

96.1.41 Height as Integer

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Queries height of the browser.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MessageBox str(m.Width) + " x " + str(m.Height)
```

Notes: Only supported for Chromium 2.x, but not 3.x.
(Read only property)

96.1.42 Identifier as Integer

MBS Win Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Unique identifier.
Notes: (Read only property)

96.1.43 IsPopup as boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns true if the window is a popup window.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MessageBox str(m.IsPopup)
```

Notes: (Read only property)

96.1.44 MainFrame as ChromiumFrameMBS

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns the main (top-level) frame for the browser window.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var f as ChromiumFrameMBS = b.MainFrame
Var s as string = f.URL
MessageBox s
```

Notes: (Read only property)

96.1.45 Parent as Variant

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: The owner htmlviewer.
Notes: Can reference a Window or DesktopWindow object.
(Read only property)

96.1.46 PopupVisible as Boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns true if a popup is currently visible.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MessageBox str(m.PopupVisible)
```

Notes: Only supported for Chromium 2.x, but not 3.x.
(Read only property)

96.1.47 Width as Integer

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Queries width of the browser.
Example:

```
// This example needs a window with HTMLViewer1.
Var m as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
MessageBox str(m.Width) + " x " + str(m.Height)
```

Notes: Only supported for Chromium 2.x, but not 3.x.
(Read only property)

96.1.48 WindowRenderingDisabled as Boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns true if window rendering is disabled.
Notes: Only supported for Chromium 2.x, but not 3.x.
(Read only property)

96.1.49 ZoomLevel as Double

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Get/Set the zoom level.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b.ZoomLevel = 2
```

Notes: Change the zoom level to the specified value.
(Read and Write property)

96.2 class ChromiumCookieManagerMBS

96.2.1 class ChromiumCookieManagerMBS

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The class to manage cookies for Chromium on Windows.
Example:

```
// list and delete cookies of the Chromium based HTMLViewer on Windows
Var manager As New ChromiumCookieManagerMBS
Var lines() As String
For Each c As ChromiumCookieMBS In manager.URLCookies("https://www.example.com/")
lines.Add c.Name + " = " + c.Value + " (" + c.Domain + ")"
Next
MessageBox String.FromArray(lines, EndOfLine)

// log out of the site by deleting its cookies
Call manager.DeleteURLCookies("https://www.example.com/")
```

Notes: May need to have a HTMLViewer first being initialized by Xojo before the Chromium DLLs can work properly.

Supports Xojo 2019r3 with MBS Plugin 20.1.

96.2.2 Methods

96.2.3 AllCookies as ChromiumCookieMBS()

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: Visit all cookies.
Example:

```
Var m as new ChromiumCookieManagerMBS
Var cookies() as ChromiumCookieMBS = m.AllCookies
MessageBox str(cookies.Count)+" cookies"
```

Notes: The returned cookies are ordered by longest path, then by earliest creation date. Returns false (0) if cookies cannot be accessed.

96.2.4 Constructor

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The constructor.
Notes: Can raise exception if no cookie manager is available, e.g. when calling on Linux or Mac OS X or Windows if you don't have the dlls.
May not work if the Chromium was not initialized before by Xojo.
See also:

- 96.2.5 Constructor(path as string, PersistSessionCookies as Boolean) 15324

96.2.5 Constructor(path as string, PersistSessionCookies as Boolean)

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop only.

Function: The constructor for a new cookie manager.
Notes: Can raise exception if no cookie manager is available, e.g. when calling on Linux or Mac OS X or Windows if you don't have the dlls.
May not work if the Chromium was not initialized before by Xojo.
See also:

- 96.2.4 Constructor 15324

96.2.6 DeleteAllCookies as Integer

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: Deletes all cookies.
Notes: Returns number of deleted cookies.

96.2.7 DeleteCookie(URL as string, CookieName as string) as boolean

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: Delete all cookies that match the specified parameters.
Notes: If both url and values cookieName are specified all host and domain cookies matching both will be deleted. If only | url | is specified all host cookies (but not domain cookies) irrespective of path will be deleted. If url is empty all cookies for all hosts and domains will be deleted. Returns false if a non-empty invalid URL is specified or if cookies cannot be accessed.
Returns true on success.

96.2.8 DeleteCookies(URLs() as string, CookieNames() as string) as Integer

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: Deletes several cookies.
Notes: Same as DeleteCookie, but with arrays for parameters.
Returns number of successful delete attempts.

96.2.9 DeleteURLCookies(URL as String, HTTPOnly as boolean = false) as Integer

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: Deletes all cookies for a given URL.
Notes: The cookies to delete are filtered by the given url scheme, host, domain and path. If includeHttpOnly is true HTTP-only cookies will also be included in the deletion.
Returns number of cookies deleted.

96.2.10 Destructor

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The destructor.

96.2.11 SetCookie(URL as string, cookie as ChromiumCookieMBS) as boolean

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: Sets a cookie given a valid URL and explicit user-provided cookie attributes.
Example:

```
Var d as new date
Var c as new ChromiumCookieMBS

c.Domain = "www.mbsplugins.de"
c.Path = "/"
c.CreationDate = d
c.LastAccessDate = d
c.ExpirationDate = nil
c.Value = "test "+d.SQLDateTime
c.Name = "test"
c.Secure = false
c.HTTPonly = false

if CookieManager.SetCookie(c.URL, c) then
MessageBox "OK"
else
MessageBox "Failed to add cookie"
end if
```

Notes: This function expects each attribute to be well-formed. It will check for disallowed characters (e.g. the ';' character is disallowed within the cookie value attribute) and will return false without setting the cookie if such characters are found.

96.2.12 SetCookies(URL() as string, cookies() as ChromiumCookieMBS) as Integer

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: Sets a lot of cookies.
Notes: Same as SetCookie, but with arrays of URLs and cookie objects.
Returns number of cookies created successfully.

96.2.13 SetStoragePath(Path as string) as boolean

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: Sets the directory path that will be used for storing cookie data.
Example:

```
Var CookieManager as ChromiumCookieManagerMBS // property of window/app

Var f as FolderItem = SpecialFolder.Desktop.Child("cookies")
f.CreateAsFolder
```

```
CookieManager = new ChromiumCookieManagerMBS

if CookieManager.SetStoragePath(f.NativePath) then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: If path is empty data will be stored in memory only.
Returns false if cookies cannot be accessed.

96.2.14 URLCookies(URL as String, HTTPOnly as boolean = false) as ChromiumCookieMBS()

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: Queries a subset of cookies.
Notes: The results are filtered by the given url scheme, host, domain and path. If includeHttpOnly is true HTTP-only cookies will also be included in the results. The returned cookies are ordered by longest path, then by earliest creation date. Returns empty array if cookies cannot be accessed.
Returns nil on any error like low memory.

96.2.15 Properties

96.2.16 Handle as Integer

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The internal object refernce.
Notes: (Read only property)

96.3 class ChromiumCookieMBS

96.3.1 class ChromiumCookieMBS

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The class for a cookie with WebKit on Windows.
Example:

```
// set a cookie for the Chromium based HTMLViewer on Windows before loading a page
Var cookie As New ChromiumCookieMBS
cookie.Name = "language"
cookie.Value = "de"
cookie.Domain = "www.example.com"
cookie.Path = "/"
cookie.Secure = True

Var manager As New ChromiumCookieManagerMBS
If manager.SetCookie("https://www.example.com/", cookie) Then
// now load the page in the HTMLViewer
End If
```

Notes: Supports Xojo 2019r3 with MBS Plugin 20.1.

96.3.2 Methods

96.3.3 Constructor

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The constructor.

96.3.4 Destructor

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The destructor.

96.3.5 Properties

96.3.6 CreationDate as Date

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The cookie creation date.
Notes: This is automatically populated by the system on cookie creation.
(Read and Write property)

96.3.7 Domain as String

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The domain for this cookie.
Notes: If domain is empty a host cookie will be created instead of a domain cookie. Domain cookies are stored with a leading "." and are visible to sub-domains whereas host cookies are not.
(Read and Write property)

96.3.8 ExpirationDate as Date

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The cookie expiration date.
Notes: Can be nil to have no expiration date.
(Read and Write property)

96.3.9 HTTPonly as Boolean

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The HTTP only state.
Notes: If httponly is true the cookie will only be sent for HTTP requests.
(Read and Write property)

96.3.10 LastAccessDate as Date

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The cookie last access date.
Notes: This is automatically populated by the system on access.
(Read and Write property)

96.3.11 Name as String

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The cookie name.
Notes: (Read and Write property)

96.3.12 Path as String

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The path.
Notes: If path is non-empty only URLs at or below the path will get the cookie value.
(Read and Write property)

96.3.13 Scheme as String

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The scheme.
Notes: Depends on secure setting only.
Can be "http://" or "https://".
(Read only property)

96.3.14 Secure as Boolean

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: Whether this is a HTTPS only cookie.
Notes: If secure is true the cookie will only be sent for HTTPS requests.
(Read and Write property)

96.3.15 URL as String

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The URL of the cookie.
Notes: Build from Secure, Path and Domain.
(Read only property)

96.3.16 Value as String

MBS Win Plugin, Plugin Version: 15.2, Platform: Windows, Targets: Desktop only.

Function: The cookie value.
Notes: (Read and Write property)

96.4 class ChromiumFrameMBS

96.4.1 class ChromiumFrameMBS

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: The class for a webframe with WebKit on Windows.
Notes: Supports Xojo 2019r3 with MBS Plugin 20.1.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo / Real Studio Plugins, version 14.2pr7

96.4.2 Methods

96.4.3 Constructor

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

96.4.4 copy

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Execute copy in this frame.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b.MainFrame.copy
```

96.4.5 cut

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Execute cut in this frame.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b.MainFrame.cut
```

96.4.6 delete

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Execute delete in this frame.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b.MainFrame.delete
```

96.4.7 Destructor

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: The destructor.

96.4.8 ExecuteJavaScript(jsCode as string, scriptUrl as string = "", startLine as Integer = 0)

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Execute a string of JavaScript code in this frame.
Example:

```
// This example needs a window with HTMLViewer1.
// go back to last page via javascript
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var m as ChromiumFrameMBS = b.mainFrame
m.ExecuteJavaScript "window.history.back();"
```

Notes: The scriptUrl parameter is the URL where the script in question can be found, if any. The renderer may request this URL to show the developer the source of the error. The startLine parameter is the base

line number to use for error reporting.

You can use JavaScriptEngineMBS class to execute JavaScript without HTMLViewer in our own cross platform JavaScript engine.

96.4.9 LoadString(StringValue as string, URL as string)

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Load the contents of StringValue with the optional dummy target URL.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var m as ChromiumFrameMBS = b.mainFrame
m.LoadString "<p>Hello</p>", "blank:about"
```

Notes: Since this was deprecated in Chromium and removed in newer function, it won't work for Xojo 2021r3 or newer. Please use data URL there or load html file URL.

96.4.10 LoadURL(URL as string)

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Load the specified url.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var m as ChromiumFrameMBS = b.mainFrame
m.LoadURL "http://www.macrumors.com"
```

96.4.11 paste

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Execute paste in this frame.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
```

b.MainFrame.paste

96.4.12 print

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** Execute printing in the this frame. The user will be prompted with the print dialog appropriate to the operating system.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b.MainFrame.print
```

Notes: Only supported for Chromium 2.x, but not 3.x.

96.4.13 redo

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Execute redo in this frame.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b.MainFrame.redo
```

96.4.14 SelectAll

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Execute select all in this frame.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var m as ChromiumFrameMBS = b.mainFrame
m.SelectAll
```

96.4.15 undo

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Execute undo in this frame.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
b.MainFrame.undo
```

96.4.16 ViewSource

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Save this frame's HTML source to a temporary file and open it in the default text viewing application.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var m as ChromiumFrameMBS = b.mainFrame
m.ViewSource
```

96.4.17 Properties

96.4.18 Browser as ChromiumBrowserMBS

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns the browser that this frame belongs to.
Notes: (Read only property)

96.4.19 Handle as Integer

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

96.4.20 identifier as Int64

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns the globally unique identifier for this frame.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var m as ChromiumFrameMBS = b.mainFrame
MessageBox str(m.identifier)
```

Notes: (Read only property)

96.4.21 IsFocused as Boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns true if this is the focused frame.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var m as ChromiumFrameMBS = b.mainFrame
MessageBox str(m.IsFocused)
```

Notes: (Read only property)

96.4.22 IsMain as Boolean

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns true if this is the main (top-level) frame.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var m as ChromiumFrameMBS = b.mainFrame
MessageBox str(m.IsMain)
```

Notes: (Read only property)

96.4.23 Name as String

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns the name for this frame.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var m as ChromiumFrameMBS = b.mainFrame
MessageBox m.Name
```

Notes: If the frame has an assigned name (for example, set via the iframe "name" attribute) then that value will be returned. Otherwise a unique name will be constructed based on the frame parent hierarchy. The main (top-level) frame will always have an empty name value.
(Read only property)

96.4.24 Parent as Variant

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: The owner htmlviewer.
Notes: Can reference a Window or DesktopWindow object.
(Read only property)

96.4.25 ParentFrame as ChromiumFrameMBS

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns the parent of this frame or nil if this is the main (top-level) frame.
Notes: (Read only property)

96.4.26 Source as String

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns this frame's HTML source as a string.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var f as ChromiumFrameMBS = b.MainFrame
Var s as string = f.Source
Break // view in debugger
```

Notes: (Read only property)

96.4.27 Text as String

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns this frame's display text as a string.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var f as ChromiumFrameMBS = b.MainFrame
Var s as string = f.Text
Break // view in debugger
```

Notes: (Read only property)

96.4.28 URL as String

MBS Win Plugin, Plugin Version: 14.2, Platform: Windows, Targets: Desktop only.

Function: Returns the URL currently loaded in this frame.
Example:

```
// This example needs a window with HTMLViewer1.
Var b as ChromiumBrowserMBS = HTMLViewer1.ChromiumBrowserMBS
Var f as ChromiumFrameMBS = b.MainFrame
Var s as string = f.URL
MessageBox s
```

Notes: (Read only property)

96.5 class ChromiumWebPluginInfoMBS

96.5.1 class ChromiumWebPluginInfoMBS

MBS Win Plugin, Plugin Version: 16.0, Platform: Windows, Targets: Desktop only.

Function: The class for details on installed plugins.
Notes: Supports Xojo 2019r3 with MBS Plugin 20.1.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Upgrading WebKit for Windows support
- MBS Xojo Plugins, version 20.1pr4
- MBS Xojo / Real Studio Plugins, version 16.0pr6

96.5.2 Methods

96.5.3 Constructor

MBS Win Plugin, Plugin Version: 16.0, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

96.5.4 Destructor

MBS Win Plugin, Plugin Version: 16.0, Platform: Windows, Targets: Desktop only.

Function: The destructor.

96.5.5 Plugins as ChromiumWebPluginInfoMBS()

MBS Win Plugin, Plugin Version: 16.0, Platform: Windows, Targets: Desktop only.

Function: Queries list of plugins.
Notes: Those are the plugins Chromium found on the Windows PC.
e.g. 5 different versions of QuickTime Plugin.

96.5.6 Properties

96.5.7 Description as String

MBS Win Plugin, Plugin Version: 16.0, Platform: Windows, Targets: Desktop only.

Function: A description of the plugin from the version information.
Notes: (Read only property)

96.5.8 Name as String

MBS Win Plugin, Plugin Version: 16.0, Platform: Windows, Targets: Desktop only.

Function: The plugin name (i.e. Flash).
Notes: (Read only property)

96.5.9 Path as String

MBS Win Plugin, Plugin Version: 16.0, Platform: Windows, Targets: Desktop only.

Function: The plugin file path (DLL/bundle/library).
Notes: (Read only property)

96.5.10 Version as String

MBS Win Plugin, Plugin Version: 16.0, Platform: Windows, Targets: Desktop only.

Function: The version of the plugin (may be OS-specific).
Notes: (Read only property)

96.6 class IEDocumentMBS

96.6.1 class IEDocumentMBS

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: The class for the web document.
Notes: For HTMLViewer based on Internet Explorer on Windows.
All the methods and properties may raise IEExceptionMBS exceptions in case of failure.

Based on IHTMLDocument2 interface:
https://docs.microsoft.com/en-us/previous-versions/windows/internet-explorer/ie-developer/platform-apis/aa752574(v=vs.8

- Upgrading our HTMLViewer functions for Internet Explorer

Xojo Developer Magazine

- 19.2, page 10: News
- 18.3, page 53: Happy Birthday MonkeyBread Software, What is new in the MBS Xojo Plugins by Stefanie Juchmes

96.6.2 Methods

96.6.3 CallFunction(FunctionName as string, paramArray params as variant) as variant

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Calls a JavaScript function.
Example:

```
Var doc as IEDocumentMBS = HTMLViewer1.IEDocumentMBS

Var v as variant = doc.CallFunctiom("test", 2, 3)
```

Notes: Returns result as variant.
You can pass as many parameters as needed.

Our plugin converts Xojo data types to JavaScript data types like boolean, number, text or NULL. This could be extended in future to convert arrays, too.

FunctionName should be the name of a global function defined in JavaScript.
See also:

- 96.6.4 CallFunction(FunctionName as string, params() as variant) as variant 15343

96.6.4 CallFunction(FunctionName as string, params() as variant) as variant

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Calls a JavaScript function.
Example:

```
Var doc as IEDocumentMBS = HTMLViewer1.IEDocumentMBS

Var Params() as Variant
Params.Add 2
Params.Add 3

Var v as variant = doc.CallFunctiom("test", Params)
```

Notes: Returns result as variant.
You can pass parameters for the function as array.

Our plugin converts Xojo data types to JavaScript data types like boolean, number, text or NULL. This could be extended in future to convert arrays, too.

FunctionName should be the name of a global function defined in JavaScript.
See also:

- 96.6.3 CallFunction(FunctionName as string, paramArray params as variant) as variant 15342

96.6.5 ClearBrowserSession as boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Ends browser session.
Notes: For HTMLViewer using Internet Explorer engine. If you close one by closing the window with HTMLViewer control, this method should end session and a new window would start fresh again.

Flushes entries not in use from the password cache on the hard disk drive. Also resets the cache time used when the synchronization mode is once-per-session.
This should clear current session cookies.

96.6.6 Constructor(DesktopHTMLViewer as DesktopHTMLViewer)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Creates new web document object for this HTMLViewer.
Notes: For browser based on Internet Explorer on Windows.
Raises exception on failure.
See also:

- 96.6.7 Constructor(HTMLViewer as HTMLViewer) 15344

96.6.7 Constructor(HTMLViewer as HTMLViewer)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Creates new web document object for this HTMLViewer.
Notes: For browser based on Internet Explorer on Windows.
Raises exception on failure.
See also:

- 96.6.6 Constructor(DesktopHTMLViewer as DesktopHTMLViewer) 15344

96.6.8 ContinueFindText(text as string, count as integer, flags as integer, selectText as boolean) as boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Continues a search started with IEFindTextMBS.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
```

```
// find first
Var found as boolean = d.FindText("Xojo", 0, 0, true)

MessageBox "Found Xojo: "+str(found)

if found then
// find next
found = d.ContinueFindText("Xojo", 0, 0, true)
end if
```

Notes: Parameters are the same as for IEFindTextMBS.

96.6.9 DrawToHDC(HDC as Ptr, PrinterName as string = "")

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Draws the content of the html document into the graphics context.
Notes: As of Windows Internet Explorer 9, this method is deprecated and should not be used.
Returns true on success and false on failure.

With some printers, running DrawToDC may cause problems. You can ensure that DrawToDC works properly on all printers by running SetDocumentPrinter method first, and then passing the modified device context to DrawToDC. The plugin calls SetDocumentPrinter for you when you provide a printer name.

96.6.10 Evaluate(expression as string) as variant

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Evaluates a JavaScript expression.
Example:

```
Var doc as IEDocumentMBS = HTMLViewer1.IEDocumentMBS

Var v as variant = doc.Evaluate("1+2")
MessageBox v
```

Notes: In contrast to IEWindowMBS.RunJavaScript this function returns the result on Windows, but needs IE 9 or newer.

Our plugin converts Xojo data types to JavaScript data types like boolean, number, text or NULL. This could be extended in future to convert arrays, too.

96.6.11 FindText(text as string, count as integer, flags as integer, selectText as boolean) as boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Finds text on the current website.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS

// find first
Var found as boolean = d.FindText("Xojo", 0, 0, true)

MessageBox "Found Xojo: "+str(found)

if found then
// find next
found = d.ContinueFindText("Xojo", 0, 0, true)
end if
```

Notes: text: the string that specifies the text to find.
count: long that specifies the number of characters to search from the starting point of the range. A positive integer indicates a forward search; a negative integer indicates a backward search.
Flags: integer that specifies one or more of the following flags to indicate the type of search:

0	Default. Match partial words.
1	Match backwards.
2	Match whole words only.
4	Match case.
131072	Match bytes.
536870912	Match diacritical marks.
1073741824	Match Kashida character.
2147483648	Match AlefHamza character.

Returns true: The search text was found.
Returns false: The search text was not found.

96.6.12 Frames as IEWindowMBS()

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop only.

Function: Queries the collection of frames.

Example:

```
// This example needs a window with HTMLViewer1.
Var hdoc As IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var frames() As IEWindowMBS = hdoc.Frames

For Each frame As IEWindowMBS In frames
Var doc As IEDocumentMBS = frame.Document

Var URL As String = doc.URL
Var Name As String = doc.NameProp
Var HTMLText As String = doc.HTMLText

Break // read in debugger
Next
```

Notes: MBS Plugin will return the window objects for each frame as an array.

96.6.13 GetTextArea(FormName as String, FieldName as String) as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Queries text for a textarea.
Notes: FormName can be "" to look for any field with given name.
Raises exception if field is not found.
Returns text from textarea.

96.6.14 HTMLText as string

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Returns a copy of the html source code of the current webpage.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var htmlText as string = d.HTMLText
Var PlainText as string = d.text
Var toString as string = d.ToString

Break // see in debug
```

Notes: Improved in plugin version 12.2 to return better HTML text. This is the html generated from current web content and not the page we originally loaded. So this works with Editable property.

Returns "" on any error.

96.6.15 Image as picture

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Copies the picture from the document.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var p as Picture = d.Image
Canvas1.Backdrop = p
```

Notes: You may want to resize the htmlviewer to get a picture without scrollbars. (See example projects)
You may need to call ClearFocus as it seems like if the focus is on the htmlviewer it does not draw itself in our picture.

96.6.16 LoadHTML(HTMLText as string)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Loads the HTML text into the htmlviewer.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS

d.LoadHTML "<p>Hello World</p>"
```

Notes: Does not use a temp file like Xojo's built in method.
Returns true on success.
On Windows you may need to reset webviewer before or load "about:blank" to initialize the webviewer by Xojo (or Xojo).

96.6.17 PrintPreview as boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Commands Internet Explorer to show the print preview dialog for this htmlviewer.
Notes: Returns true on success. Returns false if function is not supported.
The function returns directly while the preview dialog is still running.

96.6.18 Reload(Force as boolean = false)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Reloads the current page.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
d.Reload
```

Notes: Boolean that specifies one of the following possible values:
False: Default. Reloads the document from the cache.
True: Reloads the document from the server.

96.6.19 SetTextArea(FormName as String, FieldName as String, Value as String) as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets text for a textarea.
Notes: FormName can be "" to look for any field with given name.
Raises exception if field is not found.
Returns true if text is set or false on failure.

96.6.20 Text as string

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Returns a copy of the text of the current webpage.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var htmlText as string = d.HTMLText
Var PlainText as string = d.text
Var toString as string = d.ToString

Break // see in debug
```

Notes: Asks Internet Explorer for a selection of the whole document and asks selection about the text content.
Returns "" on any error.

96.6.21 Properties

96.6.22 CharSet as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or retrieves the character set used to encode the object.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
MessageBox d.CharSet
```

Notes: Example value: "utf-8"
(Read and Write property)

96.6.23 Cookie as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets the string value of a cookie.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
MessageBox d.Cookie
```

Notes: Example value: "s_vi= [CS] v1 | 427CA13500002D10-A000B5B00000001 [CE] ; s_cc=true; s_nr=1196708888562; s_sq=%5B%5BB%5D%5D"
(Read and Write property)

96.6.24 DefaultCharset as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Gets the default character set from the current regional language settings.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
MessageBox d.DefaultCharset
```

Notes: Example value: "windows-1252"
(Read and Write property)

96.6.25 Domain as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets the security domain of the document.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
MessageBox d.Domain
```

Notes: Example value: "www.apple.com"
(Read and Write property)

96.6.26 Editable as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Whether the htmlviewer is editable on Windows.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
d.Editable = true
```

Notes: (Read and Write property)

96.6.27 FileCreationDate as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the date the file was created.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
MessageBox d.FileCreationDate
```

Notes: Example value: "09/13/2007"
(Read only property)

96.6.28 FileModifiedDate as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the date the file was last modified.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
MessageBox d.FileModifiedDate
```

Notes: Example value: "12/03/2007"
(Read only property)

96.6.29 FileSize as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the file size.
Notes: Example value: "12475"
(Read only property)

96.6.30 FileUpdatedDate as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the date the file was last updated.
Notes: Example value: "01/01/1601"
(Read only property)

96.6.31 Handle as Integer

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

96.6.32 History as IEHistoryMBS

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Queries history object for web document.
Notes: (Read only property)

96.6.33 LastModified as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Gets the date that the page was last modified, if the page supplies one.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
MessageBox d.LastModified
```

Notes: Example value: "12/03/2007 20:08:17"
(Read only property)

96.6.34 MimeType as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the MIME type for the file.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
MessageBox d.MimeType
```

Notes: Example value: "HTM-Datei"
See also MimeTypeToFileExtensionMBS function.
(Read only property)

96.6.35 NameProp as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Gets the title of the document file.
Notes: Example value: "Apple"
(Read only property)

96.6.36 Navigator as IENavigatorMBS

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Queries navigator object for web document.
Notes: (Read only property)

96.6.37 ParentWindow as IEWindowMBS

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Queries parent window for this document.
Notes: (Read only property)

96.6.38 Protocol as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or retrieves the protocol portion of a URL.
Notes: Example value: "HTTP (HyperText Transfer-Protokoll)"
(Read only property)

96.6.39 ReadyState as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves a value that indicates the current state of the htmlviewer.
Notes: uninitialized: Object is not initialized with data.
loading: Object is loading its data.
loaded: Object has finished loading its data.
interactive: User can interact with the object even though it is not fully loaded.
complete: Object is completely initialized.

An object's state is initially set to uninitialized, and then to loading. When data loading is complete, the state of the link object passes through the loaded and interactive states to reach the complete state.

The states through which an object passes are determined by that object; an object can skip certain states (for example, interactive) if the state does not apply to that object.

Data source objects and databound elements are normally populated asynchronously, and certain programmatic operations can only be performed reliably on databound objects when they are ready for use. There-

fore, the appropriate code should be written to confirm the readyState of objects prior to performing certain operations on them. For example, walking the rows of a table should not be attempted until after the table has reached the complete state.

The readyState property enables the status of an object to be tested. The correct place to test the readyState property is in the event handler for onreadystatechange. Similarly, a data source object (DSO) fires the ondatasetcomplete event to notify the document that the dataset is ready for programmatic operation.
(Read only property)

96.6.40 Referrer as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Gets the URL of the location that referred the user to the current page.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
MessageBox d.Referrer
```

Notes: Example value: "http://www.apple.com/"
(Read only property)

96.6.41 ScrollHeight as integer

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Queries the height of the html viewer content.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS

MessageBox str(d.ScrollWidth)+" "+str(d.ScrollHeight)
```

Notes: Returns 0 on any error.
(Read only property)

96.6.42 ScrollWidth as integer

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Queries the width of the html viewer content.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS

MessageBox str(d.ScrollWidth)+" "+str(d.ScrollHeight)
```

Notes: Returns 0 on any error.
(Read only property)

96.6.43 Security as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the security state.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
MessageBox d.Security
```

Notes: Example value: "F√ºr diesen Dokumententyp gibt es kein Sicherheitszertifikat."
(Read only property)

96.6.44 Title as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets the title of the document.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
MessageBox d.Title
```

Notes: Example value: "Apple"
(Read and Write property)

96.6.45 ToString as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves a string representation of the object.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var htmlText as string = d.HTMLText
Var PlainText as string = d.text
Var toString as string = d.ToString

Break // see in debug
```

Notes: Example value: " [object] "
(Read only property)

96.6.46 URL as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets the URL for the current document.
Example:

```
// This example needs a window with HTMLViewer1.
Var d as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
MessageBox d.URL
```

Notes: Example value: "http://www.apple.com/"
(Read and Write property)

96.7 class IEExceptionMBS

96.7.1 class IEExceptionMBS

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for an error in one of the IE classes.
Notes: See errorNumber and message properties.
Subclass of the RuntimeException class.
Blog Entries

- Upgrading our HTMLViewer functions for Internet Explorer

96.8 class IEHistoryMBS

96.8.1 class IEHistoryMBS

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: The class for the web history.
Example:

```
// This example needs a window with HTMLViewer1.
// go back two pages in the history of an Internet Explorer based HTMLViewer on Windows
Var history As New IEHistoryMBS(HTMLViewer1)
If history.Length >1 Then
history.Go(-2)
End If
```

Notes: For HTMLViewer based on Internet Explorer on Windows.
All the methods and properties may raise IEExceptionMBS exceptions in case of failure.

Based on IOmHistory interface:
https://docs.microsoft.com/en-us/previous-versions/aa703740(v=vs.85)

96.8.2 Methods

96.8.3 Back

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Loads a previous URL from the History list.

96.8.4 Constructor(DesktopHTMLViewer as DesktopHTMLViewer)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Constructor to get the history for a HTMLViewer easily.
See also:

• 96.8.5 Constructor(HTMLViewer as HTMLViewer) 15360

96.8.5 Constructor(HTMLViewer as HTMLViewer)

MBS Win Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Constructor to get the history for a HTMLViewer easily.
See also:

• 96.8.4 Constructor(DesktopHTMLViewer as DesktopHTMLViewer) 15359

96.8.6 Forward

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Loads the next URL from the History list.

96.8.7 Go(index as Integer)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Loads a URL from the History list.
Notes: index: An integer indicates the relative position of a URL in the History list.

An error does not occur if the user tries to go beyond the beginning or end of the history. Instead, the user remains at the current page.

96.8.8 Properties

96.8.9 Handle as Integer

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

96.8.10 Length as Integer

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the number of elements in the History list.
Notes: Example value: 0
(Read only property)

96.9 class IENavigatorMBS

96.9.1 class IENavigatorMBS

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: The class for a navigator object.
Notes: For HTMLViewer based on Internet Explorer on Windows.
All the methods and properties may raise IEExceptionMBS exceptions in case of failure.

Based on IOmNavigator interface:
https://docs.microsoft.com/en-us/previous-versions/windows/internet-explorer/ie-developer/platform-apis/hh774262(v=vs.8

Function: Constructor to get the navigator for a HTMLViewer easily.
See also:

- 96.9.3 Constructor(DesktopHTMLViewer as DesktopHTMLViewer) 15362

96.9.5 Properties

96.9.6 AppCodeName as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the code name.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var a as IENavigatorMBS = w.Navigator

MessageBox a.AppCodeName
```

Notes: Returns "Mozilla". Returned by Internet Explorer and Netscape Navigator.
(Read only property)

96.9.7 AppMinorVersion as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the application's minor version value.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var a as IENavigatorMBS = w.Navigator

MessageBox a.AppMinorVersion
```

Notes: Example value: ";SP2;"
e.g. "0"
(Read only property)

96.9.8 AppName as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the name of the browser.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var a as IENavigatorMBS = w.Navigator
```

MessageBox a.AppName

Notes: Example value: "Microsoft Internet Explorer"
(Read only property)

96.9.9 AppVersion as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the platform and version of the browser.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var a as IENavigatorMBS = w.Navigator

MessageBox a.AppVersion
```

Notes: Example value: "4.0 (compatible; MSIE 6.0; Windows NT 5.1; SV1; .NET CLR 1.1.4322; .NET CLR 2.0.50727)"
(Read only property)

96.9.10 BrowserLanguage as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the current browser language.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var a as IENavigatorMBS = w.Navigator

MessageBox a.BrowserLanguage
```

Notes: Example value: "de"
(Read only property)

96.9.11 CookieEnabled as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves whether client-side persistent cookies are enabled in the browser.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var a as IENavigatorMBS = w.Navigator

if a.CookieEnabled then
MessageBox "Cookie enabled"
else
MessageBox "Cookie disabled"
end if
```

Notes: Persistent cookies are those that are stored on the client-side computer.
Example value: True
(Read only property)

96.9.12 CPUClass as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves a string denoting the CPU class.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var a as IENavigatorMBS = w.Navigator

MessageBox a.CPUClass
```

Notes: Returns "x86" for Intel processor.
(Read only property)

96.9.13 Handle as Integer

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

96.9.14 JavaEnabled as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Returns whether Java is enabled.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var a as IENavigatorMBS = w.Navigator

if a.JavaEnabled then
MessageBox "Java enabled"
else
MessageBox "Java disabled"
end if
```

Notes: Example value: True
(Read only property)

96.9.15 OnLine as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves a value indicating whether the system is in global offline mode.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var a as IENavigatorMBS = w.Navigator

MessageBox a.OnLine
```

Notes: The user can modify the global offline state by choosing Work Offline from the File menu in Microsoft Internet Explorer version 4.0 or later. This property does not indicate whether the system is connected to the network.

Example value: True
(Read only property)

96.9.16 Platform as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the name of the user's operating system.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var a as IENavigatorMBS = w.Navigator

MessageBox a.Platform
```

Notes: Returns "Win64" for Windows 64-bit platform.
Returns "Win32" for Windows 32-bit platform.
(Read only property)

96.9.17 SystemLanguage as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the default language used by the operating system.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var a as IENavigatorMBS = w.SystemLanguage

MessageBox a.AppCodeName
```

Notes: The systemLanguage property reflects the language edition of the installed operating system.
e.g. de-DE
(Read only property)

96.9.18 UserAgent as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves a string equivalent to the HTTP user-agent request header.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var a as IENavigatorMBS = w.Navigator

MessageBox a.UserAgent
```

Notes: The HTTP user-agent request header contains information about compatibility, the browser, and

the platform name. For more information about the browser, see the IENavigatorappNameMBS property. For more information about the platform, see the IENavigatorappVersionMBS property.

The IENavigatoruserAgentMBS property dynamically returns a different value depending on the browser and platform versions. For example, Microsoft Internet Explorer 6 returns the following string for Microsoft Windows XP.

Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1)

Example value: "Mozilla/4.0 (compatible; MSIE 6.0; Windows NT 5.1; SV1; .NET CLR 1.1.4322; .NET CLR 2.0.50727)"

Like other plugin function, this can only work if a page has been loaded. Xojo won't create the internal htmlviewer object before you load a page.
(Read only property)

96.9.19 UserLanguage as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the operating system's natural language setting.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEDocumentMBS = HTMLViewer1.IEDocumentMBS
Var a as IENavigatorMBS = w.Navigator

MessageBox a.AppCodeName
```

Notes: Example value: "de-DE"
(Read only property)

96.10 class IEWebBrowserMBS

96.10.1 class IEWebBrowserMBS

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: The class for a web browser.
Notes: For HTMLViewer based on Internet Explorer on Windows.
All the methods and properties may raise IEExceptionMBS exceptions in case of failure.

Based on IWebBrowser2 interface:
https://docs.microsoft.com/en-us/previous-versions/windows/internet-explorer/ie-developer/platform-apis/aa752127(v=vs.8

96.10.2 Methods

96.10.3 Constructor(DesktopHTMLViewer as DesktopHTMLViewer)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Constructor to get the browser for a HTMLViewer easily.
See also:

- 96.10.4 Constructor(HTMLViewer as HTMLViewer) 15370

96.10.4 Constructor(HTMLViewer as HTMLViewer)

MBS Win Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Constructor to get the browser for a HTMLViewer easily.
See also:

- 96.10.3 Constructor(DesktopHTMLViewer as DesktopHTMLViewer) 15369

96.10.5 GetInternetExplorerHiDPI as Integer

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop only.

Function: Query whether HiDPI handling is enabled.
Notes: We can opt-in for your application to let HTMLviewer use proper resolution handling for web content.

96.10.6 GetInternetExplorerVersion as Integer

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Queries IE version used for this application.
Notes: Queries the Internet Explorer version to use for HTMLViewer.

96.10.7 GoBack

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Navigates backward one item in the history list.

96.10.8 GoForward

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Navigates forward one item in the history list.

96.10.9 GoHome

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Navigates to the current home or start page.
Notes: The user can indicate the URL to use for the home page from the Internet Options dialog box, which is accessible from the Tools menu of Windows Internet Explorer, or in the Control Panel.
Internet Explorer 7 and later. This method navigates to the first URL in the home tabs group.

96.10.10 GoSearch

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Navigates to the current search page.
Notes: The user can indicate the URL to use for the search page with the Internet Options dialog box, which is accessible from the Tools menu of Windows Internet Explorer, or in the Control Panel.
Internet Explorer 7 and later. GoSearch navigates to the default search provider. For more information, see Windows Search Guide.

96.10.11 Navigate(URL as string, Flags as Integer = 0, TargetFrameName as String = "", PostData as String = "", Headers as String = "")

MBS Win Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop only.

Function: Navigates to a resource identified by a URL or to a file identified by a full path.
Notes: URL: The URL, full path, or Universal Naming Convention (UNC) location and name of the resource to display.
Flags: The combination of Navigate* constants.
TargetFrameName: Optional, the name of the frame in which to display the resource.
PostData: The post data that is sent to the server as part of a HTTP POST transaction. A POST transaction is typically used to send data gathered by an HTML form. If this parameter does not specify any post data, this method issues an HTTP GET transaction. This parameter is ignored if the URL is not an HTTP URL.
Headers: The text list that contains additional HTTP headers to send to the server. These headers are added to the default headers. For example, headers can specify the action required of the server, the type of data being passed to the server, or a status code. This parameter is ignored if the URL is not an HTTP URL.

The possible values for the TargetFrameName parameter are:

96.10.12 Refresh

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

_blank	Load the link into a new unnamed window.
_parent	Load the link into the immediate parent of the document the link is in.
_self	Load the link into the same window the link was clicked in.
_top	Load the link into the full body of the current window.
WindowName	A named HTML frame. If no frame or window exists that matches the specified target name, a new window is opened for the specified link.

Function: Reloads the file that is currently displayed in the object.
Notes: This method is the same as clicking the Refresh button or pressing F5 in Windows Internet Explorer. To save time and network bandwidth, the WebBrowser control and InternetExplorer application store pages from recently visited sites in cached memory on the user's hard disk. When you revisit a Web site, the page is reloaded from the local disk instead of being downloaded again from the server. To ensure that you are viewing the most current version of the page, you can force a fresh download by using the Refresh method. This method adds the "Pragma: No-cache" HTTP header to the request.
See also:

- 96.10.13 Refresh(Level as Integer) 15372

96.10.13 Refresh(Level as Integer)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Reloads the file that is currently displayed with the specified refresh level.
See also:

- 96.10.12 Refresh 15371

96.10.14 SetInternetExplorerHiDPI(Enable as Boolean) as Boolean

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop only.

Function: Sets whether HiDPI handling is enabled.
Notes: We can opt-in for your application to let HTMLviewer use proper resolution handling for web content.
You may just call this in your app.open event.

96.10.15 SetInternetExplorerVersion(version as Integer) as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets IE version used for this application.
Example:

```
// make sure we don't end up with Internet Explorer in version 7, which is default.
Var v As Integer = IEWebBrowserMBS.GetInternetExplorerVersion

If v <11000 Then // below version 11.0

Var b As Boolean = IEWebBrowserMBS.SetInternetExplorerVersion(11000)
If b Then
MessageBox "Requested Internet Explorer version 11.0."
Else
MessageBox "Failed to set IE version?"
End If
End If
```

Notes: By default Xojo uses IE7 for the HTMLViewer, even if you have version 11 enabled.

In a test on Windows 10, we get by default this browser version:

Mozilla/4.0 (compatible; MSIE 7.0; Windows NT 6.2; Win64; x64; Trident/7.0; .NET4.0C; .NET4.0E; Tablet PC 2.0; .NET CLR 2.0.50727; .NET CLR 3.0.30729; .NET CLR 3.5.30729)

and with setting it to 11000, we get this:

Mozilla/5.0 (Windows NT 6.2; Win64; x64; Trident/7.0; rv:11.0) like Gecko

96.10.16 Stop

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Stops loading.
Notes: Returns true on success and false on failure.

96.10.17 Zoom(factor as integer)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Zooms the web content.
Notes: Factor can be 50 for 50%.
Returns true on success.

96.10.18 Properties

96.10.19 AddressBar as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets a value that indicates whether the address bar of the object is visible or hidden.
Notes: (Read and Write property)

96.10.20 Busy as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the object is engaged in a navigation or downloading operation.
Notes: If the control is busy, you can use the Stop method to cancel the navigation or download operation before it is completed.
(Read only property)

96.10.21 FullName as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the fully qualified path of the Windows Internet Explorer executable.
Notes: Internet Explorer 8 and later. Always returns an empty string.
This method also updates the window list.
(Read only property)

96.10.22 FullScreen as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets a value that indicates whether Windows Internet Explorer is in full-screen mode or normal window mode.
Notes: True: Internet Explorer is in full-screen mode.
False: Default. Internet Explorer is in normal window mode.

In full-screen mode, the Internet Explorer main window is maximized, and the status bar, toolbar, menu bar, and title bar are hidden.
Setting FullScreen (even to false) resets the values of the AddressBar and ToolBar properties to true. Disable the address bar and toolbars after you set the FullScreen property.
The WebBrowser object saves the value of this property, but otherwise ignores it.

(Read and Write property)

96.10.23 Handle as Integer

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

96.10.24 LocationName as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the path or title of the resource that is currently displayed.
Notes: If the resource is an HTML webpage, the name is the title of the document. If the resource is a folder or file on the network or local computer, the name is the full file system path of the folder or file in Universal Naming Convention (UNC) format.
If this method is called before the first navigation is complete, InternetExplorer returns an empty string.
(Read only property)

96.10.25 LocationURL as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Gets the URL of the resource that is currently displayed.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEWebBrowserMBS = HTMLViewer1.IEWebBrowserMBS
MessageBox w.LocationURL
```

Notes: If the resource is a folder or file on the network or local computer, the name is the full path of the folder or file in the Universal Naming Convention (UNC) format.
If this method is called before the first navigation is complete, InternetExplorer returns an empty string.
(Read only property)

96.10.26 MenuBar as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets a value that indicates whether the Windows Internet Explorer menu bar is visible.

Notes: True: Default. Menu bar is visible.
False: Menu bar is hidden.
(Read and Write property)

96.10.27 Name as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: The frame name or application name of the object.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEWebBrowserMBS = HTMLViewer1.IEWebBrowserMBS
MessageBox w.Name
```

Notes: (Read only property)

96.10.28 Offline as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets a value that indicates whether the object is operating in offline mode.
Notes: In offline mode, the browser is forced to read HTML pages from the local cache instead of reading from the source document online.
The WebBrowser object delegates this method to the top-level frame. If no frame exists, it returns false.
(Read and Write property)

96.10.29 ReadyState as Integer

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Gets the ready state of the object.
Notes: (Read only property)

96.10.30 RegisterAsBrowser as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets a value that indicates whether the object is registered as a top-level browser window.
Notes: The architecture of Windows Internet Explorer allows for multiple instances of the IWebBrowser2 object. A "top-level" IWebBrowser2 object is the parent of all other IWebBrowser2 objects. Only top-level

objects can register as a browser with this method.
By setting this property to True, Internet Explorer and Windows can locate other top-level IWebBrowser2 objects that can participate in frame name resolution. For example, if the user clicks on a hyperlink that specifies a target attribute that is not in the current window, Internet Explorer searches all registered IWebBrowser2 objects in an attempt to resolve the target name.
After the window is registered as a top-level browser, it cannot be unregistered.
(Read and Write property)

96.10.31 RegisterAsDropTarget as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets a value that indicates whether the object is registered as a drop target for navigation.
Notes: A drop target is an object that has been registered to accept data from a drag-and-drop operation. The WebBrowser object delegates this method to the top-level frame. If no frame exists, it raises exception.
(Read and Write property)

96.10.32 Silent as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets a value that indicates whether the object can display dialog boxes.
Notes: False: Default. Dialog boxes and messages can be displayed. Critical errors and security alerts are not suppressed.
True: Dialog boxes are not displayed.

The WebBrowser object delegates this method to the top-level frame. If no frame exists, it raises exception.
(Read and Write property)

96.10.33 StatusBar as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets a value that indicates whether the status bar for the object is visible.
Notes: The WebBrowser object saves the value of this property, but otherwise ignores it.
(Read and Write property)

96.10.34 StatusText as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets the text in the status bar for the object.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEWebBrowserMBS = HTMLViewer1.IEWebBrowserMBS
MessageBox w.StatusText
```

Notes: Windows Internet Explorer 7 and later. The security settings that restrict access to the status bar from script do not apply to this method.
(Read and Write property)

96.10.35 TheaterMode as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets whether the object is in theater mode.
Notes: True: Object is in theater mode.
False: Default. Object is in normal mode.

In theater mode, the object's main window fills the entire screen and displays a toolbar that has a minimal set of navigational buttons. A status bar is also provided in the upper-right corner of the screen. Explorer bars, such as History and Favorites , are displayed as an autohide pane on the left edge of the screen in theater mode.

Setting TheaterMode (even to false) resets the values of the AddressBar and ToolBar properties to true. Disable the address bar and toolbars after you set the TheaterMode property.
The WebBrowser object saves the value of this property, but otherwise ignores it.
(Read and Write property)

96.10.36 ToolBar as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or gets whether toolbars for the object are visible.
Notes: False: Toolbar is hidden.
True: Default. Toolbar is visible.

When the ToolBar property is set to falsde, it is not equivalent to the "toolbar=no" feature of window.open. Instead, it turns off all user interface elements that can be considered toolbars, leaving Windows Internet Explorer in a blank state.
The WebBrowser object saves the value of this property, but otherwise ignores it.
(Read and Write property)

96.10.37 Type as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Gets the user type name of the contained document object.
Notes: For example, this method returns "HTML Document" if the document supports the IHTMLDocument2 interface.

The WebBrowser object delegates this method to the top-level frame. If no frame exists, it returns empty text.
(Read only property)

96.10.38 Constants

Constants

Constant	Value	Description
RefreshIfExpired	1	One of the Refresh levels. Not currently implemented.
RefreshNormal	0	One of the Refresh levels. Refresh without sending a "Pragma:no-cache" HTTP header to the server.

Navigation Flags

Constant	Value	Description
NavigateAllowAutosearch	&h10	If the navigation fails, the autosearch functionality attempts to navigate c mon root domains (.com, .edu, and so on). If this also fails, the URL is pa to a search engine.
NavigateBlockRedirectsXDomain	&h8000	Internet Explorer 8. Block cross-domain redirect requests.
NavigateBrowserBar	&h20	Causes the current Explorer Bar to navigate to the given item, if possible
NavigateEnforceRestricted	&h80	Internet Explorer 6 for Windows XP SP2 and later. Force the URL into restricted zone.
NavigateHyperlink	&h40	Internet Explorer 6 for Windows XP SP2 and later. If the navigation fails w a hyperlink is being followed, this constant specifies that the resource sh then be bound to the moniker using the BINDF_HYPERLINK flag.
NavigateKeepWordWheelText	&h2000	Internet Explorer 7. Maintain state for dynamic navigation based on the f string entered in the search band text box (wordwheel). Restore the wordw text when the navigation completes.
NavigateNewWindowsManaged	&h100	Internet Explorer 6 for Windows XP SP2 and later. Use the default Po Manager to block pop-up windows.
NavigateNoHistory	2	Do not add the resource or file to the history list. The new page replaces current page in the list.
NavigateNoReadFromCache	4	Not implemented.
NavigateNoWriteToCache	8	Not implemented.
NavigateOpenInBackgroundTab	&h1000	Internet Explorer 7. Open the resource or file in a new background tab; currently active window and/or tab remains open on top.
NavigateOpenInNewTab	&h800	Internet Explorer 7. Open the resource or file in a new tab. Allow the d nation window to come to the foreground, if necessary.
NavigateOpenNewForegroundTab	&h10000	Internet Explorer 8 and later. Open the resource in a new tab that beco the foreground tab.
NavigateTrustedForActiveX	&h400	Internet Explorer 6 for Windows XP SP2 and later. Prompt for the installa of ActiveX controls.
NavigateUntrustedForDownload	&h200	Internet Explorer 6 for Windows XP SP2 and later. Block files that norm trigger a file download dialog box.
NavigateVirtualTab	&h4000	Internet Explorer 8. Open the resource as a replacement for the curren target tab. The existing tab is closed while the new tab takes its place in the bar and replaces it in the tab group, if any. Browser history is copied forw to the new tab. On Windows Vista, this flag is implied if the navigation w cross integrity levels and navOpenInNewTab, navOpenInBackgroundTab navOpenInNewWindow is not specified.

Ready States

Constant	Value	Description
ReadyStateComplete	4	Object has received all of its data.
ReadyStateInteractive	3	Object is interactive, but not all of its data is available.
ReadyStateLoaded	2	Object has been initialized.
ReadyStateLoading	1	Object is currently loading its properties.
ReadyStateUninitialized	0	Default initialization state.

Refresh Levels

Constant	Value	Description
RefreshCompletely	2	Refresh without forced cache validation by sending a "Pragma:no-cache" header to the server (HTTP URLs only). Same as pressing Ctrl+F5 in Microsoft Internet Explorer.

Value	Description
11001	Internet Explorer 11. Webpages are displayed in IE11 edge mode, regardless of the declared !DOCTYPE directive. Failing to declare a !DOCTYPE directive causes the page to load in Quirks.
11000	IE11. Webpages containing standards-based !DOCTYPE directives are displayed in IE11 edge mode. Default value for IE11.
10001	Internet Explorer 10. Webpages are displayed in IE10 Standards mode, regardless of the !DOCTYPE directive.
10000	Internet Explorer 10. Webpages containing standards-based !DOCTYPE directives are displayed in IE10 Standards mode. Default value for Internet Explorer 10.
9999	Windows Internet Explorer 9. Webpages are displayed in IE9 Standards mode, regardless of the declared !DOCTYPE directive. Failing to declare a !DOCTYPE directive causes the page to load in Quirks.
9000	Internet Explorer 9. Webpages containing standards-based !DOCTYPE directives are displayed in IE9 mode. Default value for Internet Explorer 9. In Internet Explorer 10, Webpages containing standards-based !DOCTYPE directives are displayed in IE10 Standards mode.
8888	Webpages are displayed in IE8 Standards mode, regardless of the declared !DOCTYPE directive. Failing to declare a !DOCTYPE directive causes the page to load in Quirks.
8000	Webpages containing standards-based !DOCTYPE directives are displayed in IE8 mode. Default value for Internet Explorer 8. In Internet Explorer 10, Webpages containing standards-based !DOCTYPE directives are displayed in IE10 Standards mode.
7000	Webpages containing standards-based !DOCTYPE directives are displayed in IE7 Standards mode. Default value for applications hosting the WebBrowser Control.

96.11 class IEWindowMBS

96.11.1 class IEWindowMBS

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: The class for a web window.
Notes: For HTMLViewer based on Internet Explorer on Windows.
All the methods and properties may raise IEExceptionMBS exceptions in case of failure.

Based on IHTMLWindow2 interface:
https://docs.microsoft.com/en-us/previous-versions/windows/internet-explorer/ie-developer/platform-apis/aa741505(v=vs.8

96.11.2 Methods

96.11.3 Alert(Message as string)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Displays a dialog box containing an application-defined message.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEWindowMBS = HTMLViewer1.IEWindowMBS
w.Alert("Hello Alert!")
```

96.11.4 Blur

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Causes the element to lose focus and fires the onblur event.

96.11.5 Confirm(Message as string) as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Displays a confirmation dialog box that contains an optional message as well as OK and Cancel buttons.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEWindowMBS = HTMLViewer1.IEWindowMBS

Var b as Boolean = w.Confirm("Like Xojo?")
Break
```

Notes: Message: that specifies the message to display in the confirmation dialog box.
If no value is provided, the dialog box does not contain a message.

The title bar of the confirmation dialog box cannot be changed.

96.11.6 Constructor(DesktopHTMLViewer as DesktopHTMLViewer)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Creates new web window object for this HTMLViewer.
Notes: For browser based on Internet Explorer on Windows.
Raises exception on failure.
See also:

- 96.11.7 Constructor(HTMLViewer as HTMLViewer) 15384

96.11.7 Constructor(HTMLViewer as HTMLViewer)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Creates new web window object for this HTMLViewer.
Notes: For browser based on Internet Explorer on Windows.
Raises exception on failure.
See also:

• 96.11.6 Constructor(DesktopHTMLViewer as DesktopHTMLViewer) 15384

96.11.8 ExecScript(Code as string, language as String)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Executes the specified script in the provided language.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEWindowMBS = HTMLViewer1.IEWindowMBS

w.ExecScript("alert('Hello');", "JavaScript")
```

Notes: code: specifies the code to be executed.
language: specifies the language in which the code is executed. The language defaults to JScript.

Script executed through the execScript method can access all global variables available to the calling script. This can be useful when you want the functionality of another scripting language that would not otherwise be available in JScript, such as the Microsoft Visual Basic Scripting Edition (VBScript) MsgBox function.

96.11.9 Frames as IEWindowMBS()

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop only.

Function: Queries the collection of frames.
Example:

```
// This example needs a window with HTMLViewer1.
Var win As IEWindowMBS = HTMLViewer1.IEWindowMBS
Var frames() As IEWindowMBS = win.Frames

For Each frame As IEWindowMBS In frames
Var doc As IEDocumentMBS = frame.Document

Var URL As String = doc.URL
Var Name As String = doc.NameProp
Var HTMLText As String = doc.HTMLText

Break // read in debugger
Next
```

Notes: MBS Plugin will return the window objects for each frame as an array.

96.11.10 MoveBy(x as integer, y as integer)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Moves the screen position of the window by the specified x and y offset values.
Notes: x: long that specifies the horizontal scroll offset in pixels. The value can be either positive or negative.
y: long that specifies the vertical scroll offset in pixels. The value can be either positive or negative.

96.11.11 MoveTo(x as integer, y as integer)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Moves the screen position of the upper-left corner of the window to the specified x and y position.
Notes: x: long that specifies the horizontal scroll offset in pixels. The value can be either positive or negative.
y: long that specifies the vertical scroll offset in pixels. The value can be either positive or negative.

96.11.12 Navigate(URL as string)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Loads the specified URL to the current window.
Notes: URL: that specifies the URL to display.

96.11.13 Print

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Opens the normal print dialog for the Internet Explorer.
Notes: Raises exception on failure.

96.11.14 RunJavaScript(JavaScript as string)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Executes the specified script in the provided language.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEWindowMBS = HTMLViewer1.IEWindowMBS
```

```
w.RunJavaScript("alert('Hello');")
```

Notes: Same as ExecScript with language JavaScript.
Raises exception on failure.

The IE API does not allow to return values from Javascript. So you need to store your result in window.title and access it later using IETitleMBS.

IERunJavaScriptMBS fails if the htmlviewer is empty. You can load a dummy page like above.

You can use JavaScriptEngineMBS class to execute JavaScript without HTMLViewer in our own cross platform JavaScript engine.

See IEDocumentMBS.Evaluate for newer version which can return result.

96.11.15 Scroll(x as integer, y as integer)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Causes the window to scroll to the specified x- and y-offset at the upper-left corner of the window.
Notes: x: long that specifies the horizontal scroll offset, in pixels.
y: long that specifies the vertical scroll offset, in pixels.

This method is provided for backward compatibility only. The recommended way to scroll a window is to use the scrollTo method.

96.11.16 ScrollBy(x as integer, y as integer)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Causes the window to scroll relative to the current scrolled position by the specified x- and y-pixel offset.
Example:

```
// This example needs a window with HTMLViewer1.
Var w as IEWindowMBS = HTMLViewer1.IEWindowMBS

w.ScrollBy 0, 1000
```

Notes: x: long that specifies the horizontal scroll offset, in pixels. Positive values scroll the window right, and negative values scroll it left.

y: long that specifies the vertical scroll offset, in pixels. Positive values scroll the window down, and negative values scroll it up.

96.11.17 ScrollTo(x as integer, y as integer)

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Scrolls the window to the specified x- and y-offset.
Notes: x: long that specifies the horizontal scroll offset, in pixels.
y: long that specifies the vertical scroll offset, in pixels.

96.11.18 Properties

96.11.19 DefaultStatus as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or retrieves the default message displayed in the status bar at the bottom of the window.
Notes: (Read and Write property)

96.11.20 Document as IEDocumentMBS

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop only.

Function: Queries the document for this window.
Notes: May be nil if no document is loaded yet.
(Read only property)

96.11.21 Handle as Integer

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

96.11.22 Name as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or retrieves a value that indicates the window name.
Notes: (Read and Write property)

96.11.23 Status as String

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Sets or retrieves the message in the status bar at the bottom of the window.
Notes: (Read and Write property)

96.12 Globals

96.12.1 IEClearBrowserSessionMBS as boolean

MBS Win Plugin, Plugin Version: 18.5, Platform: Windows, Targets: Desktop only.

Function: Ends browser session.
Notes: For HTMLViewer using Internet Explorer engine. If you close one by closing the window with HTMLViewer control, this method should end session and a new window would start fresh again.

Flushes entries not in use from the password cache on the hard disk drive. Also resets the cache time used when the synchronization mode is once-per-session.
This should clear current session cookies.

Chapter 97

iCloud

97.1 class NSComparisonPredicateMBS

97.1.1 class NSComparisonPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: NSComparisonPredicateMBS is a subclass of NSPredicateMBS that you use to compare expressions.
Example:

```
Var n1 as NSExpressionMBS = NSExpressionMBS.expressionForConstantValue(4)
Var n2 as NSExpressionMBS = NSExpressionMBS.expressionForConstantValue(9)

Var modifier as Integer = NSComparisonPredicateMBS.NSDirectPredicateModifier
Var type as Integer = NSComparisonPredicateMBS.NSGreaterThanPredicateOperatorType
Var options as Integer = 0

Var c as new NSComparisonPredicateMBS(n1, n2, Modifier, type, options)

MessageBox c.predicateFormat
```

Notes: You use comparison predicates to compare the results of two expressions. You create a comparison predicate with an operator, a left expression, and a right expression. You represent the expressions using instances of the NSExpressionMBS class. When you evaluate the predicate, it returns as a BOOL value the result of invoking the operator with the results of evaluating the expressions.
Subclass of the NSPredicateMBS class.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr10

97.1.2 Methods

97.1.3 comparisonPredicateModifier as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the comparison predicate modifier for the receiver.
Notes: Available in Mac OS X v10.4 and later.
The default value is NSDirectPredicateModifier.

97.1.4 Constructor(LeftExpression as NSExpressionMBS, rightExpression as NSExpressionMBS, modifier as UInt32, type as UInt32, options as UInt32)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Initializes a predicate to a given type formed by combining given left and right expressions using a given modifier and options.
Example:

```
Var n1 as NSExpressionMBS = NSExpressionMBS.expressionForConstantValue(4)
Var n2 as NSExpressionMBS = NSExpressionMBS.expressionForConstantValue(9)

Var modifier as Integer = NSComparisonPredicateMBS.NSDirectPredicateModifier
Var type as Integer = NSComparisonPredicateMBS.NSGreaterThanPredicateOperatorType
Var options as Integer = 0

Var c as new NSComparisonPredicateMBS(n1, n2, Modifier, type, options)

MessageBox c.predicateFormat
```

Notes: LeftExpression: The left hand expression.
rightExpression: The right hand expression.
modifier: The modifier to apply.
type: The predicate operator type.
options: The options to apply (see constants). For no options, pass 0.

The receiver, initialized to a predicate of type type formed by combining the left and right expressions using the modifier and options.
Available in Mac OS X v10.4 and later.

97.1.5 leftExpression as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the left expression for the receiver, or nil if there is none.

97.1.6 options as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the options that are set for the receiver.

97.1.7 predicate(LeftExpression as NSExpressionMBS, rightExpression as NSExpressionMBS, modifier as UInt32, type as UInt32, options as UInt32) as NSPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates and returns a predicate of a given type formed by combining given left and right expressions using a given modifier and options.
Notes: LeftExpression: The left hand expression.
rightExpression: The right hand expression.
modifier: The modifier to apply.
type: The predicate operator type.
options: The options to apply (see "NSComparisonPredicate Options"). For no options, pass 0.

Returns a new predicate of type type formed by combining the given left and right expressions using the modifier and options.
Available in Mac OS X v10.4 and later.

97.1.8 predicateOperatorType as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the predicate type for the receiver.

97.1.9 rightExpression as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the right expression for the receiver, or nil if there is none.

97.1.10 Constants

Modifier Type Constants

Constant	Value	Description
NSAllPredicateModifier	1	A predicate to compare all entries in the destination of a to-many relationship. The left hand side must be a collection. The corresponding predicate compares each value in the left hand side with the right hand side, and returns false when it finds the first mismatch—¬Ä¬îor true if all match. Available in Mac OS X v10.4 and later.
NSAnyPredicateModifier	2	A predicate to match with any entry in the destination of a to-many relationship. The left hand side must be a collection. The corresponding predicate compares each value in the left hand side against the right hand side and returns true when it finds the first match—or false if no match is found Available in Mac OS X v10.4 and later.
NSDirectPredicateModifier	0	A predicate to compare directly the left and right hand sides. Available in Mac OS X v10.4 and later.

Comparison Type Constants

Constant	Value	Description
NSBeginsWithPredicateOperatorType	8	A begins-with predicate. Available in Mac OS X v10.4 and later.
NSBetweenPredicateOperatorType	100	A predicate to determine if the right hand side lies at or specified by the left hand side. Returns true if [lhs between rhs] ; the right hand side mu which the first element sets the lower bound and the second e inclusive. Comparison is performed using compare: or the equivalent. Available in Mac OS X v10.5 and later.
NSContainsPredicateOperatorType	99	A predicate to determine if the left hand side contains the r Returns true if [lhs contains rhs] ; the left hand side must be object that evaluates to a collection Available in Mac OS X v10.5 and later.
NSCustomSelectorPredicateOperatorType	11	A predicate that uses a custom selector that takes a single arg a BOOL value. The selector is invoked on the left hand side with the right argument. Available in Mac OS X v10.4 and later.
NSEndsWithPredicateOperatorType	9	An ends-with predicate. Available in Mac OS X v10.4 and later.
NSEqualToPredicateOperatorType	4	An equal-to predicate. Available in Mac OS X v10.4 and later.
NSGreaterThanOrEqualToPredicateOperatorType	3	A greater-than-or-equal-to predicate. Available in Mac OS X v10.4 and later.
NSGreaterThanPredicateOperatorType	2	A greater-than predicate. Available in Mac OS X v10.4 and later.
NSInPredicateOperatorType	10	A predicate to determine if the left hand side is in the right For strings, returns true if the left hand side is a substring side . For collections, returns true if the left hand side is in t . Available in Mac OS X v10.4 and later.
NSLessThanOrEqualToPredicateOperatorType	1	A less-than-or-equal-to predicate. Available in Mac OS X v10.4 and later.
NSLessThanPredicateOperatorType	0	A less-than predicate. Available in Mac OS X v10.4 and later.
NSLikePredicateOperatorType	7	A simple subset of the MATCHES predicate, similar in behav Available in Mac OS X v10.4 and later.
NSMatchesPredicateOperatorType	6	A full regular expression matching predicate. Available in Mac OS X v10.4 and later.
NSNotEqualToPredicateOperatorType	5	A not-equal-to predicate. Available in Mac OS X v10.4 and later.

String Comparison Types

Constant	Value	Description
NSCaseInsensitivePredicateOption	1	A case-insensitive predicate. You represent this option in a predicate format string using a [c] follov string operation (for example, ”NeXT” like [c] ”next”). Available in Mac OS X v10.4 and later. These options are supported for LIKE as well as all of the equality/comp operators.
NSDiacriticInsensitivePredicateOption	2	A diacritic-insensitive predicate. You represent this option in a predicate format string using a [d] follov string operation (for example, ”na√Øve” like [d] ”naive”). Available in Mac OS X v10.4 and later. These options are supported for LIKE as well as all of the equality/comp operators.
NSNormalizedPredicateOption	4	Indicates that the strings to be compared have been preprocessed. This option supersedes NSCaseInsensitivePredicateOption and NSDiacr sensitivePredicateOption, and is intended as a performance optimizatio tion. You represent this option in a predicate format string using a [n] follov string operation (for example, ”WXYZlan” matches [n] ”.lan”). Available in Mac OS X v10.7 and later. These options are supported for LIKE as well as all of the equality/comp operators.

97.2 class NSCompoundPredicateMBS

97.2.1 class NSCompoundPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: NSCompoundPredicate is a subclass of NSPredicate used to represent logical "gate" operations (AND/OR/NOT) and comparison operations.
Example:

```
Var n1 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(true)
Var n2 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(false)

Var n as NSPredicateMBS = NSCompoundPredicateMBS.orPredicateWithSubpredicates(array(n1,n2))
MessageBox n.predicateFormat
```

Notes: Comparison operations are based on two expressions, as represented by instances of the NSExpression class. Expressions are created for constant values, key paths, and so on.

In Mac OS X v10.5 and later and in iOS, you can use NSCompoundPredicate to create an AND or OR compound predicate (but not a NOT compound predicate) using an array with 0, 1, or more elements:

- An AND predicate with no subpredicates evaluates to TRUE.
- An OR predicate with no subpredicates evaluates to FALSE.
- A compound predicate with one or more subpredicates evaluates to the truth of its subpredicates.

Subclass of the NSPredicateMBS class.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr10

97.2.2 Methods

97.2.3 andPredicateWithSubpredicates(predicates() as NSPredicateMBS) as NSPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a new predicate formed by AND-ing the predicates in a given array.
Example:

```
Var n1 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(true)
Var n2 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(false)

Var n as NSPredicateMBS = NSCompoundPredicateMBS.andPredicateWithSubpredicates(array(n1,n2))

MessageBox n.predicateFormat
```

Notes: subpredicates: An array of NSPredicate objects.

Returns a new predicate formed by AND-ing the predicates specified by subpredicates.
An AND predicate with no subpredicates evaluates to TRUE.

97.2.4 compoundPredicateType as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the predicate type for the receiver.

97.2.5 Constructor(type as Integer, predicates() as NSPredicateMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the receiver initialized to a given type using predicates from a given array.
Example:

```
Var n1 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(true)
Var n2 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(false)

Var n as NSPredicateMBS = new NSCompoundPredicateMBS(NSCompoundPredicateMBS.kAnd, array(n1,n2))
MessageBox n.predicateFormat
```

Notes: type: The type of the new predicate.
subpredicates: An array of NSPredicate objects.

97.2.6 notPredicateWithSubpredicate(predicate as NSPredicateMBS) as NSPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a new predicate formed by NOT-ing a given predicate.
Notes: predicate: A predicate.

Returns a new predicate formed by NOT-ing the predicate specified by predicate.

97.2.7 orPredicateWithSubpredicates(predicates() as NSPredicateMBS) as NSPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a new predicate formed by OR-ing the predicates in a given array.
Notes: subpredicates: An array of NSPredicate objects.

Returns a new predicate formed by OR-ing the predicates specified by subpredicates.

An OR predicate with no subpredicates evaluates to FALSE.

97.2.8 subpredicates as NSPredicateMBS()

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the array of the receiver's subpredicates.
Example:

```
Var n1 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(true)
Var n2 as NSPredicateMBS = NSPredicateMBS.predicateWithValue(false)

Var n as new NSCompoundPredicateMBS(NSCompoundPredicateMBS.kAnd, array(n1,n2))

for each x as NSPredicateMBS in n.subpredicates
MessageBox x.predicateFormat
next
```

97.2.9 Constants

Compound Predicate Types

Constant	Value	Description
kAnd	1	A logical AND predicate.
kNot	0	A logical NOT predicate.
kOR	2	A logical OR predicate.

97.3 class NSExpressionMBS

97.3.1 class NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: NSExpression is used to represent expressions in a predicate.
Notes: Comparison operations in an NSPredicate are based on two expressions, as represented by instances of the NSExpression class. Expressions are created for constant values, key paths, and so on.

Generally, anywhere in the NSExpression class hierarchy where there is composite API and subtypes that may only reasonably respond to a subset of that API, invoking a method that does not make sense for that subtype will cause an exception to be thrown.

See NSException class documentation on apple.com.

- More notes
- MBS Real Studio Plugins, version 11.3pr10

97.3.2 Methods

97.3.3 arguments as Variant()

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the arguments for the receiver.
Example:

```
Var args() as Variant
args.Add 5.0
Var n as NSExpressionMBS = NSExpressionMBS.expressionForFunction("abs:", args)

// query arguments
Var theargs() as Variant = n.arguments
MessageBox theargs(0)
```

Notes: Returns the arguments for the receiver—that is, the array of expressions that will be passed as parameters during invocation of the selector on the operand of a function expression.

This method raises an exception if it is not applicable to the receiver.

97.3.4 constantValue as Variant

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the constant value of the receiver.
Example:

```
Var n as NSExpressionMBS = NSExpressionMBS.expressionForConstantValue(5)
Var v as Variant = n.constantValue
MessageBox v.StringValue // shows 5
```

Notes: This method raises an exception if it is not applicable to the receiver.
Available in Mac OS X v10.4 and later.

97.3.5 Constructor(Type as Integer)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Initializes the receiver with the specified expression type.
Notes: Available in Mac OS X v10.4 and later.

97.3.6 expressionForAggregate(subexpressions() as NSExpressionMBS) as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a new aggregate expression for a given collection.
Notes: collection: A collection object that contains further expressions.
Returns a new expression that contains the expressions in collection.

97.3.7 expressionForConstantValue(value as Variant) as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a new expression that represents a given constant value.
Example:

```
Var n as NSExpressionMBS = NSExpressionMBS.expressionForConstantValue(5)
Var v as Variant = n.constantValue
MessageBox v.StringValue // shows 5
```

Notes: obj: The constant value the new expression is to represent.

Returns a new expression that represents the constant value, obj.
Available in Mac OS X v10.4 and later.

97.3.8 expressionForEvaluatedObject as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a new expression that represents the object being evaluated.
Notes: Available in Mac OS X v10.4 and later.

97.3.9 expressionForFunction(FunctionName as string, arguments() as Variant) as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a new expression that will invoke one of the predefined functions.
Notes: name: The name of the function to invoke.
parameters: An array containing NSExpression objects that will be used as parameters during the invocation of selector.
For a selector taking no parameters, the array should be empty. For a selector taking one or more parameters, the array should contain one NSExpression object which will evaluate to an instance of the appropriate type for each parameter.
If there is a mismatch between the number of parameters expected and the number you provide during evaluation, an exception may be raised or missing parameters may simply be replaced by nil (which occurs depends on how many parameters are provided, and whether you have over- or underflow).

Returns a new expression that invokes the function name using the parameters in parameters.
The name parameter can be one of the following predefined functions.

See NSExpression class documentation on apple.com for details.

97.3.10 expressionForIntersectSet(LeftExpression as NSExpressionMBS, rightExpression as NSExpressionMBS) as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a new NSExpression object that represent the intersection of a given set and collection.
Notes: LeftExpression: An expression that evaluates to an NSSet object.
rightExpression: An expression that evaluates to a collection object (an instance of NSArray, NSSet, or NSDictionary).

Returns a new NSExpression object that represents the intersection of left and right.
Available in Mac OS X v10.5 and later.

97.3.11 expressionForKeyPath(name as string) as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a new expression that invokes valueForKeyPath: with a given key path.
Notes: keyPath: The key path that the new expression should evaluate.

Returns a new expression that invokes valueForKeyPath: with keyPath.
Available in Mac OS X v10.4 and later.

97.3.12 expressionForMinusSet(LeftExpression as NSExpressionMBS, rightExpression as NSExpressionMBS) as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a new NSExpression object that represent the subtraction of a given collection from a given set.
Notes: LeftExpression: An expression that evaluates to an NSSet object.
rightExpression: An expression that evaluates to a collection object (an instance of NSArray, NSSet, or NSDictionary).

Returns a new NSExpression object that represents the subtraction of right from left.
Available in Mac OS X v10.5 and later.

97.3.13 expressionForUnionSet(LeftExpression as NSExpressionMBS, rightExpression as NSExpressionMBS) as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a new NSExpression object that represent the union of a given set and collection.
Notes: LeftExpression: An expression that evaluates to an NSSet object.
rightExpression: An expression that evaluates to a collection object (an instance of NSArray, NSSet, or NSDictionary).

Returns an new NSExpression object that represents the union of left and right.
Available in Mac OS X v10.5 and later.

97.3.14 expressionForVariable(name as string) as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a new expression that extracts a value from the variable bindings dictionary for a given key.
Notes: name: The key for the variable to extract from the variable bindings dictionary.

Returns a new expression that extracts from the variable bindings dictionary the value for the key string. Available in Mac OS X v10.4 and later.

97.3.15 expressionType as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the expression type for the receiver.
Example:

```
Var n as NSExpressionMBS = NSExpressionMBS.expressionForVariable("hello")
MessageBox str(n.expressionType) // = NSVariableExpressionType
```

Notes: This method raises an exception if it is not applicable to the receiver.

97.3.16 expressionWithFormat(format as string) as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates an expression with the given format.
See also:

- 97.3.17 expressionWithFormat(format as string, arguments() as Variant) as NSExpressionMBS 15404

97.3.17 expressionWithFormat(format as string, arguments() as Variant) as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates an expression with the given format.
See also:

- 97.3.16 expressionWithFormat(format as string) as NSExpressionMBS 15404

97.3.18 functionName as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the function for the receiver.
Example:

```
Var args() as Variant
args.Add "World"
args.Add 5.0
Var n as NSExpressionMBS = NSExpressionMBS.expressionForFunction("Hello", args)

MessageBox n.functionName
```

Notes: This method raises an exception if it is not applicable to the receiver.

97.3.19 keyPath as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the key path for the receiver.
Notes: This method raises an exception if it is not applicable to the receiver.
Available in Mac OS X v10.4 and later.

97.3.20 leftExpression as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the left expression of an aggregate expression.
Notes: This method raises an exception if it is not applicable to the receiver.
Available in Mac OS X v10.5 and later.

97.3.21 operand as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the operand for the receiver.
Notes: The operand for the receiver—that is, the object on which the selector will be invoked.
The object is the result of evaluating a key path or one of the defined functions. This method raises an exception if it is not applicable to the receiver.
Available in Mac OS X v10.4 and later.

97.3.22 predicate as NSPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Return the predicate of a subquery expression.
Notes: This method raises an exception if it is not applicable to the receiver.
Available in Mac OS X v10.5 and later.

97.3.23 rightExpression as NSExpressionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the right expression of an aggregate expression.
Notes: This method raises an exception if it is not applicable to the receiver.
Available in Mac OS X v10.5 and later.

97.3.24 variable as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the variable for the receiver.
Example:

```
Var n as NSExpressionMBS = NSExpressionMBS.expressionForVariable("hello")
MessageBox n.variable
```

Notes: This method raises an exception if it is not applicable to the receiver.
Available in Mac OS X v10.4 and later.

97.3.25 Properties

97.3.26 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The internal reference to the NSExpression object.
Notes: (Read and Write property)

97.3.27 Constants

Expression Type Constants

Constant	Value	Description
NSAggregateExpressionType	14	An expression that defines an aggregate of NSExpression objects. Available in Mac OS X v10.5 and later.
NSBlockExpressionType	19	An expression that uses an Block. Available in Mac OS X v10.6 and later.
NSConstantValueExpressionType	0	An expression that always returns the same value. Available in Mac OS X v10.4 and later.
NSEvaluatedObjectExpressionType	1	An expression that always returns the parameter object itself. Available in Mac OS X v10.4 and later.
NSFunctionExpressionType	4	An expression that returns the result of evaluating a function. Available in Mac OS X v10.4 and later.
NSIntersectSetExpressionType	6	An expression that creates an intersection of the results of two nested expr sions. Available in Mac OS X v10.5 and later.
NSKeyPathExpressionType	3	An expression that returns something that can be used as a key path. Available in Mac OS X v10.4 and later.
NSMinusSetExpressionType	7	An expression that combines two nested expression results by set subtracti Available in Mac OS X v10.5 and later.
NSSubqueryExpressionType	13	An expression that filters a collection using a subpredicate. Available in Mac OS X v10.5 and later.
NSUnionSetExpressionType	5	An expression that creates a union of the results of two nested expressions. Available in Mac OS X v10.5 and later.
NSVariableExpressionType	2	An expression that always returns whatever value is associated with the l specified by ‚Äòvariable' in the bindings dictionary. Available in Mac OS X v10.4 and later.

97.4 class NSFileCoordinatorMBS

97.4.1 class NSFileCoordinatorMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The class for file coordinating.
Example:

```
// write a file in iCloud Drive safely while other apps or iCloud sync may access it
// MyCoordinator is a subclass of NSFileCoordinatorMBS with the coordinateWritingItemAtURL event implemented.
Var coordinator As New MyCoordinator
Var file As FolderItem = SpecialFolder.UserHome.Child("Library").Child("Mobile Documents").Child("com textasciitilde apple
textasciitilde CloudDocs").Child("notes.txt")
Var error As NSErrorMBS
coordinator.coordinateWritingItemAtURL(file, NSFileCoordinatorMBS.NSFileCoordinatorWritingForReplacing, error, "Hello from Xojo")
If error <>Nil Then MessageBox error.localizedDescription

// in MyCoordinator:
Sub coordinateWritingItemAtURL(url As String, file As FolderItem, tag As Variant) Handles coordinateWritingItemAtURL
// now we may write, the event runs synchronously inside coordinateWritingItemAtURL
Var stream As TextOutputStream = TextOutputStream.Create(file)
stream.Write tag.StringValue
stream.Close
End Sub
```

Notes: Please also check the documentation from Apple for the NSFileCoordinator class.

97.4.2 Methods

97.4.3 addFilePresenter(filePresenter as NSFilePresenterMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Adds a new file presenter.
Notes: If you invoke addFilePresenter: you have to do a balancing invocation of removeFilePresenter before the file presenter is deallocated, even in a garbage-collected application.

If your application reads an item and then registers a file presenter for it there is a possible race condition in which between those two steps another process does coordinated reading or writing of the item, without any messages sent to your not-quite-registered file presenter. This can leave your file presenter ignorant of the fact that what it knows about the item it just read is already out of date, or under the misconception that just because it hasn't received a relinquish... method it owns the item. To avoid that race condition you can invoke addFilePresenter in the same block that you pass to coordinateReadingItemAtURL to read what the file presenter will present.

97.4.4 cancel

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Cancel all invocations of coordinate... and prepare... methods for the receiver.
Notes: Any current invocation of one of those methods will stop waiting and return immediately, unless it has already invoked the passed-in block, in which case it will return when the passed-in block returns. Subsequent invocations of those methods will not invoke the blocks passed into them at all. When an invocation of coordinate... or prepare... returns without invoking the passed-in block because this method was invoked it instead returns an error whose domain is NSCocoaErrorDomain and whose code is NSUserCancelledError. Messages that have already been sent to NSFilePresenters will not be cancelled but the file coordination machinery will stop waiting for the replies.

This method this can be invoked from any thread. It always returns immediately, without waiting for anything. Cancellation is racy; you usually cannot assume that no block passed into a coordinate... or prepare... method is already being invoked, so the code inside those blocks typically still has to check for cancellation, whatever that means in your application.

97.4.5 Constructor(filePresenter as NSFilePresenterMBS = nil)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The constructor.
Notes: The designated initializer. If an NSFilePresenter is provided then the receiver is considered to have been created by that NSFilePresenter, or on its behalf.

NSFileCoordinator is meant to be instantiated on a per-file-operation basis, where a file operation is something like the opening or saving of a document, or the copying or moving of a batch of folders and files. There is no benefit to keeping an instance of it alive in your application for much more time than it takes to actually perform the file operation. Doing so can be harmful, or at least wasteful of memory, because NSFileCoordinators may retain NSFilePresenters.

You pass an NSFilePresenter to this initializer when the operation whose file access is to be coordinated is being performed by that NSFilePresenter. Associating an NSFileCoordinator with an NSFilePresenter accomplishes a few important things:
- It prevents the NSFileCoordinator from sending messages to that NSFilePresenter, so the NSFilePresenter does not have to somehow filter out messages about its own file operations. The exception to this rule is that messages about versions of the presented item being added, remove, or resolved during coordinated writing are sent to every relevant NSFilePresenter, even the one passed to Constructor.
- It allows the file coordination mechanism to determine when coordinated writing is being done in response to an NSFilePresenter receiving a savePresentedItemChangesWithCompletionHandler message, and not deadlock. Usually coordinated writing done by one NSFileCoordinator must wait for coordinated reading of the same file or directory done by another NSFileCoordinator. But, for example, when coordinated reading is begun with one NSFileCoordinator, and that causes an NSFilePresenter to do coordinated writing using another NSFileCoordinator, the writing done with the second NSFileCoordinator should not wait for the completion of the first NSFileCoordinator's reading, it should instead happen while the first NSFileCoordinator is waiting to read.
- It allows the file coordination mechanism to handle a race condition that can occur when it has sent an NSFilePresenter a presentedItemDidMoveToURL message in the NSFilePresenter's operation queue but before that message is dequeued the NSFilePresenter enqueues, on a different queue, an operation using the old URL. For this to be effective however the NSFileCoordinator must be initialized in the same operation queue in which NSFilePresenter messages are received.
- It allows the file coordination mechanism to gracefully handle your application's registration of an NSFilePresenter that at first returns nil when sent presentedItemURL but can later return non-nil at the end of doing a coordinated write that creates the presented item in the file system for the very first time. AppKit for example takes advantage of this by registering brand new untitled NSDocuments as NSFilePresenters immediately, instead of waiting until after the first time the user causes the document to be saved to a file, which would be more complicated.

For example, NSDocument creates a single NSFileCoordinator for all of the coordinated reading and writing it does during the saving of a document. It always creates the NSFileCoordinator in the main queue even when it is doing the actual coordinated reading and writing in a background queue to implement asynchronous saving.

97.4.6 coordinateReadingItemAtURL(File as folderitem, options as Integer, byref error as NSErrorMBS, tag as Variant = nil)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Initiates a read operation on a single file or directory using the specified options.
Notes: file: A URL identifying the file or directory to read. If other objects or processes are acting on the item at the URL, the actual URL passed to reader parameter may be different than the one in this parameter. The plugin converts the folderitem to an URL for you.
options: One of the reading options (see constants). If you pass 0 for this parameter, the savePresentedItemChangesWithCompletionHandler method of relevant file presenters is called before your block executes.
Error: If a file presenter encounters an error while preparing for this read operation, that error is returned

in this parameter and the block in the reader parameter is not executed. If you cancel this operation before the reader block is executed, this parameter contains an error object on output.

The coordinateReadingItemAtURL event performs the file operations in a coordinated manner. This block receives an url and folderitem of the item and returns no value. Always use the URL/folderitem passed into the event instead of the value in the url parameter.

You use this method to perform read-related operations on a file or directory in a coordinated manner. This method executes synchronously, blocking the current thread until the reader event finishes executing. Before executing that event, though, the file coordinator waits until other relevant file presenter objects finish in-progress actions. Similarly, your read operation may cause pending actions for other file presenters to wait until your operations are complete. Whether or not the file coordinator waits depends on whether the item being read is a file or directory and also depends on other related operations.

If the url parameter specifies a file:

- This method waits for other writers of the exact same file to finish in-progress actions.
- This method waits if the file is a file package and other writers are writing to items in the package directory.
- This method does not wait for other readers of the file.
- This method does not wait for writers that are manipulating the parent directory of the file, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinatorWritingForMoving option.

If the url parameter specifies a directory:

- This method waits if other write operations are occurring on the exact same directory.
- This method does not wait if write operations are occurring on items inside the directory (but not on the directory itself).
- This method does not wait for other readers of the directory.
- This method does not wait for writers that are manipulating the parent directory of the directory, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinatorWritingForMoving option.

This method calls the relinquishPresentedItemToReader method of any relevant file presenters. This method is called both for file presenters in the current process and in other processes. Depending on the options you specify, other methods of the file presenters may also be called. When reading a file package directory, file presenter objects that are currently reading the contents of that file package also receive these notifications. All of the called methods must return successfully before the file coordinator executes your block. If

multiple file presenters are operating on the item, the order in which those presenters are notified is undefined.

Do not nest calls to file coordinator methods inside the event. If you call this method or any of the other file coordination methods from inside your event, the file coordinator object throws an exception. If you want to perform a write operation from inside a read block, use the coordinateWritingItemAtURL method instead. If you want to perform a batch read operation on multiple files, use the prepareForReadingItemsAtURLs method.

Available in Mac OS X v10.7 and later.
See also:

- 97.4.22 coordinateReadingItemAtURL(url as string, file as folderitem, tag as Variant) 15422
- 97.4.7 coordinateReadingItemAtURL(URL as string, options as Integer, byref error as NSErrorMBS, tag as Variant = nil) 15412

97.4.7 coordinateReadingItemAtURL(URL as string, options as Integer, byref error as NSErrorMBS, tag as Variant = nil)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Initiates a read operation on a single file or directory using the specified options.
Notes: url: A URL identifying the file or directory to read. If other objects or processes are acting on the item at the URL, the actual URL passed to reader parameter may be different than the one in this parameter.
options: One of the reading options (see constants). If you pass 0 for this parameter, the savePresentedItemChangesWithCompletionHandler method of relevant file presenters is called before your block executes.
Error: If a file presenter encounters an error while preparing for this read operation, that error is returned in this parameter and the block in the reader parameter is not executed. If you cancel this operation before the reader block is executed, this parameter contains an error object on output.

The coordinateReadingItemAtURL event performs the file operations in a coordinated manner. This block receives an url and folderitem of the item and returns no value. Always use the URL/folderitem passed into the event instead of the value in the url parameter.

You use this method to perform read-related operations on a file or directory in a coordinated manner. This method executes synchronously, blocking the current thread until the reader event finishes executing. Before executing that event, though, the file coordinator waits until other relevant file presenter objects finish in-progress actions. Similarly, your read operation may cause pending actions for other file presenters to wait until your operations are complete. Whether or not the file coordinator waits depends on whether the item being read is a file or directory and also depends on other related operations.

If the url parameter specifies a file:

- This method waits for other writers of the exact same file to finish in-progress actions.
- This method waits if the file is a file package and other writers are writing to items in the package directory.
- This method does not wait for other readers of the file.
- This method does not wait for writers that are manipulating the parent directory of the file, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinatorWritingFor-Moving option.

If the url parameter specifies a directory:

- This method waits if other write operations are occurring on the exact same directory.
- This method does not wait if write operations are occurring on items inside the directory (but not on the directory itself).
- This method does not wait for other readers of the directory.
- This method does not wait for writers that are manipulating the parent directory of the directory, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinator-WritingForMoving option.

This method calls the relinquishPresentedItemToReader method of any relevant file presenters. This method is called both for file presenters in the current process and in other processes. Depending on the options you specify, other methods of the file presenters may also be called. When reading a file package directory, file presenter objects that are currently reading the contents of that file package also receive these notifications. All of the called methods must return successfully before the file coordinator executes your block. If multiple file presenters are operating on the item, the order in which those presenters are notified is undefined.

Do not nest calls to file coordinator methods inside the event. If you call this method or any of the other file coordination methods from inside your event, the file coordinator object throws an exception. If you want to perform a write operation from inside a read block, use the coordinateWritingItemAtURL method instead. If you want to perform a batch read operation on multiple files, use the prepareForReadingItemsAtURLs method.

Available in Mac OS X v10.7 and later.

- 97.4.22 coordinateReadingItemAtURL(url as string, file as folderitem, tag as Variant) 15422

97.4.8 coordinateReadingItemAtURLwritingItemAtURL(readingFile as folderitem, readingOptions as Integer, writingItemAtFile as folderitem, writingOptions as Integer, byref error as NSErrorMBS, tag as Variant = nil)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Initiates a read operation that contains a follow-up write operation.
Notes: readingFile: A URL identifying the file or directory to read. If other objects or processes are acting on the item at the URL, the actual URL passed to the block in the readerWriter parameter may be different than the one in this parameter.
readingOptions: One of the reading options (see constants). If you pass 0 for this parameter, the savePresentedItemChangesWithCompletionHandler: method of relevant file presenters is called before your block executes.
writingItemAtFile: A URL identifying the file or directory to write. If other objects or processes are acting on the item at the URL, the actual URL passed to the block in the readerWriter parameter may be different than the one in this parameter.
writingOptions: One of the writing options (see constants). The options you specify partially determine how file presenters are notified and how this file coordinator object waits to execute your block.
Error: If a file presenter encounters an error while preparing for this operation, that error is returned in this parameter and the event is not executed. If you cancel this operation before the readerWriter event is executed, this parameter contains an error object on output.

The coordinateReadingItemAtURLwritingItemAtURL event performs the read and write operations in a coordinated manner. This event receives URLs of the items to read and write and returns no value. Always use the URLs passed into the block instead of the values in the readingURL and writingURL parameters.

You use this method to perform a read operation that might also contain a write operation that needs to be coordinated. This method executes synchronously, blocking the current thread until the readerWriter event finishes executing. When performing the write operation, you may call the coordinateWritingItemAtURL method from your readerWriter block. This method does the canonical lock ordering that is required to prevent a potential deadlock of the file operations.

This method makes the same calls to file presenters, and has the same general wait behavior as the coordinateReadingItemAtURL method.

Available in Mac OS X v10.7 and later.

97.4.9 coordinateReadingItemAtURLwritingItemAtURL(readingURL as string, readingOptions as Integer, writingItemAtURL as string, writingOptions as Integer, byref error as NSErrorMBS, tag as Variant = nil)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Initiates a read operation that contains a follow-up write operation.
Notes: readingURL: A URL identifying the file or directory to read. If other objects or processes are acting on the item at the URL, the actual URL passed to the block in the readerWriter parameter may be different than the one in this parameter.
readingOptions: One of the reading options (see constants). If you pass 0 for this parameter, the savePresentedItemChangesWithCompletionHandler: method of relevant file presenters is called before your block executes.
writingItemAtURL: A URL identifying the file or directory to write. If other objects or processes are acting on the item at the URL, the actual URL passed to the block in the readerWriter parameter may be different than the one in this parameter.
writingOptions: One of the writing options (see constants). The options you specify partially determine how file presenters are notified and how this file coordinator object waits to execute your block.
Error: If a file presenter encounters an error while preparing for this operation, that error is returned in this parameter and the event is not executed. If you cancel this operation before the readerWriter event is executed, this parameter contains an error object on output.

The coordinateReadingItemAtURLwritingItemAtURL event performs the read and write operations in a coordinated manner. This event receives URLs of the items to read and write and returns no value. Always use the URLs passed into the block instead of the values in the readingURL and writingURL parameters.

You use this method to perform a read operation that might also contain a write operation that needs to be coordinated. This method executes synchronously, blocking the current thread until the readerWriter event finishes executing. When performing the write operation, you may call the coordinateWritingItemAtURL method from your readerWriter block. This method does the canonical lock ordering that is required to prevent a potential deadlock of the file operations.

This method makes the same calls to file presenters, and has the same general wait behavior as the coordinateReadingItemAtURL method.

Available in Mac OS X v10.7 and later.
See also:

- 97.4.23 coordinateReadingItemAtURLwritingItemAtURL(readingURL as string, readingFile as folderitem, writingURL as string, writingFile as folderitem, tag as Variant) 15423

97.4.10 coordinateWritingItemAtURL(File as folderitem, options as Integer, byref error as NSErrorMBS, tag as Variant = nil)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Initiates a write operation on a single file or directory using the specified options.
Notes: File: A URL identifying the file or directory to write. If other objects or processes are acting on the item at the URL, the actual URL passed to writer parameter may be different than the one in this parameter. (plugin converts from folderitem to URL for you)
options: One of the writing options (see constants). The options you specify partially determine how file presenters are notified and how this file coordinator object waits to execute your coordinateWritingItemAtURL event.
error: If a file presenter encounters an error while preparing for this write operation, that error is returned in this parameter and the event in the writer parameter is not executed. If you cancel this operation before the writer event is executed, this parameter contains an error object on output.

The coordinateWritingItemAtURL event performs the file operations in a coordinated manner. This event receives the file reference containing the URL of the item and returns no value. Always use the UR passed into the block instead of the value in the url parameter.

You use this method to perform write-related operations on a file or directory in a coordinated manner. This method executes synchronously, blocking the current thread until the writer block finishes executing. Before executing the block, though, the file coordinator waits until other relevant file presenter objects finish in-progress actions. Similarly, your write operation may cause pending actions for other file presenters to wait until your operations are complete. Whether or not the file coordinator waits depends on whether the item being written is a file or directory and also depends on other related operations.

If the url parameter specifies a file:

- This method waits for other readers and writers of the exact same file to finish in-progress actions.
- This method waits if the file is a file package and other writers are reading or writing items in the package directory.
- This method does not wait for readers or writers that are manipulating the parent directory of the file, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinatorWritingForMoving option.

If the url parameter specifies a directory:

- This method waits if other read or write operations are occurring on the exact same directory.
- This method does not wait if read or write operations are occurring on items inside the directory (but not on the directory itself).

- This method does not wait for readers or writers that are manipulating the parent directory of the directory, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinatorWritingForMoving option.

This method calls the relinquishPresentedItemToWriter method of any relevant file presenters. This method is called both for file presenters in the current process and in other processes. Depending on the options you specify, other methods of the file presenters may also be called. When writing a file package directory, file presenter objects that are currently reading or writing the contents of that file package also receive these notifications. All of the called methods must return successfully before the file coordinator executes your block. If multiple file presenters are operating on the item, the order in which those presenters are notified is undefined.

Note: When deleting an item inside a file package using the NSFileCoordinatorWritingForDeleting option, the file coordinator does not call the accommodatePresentedItemDeletionWithCompletionHandler method of any file presenters monitoring the file package directory itself. Instead, the delete operation is treated as a write operation on the file package.
With one exception, do not nest calls to file coordinator methods inside the block you pass to this method. You may call the coordinateReadingItemAtURL method to read the file if you discover through modification-date checking that the contents of the file have changed. However, if you call this method from inside your block, the file coordinator object throws an exception.

Available in Mac OS X v10.7 and later.

97.4.11 coordinateWritingItemAtURL(URL as string, options as Integer, byref error as NSErrorMBS, tag as Variant = nil)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Initiates a write operation on a single file or directory using the specified options.
Notes: url: A URL identifying the file or directory to write. If other objects or processes are acting on the item at the URL, the actual URL passed to writer parameter may be different than the one in this parameter.
options: One of the writing options (see constants). The options you specify partially determine how file presenters are notified and how this file coordinator object waits to execute your coordinateWritingItemAtURL event.
error: If a file presenter encounters an error while preparing for this write operation, that error is returned in this parameter and the event in the writer parameter is not executed. If you cancel this operation before the writer event is executed, this parameter contains an error object on output.

The coordinateWritingItemAtURL event performs the file operations in a coordinated manner. This event receives the file reference containing the URL of the item and returns no value. Always use the UR passed into the block instead of the value in the url parameter.

You use this method to perform write-related operations on a file or directory in a coordinated manner. This method executes synchronously, blocking the current thread until the writer block finishes executing. Before executing the block, though, the file coordinator waits until other relevant file presenter objects finish in-progress actions. Similarly, your write operation may cause pending actions for other file presenters to wait until your operations are complete. Whether or not the file coordinator waits depends on whether the item being written is a file or directory and also depends on other related operations.

If the url parameter specifies a file:

- This method waits for other readers and writers of the exact same file to finish in-progress actions.
- This method waits if the file is a file package and other writers are reading or writing items in the package directory.
- This method does not wait for readers or writers that are manipulating the parent directory of the file, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCoordinator-WritingForMoving option.

If the url parameter specifies a directory:

- This method waits if other read or write operations are occurring on the exact same directory.
- This method does not wait if read or write operations are occurring on items inside the directory (but not on the directory itself).
- This method does not wait for readers or writers that are manipulating the parent directory of the directory, unless one of those writers specified the NSFileCoordinatorWritingForDeleting or NSFileCo-ordinatorWritingForMoving option.

This method calls the relinquishPresentedItemToWriter method of any relevant file presenters. This method is called both for file presenters in the current process and in other processes. Depending on the options you specify, other methods of the file presenters may also be called. When writing a file package directory, file presenter objects that are currently reading or writing the contents of that file package also receive these notifications. All of the called methods must return successfully before the file coordinator executes your block. If multiple file presenters are operating on the item, the order in which those presenters are notified is undefined.

Note: When deleting an item inside a file package using the NSFileCoordinatorWritingForDeleting option, the file coordinator does not call the accommodatePresentedItemDeletionWithCompletionHandler method of any file presenters monitoring the file package directory itself. Instead, the delete operation is treated as a write operation on the file package.

With one exception, do not nest calls to file coordinator methods inside the block you pass to this method. You may call the coordinateReadingItemAtURL method to read the file if you discover through modification-date checking that the contents of the file have changed. However, if you call this method from inside your block, the file coordinator object throws an exception.

Available in Mac OS X v10.7 and later.

- 97.4.24 coordinateWritingItemAtURL(url as string, file as folderitem, tag as Variant) 15423

97.4.12 filePresenters as NSFilePresenterMBS()

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The process' file presenters.

97.4.13 FileURL(file as folderitem) as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Convenience method to give you an URL for a folderitem.

97.4.14 itemAtURLdidMoveToURL(oldURL as string, newURL as string)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Announce that the item located by a URL is now located by another URL.
Notes: This triggers the sending of messages to NSFilePresenters that implement the corresponding optional methods, even those in other processes, except the one specified when -initWithFilePresenter: was invoked:
- presentedItemDidMoveToURL: is sent to NSFilePresenters of the item.
- If the item is a directory then presentedItemDidMoveToURL is sent to NSFilePresenters of each item contained by it.
- presentedSubitemAtURL is sent to NSFilePresenters of each directory that contains the item, unless that method is not implemented but presentedItemDidChange is, and the directory is actually a file package, in which case presentedItemDidChange is sent instead.

Useless invocations of this method are harmless, so you don't have to write code that compares NSURLs for equality, which is not straightforward. This method must be invoked from within the block passed to an

invocation of coordinateWritingItemAtURL.

97.4.15 itemAtURLwillMoveToURL(oldURL as string, newURL as string)

MBS MacCloud Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Announce that the item located by a URL is going to be located by another URL.
Notes: Support for App Sandbox on OS X. Some applications can rename files while saving them. For example, when a user adds attachments to a rich text document, TextEdit changes the document's extension from .rtf to .rtfd. A sandboxed application like TextEdit must ordinarily prompt the user for approval before renaming a document. You can invoke this method to make your process declare its intent to rename a document without user approval. After the renaming succeeds you must invoke itemAtURLdidMoveToURL, with the same arguments, for the process to keep access to the file with its new name and to give up access to any file that appears with the old name. If the renaming fails you should probably not invoke itemAtURLwillMoveToURL.

There is no reason to invoke this method from applications that do not use App Sandbox. Invoking it does nothing on iOS.

97.4.16 prepareForReadingItemsAtURLs(readingFiles() as folderitem, readingOptions as Integer, writingItemsAtFiles() as folderitem, writingOptions as Integer, byref error as NSErrorMBS, tag as Variant = nil)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Prepare to read or write from multiple files in a single batch operation.
Notes: readingFiles: An array of folderitems identifying the items you want to read.
readingOptions: One of the reading options (see constants). If you pass 0 for this parameter, the savePresentedItemChangesWithCompletionHandler method of relevant file presenters is called before the prepareComplete event executes.
writingItemsAtFiles: An array of folderitems identifying the items you want to write.
writingOptions: One of the writing options (see constants). The options you specify partially determine how file presenters are notified and how this file coordinator object waits to execute your block.

Error: If a file presenter encounters an error while preparing for this operation, that error is returned in this parameter and the block in the writer parameter is not executed. If you cancel this operation before the batchAccessor block is executed, this parameter contains an error object on output.

The prepareComplete event is called and receives a completion handler that it must execute when it has finished its read and write calls.

You use this method to prepare the file coordinator for multiple read and write operations. This method

executes synchronously, blocking the current thread until the prepareComplete event finishes executing. The event does not perform the actual operations itself but calls the coordinateReadingItemAtURL and coordinateWritingItemAtURL methods to perform them. The reason to call this method first is to improve performance when reading and writing large numbers of files or directories.

Because file coordination requires interprocess communication, it is much more efficient to batch changes to large numbers of files and directories than to change each item individually. The file coordinator uses the values in the readingURLs and writingURLs parameters together with reading and writing options to prepare any relevant file presenters for the upcoming operations. Specifically, it uses these parameters in the same way as the coordinateReadingItemAtURL and coordinateWritingItemAtURL methods to determine which file presenter methods to call.

Available in Mac OS X v10.7 and later.
See also:

97.4.17 prepareForReadingItemsAtURLs(readingURLs() as string, readingOptions as Integer, writingItemsAtURLs() as string, writingOptions as Integer, byref error as NSErrorMBS, tag as Variant = nil)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Prepare to read or write from multiple files in a single batch operation.
Notes: readingURLs: An array of url strings identifying the items you want to read.
readingOptions: One of the reading options (see constants). If you pass 0 for this parameter, the savePresentedItemChangesWithCompletionHandler method of relevant file presenters is called before the prepareComplete event executes.
writingItemsAtURLs: An array of url strings identifying the items you want to write.
writingOptions: One of the writing options (see constants). The options you specify partially determine how file presenters are notified and how this file coordinator object waits to execute your block.

Error: If a file presenter encounters an error while preparing for this operation, that error is returned in this parameter and the block in the writer parameter is not executed. If you cancel this operation before the batchAccessor block is executed, this parameter contains an error object on output.

The prepareComplete event is called and receives a completion handler that it must execute when it has finished its read and write calls.

You use this method to prepare the file coordinator for multiple read and write operations. This method executes synchronously, blocking the current thread until the prepareComplete event finishes executing. The event does not perform the actual operations itself but calls the coordinateReadingItemAtURL and coor-

dinateWritingItemAtURL methods to perform them. The reason to call this method first is to improve performance when reading and writing large numbers of files or directories.

Because file coordination requires interprocess communication, it is much more efficient to batch changes to large numbers of files and directories than to change each item individually. The file coordinator uses the values in the readingURLs and writingURLs parameters together with reading and writing options to prepare any relevant file presenters for the upcoming operations. Specifically, it uses these parameters in the same way as the coordinateReadingItemAtURL and coordinateWritingItemAtURL methods to determine which file presenter methods to call.

Available in Mac OS X v10.7 and later.

97.4.25 prepareComplete(Complete as NSFilePresenterHandlerMBS, tag as Variant)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: This event is called by prepareForReadingItemsAtURLs.
Notes: You must call the complete handler when you are done.

97.4.26 Constants

Reading flag constants.

Constant	Value	Description
NSFileCoordinatorReadingResolvesSymbolicLink	2	Whether reading of an item that might be a symbolic link fil olution of the link if it is. This affects the URL passed to the an invocation of one of the coordinateReadingItemAtURL... not a valid option to use with prepareForReadingItemsAtURI
NSFileCoordinatorReadingWithoutChanges	1	Whether reading does _not_ trigger sending of sav ChangesWithCompletionHandler to certain NSFilePresenter and waiting for those NSFilePresenters to respond. The defau ing coordinated reading is to send savePresentedItemChangesW Handler to NSFilePresenters.

Writing flag constants.

Constant	Value	Description
NSFileCoordinatorWritingForDeleting	1	Whether the writing to be done is actually the deletion of the item. T fects how the writing waits for previously scheduled coordinated readi writing, how the writing causes subsequently scheduled reading and to wait, and what NSFilePresenter messaging is done. See the comm the Single File Coordination section below. This option is how you sending of accommodatePresentedItemDeletionWithCompletionHandle commodatePresentedSubitemDeletionAtURL messages to NSFilePrese For example, Finder uses this when it's emptying the trash to give N resenters a chance to close documents before their files disappear, or disappear if the files weren't still open.
NSFileCoordinatorWritingForMerging	4	Whether coordinated writing triggers sending of savePresente ChangesWithCompletionHandler to certain NSFilePresenters in the and waiting for those NSFilePresenters to respond.
NSFileCoordinatorWritingForMoving	2	Whether the writing to be done is actually the moving or renaming of th This affects how the writing waits for previously scheduled coordinated and writing, how the writing causes subsequently scheduled reading and to wait, and what NSFilePresenter messaging is done. See the comment Single File Coordination section below. This option has no effect when being moved is a plain file so you can use it in code that moves file items without checking whether the items are files or directories. A check would invite a race condition anyway. For example, Finder uses this when it's moving items that the user has and dropped so as not to yank files contained by moved folders out fr derneath applications that are reading or writing those files.
NSFileCoordinatorWritingForReplacing	8	Whether the writing to be done is actually the replacement of the ite a different item. It causes the same behavior as NSFileCoordinatorW ForDeleting except that when the item being written to is renamed or while the writer is being made to wait the item is considered to have different item, so the writer is not passed an updated URL to reflect the ing or moving. Use this when the moving or creation of an item will any item that gets in its way. To avoid a race condition use it regar whether there is actually an item in the way before the writing begins. use this when simply updating the contents of a file, even if the way that is writing the contents to another file and renaming it into place. not a valid option to use with prepareForReadingItemsAtURLs. For example, NSDocument uses this for NSSaveAsOperation and NSS Operation to announce that it is possibly overwriting an item with a new file or file package. This gives any NSFilePresenter of the over item, including perhaps a different instance of NSDocument, perhaps same application, a chance to close itself before the item is overwritten For another example, the most accurate and safe way to coordinate a to invoke coordinateWritingItemAtURL using the NSFileCoordinatorW ForMoving option with the source URL and NSFileCoordinatorWriting placing with the destination URL.

97.5 class NSFileManagerMBS

97.5.1 class NSFileManagerMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The NSFileManager class enables you to perform many generic file-system operations and insulates an application from the underlying file system.
Example:

```
// create a folder, move a file to the trash and read file attributes
Var fm As NSFileManagerMBS = NSFileManagerMBS.defaultManager
Var error As NSErrorMBS

Var folder As FolderItem = SpecialFolder.Desktop.Child("Test Folder")
If Not fm.createDirectory(folder, True, Nil, error) Then
MessageBox error.localizedDescription
Return
End If

Var file As FolderItem = SpecialFolder.Desktop.Child("test.txt")
Var attrs As Dictionary = fm.attributesOfItemAtPath(file, error)
If attrs <>Nil Then
MessageBox "Size: " + attrs.Lookup(NSFileManagerMBS.NSFileSize, 0).StringValue + " bytes"
End If

Var trashed As FolderItem
If fm.trashItem(file, trashed, error) Then
MessageBox "Moved to " + trashed.NativePath
End If
```

Notes: In Xojo you can do the same with folderitem. But for some iCloud related tasks you need to use this class.

In Cocoa applications, a file manager object is usually your first interaction with the file system. You use this object to locate, create, copy, and move files and directories. You also use this object to get information about files and directories, such as its size, modification date, and BSD permissions. You can also use a file manager object to change the values of many file and directory attributes.

The NSFileManagerMBS class supports both the folderitem and path string as ways to specify the location of a file or directory. The use of the folderitem is generally preferred for specifying file-system items because they can convert path information to a more efficient representation internally. You can also obtain a bookmark from an folderitem, which is similar to an alias and offers a more sure way of locating the file or directory later.

In iOS 5.0 and later and in Mac OS X v10.7 and later, NSFileManager includes methods for managing items

stored in the cloud. Files and directories tagged for cloud storage are synced to the user's MobileMe account so that they can be made available to the user's iOS devices and Macintosh computers. Changes to an item in one location are propagated to all other locations to ensure the items stay in sync.

97.5.2 Methods

97.5.3 attributesOfFileSystemForPath(item as folderitem, byref error as NSErrorMBS) as Dictionary

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Returns a dictionary that describes the attributes of the mounted file system on which a given path resides.
Notes: path: A folderitem pointing to the mounted file system.
error: On input, a pointer to an error object. If an error occurs, this pointer is set to an actual error object containing the error information. You may specify nil for this parameter if you do not want the error information.

Returns an Dictionary object that describes the attributes of the mounted file system on which path resides, or nil if an error occurs. See File-System Attribute Keys for a description of the keys available in the dictionary.
See also:

- 97.5.4 attributesOfFileSystemForPath(path as string, byref error as NSErrorMBS) as Dictionary 15428

97.5.4 attributesOfFileSystemForPath(path as string, byref error as NSErrorMBS) as Dictionary

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Returns a dictionary that describes the attributes of the mounted file system on which a given path resides.
Notes: path: Any pathname within the mounted file system.
error: On input, a pointer to an error object. If an error occurs, this pointer is set to an actual error object containing the error information. You may specify nil for this parameter if you do not want the error information.

Returns an Dictionary object that describes the attributes of the mounted file system on which path resides, or nil if an error occurs. See File-System Attribute Keys for a description of the keys available in the dictionary.

- 97.5.3 attributesOfFileSystemForPath(item as folderitem, byref error as NSErrorMBS) as Dictionary 15427

97.5.5 attributesOfItemAtPath(item as folderitem, byref error as NSErrorMBS) as Dictionary

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the attributes of the item at a given path.
Example:

```
Var n as new NSFileManagerMBS
Var e as NSErrorMBS
Var d as Dictionary = n.attributesOfItemAtPath(SpecialFolder.Desktop, e)

break // check dictionary in debugger
```

Notes: item: The folderitem of a file or directory.
Error: If an error occurs, this is set to an actual error object containing the error information.

Return a Dictionary object that describes the attributes (file, directory, symlink, and so on) of the file specified by path. The keys in the dictionary are described in File Attribute Keys. (see NSFile* methods)

Special Considerations
This method does not traverse symbolic links. If the item at the path is a symbolic link—that is, the value of the NSFileType key in the attributes dictionary is NSFileTypeSymbolicLink—you can use the destinationOfSymbolicLinkAtPath method to retrieve the path of the item pointed to by the link. You can also use the stringByResolvingSymlinksInPath method of NSString to resolve links in the path before retrieving the

item's attributes.

Available in Mac OS X v10.5 and later.
See also:

- 97.5.6 attributesOfItemAtPath(path as string, byref error as NSErrorMBS) as Dictionary 15429

97.5.6 attributesOfItemAtPath(path as string, byref error as NSErrorMBS) as Dictionary

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Returns the attributes of the item at a given path.
Notes: path: The path of a file or directory.
Error: If an error occurs, this is set to an actual error object containing the error information.

Return a Dictionary object that describes the attributes (file, directory, symlink, and so on) of the file specified by path. The keys in the dictionary are described in File Attribute Keys. (see NSFile* methods)

Special Considerations
This method does not traverse symbolic links. If the item at the path is a symbolic link—that is, the value of the NSFileType key in the attributes dictionary is NSFileTypeSymbolicLink—you can use the destinationOfSymbolicLinkAtPath method to retrieve the path of the item pointed to by the link. You can also use the stringByResolvingSymlinksInPath method of NSString to resolve links in the path before retrieving the item's attributes.

Available in Mac OS X v10.5 and later.
See also:

- 97.5.5 attributesOfItemAtPath(item as folderitem, byref error as NSErrorMBS) as Dictionary 15428

97.5.7 changeCurrentDirectory(folder as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Changes the path of the current working directory to the specified path.
Example:

```
Var m as new NSFileManagerMBS
Var f as FolderItem = SpecialFolder.Applications
if m.changeCurrentDirectory(f) then
MessageBox m.currentDirectory.NativePath
end if
```

Notes: folder: The path of the directory to which to change.

Returns true if successful, otherwise false.

All relative pathnames refer implicitly to the current working directory. Changing the current working directory affects only paths created in the current process.
See also:

- 97.5.8 changeCurrentDirectory(path as string) as boolean 15430

97.5.8 changeCurrentDirectory(path as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Changes the path of the current working directory to the specified path.
Example:

```
Var m as new NSFileManagerMBS
if m.changeCurrentDirectory("/Users") then
MessageBox m.currentDirectoryPath
end if
```

Notes: path: The path of the directory to which to change.

Returns true if successful, otherwise false.

All relative pathnames refer implicitly to the current working directory. Changing the current working directory affects only paths created in the current process.
See also:

- 97.5.7 changeCurrentDirectory(folder as folderitem) as boolean 15429

97.5.9 Constructor

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The constructor.

97.5.10 containerFolderForSecurityApplicationGroupIdentifier(groupIdentifier as string) as folderItem

MBS MacCocoa Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Returns the container directory associated with the specified security application group ID.
Notes: As explained in App Sandbox Design Guide, groups of sandboxed apps that need to share files and other information can request a container directory as part of their entitlements. These directories are stored in
textasciitilde /Library/Group Containers/.

When called with a valid group identifier, this method returns the location of that directory as an folderitem. This method also creates the directory if it does not yet exist.

Important: Your app must have a com.apple.security.application-groups entitlement for the specified application group.

Available in OS X v10.8 and later.

97.5.11 containerURLForSecurityApplicationGroupIdentifier(groupIdentifier as string) as string

MBS MacCocoa Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: Returns the container directory associated with the specified security application group ID.
Notes: As explained in App Sandbox Design Guide, groups of sandboxed apps that need to share files and other information can request a container directory as part of their entitlements. These directories are stored in
textasciitilde /Library/Group Containers/.

When called with a valid group identifier, this method returns the location of that directory as an URL. This method also creates the directory if it does not yet exist.

Important: Your app must have a com.apple.security.application-groups entitlement for the specified application group.

Available in OS X v10.8 and later.

97.5.12 contentsEqual(path1 as folderitem, path2 as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the files or directories in specified paths have the same contents.
Notes: path1: The path of a file or directory to compare with the contents of path2.
path2: The path of a file or directory to compare with the contents of path1.

Returns true if file or directory specified in path1 has the same contents as that specified in path2, otherwise false.

If path1 and path2 are directories, the contents are the list of files and subdirectories each contains—contents of subdirectories are also compared. For files, this method checks to see if they,Äôre the same file, then compares their size, and finally compares their contents. This method does not traverse symbolic links, but compares the links themselves.

97.5.13 copyItem(source as folderItem, dest as folderItem, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Copies the item at the specified path to a new location synchronously.
Notes: Source: The path to the file or directory you want to move.
Dest: The path at which to place the copy of srcPath. This path must include the name of the file or directory in its new location.
error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if the item was copied successfully or the file manager's delegate aborted the operation deliberately. Returns false if an error occurred.

When copying items, the current process must have permission to read the file or directory at Source and write the parent directory of Dest. If the item at Source is a directory, this method copies the directory and all of its contents, including any hidden files. If a file with the same name already exists at Dest, this method aborts the copy attempt and returns an appropriate error. If the last component of srcPath is a symbolic link, only the link is copied to the new path.

Available in OS X v10.5 and later.
See also:

- 97.5.14 copyItem(sourcePath as String, destPath as String, byref error as NSErrorMBS) as boolean 15432

97.5.14 copyItem(sourcePath as String, destPath as String, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 19.5, Platform: macOS, Targets: All.

Function: Copies the item at the specified path to a new location synchronously.
Notes: Source: The path to the file or directory you want to move.

Dest: The path at which to place the copy of srcPath. This path must include the name of the file or directory in its new location.
error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if the item was copied successfully or the file manager's delegate aborted the operation deliberately. Returns false if an error occurred.

When copying items, the current process must have permission to read the file or directory at Source and write the parent directory of Dest. If the item at Source is a directory, this method copies the directory and all of its contents, including any hidden files. If a file with the same name already exists at Dest, this method aborts the copy attempt and returns an appropriate error. If the last component of srcPath is a symbolic link, only the link is copied to the new path.

Available in OS X v10.5 and later.
See also:

- 97.5.13 copyItem(source as folderItem, dest as folderItem, byref error as NSErrorMBS) as boolean 15432

97.5.15 copyItemMT(source as folderItem, dest as folderItem, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 18.2, Platform: macOS, Targets: All.

Function: Copies the item at the specified path to a new location synchronously.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var d as FolderItem = SpecialFolder.Desktop.Child("output.rtf")
Var e as NSErrorMBS

if not NSFileManagerMBS.defaultManager.copyItemMT(f,d,e) then
MessageBox e.LocalizedDescription
else
MessageBox "OK"
end if
```

Notes: Source: The path to the file or directory you want to move.
Dest: The path at which to place the copy of srcPath. This path must include the name of the file or directory in its new location.
error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if the item was copied successfully or the file manager's delegate aborted the operation deliberately. Returns false if an error occurred.

When copying items, the current process must have permission to read the file or directory at Source and write the parent directory of Dest. If the item at Source is a directory, this method copies the directory and all of its contents, including any hidden files. If a file with the same name already exists at Dest, this method aborts the copy attempt and returns an appropriate error. If the last component of srcPath is a symbolic link, only the link is copied to the new path.

Available in OS X v10.5 and later.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

15433

97.5.17 createDirectory(Path as folderItem, createIntermediates as boolean = true, attrs as Dictionary = nil, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Creates a directory with given attributes at the specified path.
Notes: path: A folderitme identifying the directory to create. You may specify a full path or a path that is relative to the current working directory. This parameter must not be nil.
createIntermediates: If true, this method creates any non-existent parent directories as part of creating the directory in path. If NO, this method fails if any of the intermediate parent directories does not exist. This method also fails if any of the intermediate path elements corresponds to a file and not a directory.
attributes: The file attributes for the new directory and any newly created intermediate directories. You can set the owner and group numbers, file permissions, and modification date. If you specify nil for this parameter or omit a particular value, one or more default values are used as described in the discussion. For a list of keys you can include in this dictionary, see Constants. Some of the keys, such as NSFileHFSCreatorCode and NSFileHFSTypeCode, do not apply to directories.
error: If an error occurs, this variable is set to an actual error object containing the error information.

Returns true if the directory was created, true if createIntermediates is set and the directory already exists, or false if an error occurred.

If you specify nil for the attributes parameter, this method uses a default set of values for the owner, group, and permissions of any newly created directories in the path. Similarly, if you omit a specific attribute, the default value is used. The default values for newly created directories are as follows:

- Permissions are set according to the umask of the current process. For more information, see umask.
- The owner ID is set to the effective user ID of the process.
- The group ID is set to that of the parent directory.

See also:

- 97.5.18 createDirectory(Path as String, createIntermediates as boolean = true, attrs as Dictionary = nil, byref error as NSErrorMBS) as boolean 15435

97.5.18 createDirectory(Path as String, createIntermediates as boolean = true, attrs as Dictionary = nil, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Creates a directory with given attributes at the specified path.
Notes: path: A path string identifying the directory to create. You may specify a full path or a path that

is relative to the current working directory. This parameter must not be nil.
createIntermediates: If true, this method creates any non-existent parent directories as part of creating the directory in path. If NO, this method fails if any of the intermediate parent directories does not exist. This method also fails if any of the intermediate path elements corresponds to a file and not a directory.
attributes: The file attributes for the new directory and any newly created intermediate directories. You can set the owner and group numbers, file permissions, and modification date. If you specify nil for this parameter or omit a particular value, one or more default values are used as described in the discussion. For a list of keys you can include in this dictionary, see Constants. Some of the keys, such as NSFileHFSCreatorCode and NSFileHFSTypeCode, do not apply to directories.
error: If an error occurs, this variable is set to an actual error object containing the error information.

Returns true if the directory was created, true if createIntermediates is set and the directory already exists, or false if an error occurred.

If you specify nil for the attributes parameter, this method uses a default set of values for the owner, group, and permissions of any newly created directories in the path. Similarly, if you omit a specific attribute, the default value is used. The default values for newly created directories are as follows:

- Permissions are set according to the umask of the current process. For more information, see umask.
- The owner ID is set to the effective user ID of the process.
- The group ID is set to that of the parent directory.

See also:

- 97.5.17 createDirectory(Path as folderItem, createIntermediates as boolean = true, attrs as Dictionary = nil, byref error as NSErrorMBS) as boolean 15435

97.5.19 createFile(Path as folderItem, contents as MemoryBlock, attrs as Dictionary = nil) as boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Creates a file with the specified content and attributes at the given location.
Notes: path: The folderitem for the new file.
contents: A data object containing the contents of the new file.
attributes: A dictionary containing the attributes to associate with the new file. You can use these attributes to set the owner and group numbers, file permissions, and modification date. For a list of keys, see NSFileAttributeKey. If you specify nil for attributes, the file is created with a set of default attributes.

Returns true if the operation was successful or if the item already exists, otherwise false.

If you specify nil for the attributes parameter, this method uses a default set of values for the owner, group, and permissions of any newly created directories in the path. Similarly, if you omit a specific attribute, the

default value is used. The default values for newly created files are as follows:

- Permissions are set according to the umask of the current process. For more information, see umask.
- The owner ID is set to the effective user ID of the process.
- The group ID is set to that of the parent directory.

If a file already exists at path, this method overwrites the contents of that file if the current process has the appropriate privileges to do so.
See also:

- 97.5.20 createFile(Path as String, contents as MemoryBlock, attrs as Dictionary = nil) as boolean 15437

97.5.20 createFile(Path as String, contents as MemoryBlock, attrs as Dictionary = nil) as boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Creates a file with the specified content and attributes at the given location.
Notes: path: The path for the new file.
contents: A data object containing the contents of the new file.
attributes: A dictionary containing the attributes to associate with the new file. You can use these attributes to set the owner and group numbers, file permissions, and modification date. For a list of keys, see NSFileAttributeKey. If you specify nil for attributes, the file is created with a set of default attributes.

Returns true if the operation was successful or if the item already exists, otherwise false.

If you specify nil for the attributes parameter, this method uses a default set of values for the owner, group, and permissions of any newly created directories in the path. Similarly, if you omit a specific attribute, the default value is used. The default values for newly created files are as follows:

- Permissions are set according to the umask of the current process. For more information, see umask.
- The owner ID is set to the effective user ID of the process.
- The group ID is set to that of the parent directory.

If a file already exists at path, this method overwrites the contents of that file if the current process has the appropriate privileges to do so.

- 97.5.19 createFile(Path as folderItem, contents as MemoryBlock, attrs as Dictionary = nil) as boolean 15436

97.5.21 createSymbolicLink(file as folderitem, destFile as folderitem, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates a symbolic link at the specified URL that points to an item at the given URL.
Example:

```
Var m as new NSFileManagerMBS
Var file as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var destfile as FolderItem = SpecialFolder.Desktop.Child("Notes.rtf")
Var error as NSErrorMBS

if m.createSymbolicLink(file, destfile, error) then
MessageBox "OK"
else
MessageBox "Error: "+error.localizedDescription
end if
```

Notes: file: The path at which to create the new symbolic link. The last path component is used as the name of the link.
destFile: The path that contains the item to be pointed to by the link. In other words, this is the destination of the link.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true if the symbolic link was created or false if an error occurred. This method also returns false if a file, directory, or link already exists at path.

This method does not traverse symbolic links contained in either path or destPath.

Available in Mac OS X v10.5 and later.
As of Mac OS X 10.7 tests here, it seems like an alias file is created, not a symbolic link.
See also:

- 97.5.22 createSymbolicLink(path as string, destPath as string, byref error as NSErrorMBS) as boolean 15438

97.5.22 createSymbolicLink(path as string, destPath as string, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates a symbolic link that points to the specified destination.
Notes: path: The path at which to create the new symbolic link. The last path component is used as the name of the link.

destPath: The path that contains the item to be pointed to by the link. In other words, this is the destination of the link.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns true if the symbolic link was created or false if an error occurred. This method also returns false if a file, directory, or link already exists at path.

This method does not traverse symbolic links contained in either path or destPath.

Available in Mac OS X v10.5 and later.
As of Mac OS X 10.7 tests here, it seems like an alias file is created, not a symbolic link.
See also:

- 97.5.21 createSymbolicLink(file as folderitem, destFile as folderitem, byref error as NSErrorMBS) as boolean 15438

97.5.23 destinationOfSymbolicLinkAtPath(file as folderitem, byref error as NSErrorMBS) as string

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns the path of the item pointed to by a symbolic link.
Notes: file: The folderitem of a file or directory. Be aware that Xojo may already have resolved the symlink!
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns a string containing the path of the directory or file to which the symbolic link path refers, or "" upon failure. If the symbolic link is specified as a relative path, that relative path is returned.
See also:

- 97.5.24 destinationOfSymbolicLinkAtPath(path as string, byref error as NSErrorMBS) as string 15439

97.5.24 destinationOfSymbolicLinkAtPath(path as string, byref error as NSErrorMBS) as string

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns the path of the item pointed to by a symbolic link.
Example:

```
Var f as new NSFileManagerMBS
Var e as NSErrorMBS

Var p as string = f.destinationOfSymbolicLinkAtPath("/tmp", e)
```

```
if e = nil then
MessageBox p
else
MessageBox e.LocalizedDescription
end if
```

Notes: path: The path of a file or directory.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns a string containing the path of the directory or file to which the symbolic link path refers, or "" upon failure. If the symbolic link is specified as a relative path, that relative path is returned.
See also:

- 97.5.23 destinationOfSymbolicLinkAtPath(file as folderitem, byref error as NSErrorMBS) as string 15439

97.5.25 displayName(path as folderitem) as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the display name of the file or directory at a specified path.
Notes: path: The path of a file or directory.

The name of the file or directory at path in a localized form appropriate for presentation to the user. If there is no file or directory at path, or if an error occurs, returns path as is.

Display names are user-friendly names for files. They are typically used to localize standard file and directory names according to the user's language settings. They may also reflect other modifications, such as the removal of filename extensions. Such modifications are used only when displaying the file or directory to the user and do not reflect the actual path to the item in the file system. For example, if the current user's preferred language is French, the following code fragment logs the name Biblioth√®que and not the name Library, which is the actual name of the directory.

97.5.26 evictUbiquitousItem(item as folderitem, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Removes the local copy of the specified cloud-based item.
Notes: item: Specify the file or directory in iCloud storage.
error: If an error occurs, this pointer is set to an NSError object containing information about the error.

Returns true if the local item was removed successfully or false if it was not. If false is returned, an NSError object describing the error is returned in the error parameter.

This method does not remove the item from the cloud. It removes only the local version. You can use this method to force iCloud to download a new version of the file or directory from the server.

To delete a file permanently from the user's iCloud storage, use the regular NSFileManager routines for deleting files and directories. Remember that deleting items from iCloud cannot be undone. Once deleted, the item is gone forever.

Available in Mac OS X v10.7 and later.

97.5.27 fileExists(path as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a file or directory exists at a specified path.
Example:

```
Var m as new NSFileManagerMBS
Var f as FolderItem = SpecialFolder.Desktop.Child("notes.rtf")

MessageBox "File exists: "+str(m.fileExists(f))
```

Notes: path: The path of the file or directory. I

Returns true if a file at the specified path exists or false if the file's does not exist or its existence could not be determined.

If the file at path is inaccessible to your application, perhaps because one or more parent directories are inaccessible, this method returns false. If the final element in path specifies a symbolic link, this method traverses the link and returns true or false based on the existence of the file at the link destination.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior or race conditions. It's far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle those errors gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see Race Conditions, File Operations, and Interprocess Communication in Secure Coding Guide.
http://developer.apple.com/library/mac/documentation/Security/Conceptual/SecureCodingGuide/Articles/RaceConditions.html#//apple_ref/doc/uid/TP40002585
See also:

• 97.5.28 fileExists(path as folderitem, byref isDirectory as boolean) as boolean 15442

97.5.28 fileExists(path as folderitem, byref isDirectory as boolean) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether a file or directory exists at a specified path.
Example:

```
Var m as new NSFileManagerMBS
Var f as FolderItem = SpecialFolder.Desktop

Var directory as Boolean
MessageBox "File exists: "+str(m.fileExists(f, directory))+" and is Directory: "+str(Directory)
```

Notes: path: The path of a file or directory.
isDirectory: Upon return, contains true if path is a directory or if the final path element is a symbolic link that points to a directory, otherwise contains false. If path doesn't exist, the return value is undefined.

Returns true if a file at the specified path exists or false if the file's does not exist or its existence could not be determined.

If the file at path is inaccessible to your application, perhaps because one or more parent directories are inaccessible, this method returns false. If the final element in path specifies a symbolic link, this method traverses the link and returns true or false based on the existence of the file at the link destination.

If you need to further determine if path is a package, use the isFilePackageAtPath method of NSWorkspaceMBS.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior or race conditions. It's far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle those errors gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see Race Conditions, File Operations, and Interprocess Communication in Secure Coding Guide.
http://developer.apple.com/library/mac/documentation/Security/Conceptual/SecureCodingGuide/Articles/RaceConditions.html#//apple_ref/doc/uid/TP40002585

• 97.5.27 fileExists(path as folderitem) as boolean 15441

97.5.29 FileForUbiquityContainerIdentifier(containerIdentifier as string) as folderitem

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns the iCloud directory associated with the specified container ID.
Notes: containerID: Specify the container ID of the cloud-based storage container. The string you specify must not contain wildcards and must be of the form <TEAMID>.<CONTAINER>, where <TEAMID>is your development team ID and <CONTAINER>describes the bundle identifier of the container you want to access. The container identifiers for your application must be declared in the com.apple.developer.ubiquity-container-identifiers entitlement.
If you specify "", this method returns the first container listed in the com.apple.developer.ubiquity-container-identifiers entitlement.

Returns a folderitem pointing to the specified container directory or nil if the container could not be located or if iCloud storage is unavailable for the current user or device.

You can use the folderitem returned by this method to build paths to files and directories in the user's iCloud storage. Each application that syncs documents to the cloud must have at least one associated container directory in which to put those files. This container directory can be unique to the application or shared by multiple applications. You use this method to retrieve the folderitem for that container directory.

In addition to writing to its own container directory, an application can write to any container directory for which it has the appropriate permission. Each additional container directory should be listed as an additional value in the com.apple.developer.ubiquity-container-identifiers entitlement.

Note: The development team ID that precedes each container ID string is the unique identifier associated with your development team. You can find this string in the Member Center of the Apple Developer website (http://developer.apple.com/membercenter). From the Member Center home page, select the Your Account tab and then select Organization Profile from the column on the left of that tab. Your team's identifier is in the Company/Organization ID field.
The first time you call this method for a given container directory, iOS extends your application sandbox to include that container directory. Thus, it is important that you call this method at least once before trying to search for files in iCloud. And if your application accesses multiple container directories, you should call the method once for each directory.

Available in Mac OS X v10.7 and later.
FileForUbiquityContainerIdentifier returns folderitem while URLForUbiquityContainerIdentifier returns URL string.

97.5.30 fileManagerWithAuthorization(authorization as NSWorkspaceAuthorizationMBS) as NSFileManagerMBS

MBS MacCocoa Plugin, Plugin Version: 19.3, Platform: macOS, Targets: Desktop only.

Function: Initializes a file manager object that is authorized to perform privileged file system operations.
Notes: Returns nil in case of errors.

This method returns an NSFileManagerMBS instance that can perform file system operations previously allowed by the user via NSWorkspaceMBS.requestAuthorization. Each NSWorkspaceAuthorizationMBS you receive requires creating a new NSFileManagerMBS instance using this method.

Only the following NSFileManagerMBS methods currently take advantage of an authorization:

- createSymbolicLink (NSWorkspaceAuthorizationTypeCreateSymbolicLink)
- setAttributes (NSWorkspaceAuthorizationTypeSetAttributes)
- replaceItem (NSWorkspaceAuthorizationTypeReplaceFile)

Note that an NSWorkspaceAuthorizationTypeSetAttributes authorization only enables setAttributes to modify the following attributes:

- NSFileOwnerAccountID
- NSFileGroupOwnerAccountID
- NSFilePosixPermissions

Also note that for replaceItem, the backupItemName and options parameters will be ignored.

These methods may also fail with any of the following errors:

- NSWorkspaceAuthorizationInvalidError: The provided NSWorkspaceAuthorization expired or is invalid.
- NSFileWriteUnknownError: The application failed to communicate with a helper process, or a file system error occurred.
- NSFileWriteNoPermissionError: The operation failed for any other reason, including the user denying access to the resource, or access to a resource is denied by system policy.

All other NSFileManager methods invoked on this instance will behave normally.
The app using this may need code signature with com.apple.developer.security.privileged-file-operations entitlement for the sandboxed application and may need to be in applications folder.

97.5.31 homeDirectoryForUser(Name as string) as FolderItem

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the home directory for the specified user.
Notes: userName: The username of the owner of the desired home directory.

Returns the folderitem containing the location of the specified user,Äôs home directory, or nil if no such user exists or the user,Äôs home directory is not available.

97.5.32 isDeletableFile(path as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the invoking object appears able to delete a specified file.
Example:

```
Var m as new NSFileManagerMBS
Var f as FolderItem = SpecialFolder.Desktop.Child("notes.rtf")

MessageBox "Can delete: "+str(m.isDeletableFile(f))
```

Notes: path: A file path.

Returns true if the current process has delete privileges for the file at path; otherwise false if the process does not have delete privileges or the existence of the file could not be determined.

For a directory or file to be deletable, the current process must either be able to write to the parent directory of path or it must have the same owner as the item at path. If path is a directory, every item contained in path must be deletable by the current process.

If the file at path is inaccessible to your application, perhaps because it does not have search privileges for one or more parent directories, this method returns false. This method does not traverse symbolic links in the path.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior or race conditions. It's far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle those errors gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see Race Conditions, File Operations, and Interprocess Communication in Secure Coding Guide.
http://developer.apple.com/library/mac/documentation/Security/Conceptual/SecureCodingGuide/Articles/RaceConditions.html#//apple_ref/doc/uid/TP40002585

97.5.33 isExecutableFile(path as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the operating system appears able to execute a specified file.
Example:

```
Var m as new NSFileManagerMBS
Var f as FolderItem = SpecialFolder.Desktop.Child("notes.rtf")

MessageBox "Can execute: "+str(m.isExecutableFile(f))
```

Notes: path: A file path.

Returns true if the current process has execute privileges for the file at path; otherwise false if the process does not have execute privileges or the existence of the file could not be determined.

If the file at path is inaccessible to your application, perhaps because it does not have search privileges for one or more parent directories, this method returns false. This method traverses symbolic links in the path. This method also uses the real user ID and group ID, as opposed to the effective user and group IDs, to determine if the file is executable.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior or race conditions. It's far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle those errors gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see Race Conditions, File Operations, and Interprocess Communication in Secure Coding Guide:
http://developer.apple.com/library/mac/documentation/Security/Conceptual/SecureCodingGuide/Articles/RaceConditions.html#//apple_ref/doc/uid/TP40002585

97.5.34 isReadableFile(path as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the invoking object appears able to read a specified file.
Example:

```
Var m as new NSFileManagerMBS
Var f as FolderItem = SpecialFolder.Desktop.Child("notes.rtf")

MessageBox "Can read: "+str(m.isReadableFile(f))
```

Notes: path: A file path.

Returns true if the current process has read privileges for the file at path; otherwise false if the process does not have read privileges or the existence of the file could not be determined.

If the file at path is inaccessible to your application, perhaps because it does not have search privileges for one or more parent directories, this method returns false. This method traverses symbolic links in the path. This method also uses the real user ID and group ID, as opposed to the effective user and group IDs, to determine if the file is readable.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior or race conditions. It's far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle those errors gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see Race Conditions, File Operations, and Interprocess Communication in Secure Coding Guide.
http://developer.apple.com/library/mac/documentation/Security/Conceptual/SecureCodingGuide/Articles/RaceConditions.html#//apple_ref/doc/uid/TP40002585

97.5.35 isUbiquitousItem(item as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a Boolean indicating whether the item is targeted for storage in iCloud.
Example:

```
Var m as new NSFileManagerMBS
Var f as FolderItem = SpecialFolder.Desktop.Child("notes.rtf")

MessageBox "Is in iCloud: "+str(m.isUbiquitousItem(f))
```

Notes: item: Specify the folderitem for the file or directory whose status you want to check.

Returns true if the item is targeted for iCloud storage or false if it is not. This method also returns false if no item exists at url.

This method reflects only whether the item should be stored in iCloud because a call was made to the setUbiquitous method with a value of true for its flag parameter. This method does not reflect whether the file has actually been uploaded to any iCloud servers. To determine a file's upload status, check the IsUploadedMBS function in the folderitem class.

Available in Mac OS X v10.7 and later.

See also:

- 97.5.36 isUbiquitousItem(URL as string) as boolean 15448

97.5.36 isUbiquitousItem(URL as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a Boolean indicating whether the item is targeted for storage in iCloud.
Notes: item: Specify the URL for the file or directory whose status you want to check.

Returns true if the item is targeted for iCloud storage or false if it is not. This method also returns false if no item exists at url.

This method reflects only whether the item should be stored in iCloud because a call was made to the setUbiquitous method with a value of true for its flag parameter. This method does not reflect whether the file has actually been uploaded to any iCloud servers. To determine a file's upload status, check the IsUploadedMBS function in the folderitem class.

Available in Mac OS X v10.7 and later.
See also:

- 97.5.35 isUbiquitousItem(item as folderitem) as boolean 15447

97.5.37 isWritableFile(path as folderitem) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the invoking object appears able to write to a specified file.
Example:

```
Var m as new NSFileManagerMBS
Var f as FolderItem = SpecialFolder.Desktop.Child("notes.rtf")

MessageBox "Can write: "+str(m.isWritableFile(f))
```

Notes: path: A file path.

Returns true if the current process has write privileges for the file at path; otherwise false if the process does not have write privileges or the existence of the file could not be determined.

If the file at path is inaccessible to your application, perhaps because it does not have search privileges for one or more parent directories, this method returns false. This method traverses symbolic links in the path.

This method also uses the real user ID and group ID, as opposed to the effective user and group IDs, to determine if the file is writable.

Note: Attempting to predicate behavior based on the current state of the file system or a particular file on the file system is not recommended. Doing so can cause odd behavior or race conditions. It's far better to attempt an operation (such as loading a file or creating a directory), check for errors, and handle those errors gracefully than it is to try to figure out ahead of time whether the operation will succeed. For more information on file system race conditions, see Race Conditions, File Operations, and Interprocess Communication in Secure Coding Guide:
http://developer.apple.com/library/mac/documentation/Security/Conceptual/SecureCodingGuide/Articles/RaceConditions.html#//apple_ref/doc/uid/TP40002585

97.5.38 lastPathComponent(pathOrURL as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns the last path component of a file URL or file path.
Notes: Available in Mac OS X v10.6 and later.

97.5.39 linkItem(source as folderItem, dest as folderItem, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Creates a hard link between the items at the specified paths.
Notes: Source: The path that specifies the item you wish to link to. The value in this parameter must not be nil.
Dest: The path that identifies the location where the link will be created. The value in this parameter must not be nil.
error: If an error occurs, this pointer is set to an actual error object containing the error information.

Returns true if the hard link was created or NO if an error occurred. This method also returns false if a file, directory, or link already exists at dstPath.

Use this method to create hard links between files in the current file system. If Source is a directory, this method creates a new directory at Dest and then creates hard links for the items in that directory. If Source is (or contains) a symbolic link, the symbolic link is copied to the new location and not converted to a hard link.

Available in OS X v10.5 and later.
See also:

- 97.5.40 linkItem(sourcePath as String, destPath as String, byref error as NSErrorMBS) as boolean

15450

97.5.40 linkItem(sourcePath as String, destPath as String, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 19.5, Platform: macOS, Targets: All.

Function: Creates a hard link between the items at the specified paths.
Notes: Source: The path that specifies the item you wish to link to. The value in this parameter must not be nil.
Dest: The path that identifies the location where the link will be created. The value in this parameter must not be nil.
error: If an error occurs, this pointer is set to an actual error object containing the error information.

Returns true if the hard link was created or NO if an error occurred. This method also returns false if a file, directory, or link already exists at dstPath.

Use this method to create hard links between files in the current file system. If Source is a directory, this method creates a new directory at Dest and then creates hard links for the items in that directory. If Source is (or contains) a symbolic link, the symbolic link is copied to the new location and not converted to a hard link.

Available in OS X v10.5 and later.
See also:

- 97.5.39 linkItem(source as folderItem, dest as folderItem, byref error as NSErrorMBS) as boolean 15449

97.5.41 moveItem(source as folderItem, dest as folderItem, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Moves the file or directory at the specified path to a new location synchronously.
Notes: source: The path to the file or directory you want to move. This parameter must not be nil.
dest: The new path for the item in Source. This path must include the name of the file or directory in its new location. This parameter must not be nil.
error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if the item was moved successfully or the file manager's delegate aborted the operation deliberately. Returns NO if an error occurred.

When moving items, the current process must have permission to read the item at Source and write the parent directory of Dest. If the item at Source is a directory, this method moves the directory and all of its contents, including any hidden files. If an item with the same name already exists at Dest, this method

aborts the move attempt and returns an appropriate error. If the last component of Source is a symbolic link, only the link is moved to the new path; the item pointed to by the link remains at its current location.

If the source and destination of the move operation are not on the same volume, this method copies the item first and then removes it from its current location. This behavior may trigger additional delegate notifications related to copying and removing individual items.

Available in OS X v10.5 and later.
See also:

- 97.5.42 moveItem(sourcePath as String, destPath as String, byref error as NSErrorMBS) as boolean 15451

97.5.42 moveItem(sourcePath as String, destPath as String, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 19.5, Platform: macOS, Targets: All.

Function: Moves the file or directory at the specified path to a new location synchronously.
Notes: source: The path to the file or directory you want to move. This parameter must not be nil.
dest: The new path for the item in Source. This path must include the name of the file or directory in its new location. This parameter must not be nil.
error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if the item was moved successfully or the file manager's delegate aborted the operation deliberately. Returns NO if an error occurred.

When moving items, the current process must have permission to read the item at Source and write the parent directory of Dest. If the item at Source is a directory, this method moves the directory and all of its contents, including any hidden files. If an item with the same name already exists at Dest, this method aborts the move attempt and returns an appropriate error. If the last component of Source is a symbolic link, only the link is moved to the new path; the item pointed to by the link remains at its current location.

If the source and destination of the move operation are not on the same volume, this method copies the item first and then removes it from its current location. This behavior may trigger additional delegate notifications related to copying and removing individual items.

Available in OS X v10.5 and later.
See also:

- 97.5.41 moveItem(source as folderItem, dest as folderItem, byref error as NSErrorMBS) as boolean 15450

97.5.43 NSFileAppendOnly as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Notes: The key in a file attribute dictionary whose value indicates whether the file is read-only.
The corresponding value is a number containing a Boolean value.
Available in Mac OS X v10.2 and later.

97.5.44 NSFileBusy as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Notes: The key in a file attribute dictionary whose value indicates whether the file is busy.
The corresponding value is a number containing a Boolean value.
Available in Mac OS X v10.4 and later.

97.5.45 NSFileCreationDate as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Notes: The key in a file attribute dictionary whose value indicates the file's creation date.
The corresponding value is a date.
Available in Mac OS X v10.2 and later.

97.5.46 NSFileDeviceIdentifier as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Notes: The key in a file attribute dictionary whose value indicates the identifier for the device on which the file resides.
The corresponding value is a number containing an Int32.
Available in Mac OS X v10.0 and later.

97.5.47 NSFileExtensionHidden as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Notes: The key in a file attribute dictionary whose value indicates whether the file's extension is hidden.
The corresponding value is a number containing a Boolean value.
Available in Mac OS X v10.1 and later.

97.5.48 NSFileGroupOwnerAccountID as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var fileManager As New NSFileManagerMBS

Var error as NSErrorMBS
Var Values As Dictionary = fileManager.attributesOfItemAtPath(file, error)
Var Permissions As Integer = Values.Value(fileManager.NSFilePosixPermissions)

MessageBox "Group: "+_
values.Value(fileManager.NSFileGroupOwnerAccountID)+_
" "+_
values.Value(fileManager.NSFileGroupOwnerAccountName)
```

Notes: The key in a file attribute dictionary whose value indicates the file's group ID.
The corresponding value is a number containing an Int32.
Available in Mac OS X v10.2 and later.

97.5.49 NSFileGroupOwnerAccountName as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var fileManager As New NSFileManagerMBS
```

```
Var error as NSErrorMBS
Var Values As Dictionary = fileManager.attributesOfItemAtPath(file, error)
Var Permissions As Integer = Values.Value(fileManager.NSFilePosixPermissions)

MessageBox "Group: "+_
values.Value(fileManager.NSFileGroupOwnerAccountID)+_
" "+_
values.Value(fileManager.NSFileGroupOwnerAccountName)
```

Notes: The key in a file attribute dictionary whose value indicates the group name of the file's owner.
The corresponding value is a string.
Available in Mac OS X v10.0 and later.

97.5.50 NSFileHFSCreatorCode as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Notes: The key in a file attribute dictionary whose value indicates the file's HFS creator code.
The corresponding value is a number containing an Int32. See "HFS File Types" for possible values.
Available in Mac OS X v10.1 and later.

97.5.51 NSFileHFSTypeCode as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Notes: The key in a file attribute dictionary whose value indicates the file's HFS type code.
The corresponding value is a number containing an Int32. See "HFS File Types" for possible values.
Available in Mac OS X v10.1 and later.

97.5.52 NSFileImmutable as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Example:

```
Var n As New NSFileManagerMBS
Var e as NSErrorMBS
```

```
Var d As Dictionary = n.attributesOfItemAtPath("/Users/cs/Desktop/test.rtf", e)
Var locked as Boolean = d.Lookup(n.NSFileImmutable, false)

Break // inspect in debugger
```

Notes: The key in a file attribute dictionary whose value indicates whether the file is mutable.
The corresponding value is a number containing a Boolean value.
Available in Mac OS X v10.2 and later.

97.5.53 NSFileManagerUnmountDissentingProcessIdentifierErrorKey as string

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: The key for the error dictionary containing process ID of the process blocking the unmount.

97.5.54 NSFileModificationDate as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Notes: The key in a file attribute dictionary whose value indicates the file's last modified date.
The corresponding value is a date.
Available in Mac OS X v10.0 and later.

97.5.55 NSFileOwnerAccountID as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var fileManager As New NSFileManagerMBS

Var error as NSErrorMBS
Var Values As Dictionary = fileManager.attributesOfItemAtPath(file, error)
Var Permissions As Integer = Values.Value(fileManager.NSFilePosixPermissions)

MessageBox "Owner: "+_
values.Value(fileManager.NSFileOwnerAccountID)+_
" "+_
```

values.Value(fileManager.NSFileOwnerAccountName)

Notes: The key in a file attribute dictionary whose value indicates the file's owner's account ID.
The corresponding value is a number containing an Int32.
Available in Mac OS X v10.2 and later.

97.5.56 NSFileOwnerAccountName as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var fileManager As New NSFileManagerMBS

Var error as NSErrorMBS
Var Values As Dictionary = fileManager.attributesOfItemAtPath(file, error)
Var Permissions As Integer = Values.Value(fileManager.NSFilePosixPermissions)

'MessageBox "POSIX Permissions: "+Oct(Permissions)
MessageBox "Owner: "+_
values.Value(fileManager.NSFileOwnerAccountID)+_
" "+_
values.Value(fileManager.NSFileOwnerAccountName)
```

Notes: The key in a file attribute dictionary whose value indicates the name of the file's owner.
The corresponding value is a string.
Available in Mac OS X v10.0 and later.

97.5.57 NSFilePosixPermissions as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Example:

```
Var file As FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var fileManager As New NSFileManagerMBS

Var error as NSErrorMBS
Var Values As Dictionary = fileManager.attributesOfItemAtPath(file, error)
```

```
Var Permissions As Integer = Values.Value(fileManager.NSFilePosixPermissions)

MessageBox "POSIX Permissions: "+oct(Permissions)
```

Notes: The key in a file attribute dictionary whose value indicates the file's Posix permissions.
The corresponding value is a number.
Available in Mac OS X v10.0 and later.

97.5.58 NSFileReferenceCount as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Notes: The key in a file attribute dictionary whose value indicates the file's reference count.
The corresponding value is a number containing an Int32.
The number specifies the number of hard links to a file.
Available in Mac OS X v10.0 and later.

97.5.59 NSFileSize as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Notes: The key in a file attribute dictionary whose value indicates the file's size in bytes.
The corresponding value is a number containing an Int64.
Important If the file has a resource fork, the returned value does not include the size of the resource fork.

97.5.60 NSFileSystemFileNumber as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Notes: The key in a file attribute dictionary whose value indicates the file's filesystem file number.
The corresponding value is a number containing an Int32. The value corresponds to the value of st_ino, as returned by stat(2).
Available in Mac OS X v10.0 and later.

97.5.61 NSFileSystemFreeNodes as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access the file attribute values contained in the dictionary object returned from the attributesOfFileSystemForPath function.
Notes: The key in a file system attribute dictionary dictionary whose value indicates the number of free nodes in the file system.
The corresponding value is a number that specifies the number of free nodes in the file system.
Available in Mac OS X v10.0 and later.

97.5.62 NSFileSystemFreeSize as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access the file attribute values contained in the dictionary object returned from the attributesOfFileSystemForPath function.
Notes: The key in a file system attribute dictionary whose value indicates the amount of free space on the file system.
The corresponding value is a number that specifies the amount of free space on the file system in bytes. The value is determined by statfs().
Available in Mac OS X v10.0 and later.

97.5.63 NSFileSystemNodes as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access the file attribute values contained in the dictionary object returned from the attributesOfFileSystemForPath function.
Notes: The key in a file system attribute dictionary whose value indicates the number of nodes in the file system.
The corresponding value is a number that specifies the number of nodes in the file system.
Available in Mac OS X v10.0 and later.

97.5.64 NSFileSystemNumber as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access the file attribute values contained in the dictionary object returned from the attributesOfFileSystemForPath function.
Notes: The key in a file system attribute dictionary dictionary whose value indicates the filesystem number of the file system.
The corresponding value is a number that specifies the filesystem number of the file system. The value

corresponds to the value of st_dev, as returned by stat(2).
Available in Mac OS X v10.0 and later.

97.5.65 NSFileSystemSize as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access the file attribute values contained in the dictionary object returned from the attributesOfFileSystemForPath function.
Notes: The key in a file system attribute dictionary whose value indicates the size of the file system.
The corresponding value is a number that specifies the size of the file system in bytes. The value is determined by statfs().
Available in Mac OS X v10.0 and later.

97.5.66 NSFileType as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the keys to access file attribute values contained in dictionary used by setAttributes, attributesOfItemAtPath, createDirectory, and createFile.
Notes: The key in a file attribute dictionary whose value indicates the file's type.
The corresponding value is a string (see NSFileType* shared methods for possible values).
Available in Mac OS X v10.0 and later.

97.5.67 NSFileTypeBlockSpecial as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the possible NSFileType values.
Example:

```
// check first hard disc
Var e as NSErrorMBS
Var n as new NSFileManagerMBS
Var d as Dictionary = n.attributesOfItemAtPath("/dev/disk0", e)
MessageBox d.Value(n.NSFileType)
```

Notes: Block special file (e.g. hard disk)

97.5.68 NSFileTypeCharacterSpecial as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the possible NSFileType values.
Notes: Character special file

97.5.69 NSFileTypeDirectory as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the possible NSFileType values.
Example:

```
Var e as NSErrorMBS
Var n as new NSFileManagerMBS
Var d as Dictionary = n.attributesOfItemAtPath("/System", e)
MessageBox d.Value(n.NSFileType)
```

Notes: Directory

97.5.70 NSFileTypeRegular as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the possible NSFileType values.
Notes: Regular file

97.5.71 NSFileTypeSocket as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the possible NSFileType values.
Notes: Socket (a socket visible in file system as a file)

97.5.72 NSFileTypeSymbolicLink as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the possible NSFileType values.
Notes: Symbolic link

97.5.73 NSFileTypeUnknown as string

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: One of the possible NSFileType values.
Notes: Unknown

97.5.74 NSUbiquityIdentityDidChangeNotification as string

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Sent after the iCloud (‚Äúubiquity‚Äù) identity has changed.
Notes: The system generates this notification when the user logs into or out of an iCloud account or enables or disables the syncing of documents and data. This notification is your cue to update caches and any interface elements displaying iCloud–related content. For example, hide all references to iCloud files when the user logs out of iCloud.
When your app receives this notification, get the new token from the NSURLRelationship property. The value of that token is nil if the user disabled iCloud or logged out. There is no userInfo dictionary.

97.5.75 pathExtension(pathOrURL as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns the path extension of a file URL or file path.
Notes: Available in Mac OS X v10.6 and later.

97.5.76 removeItem(file as folderitem, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Removes the file or directory at the specified path.
Notes: path: A path string indicating the file or directory to remove. If the path specifies a directory, the contents of that directory are recursively removed.
error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if the item was removed successfully or if path was nil. Returns false if an error occurred. If the delegate aborts the operation for a file, this method returns true. However, if the delegate aborts the operation for a directory, this method returns false.

Available in OS X v10.5 and later.
See also:

- 97.5.77 removeItem(path as string, byref error as NSErrorMBS) as boolean 15462

97.5.77 removeItem(path as string, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Removes the file or directory at the specified path.
Notes: path: A path string indicating the file or directory to remove. If the path specifies a directory, the contents of that directory are recursively removed.
error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if the item was removed successfully or if path was nil. Returns false if an error occurred. If the delegate aborts the operation for a file, this method returns true. However, if the delegate aborts the operation for a directory, this method returns false.

Available in OS X v10.5 and later.
See also:

- 97.5.76 removeItem(file as folderitem, byref error as NSErrorMBS) as boolean 15461

97.5.78 replaceItem(originalItem as FolderItem, newItem as FolderItem, backupItemName as String, options as integer, byref resultingItem as FolderItem, byref error as NSErrorMBS) as Boolean

MBS MacCocoa Plugin, Plugin Version: 19.3, Platform: macOS, Targets: All.

Function: Replaces the contents of the item at the specified URL in a manner that ensures no data loss occurs.
Example:

```
Var fileManager As New NSFileManagerMBS

Var source As FolderItem = SpecialFolder.Desktop.Child("test.rtf")
Var dest As FolderItem = SpecialFolder.Desktop.Child("dest.rtf")

Var result As Boolean
Var output As FolderItem
Var error As NSErrorMBS

result = fileManager.replaceItemAtURL(dest, source, "", 0, output, error)

If result Then
```

```
MessageBox output.NativePath
Else
MessageBox error.LlocalizedDescription
End If
```

Notes: originalItem: The item containing the content you want to replace.
newItem: The item containing the new content for originalItem. It is recommended that you put this item in a temporary directory as provided by the OS. If a temporary directory is not available, put this item in a uniquely named directory that is in the same directory as the original item.
backupItemName: If provided, the name used to create a backup of the original item.
The backup is automatically placed in the same directory as the original item. If an error occurs during the creation of the backup item, the operation fails. If there is already an item with the same name as the backup item, that item will be removed.
The backup item will be removed in the event of success unless the NSFileManagerItemReplacementWithoutDeletingBackupItem option is provided in options.
options: The options to use during the replacement. Typically, you pass NSFileManagerItemReplacementUsingNewMetadataOnly for this parameter, which uses only the metadata from the new item. You can also combine the options described in NSFileManagerItemReplacementOptions using the C-bitwise OR operator.
resultingItem: On input, a variale for a folderitem variable. When the item is replaced, this variable is set to the folderitem of the new item. If no new file system object is required, the folderitem in this parameter may be the same passed to the originalItem parameter. However, if a new file system object is required, the folderitem may be different. For example, replacing an RTF document with an RTFD document requires the creation of a new file.
error: On input, a variable for an error object. If an error occurs, this variable is set to an error object containing the error information.

Returns true if the replacement was successful or false if an error occurred.

By default, the creation date, permissions, Finder label and color, and Spotlight comments of the original item are preserved on the new item. You can configure which metadata is preserved using the options parameter.
This method works only when the originalItem and newItem parameters are located on the same volume. Attempting to call this method by passing originalItem and newItem parameters that have locations on different volumes results in an error. Instead, you can call the URLForDirectory method, passing NSItemReplacementDirectory as the search path directory, to get a temporary URL on the destination's volume that is suitable for use with this method.
If an error occurs and the original item is not in the original location or a temporary location, the resulting error object contains a user info dictionary with the key "NSFileOriginalItemLocationKey". The value assigned to that key is an URL with the location of the item. The error code is one of the file-related errors described in NSError Codes.

97.5.79 replaceItemAtURL(originalItemURL as string, newItemURL as String, backupItemName as String, options as integer, byref resultingURL as String, byref error as NSErrorMBS) as Boolean

MBS MacCocoa Plugin, Plugin Version: 19.3, Platform: macOS, Targets: All.

Function: Replaces the contents of the item at the specified URL in a manner that ensures no data loss occurs.
Notes: originalItemURL: The item containing the content you want to replace.
newItemURL: The item containing the new content for originalItemURL. It is recommended that you put this item in a temporary directory as provided by the OS. If a temporary directory is not available, put this item in a uniquely named directory that is in the same directory as the original item.
backupItemName: If provided, the name used to create a backup of the original item.
The backup is automatically placed in the same directory as the original item. If an error occurs during the creation of the backup item, the operation fails. If there is already an item with the same name as the backup item, that item will be removed.
The backup item will be removed in the event of success unless the NSFileManagerItemReplacementWithoutDeletingBackupItem option is provided in options.
options: The options to use during the replacement. Typically, you pass NSFileManagerItemReplacementUsingNewMetadataOnly for this parameter, which uses only the metadata from the new item. You can also combine the options described in NSFileManagerItemReplacementOptions using the C-bitwise OR operator.
resultingURL: On input, a variale for an URL variable. When the item is replaced, this variable is set to the URL of the new item. If no new file system object is required, the URL object in this parameter may be the same passed to the originalItemURL parameter. However, if a new file system object is required, the URL object may be different. For example, replacing an RTF document with an RTFD document requires the creation of a new file.
error: On input, a variable for an error object. If an error occurs, this variable is set to an error object containing the error information.

Returns true if the replacement was successful or false if an error occurred.

By default, the creation date, permissions, Finder label and color, and Spotlight comments of the original item are preserved on the new item. You can configure which metadata is preserved using the options parameter.
This method works only when the originalItemURL and newItemURL parameters are located on the same volume. Attempting to call this method by passing originalItemURL and newItemURL parameters that have locations on different volumes results in an error. Instead, you can call the URLForDirectory method, passing NSItemReplacementDirectory as the search path directory, to get a temporary URL on the destination's volume that is suitable for use with this method.
If an error occurs and the original item is not in the original location or a temporary location, the resulting error object contains a user info dictionary with the key "NSFileOriginalItemLocationKey". The value assigned to that key is an URL with the location of the item. The error code is one of the file-related errors described in NSError Codes.

97.5.80 setAttributes(attributesDic as dictionary, item as folderitem, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Sets the attributes of the specified file or directory.
Notes: attributes: A dictionary containing as keys the attributes to set for path and as values the corresponding value for the attribute. You can set the following attributes: NSFileBusy, NSFileCreationDate, NSFileExtensionHidden, NSFileGroupOwnerAccountID, NSFileGroupOwnerAccountName, NSFileHFSCreatorCode, NSFileHFSTypeCode, NSFileImmutable, NSFileModificationDate, NSFileOwnerAccountID, NSFileOwnerAccountName, NSFilePosixPermissions. You can change single attributes or any combination of attributes; you need not specify keys for all attributes.
item: The folderitem of a file or directory.
error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if all changes succeed. If any change fails, returns false, but it is undefined whether any changes actually occurred.

Discussion
As in the POSIX standard, the application either must own the file or directory or must be running as superuser for attribute changes to take effect. The method attempts to make all changes specified in attributes and ignores any rejection of an attempted modification. If the last component of the path is a symbolic link it is traversed.

The NSFilePosixPermissions value must be initialized with the code representing the POSIX file-permissions bit pattern. NSFileHFSCreatorCode and NSFileHFSTypeCode will only be heeded when path specifies a file.

Available in Mac OS X v10.5 and later.
See also:

- 97.5.81 setAttributes(attributesDic as dictionary, path as string, byref error as NSErrorMBS) as boolean 15465

97.5.81 setAttributes(attributesDic as dictionary, path as string, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Sets the attributes of the specified file or directory.
Notes: attributes: A dictionary containing as keys the attributes to set for path and as values the corresponding value for the attribute. You can set the following attributes: NSFileBusy, NSFileCreationDate, NSFileExtensionHidden, NSFileGroupOwnerAccountID, NSFileGroupOwnerAccountName, NSFileHFSCreatorCode, NSFileHFSTypeCode, NSFileImmutable, NSFileModificationDate, NSFileOwnerAccountID, NSFileOwnerAccountName, NSFilePosixPermissions. You can change single attributes or any combination of attributes; you need not specify keys for all attributes.

path: The path of a file or directory.
error: If an error occurs, this is set to an actual error object containing the error information.

Returns true if all changes succeed. If any change fails, returns false, but it is undefined whether any changes actually occurred.

Discussion
As in the POSIX standard, the application either must own the file or directory or must be running as superuser for attribute changes to take effect. The method attempts to make all changes specified in attributes and ignores any rejection of an attempted modification. If the last component of the path is a symbolic link it is traversed.

The NSFilePosixPermissions value must be initialized with the code representing the POSIX file-permissions bit pattern. NSFileHFSCreatorCode and NSFileHFSTypeCode will only be heeded when path specifies a file.

Available in Mac OS X v10.5 and later.
See also:

- 97.5.80 setAttributes(attributesDic as dictionary, item as folderitem, byref error as NSErrorMBS) as boolean 15465

97.5.82 setUbiquitous(flag as boolean, item as folderitem, destitem as folderitem, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sets whether the item at the specified URL should be stored in the cloud.
Notes: flag: Specify true to move the item to iCloud or false to remove it from iCloud (if it is there currently).
item: Specify the folderitem of the item (file or directory) that you want to store in iCloud.
destitem: Specify the location in iCloud at which to store the file or directory. This folderitem must be constructed from a folderitem returned by the URLForUbiquityContainerIdentifier method, which you use to retrieve the desired iCloud container directory. The folderitem you specify may contain additional subdirectories so that you can organize your files hierarchically in iCloud. However, you are responsible for creating those intermediate subdirectories (using the NSFileManagerMBS or folderitem class) in your iCloud container directory.
error: If an error occurs, this pointer is set to an NSError object containing information about the error. You may specify nil for this parameter if you do not want the error information.

Returns yes if the item's status was updated successfully or false if an error occurred. If this method returns false and you specified a value for the error parameter, this method returns an error object.

Use this method to move a file from its current location to iCloud. For files located in an application's sandbox, this involves physically removing the file from the sandbox directory. (The system extends your

application's sandbox privileges to give it access to files it moves to iCloud.) You can also use this method to move files out of iCloud and back into a local directory.

Your application must have an active file presenter object configured to monitor the specified file or directory before calling this method. When you specify true for the flag parameter, this method attempts to move the file or directory to the cloud and returns true if it is successful. This method also notifies your file presenter of the new location of the file so that your application can continue to operate on it.

Important: Do not call this method from your application's main thread. This method performs a coordinated write operation on the file you specify, and calling this method from the main thread can trigger a deadlock with the file presenter you have monitoring the file. Instead, use a dispatch queue (other than the main thread queue) to perform the method call on a secondary thread. You can always message your main thread after the call finishes to update the rest of your application's data structures.

Available in Mac OS X v10.7 and later.

97.5.83 setUbiquitous(flag as boolean, item as folderitem, destURL as string, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Sets whether the item at the specified URL should be stored in the cloud.
Notes: flag: Specify true to move the item to iCloud or false to remove it from iCloud (if it is there currently).
item: Specify the folderitem of the item (file or directory) that you want to store in iCloud.
destitem: Specify the location in iCloud at which to store the file or directory. This folderitem must be constructed from a folderitem returned by the URLForUbiquityContainerIdentifier method, which you use to retrieve the desired iCloud container directory. The folderitem you specify may contain additional subdirectories so that you can organize your files hierarchically in iCloud. However, you are responsible for creating those intermediate subdirectories (using the NSFileManagerMBS or folderitem class) in your iCloud container directory.
error: If an error occurs, this pointer is set to an NSError object containing information about the error. You may specify nil for this parameter if you do not want the error information.

Returns yes if the item's status was updated successfully or false if an error occurred. If this method returns false and you specified a value for the error parameter, this method returns an error object.

Use this method to move a file from its current location to iCloud. For files located in an application's sandbox, this involves physically removing the file from the sandbox directory. (The system extends your application's sandbox privileges to give it access to files it moves to iCloud.) You can also use this method

to move files out of iCloud and back into a local directory.

Your application must have an active file presenter object configured to monitor the specified file or directory before calling this method. When you specify true for the flag parameter, this method attempts to move the file or directory to the cloud and returns true if it is successful. This method also notifies your file presenter of the new location of the file so that your application can continue to operate on it.

Important: Do not call this method from your application's main thread. This method performs a coordinated write operation on the file you specify, and calling this method from the main thread can trigger a deadlock with the file presenter you have monitoring the file. Instead, use a dispatch queue (other than the main thread queue) to perform the method call on a secondary thread. You can always message your main thread after the call finishes to update the rest of your application's data structures.

Available in Mac OS X v10.7 and later.
See also:

- 97.5.82 setUbiquitous(flag as boolean, item as folderitem, destitem as folderitem, byref error as NSErrorMBS) as boolean 15466

97.5.84 startDownloadingUbiquitousItem(item as folderitem, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Starts downloading (if necessary) the specified item to the local system.
Notes: item: Specify the folderitem for the file or directory in the cloud that you want to download.
error: On input, a pointer to variable for an NSError object. If an error occurs, this pointer is set to an NSError object containing information about the error. Y

Returns true if the download started successfully or was not necessary, otherwise false. If false is returned and error is not nil, an NSError object describing the error is returned in that parameter.

If a cloud-based file or directory has not been downloaded yet, calling this method starts the download process. If the item exists locally, calling this method synchronizes the local copy with the version in the cloud.

For a given folderitem, you can determine if a file is downloaded by getting the value of the IsDownloaded method. You can also use related methods to determine the current progress in downloading the file.

Available in Mac OS X v10.7 and later.
See also:

- 97.5.85 startDownloadingUbiquitousItem(URL as string, byref error as NSErrorMBS) as boolean 15469

97.5.85 startDownloadingUbiquitousItem(URL as string, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Starts downloading (if necessary) the specified item to the local system.
Notes: item: Specify the URL for the file or directory in the cloud that you want to download.
error: On input, a pointer to variable for an NSError object. If an error occurs, this pointer is set to an NSError object containing information about the error. Y

Returns true if the download started successfully or was not necessary, otherwise false. If false is returned and error is not nil, an NSError object describing the error is returned in that parameter.

If a cloud-based file or directory has not been downloaded yet, calling this method starts the download process. If the item exists locally, calling this method synchronizes the local copy with the version in the cloud.

For a given folderitem, you can determine if a file is downloaded by getting the value of the IsDownloaded method. You can also use related methods to determine the current progress in downloading the file.

Available in Mac OS X v10.7 and later.
See also:

- 97.5.84 startDownloadingUbiquitousItem(item as folderitem, byref error as NSErrorMBS) as boolean 15468

97.5.86 stringByAbbreviatingWithTildeInPath(path as string) as string

MBS MacCocoa Plugin, Plugin Version: 16.4, Platform: macOS, Targets: All.

Function: Returns a new string that replaces the current home directory portion of the current path with a tilde (
textasciitilde) character.
Notes: A new string based on the current string object. If the new string specifies a file in the current home directory, the home directory portion of the path is replaced with a tilde (
textasciitilde) character. If the string does not specify a file in the current home directory, this method returns a new string object whose path is unchanged from the path in the current string.

Note that this method only works with file paths. It does not work for string representations of URLs.

For sandboxed apps in OS X, the current home directory is not the same as the user,Äôs home directory. For a sandboxed app, the home directory is the app,Äôs home directory. So if you specified a path of /Users/<current_user>/file.txt for a sandboxed app, the returned path would be unchanged from the original. However, if you specified the same path for an app not in a sandbox, this method would replace the

/Users/<current_user>portion of the path with a tilde.

97.5.87 stringByAppendingPathComponent(path as string, Component as string) as string

MBS MacCocoa Plugin, Plugin Version: 16.4, Platform: macOS, Targets: All.

Function: Returns a new string made by appending to the receiver a given string.
Notes: The following table illustrates the effect of this method on a variety of different paths, assuming that aString is supplied as ,Äúscratch.tiff,Äù:

Receiver,Äôs String Value	Resulting String
,Äú/tmp,Äù	,Äú/tmp/scratch.tiff,Äù
,Äú/tmp/,Äù	,Äú/tmp/scratch.tiff,Äù
,Äú/,Äù	,Äú/scratch.tiff,Äù
,Äú,Äù (an empty string)	,Äúscratch.tiff,Äù

Note that this method only works with file paths (not, for example, string representations of URLs).

97.5.88 stringByAppendingPathExtension(path as string, Extension as string) as string

MBS MacCocoa Plugin, Plugin Version: 16.4, Platform: macOS, Targets: All.

Function: Returns a new string made by appending to the receiver an extension separator followed by a given extension.
Notes: The following table illustrates the effect of this method on a variety of different paths, assuming that ext is supplied as "tiff":

Receiver,Äôs String Value	Resulting String
,Äú/tmp/scratch.old,Äù	,Äú/tmp/scratch.old.tiff,Äù
,Äú/tmp/scratch.,Äù	,Äú/tmp/scratch..tiff,Äù
,Äú/tmp/,Äù	,Äú/tmp.tiff,Äù
,Äúscratch,Äù	,Äúscratch.tiff,Äù

Note that adding an extension to "/tmp/" causes the result to be "/tmp.tiff" instead of "/tmp/.tiff". This difference is because a file named ".tiff" is not considered to have an extension, so the string is appended to the last nonempty path component.

Note that this method only works with file paths (not, for example, string representations of URLs).

Special Considerations
Prior to OS X v10.9 this method did not allow you to append file extensions to filenames starting with the tilde character (
textasciitilde).

97.5.89 stringByDeletingLastPathComponent(path as string) as string

MBS MacCocoa Plugin, Plugin Version: 16.4, Platform: macOS, Targets: All.

Function: Returns a new string made by deleting the last path component from the receiver, along with any final path separator.
Notes: A new string made by deleting the last path component from the receiver, along with any final path separator. If the receiver represents the root path it is returned unaltered.

The following table illustrates the effect of this method on a variety of different paths:

Receiver,Äôs String Value	Resulting String
,Äú/tmp/scratch.tiff,Äù	,Äú/tmp,Äù
,Äú/tmp/lock/,Äù	,Äú/tmp,Äù
,Äú/tmp/,Äù	,Äú/,Äù
,Äú/tmp,Äù	,Äú/,Äù
,Äú/,Äù	,Äú/,Äù
,Äúscratch.tiff,Äù	,Äú,Äù (an empty string)

Note that this method only works with file paths (not, for example, string representations of URLs).

97.5.90 stringByDeletingPathExtension(path as string) as string

MBS MacCocoa Plugin, Plugin Version: 16.4, Platform: macOS, Targets: All.

Function: Returns a new string made by deleting the extension (if any, and only the last) from the receiver.
Notes: A new string made by deleting the extension (if any, and only the last) from the receiver. Strips any trailing path separator before checking for an extension. If the receiver represents the root path, it is returned unaltered.

The following table illustrates the effect of this method on a variety of different paths:

Note that attempting to delete an extension from ".tiff" causes the result to be @".tiff" instead of an empty string. This difference is because a file named ".tiff" is not considered to have an extension, so nothing is deleted. Note also that this method only works with file paths (not, for example, string representations of

Receiver,Äôs String Value	Resulting String
,Äú/tmp/scratch.tiff,Äù	,Äú/tmp/scratch,Äù
,Äú/tmp/,Äù	,Äú/tmp,Äù
,Äúscratch.bundle/,Äù	,Äúscratch,Äù
,Äúscratch..tiff,Äù	,Äúscratch.,Äù
,Äú.tiff,Äù	,Äú.tiff,Äù
,Äú/,Äù	,Äú/,Äù

URLs).

97.5.91 stringByExpandingTildeInPath(path as string) as string

MBS MacCocoa Plugin, Plugin Version: 16.4, Platform: macOS, Targets: All.

Function: Returns a new string made by expanding the initial component of the receiver to its full path value.
Notes: A new string made by expanding the initial component of the receiver, if it begins with ,Äú textasciitilde ,Äù or ,Äú
textasciitilde user,Äù, to its full path value. Returns a new string matching the receiver if the receiver,Äôs initial component can,Äôt be expanded.

Note that this method only works with file paths (not, for example, string representations of URLs).

97.5.92 stringByResolvingSymlinksInPath(path as string) as string

MBS MacCocoa Plugin, Plugin Version: 16.4, Platform: macOS, Targets: All.

Function: Returns a new string made from the receiver by resolving all symbolic links and standardizing path.
Notes: A new string made by resolving all symbolic links, then removing extraneous path components. For absolute paths, all symbolic links are guaranteed to be removed. For relative paths, symbolic links that can,Äôt be resolved are left unresolved in the returned string.

Returns self if an error occurs.

Note that this method only works with file paths (not, for example, string representations of URLs).

97.5.93 stringByStandardizingPath(path as string) as string

MBS MacCocoa Plugin, Plugin Version: 16.4, Platform: macOS, Targets: All.

Function: Returns a new string made by removing extraneous path components from the receiver.
Notes: A new string made by performing the following operations:

- Expanding an initial tilde expression using stringByExpandingTildeInPath.
- Removing an initial component of ,Äú/private/var/automount,Äù, ,Äú/var/automount,Äù, or ,Äú/private,Äù from the path, if the result still indicates an existing file or directory (checked by consulting the file system).
- Reducing empty components and references to the current directory (that is, the sequences ,Äú//,Äù and ,Äú/./,Äù) to single path separators.
- Removing a trailing slash from the last component.
- For absolute paths only, resolving references to the parent directory (that is, the component ,Äú..,Äù) to the real parent directory if possible using stringByResolvingSymlinksInPath. For relative paths, references to the parent directory are left in place.
- Returns self if an error occurs.

Note that the path returned by this method may still have symbolic link components in it. Note also that this method only works with file paths (not, for example, string representations of URLs).

97.5.94 trashItem(file as folderItem, byref Resulting as folderItem, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Moves an item to the trash.
Notes: Returns true if the item at url was successfully moved to the trash. Since the operation may require renaming the item to avoid a file name collision, this method returns, by reference, the resulting folderitem that the item was moved to.

If this method returns false, the item was not moved to the trash; the error parameter then contains information about the error.

Available in OS X v10.8 and later.
See also:

- 97.5.95 trashItem(Path as String, byref Resulting as FolderItem, byref error as NSErrorMBS) as boolean

97.5.95 trashItem(Path as String, byref Resulting as FolderItem, byref error as NSErrorMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 19.5, Platform: macOS, Targets: All.

Function: Moves an item to the trash.
Notes: Returns true if the item at url was successfully moved to the trash. Since the operation may require renaming the item to avoid a file name collision, this method returns, by reference, the resulting folderitem that the item was moved to.

If this method returns false, the item was not moved to the trash; the error parameter then contains information about the error.

Available in OS X v10.8 and later.
See also:

- 97.5.94 trashItem(file as folderItem, byref Resulting as folderItem, byref error as NSErrorMBS) as boolean 15473

97.5.96 URLByAppendingPathComponent(URL as string, pathComponent as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a new URL made by appending a path component to the original URL.
Notes: pathComponent: The path component to add to the URL.

Returns a new URL with pathComponent appended.

If the original URL does not end with a forward slash and pathComponent does not begin with a forward slash, a forward slash is inserted between the two parts of the returned URL, unless the original URL is the empty string.

Available in Mac OS X v10.6 and later.
See also:

- 97.5.97 URLByAppendingPathComponent(URL as string, pathComponent as string, isDirectory as boolean) as string 15474

97.5.97 URLByAppendingPathComponent(URL as string, pathComponent as string, isDirectory as boolean) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a new URL made by appending a path component to the original URL, along with a trailing slash if the component is designated a directory.
Notes: pathComponent: The path component to add to the URL.
isDirectory: If true, a trailing slash is appended after pathComponent.
Returns a new URL with pathComponent appended.

If the original URL does not end with a forward slash and pathComponent does not begin with a forward slash, a forward slash is inserted between the two parts of the returned URL, unless the original URL is the empty string.

Available in Mac OS X v10.7 and later.
See also:

- 97.5.96 URLByAppendingPathComponent(URL as string, pathComponent as string) as string 15474

97.5.98 URLByAppendingPathExtension(URL as string, pathExtension as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a new URL made by appending a path extension to the original URL.
Notes: pathExtension: The path extension to add to the URL.

Returns a new URL with pathExtension appended.

If the original URL ends with one or more forward slashes, these are removed from the returned URL. A period is inserted between the two parts of the new URL.
Available in Mac OS X v10.6 and later.

97.5.99 URLByDeletingLastPathComponent(URL as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a new URL made by deleting the last path component from the original URL.
Notes: If the original URL represents the root path, the returned URL is identical. Otherwise, if the original URL has only one path component, the new URL is the empty string.
Available in Mac OS X v10.6 and later.

97.5.100 URLByDeletingPathExtension(URL as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a new URL made by deleting the path extension, if any, from the original URL.
Notes: If the original URL represents the root path, the returned URL is identical. If the URL has multiple path extensions, only the last one is removed.
Available in Mac OS X v10.6 and later.

97.5.101 URLByResolvingSymlinksInPath(URL as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a new URL that points to the same resource as the original URL and includes no symbolic links.
Notes: If the original URL has no symbolic links, the returned URL is identical to the original URL.

This method only works on URLs with the file: path scheme. This method will return an identical URL for all other URLs.

Available in Mac OS X v10.6 and later.

97.5.102 URLByStandardizingPath(URL as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns a new URL that points to the same resource as the original URL and is an absolute path.
Notes: This method only works on URLs with the file: path scheme. This method will return an identical URL for all other URLs.

Available in Mac OS X v10.6 and later.

97.5.103 URLForPublishingUbiquitousItem(item as folderitem, byref expirationDate as date, byref error as NSErrorMBS) as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a URL that can be emailed to users to allow them to download a copy of a cloud-based item.
Example:

```
Var m as new NSFileManagerMBS
Var f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")

Var error as NSErrorMBS
Var exdate as date
Var url as string = m.URLForPublishingUbiquitousItem(f, exdate, error)

// always fails as desktop folder is not in cloud
if error<>nil then
MessageBox error.localizedDescription
end if
```

Notes: url: Specify the URL of the item in the cloud that you want to share. The URL must be prefixed with the base URL returned from the URLForUbiquityContainerIdentifier method that corresponds to the item's location.
expirationDate: On output, this parameter contains the date after which the item is no longer available at the returned URL.
error: If an error occurs, this pointer is set to an NSError object containing information about the error.

Returns an URL with which users can download a copy of the item at url. Returns nil if the URL could not be created for any reason.

Discussion
This method creates a snapshot of the specified file and places that copy in a temporary iCloud location where it can be accessed by other users using the returned URL. The snapshot reflects the contents of the file at the time the URL was generated and is not updated when subsequent changes are made to the original file in the user's iCloud storage. The snapshot file remains available at the specified URL until the date specified in the outDate parameter, after which it is automatically deleted.

Your application must have access to the network for this call to succeed.
Available in Mac OS X v10.7 and later.

- 97.5.104 URLForPublishingUbiquitousItem(URL as string, byref expirationDate as date, byref error as NSErrorMBS) as string 15478

97.5.104 URLForPublishingUbiquitousItem(URL as string, byref expirationDate as date, byref error as NSErrorMBS) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a URL that can be emailed to users to allow them to download a copy of a cloud-based item.
Notes: url: Specify the URL of the item in the cloud that you want to share. The URL must be prefixed with the base URL returned from the URLForUbiquityContainerIdentifier method that corresponds to the item's location.
expirationDate: On output, this parameter contains the date after which the item is no longer available at the returned URL.
error: If an error occurs, this pointer is set to an NSError object containing information about the error.

Returns an URL with which users can download a copy of the item at url. Returns nil if the URL could not be created for any reason.

Discussion
This method creates a snapshot of the specified file and places that copy in a temporary iCloud location where it can be accessed by other users using the returned URL. The snapshot reflects the contents of the file at the time the URL was generated and is not updated when subsequent changes are made to the original file in the user's iCloud storage. - 97.5.103 URLForPublishingUbiquitousItem(item as folderitem, byref expirationDate as date, byref error as NSErrorMBS) as string 15477

97.5.105 URLForUbiquityContainerIdentifier(containerIdentifier as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Returns the iCloud directory associated with the specified container ID.
Notes: containerID: Specify the container ID of the cloud-based storage container. The string you specify must not contain wildcards and must be of the form <TEAMID>.<CONTAINER>, where <TEAMID>is your development team ID and <CONTAINER>describes the bundle identifier of the container you want to access. The container identifiers for your application must be declared in the com.apple.developer.ubiquity-container-identifiers entitlement.
If you specify "", this method returns the first container listed in the com.apple.developer.ubiquity-container-identifiers entitlement.

Returns a folderitem pointing to the specified container directory or nil if the container could not be located or if iCloud storage is unavailable for the current user or device.

You can use the folderitem returned by this method to build paths to files and directories in the user's iCloud storage. Each application that syncs documents to the cloud must have at least one associated container directory in which to put those files. This container directory can be unique to the application or shared by multiple applications. You use this method to retrieve the folderitem for that container directory.

In addition to writing to its own container directory, an application can write to any container directory for which it has the appropriate permission. Each additional container directory should be listed as an additional value in the com.apple.developer.ubiquity-container-identifiers entitlement.

Note: The development team ID that precedes each container ID string is the unique identifier associated with your development team. You can find this string in the Member Center of the Apple Developer website (http://developer.apple.com/membercenter). From the Member Center home page, select the Your Account tab and then select Organization Profile from the column on the left of that tab. Your team's identifier is in the Company/Organization ID field.
The first time you call this method for a given container directory, iOS extends your application sandbox to include that container directory. Thus, it is important that you call this method at least once before trying to search for files in iCloud. And if your application accesses multiple container directories, you should call the method once for each directory.

Available in Mac OS X v10.7 and later.
FileForUbiquityContainerIdentifier returns folderitem while URLForUbiquityContainerIdentifier returns URL string.

97.5.106 Properties

97.5.107 currentDirectory as folderitem

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the path of the program's current directory.
Example:

```
Var m as new NSFileManagerMBS
Var f as FolderItem = SpecialFolder.Applications
if m.changeCurrentDirectory(f) then
MessageBox m.currentDirectory.NativePath
end if
```

Notes: Returns the path of the program's current directory. If the program's current working directory isn't accessible, returns nil.

The string returned by this method is initialized to the current working directory; you can change the working directory by invoking changeCurrentDirectoryPath.

Relative pathnames refer implicitly to the current directory. For example, if the current directory is /tmp, and the relative pathname reports/info.txt is specified, the resulting full pathname is /tmp/reports/info.txt.
(Read only property)

97.5.108 currentDirectoryPath as string

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the path of the program's current directory as string.
Example:

```
Var m as new NSFileManagerMBS
MessageBox m.currentDirectoryPath
```

Notes: Returns the path of the program's current directory. If the program's current working directory isn't accessible, returns "".

The string returned by this method is initialized to the current working directory; you can change the working directory by invoking changeCurrentDirectoryPath.

Relative pathnames refer implicitly to the current directory. For example, if the current directory is /tmp, and the relative pathname reports/info.txt is specified, the resulting full pathname is /tmp/reports/info.txt.
(Read only property)

97.5.109 defaultManager as NSFileManagerMBS

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: The default manager.
Notes: This is just one global property, so we only create instance on first call and than return the same instance again.
(Read only property)

97.5.110 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

97.5.111 homeDirectoryForCurrentUser as FolderITem

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the home directory for the current user.
Notes: (Read only property)

97.5.112 temporaryDirectory as FolderITem

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: Returns the temporary directory for the current user.
Notes: (Read only property)

97.5.113 Constants

Constants

Constant	Value	Description
NSDirectoryEnumerationSkipsHiddenFiles	4	One of the option constants for enumerating the the contentsOfDirectoryAtURL method. Do not enumerate hidden files. Available in Mac OS X v10.6 and later.
NSDirectoryEnumerationSkipsPackageDescendants	2	One of the option constants for enumerating the the contentsOfDirectoryAtURL method. Do not descend into packages. Available in Mac OS X v10.6 and later.
NSDirectoryEnumerationSkipsSubdirectoryDescendants	1	One of the option constants for enumerating the the contentsOfDirectoryAtURL method. Perform a shallow enumeration; do not descend i Available in Mac OS X v10.6 and later.
NSFileManagerItemReplacementUsingNewMetadataOnly	1	One of the options constants to specify the repla anagerItemReplacementWithoutDeletingBackupI Causes NSFileManagerItemReplacementWithou metadata from the new item only and not to a from the original item. Available in Mac OS X v10.6 and later.
NSFileManagerItemReplacementWithoutDeletingBackupItem	2	One of the options constants to specify the repla anagerItemReplacementWithoutDeletingBackupI Causes NSFileManagerItemReplacementWithout the backup item in place after a successful replac is to remove the item. Available in Mac OS X v10.6 and later.
NSVolumeEnumerationProduceFileReferenceURLs	4	One of the option constants for enumerating mou edVolumeURLsIncludingResourceValuesForKeys The enumeration produces file reference URLs ra Available in Mac OS X v10.6 and later.
NSVolumeEnumerationSkipHiddenVolumes	2	One of the option constants for enumerating mou edVolumeURLsIncludingResourceValuesForKeys The enumeration skips hidden volumes. Available in Mac OS X v10.6 and later.

Unmount options

Constant	Value	Description
NSFileManagerUnmountAllPartitionsAndEjectDisk	1	Unmount all partitions of this disk and eject it.
NSFileManagerUnmountWithoutUI	2	Unmount without user interface.

Relationships

Constant	Value	Description
NSURLRelationshipContains	0	The directory contains the specified item.
NSURLRelationshipOther	2	The directory does not contain the item and is not the same as the item.
NSURLRelationshipSame	1	The directory and the item are the same. This relationship occurs when the value of the NSURLFileResourceIdentifierKey is the same for the directory and item.

97.6 class NSFilePresenterHandlerMBS

97.6.1 class NSFilePresenterHandlerMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The class for a callback.
Notes: Some iCloud related functions in NSFileCoordinatorMBS or NSFilePresenterMBS require that you call a function to notify the caller that you are finished doing some work.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr9

97.6.2 Methods

97.6.3 Destructor

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Cleans up.

97.6.4 Run(errorOrNil as NSErrorMBS = nil)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Calls the callback.
Notes: As some callbacks ask for an error object in case of an error, you can pass one.
Other callbacks don't take a parameter.

97.7 class NSFilePresenterMBS

97.7.1 class NSFilePresenterMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The plugin class to implement the NSFilePresenter protocol.
Example:

```
// get notified when another app changes a file
// MyPresenter is a subclass of NSFilePresenterMBS with the events implemented.
// Presenter is a property of the window: Presenter As MyPresenter
Presenter = New MyPresenter
NSFileCoordinatorMBS.addFilePresenter Presenter

// remove it when done: NSFileCoordinatorMBS.removeFilePresenter Presenter

// in MyPresenter:
Function presentedItemURL() As String Handles presentedItemURL
Return NSFileCoordinatorMBS.FileURL(SpecialFolder.Desktop.Child("notes.txt"))
End Function

Sub presentedItemDidChange() Handles presentedItemDidChange
System.DebugLog "notes.txt was changed, reload it."
End Sub
```

Notes: A protocol to be implemented by objects that present the contents of files or directories to the user for viewing or editing. The objects can take an active role in operations that access those files or directories, even operations performed by other processes in the system. For an NSFilePresenter to be aware of such file access it must be "coordinated" file access. Starting in version 10.7 many components of Mac OS X use NSFileCoordinatorMBS, including AppKit, Finder, and various applications. NSDocument conforms to the NSFilePresenter protocol and has useful implementations of all of its methods. You are unlikely to have to implement NSFilePresenter yourself in an NSDocument-based application.

See the comments for NSFileCoordinator.Constructor for information about how an NSFilePresenter can avoid receiving messages about its own reading and writing.

You can consider "item" in method names in this header file to be an abbreviation of "fileOrDirectory." As always, a directory might actually be a file package.

Please also check the documentation from Apple for the NSFilePresenter protocol.

- MBS Real Studio Plugins, version 11.3pr9

97.7.2 Methods

97.7.3 Constructor

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The constructor.

97.7.4 Destructor

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The destructor.

97.7.5 Properties

97.7.6 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The internal reference to the NSFilePresenter object.
Notes: (Read and Write property)

97.7.7 Events

97.7.8 accommodatePresentedItemDeletionWithCompletionHandler(Complete as NSFilePresenterHandlerMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Tells your object that its presented item is about to be deleted.
Notes: Complete: The complete handler object to call after updating your data structures. Pass nil to the run method's errorOrNil parameter if you were able to successfully prepare for the deletion of the item. Pass an error object if your object could not prepare itself properly.

A file coordinator calls this method when your object's presented item is about to be deleted. You can use this method to perform any actions that are needed to prepare for the deletion. For example, document objects typically use this method to close the document.

Important: If you implement this method, you must execute the run method in the complete parameter at the end of your implementation. The system waits for you to execute that method before allowing the other object to delete the file or directory. Therefore, failure to execute the method could stall threads in your application or other processes.

Available in Mac OS X v10.7 and later.

97.7.9 accommodatePresentedSubitemDeletionAtURL(URL as string, file as FolderItem, Complete as NSFilePresenterHandlerMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Tells the delegate that some entity wants to delete an item that is inside of a presented directory. (required)
Notes: url: The URL of the item being deleted from the presented directory. The item need not be at the top level of the presented directory but may itself be inside a nested subdirectory.
file: URL as folderitem.
complete: The complete handler object to call after updating your data structures. Pass nil to the run method's errorOrNil parameter if you were able to successfully prepare for the deletion of the item. Pass an error object if your object could not prepare itself properly.

This method is relevant for applications that present directories. This might occur if the delegate manages the contents of a directory or manages a file that is implemented as a file package. When called, your implementation of this method should take whatever actions needed to update your application to handle the deletion of the specified file.

Important: If you implement this method, you must execute the run method in the Complete parameter at the end of your implementation. The system waits for you to execute that method before allowing the other object to delete the item at the specified URL. Therefore, failure to execute the method could stall threads in your application or in other processes.

Available in Mac OS X v10.7 and later.

97.7.10 presentedItemDidChange

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: This event is called when the item changed.
Notes: Be notified that the file or file package's contents or attributes have been been written to. Because this method may be be invoked when the attributes have changed but the contents have not, implementations that read the contents must use modification date checking to avoid needless rereading. They should check that the modification date has changed since the receiver most recently read from or wrote to the item. To

avoid race conditions, getting the modification date should typically be done within invocations of one of the NSFileCoordinatorMBS.coordinate... methods.

For example, NSDocument implements this method to react to both contents changes (like the user overwriting the document file with another application) and attribute changes (like the user toggling the "Hide extension" checkbox in a Finder info panel). It uses modification date checking as described above.

Not all programs use file coordination. Your NSFileProvider may be sent this message without being sent relinquishPresentedItemToWriter first. Make your application do the best it can in that case.

97.7.11 presentedItemDidGainVersion(version as NSFileVersionMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Be notified that something in the system has added a version of the file or file package.

97.7.12 presentedItemDidLoseVersion(version as NSFileVersionMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Be notified that something in the system has removed a version of the file or file package.

97.7.13 presentedItemDidMoveToURL(url as string, file as folderitem)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Be notified that the file or directory has been moved or renamed, or a directory containing it has been moved or renamed.
Notes: A typical implementation of this method will cause subsequent invocations of presentedItemURL to return the new URL.

The new URL may have a different file name extension than the current value of the presentedItemURL property.

For example, NSDocument implements this method to handle document file moving and renaming. A shoebox application would only implement this method to be robust against surprising things like the user moving its data directory while the application is running.

Not all programs use file coordination. Your NSFileProvider may be sent this message without being sent relinquishPresentedItemToWriter first. Make your application do the best it can in that case.

97.7.14 presentedItemDidResolveConflictVersion(version as NSFileVersionMBS)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Be notified that something in the system has resolved a version of the file or file package.

97.7.15 presentedItemURL as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The URL that locates the file or directory that the receiver is presenting to the user.
Notes: Implementations of this method must be prepared to be invoked by Cocoa in any queue, at any time, including from within invocations of NSFileCoordinator methods. A nil value is valid and means that the presented item does not exist yet. An NSFilePresenter with a nil presentedItemURL will be asked for its presentedItemURL again when coordinated file access on behalf of that NSFilePresenter completes, in case the presented item was just created.

For example, NSDocument has a -presentedItemURL method that usually returns self.fileURL. In a shoebox application that stores the user's data in files somewhere on the user's computer you can implement this method to specify the directory that contains those files.

97.7.16 presentedSubitemAtURLdidGainVersion(URL as string, file as FolderItem, version as NSFileVersionMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Tells the delegate that the item inside the presented directory gained a new version. (required)
Notes: url: The URL of the item inside the presented directory that gained a new version. The item need not be at the top level of the presented directory but may itself be inside a nested subdirectory.
file: url as folderitem.
version: The file version object containing information about the new file version.

Your delegate can use this method to determine how to incorporate data from the new version of the item. This might involve incorporating the version silently or asking the user about how to proceed.

Available in Mac OS X v10.7 and later.

97.7.17 presentedSubitemAtURLdidLoseVersion(URL as string, file as FolderItem, version as NSFileVersionMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Tells the delegate that the item inside the presented directory lost an existing version. (required)
Notes: url: The URL of the item inside the presented directory that lost a version. The item need not be at the top level of the presented directory but may itself be inside a nested subdirectory.
file: URL as folderitem.
version: The file version object containing information about the version that was removed.

Your delegate can use this method to determine how to handle the loss of the specified file version. For an old version, you might not have to do anything. However, if your application is currently using the lost version, you would need to update your application's user interface or prompt the user about how to proceed.

Available in Mac OS X v10.7 and later.

97.7.18 presentedSubitemAtURLdidMoveToURL(oldURL as string, newURL as string, oldFile as folderitem, newFile as folderitem)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Tells the delegate that an item in the presented directory moved to a new location. (required)
Notes: oldURL: The original URL of the item inside the presented directory. The item need not be at the top level of the presented directory but may itself be inside a nested subdirectory.
newURL: The new URL for the item. This URL may or may not be located inside the presented directory.
oldFile: oldURL as folderitem.
newFile: newURL as folderitem.

This method is relevant for applications that present directories. This might occur if the delegate manages the contents of a directory or manages a file that is implemented as a file package. Your implementation of this method should take whatever actions necessary to handle the change in location of the specified item. For example, you might update references to the item in your application's data structures and refresh your user interface.

If the presented directory is a file package, the system calls the presentedItemDidChange method if your delegate does not implement this method.

Available in Mac OS X v10.7 and later.

97.7.19 presentedSubitemAtURLdidResolveConflictVersion(URL as string, file as FolderItem, version as NSFileVersionMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Tells the delegate that the item inside the presented directory had a version conflict resolved by an outside entity. (required)
Notes: url: The URL of the item inside the presented directory that was in conflict. The item need not be at the top level of the presented directory but may itself be inside a nested subdirectory.
file: URL as folderitem.
version: The version object containing the conflicting change.

Your delegate can use this method to respond to the resolution of a version conflict by a different file presenter. This might occur if a version of your application running on another device resolves the conflict first. You might then use this method to update your user interface to indicate that there is no longer a conflict.

Available in Mac OS X v10.7 and later.

97.7.20 presentedSubitemDidAppearAtURL(URL as string, file as FolderItem)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Tells the delegate that an item was added to the presented directory. (required)
Notes: url: The URL of the item being added to the presented directory. The item need not be at the top level of the presented directory but may itself be inside a nested subdirectory.
file: URL as a folderitem.

This method is relevant for applications that present directories. This might occur if the delegate manages the contents of a directory or manages a file that is implemented as a file package. Your implementation of this method should take whatever actions necessary to incorporate the new file or directory into the presented content. For example, you might add the new item to your application's data structures and refresh your user interface.

If the presented directory is a file package, the system calls the presentedItemDidChange method if your delegate does not implement this method.

Available in Mac OS X v10.7 and later.

97.7.21 presentedSubitemDidChangeAtURL(URL as string, file as FolderItem)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Tells the delegate that the contents or attributes of the specified item changed. (required)
Notes: url: The URL of the item in the presented directory that changed. The item need not be at the top level of the presented directory but may itself be inside a nested subdirectory.

This method is relevant for applications that present directories. This might occur if the delegate manages the contents of a directory or manages a file that is implemented as a file package. Your implementation of this method should take whatever actions necessary to handle the change in content or attributes of the specified item.

If the presented directory is a file package, the system calls the presentedItemDidChange method if your delegate does not implement this method.

Available in Mac OS X v10.7 and later.

97.7.22 primaryPresentedItemURL as string

MBS MacCloud Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The URL of a secondary item's primary presented file or directory. (read-only)
Notes: This property supports App Sandbox in OS X.

Some apps require access to secondary files or directories with names that are related to the primary, user-selected file. For example, a subtitle file, by convention, has the same name as its corresponding movie file, but with a different filename extension. If a movie player is sandboxed, an NSOpenPanel object will grant access only to the user-selected movie file (the primary item) and not its associated subtitle file (the secondary item).

To gain access to a secondary item, first register an NSFilePresenter object for it. At any point in its existence, a secondary item must be able to return an NSURL object to its primary item. This is done by using this property. When done accessing the secondary item, unregister the file presenter object.

Available in OS X v10.8 and later.

97.7.23 reacquirer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The reacquirer event.
Notes: Called when you can reacquire an object.
e.g. called by relinquishPresentedItemToReader method.

97.7.24 relinquishPresentedItemToReader(reader as NSFilePresenterHandlerMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Notifies your object that another object or process wants to read the presented file or directory.
Notes: reader: A handler object. The reacquirer event is called to notify when the reader is done. If your object does not need to be notified, it can pass nil for the reacquirer block.

You use this method to provide an appropriate response when another object wants to read from your presented URL. For example, when this method is called, you might temporarily stop making changes to the file or directory. After taking any appropriate steps, you must execute the block in the reader parameter to let the waiting object know that it may now proceed with its task. If you want to be notified when the reader has completed its task, pass your own block to the reader and use that block to reacquire the file or URL for your own uses.

Important: If you implement this method, you must execute the run method in the reader parameter as part of your implementation. The system waits for you to execute that method before allowing the reader to operate on the file. Therefore, failure to execute the method could stall threads in your application or other processes until the user takes corrective actions.

Your implementation of this method is executed using the queue in the presentedItemOperationQueue property. Your reacquirer event is executed on the queue associated with the reader.

Available in Mac OS X v10.7 and later.

97.7.25 relinquishPresentedItemToWriter(writer as NSFilePresenterHandlerMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Notifies your object that another object or process wants to write to the presented file or directory.
Notes: writer: A complete handler object. The reacquirer event is called so that your object can be notified when the writer is done.

You use this method to provide an appropriate response when another object wants to write to your presented URL. For example, when this method is called, you would likely stop making changes to the file or directory. After taking any appropriate steps, you must execute the run method in the writer parameter to let the waiting object know that it may now proceed with its task.

Important: If you implement this method, you must execute the run method in the writer parameter at the end of your implementation. The system waits for you to execute that block before allowing the writer to operate on the file. Therefore, failure to execute the run method could stall threads in your application or other processes.

If the writer changes the file or directory, you do not need to incorporate those changes in your reacquirer block. Instead, implement the presentedItemDidChange method and use it to detect when a writer actually wrote its changes to disk.

Your implementation of this method is executed using the queue in the presentedItemOperationQueue property. Your reacquirer event is executed on the queue associated with the writer.

Available in Mac OS X v10.7 and later.

97.7.26 savePresentedItemChangesWithCompletionHandler(Complete as NSFilePresenterHandlerMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Tells your object to save any unsaved changes for the presented item.
Notes: Complete: The handler object to call after you save your changes. If you saved your changes successfully, pass nil for the run's errorOrNil parameter; otherwise, pass an error object indicating why the changes could not be saved.

The file coordinator calls this method to ensure that all objects trying to access the file or directory see the same contents. Implement this method if your object can change the presented item in a way that requires you to write those changes back to disk. If your presenter object does not make changes that need to be saved, you do not need to implement this method.

Important: If you implement this method, you must execute the run method in the Complete parameter at the end of your implementation. The system waits for you to execute that block before allowing other objects to operate on the file. Therefore, failure to execute the run method could stall threads in your application or other processes.

Available in Mac OS X v10.7 and later.

97.8 class NSFileVersionMBS

97.8.1 class NSFileVersionMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The class for different file versions on Mac OS X 10.7.
Example:

```
// list the saved versions of a document (Versions / Time Machine)
Var file As FolderItem = SpecialFolder.Documents.Child("Report.pages")
Var current As NSFileVersionMBS = NSFileVersionMBS.currentVersionOfItemAtURL(file)

Var lines() As String
lines.Add "Current: " + current.modificationDateTime.ToString
For Each v As NSFileVersionMBS In NSFileVersionMBS.otherVersionsOfItemAtURL(file)
lines.Add v.localizedName + ": " + v.modificationDateTime.ToString
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: Instances of NSFileVersionMBS for the same version of the same file are equal, and instances of NSFileVersionMBS for different versions of the same file are not equal, but the equality of NSFileVersionMBSs for different files is undefined. Repeated invocations of the methods that return NSFileVersionMBSs do not necessarily return the exact same instance of NSFileVersionMBS.

An NSFileVersion object represents a snapshot of a file at a specific point in time. You use the NSFileVersion class to access and create and manage file revisions in your application. Each instance of this class contains meta information about a single revision, such as the location of the file containing the revision data, the modification date of the revision, and whether the revision is discardable.

In Mac OS X applications, you can use file version objects to track changes to a local file over time and to prevent the loss of data during editing. When managing local versions, the document architecture creates versions at specific points in the lifetime of your application. Your application can also create versions explicitly at times that your application designates as appropriate.

In addition to managing local files, the system also uses this class to manage cloud-based files. For files in the cloud, there is usually only one version of the file at any given time. However, additional file versions may be created in cases where two different computers attempt to save the file to the cloud at the same time. In that case, one file is chosen as the current version and any other versions are tagged as being in conflict with the original. Conflict versions are reported to the appropriate file presenter objects and should be resolved as soon as possible so that the corresponding files can be removed from the cloud.

Available on Mac OS X 10.7 or later.
Please also check the documentation from Apple for the NSFileVersion class.

Works also well with files in backup (Time Machine) to find older versions.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Lion features for Real Studio

97.8.2 Methods

97.8.3 addVersionOfItemAtURL(url as string, withContentsOfURL as string, options as Integer, byref error as NSErrorMBS) as NSFileVersionMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Add a new version of the file located by a URL, with the contents coming from a file located by either the same or a different URL, and return a new instance that represents the version if successful.
Notes: If not successful, return false after setting Error to an NSErrorMBS that encapsulates why not.

You can add versions only on Mac OS X.

When adding or removing versions of a file you should do it as part of a "coordinated" write to the file. see NSFileCoordinatorMBS class. Using it properly ensures that NSFilePresenters of the file, or directories that contain the file, receive accurate notifications about versions being added or removed. For example, use NSFileCoordinatorMBS.coordinateWritingItemAtURL when the file URL and the contents url are the same. (NSFileVersion doesn't simply use NSFileCoordinator itself because that would be insufficient when the adding or removing of versions is part of a larger operation that should be treated as one coordinated file access.)

97.8.4 Conflict as boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Whether the version was created as a result of the discovery of a conflict between two writers of the versioned file.
Notes: When two or more versions of a file are written at the same time, perhaps because the file is saved in the cloud and one or more of the writers were offline when they were writing, the system attempts to resolve the conflict automatically. It does this by picking one of the file versions to be the current file and setting this property to true for the other file version that are in conflict.

97.8.5 Constructor

MBS MacCloud Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

97.8.6 currentVersionOfItemAtURL(file as folderitem) as NSFileVersionMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Convenience variant of currentVersionOfItemAtURL which takes folderitem.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("Notes.rtf")
Var n as NSFileVersionMBS = NSFileVersionMBS.currentVersionOfItemAtURL(f)

MessageBox n.localizedName
```

See also:

- 97.8.7 currentVersionOfItemAtURL(url as string) as NSFileVersionMBS 15497

97.8.7 currentVersionOfItemAtURL(url as string) as NSFileVersionMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Return an NSFileVersionMBS that represents the contents of the file located by a URL, or nil if there is no such file.
See also:

- 97.8.6 currentVersionOfItemAtURL(file as folderitem) as NSFileVersionMBS 15497

97.8.8 File as folderitem

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The location of the receiver's storage.
Notes: Or possibly nil if the receiver's storage has been deleted. The storage is read-only. The URL will have an arcane path. You must not derive user-presentable text from it.
If the URL does not represent a folderitem, this function gives nil.

97.8.9 FileURL(file as folderitem) as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns URL for a folderitem.
Notes: Call is method in case you need to provide an URL for a folderitem.

97.8.10 localizedName as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The user-presentable name of the version, or possibly "" if the receiver's storage has been deleted.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("Notes.rtf")
Var n as NSFileVersionMBS = NSFileVersionMBS.currentVersionOfItemAtURL(f)
MessageBox n.localizedName
```

Notes: This will be different from the user-presentable name of the versioned file if, for example, the file has been renamed since the version was added.

97.8.11 localizedNameOfSavingComputer as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The user-presentable name of the computer on which the version was saved, or possibly "" if the receiver's storage has been deleted, or "" if no computer name was recorded.
Notes: The computer name is guaranteed to have been recorded only if the version is a conflict version. This will be different from that computer's current name if the computer's name has been changed since the version was retrieved from that computer.

97.8.12 modificationDate as date

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The modification date of the version, or possibly nil if the receiver's storage has been deleted.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("Notes.rtf")
Var n as NSFileVersionMBS = NSFileVersionMBS.currentVersionOfItemAtURL(f)

MessageBox n.modificationDate.SQLDateTime
```

97.8.13 modificationDateTime as dateTime

MBS MacCloud Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The modification date of the version, or possibly nil if the receiver's storage has been deleted.

97.8.14 otherVersionsOfItemAtURL(file as folderitem) as NSFileVersionMBS()

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Convenience variant of otherVersionsOfItemAtURL taking a folderitem.
Example:

```
Var f as FolderItem = SpecialFolder.Desktop.Child("Notes.rtf")
Var n() as NSFileVersionMBS = NSFileVersionMBS.otherVersionsOfItemAtURL(f)

// shows all time stamps of this file.
Var lines() as string
for each x as NSFileVersionMBS in n
lines.Add x.modificationDate.SQLDateTime
next
MessageBox Join(lines,EndOfLine)
```

See also:

- 97.8.15 otherVersionsOfItemAtURL(url as string) as NSFileVersionMBS() 15499

97.8.15 otherVersionsOfItemAtURL(url as string) as NSFileVersionMBS()

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Return an array of NSFileVersionMBS objects associated with the file located by a URL, or an empty array if there is no such file.
Notes: The array never contains an NSFileVersionMBS equal to what currentVersionOfItemAtURL would return.
See also:

- 97.8.14 otherVersionsOfItemAtURL(file as folderitem) as NSFileVersionMBS() 15499

97.8.16 persistentIdentifier as Memoryblock

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The identifier for this version of the file. (read-only)
Example:

```
// get a file version
Var f as FolderItem = SpecialFolder.Desktop.Child("Notes.rtf")
Var n as NSFileVersionMBS = NSFileVersionMBS.currentVersionOfItemAtURL(f)
```

```
// get persistent identifier
Var m as MemoryBlock = n.persistentIdentifier

// later find version again
Var x as NSFileVersionMBS = NSFileVersionMBS.versionOfItemAtURLforPersistentIdentifier(f, m)

// and show something
MessageBox x.localizedName
```

Notes: You can save the value of this property persistently and use it to recreate the version object later. When recreating the version object using the versionOfItemAtURLforPersistentIdentifier method, the version object returned is equivalent to the current object.

The plugin encodes the identifier for you into a memoryblock, so you can store it somewhere in your preferences.

97.8.17 removeAndReturnError(byref error as NSErrorMBS) as boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Delete the receiver's storage, and return true if successful.
Notes: If not successful, return false after setting Error to an NSErrorMBS that encapsulates why not. Subsequent invocations of versionsOfItemAtURL won't include an NSFileVersion for a successfully removed version.

You cannot use this method to delete the versioned file itself. This method always throws an exception when sent to the result of invoking currentVersionOfItemAtURL. Use NSFileManagerMBS.removeItemAtURL for that instead.

When removing versions of a file you should do it as part of a coordinated write to the file. The advice about this for addVersionOfItemAtURL applies here too.

97.8.18 removeOtherVersionsOfItemAtURL(file as folderitem, byref error as NSErrorMBS) as boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Convenience variant of removeOtherVersionsOfItemAtURL which takes folderitem.
See also:

- 97.8.19 removeOtherVersionsOfItemAtURL(url as string, byref error as NSErrorMBS) as boolean 15501

97.8.19 removeOtherVersionsOfItemAtURL(url as string, byref error as NSErrorMBS) as boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Delete all of the versions associated with the file located by a URL, except for the current one, and return true if successful.
Notes: If not successful, return false after setting error to an NSErrorMBS that encapsulates why not.

When removing versions of a file you should do it as part of a coordinated write to the file. The advice about this for addVersionOfItemAtURL applies here too.
See also:

- 97.8.18 removeOtherVersionsOfItemAtURL(file as folderitem, byref error as NSErrorMBS) as boolean 15500

97.8.20 replaceItemAtURL(file as folderitem, options as Integer, byref error as NSErrorMBS) as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Convenience variant of replaceItemAtURL which takes a folderitem.
See also:

- 97.8.21 replaceItemAtURL(url as string, options as Integer, byref error as NSErrorMBS) as string 15501

97.8.21 replaceItemAtURL(url as string, options as Integer, byref error as NSErrorMBS) as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: If the passed-in URL locates a file, replace the file with a file whose contents are taken from the version but whose display name is taken from the file.
Notes: If the passed-in URL does not locate a file then simply write one. If successful, return a URL that locates the resulting file; it may be different from the passed-in URL. The one exception to taking the display name from an existing file is if the version is of a different type than the overwritten file. In that case the file name extension will be taken from the version. (When file name extensions are being hidden in a user-friendly way this is not actually an exception.) If not successful, return false after setting *outError to an NSError that encapsulates why not.

When you use NSFileVersionReplacingByMoving you remove a version of the file, and should do it as part of a coordinated write to the file. The advice about this for addVersionOfItemAtURL applies here too. When you use it to promote a version to a separate file you actually write to two files, and should do it as part of a coordinated write to two files, using NSFileCoordinatorMBS.coordinateWritingItemAtURL, most likely

using NSFileCoordinatorWritingForReplacing for the file you're promoting the version to.
See also:

- 97.8.20 replaceItemAtURL(file as folderitem, options as Integer, byref error as NSErrorMBS) as string 15501

97.8.22 temporaryDirectoryURLForNewVersionOfItemAtURL(url as string) as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Given a URL, create a new directory that is suitable for using as the container of a new temporary file that you will create and use with NSFileVersionAddingByMoving.
Notes: This is useful when you want to create a new version of a file out of something other than the file's current contents, for example, the contents in memory of a document that has not yet been saved to its file. You must remove this directory when you are done with it, using NSFileManagerMBS.removeItemAtURL for example.

97.8.23 unresolvedConflictVersionsOfItemAtURL(file as folderitem) as NSFileVersionMBS()

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Return an array of NSFileVersions that represent unresolved conflicts for the file located by a URL, or nil if there is no such file.
See also:

- 97.8.24 unresolvedConflictVersionsOfItemAtURL(url as string) as NSFileVersionMBS() 15502

97.8.24 unresolvedConflictVersionsOfItemAtURL(url as string) as NSFileVersionMBS()

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Return an array of NSFileVersions that represent unresolved conflicts for the file located by a URL, or nil if there is no such file.
See also:

- 97.8.23 unresolvedConflictVersionsOfItemAtURL(file as folderitem) as NSFileVersionMBS() 15502

97.8.25 URL as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The location of the receiver's storage.
Notes: Or possibly "" if the receiver's storage has been deleted. The storage is read-only. The URL will have an arcane path. You must not derive user-presentable text from it.

97.8.26 versionOfItemAtURLforPersistentIdentifier(file as folderitem, PersistentIdentifier as Memoryblock) as NSFileVersionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the version of the file that has the specified persistent ID.
Notes: url: The URL of the file whose version you want.
persistentIdentifier: The persistent ID of the NSFileVersion object you want. The plugin decodes it for you from the memoryblock.

Returns the file version object with the specified ID or nil if no such version object exists.
See also:

- 97.8.27 versionOfItemAtURLforPersistentIdentifier(URL as string, PersistentIdentifier as Memoryblock) as NSFileVersionMBS 15503

97.8.27 versionOfItemAtURLforPersistentIdentifier(URL as string, PersistentIdentifier as Memoryblock) as NSFileVersionMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the version of the file that has the specified persistent ID.
Notes: url: The URL of the file whose version you want.
persistentIdentifier: The persistent ID of the NSFileVersion object you want. The plugin decodes it for you from the memoryblock.

Returns the file version object with the specified ID or nil if no such version object exists.
See also:

- 97.8.26 versionOfItemAtURLforPersistentIdentifier(file as folderitem, PersistentIdentifier as Memoryblock) as NSFileVersionMBS 15503

97.8.28 Properties

97.8.29 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The internal reference to the NSFileVersion object.
Notes: (Read and Write property)

97.8.30 Discardable as boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the system is allowed to automatically delete the receiver's storage in the future, at an unpredictable time.
Notes: Setting this to true can fail so you must not depend on discarding for correct operation.

Once you have indicated that a version is discardable you cannot make it undiscardable again. Setting this to false causes an exception to be thrown.

You cannot make the versioned file itself discardable. Setting the value of this property always throws an exception when sent to the result of invoking currentVersionOfItemAtURL.

Versions can be discardable only on Mac OS X.
(Read and Write computed property)

97.8.31 Resolved as boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: If the version is a conflict version, whether the conflict has been resolved.
Notes: If the version is not a conflict version, simply true.

The operating system's reaction to your setting this to true is complicated and subject to change in future releases. One result however is that the version won't appear in arrays returned by unresolvedConflictVersionsOfItemAtURL anymore, unless setting fails.

Once you have indicated that a conflict has been resolved you cannot make it unresolved again. Setting this to false causes an exception to be thrown.
(Read and Write computed property)

97.8.32 Constants

Constants

Constant	Value	Description
NSFileVersionAddingByMoving	1	One of the constants for addVersionOfItemAtURL. Whether addVersionOfItemAtURL can move the new version contents file int the version store instead of copying it. Moving is much faster. See the com ment for temporaryDirectoryURLForNewVersionOfItemAtURL for an exampl of when this useful.
NSFileVersionReplacingByMoving	1	One of the constants for replaceItemAtURL. Whether replaceItemAtURL must move the version's contents out of the ver sion store instead of copying it. This is useful when you want to promote version's contents to a separate file. You wouldn't use this to restore a versio of a file.

97.9 class NSMetadataItemMBS

97.9.1 class NSMetadataItemMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The NSMetadataItem class represents the metadata associated with a file, providing a simple interface to retrieve the available attribute names and values.
Example:

```
// show details of the files a Spotlight query found
// Query is a property of the window: Query As NSMetadataQueryMBS (see there)
If Query = Nil Then Return

For Each item As NSMetadataItemMBS In Query.results
System.DebugLog item.DisplayName + ": " + item.FileSize.ToString + " bytes, created " + item.FileCreationDateTime.ToString + _
", in iCloud: " + item.IsUbiquitous.ToString
Next
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr9

97.9.2 Methods

97.9.3 attributeKeys as string()

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns an array containing the attribute names of the receiver's values.

97.9.4 Constructor

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Private constructor.

97.9.5 DisplayName as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The display name of the item, which may be different then the file system name.
Notes: Available in Mac OS X v10.7 and later.

97.9.6 File as folderitem

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The file reference.
Notes: Available in Mac OS X v10.7 and later.

97.9.7 FileContentChangeDate as date

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time that the file contents last changed.
Notes: Available in Mac OS X v10.7 and later.

97.9.8 FileContentChangeDateTime as dateTime

MBS MacCloud Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The date and time that the file contents last changed.
Notes: Available in Mac OS X v10.7 and later.

97.9.9 FileCreationDate as date

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time that the file was created.
Notes: Available in Mac OS X v10.7 and later.

97.9.10 FileCreationDateTime as dateTime

MBS MacCloud Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The date and time that the file was created.
Notes: Available in Mac OS X v10.7 and later.

97.9.11 FileName as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The name of the item as seen in the file system.
Notes: Available in Mac OS X v10.7 and later.

97.9.12 FileSize as UInt64

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The size (in bytes) of the file on disk.
Notes: Available in Mac OS X v10.7 and later.

97.9.13 IsUbiquitous as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Whether the item is stored in the cloud.
Notes: Available in Mac OS X v10.7 and later.

97.9.14 NSMetadataItemDisplayNameKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that may be associated with an item.
Notes: The value is a string with the display name of the item, which may be different then the file system name.
Available in Mac OS X v10.7 and later.

97.9.15 NSMetadataItemFSContentChangeDateKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that may be associated with an item.
Notes: The value is a date object that contains the date and time that the file contents last changed.

Available in Mac OS X v10.7 and later.

97.9.16 NSMetadataItemFSCreationDateKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that may be associated with an item.
Notes: The value is a date object that contains the date and time that the file was created.
Available in Mac OS X v10.7 and later.

97.9.17 NSMetadataItemFSNameKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that may be associated with an item.
Notes: The value is a string with the name of the item as seen in the file system.
Available in Mac OS X v10.7 and later.

97.9.18 NSMetadataItemFSSizeKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that may be associated with an item.
Notes: The value is a number that indicates the size (in bytes) of the file on disk.
Available in Mac OS X v10.7 and later.

97.9.19 NSMetadataItemIsUbiquitousKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that describe cloud-related information about the item.
Notes: The value is a boolean indicating whether the item is stored in the cloud.
Available in Mac OS X v10.7 and later.

97.9.20 NSMetadataItemPathKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that may be associated with an item.
Notes: The value is a string object that contains the full path to the file

Available in Mac OS X v10.7 and later.

97.9.21 NSMetadataItemURLKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that may be associated with an item.
Notes: The value is an URL string that you can use to open the file.
Available in Mac OS X v10.7 and later.

97.9.22 NSMetadataUbiquitousItemHasUnresolvedConflictsKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that describe cloud-related information about the item.
Notes: The value is a Boolean indicating whether the item is currently in conflict with another version of the file somewhere else.
Available in Mac OS X v10.7 and later.

97.9.23 NSMetadataUbiquitousItemIsDownloadedKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that describe cloud-related information about the item.
Notes: The value is a Boolean indicating whether the current version of the item has been downloaded and is available locally.
Available in Mac OS X v10.7 and later.

97.9.24 NSMetadataUbiquitousItemIsDownloadingKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that describe cloud-related information about the item.
Notes: The value is a Boolean indicating whether the item is currently being downloaded to the local device.
Available in Mac OS X v10.7 and later.

97.9.25 NSMetadataUbiquitousItemIsUploadedKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that describe cloud-related information about the item.
Notes: The value is a Boolean indicating whether the item has been uploaded to the cloud.
Available in Mac OS X v10.7 and later.

97.9.26 NSMetadataUbiquitousItemIsUploadingKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that describe cloud-related information about the item.
Notes: The value is a Boolean indicating whether the current version of the item is currently being uploaded to the cloud.
Available in Mac OS X v10.7 and later.

97.9.27 NSMetadataUbiquitousItemPercentDownloadedKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that describe cloud-related information about the item.
Notes: The value is a number that contains the percentage of the file that has already been downloaded from the cloud. The value is a double in the range 0.0 to 100.0.
Available in Mac OS X v10.7 and later.

97.9.28 NSMetadataUbiquitousItemPercentUploadedKey as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the possible attribute keys that describe cloud-related information about the item.
Notes: The value is a number that contains the percentage of the file that has already been uploaded to the cloud. The value is a double in the range 0.0 to 100.0.
Available in Mac OS X v10.7 and later.

97.9.29 Path as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The file path.
Notes: Available in Mac OS X v10.7 and later.

97.9.30 UbiquitousItemHasUnresolvedConflicts as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Whether the item is currently in conflict with another version of the file somewhere else.
Notes: Available in Mac OS X v10.7 and later.

97.9.31 UbiquitousItemIsDownloaded as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Whether the current version of the item has been downloaded and is available locally.
Notes: Available in Mac OS X v10.7 and later.

97.9.32 UbiquitousItemIsDownloading as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Whether the item is currently being downloaded to the local device.
Notes: Available in Mac OS X v10.7 and later.

97.9.33 UbiquitousItemIsUploaded as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Whether the item has been uploaded to the cloud.
Notes: Available in Mac OS X v10.7 and later.

97.9.34 UbiquitousItemIsUploading as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Whether the current version of the item is currently being uploaded to the cloud.
Notes: Available in Mac OS X v10.7 and later.

97.9.35 UbiquitousItemPercentDownloaded as Double

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The percentage of the file that has already been downloaded from the cloud. The value is a double in the range 0.0 to 100.0.
Notes: Available in Mac OS X v10.7 and later.

97.9.36 UbiquitousItemPercentUploaded as Double

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The percentage of the file that has already been uploaded to the cloud. The value is a double in the range 0.0 to 100.0.
Notes: Available in Mac OS X v10.7 and later.

97.9.37 URL as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The file URL.
Notes: Available in Mac OS X v10.7 and later.

97.9.38 valueForAttribute(key as string) as Variant

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the receiver's metadata attribute name specified by a given key.
Notes: key: The name of a metadata attribute.
Returns value as Variant.

97.9.39 valuesForAttributes(keys() as string) as dictionary

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a dictionary containing the key-value pairs for the attribute names specified by a given array of keys.
Notes: keys: An array containing strings that specify the names of a metadata attributes.

A dictionary containing the key-value pairs for the attribute names specified by keys.

97.9.40 Properties

97.9.41 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The internal reference to the metadata item.
Notes: Available in Mac OS X v10.7 and later.
(Read and Write property)

97.10 class NSMetadataQueryMBS

97.10.1 class NSMetadataQueryMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The NSMetadataQuery class encapsulates the functionality provided by the MDQuery opaque type for querying the Spotlight metadata.
Example:

```
// find all PDF files in the home folder with Spotlight
// MyMetadataQuery is a subclass of NSMetadataQueryMBS with the DidFinishGathering event implemented.
// Query is a property of the window: Query As MyMetadataQuery
Query = New MyMetadataQuery
Query.predicate = NSPredicateMBS.predicateWithFormat("kMDItemContentType == 'com.adobe.pdf'")

Var scopes() As String = Array(NSMetadataQueryMBS.NSMetadataQueryUserHomeScope)
Query.setSearchScopes scopes

If Not Query.startQuery Then
MessageBox "Failed to start query."
End If

// in MyMetadataQuery:
Sub DidFinishGathering(n As NSNotificationMBS) Handles DidFinishGathering
Me.stopQuery
For Each item As NSMetadataItemMBS In Me.results
System.DebugLog item.Path
Next
System.DebugLog Me.resultCount.ToString + " PDF files found."
End Sub
```

Notes: You may prefer MDQueryMBS class from our plugins. NSMetadataQueryMBS exists as it supports iCloud search.

NSMetadataQuery objects provide metadata query results in several ways:

- As individual attribute values for requested attributes.
- As value lists that contain the distinct values for given attributes in the query results.
- A result array proxy, containing all the query results. This is suitable for use with Cocoa bindings.
- As a hierarchical collection of results, grouping together items with the same values for specified grouping attributes. This is also suitable for use with Cocoa bindings.

Queries have two phases: the initial gathering phase that collects all currently matching results and a second live-update phase.
By default the receiver has no limitation on its search scope. Use setSearchScopes to customize.
By default, notification of updated results occurs at 1.0 seconds. Use setNotificationBatchingInterval to customize.
You must set a predicate with the setPredicate method before starting a query.
Blog Entries

- More notes
- MBS Real Studio Plugins, version 11.3pr9

97.10.2 Methods

97.10.3 Constructor

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Initializes the NSMetadataQuery object.

97.10.4 Destructor

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The destructor.

97.10.5 disableUpdates

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Disables updates to the query results.
Notes: You should invoke this method before iterating over query results that could change due to live updates.

97.10.6 enableUpdates

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Enables updates to the query results.
Notes: You should invoke this method after you're done iterating over the query results.

97.10.7 groupedResults as NSMetadataQueryResultGroupMBS()

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns an array containing hierarchical groups of query results based on the receiver's grouping attributes.

97.10.8 groupingAttributes as string()

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the receiver's grouping attributes.

97.10.9 indexOfResult(item as NSMetadataItemMBS) as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the index of a query result object in the receiver's results array.

97.10.10 isGathering as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the receiver is in the initial gathering phase of the query.
Notes: Returns true when the query is in the initial gathering phase; false otherwise.

97.10.11 isStarted as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the receiver has started the query.
Notes: Returns true when the receiver has executed the startQuery method; false otherwise.

97.10.12 isStopped as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the receiver has stopped the query.
Notes: Returns true when the receiver has stopped the query, false otherwise.

97.10.13 NSMetadataQueryDidFinishGatheringNotification as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the query notification names.
Notes: Posted when the receiver has finished with the initial result-gathering phase of the query.

97.10.14 NSMetadataQueryDidStartGatheringNotification as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the query notification names.
Notes: Posted when the receiver begins with the initial result-gathering phase of the query.

97.10.15 NSMetadataQueryDidUpdateNotification as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the query notification names.
Notes: Posted when the receiver's results have changed during the live-update phase of the query.

97.10.16 NSMetadataQueryGatheringProgressNotification as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the query notification names.
Notes: Posted as the receiver's is collecting results during the initial result-gathering phase of the query.

97.10.17 NSMetadataQueryLocalComputerScope as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the scope constants you can use with setSearchScopes.

97.10.18 NSMetadataQueryNetworkScope as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the scope constants you can use with setSearchScopes.
Notes: Search all user-mounted remote volumes.

97.10.19 NSMetadataQueryResultContentRelevanceAttribute as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: In addition to the requested metadata attributes, a query result also includes content relevance, accessed with this key.
Notes: Key used to retrieve a number with a floating point value between 0.0 and 1.0 inclusive. The relevance value indicates the relevance of the content of a result object. The relevance is computed based on the value of the result itself, not on its relevance to the other results returned by the query. If the value is not computed, it is treated as an attribute on the item that does not exist.
Available in Mac OS X v10.4 and later.

97.10.20 NSMetadataQueryUbiquitousDataScope as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the scope constants you can use with setSearchScopes.
Notes: Search all files not in the Documents directories of the application's iCloud container directories.
vailable in Mac OS X v10.7 and later.

97.10.21 NSMetadataQueryUbiquitousDocumentsScope as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the scope constants you can use with setSearchScopes.
Notes: Search all files in the Documents directories of the application's iCloud container directories.
vailable in Mac OS X v10.7 and later.

97.10.22 NSMetadataQueryUserHomeScope as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the scope constants you can use with setSearchScopes.
Notes: Search all local mounted volumes, including the user home directory. The user's home directory is searched even if it is a remote volume.

97.10.23 resultAtIndex(index as Integer) as NSMetadataItemMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the query result at a specific index.
Notes: index: Index of the desired result in the query result array.
Returns query result at the position specified by index.

For performance reasons, you should use this method when retrieving a specific result, rather than they array returned by results.

97.10.24 resultCount as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the number of results returned by the receiver.
Notes: For performance reasons, you should use this method, rather than invoking count on results array.

97.10.25 results as NSMetadataItemMBS()

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns an array containing the result objects for the receiver.
Notes: The results array is a proxy object that is primarily intended for use with Cocoa bindings. While it is possible to copy the proxy array and receive a "snapshot" of the complete current query results, it is generally not recommended due to performance and memory issues. To access individual result array elements you should instead use the resultCount and resultAtIndex methods.

97.10.26 searchScopes as string()

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns an array containing the receiver's search scopes.
Notes: The array can contain strings that represent file system directories or the search scopes specified in Constants. An empty array indicates that there is no limitation on where the receiver searches.

97.10.27 setGroupingAttributes(attributeNames() as string)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sets the receiver's grouping attributes to specific attribute names.
Notes: Invoking this method on a receiver while it's running a query, stops the query and discards current results, and immediately starts a new query.
Available in Mac OS X v10.4 and later.

97.10.28 setSearchScopes(folders() as folderitem)

MBS MacCloud Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Restrict the search scope of the receiver.
Notes: You can pass paths as folderitem.
See also:

- 97.10.29 setSearchScopes(paths() as string) 15521
- 97.10.30 setSearchScopes(paths() as string, folders() as folderitem) 15521

97.10.29 setSearchScopes(paths() as string)

MBS MacCloud Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Restrict the search scope of the receiver.
Notes: You can pass paths as strings and with the string array also the special scope strings from this class.
See also:

- 97.10.28 setSearchScopes(folders() as folderitem) 15521
- 97.10.30 setSearchScopes(paths() as string, folders() as folderitem) 15521

97.10.30 setSearchScopes(paths() as string, folders() as folderitem)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Restrict the search scope of the receiver.
Example:

```
Var m as new NSMetadataQueryMBS
Var paths() as string
Var folders() as FolderItem

// you can specify where to search either by path or by FolderItem
'paths.Add "/Applications"
folders.Add SpecialFolder.Applications

m.setSearchScopes paths, folders
```

Notes: You can pass paths as strings, paths as folderitem and with the string array also the special scope strings from this class.
See also:

- 97.10.28 setSearchScopes(folders() as folderitem) 15521
- 97.10.29 setSearchScopes(paths() as string) 15521

97.10.31 setSortDescriptor(sortDescriptor as NSSortDescriptorMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sets the sort descriptors to be used by the receiver.
Example:

Var m as new NSMetadataQueryMBS
m.setSortDescriptor NSSortDescriptorMBS.sortDescriptorWithKey(NSMetadataItemMBS.NSMetadataItemDisplayNameKey, true)

Notes: Invoking this method on the receiver running a query causes the existing query to stop, all current results are discarded, and a new query is started immediately.

97.10.32 setSortDescriptors(sortDescriptors() as NSSortDescriptorMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Sets the sort descriptors to be used by the receiver.
Notes: Invoking this method on the receiver running a query causes the existing query to stop, all current results are discarded, and a new query is started immediately.

97.10.33 sortDescriptors as NSSortDescriptorMBS()

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns an array containing the receiver's sort descriptors.
Notes: Available in Mac OS X v10.4 and later.

97.10.34 startQuery as boolean

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Attempts to start the query.
Notes: Returns true when successful; false otherwise.

A query can't be started if the receiver is already running a query or no predicate has been specified.

97.10.35 stopQuery

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Stops the receiver's current query from gathering any further results.
Notes: The receiver first completes gathering any unprocessed results. If a query is stopped before the gathering phase finishes, it will not post an NSMetadataQueryDidStartGatheringNotification notification.

You would call this function to stop a query that is generating too many results to be useful but still want to access the available results. If the receiver is sent a startQuery message after performing this method, the existing results are discarded.

97.10.36 Properties

97.10.37 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The internal reference to the NSMetadataQuery object.
Notes: (Read and Write property)

97.10.38 notificationBatchingInterval as Double

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The interval that the receiver provides notification of updated query results.
Notes: in seconds.
(Read and Write computed property)

97.10.39 predicate as NSPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The predicate used by the receiver to filter the query results.
Example:

```
Var m as new NSMetadataQueryMBS
m.predicate = NSPredicateMBS.predicateWithFormat("kMDItemContentType=""com.apple.application-bundle""")
```

Notes: Setting the predicate on a receiver running a query causes the existing query to stop, all current results are discarded, and a new query is started immediately.
(Read and Write computed property)

97.10.40 Events

97.10.41 DidFinishGathering(n as NSNotificationMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Called as the query has finished with the initial result-gathering phase of the query.

97.10.42 DidStartGathering(n as NSNotificationMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Called as the query begins with the initial result-gathering phase of the query.

97.10.43 DidUpdate(n as NSNotificationMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Called as the query's results have changed during the live-update phase of the query.

97.10.44 GatheringProgress(n as NSNotificationMBS)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Called as the query is collecting results during the initial result-gathering phase of the query.

97.11 class NSMetadataQueryResultGroupMBS

97.11.1 class NSMetadataQueryResultGroupMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The NSMetadataQueryResultGroupMBS class represents a collection of grouped attribute results returned by an NSMetadataQueryMBS object.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 11.3pr10

97.11.2 Methods

97.11.3 attributeName as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the attribute name for the receiver's result group.

97.11.4 Constructor

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The private constructor.

97.11.5 resultAtIndex(index as Integer) as NSMetadataItemMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the query result at a specific index.
Notes: index: The index of the desired result.

For performance reasons, you should use this method when retrieving a specific result, rather than they array returned by results.

97.11.6 resultCount as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the number of results returned by the receiver.
Notes: For performance reasons, you should use this method, rather than invoking count on results.

97.11.7 results as NSMetadataItemMBS()

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns an array containing the result objects for the receiver.
Notes: The results array is a proxy object that is primarily intended for use with Cocoa bindings. While it is possible to copy the proxy array to get a "snapshot" of the complete current query results, it is generally not recommended due to performance and memory issues. To access individual result array elements you should instead use the resultCount and resultAtIndex methods.

97.11.8 subgroups as NSMetadataQueryResultGroupMBS()

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns an array containing the subgroups of the receiver.

97.11.9 value as Variant

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the value of the attribute name for the receiver.

97.11.10 Properties

97.11.11 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The internal handle to the NSMetadataQueryResultGroup object.
Notes: (Read and Write property)

97.12 class NSPredicateMBS

97.12.1 class NSPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The NSPredicate class is used to define logical conditions used to constrain a search either for a fetch or for in-memory filtering.
Example:

```
// find all PDF files in the home folder with Spotlight
// MyQuery is a subclass of NSMetadataQueryMBS with the DidFinishGathering event implemented.
// Query is a property of the window: Query As MyQuery
Query = New MyQuery
Query.predicate = NSPredicateMBS.predicateWithFormat("kMDItemContentType == 'com.adobe.pdf'")

Var scopes() As String
scopes.Add NSMetadataQueryMBS.NSMetadataQueryUserHomeScope
Query.setSearchScopes scopes
Call Query.startQuery

// in MyQuery:
Sub DidFinishGathering(n As NSNotificationMBS) Handles DidFinishGathering
For Each item As NSMetadataItemMBS In Me.results
System.DebugLog item.valueForAttribute(NSMetadataItemMBS.NSMetadataItemPathKey).StringValue
Next
End Sub
```

Notes: You use predicates to represent logical conditions, used for describing objects in persistent stores and in-memory filtering of objects. Although it is common to create predicates directly from instances of NSComparisonPredicate, NSCompoundPredicate, and NSExpression, you often create predicates from a format string which is parsed by the class methods on NSPredicate. Examples of predicate format strings include:

- Simple comparisons, such as grade == "7" or firstName like "Shaffiq"
- Case and diacritic insensitive lookups, such as name contains [cd] "itroen"
- Logical operations, such as (firstName like "Mark") OR (lastName like "Adderley")
- In Mac OS X v10.5 and later, you can create ¬Ä¬úbetween¬Ä¬ù predicates such as date between { $ YESTERDAY, $ TOMORROW } .

You can create predicates for relationships, such as:

- group.name like "work*"

- ALL children.age >12
- ANY children.age >12

You can create predicates for operations, such as @sum.items.price <1000. For a complete syntax reference, refer to the Predicate Programming Guide:
http://developer.apple.com/library/mac/#documentation/Cocoa/Conceptual/Predicates/predicates.html#//apple_ref/doc/uid/TP40001789

97.12.2 Methods

97.12.3 Constructor(predicateFormat as string)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates and returns a new predicate by substituting the values in a given array into a format string and parsing the result.
Example:

```
Var n as new NSPredicateMBS("kMDItemContentType=""com.apple.application-bundle""")
MessageBox n.predicateFormat
```

Notes: predicateFormat: The format string for the new predicate.
arguments: Optional, the arguments to substitute into predicateFormat. Values are substituted into predicateFormat in the order they appear in the array.

You get a new predicate by substituting the values in arguments into predicateFormat, and parsing the result.
For details of the format of the format string and of limitations on variable substitution, see Predicate Format String Syntax:
http://developer.apple.com/library/mac/documentation/Cocoa/Conceptual/Predicates/Articles/pSyntax.html#//apple_ref/doc/uid/TP40001795

Available in Mac OS X v10.4 and later.
See also:

- 97.12.4 Constructor(predicateFormat as string, arguments() as Variant) 15529
- 97.12.5 Constructor(value as boolean) 15529

97.12.4 Constructor(predicateFormat as string, arguments() as Variant)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates and returns a new predicate by substituting the values in a given array into a format string and parsing the result.
Example:

```
// we use one parameter here
Var s() as Variant
s.Add "com.apple.application-bundle"

Var n as new NSPredicateMBS("kMDItemContentType=%@", s)

// shows final string
MessageBox n.predicateFormat
```

Notes: predicateFormat: The format string for the new predicate.
arguments: Optional, the arguments to substitute into predicateFormat. Values are substituted into predicateFormat in the order they appear in the array.

You get a new predicate by substituting the values in arguments into predicateFormat, and parsing the result.
For details of the format of the format string and of limitations on variable substitution, see Predicate Format String Syntax:
http://developer.apple.com/library/mac/documentation/Cocoa/Conceptual/Predicates/Articles/pSyntax.html#//apple_ref/doc/uid/TP40001795

Available in Mac OS X v10.4 and later.
See also:

- 97.12.3 Constructor(predicateFormat as string) 15528
- 97.12.5 Constructor(value as boolean) 15529

97.12.5 Constructor(value as boolean)

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates and returns a predicate that always evaluates to a given value.
Example:

```
Var n as new NSPredicateMBS(true)
MessageBox n.predicateFormat
```

See also:

- 97.12.3 Constructor(predicateFormat as string) 15528
- 97.12.4 Constructor(predicateFormat as string, arguments() as Variant) 15529

97.12.6 description as string

MBS MacCloud Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: The descriptor for this event.
Example:

```
Var args() as Variant
args.Add NSMetadataItemMBS.NSMetadataItemFSNameKey
Var pred as NSPredicateMBS = NSPredicateMBS.predicateWithFormat("%K LIKE '*'", args)
MessageBox pred.description
```

Notes: This is a text representation for debugging.

97.12.7 predicateFormat as string

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the receiver's format string.
Notes: The string returned by this method is not guaranteed to be the same as a string used to create the predicate.

97.12.8 predicateWithFormat(predicateFormat as string) as NSPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates and returns a new predicate by substituting the values in a given array into a format string and parsing the result.
Example:

```
Var n as NSPredicateMBS
n = NSPredicateMBS.predicateWithFormat("kMDItemContentType=""com.apple.application-bundle""")
MessageBox n.predicateFormat
```

Notes: predicateFormat: The format string for the new predicate.
arguments: Optional, the arguments to substitute into predicateFormat. Values are substituted into predicateFormat in the order they appear in the array.

Returns a new predicate by substituting the values in arguments into predicateFormat, and parsing the result.

For details of the format of the format string and of limitations on variable substitution, see Predicate Format String Syntax:
http://developer.apple.com/library/mac/documentation/Cocoa/Conceptual/Predicates/Articles/pSyntax.html#//apple_ref/doc/uid/TP40001795

Available in Mac OS X v10.4 and later.
See also:

- 97.12.9 predicateWithFormat(predicateFormat as string, arguments() as Variant) as NSPredicateMBS 15531

97.12.9 predicateWithFormat(predicateFormat as string, arguments() as Variant) as NSPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates and returns a new predicate by substituting the values in a given array into a format string and parsing the result.
Example:

```
Var args() as Variant
args.Add NSMetadataItemMBS.NSMetadataItemFSNameKey
Var pred as NSPredicateMBS = NSPredicateMBS.predicateWithFormat("%K LIKE '*'", args)
MessageBox pred.description
```

Notes: predicateFormat: The format string for the new predicate.
arguments: Optional, the arguments to substitute into predicateFormat. Values are substituted into predicateFormat in the order they appear in the array.

Returns a new predicate by substituting the values in arguments into predicateFormat, and parsing the result.
For details of the format of the format string and of limitations on variable substitution, see Predicate Format String Syntax:
http://developer.apple.com/library/mac/documentation/Cocoa/Conceptual/Predicates/Articles/pSyntax.html#//apple_ref/doc/uid/TP40001795

Available in Mac OS X v10.4 and later.
See also:

- 97.12.8 predicateWithFormat(predicateFormat as string) as NSPredicateMBS 15530

97.12.10 predicateWithValue(value as boolean) as NSPredicateMBS

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates and returns a predicate that always evaluates to a given value.
Example:

```
Var p as NSPredicateMBS = NSPredicateMBS.predicateWithValue(true)
MessageBox p.predicateFormat
```

97.12.11 Print

MBS MacCloud Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Writes description for this event descriptor to the console.
Notes: You can see result in Console.app.

97.12.12 Properties

97.12.13 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The internal handle to the NSPredicate object.
Notes: (Read and Write property)

97.13 class NSSortDescriptorMBS

97.13.1 class NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The cocoa class for sort descriptions.
Example:

```
Var n as new NSSortDescriptorMBS("Hello", true)
MessageBox str(n.key)
```

Notes: An instance of NSSortDescriptor describes a basis for ordering objects by specifying the property to use to compare the objects, the method to use to compare the properties, and whether the comparison should be ascending or descending. Instances of NSSortDescriptor are immutable.

You construct an instance of NSSortDescriptor by specifying the key path of the property to be compared, the order of the sort (ascending or descending), and (optionally) a selector to use to perform the comparison. The three-argument constructor allows you to specify other comparison selectors such as caseInsensitiveCompare: and localizedCompare:. Sorting raises an exception if the objects to be sorted do not respond to the sort descriptor's comparison selector.

Note: Many of the descriptions of NSSortDescriptor methods refer to "property key". This, briefly, is a string (key) that identifies a property (an attribute or relationship) of an object. You can find a discussion of this terminology in "Object Modeling" in Cocoa Fundamentals Guide and in Key-Value Coding Programming Guide.
There are a number of situations in which you can use sort descriptors, for example:

- To sort an array (an instance of NSArray or NSMutableArray—see sortedArrayUsingDescriptors and sortUsingDescriptors)
- To directly compare two objects (see compareObject method)
- To specify how the elements in a table view should be arranged (see sortDescriptors)
- To specify how the elements managed by an array controller should be arranged (see sortDescriptors)
- If you are using Core Data, to specify the ordering of objects returned from a fetch request (see sortDescriptors)

97.13.2 Methods

97.13.3 compareObject(obj1 as variant, obj2 as variant) as Integer

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Compares two objects.
Notes: Returns 1, -1 or 0 (zero for equal).

97.13.4 Constructor(key as string, ascending as boolean)

MBS Main Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Initializes an NSSortDescriptor object initialized with a given property key path and sort order, and with the default comparison selector.
Example:

```
Var n as new NSSortDescriptorMBS("Hello", true)
MessageBox str(n.key)
```

Notes: key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
ascending: True if the receiver specifies sorting in ascending order, otherwise false.

On success the handle property is not zero.
Available in Mac OS X v10.3 and later.
If you implement the Compare event, we use it on OS X 10.6 and newer.
See also:

- 97.13.5 Constructor(key as string, ascending as boolean, SelectorName as String) 15534

97.13.5 Constructor(key as string, ascending as boolean, SelectorName as String)

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Initializes an NSSortDescriptor object initialized with a given property key path and sort order, and with the default comparison selector.
Notes: key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
ascending: True if the receiver specifies sorting in ascending order, otherwise false.

On success the handle property is not zero.
Please pass valid name of a selector for the objects. Wrong selector causes trouble, e.g. "localizedCompare:".

Available in Mac OS X v10.3 and later.
See also:

- 97.13.4 Constructor(key as string, ascending as boolean) 15534

97.13.6 reversedSortDescriptor as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a copy of the receiver with the sort order reversed.
Example:

```
Var n as NSSortDescriptorMBS
n = NSSortDescriptorMBS.sortDescriptorWithKey("Hello", true)

Var x as NSSortDescriptorMBS = n.reversedSortDescriptor
MessageBox x.key+" "+str(x.ascending)
```

97.13.7 sortDescriptorWithKey(key as string, ascending as boolean) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates and returns an NSSortDescriptor with the specified key and ordering.
Example:

```
Var n as NSSortDescriptorMBS

n = NSSortDescriptorMBS.sortDescriptorWithKey("Hello", true)
MessageBox n.key
```

Notes: key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
ascending: True if the receiver specifies sorting in ascending order, otherwise false.

Returns an NSSortDescriptorMBS object initialized with the specified key and ordering.
Available in Mac OS X 10.3 and newer.

97.13.8 sortDescriptorWithKeyComparator(key as string, ascending as boolean, Comparator as NSComparatorDelegateMBS, tag as Variant = nil) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Creates and returns an NSSortDescriptor object initialized to do with the given ordering and comparator delegate.
Notes: key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding (see Key-Value Coding Programming Guide).
ascending: true if the receiver specifies sorting in ascending order, otherwise false.
Comparator: the comparator to use with delegate declaration "NSComparatorDelegateMBS(obj1 as Variant, obj2 as Variant, tag as Variant) as Integer".

97.13.9 sortDescriptorWithKeyWithCaseInsensitiveCompare(key as string, ascending as boolean) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates and returns an NSSortDescriptor with the specified key and ordering.
Example:

```
Var n as NSSortDescriptorMBS

n = NSSortDescriptorMBS.sortDescriptorWithKeyWithCaseInsensitiveCompare("Hello", true)
MessageBox n.key
```

Notes: key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
ascending: True if the receiver specifies sorting in ascending order, otherwise false.

Returns an NSSortDescriptorMBS object initialized with the specified key and ordering. With case insensitive string comparison.
Available in Mac OS X 10.3 and newer.

97.13.10 sortDescriptorWithKeyWithCompare(key as string, ascending as boolean) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Creates and returns an NSSortDescriptor with the specified key and ordering.
Example:

```
Var n as NSSortDescriptorMBS

n = NSSortDescriptorMBS.sortDescriptorWithKeyWithCompare("Hello", true)
MessageBox n.key
```

Notes: key: The property key to use when performing a comparison. In the comparison, the property is

accessed using key-value coding.
ascending: True if the receiver specifies sorting in ascending order, otherwise false.

Returns an NSSortDescriptorMBS object initialized with the specified key and ordering. Uses selector "compare:".
Available in Mac OS X 10.3 and newer.
See also:

- 97.13.11 sortDescriptorWithKeyWithCompare(key as string, ascending as boolean, Options as Integer) as NSSortDescriptorMBS 15537

97.13.11 sortDescriptorWithKeyWithCompare(key as string, ascending as boolean, Options as Integer) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Creates and returns an NSSortDescriptor with the specified key and ordering.
Example:

```
Var n as NSSortDescriptorMBS

n = NSSortDescriptorMBS.sortDescriptorWithKeyWithCompare("Hello", true)
MessageBox n.key
```

Notes: key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
ascending: True if the receiver specifies sorting in ascending order, otherwise false.

Returns an NSSortDescriptorMBS object initialized with the specified key and ordering. Uses selector "compare:options:".
Please pass options for NSString comparison. e.g. NSNumericSearch
Available in Mac OS X 10.3 and newer.
See also:

- 97.13.10 sortDescriptorWithKeyWithCompare(key as string, ascending as boolean) as NSSortDescriptorMBS 15536

97.13.12 sortDescriptorWithKeyWithLocalizedCaseInsensitiveCompare(key as string, ascending as boolean) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Creates and returns an NSSortDescriptor with the specified key and ordering.
Example:

Var n as NSSortDescriptorMBS

n = NSSortDescriptorMBS.sortDescriptorWithKeyWithLocalizedCaseInsensitiveCompare("Hello", true)
MessageBox n.key

Notes: key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
ascending: True if the receiver specifies sorting in ascending order, otherwise false.

Returns an NSSortDescriptorMBS object initialized with the specified key and ordering. With localized string comparison. With case insensitive string comparison.
Available in Mac OS X 10.3 and newer.

97.13.13 sortDescriptorWithKeyWithLocalizedCompare(key as string, ascending as boolean) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates and returns an NSSortDescriptor with the specified key and ordering.
Example:

Var n as NSSortDescriptorMBS

n = NSSortDescriptorMBS.sortDescriptorWithKeyWithLocalizedCompare("Hello", true)
MessageBox n.key

Notes: key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.
ascending: True if the receiver specifies sorting in ascending order, otherwise false.

Returns an NSSortDescriptorMBS object initialized with the specified key and ordering. With localized string comparison.
Available in Mac OS X 10.3 and newer.

97.13.14 sortDescriptorWithKeyWithSelector(key as string, ascending as boolean, SelectorName as String) as NSSortDescriptorMBS

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Creates and returns an NSSortDescriptor with the specified selector, key and ordering.
Notes: key: The property key to use when performing a comparison. In the comparison, the property is accessed using key-value coding.

ascending: True if the receiver specifies sorting in ascending order, otherwise false.

Returns an NSSortDescriptorMBS object initialized with the specified key and ordering.
Please pass valid name of a selector for the objects. Wrong selector causes trouble, e.g. "localizedCompare:".
Available in Mac OS X 10.3 and newer.

97.13.15 Properties

97.13.16 ascending as boolean

MBS Main Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the receiver specifies sorting in ascending order.
Example:

```
Var n as new NSSortDescriptorMBS("Hello", true)
MessageBox str(n.ascending)
```

Notes: (Read only property)

97.13.17 Handle as Integer

MBS Main Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The internal handle to the NSSortDescriptor object.
Notes: (Read and Write property)

97.13.18 key as string

MBS Main Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the receiver's property key path.
Example:

```
Var n as new NSSortDescriptorMBS("Hello", true)
MessageBox str(n.key)
```

Notes: This key path specifies the property that is compared during sorting.
(Read only property)

97.13.19 selector as String

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: The selector used to sort.
Notes: (Read only property)

97.13.20 Events

97.13.21 Comparator(obj1 as Variant, obj2 as Variant) as Integer

MBS Main Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: The compare event.

97.13.22 Delegates

97.13.23 NSComparatorDelegateMBS(obj1 as Variant, obj2 as Variant, tag as variant) as Integer

MBS Main Plugin, Plugin Version: 18.5, Platform: macOS, Targets: All.

Function: The delegate for use with sortDescriptorWithKeyComparator method.

97.14 class NSUbiquitousKeyValueStoreMBS

97.14.1 class NSUbiquitousKeyValueStoreMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The iCloud class to store key value data.
Example:

```
// store small settings in iCloud so they sync between the Macs of the user
// The app needs the iCloud key-value store entitlement and must be code signed.
Var store As NSUbiquitousKeyValueStoreMBS = NSUbiquitousKeyValueStoreMBS.defaultStore

store.StringValue("UserName") = "John"
store.IntegerValue("LaunchCount") = store.IntegerValue("LaunchCount") + 1
Call store.synchronize

MessageBox store.StringValue("UserName") + " launched " + store.IntegerValue("LaunchCount").ToString
+ " times"
```

Notes: Size of data is limited to 64 KB per application and 4 KB per value.
Do not store data here. Better store some configuration data, bookmarks or highscores.

Please also check the documentation from Apple for the NSUbiquitousKeyValueStore class. Seems like you need your app to be signed with iCloud Storage Entitlements.

97.14.2 Methods

97.14.3 ArrayValue(key as string) as Variant()

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Get the value for this key as a variant.
Example:

```
Var values() as Variant

values.Add "Hello"
values.Add "World"

Var u as new NSUbiquitousKeyValueStoreMBS
```

```
u.ArrayValue("key")=values

// later read back
Var nvalues() as Variant = u.ArrayValue("key")
```

See also:

- 97.14.4 ArrayValue(key as string, assigns values() as Variant) 15542

97.14.4 ArrayValue(key as string, assigns values() as Variant)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Set the value for this key as a variant.
Example:

```
Var u as new NSUbiquitousKeyValueStoreMBS
Var nvalues() as Variant = u.ArrayValue("key")
```

See also:

- 97.14.3 ArrayValue(key as string) as Variant() 15541

97.14.5 available as boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Example:

```
MessageBox "iCloud Key Value Store available: "+str(NSUbiquitousKeyValueStoreMBS.available)
```

Notes: This does not tell you whether Apple switched on their servers.

97.14.6 Constructor

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The constructor.

97.14.7 defaultStore as NSUbiquitousKeyValueStoreMBS

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Returns a reference to the default key store.

97.14.8 Destructor

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The destructor.

97.14.9 dictionaryRepresentation as dictionary

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The key value store as a dictionary.

97.14.10 NSUbiquitousKeyValueStoreChangedKeysKey as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: A key name for the userinfo dictionary when you receive the NSUbiquitousKeyValueStoreDidChangeExternallyNotification notification.
Notes: Value for this key in the dictionary in an array of strings.

97.14.11 NSUbiquitousKeyValueStoreChangeReasonKey as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: A key name for the userinfo dictionary when you receive the NSUbiquitousKeyValueStoreDidChangeExternallyNotification notification.
Notes: Value for this key in the dictionary in an integer.

97.14.12 NSUbiquitousKeyValueStoreDidChangeExternallyNotification as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The notification name for the notification sent when the .
Notes: You can observe this notification with the NSNotificationObserverMBS class or simply subclass

NSUbiquitousKeyValueStoreMBS and use the DidChangeExternally event.

97.14.13 removeObjectForKey(key as string)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Removes the value for the key.

97.14.14 synchronize as boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Synchronizes the key value store.
Example:

```
Var u as NSUbiquitousKeyValueStoreMBS = NSUbiquitousKeyValueStoreMBS.defaultStore

// safe something
u.StringValue("Font") = "Times"

if u.synchronize then
MessageBox "OK"
else
MessageBox "Failed"
end if
```

Notes: Returns true on success.

97.14.15 Properties

97.14.16 Handle as Integer

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: The internal reference for this object.
Notes: (Read and Write property)

97.14.17 BooleanValue(key as string) as Boolean

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Get or set the value for this key as a boolean.
Notes: (Read and Write computed property)

97.14.18 DataValue(key as string) as memoryblock

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Get or set the value for this key as a memoryblock.
Notes: (Read and Write computed property)

97.14.19 DictionaryValue(key as string) as Dictionary

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Get or set the value for this key as a dictionary.
Notes: (Read and Write computed property)

97.14.20 DoubleValue(key as string) as Double

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Get or set the value for this key as a double.
Example:

```
Var u as new NSUbiquitousKeyValueStoreMBS

u.DoubleValue("HighScore") = 3456
```

Notes: (Read and Write computed property)

97.14.21 IntegerValue(key as string) as Int64

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Get or set the value for this key as an integer.
Example:

```
Var u as new NSUbiquitousKeyValueStoreMBS

// query highscore value
MessageBox str(u.IntegerValue("HighScore"))
```

Notes: (Read and Write computed property)

97.14.22 StringValue(key as string) as string

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Get or set the string value for the given key.
Example:

```
Var u as NSUbiquitousKeyValueStoreMBS = NSUbiquitousKeyValueStoreMBS.defaultStore

// safe something
u.StringValue("Font") = "Times"
```

Notes: (Read and Write computed property)

97.14.23 VariantValue(key as string) as Variant

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Get or set the value for this key as a variant.
Notes: (Read and Write computed property)

97.14.24 Events

97.14.25 DidChangeExternally(ChangeReason as Integer, ChangedKeys() as string, notification as Variant)

MBS MacCloud Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: This event is called when the ubiquitious key value store changed.
Notes: ChangeReason gives the reason.
Can be NSUbiquitousKeyValueStoreServerChange, NSUbiquitousKeyValueStoreInitialSyncChange or NSUbiquitousKeyValueStoreQuotaViolationChange.

97.14.26 Constants

Change Reason Constants

Constant	Value	Description
NSUbiquitousKeyValueStoreInitialSyncChange	1	
NSUbiquitousKeyValueStoreQuotaViolationChange	2	
NSUbiquitousKeyValueStoreServerChange	0	

Chapter 98

Icon Service

98.1 Globals

98.1.1 CompositeIconsMBS(ForeGround as IconMBS, BackGround as IconMBS) as IconMBS

MBS Picture Plugin, Plugin Version: 5.1, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** Combines two icons.
Example:

```
Var i as IconMBS // global

Sub Open()
Var a,b as IconMBS

b=new IconMBS(SpecialFolder.Desktop)
a=new IconMBS(app.ApplicationFileMBS)

i=CompositeIconsMBS(a,b)

End Sub

Sub Paint(g As Graphics)
i.DrawIcon(g,0,0,128,128)
End Sub
```

Notes: Returns nil on any error (e.g. one of the two icons is invalid or nil).

98.2.2 Methods

98.2.3 Constructor(f as folderitem, NoBadge as boolean = false)

MBS Picture Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Loads the icon for this file/folder/volume.
Example:

```
// in a paint event:

Var i as new IconMBS(SpecialFolder.Desktop)

i.DrawIcon(g, 0, 0, 128, 128)
```

Notes: The example "GetIcon.rb" shows how to get the file icons.
A custom icon is preferred (ID -16455).

NoBadge can be set to true to have no badges on the icon.
See also:

- 98.2.4 Constructor(type as string, creator as string) 15551
- 98.2.5 Constructor(type as string, creator as string, extension as string, mime as string) 15551

98.2.4 Constructor(type as string, creator as string)

MBS Picture Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Loads the icon for this type and creator code combination.
Example:

```
// in a paint event:

Var i as new IconMBS("FNDR", "MACS")

i.DrawIcon(g, 0, 0, 128, 128)
```

Notes: The example "GetIcon.rb" shows how to get the predefined icons from the system.
See also:

- 98.2.3 Constructor(f as folderitem, NoBadge as boolean = false) 15550
- 98.2.5 Constructor(type as string, creator as string, extension as string, mime as string) 15551

98.2.5 Constructor(type as string, creator as string, extension as string, mime as string)

MBS Picture Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Loads the icon base on the given information.
Example:

```
Sub Paint(g As Graphics)
// in a window paint event:

Var i as IconMBS
Var type, creator, extension, mime as string

type=""
creator=""
extension="jpg"
mime=""

i=new iconmbs(type, creator, extension, mime)
// draws jpeg icon
i.DrawIcon(g,0,0,128,128)
```

```
type=""
creator=""
extension=""
mime="video/quicktime"

i=new iconmbs(type, creator, extension, mime)
// draws quicktime movie icon
i.DrawIcon(g,128,0,128,128)

type="TEXT"
creator="MSWD"
extension=""
mime=""

i=new iconmbs(type, creator, extension, mime)
// draws microsoft word text file icon
i.DrawIcon(g,0,128,128,128)

type=""
creator="GKON"
extension="jpg"
mime=""

i=new iconmbs(type, creator, extension, mime)
// draws graphic converter jpeg file icon
i.DrawIcon(g,128,128,128,128)

End Sub
```

Notes: All parameters can be empty strings if you don't know this information.
Requires Mac OS X 10.3 to work properly.
See also:

- 98.2.3 Constructor(f as folderitem, NoBadge as boolean = false) 15550
- 98.2.4 Constructor(type as string, creator as string) 15551

98.2.6 DrawIconCGContext(CGContextHandle as Integer,x as Integer,y as Integer,width as Integer,height as Integer, align as Integer, transform as Integer, flags as Integer, labelColor as color)

MBS Picture Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Draws the icon in a CoreGraphics Context.
Example:

```
Function GetIconImage(i as iconmbs, w as Integer, h as Integer) As picture
```

```
Var c as new CGPictureContextMBS(w,h)

const DrawNormal=0
const DrawNoImage=2
const DrawNoMask=4
const DrawSelected=&h8000

i.DrawIconCGContext(c.Handle, 0,0,w,h,0,0,DrawNoMask,&c000000)

c.Flush

Return c.CopyPicture
End Function
```

Notes: You must make sure that the CGContext handle you pass in is valid. You can use CGContextMBS class for this and use GetCurrentCGContextMBS or Window.CGContextMBS to get a context. Please note that coordinates have the origin typically on the lower left.

98.2.7 GetBackground as IconMBS

MBS Picture Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: If the icon is a composited one, this function returns the icon used for the background.
Notes: Returns nil on any error.
Lasterror ist set.

98.2.8 GetForeground as IconMBS

MBS Picture Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: If the icon is a composited one, this function returns the icon used for the foreground.
Notes: Returns nil on any error.
Lasterror ist set.

98.2.9 IsIconRefMaskEmpty as boolean

MBS Picture Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if the mask of the icon is empty.
Example:

```
Var i as new IconMBS("FNDR", "MACS")

MessageBox str(i.IsIconRefMaskEmpty)
```

Notes: Lasterror is set.

98.2.10 PointInIcon(pointx as Integer,pointy as Integer,x as Integer,y as Integer,width as Integer,height as Integer,align as Integer) as boolean

MBS Picture Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Tests whether a point is inside the icon's picture.
Notes: The coordinates for pointx/pointy and x/y must be in the same system.

This call may fail in some RB versions because of the count of parameters.

98.2.12 RetainCount as Integer

MBS Picture Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: How many references to this icon are hold on this Mac.
Example:

```
Var i as new IconMBS("FNDR", "MACS") // Finder Icon

MessageBox str(i.RetainCount)
```

98.2.13 Properties

98.2.14 handle as Integer

MBS Picture Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The handle of this icon in memory.
Example:

```
Var i as new IconMBS("FNDR", "MACS") // Finder Icon

MessageBox str(i.handle)
```

Notes: (Read and Write property)

98.2.15 LastError as Integer

MBS Picture Plugin, Plugin Version: 2.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The last error code.
Example:

```
Var i as new IconMBS("FNDR", "MACS") // Finder Icon

MessageBox str(i.LastError)
```

Notes: The last function was successful if lasterror is 0.
If the last function was not available on this machine, the value is set to -1.
Other values are Mac OS error codes.
(Read and Write property)

98.2.16 Release as boolean

MBS Picture Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: whether the destructor will release the handle.
Example:

```
Var i as new IconMBS("FNDR", "MACS") // Finder Icon

MessageBox str(i.Release)
```

Notes: (Read and Write property)

98.2.17 valid as boolean

MBS Picture Plugin, Plugin Version: 2.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Were the constructors successful?
Example:

```
Var i as new IconMBS("FNDR", "MACS") // Finder Icon

MessageBox str(i.valid)
```

Notes: (Read and Write property)

Chapter 99

Image Capture

99.1 control DesktopIKCameraDeviceViewControlMBS

99.1.1 control DesktopIKCameraDeviceViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a Camera Device View.
Notes: For Xojo with Cocoa target.
Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 14.3pr2

99.1.2 Properties

99.1.3 View as IKCameraDeviceViewMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The camera device view used in this control.
Notes: (Read only property)

99.1.4 Events

99.1.5 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

99.1.6 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

99.1.7 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

99.1.8 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

99.1.9 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

99.1.10 DidDownloadFile(CameraFile as ICCameraFileMBS, URL as string, File as folderItem, data as MemoryBlock, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event is sent for each file that gets downloaded.
Notes: Based on the IKCameraDeviceViewDisplayMode the downloaded file will be saved on disk using the 'url', or returned in memory as Memoryblock.

99.1.11 DidEncounterError(Error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event is sent every time the camera device reports an error.

99.1.12 FocusLost

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

99.1.13 FocusReceived

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

99.1.14 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

99.1.15 MenuBarSelected

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

99.1.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

99.1.17 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

99.1.18 MouseUp(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

99.1.19 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

99.1.20 ScaleFactorChanged(NewFactor as Double)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

99.1.21 SelectionDidChange

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the user selection did change.

99.1.22 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

99.2 control DesktopIKDeviceBrowserViewControlMBS

99.2.1 control DesktopIKDeviceBrowserViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a Device Browser View.
Notes: For Xojo with Cocoa target.
Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 14.3pr2

99.2.2 Properties

99.2.3 View as IKDeviceBrowserViewMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The device browser view used in this control.
Notes: (Read only property)

99.2.4 Events

99.2.5 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

99.2.6 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

99.2.7 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

99.2.8 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

99.2.9 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

99.2.10 DidEncounterError(error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event is sent every time the device browser reports an error.

99.2.11 FocusLost

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

99.2.12 FocusReceived

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

99.2.13 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

99.2.14 MenuBarSelected

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

99.2.15 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

99.2.16 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

99.2.17 MouseUp(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

99.2.18 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

99.2.19 ScaleFactorChanged(NewFactor as Double)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

99.2.20 SelectionDidChange(device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the user selection did change.
Notes: The device may be a ICCameraDeviceMBS or a ICScannerDeviceMBS.

99.2.21 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

99.3 control DesktopIKScannerDeviceViewControlMBS

99.3.1 control DesktopIKScannerDeviceViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a Scanner Device View.
Notes: For Xojo with Cocoa target.
Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 14.3pr2

99.3.2 Properties

99.3.3 View as IKScannerDeviceViewMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The scanner view used in this control.
Notes: For Xojo with Cocoa target.
(Read only property)

99.3.4 Events

99.3.5 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

99.3.6 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

99.3.7 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

99.3.8 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

99.3.9 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

99.3.10 DidEncounterError(error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event is sent every time the scanner device reports an error.

99.3.11 DidScanToBandData(data as ICScannerBandDataMBS, scanInfo as Dictionary, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: For memory a based transfer this event is sent for every time an image band of data was scanned.
Notes: The 'data' parameter describes the scanned image data. Note that rotation/cropping/image adjustments are not applied yet. The 'scanInfo' parameter contains additional information (rotation angle, ...) that should be applied once the scan is completed.

99.3.12 DidScanToURL(url as String, file as FolderItem, fileData as MemoryBlock, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: For file based transfer this event is sent for each image that gets scanned.
Notes: Based on the IKScannerDeviceViewTransferMode the downloaded file will be saved on disk using the 'url', or returned in memory as Memoryblock.

99.3.13 FocusLost

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

99.3.14 FocusReceived

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

99.3.15 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

99.3.16 MenuBarSelected

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

99.3.17 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

99.3.18 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

99.3.19 MouseUp(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

99.3.20 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

99.3.21 ScaleFactorChanged(NewFactor as Double)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

99.3.22 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

99.4 class ICCameraDeviceMBS

99.4.1 class ICCameraDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: ICCameraDeviceMBS is a concrete subclass of ICDeviceMBS class.
Example:

```
// download all pictures from a connected camera or iPhone
// camera is an ICCameraDeviceMBS with an open session, e.g. from ICDeviceBrowserMBS
Var camera As ICCameraDeviceMBS // your camera
If camera = Nil Then Return

Var options As New Dictionary
options.Value(ICCameraDeviceMBS.ICDownloadsDirectoryURL) = NSFileCoordinatorMBS.FileURL(SpecialFolder.Pictures)
For Each f As ICCameraFileMBS In camera.mediaFiles
camera.requestDownloadFile(f, options)
Next
MessageBox camera.mediaFiles.Count.ToString + " files, battery " + camera.batteryLevel.ToString + "%"
```

Notes: ICDeviceBrowserMBS creates instances of this class.
Subclass of the ICDeviceMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 26.4pr6

99.4.2 Methods

99.4.3 cancelDelete

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Cancels the current delete operation started by sending a requestDeleteFiles.

99.4.4 cancelDownload

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Cancels the current download operation.

99.4.5 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.4.6 contents as ICCameraItemMBS()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Contents of the camera.
Notes: The structure of the elements in this array will reflect the folder structure of the storage reported by the camera. Each item in this array will correspond to a storage on the camera.

99.4.7 filesOfType(fileUTType as string) as ICCameraFileMBS()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This method returns an array of files on the camera of type fileType.
Notes: The fileType string is one of the following Uniform Type Identifier strings: kUTTypeImage, kUTTypeMovie, kUTTypeAudio, or kUTTypeData.
See UTTypeMBS module.

99.4.8 ICCameraDeviceCanAcceptPTPCommands as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to describe capabilities of a camera.
Notes: Indicates that the camera can accept PTP commands.

99.4.9 ICCameraDeviceCanDeleteAllFiles as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to describe capabilities of a camera.
Notes: Indicates that the camera can delete all files in a single operation while it is connected.

99.4.10 ICCameraDeviceCanDeleteOneFile as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to describe capabilities of a camera.
Notes: Indicates that the camera can delete a file at a time while it is connected.

99.4.11 ICCameraDeviceCanReceiveFile as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to describe capabilities of a camera.
Notes: Indicates that the host can upload files to the camera.

99.4.12 ICCameraDeviceCanSyncClock as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to describe capabilities of a camera.
Notes: Indicates that the camera can synchronize its date and time with that of the host computer.

99.4.13 ICCameraDeviceCanTakePicture as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to describe capabilities of a camera.
Notes: Indicates that the camera can capture a picture while it is connected, if the client sends a requestTakePicture message to it.

99.4.14 ICCameraDeviceCanTakePictureUsingShutterReleaseOnCamera as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to describe capabilities of a camera.
Notes: Indicates that the camera can capture a picture while it is connected, if the user presses the shutter release on the camera.

99.4.15 ICDeleteAfterSuccessfulDownload as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for options dictionary.
Notes: The value for this key should be a boolean value. If this value is true, the file will be deleted from

the device after it is succcessfully downloaded.

99.4.16 ICDownloadsDirectoryURL as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for options dictionary.
Notes: The value for this key should be an CFURLMBS referencing a writable directory.
The downloaded files will be saved in that directory.

99.4.17 ICDownloadSidecarFiles as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for options dictionary.
Notes: The value for this key should be a boolean value. If this value is true, all sidecar files will be downloaded along with the media file.

99.4.18 ICOverwrite as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for options dictionary.
Notes: The value for this key should be a boolean value. If this value is true, the downloaded file will overwrite an existing file with the same name and extension.

99.4.19 ICSaveAsFilename as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for options dictionary.
Notes: The value for this key should be a string containing the name to be used for the downloaded file.

99.4.20 ICSavedAncillaryFiles as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for options dictionary.
Notes: The value for this key will be an array containing names of files associated with the primary file

that is downloaded. The options dictionary returned in didDownloadFile may have this key.

99.4.21 ICSavedFilename as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the keys for options dictionary.
Notes: The value for this key will be a string containing the actual name of the saved file. The options dictionary returned in didDownloadFile will have this key.

99.4.22 mediaFiles as ICCameraFileMBS()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The property mediaFiles represents all image, movie and audio files on the camera.
Notes: These files are returned as a single array without regard to the folder hierarchy used to store these files on the camera.

If no files show up, try again a second later as the framework may not yet have the list loaded.

99.4.23 requestDeleteFiles(files() as ICCameraFileMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Deletes files.

99.4.24 requestDisableTethering

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Send this message to disable tethered capture on the camera device if the camera has the 'ICCameraDeviceCanTakePicture' capability and if your process has already sent a 'requestEnableTethering' to it.

99.4.25 requestDownloadFile(file as ICCameraFileMBS, options as dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Download a file from the camera. Please refer to the top of this header for information about the options.
Notes: Calls cameraDeviceDidDownloadFile event later.
The content of error returned should be examined to determine if the request completed successfully.

99.4.26 requestEnableTethering

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Send this message to enable tethered capture on the camera device if the camera has the 'ICCameraDeviceCanTakePicture' capability.

99.4.27 requestReadDataFromFile(file as ICCameraFileMBS, offset as UInt64, Length as UInt64)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This method asynchronously reads data of a specified length from a specified offset.
Notes: Calls later ImageCaptureEventsMBS.cameraDeviceDidReadData event.
The content of error returned should be examined to determine if the request completed successfully.

99.4.28 requestSendPTPCommand(command as MemoryBlock, dataOut as MemoryBlock)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This method asynchronously sends a PTP command to a camera.
Notes: The content of error returned should be examined to determine if the request completed successfully.

99.4.29 requestSyncClock

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Synchronize camera's clock with the computer's clock.
Notes: You should send this request only if the camera has the 'ICCameraDeviceCanSyncClock' capability.

99.4.30 requestTakePicture

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Capture a new image using the camera, the camera capabilities include 'ICCameraDeviceCanTakePicture'.
Notes: You MUST send 'requestEnableTethering' message to the camera before sending 'requestTakePicture' message.

99.4.31 requestUploadFile(file as folderitem, options as dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Upload a file at fileURL to the camera.
Notes: The options dictionary is not used in this version.
Calls later ImageCaptureEventsMBS.cameraDeviceDidUploadFile event.
The content of error returned should be examined to determine if the request completed successfully.

99.4.32 Properties

99.4.33 batteryLevel as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates the battery charge level.
Notes: Its value ranges from 0 to 100.
(Read only property)

99.4.34 batteryLevelAvailable as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates if the device has reported battery charge levelÔøº.
Notes: (Read only property)

99.4.35 contentCatalogPercentCompleted as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates the percentage of content cataloging completed on the device.
Notes: Its value ranges from 0 to 100.
(Read only property)

99.4.36 isAccessRestrictedAppleDevice as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Set to true if the device is made by Apple and is pass-coded locked and connected to an untrusted host.
Notes: (Read only property)

99.4.37 mountPoint as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Filesystem mount point for a device with transportType of ICTransportTypeMassStorage.
Notes: This will be "" for all other devices.
(Read only property)

99.4.38 tetheredCaptureEnabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This property is set to YES when tethered capture is enabled on the device.
Notes: Use 'requestEnableTethering' and 'requestDisableTethering' to enable or disable tethered capture on the device.
(Read only property)

99.4.39 timeOffset as Double

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates the time offset, in seconds, between the camera's clock and the computer's clock.
Notes: This value is positive if the camera's clock is ahead of the computer's clock. This property should be ignored if the camera's capabilities property does not contain ICCameraDeviceCanSyncClock.
(Read only property)

99.5 class ICCameraFileMBS

99.5.1 class ICCameraFileMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This class represents a file on an ICCameraDevice object.
Notes: Subclass of the ICCameraItemMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

99.5.2 Methods

99.5.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.5.4 sidecarFiles as ICCameraFileMBS()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Returns array of sidecar files.
Notes: This property is an empty array if there are no sidecar files associated with this file. Otherwise it is an array of ICCameraFile instances of sidecar files associated with this file. An example of a sidecar file is a file with the same base name as this file and having an extension XMP.

99.5.5 Properties

99.5.6 Duration as Double

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Duration of audio/video file in seconds.
Notes: (Read only property)

99.5.7 FileSize as UInt64

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Size of file in bytes.
Notes: (Read only property)

99.5.8 Orientation as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Desired orientation of image to use when it is downloaded.
Notes: This property is set to ICEXIFOrientation1 initially. If the format of this file supports EXIF orientation tag, then this property will be updated to match the value of that tag, when the thumbnail or metadata for this file is received.

Possible values:

ICEXIFOrientation1	1	Normal
ICEXIFOrientation2	2	Flipped horizontally
ICEXIFOrientation3	3	Rotated 180¬∞
ICEXIFOrientation4	4	Flipped vertically
ICEXIFOrientation5	5	Rotated 90¬∞ CCW and flipped vertically
ICEXIFOrientation6	6	Rotated 90¬∞ CCW
ICEXIFOrientation7	7	Rotated 90¬∞ CW and flipped vertically
ICEXIFOrientation8	8	Rotated 90¬∞ CW

(Read and Write property)

99.6 class ICCameraFolderMBS

99.6.1 class ICCameraFolderMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This class represents a folder on an ICCameraDevice object.
Notes: Subclass of the ICCameraItemMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

99.6.2 Methods

99.6.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.6.4 contents as ICCameraItemMBS()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: A list of items contained by this folder.

99.7 class ICCameraItemMBS

99.7.1 class ICCameraItemMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: ICCameraItem is an abstract class that represents an item in an ICCameraDevice object.
Example:

```
// list the files of a connected camera with name, type and date
// camera is an ICCameraDeviceMBS with an open session, e.g. from ICDeviceBrowserMBS
Var camera As ICCameraDeviceMBS // your camera
If camera = Nil Then Return

For Each item As ICCameraItemMBS In camera.mediaFiles
Var info As String = item.Name + " (" + item.UTI + ")"
If item.CreationDateTime <>Nil Then info = info + ", created " + item.CreationDateTime.ToString
If item.Raw Then info = info + ", RAW"
If item.Locked Then info = info + ", locked"
System.DebugLog info
Next
```

Notes: ICCameraDevice object creates instances of two concrete subclasses of ICCameraItem: ICCameraFolder and ICCameraFile.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

99.7.2 Methods

99.7.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.7.4 Properties

99.7.5 addedAfterContentCatalogCompleted as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This property is set if the file is captured on the device after the device's content is fully enumerated.
Notes: This does not apply to files added as a result of adding a new store to the device.

(Read only property)

99.7.6 CreationDate as Date

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creation date of this file.
Notes: This information is usually the same as the EXIF creation date.
(Read only property)

99.7.7 CreationDateTime as DateTime

MBS AVFoundation Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: Creation date of this file.
Notes: This information is usually the same as the EXIF creation date.
(Read only property)

99.7.8 Device as ICCameraDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Parent device of this folder.
Notes: (Read only property)

99.7.9 FileSystemPath as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The file system path of the item for items on a device with transportType of ICTransportTypeMassStorage.
Notes: (Read only property)

99.7.10 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

99.7.11 InTemporaryStore as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates if this folder is in a temporary store.
Notes: A temporary store may be used by the device when images are captures on the device when it is tethered to the computer.
(Read only property)

99.7.12 largeThumbnailIfAvailable as Variant

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Large thumbnail for the item if one is readily available.
Notes: Value is a CGImageMBS. We use variant to reduce dependency to other plugins.

If one is not readily available, accessing this property will send a message to the device requesting a thumbnail for the file. The ImageCaptureEventsMBS subclass will be notified via event cameraDeviceDidReceiveThumbnailForItem.
(Read only property)

99.7.13 Locked as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates the protection state of this item.
Notes: It is locked if the storage card in the camera is locked.
(Read only property)

99.7.14 MetadataIfAvailable as Dictionary

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Metadata for the file if one is readily available.
Notes: If one is not readily available, accessing this property will send a message to the device requesting a thumbnail for the file. The ImageCaptureEventsMBS subclass will be notified via event cameraDeviceDidReceiveMetadataForItem.
(Read only property)

99.7.15 ModificationDate as Date

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Modification date of this file.
Notes: This information is usually the same as the EXIF modification date.
(Read only property)

99.7.16 ModificationDateTime as DateTime

MBS AVFoundation Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: Modification date of this file.
Notes: This information is usually the same as the EXIF modification date.
(Read only property)

99.7.17 Name as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Name of this file or folder.
Notes: (Read only property)

99.7.18 ParentFolder as ICCameraFolderMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Parent folder of this folder. The root folder's parentFolder is nil.
Notes: (Read only property)

99.7.19 ptpObjectHandle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: PTP object handle value if the item is on a camera that uses PTP protocol.
Notes: The value of this property is set to 0 if the camera does not use PTP protocol.
(Read only property)

99.7.20 Raw as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates if the file is a raw image file.
Notes: (Read only property)

99.7.21 thumbnailIfAvailable as Variant

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Thumbnail for the item if one is readily available.
Notes: Value is a CGImageMBS. We use variant to reduce dependency to other plugins.

If one is not readily available, accessing this property will send a message to the device requesting a thumbnail for the file. The ImageCaptureEventsMBS subclass will be notified via event cameraDeviceDidReceiveThumbnailForItem.
(Read only property)

99.7.22 UserData as Dictionary

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: A mutable dictionary to store arbitrary key-value pairs associated with a camera item object.
Notes: This can be used by view objects that bind to this object to store "house-keeping" information.
In Xojo, please query dictionary, modify it and assign back to this property.
(Read and Write property)

99.7.23 UTI as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Item UTI.
Notes: This is an Uniform Type Identifier string. It is one of: kUTTypeFolder, kUTTypeImage, kUTTypeMovie, kUTTypeAudio, or kUTTypeData.
See UTTypeMBS module.
(Read only property)

99.8 class ICDeviceBrowserMBS

99.8.1 class ICDeviceBrowserMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The ICDeviceBrowser object is used to find devices such as digital cameras and scanners that are supported by Image Capture.
Example:

```
// find cameras and scanners connected to the Mac
// MyDeviceBrowser is a subclass of ICDeviceBrowserMBS with the events implemented.
// Browser is a property of the window: Browser As MyDeviceBrowser
Browser = New MyDeviceBrowser
Browser.browsedDeviceTypeMask = ICDeviceMBS.ICDeviceTypeMaskCamera + ICDeviceMBS.ICDevice-
TypeMaskScanner + ICDeviceMBS.ICDeviceLocationTypeMaskLocal
Browser.Start

// in MyDeviceBrowser:
Sub DidAddDevice(device As ICDeviceMBS, moreComing As Boolean) Handles DidAddDevice
System.DebugLog "Found: " + device.name + " (" + device.productKind + ", " + device.TransportType
+ ")"
End Sub

Sub DidRemoveDevice(device As ICDeviceMBS, moreGoing As Boolean) Handles DidRemoveDevice
System.DebugLog "Removed: " + device.name
End Sub
```

Notes: These device may be directly attached to the USB or FireWire bus on the host computer, shared by other computers, or available over a TCP/IP network. This object communicates with an Image Capture agent process asynchronously to accomplish this.

- MBS Xojo / Real Studio Plugins, version 16.4pr1
- MBS Xojo / Real Studio Plugins, version 14.3pr2

99.8.2 Methods

99.8.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.

99.8.4 Destructor

MBS AVFoundation Plugin, Plugin Version: 16.4, Platform: macOS, Targets: Desktop only.

Function: The destructor.

99.8.5 devices as ICDeviceMBS()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: All devices found by the browser.
Notes: This property will change as devices appear and disappear. This array is empty before the first invocation of the deviceBrowserDidAddDevice event.

99.8.6 Start

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This message tells the receiver to start looking for devices.
Notes: Please use ImageCaptureEventsMBS class to receive events.

99.8.7 Stop

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This method tells the receiver to stop looking for devices.
Notes: This will free all device instances that are not in use.

99.8.8 Properties

99.8.9 browsedDeviceTypeMask as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The device type mask.
Notes: A mask whose set bits indicate the type of device(s) being browsed after the receiver receives the start message. This property can be changed while the browser is browsing for devices. This property can be constructed by OR'd values of ICDeviceTypeMask with values of ICDeviceLocationTypeMask.
(Read and Write property)

99.8.10 Browsing as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the device browser is browsing for devices.
Notes: (Read only property)

99.8.11 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

99.8.12 preferredDevice as ICDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This method returns a device object that should be selected by the client application when it is launched.
Notes: If the client application that calls this method is the auto-launch application associated with a device and that device is the last device attached (through USB, FireWire or network), then that device will be the preferred device. The best place to call this method is in the event deviceBrowserDidAddDevice, if the "moreComing" parameter passed to the delegate is false; or in the event deviceBrowserDidEnumerateLocalDevices.
(Read only property)

99.8.13 Events

99.8.14 DeviceDidChangeName(device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent if the name of a device changes.
Notes: This happens if the device module overrides the default name of the device reported by the device's transport layer, or if the name of the filesystem volume mounted by the device is changed by the user.

99.8.15 DeviceDidChangeSharingState(device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the sharing state of a device has changes.
Notes: Any Image Capture client application can choose to share the device over the network using the sharing or webSharing facility in Image Capture.

99.8.16 DidAddDevice(device as ICDeviceMBS, moreComing as boolean)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent to inform that a device has been added.
Notes: If several devices are found during the initial search, then this event is sent once for each device with the value of 'moreComing' set to true in each event except the last one.

99.8.17 DidEnumerateLocalDevices

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent after the device browser completes sending deviceBrowser:didAddDevice event for all local devices.
Notes: Detecting locally connected devices (USB and FireWire devices) is faster than detecting devices connected using a network protocol. An Image Capture client application may use this event to update its user interface to let the user know that it has completed looking for locally connected devices and then start looking for network devices.

99.8.18 DidRemoveDevice(device as ICDeviceMBS, moreGoing as boolean)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent to the delegate to inform that a device has been removed.
Notes: If several devices are removed at the same time, then this event is sent once for each device with the value of 'moreGoing' set to true in each event except the last one.

99.8.19 RequestsSelectDevice(device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when an event that occurred on the device may be of interest to the client application.
Notes: In Mac OS X 10.6, this event is sent when a button is pressed on a device and the current application is the target for that button press. In the case of the button-press event, if a session is open on the device, this event will not be sent, instead the deviceDidReceiveButtonPress event is sent.

99.9 class ICDeviceMBS

99.9.1 class ICDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: ICDevice is an abstract class that represents a device supported by Image Capture.
Example:

```
// list connected cameras and scanners found by an ICDeviceBrowserMBS
// Browser is a property of the window: Browser As ICDeviceBrowserMBS (started, see there)
If Browser = Nil Then Return

For Each d As ICDeviceMBS In Browser.devices
System.DebugLog d.Name + " (" + d.ProductKind + ", " + d.TransportType + ", " + d.UUIDString +
")"
Next
```

Notes: ImageCaptureCore defines two concrete subclasses of ICDeviceMBS, ICCameraDeviceMBS and ICScannerDeviceMBS. ICDeviceBrowserMBS creates instances of these two subclasses to represent cameras and scanners it finds.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 20.5pr10

99.9.2 Methods

99.9.3 capabilities as Variant()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The capabilities of the device as reported by the device module.

99.9.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.9.5 ICButtonTypeCopy as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to identify button-press on a device.
Notes: Indicates that the "Copy" button on the device was pressed.

99.9.6 ICButtonTypeMail as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to identify button-press on a device.
Notes: Indicates that the "Mail" button on the device was pressed.

99.9.7 ICButtonTypePrint as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to identify button-press on a device.
Notes: Indicates that the "Print" button on the device was pressed.

99.9.8 ICButtonTypeScan as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to identify button-press on a device.
Notes: Indicates that the "Scan" button on the device was pressed.

99.9.9 ICButtonTypeTransfer as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to identify button-press on a device.
Notes: Indicates that the "Transfer" button on the device was pressed.

99.9.10 ICButtonTypeWeb as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to identify button-press on a device.
Notes: Indicates that the "Web" button on the device was pressed.

99.9.11 ICDeviceCanEjectOrDisconnect as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used to describe capabilities of a device.
Notes: Indicates either the device is mounted as a mass-storage volume and can be ejected or the it is a remote device with an active connection that can be disconnected.

99.9.12 ICDeviceLocationDescriptionBluetooth as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This description is returned for locationDescription property of a device connected via Bluetooth.

99.9.13 ICDeviceLocationDescriptionFireWire as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This description is returned for locationDescription property of a device connected to a FireWire port.

99.9.14 ICDeviceLocationDescriptionMassStorage as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This description is returned for locationDescription property of a device that is mounted as a mass-storage volume.

99.9.15 ICDeviceLocationDescriptionUSB as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This description is returned for locationDescription property of a device connected to a USB port.

99.9.16 ICLocalizedStatusNotificationKey as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used for device status notifications.
Notes: Key for a localized notification string.

99.9.17 ICStatusCodeKey as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used for device status notifications.
Notes: One of values defined in ICReturnCode.

99.9.18 ICStatusNotificationKey as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the constants used for device status notifications.
Notes: Key for a non-localized notification string.

99.9.19 ICTransportTypeBluetooth as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates that the device uses Bluetooth transport.

99.9.20 ICTransportTypeFireWire as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates that the device uses FireWire transport.

99.9.21 ICTransportTypeMassStorage as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates that the device use mounts as a mass-storage volume.

99.9.22 ICTransportTypeTCPIP as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates that the device uses TCP/IP transport.
Notes: These devices are discovered using Bonjour.

99.9.23 ICTransportTypeUSB as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates that the device uses USB transport.

99.9.24 requestCloseSession

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This message requests to close a previously opened session on this device.
Notes: This request is completed when the ImageCaptureEventsMBS subclass receives a deviceDidCloseSessionWithError event.

99.9.25 requestEjectOrDisconnect

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Eject the media if permitted by the device, or disconnect from a remote device.

99.9.26 requestOpenSession

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This message requests to open a session on the device.
Notes: A client MUST open a session on a device in order to use the device.
This request is completed when the ImageCaptureEventsMBS subclass receives a deviceDidOpenSessionWithError event. No more events will be sent to the delegate if this request fails.

99.9.27 requestSendMessage(messageCode as UInt32, data as MemoryBlock, maxReturnedDataSize as UInt64)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This method asynchronously sends an arbitrary message with optional data to a device.
Notes: This method allows developers to send a private message from a client application to a device

module. This method is the functional equivalent of calling ICAObjectSendMessage() found in ImageCapture.framework, which has been deprecated in Mac OS X 10.6. The response to this command will be delivered using deviceDidSendMessage event.
The content of error returned should be examined to determine if the request completed successfully.
NOTE: This method SHOULD NOT BE USED to send PTP pass-through commands to a PTP camera. Please refer to requestSendPTPCommand defined in ICCameraDeviceMBS for sending PTP pass-through commands.

99.9.28 requestYield

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This message requests the device module in control of this device to yield control.
Notes: This message should be used only if the client is planning on communiting with the device directly. The device module may not yield control of the device if it has an open session.

99.9.29 Properties

99.9.30 AutolaunchApplicationPath as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Filesystem path of an application that is to be automatically launched when this device is added.
Notes: (Read and Write property)

99.9.31 BonjourServiceType as String

MBS AVFoundation Plugin, Plugin Version: 17.0, Platform: macOS, Targets: Desktop only.

Function: Service type if device was found via Bonjour..
Notes: (Read only property)

99.9.32 BskonjourServiceName as String

MBS AVFoundation Plugin, Plugin Version: 17.0, Platform: macOS, Targets: Desktop only.

Function: Service name if device was found via Bonjour..
Notes: (Read only property)

99.9.33 ButtonPressed as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: A string object with one of the ICButtonType* values defined above.
Notes: (Read only property)

99.9.34 canDeleteAllFiles as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: If all files can be deleted.
Notes: (Read only property)

99.9.35 canDeleteOneFile as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Whether a file can be deleted.
Notes: (Read only property)

99.9.36 canEject as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Whether this device can be ejected.
Notes: (Read only property)

99.9.37 canReceiveFile as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Whether this device can receive a file.
Notes: (Read only property)

99.9.38 canSyncClock as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Whether this device can sync clock.
Notes: (Read only property)

99.9.39 canTakePicture as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Whether this device can take pictures.
Notes: (Read only property)

99.9.40 fwGUID as Int64

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The FireWire GUID of a FireWire device in the IOKit registry.
Notes: This will be 0 for non-FireWire devices.
(Read only property)

99.9.41 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

99.9.42 HasConfigurableWiFiInterface as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the device can be configured for use on a WiFi network.
Notes: (Read only property)

99.9.43 HasOpenSession as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the device has an open session.
Notes: (Read only property)

99.9.44 Icon as Variant

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Icon image for the device.
Notes: Value is a CGImageMBS. We use variant to reduce dependency to other plugins.
(Read only property)

99.9.45 IconPath as String

MBS AVFoundation Plugin, Plugin Version: 17.0, Platform: macOS, Targets: Desktop only.

Function: Path to icon file.
Notes: (Read only property)

99.9.46 IPAddress as String

MBS AVFoundation Plugin, Plugin Version: 17.0, Platform: macOS, Targets: Desktop only.

Function: IP Address.
Notes: (Read only property)

99.9.47 IsRemote as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the device is a remote device published by Image Capture device sharing facility.
Notes: (Read only property)

99.9.48 IsShared as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the device is shared using the Image Capture device sharing facility.
Notes: This value will change when sharing of this device is enabled or disabled.
(Read only property)

99.9.49 LocationDescription as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: A non-localized location description string for the device.
Notes: The value returned in one of the location description strings defined above, or location obtained from the Bonjour TXT record of a network device.
(Read only property)

99.9.50 ModuleExecutableArchitecture as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Executable Architecture of the device module in control of this device.
Notes: Possible values:

I386	&h00000007
PPC	&h00000012
X86_64	&h01000007
PPC64	&h01000012

(Read only property)

99.9.51 ModulePath as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Filesystem path of the device module that is associated with this device.
Notes: Camera-specific capabilities are defined in ICCameraDeviceMBS class and scanner-specific capabilities are defined in ICScannerDeviceMBS class.
(Read only property)

99.9.52 ModuleVersion as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The bundle version of the device module associated with this device.
Notes: This may change if an existing device module associated with this device is updated or a new device module for this device is installed.
(Read only property)

99.9.53 Name as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Name of the device as reported by the device module or by the device transport when a device module is not in control of this device.
Notes: This name may change if the device module overrides the default name of the device reported by the device's transport, or if the name of the filesystem volume mounted by the device is changed by the user.
(Read only property)

99.9.54 PersistentIDString as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: A string representation of the persistent ID of the device.
Notes: (Read only property)

99.9.55 ProductKind as String

MBS AVFoundation Plugin, Plugin Version: 17.0, Platform: macOS, Targets: Desktop only.

Function: Product kind.
Notes: (Read only property)

99.9.56 SerialNumberString as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The serial number of the device.
Notes: This will be "" if the device does not provide a serial number.
(Read only property)

99.9.57 SystemSymbolName as String

MBS AVFoundation Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: systemSymbolName allows to query standard system symbol used to represent the device class.
Notes: New for macOS 11.0.
Using the symbol to render an appropriate device icon will ensure proper scaling for high resolution devices.
(Read only property)

99.9.58 TransportType as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The transport type used by the device.
Notes: The possible values are: ICTransportTypeUSB, ICTransportTypeFireWire, ICTransportTypeBluetooth, ICTransportTypeTCPIP, or ICTransportTypeMassStorage.
(Read only property)

99.9.59 type as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The type of the device as defined by ICDeviceType OR'd with its ICDeviceLocationType.
Notes: The type of this device can be obtained by AND'ing the value retuned by this property with an appropriate ICDeviceTypeMask. The location type of this device can be obtained by AND'ing the value retuned by this property with an appropriate ICDeviceLocationTypeMask.
(Read only property)

99.9.60 usbLocationID as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The USB location ID of a USB device in the IOKit registry.
Notes: This will be 0 for non-USB devices.
(Read only property)

99.9.61 usbProductID as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The USB product ID of a USB device in the IOKit registry.
Notes: This will be 0 for non-USB devices.
(Read only property)

99.9.62 usbVendorID as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The USB vendor ID of a USB device in the IOKit registry.
Notes: This will be 0 for non-USB devices.

(Read only property)

99.9.63 UserData as Dictionary

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: A mutable dictionary to store arbitrary key-value pairs associated with a device object.
Notes: This can be used by view objects that bind to this object to store "house-keeping" information.
In Xojo, please query dictionary, modify it and assign back to this property.
(Read and Write property)

99.9.64 UUIDString as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: A string representation of the Universally Unique ID of the device.
Notes: (Read only property)

99.9.65 Constants

Device Types

Constant	Value	Description
ICDeviceLocationTypeBluetooth	&h00000800	Device found as a paired Bluetooth device.
ICDeviceLocationTypeBonjour	&h00000400	Device found over the network by searching for Bonjour services suppo Image Capture.
ICDeviceLocationTypeLocal	&h00000100	Device found directly attached to the Macintosh via its USB or FireWi
ICDeviceLocationTypeShared	&h00000200	Device found over the network by searching for devices shared by othe intosh hosts.

Image Capture Device Location Type Mask

Constant	Value	Description
ICDeviceLocationTypeMaskBluetooth	&h00000800	Mask to detect paired Bluetooth device.
ICDeviceLocationTypeMaskBonjour	&h00000400	Mask to detect a network device that publishes a Bonjour servic
ICDeviceLocationTypeMaskLocal	&h00000100	Mask to detect a local (e.g., USB or FireWire) device.
ICDeviceLocationTypeMaskRemote	&h0000FE00	Mask to detect a remote (shared, Bonjour, Bluetooth) device.
ICDeviceLocationTypeMaskShared	&h00000200	Mask to detect a device by another Macintosh host.

Image Capture Device Types

Constant	Value	Description
ICDeviceTypeCamera	&h00000001	Camera device.
ICDeviceTypeScanner	&h00000002	Scanner device.

Image Capture Device Type Mask

Constant	Value	Description
ICDeviceTypeMaskCamera	&h00000001	Mask to detect a camera device.
ICDeviceTypeMaskScanner	&h00000002	Mask to detect a scanner device.

99.10 class ICScannerBandDataMBS

99.10.1 class ICScannerBandDataMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The class for band data from scanner.
Notes: If image is too big to be transferred in one big block, it's sent in little chunks using this class.

Only uses when transfermode is ICScannerTransferModeMemoryBased.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- MBS Xojo Plugins, version 19.4pr7

99.10.2 Methods

99.10.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.10.4 Properties

99.10.5 bigEndian as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Describes if the banded image data is reported in big endian.
Notes: (Read only property)

99.10.6 bitsPerComponent as UInt64

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Describes the number of bits per component for the banded image.
Notes: (Read only property)

99.10.7 bitsPerPixel as UInt64

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Describes the number of bits per pixel for banded the image.
Notes: (Read only property)

99.10.8 bytesPerRow as UInt64

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Descries how many bytes are in each image band row.
Notes: (Read only property)

99.10.9 CGImage as CGImageMBS

MBS AVFoundation Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop only.

Function: Builds CGImageMBS object with the data of this band.
Notes: Returns nil if data can't be represented easily as CGImage.
This function is designed for RGB or Grayscale.
(Read only property)

99.10.10 colorSyncProfilePath as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Returns the path to the color profile matching the banded data.
Notes: (Read only property)

99.10.11 dataBuffer as Memoryblock

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The pointer to the data buffer object.
Notes: Plugin returns a copy of the data when you query this property.
(Read only property)

99.10.12 dataNumRows as UInt64

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Describes the number of rows contained in the image band.
Notes: (Read only property)

99.10.13 dataSize as UInt64

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Describes the actual data size of the image band buffer.
Notes: (Read only property)

99.10.14 dataStartRow as UInt64

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Describes the start row of the image band.
Notes: (Read only property)

99.10.15 fullImageHeight as UInt64

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Describes the full image height of the banded image.
Notes: (Read only property)

99.10.16 fullImageWidth as UInt64

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Describes the full image width of the banded image.
Notes: (Read only property)

99.10.17 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

99.10.18 numComponents as UInt64

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Describes how many components are contained within the banded image.
Notes: (Read only property)

99.10.19 Picture as Picture

MBS AVFoundation Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop only.

Function: Builds Picture object with the data of this band.
Notes: Returns nil if data can't be represented easily as CGImage.
This function is designed for RGB or Grayscale.
(Read only property)

99.10.20 pixelDataType as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Type of pixel data that is contained in the band.
Notes: See ICScannerFunctionalUnitMBS.ICScannerPixelDataType* constants.
(Read only property)

99.11 class ICScannerDeviceMBS

99.11.1 class ICScannerDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The class for a scanner device.
Example:

```
// scan a page into a PDF file in the Documents folder
// scanner is an ICScannerDeviceMBS with an open session, e.g. from ICDeviceBrowserMBS
Var scanner As ICScannerDeviceMBS // your scanner
If scanner = Nil Then Return

scanner.transferMode = ICScannerDeviceMBS.ICScannerTransferModeFileBased
scanner.downloadsFolder = SpecialFolder.Documents
scanner.documentName = "Scan"
scanner.documentUTI = "com.adobe.pdf"
scanner.selectedFunctionalUnit.resolution = 300
scanner.requestScan
```

Notes: ICScannerDeviceMBS is a concrete subclass of ICDeviceMBS class. ICDeviceBrowserMBS creates instances of this class. In this release, an instance of ICScannerDeviceMBS class is intended to be used by the IKScannerDeviceViewMBS object. The IKScannerDeviceView class encapsulates the complexities of setting scan parameters, performing scans and saving the result. The developer should consider using IKScannerDeviceViewMBS instead of building their own views using the ICScannerDeviceMBS object.
Subclass of the ICDeviceMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Xojo Developer Magazine

- 24.6, page 10: News

99.11.2 Methods

99.11.3 availableFunctionalUnitTypes as Integer()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: An array of functional unit types available on this scanner device.
Notes: This is an array of numbers whose values are of type ICScannerFunctionalUnitType.

99.11.4 cancelScan

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Cancels the current scan operation started by sending a 'requestOverviewScan' or 'requestScan'.

99.11.5 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.11.6 ICScannerStatusRequestsOverviewScan as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Constants used for device status notifications.
Notes: A non-localized notification string to indicate that the scanner is requesting an overview scan to be performed.

99.11.7 ICScannerStatusWarmingUp as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Constants used for device status notifications.
Notes: A non-localized notification string to indicate that the scanner is warming up.

99.11.8 ICScannerStatusWarmUpDone as string

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Constants used for device status notifications.
Notes: A non-localized notification string to indicate that the scanner has warmed up.

99.11.9 requestOverviewScan

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Starts an overview scan on selectedFunctionalUnit.
Notes: When this request is completed, the delegate will be notified using the scannerDeviceDidComple-

teOverviewScanWithError event. The content of error returned should be examined to determine if the request completed successfully.

99.11.10 requestScan

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Starts a scan on selectedFunctionalUnit.
Notes: When this request is completed, the delegate will be notified using the scannerDeviceDidCompleteScanWithError event. The content of error returned should be examined to determine if the request completed successfully.

99.11.11 requestSelectFunctionalUnit(type as Integer)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Requests the scanner device to select a functional unit.
Notes: When this request is completed, the delegate will be notified using the scannerDeviceDidSelectFunctionalUnit.

99.11.12 Properties

99.11.13 documentName as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The document name.
Notes: (Read and Write property)

99.11.14 documentUTI as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The document UTI.
Notes: Currently supported UTIs are: kUTTypeJPEG, kUTTypeJPEG2000, kUTTypeTIFF, kUTTypePNG etc.
see UTTypeMBS module.
(Read and Write property)

99.11.15 downloadsDirectory as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The downloads directory.
Notes: Download location can be provided as file URL with downloadsDirectory property or as folderitem with downloadsFolder property.
(Read and Write property)

99.11.16 downloadsFolder as FolderItem

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The downloads directory.
Notes: Download location can be provided as file URL with downloadsDirectory property or as folderitem with downloadsFolder property.
(Read and Write property)

99.11.17 maxMemoryBandSize as UInt64

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The total maximum band size requested when performing a ICScannerTransferModeMemory-Based.
Notes: (Read and Write property)

99.11.18 selectedFunctionalUnit as ICScannerFunctionalUnitMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The currently selected functional unit on the scanner device.
Notes: (Read only property)

99.11.19 transferMode as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The transfer mode for scanned document.
Notes: (Read and Write property)

99.11.20 Constants

Transfer Modes

Constant	Value	Description
ICScannerTransferModeFileBased	0	Save the scan as a file.
ICScannerTransferModeMemoryBased	1	Transfer the scan as data.

99.12 class ICScannerFeatureBooleanMBS

99.12.1 class ICScannerFeatureBooleanMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: ICScannerFeatureBoolean object is used to represent a property of a scanner functional unit whose value can be true or false.
Notes: Subclass of the ICScannerFeatureMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

99.12.2 Methods

99.12.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.12.4 Properties

99.12.5 value as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The value of this feature.
Notes: (Read and Write property)

99.13 class ICScannerFeatureEnumerationMBS

99.13.1 class ICScannerFeatureEnumerationMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: ICScannerFeatureEnumeration object is used to represent a feature of a scanner functional unit that can have one of several discrete values.
Notes: Subclass of the ICScannerFeatureMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

99.13.2 Methods

99.13.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.13.4 menuItemLabels as String()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The human readable menu item labels to be used in a menu to allow the user to select the current value from an array of possible values.

99.13.5 menuItemLabelsTooltips as String()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Tooltip text associated with the menu items.

99.13.6 values as Variant()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: An array of possible values. All items in this array must be of same type.

99.13.7 Properties

99.13.8 currentValue as Variant

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The current value.
Notes: The current value can be set to one of the possible values in the "values" property below.
(Read and Write property)

99.13.9 defaultValue as Variant

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The default value.
Notes: The default value can be set to one of the possible values in the "values" property below.
(Read only property)

99.14 class ICScannerFeatureMBS

99.14.1 class ICScannerFeatureMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: ICScannerFeature class is an abstract base class used to describe a scanner feature.
Example:

```
// list the special features a scanner offers, like dust removal
// scanner is an ICScannerDeviceMBS with an open session, e.g. from ICDeviceBrowserMBS
Var scanner As ICScannerDeviceMBS // your scanner
If scanner = Nil Then Return

For Each f As ICScannerFeatureMBS In scanner.selectedFunctionalUnit.vendorFeatures
System.DebugLog f.humanReadableName + " (" + f.internalName + ", type " + f.type.ToString + "): " +
f.tooltip
Next
```

Notes: ImageCaptureCore defines three concrete subclasses of ICScannerFeatureMBS: ICScannerFeatureEnumerationMBS, ICScannerFeatureRangeMBS and ICScannerFeatureBooleanMBS.
The scanner functional units may have one or more instances of these classes to allow users to choose scanner-specific settings or operations before performing a scan.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

99.14.2 Methods

99.14.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.14.4 Properties

99.14.5 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

99.14.6 humanReadableName as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The human readable name of this feature.
Notes: (Read only property)

99.14.7 internalName as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The internal name of this feature.
Notes: (Read only property)

99.14.8 tooltip as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Tooltip text describing the feature.
Notes: (Read only property)

99.14.9 type as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Scanner feature type.
Notes: See ICScannerFeatureType* constants.
(Read only property)

99.14.10 Constants

Feature Types

Constant	Value	Description
ICScannerFeatureTypeBoolean	2	The value of this feature can be true or false.
ICScannerFeatureTypeEnumeration	0	This feature can have one of several discrete values, strings or numbers.
ICScannerFeatureTypeRange	1	This value of this feature lies within a range.
ICScannerFeatureTypeTemplate	3	A group of features.

99.15 class ICScannerFeatureRangeMBS

99.15.1 class ICScannerFeatureRangeMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: ICScannerFeatureRange object is used to represent a property of a scanner functional unit whose value lies within a range.
Notes: Subclass of the ICScannerFeatureMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

99.15.2 Methods

99.15.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.15.4 Properties

99.15.5 currentValue as Double

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The current value.
Notes: Attempting to set the current value to a value that is not coincident with a step will result in a value corresponding to the nearest step being assigned to the current value.
(Read only property)

99.15.6 defaultValue as Double

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The default value.
Notes: Attempting to set the default value to a value that is not coincident with a step will result in a value corresponding to the nearest step being assigned to the default value.
(Read only property)

99.15.7 maxValue as Double

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The maximum value.
Notes: (Read only property)

99.15.8 minValue as Double

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The minimum value.
Notes: (Read only property)

99.15.9 stepSize as Double

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The step size.
Notes: (Read only property)

99.16 class ICScannerFeatureTemplateMBS

99.16.1 class ICScannerFeatureTemplateMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: ICScannerFeatureTemplate object is used to define a group of one or more rectangular scan areas that can be used with a scanner functional unit.
Notes: Subclass of the ICScannerFeatureMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

99.16.2 Methods

99.16.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.16.4 targets as ICScannerFeatureMBS()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The target features.

99.17 class ICScannerFunctionalUnitDocumentFeederMBS

99.17.1 class ICScannerFunctionalUnitDocumentFeederMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: ICScannerFunctionalUnitDocumentFeeder is a concrete subclass of ICScannerFunctionalUnit class.
Notes: ICScannerDevice creates instances of this class.
This represents the document feeder unit on the scanner.
Subclass of the ICScannerFunctionalUnitMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

99.17.2 Methods

99.17.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.17.4 Properties

99.17.5 documentLoaded as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the feeder has documents to scan.
Notes: This value will change when the document is loaded or removed from the feeder, if the scanner module has the capability to detect this state.
(Read only property)

99.17.6 duplexScanningEnabled as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates whether duplex scanning is enabled.
Notes: (Read and Write property)

99.17.7 evenPageOrientation as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Desired orientation of the even pages of the scanned document.
Notes: This property is set to ICEXIFOrientation1 initially.

Possible values:

ICEXIFOrientation1	1	Normal
ICEXIFOrientation2	2	Flipped horizontally
ICEXIFOrientation3	3	Rotated 180¬∞
ICEXIFOrientation4	4	Flipped vertically
ICEXIFOrientation5	5	Rotated 90¬∞ CCW and flipped vertically
ICEXIFOrientation6	6	Rotated 90¬∞ CCW
ICEXIFOrientation7	7	Rotated 90¬∞ CW and flipped vertically
ICEXIFOrientation8	8	Rotated 90¬∞ CW

(Read and Write property)

99.17.8 oddPageOrientation as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Desired orientation of the odd pages of the scanned document.
Notes: This property is set to ICEXIFOrientation1 initially.

Possible values:

ICEXIFOrientation1	1	Normal
ICEXIFOrientation2	2	Flipped horizontally
ICEXIFOrientation3	3	Rotated 180¬∞
ICEXIFOrientation4	4	Flipped vertically
ICEXIFOrientation5	5	Rotated 90¬∞ CCW and flipped vertically
ICEXIFOrientation6	6	Rotated 90¬∞ CCW
ICEXIFOrientation7	7	Rotated 90¬∞ CW and flipped vertically
ICEXIFOrientation8	8	Rotated 90¬∞ CW

(Read and Write property)

99.17.9 reverseFeederPageOrder as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the document feeder reads pages from back to front.
Notes: (Read only property)

99.17.10 supportsDuplexScanning as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates whether duplex scanning is supported.
Notes: (Read only property)

99.18 class ICScannerFunctionalUnitFlatbedMBS

99.18.1 class ICScannerFunctionalUnitFlatbedMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: ICScannerFunctionalUnitFlatbedMBS is a concrete subclass of ICScannerFunctionalUnitMBS class.
Notes: ICScannerDevice creates instances of this class.
This represents the flatbed unit on the scanner.
Subclass of the ICScannerFunctionalUnitMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

99.18.2 Methods

99.18.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.19 class ICScannerFunctionalUnitMBS

99.19.1 class ICScannerFunctionalUnitMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: ICScannerFunctionalUnit is an abstract class that represents a scanner functiona unit.
Example:

```
// set up a scan with 300 dpi of a letter sized area
// scanner is an ICScannerDeviceMBS with an open session, e.g. from ICDeviceBrowserMBS
Var scanner As ICScannerDeviceMBS // your scanner
If scanner = Nil Then Return

Var unit As ICScannerFunctionalUnitMBS = scanner.selectedFunctionalUnit
unit.resolution = 300
unit.scanArea = NSMakeRectMBS(0, 0, 8.5 * 72, 11 * 72) // in points
MessageBox "Bit depth: " + unit.bitDepth.ToString + ", max size " + Format(unit.physicalSize.Width /
72, "0.0") + " x " + Format(unit.physicalSize.Height / 72, "0.0") + " inch"
scanner.requestScan
```

Notes: ImageCaptureCore defines three concrete subclasses of ICScannerFunctionalUnit: ICScannerFunctionalUnitFlatbed, ICScannerFunctionalUnitPositiveTransparency, ICScannerFunctionalUnitNegativeTransparency and ICScannerFunctionalUnitDocumentFeeder. ICScannerDevice creates instances of these concrete subclasses.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

99.19.2 Methods

99.19.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.19.4 templates as ICScannerFeatureTemplateMBS()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: An array of objects of type ICScannerFeatureTemplate.

99.19.5 vendorFeatures as ICScannerFeatureMBS()

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: An array of objects of type ICScannerFeature.

99.19.6 Properties

99.19.7 acceptsThresholdForBlackAndWhiteScanning as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates if this functional unit accepts threshold value to be used when performing a scan in black & white.
Notes: (Read only property)

99.19.8 bitDepth as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The bit depth to use when performing the final scan.
Notes: This will always be one of the supported bit depths.
(Read and Write property)

99.19.9 canPerformOverviewScan as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates if this functional unit can perfrom an overview scan.
Notes: Not all functional units can perform an overview scan. For example, a document feeder or a sheet feeder unit cannot perform an overview scan.
(Read only property)

99.19.10 defaultThresholdForBlackAndWhiteScanning as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Default threshold value used when performing a scan in black & white.
Notes: This value is from 0 to 255.
(Read only property)

99.19.11 documentSize as NSSizeMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Document size of the current document type expressed in current measurement unit.
Notes: (Read only property)

99.19.12 documentType as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Current document type.
Notes: This will always be one of the supported document types.
(Read and Write property)

99.19.13 measurementUnit as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Current measurement unit. This will always be one of the supported measurement units.
Notes: (Read and Write property)

99.19.14 nativeXResolution as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Optical resolution along the X axis.
Notes: (Read only property)

99.19.15 nativeYResolution as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Optical resolution along the Y axis.
Notes: (Read only property)

99.19.16 overviewImage as Variant

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Overview scan image.
Notes: This property will be nil for functional units that do not support overview scans.

Value is a CGImageMBS. We use variant to reduce dependency to other plugins.
(Read only property)

99.19.17 overviewResolution as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Overview image resolution.
Notes: Value assigned to this will be contrained by resolutions allowed by the device.
(Read and Write property)

99.19.18 overviewScanInProgress as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates if an overview scan is in progress.
Notes: (Read only property)

99.19.19 physicalSize as NSSizeMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Physical size of the scan area in current measurement unit.
Notes: (Read only property)

99.19.20 pixelDataType as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The pixel data type.
Notes: See ICScannerPixelDataType* constants.
(Read and Write property)

99.19.21 preferredResolutions as NSIndexSetMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Current scan resolution.
Notes: This will always be one of the supported resolution values.
(Read only property)

99.19.22 preferredScaleFactors as NSIndexSetMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Preferred scale factors in percentage.
Notes: (Read only property)

99.19.23 resolution as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Current scan resolution.
Notes: This will always be one of the supported resolution values.
(Read and Write property)

99.19.24 scaleFactor as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Current scale factor.
Notes: This will always be one of the supported scale factor values.
(Read only property)

99.19.25 scanArea as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This property along with scanAreaOrientation describes the area to be scanned.
Notes: (Read and Write property)

99.19.26 scanAreaOrientation as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Desired orientation of the scan area.
Notes: This property along with scanArea describes the area to be scanned.

This property is set to ICEXIFOrientation1 initially. This property is not used by the ICScannerFunctionalUnitDocumentFeeder subclass.

Possible values:

ICEXIFOrientation1	1	Normal
ICEXIFOrientation2	2	Flipped horizontally
ICEXIFOrientation3	3	Rotated 180¬∞
ICEXIFOrientation4	4	Flipped vertically
ICEXIFOrientation5	5	Rotated 90¬∞ CCW and flipped vertically
ICEXIFOrientation6	6	Rotated 90¬∞ CCW
ICEXIFOrientation7	7	Rotated 90¬∞ CW and flipped vertically
ICEXIFOrientation8	8	Rotated 90¬∞ CW

(Read and Write property)

99.19.27 scanInProgress as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates if a scan is in progress.
Notes: (Read only property)

99.19.28 scanProgressPercentDone as Double

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates percentage of scan completed.
Notes: (Read only property)

99.19.29 state as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates the current state of the functional unit.
Notes: See ICScannerFunctionalUnitState* constants.
(Read only property)

99.19.30 supportedBitDepths as NSIndexSetMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Supported bit depths.
Notes: The values in this set are valid values defined by ICScannerBitDepth.
(Read only property)

99.19.31 supportedDocumentTypes as NSIndexSetMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Supported document types.
Notes: The values in this set are valid values defined by ICScannerDocumentType.
(Read only property)

99.19.32 supportedMeasurementUnits as NSIndexSetMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Supported measurement units. The values in this set are valid values defined by ICScannerMeasurementUnit.
Notes: (Read only property)

99.19.33 supportedResolutions as NSIndexSetMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Supported scan resolutions in DPI.
Notes: (Read only property)

99.19.34 supportedScaleFactors as NSIndexSetMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Supported scale factors in percentage.
Notes: (Read only property)

99.19.35 thresholdForBlackAndWhiteScanning as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Threshold value to be used when performing a scan in black & white.
Notes: This value should be from 0 to 255.
(Read and Write property)

99.19.36 type as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Functional unit type.
Notes: See ICScannerFunctionalUnitType* constants.
(Read only property)

99.19.37 usesThresholdForBlackAndWhiteScanning as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates if this functional unit uses threshold value to be used when performing a scan in black & white.
Notes: (Read only property)

99.19.38 Constants

Bit Depths

Constant	Value	Description
ICScannerBitDepth16Bits	16	Image with 16 bits per channel.
ICScannerBitDepth1Bit	1	1-bit image.
ICScannerBitDepth8Bits	8	Image with 8 bits per channel.

Color Data Formats

Constant	Value	Description
ICScannerColorDataFormatTypeChunky	0	For multi-channel data (e.g., RGB) data from all channels are interlea Identifies color data formats. Only relevant for multi-channel data. sponds to "ICAP_PLANARCHUNKY" of the TWAIN Specification.
ICScannerColorDataFormatTypePlanar	1	For multi-channel data (e.g., RGB) each channel is transferred sequen Identifies color data formats. Only relevant for multi-channel data. sponds to "ICAP_PLANARCHUNKY" of the TWAIN Specification.

Document Types

Constant	Value	Description
ICScannerDocumentType10	25	A10, 26.00 mm x 37.00 mm
ICScannerDocumentType10R	67	10R, 10” x 12” 254.00 mm x 304.80 mm 5:6
ICScannerDocumentType110	72	Instamatic 110, 13.00 mm x 17.00 mm
ICScannerDocumentType11R	69	11R, 11” x 14” 279.40 mm x 355.60 mm 11:14
ICScannerDocumentType12R	70	12R, 12” x 15” 304.80 mm x 381.00 mm 4:5
ICScannerDocumentType135	76	Standard 35 mm, 36.00 mm x 24.00 mm
ICScannerDocumentType2A0	18	2A0, 1189.00 mm x 1682.00 mm
ICScannerDocumentType3R	61	3R, 3.5” x 5” 88.90 mm x 127.00 mm 7:10
ICScannerDocumentType4A0	17	4A0, 1682.00 mm x 2378.00 mm
ICScannerDocumentType4R	62	4R, 4” x 6” 101.60 mm x 152.40 mm 2:3
ICScannerDocumentType5R	63	5R, 5” x 7” 127.00 mm x 177.80 mm 5:7
ICScannerDocumentType6R	64	6R, 6” x 8” 152.40 mm x 203.20 mm 3:4
ICScannerDocumentType8R	65	8R, 8” x 10” 203.20 mm x 254.00 mm 4:5
ICScannerDocumentTypeA0	19	A0, 841.00 mm x 1189.00 mm
ICScannerDocumentTypeA1	20	A1, 594.00 mm x 841.00 mm
ICScannerDocumentTypeA2	21	A2, 420.00 mm x 594.00 mm
ICScannerDocumentTypeA3	11	A3, 297.00 mm x 420.00 mm
ICScannerDocumentTypeA4	1	A4, 210.00 mm x 297.00 mm
ICScannerDocumentTypeA5	5	A5, 148.00 mm x 210.00 mm
ICScannerDocumentTypeA6	13	A6, 105.00 mm x 148.00 mm
ICScannerDocumentTypeA7	22	A7, 74.00 mm x 105.00 mm
ICScannerDocumentTypeA8	23	A8, 52.00 mm x 74.00 mm
ICScannerDocumentTypeA9	24	A9, 37.00 mm x 52.00 mm
ICScannerDocumentTypeAPSC	74	APS Classic, 25.10 mm x 16.70 mm
ICScannerDocumentTypeAPSH	73	APS High Definition, 30.20 mm x 16.70 mm
ICScannerDocumentTypeAPSP	75	APS Panoramic, 30.20 mm x 9.50 mm
ICScannerDocumentTypeB5	2	B5/JIS B5, 182.00 mm x 257.00 mm
ICScannerDocumentTypeBusinessCard	53	Business Card, 90.00 mm x 55.00 mm
ICScannerDocumentTypeC0	44	C0, 917.00 mm x 1297.00 mm
ICScannerDocumentTypeC1	45	C1, 648.00 mm x 917.00 mm
ICScannerDocumentTypeC10	51	C10, 28.00 mm x 40.00 mm
ICScannerDocumentTypeC2	46	C2, 458.00 mm x 648.00 mm
ICScannerDocumentTypeC3	47	C3, 324.00 mm x 458.00 mm
ICScannerDocumentTypeC4	14	C4, 229.00 mm x 324.00 mm
ICScannerDocumentTypeC5	15	C5, 162.00 mm x 229.00 mm
ICScannerDocumentTypeC6	16	C6, 114.00 mm x 162.00 mm
ICScannerDocumentTypeC7	48	C7, 81.00 mm x 114.00 mm
ICScannerDocumentTypeC8	49	C8, 57.00 mm x 81.00 mm
ICScannerDocumentTypeC9	50	C9, 40.00 mm x 57.00 mm
ICScannerDocumentTypeDefault	0	This is the platten size. Not valid for scanners without a platten.
ICScannerDocumentTypeE	60	Japanese E, 3.25” x 4.75” 82.55 mm x 120.65 mm 11:16
ICScannerDocumentTypeISOB0	26	ISO B0, 1000.00 mm x 1414.00 mm
ICScannerDocumentTypeISOB1	27	ISO B1, 707.00 mm x 1000.00 mm
ICScannerDocumentTypeISOB10	33	ISO B10, 31.00 mm x 44.00 mm
ICScannerDocumentTypeISOB2	28	ISO B2, 500.00 mm x 707.00 mm
ICScannerDocumentTypeISOB3	12	B3/ISO B3, 353.00 mm x 500.00 mm
ICScannerDocumentTypeISOB4	6	B4/ISO B4, 250.00 mm x 353.00 mm
ICScannerDocumentTypeISOB5	29	ISO B5, 176.00 mm x 250.00 mm
ICScannerDocumentTypeISOB6	7	B6/ISO B6, 125.00 mm x 176.00 mm
ICScannerDocumentTypeISOB7	30	ISO B7, 88.00 mm x 125.00 mm
ICScannerDocumentTypeISOB8	31	ISO B8, 62.00 mm x 88.00 mm
ICScannerDocumentTypeISOB9	32	ISO B9, 44.00 mm x 62.00 mm
ICScannerDocumentTypeJISB0	34	JIS B0, 1030.00 mm x 1456.00 mm
ICScannerDocumentTypeJISB1	35	JIS B1, 728.00 mm x 1030.00 mm
ICScannerDocumentTypeJISB10	43	JIS B10, 32.00 mm x 45.00 mm
ICScannerDocumentTypeJISB2	36	JIS B2, 515.00 mm x 728.00 mm
ICScannerDocumentTypeJISB3	37	JIS B3, 364.00 mm x 515.00 mm
ICScannerDocumentTypeJISB4	38	JIS B4, 257.00 mm x 364.00 mm

Scanner States

Constant	Value	Description
ICScannerFunctionalUnitStateOverviewScanInProgress	4	The scanner functional unit is performing an overview s
ICScannerFunctionalUnitStateReady	1	The scanner functional unit is ready for operation.
ICScannerFunctionalUnitStateScanInProgress	2	The scanner functional unit is performing a scan.

Scanner Functional Unit Types

Constant	Value	Description
ICScannerFunctionalUnitTypeDocumentFeeder	3	Document feeder functional unit.
ICScannerFunctionalUnitTypeFlatbed	0	Flatbed functional unit.
ICScannerFunctionalUnitTypeNegativeTransparency	2	Transparency functional unit for scanning negatives.
ICScannerFunctionalUnitTypePositiveTransparency	1	Transparency functional unit for scanning positives.

Measurement Units

Constant	Value	Description
ICScannerMeasurementUnitCentimeters	1	1 cm = 1.00 cm or 1/2.54 inches
ICScannerMeasurementUnitInches	0	1 inch = 2.54 cm
ICScannerMeasurementUnitPicas	2	1 pica = .42333333 cm or 1/6 inches
ICScannerMeasurementUnitPixels	5	
ICScannerMeasurementUnitPoints	3	1 point = .0352777775 cm or 1/72 inches
ICScannerMeasurementUnitTwips	4	1 twip = .0001763888 cm or 1/1440 inches

Pixel data types

Constant	Value	Description
ICScannerPixelDataTypeBW	0	Monochrome 1 bit pixel image.
ICScannerPixelDataTypeCIEXYZ	8	Color image in CIEXYZ color space.
ICScannerPixelDataTypeCMY	4	Color image in CMY color space.
ICScannerPixelDataTypeCMYK	5	Color image in CMYK color space.
ICScannerPixelDataTypeGray	1	8 bit pixel Gray color space.
ICScannerPixelDataTypePalette	3	Indexed Color image.
ICScannerPixelDataTypeRGB	2	Color image RGB color space.
ICScannerPixelDataTypeYUV	6	Color image in YUV color space.
ICScannerPixelDataTypeYUVK	7	Color image in YUVK color space.

99.20 class ICScannerFunctionalUnitNegativeTransparencyMBS

99.20.1 class ICScannerFunctionalUnitNegativeTransparencyMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: ICScannerFunctionalUnitNegativeTransparencyMBS is a concrete subclass of ICScannerFunctionalUnitMBS class.
Notes: ICScannerDeviceMBS creates instances of this class.
This represents the transparency unit on the scanner for scanning negatives.
Subclass of the ICScannerFunctionalUnitMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

99.20.2 Methods

99.20.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.21 class ICScannerFunctionalUnitPositiveTransparencyMBS

99.21.1 class ICScannerFunctionalUnitPositiveTransparencyMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: ICScannerFunctionalUnitPositiveTransparencyMBS is a concrete subclass of ICScannerFunctionalUnitMBS class.
Notes: ICScannerDeviceMBS creates instances of this class.
This represents the transparency unit on the scanner for scanning postives.
Subclass of the ICScannerFunctionalUnitMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

99.21.2 Methods

99.21.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

99.22 control IKCameraDeviceViewControlMBS

99.22.1 control IKCameraDeviceViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a Camera Device View.
Notes: For Xojo with Cocoa target.
Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 14.3pr2

99.22.2 Properties

99.22.3 View as IKCameraDeviceViewMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The camera device view used in this control.
Notes: (Read only property)

99.22.4 Events

99.22.5 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

99.22.6 Close

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

99.22.7 Closing

Plugin Version: 14.3, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

99.22.8 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

99.22.9 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

99.22.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

99.22.11 DidDownloadFile(CameraFile as ICCameraFileMBS, URL as string, File as folderItem, data as MemoryBlock, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent for each file that gets downloaded.
Notes: Based on the IKCameraDeviceViewDisplayMode the downloaded file will be saved on disk using the 'url', or returned in memory as Memoryblock.

99.22.12 DidEncounterError(Error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent every time the camera device reports an error.

99.22.13 EnableMenuItems

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

99.22.14 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

99.22.15 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

99.22.16 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

99.22.17 GotFocus

MBS AVFoundation Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

99.22.18 LostFocus

MBS AVFoundation Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

99.22.19 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

99.22.20 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.

Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

99.22.21 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

99.22.22 MouseUp(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

99.22.23 Open

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

99.22.24 Opening

Plugin Version: 14.3, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

99.22.25 ScaleFactorChanged(NewFactor as Double)

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

99.22.26 SelectionDidChange

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the user selection did change.

99.22.27 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

99.23 class IKCameraDeviceViewMBS

99.23.1 class IKCameraDeviceViewMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Displays content of a Image Capture supported camera.
Example:

```
// browse the pictures on a camera or iPhone and download selected ones
// camera is an ICCameraDeviceMBS, e.g. from ICDeviceBrowserMBS or IKDeviceBrowserViewMBS
// MyCameraView is a subclass of IKCameraDeviceViewMBS with the DidDownloadFile event implemented.
// CameraView is a property of the window: CameraView As MyCameraView
Var camera As ICCameraDeviceMBS // your camera
If camera = Nil Then Return

CameraView = New MyCameraView(0, 0, Self.Width, Self.Height)
CameraView.downloadsFolder = SpecialFolder.Pictures
CameraView.cameraDevice = camera
Self.NSWindowMBS.contentView.addSubview CameraView

// in MyCameraView:
Sub DidDownloadFile(CameraFile As ICCameraFileMBS, URL As String, File As FolderItem, data As
MemoryBlock, error As NSErrorMBS) Handles DidDownloadFile
If File <>Nil Then System.DebugLog "Downloaded " + File.Name
End Sub
```

Notes: Subclass of the NSViewMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.3pr2

99.23.2 Methods

99.23.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new box view with size 100/100 and position 0/0
Example:

```
Var x as new IKCameraDeviceViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 99.23.4 Constructor(Handle as Integer) 15649
- 99.23.5 Constructor(left as Double, top as Double, width as Double, height as Double) 15649

99.23.4 Constructor(Handle as Integer)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSView handle.
Example:

```
Var t as new IKCameraDeviceViewMBS(0, 0, 100, 100)
Var v as new IKCameraDeviceViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a IKCameraDeviceView and the plugin retains this handle.
See also:

- 99.23.3 Constructor 15648
- 99.23.5 Constructor(left as Double, top as Double, width as Double, height as Double) 15649

99.23.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with the given size and position.
Example:

```
Var left,top,width,height as Integer
// define rectangle
Var x as new IKCameraDeviceViewMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:

- 99.23.3 Constructor 15648
- 99.23.4 Constructor(Handle as Integer) 15649

99.23.6 deleteSelectedItems

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Delete selected items.

99.23.7 downloadAllItems

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Download all items.

99.23.8 downloadSelectedItems

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Download selected items.

99.23.9 rotateLeft

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Rotate selected items left.

99.23.10 rotateRight

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Rotate selected items right.

99.23.11 selectIndexes(indexes as NSIndexSetMBS, extend as boolean)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Setting current user selection.

99.23.12 Properties

99.23.13 cameraDevice as ICCameraDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The camera device.
Notes: (Read and Write property)

99.23.14 canDeleteSelectedItems as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates if the user selected items can be deleted.
Notes: (Read only property)

99.23.15 canDownloadSelectedItems as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates if the user selected items can be downloaded.
Notes: (Read only property)

99.23.16 canRotateSelectedItemsLeft as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates if the user selected items can be rotated left.
Notes: (Read only property)

99.23.17 canRotateSelectedItemsRight as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Indicates if the user selected items can be rotated right.
Notes: (Read only property)

99.23.18 displaysDownloadsDirectoryControl as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Show a downloads directory control.
Notes: (Read and Write property)

99.23.19 displaysPostProcessApplicationControl as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Show a postprocessing application control.
Notes: (Read and Write property)

99.23.20 downloadAllControlLabel as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Label for the 'Download All' control - allows for example renaming to 'Import All'.
Notes: (Read and Write property)

99.23.21 downloadsDirectory as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Downloads directory.
Notes: Download location can be provided as file URL with downloadsDirectory property or as folderitem with downloadsFolder property.
(Read and Write property)

99.23.22 downloadSelectedControlLabel as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Label for the 'Download Selected' control.
Notes: (Read and Write property)

99.23.23 downloadsFolder as FolderItem

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Downloads directory.
Notes: Download location can be provided as file URL with downloadsDirectory property or as folderitem with downloadsFolder property.
(Read and Write property)

99.23.24 hasDisplayModeIcon as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Support icon view display mode.
Notes: (Read and Write property)

99.23.25 hasDisplayModeTable as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Support table view display mode.
Notes: (Read and Write property)

99.23.26 iconSize as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: in icon mode: size of the image thumbnails.
Notes: (Read and Write property)

99.23.27 mode as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Current display mode.
Notes: see IKCameraDeviceViewDisplayMode constants.
(Read and Write property)

99.23.28 postProcessApplication as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Postprocessing application.
Notes: A file URL to application.
(Read and Write property)

99.23.29 selectedIndexes as NSIndexSetMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Current user selection.
Notes: (Read only property)

99.23.30 transferMode as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Transfer mode either file based - or - in memory.
Notes: See IKCameraDeviceViewTransferMode constants.
(Read and Write property)

99.23.31 Events

99.23.32 DidDownloadFile(CameraFile as ICCameraFileMBS, URL as string, File as folderItem, data as MemoryBlock, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent for each file that gets downloaded.
Notes: Based on the IKCameraDeviceViewDisplayMode the downloaded file will be saved on disk using the 'url', or returned in memory as Memoryblock.

99.23.33 DidEncounterError(Error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent every time the camera device reports an error.

99.23.34 SelectionDidChange

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the user selection did change.

99.23.35 Constants

Display Modes

Constant	Value	Description
IKCameraDeviceViewDisplayModeIcon	1	Show Icons
IKCameraDeviceViewDisplayModeTable	0	Show Table

Transfer Modes

Constant	Value	Description
IKCameraDeviceViewTransferModeFileBased	0	File based download.
IKCameraDeviceViewTransferModeMemoryBased	1	Memory based download.

99.24 control IKDeviceBrowserViewControlMBS

99.24.1 control IKDeviceBrowserViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a Device Browser View.
Notes: For Xojo with Cocoa target.
Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 14.3pr2

99.24.2 Properties

99.24.3 View as IKDeviceBrowserViewMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The device browser view used in this control.
Notes: (Read only property)

99.24.4 Events

99.24.5 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

99.24.6 Close

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

99.24.7 Closing

Plugin Version: 14.3, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

99.24.8 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

99.24.9 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

99.24.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

99.24.11 DidEncounterError(error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent every time the device browser reports an error.

99.24.12 EnableMenuItems

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

99.24.13 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

99.24.14 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

99.24.15 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

99.24.16 GotFocus

MBS AVFoundation Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

99.24.17 LostFocus

MBS AVFoundation Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

99.24.18 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

99.24.19 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

99.24.20 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

99.24.21 MouseUp(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

99.24.22 Open

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

99.24.23 Opening

Plugin Version: 14.3, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

99.24.24 ScaleFactorChanged(NewFactor as Double)

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

99.24.25 SelectionDidChange(device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the user selection did change.
Notes: The device may be a ICCameraDeviceMBS or a ICScannerDeviceMBS.

99.24.26 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

99.25 class IKDeviceBrowserViewMBS

99.25.1 class IKDeviceBrowserViewMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Displays Image Capture cameras and scanners.
Example:

```
// show a list of connected cameras and scanners in the window
// MyDeviceBrowserView is a subclass of IKDeviceBrowserViewMBS with the SelectionDidChange event implemented.
// DeviceList is a property of the window: DeviceList As MyDeviceBrowserView
DeviceList = New MyDeviceBrowserView(20, 20, 250, 300)
DeviceList.displaysLocalCameras = True
DeviceList.displaysLocalScanners = True
DeviceList.displaysNetworkCameras = False
DeviceList.displaysNetworkScanners = False
Self.NSWindowMBS.contentView.addSubview DeviceList

// in MyDeviceBrowserView:
Sub SelectionDidChange(device As ICDeviceMBS) Handles SelectionDidChange
If device <>Nil Then System.DebugLog "Selected: " + device.name
End Sub
```

Notes: Subclass of the NSViewMBS class.
Blog Entries

99.25.2 Methods

99.25.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new box view with size 100/100 and position 0/0
Example:

```
Var x as new IKDeviceBrowserViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 99.25.4 Constructor(Handle as Integer) 15663
- 99.25.5 Constructor(left as Double, top as Double, width as Double, height as Double) 15663

99.25.4 Constructor(Handle as Integer)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSView handle.
Example:

```
Var t as new IKDeviceBrowserViewMBS(0, 0, 100, 100)
Var v as new IKDeviceBrowserViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a IKDeviceBrowserView and the plugin retains this handle.
See also:

- 99.25.3 Constructor 15662
- 99.25.5 Constructor(left as Double, top as Double, width as Double, height as Double) 15663

99.25.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with the given size and position.
Example:

```
Var left,top,width,height as Integer
// define rectangle
Var x as new IKDeviceBrowserViewMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:

- 99.25.3 Constructor 15662
- 99.25.4 Constructor(Handle as Integer) 15663

99.25.6 Properties

99.25.7 displaysLocalCameras as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: For device filtering - indicates that the IKDeviceBrowserView should include local cameras.
Notes: (Read and Write property)

99.25.8 displaysLocalScanners as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: for device filtering - indicates that the IKDeviceBrowserView should include local scanners.
Notes: (Read and Write property)

99.25.9 displaysNetworkCameras as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: for device filtering - indicates that the IKDeviceBrowserView should include network/shared cameras.
Notes: (Read and Write property)

99.25.10 displaysNetworkScanners as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: for device filtering - indicates that the IKDeviceBrowserView should include network/shared scanners.
Notes: (Read and Write property)

99.25.11 mode as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: One of the supported display modes (table, outline, or icon mode).
Notes: (Read and Write property)

99.25.12 selectedDevice as ICDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: User selected device (ICCameraDevice or ICScannerDevice).
Notes: (Read only property)

99.25.13 Events

99.25.14 DidEncounterError(error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent every time the device browser reports an error.

99.25.15 SelectionDidChange(device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the user selection did change.
Notes: The device may be a ICCameraDeviceMBS or a ICScannerDeviceMBS.

99.25.16 Constants

Display Modes

Constant	Value	Description
IKDeviceBrowserViewDisplayModeIcon	2	Icon
IKDeviceBrowserViewDisplayModeOutline	1	Outline
IKDeviceBrowserViewDisplayModeTable	0	Table

99.26 control IKScannerDeviceViewControlMBS

99.26.1 control IKScannerDeviceViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a Scanner Device View.
Notes: For Xojo with Cocoa target.
Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 14.3pr2

99.26.2 Properties

99.26.3 View as IKScannerDeviceViewMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The scanner view used in this control.
Notes: For Xojo with Cocoa target.
(Read only property)

99.26.4 Events

99.26.5 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

99.26.6 Close

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

99.26.7 Closing

Plugin Version: 14.3, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

99.26.8 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

99.26.9 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

99.26.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

99.26.11 DidEncounterError(error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent every time the scanner device reports an error.

99.26.12 DidScanToBandData(data as ICScannerBandDataMBS, scanInfo as Dictionary, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: For memory a based transfer this event is sent for every time an image band of data was scanned.
Notes: The 'data' parameter describes the scanned image data. Note that rotation/cropping/image adjustments are not applied yet. The 'scanInfo' parameter contains additional information (rotation angle, ...) that should be applied once the scan is completed.

99.26.13 DidScanToURL(url as String, file as FolderItem, fileData as MemoryBlock, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: For file based transfer this event is sent for each image that gets scanned.
Notes: Based on the IKScannerDeviceViewTransferMode the downloaded file will be saved on disk using the 'url', or returned in memory as Memoryblock.

99.26.14 EnableMenuItems

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

99.26.15 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

99.26.16 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

99.26.17 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

99.26.18 GotFocus

MBS AVFoundation Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

99.26.19 LostFocus

MBS AVFoundation Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

99.26.20 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

99.26.21 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

99.26.22 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

99.26.23 MouseUp(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

99.26.24 Open

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

99.26.25 Opening

Plugin Version: 14.3, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

99.26.26 ScaleFactorChanged(NewFactor as Double)

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

99.26.27 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

99.27 class IKScannerDeviceViewMBS

99.27.1 class IKScannerDeviceViewMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: IKScannerDeviceView displays a UI to work with Image Capture supported scanners.
Example:

```
// show the scanner user interface for a scanner and save scans to the desktop
// scanner is an ICScannerDeviceMBS, e.g. from ICDeviceBrowserMBS or IKDeviceBrowserViewMBS
// MyScannerView is a subclass of IKScannerDeviceViewMBS with the DidScanToURL event implemented.
// ScannerView is a property of the window: ScannerView As MyScannerView
Var scanner As ICScannerDeviceMBS // your scanner
If scanner = Nil Then Return

ScannerView = New MyScannerView(0, 0, Self.Width, Self.Height)
ScannerView.downloadsFolder = SpecialFolder.Desktop
ScannerView.documentName = "Scan"
ScannerView.scannerDevice = scanner
Self.NSWindowMBS.contentView.addSubview ScannerView

// in MyScannerView:
Sub DidScanToURL(url As String, file As FolderItem, fileData As MemoryBlock, error As NSErrorMBS)
Handles DidScanToURL
If error <>Nil Then
System.DebugLog error.localizedDescription
ElseIf file <>Nil Then
System.DebugLog "Scanned to " + file.NativePath
End If
End Sub
```

Notes: Subclass of the NSViewMBS class.

- MBS Xojo / Real Studio Plugins, version 14.3pr2

99.27.2 Methods

99.27.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new box view with size 100/100 and position 0/0
Example:

```
Var x as new IKScannerDeviceViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 99.27.4 Constructor(Handle as Integer) 15673
- 99.27.5 Constructor(left as Double, top as Double, width as Double, height as Double) 15673

99.27.4 Constructor(Handle as Integer)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSView handle.
Example:

```
Var t as new IKScannerDeviceViewMBS(0, 0, 100, 100)
Var v as new IKScannerDeviceViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a IKScannerDeviceView and the plugin retains this handle.
See also:

- 99.27.3 Constructor 15672
- 99.27.5 Constructor(left as Double, top as Double, width as Double, height as Double) 15673

99.27.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with the given size and position.
Example:

```
Var left,top,width,height as Integer
// define rectangle
Var x as new IKScannerDeviceViewMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:

- 99.27.3 Constructor 15672
- 99.27.4 Constructor(Handle as Integer) 15673

99.27.6 Properties

99.27.7 displaysDownloadsDirectoryControl as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Show a downloads directory control.
Notes: (Read and Write property)

99.27.8 displaysPostProcessApplicationControl as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Show a postprocessing application control.
Notes: (Read and Write property)

99.27.9 documentName as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Document name.
Notes: (Read and Write property)

99.27.10 downloadsDirectory as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Downloads directory.
Notes: Download location can be provided as file URL with downloadsDirectory property or as folderitem with downloadsFolder property.
(Read and Write property)

99.27.11 downloadsFolder as FolderItem

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Downloads directory.
Notes: Download location can be provided as file URL with downloadsDirectory property or as folderitem with downloadsFolder property.
(Read and Write property)

99.27.12 hasDisplayModeAdvanced as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Support advanced scanning UI.
Notes: (Read and Write property)

99.27.13 hasDisplayModeSimple as Boolean

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Support a simple scanning UI.
Notes: (Read and Write property)

99.27.14 mode as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Current display mode.
Notes: See IKScannerDeviceViewDisplayMode constants.
(Read and Write property)

99.27.15 overviewControlLabel as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Label for the 'Overview' control.
Notes: (Read and Write property)

99.27.16 postProcessApplication as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Postprocessing application.
Notes: (Read and Write property)

99.27.17 scanControlLabel as String

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: label for the 'Scan' control.
Notes: (Read and Write property)

99.27.18 scannerDevice as ICScannerDeviceMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The scanner device.
Notes: (Read and Write property)

99.27.19 transferMode as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: transfer mode either file based - or - in memory.
Notes: See IKScannerDeviceViewTransferMode constants.
(Read and Write property)

99.27.20 Events

99.27.21 DidEncounterError(error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent every time the scanner device reports an error.

99.27.22 DidScanToBandData(data as ICScannerBandDataMBS, scanInfo as Dictionary, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: For memory a based transfer this event is sent for every time an image band of data was scanned.
Notes: The 'data' parameter describes the scanned image data. Note that rotation/cropping/image adjustments are not applied yet. The 'scanInfo' parameter contains additional information (rotation angle, ...) that should be applied once the scan is completed.

99.27.23 DidScanToURL(url as String, file as FolderItem, fileData as MemoryBlock, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: For file based transfer this event is sent for each image that gets scanned.
Notes: Based on the IKScannerDeviceViewTransferMode the downloaded file will be saved on disk using the 'url', or returned in memory as Memoryblock.

99.27.24 Constants

Display Modes

Constant	Value	Description
IKScannerDeviceViewDisplayModeAdvanced	1	Advanced
IKScannerDeviceViewDisplayModeSimple	0	Simple

Transfer Modes

Constant	Value	Description
IKScannerDeviceViewTransferModeFileBased	0	File based scan.
IKScannerDeviceViewTransferModeMemoryBased	1	Memory based scan.

99.28 class ImageCaptureEventsMBS

99.28.1 class ImageCaptureEventsMBS

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Central class for Image Capture events.
Notes: Whenever you have an ICA object, the plugin will register a delegate for it and dispatch all events here.
For some view classes, events are in addition dispatched to the controls.

Xojo Developer Magazine

- 18.6, page 10: News

99.28.2 Properties

99.28.3 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

99.28.4 Events

99.28.5 cameraDeviceDidAddItem(camera as ICCameraDeviceMBS, item as ICCameraItemMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when an object is added to the device.
Notes: The object may be an instance of ICCameraFolder or ICCameraFile class.

99.28.6 cameraDeviceDidAddItems(camera as ICCameraDeviceMBS, items() as ICCameraItemMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when an object or objects are added to the device.
Notes: Instead of receive one event per object, an array of objects is sent.
The objects may be instances of ICCameraFolder or ICCameraFile class.

99.28.7 cameraDeviceDidBecomeReadyWithCompleteContentCatalog(camera as ICCameraDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the camera device is done enumerating its content and is ready to receive requests.
Notes: A session must be opened on the device in order to enumerate its content and make it ready to receive requests.

99.28.8 cameraDeviceDidChangeCapability(camera as ICCameraDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the capability of a device changes.
Notes: This usually happens when the device module takes control or yields control of the device.

99.28.9 cameraDeviceDidCompleteDeleteFilesWithError(camera as ICCameraDeviceMBS, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Files have been deleted.
Notes: This event is sent after the camera device completes a delete operation initiated by sending a requestDeleteFiles event to that device.

99.28.10 cameraDeviceDidDownloadFile(file as ICCameraFileMBS, error as NSErrorMBS, options as Dictionary, device as ICCameraDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Download of file finished.

99.28.11 cameraDeviceDidEnableAccessRestriction(camera as ICCameraDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop only.

Function: Tells the client when an Apple device has been locked, and media is unavailable until the restriction has been removed.
Notes: For macOS 10.15 or newer.

99.28.12 cameraDeviceDidReadData(data as Memoryblock, file as ICCameraFileMBS, error as NSErrorMBS, device as ICCameraDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Reading file data finished.

99.28.13 cameraDeviceDidReceiveDownloadProgressForFile(file as ICCameraFileMBS, downloadedBytes as UInt64, maxBytes as UInt64)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent to the delegate to provide status of the download operation.

99.28.14 cameraDeviceDidReceiveMetadataForItem(camera as ICCameraDeviceMBS, item as ICCameraItemMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the metadata requested for an item on a device is available.

99.28.15 cameraDeviceDidReceivePTPEvent(camera as ICCameraDeviceMBS, eventData as MemoryBlock)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent to the delegate to convey a PTP event.

99.28.16 cameraDeviceDidReceiveThumbnailForItem(camera as ICCameraDeviceMBS, item as ICCameraItemMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the thumbnail requested for an item on a device is available.

99.28.17 cameraDeviceDidRemoveAccessRestriction(camera as ICCameraDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 20.4, Platform: macOS, Targets: Desktop only.

Function: Tells the client when an Apple device has been unlocked, paired to the host, and media is available.
Notes: For macOS 10.15 or newer.

99.28.18 cameraDeviceDidRemoveItem(camera as ICCameraDeviceMBS, item as ICCameraItemMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when an object is removed from the device.
Notes: The object may be an instance of ICCameraFolder or ICCameraFile class.

99.28.19 cameraDeviceDidRemoveItems(camera as ICCameraDeviceMBS, items() as ICCameraItemMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when an object or objects are removed from the device.
Notes: The objects may be instances of ICCameraFolder or ICCameraFile class. This method supercedes cameraDeviceDidRemoveItem method described above.

99.28.20 cameraDeviceDidRenameItems(camera as ICCameraDeviceMBS, items() as ICCameraItemMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when an object or objects are renamed on the device.
Notes: The objects may be instances of ICCameraFolder or ICCameraFile class.

99.28.21 cameraDeviceDidSendPTPCommand(command as Memoryblock, data as Memoryblock, response as MemoryBlock, error as NSErrorMBS, device as ICCameraDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: Called when a requestSendPTPCommand event got a response or error.

99.28.22 cameraDeviceDidUploadFile(fileURL as string, file as FolderItem, error as NSErrorMBS, device as ICCameraDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: A file upload was completed.

99.28.23 cameraDeviceViewDidDownloadFile(cameraDeviceView as IKCameraDeviceViewMBS, CameraFile as ICCameraFileMBS, URL as string, File as folderItem, data as MemoryBlock, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent for each file that gets downloaded.
Notes: Based on the IKCameraDeviceViewDisplayMode the downloaded file will be saved on disk using the 'url', or returned in memory as Memoryblock.

99.28.24 cameraDeviceViewDidEncounterError(cameraDeviceView as IKCameraDeviceViewMBS, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent every time the camera device reports an error.

99.28.25 cameraDeviceViewSelectionDidChange(cameraDeviceView as IKCameraDeviceViewMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the user selection did change.

99.28.26 deviceBrowserDeviceDidChangeName(browser as ICDeviceBrowserMBS, device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent if the name of a device changes.
Notes: This happens if the device module overrides the default name of the device reported by the device's transport layer, or if the name of the filesystem volume mounted by the device is changed by the user.

99.28.27 deviceBrowserDeviceDidChangeSharingState(browser as ICDeviceBrowserMBS, device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the sharing state of a device has changes.
Notes: Any Image Capture client application can choose to share the device over the network using the sharing or webSharing facility in Image Capture.

99.28.28 deviceBrowserDidAddDevice(browser as ICDeviceBrowserMBS, device as ICDeviceMBS, moreComing as boolean)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent to the delegate to inform that a device has been added.
Notes: If several devices are found during the initial search, then this event is sent once for each device with the value of 'moreComing' set to true in each event except the last one.

99.28.29 deviceBrowserDidEnumerateLocalDevices(browser as ICDeviceBrowserMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent after the device browser completes sending deviceBrowserDidAddDevice event for all local devices.
Notes: Detecting locally connected devices (USB and FireWire devices) is faster than detecting devices connected using a network protocol. An Image Capture client application may use this event to update its user interface to let the user know that it has completed looking for locally connected devices and then start looking for network devices.

99.28.30 deviceBrowserDidRemoveDevice(browser as ICDeviceBrowserMBS, device as ICDeviceMBS, moreGoing as boolean)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent to the delegate to inform that a device has been removed.
Notes: If several devices are removed at the same time, then this event is sent once for each device with the value of 'moreGoing' set to true in each event except the last one.

99.28.31 deviceBrowserRequestsSelectDevice(browser as ICDeviceBrowserMBS, device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when an event that occurred on the device may be of interest to the client application.
Notes: In Mac OS X 10.6, this event is sent when a button is pressed on a device and the current application is the target for that button press. In the case of the button-press event, if a session is open on the device, this event will not be sent, instead the deviceDidReceiveButtonPress event is sent.

99.28.32 deviceBrowserViewDidEncounterError(deviceBrowserView as IKDeviceBrowserViewMBS, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent every time the device browser reports an error.

99.28.33 deviceBrowserViewSelectionDidChange(deviceBrowserView as IKDeviceBrowserViewMBS, device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the user selection did change.
Notes: The device may be a ICCameraDeviceMBS or a ICScannerDeviceMBS.

99.28.34 deviceDidBecomeReady(device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the device is ready to receive requests.
Notes: A camera device is ready, when it is ready to receive requests. A scanner device is ready when its

functional units are found and the default functional unit is selected for use and is ready to receive requests. The device will become ready to receive requests only after a session is opened.

99.28.35 deviceDidChangeName(device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent if the name of a device changes.
Notes: This happens if the device module overrides the default name of the device reported by the device's transport layer, or if the name of the filesystem volume mounted by the device is changed by the user.

99.28.36 deviceDidChangeSharingState(device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the sharing state of a device has changes.
Notes: Any Image Capture client application can choose to share the device over the network using the sharing or webSharing facility in Image Capture.

99.28.37 deviceDidCloseSessionWithError(device as ICDeviceMBS, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when a session is closed on a device.
Notes: This event completes the process initiated by the message "requestCloseSession" sent to the device object. This event is also sent if the device module in control of the device ceases to control the device.

99.28.38 deviceDidEncounterError(device as ICDeviceMBS, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent to the device delegate when a camera or scanner device encounters an error.

99.28.39 deviceDidOpenSessionWithError(device as ICDeviceMBS, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when a session is opened on a device.
Notes: This event completes the process initiated by the requestOpenSession sent to the device object.

99.28.40 deviceDidReceiveButtonPress(device as ICDeviceMBS, buttonType as String)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent to the device delegate if a button is pressed on the device.
Notes: This event is sent only if a session is open on the device. The value of 'buttonType' argument is one of the ICButtonType* values defined above.

99.28.41 deviceDidReceiveCustomNotification(device as ICDeviceMBS, notification as Dictionary, data as Memoryblock)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent to the device delegate the device sends a custom notification 'notification' with an arbitrary byte buffer 'data'.
Notes: This event is sent only if a session is open on the device.

99.28.42 deviceDidReceiveStatusInformation(device as ICDeviceMBS, status as Dictionary)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when status information is received from a camera or a scanner.
Notes: In Mac OS X 10.6 this event is not called for camera devices. This may change in the future releases of Mac OS X.
The 'status' dictionary contains two keys, ICStatusNotificationKey and ICLocalizedStatusNotificationKey, which are defined above. If type of 'device' is ICDeviceTypeScanner, the value of ICStatusNotificationKey will be one of the values defined in ICScannerDevice.h (e.g., ICScannerStatusWarmingUp, ICScannerStatusWarmUpDone, or ICScannerStatusRequestsOverviewScan); the value of ICLocalizedStatusNotificationKey will be a localized status information string suitable for displaying to the user.

99.28.43 deviceDidRemove(device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent to the delegate to inform that a device has been removed.

99.28.44 deviceDidSendMessage(messageCode as UInt32, data as Memoryblock, error as NSErrorMBS, device as ICDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The call to requestSendMessage was successful.

99.28.45 scannerDeviceDidBecomeAvailable(scanner as ICScannerDeviceMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when another client closes an open session on the scanner.
Notes: Scanners require exclusive access, only one client can open a session on a scanner. The scanner is available if it does not have a session opened by another client. Attempting to open a session on a scanner that already has an open session for another client will result in an error. A client that wants to open a session on a scanner as soon as it is available should implement this method and send "requestOpenSession" message to scanner object from that method.

99.28.46 scannerDeviceDidCompleteOverviewScanWithError(scanner as ICScannerDeviceMBS, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent after the scanner device completes an overview scan.

99.28.47 scannerDeviceDidCompleteScanWithError(scanner as ICScannerDeviceMBS, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent after the scanner device completes a scan.

99.28.48 scannerDeviceDidScanToBandData(scanner as ICScannerDeviceMBS, Data as ICScannerBandDataMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the scanner device receives the requested scan progress notification and a band of data is sent for each notification received.
Notes: In memory transfer mode, this will send a band of size that has been selected by the client via the

maxMemoryBandSize property.

99.28.49 scannerDeviceDidScanToURL(scanner as ICScannerDeviceMBS, URL as string, file as folderitem, data as MemoryBlock)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when the scanner device receives the requested scan.
Notes: If selectedFunctionalUnit is a document feeder, then this event will be sent once for each scanned page.
This event is sent when the scanner device receives the requested scan. If selectedFunctionalUnit is a document feeder, then this event will be sent once for each scanned page.

99.28.50 scannerDeviceDidSelectFunctionalUnit(scanner as ICScannerDeviceMBS, functionalUnit as Variant, Error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent when a functional unit is selected on the scanner device.
Notes: A functional unit is selected immediately after the scanner device is instantiated and in response to requestSelectFunctionalUnit method.

99.28.51 scannerDeviceViewDidEncounterError(scannerDeviceView as IKScannerDeviceViewMBS, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: This event is sent every time the scanner device reports an error.

99.28.52 scannerDeviceViewDidScanToBandData(scannerDeviceView as IKScannerDeviceViewMBS, data as ICScannerBandDataMBS, scanInfo as Dictionary, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: For memory a based transfer this event is sent for every time an image band of data was scanned.
Notes: The 'data' parameter describes the scanned image data. Note that rotation/cropping/image adjustments are not applied yet. The 'scanInfo' parameter contains additional information (rotation angle, ...) that should be applied once the scan is completed.

Only called if transfermode is ICScannerTransferModeMemoryBased.

99.28.53 scannerDeviceViewDidScanToURL(scannerDeviceView as IKScannerDeviceViewMBS, url as String, file as FolderItem, fileData as MemoryBlock, error as NSErrorMBS)

MBS AVFoundation Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: For file based transfer this event is sent for each image that gets scanned.
Notes: Based on the IKScannerDeviceViewTransferMode the downloaded file will be saved on disk using the 'url', or returned in memory as Memoryblock.

99.28.54 Constants

Error Constants

Constant	Value	Description
ICReturnCommunicationTimedOut	-9923	Communication between different components of Image Cap
ICReturnDeleteFilesCanceled	-9942	A request to delete files was canceled.
ICReturnDeleteFilesFailed	-9941	A request to delete files failed.
ICReturnDeviceFailedToCloseSession	-9928	Failed to close a session on a specified device.
ICReturnDeviceFailedToOpenSession	-9927	Failed to open a session on a specified device.
ICReturnDeviceFailedToTakePicture	-9944	Failed to take a tethered-capture picture on a camera devic
ICReturnDeviceIsPasscodeLocked	-9943	The device is locked with a passcode. Its contents cannot b unlocked.
ICReturnDeviceSoftwareInstallationCanceled	-9948	Software installation for the device has been canceled.
ICReturnDeviceSoftwareInstallationCompleted	-9947	Software installation for the device has completed successfu
ICReturnDeviceSoftwareInstallationFailed	-9949	Software installation for the device failed.
ICReturnDeviceSoftwareIsBeingInstalled	-9946	Failed to open session because software to communicate with installed.
ICReturnDeviceSoftwareNotAvailable	-9950	Software for the device is not available from Apple.
ICReturnDeviceSoftwareNotInstalled	-9945	Failed to open session because software to communicate wit installed.
ICReturnDownloadCanceled	-9937	A download operation was canceled.
ICReturnDownloadFailed	-9934	A non-specific error occurred while downloading a file.
ICReturnFailedToCompletePassThroughCommand	-9936	Failed to complete a pass-through (e.g., PTP pass-through)
ICReturnFailedToCompleteSendMessageRequest	-9940	A request to send a event to a device failed.
ICReturnFailedToDisabeTethering	-9939	Failed to disable tethered-capture on a camera device.
ICReturnFailedToEnabeTethering	-9938	Failed to enable tethered-capture on a camera device.
ICReturnInvalidParam	-9922	An invalid parameter was found.
ICReturnReceivedUnsolicitedScannerErrorInfo	-9933	An unsolicited error information was received from a scanne
ICReturnReceivedUnsolicitedScannerStatusInfo	-9932	An unsolicited status information was received from a scann
ICReturnScannerFailedToCompleteOverviewScan	-9930	Overview scan operation failed to complete on the specified
ICReturnScannerFailedToCompleteScan	-9931	Scan operation failed to complete on the specified scanner.
ICReturnScannerFailedToSelectFunctionalUnit	-9929	Failed to select a functional unit on the specified scanner.
ICReturnScannerInUseByLocalUser	-9925	Scanner is being used by a remote user.
ICReturnScannerInUseByRemoteUser	-9926	Scanner is being used by a local user.
ICReturnScanOperationCanceled	-9924	The scan operation is canceled.
ICReturnSuccess	0	Operation successful.
ICReturnUploadFailed	-9935	A non-specific error occurred while updownloading a file.

99.29 class ImageCaptureMBS

99.29.1 class ImageCaptureMBS

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use ICDeviceMBS instead.
Function: The base class to start with image capture.
Example:

```
Var m as new ImageCaptureMBS
Var list as ImageCaptureObjectMBS = m.DeviceList

if List<>Nil then
// look into properties
Var dic as Dictionary = list.PropertyDictionary

// take the devices array there
if dic<>Nil and dic.HasKey(ImageCaptureObjectMBS.kICADevicesArrayKey) then
Var a(-1) as Variant = dic.Value(ImageCaptureObjectMBS.kICADevicesArrayKey)

// display device name
for each properties as Dictionary in a
MessageBox Properties.Value("ifil")
next
end if
end if
```

Notes: Deprecated. Please stop using this class soon.
On Mac OS X 10.8 some functions stop working as Apple does no longer provide 32 bit libraries.

- MBS Xojo / Real Studio Plugins, version 15.4pr5

99.29.2 Methods

99.29.3 DeviceList as ImageCaptureObjectMBS

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns the object with the device list.
Example:

```
Var m as new ImageCaptureMBS
Var list as ImageCaptureObjectMBS = m.DeviceList
```

```
if List<>Nil then
// look into properties
Var dic as Dictionary = list.PropertyDictionary

// take the devices array there
if dic<>Nil and dic.HasKey(ImageCaptureObjectMBS.kICADevicesArrayKey) then
Var a(-1) as Variant = dic.Value(ImageCaptureObjectMBS.kICADevicesArrayKey)

// display device name
for each properties as Dictionary in a
MessageBox Properties.Value("ifil")
next
end if
end if
```

Notes: Returns nil on any error.
Lasterror is set.

99.29.4 ImportImage(flags as Integer) as string()

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: This method displays a Common User Interface panel similar to the user interface of Image Capture Application.
Example:

```
Var m as new ImageCaptureMBS
Var flags as Integer = ImageCaptureObjectMBS.kICAAllowMultipleImages + ImageCaptureObjectMBS.kI-
CADownloadAndReturnPathArray

// do the import and allow all file types
Var files(-1) as string = m.ImportImage(flags)

for each path as string in files
// show path
MessageBox path

// open that picture file in preview
Var f as FolderItem = New FolderItem(path, FolderItem.PathModes.Shell)
f.Launch
next
```

Notes: Use this method to allow the user to work a camera or a scanner.

The behavior:
(a) if no device is connected, a panel saying that there's no device connected is displayed,
(b) if a single device is connected, an appropriate user interface to access that device will be displayed,
(c) if several devices are connected, a device selector panel will be displayed.

filetypes: Optional an array of file extension strings such as "jpg", "tif", etc., that are of interest to the calling application. If no array is provided, all files are displayed.

Flag values that can be used in ImportImage:

kICAAllowMultipleImages	= 1	Use this constant to allow users to select multiple images in the Import Image dialog.
kICADownloadAndReturnPathArray	= 2	Use this constant to download the images to a temporary location and return an array of paths to the downloaded images.

Returns an array of Strings for the imported images if the kICADownloadAndReturnPathArray flag is not specified. Otherwise returns an array of Strings holding the paths of the images that are downloaded.
See also:

- 99.29.5 ImportImage(flags as Integer, filetypes() as string) as string() 15693

99.29.5 ImportImage(flags as Integer, filetypes() as string) as string()

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: This method displays a Common User Interface panel similar to the user interface of Image Capture Application.
Example:

```
Var m as new ImageCaptureMBS
Var flags as Integer = ImageCaptureObjectMBS.kICAAllowMultipleImages + ImageCaptureObjectMBS.kI-
CADownloadAndReturnPathArray

// the file types we accept:
Var types(-1) as string

types.Add "tif"
types.Add "tiff"
types.Add "jpg"
types.Add "png"

Var files(-1) as string = m.ImportImage(flags, types)

for each path as string in files
// show path
```

MessageBox path

```
// open that picture file in preview
Var f as FolderItem = New FolderItem(path, FolderItem.PathModes.Shell)
f.Launch
next
```

Notes: Use this method to allow the user to work a camera or a scanner.

The behavior:
(a) if no device is connected, a panel saying that there's no device connected is displayed,
(b) if a single device is connected, an appropriate user interface to access that device will be displayed,
(c) if several devices are connected, a device selector panel will be displayed.

filetypes: Optional an array of file extension strings such as "jpg", "tif", etc., that are of interest to the calling application. If no array is provided, all files are displayed.

Flag values that can be used in ImportImage:

kICAAllowMultipleImages	= 1	Use this constant to allow users to select multiple images in the Import Image dialog.
kICADownloadAndReturnPathArray	= 2	Use this constant to download the images to a temporary location and return an array of paths to the downloaded images.

Returns an array of Strings for the imported images if the kICADownloadAndReturnPathArray flag is not specified. Otherwise returns an array of Strings holding the paths of the images that are downloaded.

99.29.6 kICABluetoothAddressKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the parameter dictionary for LoadDeviceModule.

99.29.7 kICABluetoothTransportType as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the transport type constants.

99.29.8 kICADeviceBrowserDeviceRefKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the parameter dictionary for LoadDeviceModule.

99.29.9 kICADeviceIconPathKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the parameter dictionary for LoadDeviceModule.

99.29.10 kICADeviceModulePathKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the parameter dictionary for LoadDeviceModule.

99.29.11 kICAErrorKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.12 kICAFireWireGUIDKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the parameter dictionary for LoadDeviceModule.

99.29.13 kICAFireWireTransportType as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the transport type constants.

99.29.14 kICAIOServicePathKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the parameter dictionary for LoadDeviceModule.

99.29.15 kICAIPAddressKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the parameter dictionary for LoadDeviceModule.

99.29.16 kICAIPGUIDKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the parameter dictionary for LoadDeviceModule.

99.29.17 kICAIPNameKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the parameter dictionary for LoadDeviceModule.

99.29.18 kICANotificationClassKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.19 kICANotificationClassProprietary as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the notification classes.
Notes: A possible value for kICANotificationClassKey.

99.29.20 kICANotificationClassPTPStandard as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the notification classes.
Notes: A possible value for kICANotificationClassKey.

99.29.21 kICANotificationClassPTPVendor as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the notification classes.
Notes: A possible value for kICANotificationClassKey.

99.29.22 kICANotificationDataCookieKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.23 kICANotificationDataKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.24 kICANotificationDataSizeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.25 kICANotificationDeviceICAObjectKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.26 kICANotificationDeviceListICAObjectKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.27 kICANotificationICAObjectKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.28 kICANotificationImageBytesPerRowKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.29 kICANotificationImageDataKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.30 kICANotificationImageDataSizeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.31 kICANotificationImageHeightKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.32 kICANotificationImageKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.33 kICANotificationImageNumberOfRowsKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.34 kICANotificationImageStartRowKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.35 kICANotificationImageWidthKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.36 kICANotificationNumerOfImagesRemainingKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.37 kICANotificationPercentDownloadedKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.38 kICANotificationRawEventKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.39 kICANotificationScannerButtonTypeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.40 kICANotificationScannerDocumentNameKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.41 kICANotificationSubTypeDocumentLoaded as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.42 kICANotificationSubTypeDocumentNotLoaded as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.43 kICANotificationSubTypeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.44 kICANotificationSubTypePerformOverviewScan as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.45 kICANotificationSubTypeWarmUpDone as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.46 kICANotificationSubTypeWarmUpStarted as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.47 kICANotificationTypeCaptureComplete as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.48 kICANotificationTypeDeviceAdded as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.49 kICANotificationTypeDeviceConnectionProgress as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.50 kICANotificationTypeDeviceInfoChanged as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.51 kICANotificationTypeDevicePropertyChanged as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.52 kICANotificationTypeDeviceRemoved as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.53 kICANotificationTypeDeviceStatusError as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.54 kICANotificationTypeDeviceStatusInfo as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.55 kICANotificationTypeDeviceWasReset as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.56 kICANotificationTypeDownloadProgressStatus as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.57 kICANotificationTypeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.
Notes: The type of notification. See kICANotificationType* constants.

99.29.58 kICANotificationTypeObjectAdded as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.59 kICANotificationTypeObjectInfoChanged as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.60 kICANotificationTypeObjectRemoved as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.61 kICANotificationTypeProprietary as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.62 kICANotificationTypeRequestObjectTransfer as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.63 kICANotificationTypeScannerButtonPressed as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.64 kICANotificationTypeScannerOverviewOverlayAvailable as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.65 kICANotificationTypeScannerPageDone as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.66 kICANotificationTypeScannerScanDone as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.67 kICANotificationTypeScannerSessionClosed as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.68 kICANotificationTypeScanProgressStatus as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.69 kICANotificationTypeStoreAdded as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.70 kICANotificationTypeStoreFull as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.71 kICANotificationTypeStoreInfoChanged as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.72 kICANotificationTypeStoreRemoved as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.73 kICANotificationTypeTransactionCanceled as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.74 kICANotificationTypeUnreportedStatus as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the notification types for the notification event.

99.29.75 kICANotificationVendorErrorCodeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.76 kICARefconKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the notification dictionary.

99.29.77 kICASCSITransportType as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the transport type constants.

99.29.78 kICATCPIPTransportType as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the transport type constants.

99.29.79 kICATransportTypeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the parameter dictionary for LoadDeviceModule.

99.29.80 kICATWAINDSPathKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the parameter dictionary for LoadDeviceModule.

99.29.81 kICATWAINTransportType as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the transport type constants.

99.29.82 kICAUSBLocationIDKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the parameter dictionary for LoadDeviceModule.

99.29.83 kICAUSBTransportType as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the transport type constants.

99.29.84 kICAUserAssignedDeviceNameKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the device properties keys.
Notes: This key may be present in the property dictionary of a device if the device has a user-assigned name.

99.29.85 LoadDeviceModule(params as dictionary)

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Loads a device module.
Notes: Typically, connecting a FireWire or an USB device will automatically load an appropriate device module. This API is needed only for loading a device module manually for devices that do not use a hot-plug interface, such as Bluetooth, SCSI, or TCP/IP.

Legal Key-Value pairs for populating paramDictionary:

Key	Value	Comment
kICADeviceModulePathKey	String	Path to the device module bundle that needs to be launched.
kICATransportTypeKey	String	Should be one of the six predifined transport types.
kICABluetoothAddressKey	String	Bluetooth device address string formatted as "00-11-22-33-44-55".
kICAUSBLocationIDKey	Number (integer)	32 bit USB location ID.
kICAFireWireGUIDKey	Number (Int64)	64 bit FireWire GUID.
kICAIOServicePathKey	String	IO service path to the device obtained from the IO registry.
kICAIPAddressKey	String	IP address of the device. This can be a host address ("camera.apple.com"), ipv4 address ('192.168.123.10") or ipv6 address ("3ff3:0000:0000:0000:0123:4567:89ab:cdef")
kICAIPPortKey	Number (integer)	IP port number of the device.
kICAIPNameKey	String	Human readable device name.
kICAIPGUIDKey	String	16 byte GUID string of the device formatted as "01234567-89ab-cdef-0123-456789abcdef".
kICATWAINDSPathKey	String	Path to TWAIN DS bundle.

Lasterror is set.

99.29.86 RegisterForEventNotification(objectOfInterest as ImageCaptureObjectMBS, eventsOfInterest() as string, options as dictionary)

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Register with Image Capture framework to receive notification about events of interest.

99.29.87 SendNotification(notificationDictionary as dictionary) as Integer

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Sends notification.
Notes: Returns the reply code.
Lasterror is set.

99.29.88 SendNotificationAndWaitForReply(notificationDictionary as dictionary) as Integer

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Sends notification and wait for reply.
Notes: Returns the reply code.
Lasterror is set.

99.29.89 ShowDeviceBrowser

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Displays a device browser user interface from any Image Capture client application.
Notes: The device browser user interface allows the user to do the following:

- enable and disable sharing of locally connected cameras and scanners.
- connect to or disconnect from cameras and scanners shared by other computers.
- configure WiFi capable cameras for use over the WiFi network.

Lasterror is set.

99.29.90 UnloadDeviceModule(deviceObject as ImageCaptureObjectMBS)

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Unloads a device module.
Notes: The device module providing this object will be unloaded, if this is the last device object provided by the device module.
Lasterror is set.

99.29.91 Properties

99.29.92 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The error code from the last function used.
Notes: Value is 0 if the function was successful, -1 if the function is not available, one of the following values or a Mac OS error code:

Possible values:

kICACommunicationErr = -9900
kICADeviceNotFoundErr = -9901
kICADeviceNotOpenErr = -9902
kICAFileCorruptedErr = -9903
kICAIOPendingErr = -9904
kICAInvalidObjectErr = -9905
kICAInvalidPropertyErr = -9906

kICAIndexOutOfRangeErr = -9907
kICAPropertyTypeNotFoundErr = -9908
kICACannotYieldDevice = -9909
kICADataTypeNotFoundErr = -9910
kICADeviceMemoryAllocationErr = -9911
kICADeviceInternalErr = -9912
kICADeviceInvalidParamErr = -9913
kICADeviceAlreadyOpenErr = -9914
kICADeviceLocationIDNotFoundErr = -9915
kICADeviceGUIDNotFoundErr = -9916
kICADeviceIOServicePathNotFoundErr = -9917
kICADeviceUnsupportedErr = -9918
kICAFrameworkInternalErr = -9919
kICAExtensionInternalErr = -9920
kICAInvalidSessionErr = -9921
(Read and Write property)

99.29.93 Events

99.29.94 Notification(notificationType as string, notificationDictionary as dictionary)

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The event called for all events coming from Image Capture.
Notes: Use RegisterForEventNotification to register for events.

The Image Capture notification event will be called with a notificationDictionary that may contain one or more key-value pairs as defined below:

Key	Value Type	Comments
kICANotificationICAObjectKey	Number	An object associated with the notification.
kICANotificationDeviceICAObjectKey	Number	A device object associated with the notification.
kICANotificationClassKey	String	See below.
kICANotificationTypeKey	String	See below.
kICANotificationRawEventKey	Number	The unprocesssed event code sent by a device.
kICANotificationDataKey	Data String	Data associated with the event.
kICANotificationDataSizeKey	Number	Size of data associated with the event. This is used if the data is not sent with the notification. [Needed for backward compatiblity with pre-Leopard device modules] .
kICANotificationDataCookieKey	Number	A token identifying the data associated with this event. This data can be retrieved by calling SendMessage with messageType set to kICAMessageGetEventData, dataType set to value of kICANotificationDataCookieKeyand dataSize set to value of kICANotificationDataSizeKey.

The following keys are present if the value of kICANotificationDataKey represents image data. The values of these keys are Numbers representing the width, height, bytes per row, start row, and number of rows of

the image:

kICANotificationImageKey	Dictionary	A dictionary that describes an Image associated with the notification.
kICANotificationImageDataKey	Data String	Image data
kICANotificationImageWidthKey	Number	Image width in pixels
kICANotificationImageHeightKey	Number	Image height in pixels
kICANotificationImageBytesPerRowKey	Number	Bytes per row in image
kICANotificationImageStartRowKey	Number	Starting row number of the image.
kICANotificationImageNumberOfRowsKey	Number	Number of rows of image data sent in this notification.

99.30 class ImageCaptureObjectMBS

99.30.1 class ImageCaptureObjectMBS

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use ICDeviceMBS instead.
Function: An image capture object.
Blog Entries

- MBS Plugins updated for Xojo 2019r2
- MBS Xojo Plugins, version 19.3pr2

99.30.2 Methods

99.30.3 CloseSession

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Close a session on a camera device.
Notes: Lasterror is set.
For a scanner device use the ScannerCloseSession.

99.30.4 Constructor

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new image capture object.
See also:

- 99.30.5 Constructor(handle as Integer) 15712

99.30.5 Constructor(handle as Integer)

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new image capture object with the given handle.
See also:

- 99.30.4 Constructor 15712

99.30.6 CopyData(startByte as int64, requestedSize as int64) as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Get a copy of data associated with a file object.
Example:

```
Var o as ImageCaptureObjectMBS // your object pointing to an image file.

Var d2 as Dictionary = o.PropertyDictionary
Var size as Integer = d2.Value(o.kICAPropertyImageSize)

Var data as string = o.CopyData(0, size)

if lenb(data)>0 then
// you got the data, now process it.
end if
```

Notes: startByte: Starting byte offset of the data in the file object.
requestedSize: Requested data size in bytes.

If you want to get all bytes of an object, pass startByte = 0 and requestedSize = filesize.
Lasterror is set.

99.30.7 CopyThumbnail(format as string) as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Get a thumbnail associated with an object.
Notes: This is the recommended way to get the thumbnail of an object.

Use the constants for the format: kICAThumbnailFormatJPEG, kICAThumbnailFormatTIFF or kICAThumbnailFormatPNG
Lasterror is set.

99.30.8 DownloadFile(dir as folderitem, flags as Integer, MacType as string, MacCreator as string, angle as Double) as folderitem

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Downloads a file to disk.
Notes: This API is a convenient way to download a file to disk. To receive the image data in memory use CopyObjectData.

Constants for flags:

kDeleteAfterDownload	= 1	Delete file after a successful download.
kCreateCustomIcon	= 2	Create a custom icon for Finder.
kAddMetaDataToFinderComment	= 4	Add basic metadata to finder comment field.
kAdjustCreationDate	= 8	Set creation date of the downloaded file same as the creation date for the file as reported by the device.
kSetFileTypeAndCreator	= &h10	Set 4-char file type and creator code.
kEmbedColorSyncProfile	= &h20	Embed ColorSync profile to the image if one was not already embedded.
kRotateImage	= &h40	Rotate the image.
kDontEmbedColorSyncProfile	= &h80	Do not embed ColorSync profile to the image.

Lasterror is set.

99.30.9 ImportImage(flags as Integer) as string()

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: This method displays a Common User Interface panel similar to the user interface of Image Capture Application.
Notes: Use this method to allow the user to work a camera or a scanner.
The ImageCaptureObjectMBS object you use for this call, should point to a camera or scanner device.

filetypes: Optional an array of file extension strings such as "jpg", "tif", etc., that are of interest to the calling application. If no array is provided, all files are displayed.

Flag values that can be used in ImportImage:

kICAAllowMultipleImages	= 1	Use this constant to allow users to select multiple images in the Import Image dialog.
kICADownloadAndReturnPathArray	= 2	Use this constant to download the images to a temporary location and return an array of paths to the downloaded images.

Returns an array of Strings for the imported images if the kICADownloadAndReturnPathArray flag is not specified. Otherwise returns an array of Strings holding the paths of the images that are downloaded.
See also:

- 99.30.10 ImportImage(flags as Integer, filetypes() as string) as string() 15714

99.30.10 ImportImage(flags as Integer, filetypes() as string) as string()

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: This method displays a Common User Interface panel similar to the user interface of Image Capture Application.
Notes: Use this method to allow the user to work a camera or a scanner.
The ImageCaptureObjectMBS object you use for this call, should point to a camera or scanner device.

filetypes: Optional an array of file extension strings such as "jpg", "tif", etc., that are of interest to the calling application. If no array is provided, all files are displayed.

Flag values that can be used in ImportImage:

kICAAllowMultipleImages	= 1	Use this constant to allow users to select multiple images in the Import Image dialog.
kICADownloadAndReturnPathArray	= 2	Use this constant to download the images to a temporary location and return an array of paths to the downloaded images.

Returns an array of Strings for the imported images if the kICADownloadAndReturnPathArray flag is not specified. Otherwise returns an array of Strings holding the paths of the images that are downloaded.

- 99.30.9 ImportImage(flags as Integer) as string() 15714

99.30.11 kICABonjourServiceNameKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.12 kICABonjourServiceTypeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.13 kICABonjourTXTRecordKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.14 kICACreationDateStringKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.15 kICADataPropertyKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.16 kICADataSizeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.17 kICADataTypeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.18 kICADeviceCapabilitiesKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.19 kICADevicePropArtist as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.20 kICADevicePropBatteryLevel as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.21 kICADevicePropBurstInterval as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.22 kICADevicePropBurstNumber as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.23 kICADevicePropCaptureDelay as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.24 kICADevicePropCompressionSetting as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.25 kICADevicePropContrast as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.26 kICADevicePropCopyrightInfo as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.27 kICADevicePropDateTime as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.28 kICADevicePropDigitalZoom as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.29 kICADevicePropEffectMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.30 kICADevicePropExposureBiasCompensation as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.31 kICADevicePropExposureIndex as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.32 kICADevicePropExposureMeteringMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.33 kICADevicePropExposureProgramMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.34 kICADevicePropExposureTime as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.35 kICADevicePropFlashMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.36 kICADevicePropFNumber as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.37 kICADevicePropFocalLength as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.38 kICADevicePropFocusDistance as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.39 kICADevicePropFocusMeteringMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.40 kICADevicePropFocusMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.41 kICADevicePropFunctionalMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.42 kICADevicePropImageSize as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.43 kICADevicePropRGBGain as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.44 kICADevicePropSharpness as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.45 kICADevicePropStillCaptureMode as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.46 kICADevicePropTimelapseInterval as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.47 kICADevicePropTimelapseNumber as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.48 kICADevicePropUndefined as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.49 kICADevicePropUploadURL as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.50 kICADevicePropWhiteBalance as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the device properties.

99.30.51 kICADevicesArrayKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.
Example:

```
Var m as new ImageCaptureMBS
Var list as ImageCaptureObjectMBS = m.DeviceList

if List<>Nil then
// look into properties
Var dic as Dictionary = list.PropertyDictionary

// take the devices array there
if dic<>Nil and dic.HasKey(ImageCaptureObjectMBS.kICADevicesArrayKey) then
Var a(-1) as Variant = dic.Value(ImageCaptureObjectMBS.kICADevicesArrayKey)

// display device name
for each properties as Dictionary in a
MessageBox Properties.Value("ifil")
next
end if
end if
```

99.30.52 kICADeviceSharedKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.53 kICADeviceTypeCamera as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the device type constants.

99.30.54 kICADeviceTypeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.55 kICADeviceTypeScanner as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the device type constants.

99.30.56 kICADeviceUsedKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.57 kICADeviceWebSharedKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.58 kICAExecutableArchitectureKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.59 kICALockStatusKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.60 kICAMediaDurationInSecondsKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.61 kICAMediaHeightKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys for a device.
Notes: Value for this key in the dictionary is a number.

99.30.62 kICAMediaWidthKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys for a device.
Notes: Value for this key in the dictionary is a number.

99.30.63 kICAModificationDateStringKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.64 kICAObjectKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys for a device.

99.30.65 kICAObjectNameKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys for a device.

99.30.66 kICARawKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.67 kICARemoteDeviceKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.68 kICAThumbnailPropertyKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.69 kICAThumbnailSizeKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.70 kICAUSBProductIDKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys for a device.

99.30.71 kICAUSBVendorIDKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the property keys for a device.

99.30.72 kMetaDataDictionaryKey as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: One of the constants for the keys in the dictionaries.

99.30.73 OpenSession(device as ImageCaptureObjectMBS)

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Opens a session on a camera device.
Notes: Lasterror is set.
For a scanner device use the ScannerOpenSession method.

99.30.74 PropertyDictionary as dictionary

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Get a dictionary containing all the properties for an object specified.
Example:

```
Var m as new ImageCaptureMBS
Var list as ImageCaptureObjectMBS = m.DeviceList

if List<>Nil then
// look into properties
Var dic as Dictionary = list.PropertyDictionary

// take the devices array there
if dic<>Nil and dic.HasKey(ImageCaptureObjectMBS.kICADevicesArrayKey) then
Var a(-1) as Variant = dic.Value(ImageCaptureObjectMBS.kICADevicesArrayKey)

// display device name
for each properties as Dictionary in a
MessageBox Properties.Value("ifil")
next
end if
end if
```

Notes: Lasterror is set.

99.30.75 PropertyDictionaryText as string

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Get a dictionary containing all the properties for an object specified.
Example:

```
Var m as new ImageCaptureMBS
Var list as ImageCaptureObjectMBS = m.DeviceList

if List<>Nil then
MessageBox List.PropertyDictionaryText
end if
```

Notes: Lasterror is set.
This is for debugging and may be removed soon.
The format of the text is the plist file format.

99.30.76 ScannerCloseSession

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Closes a session on a scanner device.
Notes: Lasterror is set.
For a camera device use the CloseSession method.

99.30.77 ScannerGetParameters as dictionary

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Query scanner parameters.
Notes: Use this method to get information about the scanner such as resolution, scanning area, etc.
Lasterror is set.

99.30.78 ScannerInitialize

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Initializes a scanner device.
Notes: Lasterror is set.

99.30.79 ScannerOpenSession(device as ImageCaptureObjectMBS)

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Opens a session on a scanner device.
Notes: Lasterror is set.
For a camera device use the OpenSession method.

99.30.80 ScannerSetParameters(dic as dictionary)

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Configures a scanner.
Notes: Use this method to specify scan parameters that will be used when a scan is initiated via ScannerStart.
Lasterror is set.

99.30.81 ScannerStart

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Starts scanning.
Notes: Use this method to start a scan based on the parameters that were specified in a previous ScannerSetParameters call.
Lasterror is set.

99.30.82 ScannerStatus as Integer

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Returns the scanner status.
Notes: Lasterror is set.

99.30.83 SendMessageMemory(messageType as string, startByte as UInt32, data as memoryblock, dataType as string) as UInt32

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Sends a message to a device object.
Notes: Use this API to send a message to a device object. All devices do not respond to all the messages

defined above.

messageType: A message type. e.g., kICAMessageCameraCaptureNewImage.
startByte: Offset in dataPtr from where data access for read/write should occur.
data: The data to send.
dataType: Data type.

Lasterror is set.
Retruns the result from this message.

99.30.84 SendMessageString(messageType as string, startByte as UInt32, data as string, dataType as string) as UInt32

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Sends a message to a device object.
Notes: Use this API to send a message to a device object. All devices do not respond to all the messages defined above.

messageType: A message type. e.g., kICAMessageCameraCaptureNewImage.
startByte: Offset in dataPtr from where data access for read/write should occur.
data: The data to send.
dataType: Data type.

Lasterror is set.
Retruns the result from this message.

99.30.85 UploadFile(file as folderitem, flags as Integer)

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: Uploads a file to a device that supports this capability.
Notes: The device choses an appropriate destination location for the uploaded image and sends a kICANotificationTypeObjectAdded notification.
Lasterror is set.

Flag values that can be used in UploadFile:

kICAUploadFileAsIs	Use this constant to upload a file as is.
kICAUploadFileScaleToFit	Use this constant to upload a file after scaling to fit a specified bounding rect.

99.30.86 Properties

99.30.87 Handle as Integer

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The internal object handle.
Notes: (Read and Write property)

99.30.88 Lasterror as Integer

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The error code from the last function used.
Notes: Value is 0 if the function was successful, -1 if the function is not available, one of the following values or a Mac OS error code:

Possible values:

kICACommunicationErr = -9900
kICADeviceNotFoundErr = -9901
kICADeviceNotOpenErr = -9902
kICAFileCorruptedErr = -9903
kICAIOPendingErr = -9904
kICAInvalidObjectErr = -9905
kICAInvalidPropertyErr = -9906
kICAIndexOutOfRangeErr = -9907
kICAPropertyTypeNotFoundErr = -9908
kICACannotYieldDevice = -9909
kICADataTypeNotFoundErr = -9910
kICADeviceMemoryAllocationErr = -9911
kICADeviceInternalErr = -9912
kICADeviceInvalidParamErr = -9913
kICADeviceAlreadyOpenErr = -9914
kICADeviceLocationIDNotFoundErr = -9915
kICADeviceGUIDNotFoundErr = -9916
kICADeviceIOServicePathNotFoundErr = -9917
kICADeviceUnsupportedErr = -9918
kICAFrameworkInternalErr = -9919
kICAExtensionInternalErr = -9920

kICAInvalidSessionErr = -9921
(Read and Write property)

99.30.89 ScannerSessionHandle as Integer

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The internal handle for a scanner session.
Notes: Lasterror is set.
(Read and Write property)

99.30.90 SessionHandle as Integer

MBS MacOSX Plugin, Plugin Version: 10.1, Platform: macOS, Targets: Desktop only.

Function: The handle for the session.
Notes: (Read and Write property)

99.30.91 Constants

Constants

Constant	Value	Description
kAddMetaDataToFinderComment	4	One of the flag constants for DownloadFile. Add basic metadata to finder comment field.
kAdjustCreationDate	8	One of the flag constants for DownloadFile. Set creation date of the downloaded file same as the crea as reported by the device.
kCreateCustomIcon	2	One of the flag constants for DownloadFile. Create a custom icon for Finder.
kDeleteAfterDownload	1	One of the flag constants for DownloadFile. Delete file after a successful download.
kDontEmbedColorSyncProfile	&h80	One of the flag constants for DownloadFile. Do not embed ColorSync profile to the image.
kEmbedColorSyncProfile	&h20	One of the flag constants for DownloadFile. Embed ColorSync profile to the image if one was not alre
kICAAccessReadOnly	1	One of the constant values for kICAPropertyCameraAcce Read-only without object deletion.
kICAAccessReadOnlyWithObjectDeletion	2	One of the constant values for kICAPropertyCameraAcce Read-only with object deletion.
kICAAccessReadWrite	0	One of the constant values for kICAPropertyCameraAcce Read-write.
kICAAllowMultipleImages	1	One of the flag constants for ImportImage. Use this constant to allow users to select multiple images dialog. Seems like Image Capture in Mac OS X 10.6 ignores this fla images always.
kICAButtonCopy	”copy”	One of the constants for scanner buttons. Copy button.
kICAButtonEMail	”mail”	One of the constants for scanner buttons. Email button.
kICAButtonScan	”scan”	One of the constants for scanner buttons. Scan button.
kICAButtonWeb	”web ”	One of the constants for scanner buttons. Web button.
kICACameraPassThruNotUsed	2	One of the flag constants associated with Image Capture F Use this constant when using a pass-through command sending or receiving data.
kICACameraPassThruReceive	1	One of the flag constants associated with Image Capture F Use this constant when receiving data from a device using mand.
kICACameraPassThruSend	0	One of the flag constants associated with Image Capture F Use this constant when sending data to a device using a pas
kICACannotYieldDevice	-9909	One of the image capture specific error constants. The device module cannot yield the specified device to th
kICACapabilityCanCameraCaptureNewImage	”ccni”	One of the Camera capabilities constants. Can capture a new image using the camera.
kICACapabilityCanCameraDeleteAll	”dela”	One of the Camera capabilities constants. Can delete all images stored in the camera.
kICACapabilityCanCameraDeleteOne	”del1”	One of the Camera capabilities constants. Can delete one image stored in the camera.
kICACapabilityCanCameraSyncClock	”sclk”	One of the Camera capabilities constants. Can synchronize camera’s clock with the computer’s cloc
kICACapabilityCanCameraUploadData	”load”	One of the Camera capabilities constants. Can upload data to the camera.
kICACapabilityMayStoreNewImagesInTempStore	”temp”	One of the Camera capabilities constants.
kICACommunicationErr	-9900	One of the image capture specific error constants. An error occurred in communication between different c Capture framework.
kICADataTypeNotFoundErr	-9910	One of the image capture specific error constants. Data with the specified data type is not found.

99.31 class WIADataCallbackMBS

99.31.1 class WIADataCallbackMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides an application callback mechanism during data transfers from Windows Image Acquisition (WIA) hardware devices to applications.
Notes: Works on Windows 2000 Professional, Windows XP and Windows Server 2003.

99.31.2 Properties

99.31.3 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: (Read and Write property)

99.31.4 Events

99.31.5 BandedDataCallback(message as Integer, Status as Integer, PercentComplete as Integer, Offset as Integer, Length as Integer, Buffer as memoryblock) as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides data transfer status notifications.
Notes: Windows Image Acquisition (WIA) data transfer methods of the WiaDataTransfer interface periodically call this method.

Message: Specifies a constant that indicates the reason for the callback. Can be one of the kMessage* constants.
Status: Specifies a constant that indicates the status of the WIA device. Can be set to a combination of the kStatus* constants.
PercentComplete: Specifies the percentage of the total data that has been transferred so far.
Offset: Specifies an offset, in bytes, from the beginning of the buffer where the current band of data begins.
Length: Specifies the length, in bytes, of the current band of data.
Buffer: The data buffer.

Lasterror is set.

Your application must provide the BandedDataCallback event. This event is periodically invoked by the data transfer methods of the WiaDataTransferMBS interface. It provides status messages to the application during the data transfer. By returning false, your program can also use this method to prematurely terminate the data transfer.

When this method is invoked, the Message parameter will contain the reason for the call. Not all parameters will contain data on all calls. For example, when BandedDataCallback is invoked with a message of kMessageTermination, it should not attempt to use the values in the Buffer, Offset, and Length parameters.

If the value of Message is kMessageData, the buffer contains a band of image data. The Offset parameter contains an offset in bytes from the beginning of the buffer where the current band of data begins. The Length parameter specified the length in bytes of the current band of data.

During calls where Message is set to kMessageData or kMessageStatus, the Status parameter contains a valid value. Its contents should not be used when Message contains other values.

If Message is kMessageDataHeader, the Buffer parameter points to a WIA_DATA_CALLBACK_HEADER structure.

When an error has occurred during an image data transfer, the driver sets Message to IT_MSG_DEVICE_STATUS. The proxy callback object calls ReportStatus, which handles the error and displays messages to the user.

99.31.6 Constants

Constants

Constant	Value	Description
kMessageData	2	One of the constants for the message parameter in the BandedDataCallback callback. The WIA system is transferring data to the application.
kMessageDataHeader	1	One of the constants for the message parameter in the BandedDataCallback callback. The application is receiving a header prior to receiving the actual data.
kMessageFilePreviewData	6	One of the constants for the message parameter in the BandedDataCallback callback. The WIA system is transferring preview data to the application.
kMessageFilePreviewDataHeader	7	One of the constants for the message parameter in the BandedDataCallback callback. The application is receiving a header prior to receiving the actual preview data
kMessageNewPage	5	One of the constants for the message parameter in the BandedDataCallback callback. The data transfer is beginning a new page.
kMessageStatus	3	One of the constants for the message parameter in the BandedDataCallback callback. This invocation of the callback is sending only status information.
kMessageTermination	4	One of the constants for the message parameter in the BandedDataCallback callback. The data transfer is complete.
kStatusProcessingData	2	One of the constants for the status parameter in the BandedDataCallback callback. Data is currently being processed.
kStatusTransferFromDevice	1	One of the constants for the status parameter in the BandedDataCallback callback. Data is currently being transferred from the WIA device.
kStatusTransferToClient	4	One of the constants for the status parameter in the BandedDataCallback callback. Data is currently being transferred to the client's data buffer.

99.32 class WIADataTransferInfoMBS

99.32.1 class WIADataTransferInfoMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WIADataTransferInfoMBS class is used by applications to describe the buffer used to retrieve bands of data from Windows Image Acquisition (WIA) devices.
Notes: It is primarily used in conjunction with the methods of the IWiaDataTransfer interface.

99.32.2 Properties

99.32.3 BufferSize as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size in bytes of the buffer that is used for the data transfer.
Notes: (Read and Write property)

99.32.4 DoubleBuffer as Boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains true if the device is double buffered, false if the device is not double buffered.
Notes: (Read and Write property)

99.32.5 Section as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies an optional handle to a shared section of memory allocated by the application. If this member is set to nil, GetBandedData allocates the shared memory itself.
Notes: (Read and Write property)

99.32.6 Size as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains the size of this structure.
Notes: (Read and Write property)

99.33 class WIADataTransferMBS

99.33.1 class WIADataTransferMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WIADataTransferMBS interface is a high performance data transfer interface.
Notes: This interface supports a shared memory window to transfer data from the device object to the application, and eliminates unnecessary data copies during marshalling. A callback mechanism is provided in the form of the WiaDataCallbackMBS interface. It enables applications to obtain data transfer status notification, transfer data from the Windows Image Acquisition (WIA) device to the application, and cancel pending data transfers.

For Windows Vista applications, use IWiaTransfer instead of IWiaDataTransfer.

99.33.2 Methods

99.33.3 EnumerateFormatInfo as WIAFormatInfoEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns an enumerator for the format information.
Notes: Lasterror is set.

99.33.4 GetBandedData(DataTransInfo as WIADataTransferInfoMBS, DataCallback as WIADataCallbackMBS)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetBandedData method transfers a band of data from a hardware device to an application.
Notes: For efficiency, applications retrieve data from Windows Image Acquisition (WIA) hardware devices in successive bands.
Lasterror is set.

99.33.5 GetDataFile(DataCallback as WIADataCallbackMBS) as folderitem

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetData method retrieves complete files from a Windows Image Acquisition (WIA) device.
Notes: Lasterror is set.
Returns the folderitem for the new file. Copy or load the file as this temporary file is deleted as soon as the

object is destroyed.

99.33.6 GetDataPath(DataCallback as WIADataCallbackMBS) as string

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetData method retrieves complete files from a Windows Image Acquisition (WIA) device.
Notes: Lasterror is set.
Returns the folderitem for the new file. Copy or load the file as this temporary file is deleted as soon as the object is destroyed.

99.33.7 GetExtendedTransferInfo as WIAExtendedTransferInfoMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetExtendedTransferInfo retrieves extended information relating to data transfer buffers in the case of banded data transfers.
Notes: Applications typically use this method to retrieve driver recommended settings for minimum buffer size, maximum buffer size, and optimal buffer size for banded data transfers.

Lasterror is set.

99.33.8 QueryGetData as WIAFormatInfoMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The QueryGetData method is used by applications to query a Windows Image Acquisition (WIA) device to determine what types of data formats it supports.
Notes: Lasterror is set.

99.33.9 Properties

99.33.10 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: (Read and Write property)

99.33.11 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

99.34 class WIADeviceCapabilitiesEnumeratorMBS

99.34.1 class WIADeviceCapabilitiesEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WIADeviceCapabilitiesEnumeratorMBS class enumerates the currently available Windows Image Acquisition (WIA) hardware device capabilities.
Notes: Device capabilities include commands and events that the device supports.

99.34.2 Methods

99.34.3 Clone as WIADeviceCapabilitiesEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a copy of the WIADeviceCapabilitiesEnumeratorMBS object.
Notes: Lasterror is set.

99.34.4 Count as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the number of items in the enumeration.
Notes: Lasterror is set.

99.34.5 NextItem as WIADeviceCapabilitiesMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the next item in the enumeration.
Notes: Lasterror is set.

99.34.6 Reset

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resets the enumeration.
Notes: Lasterror is set.

99.34.7 Skip(celt as Integer)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Skips the given number of entries in the enumeration.
Notes: Lasterror is set.

99.34.8 Properties

99.34.9 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: (Read and Write property)

99.34.10 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

99.35 class WIADeviceCapabilitiesMBS

99.35.1 class WIADeviceCapabilitiesMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for device capabilities.

99.35.2 Properties

99.35.3 Commandline as String

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies a string that represents command line arguments.
Notes: (Read and Write property)

99.35.4 Description as String

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies a string that contains a description of the capability that is displayed to the user.
Notes: (Read and Write property)

99.35.5 Flags as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Flags for this capability
Notes: (Read and Write property)

99.35.6 GUID as String

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies a GUID that identifies the device capability.
Notes: This member can be set to any of the values specified in WIAItemMBS constants for Device Commands (kCommand*) or WIA Event Identifiers (kEvent*).
(Read and Write property)

99.35.7 Icon as String

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies a string that represents the location and resource ID of the icon that represents this capability or handler.
Notes: The string must be of the following form: drive:\path\module,n, where n is the icon's negated resource ID (that is, if the resource ID of the icon is 100, then n is -100).
(Read and Write property)

99.35.8 Name as String

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies a string that contains a short version of the capability name.
Notes: (Read and Write property)

99.36 class WIADeviceInfoEnumeratorMBS

99.36.1 class WIADeviceInfoEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WIADeviceInfoEnumeratorMBS class enumerates the currently available Windows Image Acquisition (WIA) hardware devices and their properties.
Notes: Device information properties describe the installation and configuration of WIA hardware devices.

99.36.2 Methods

99.36.3 Clone as WIADeviceInfoEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a copy of the enumerator.
Notes: Lasterror is set.

99.36.4 Count as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the number of items in the enumeration.
Notes: Lasterror is set.

99.36.5 NextItem as WIAPropertyStorageMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the next item in the enumeration.
Notes: Lasterror is set.

99.36.6 Reset

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resets the enumeration.
Notes: Lasterror is set.

99.36.7 Skip(celt as Integer)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Skips the given number of entries in the enumeration.
Notes: Lasterror is set.

99.36.8 Properties

99.36.9 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: (Read and Write property)

99.36.10 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

99.37 class WIADeviceManager1MBS

99.37.1 class WIADeviceManager1MBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WIADeviceManager1MBS interface is used to create and manage image acquisition devices and to register to receive device events.
Notes: WIA 1.x is available on Windows 2000 and newer
Blog Entries

- MBS REALbasic Plugins, version 10.3pr4

99.37.2 Methods

99.37.3 Constructor

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new WIA 1.0 manager object.
Example:

```
Var DeviceManager as new WIADeviceManager1MBS

if 0 = DeviceManager.Handle then
MessageBox "Failed to initialize device manager."
else
MessageBox "OK"
end if
```

99.37.4 CreateDevice(DeviceID as string) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a hierarchical tree of WiaItem objects for a Windows Image Acquisition device.
Notes: DeviceID: Specifies the unique identifier of the WIA device.

Lasterror is set.

Applications use the CreateDevice method to create a device object for the WIA devices specified by the DeviceID parameter.

Returns the WIAItemMBS object for the root item. Applications can use this tree of objects to control and retrieve data from the WIA device.

99.37.5 EnumDeviceInfo(flags as Integer = &h10) as WIADeviceInfoEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates an enumerator of property information for each available Windows Image Acquisition device.
Example:

```
// This example needs a window with ListBox1.
Var DeviceManager1 as new WIADeviceManager1MBS

// Enumerate all local devices
Var e as WIADeviceInfoEnumeratorMBS = DeviceManager1.EnumDeviceInfo(DeviceManager1.kEnumLocal)
if e<>Nil then

Var p as WIAPropertyStorageMBS = e.NextItem
while p<>Nil

// display the name of the device in a listbox
ListBox1.AddFolder p.Read(p.kDevicePropertyDevNameString)

p = e.NextItem
wend
end if
```

Notes: Flags: Specifies the types of WIA devices to enumerate. Should be set to kEnumLocal.
Lasterror is set.

99.37.6 GetImageDialog(parentWindow as DesktopWindow, DeviceType as integer, Flags as integer, Intent as integer, file as folderitem, rootitem as WIAItemMBS=nil)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The GetImageDialog method displays one or more dialog boxes that enable a user to acquire an

image from a Windows Image Acquisition (WIA) device and write the image to a specified file.
Notes: Lasterror is set.

This method combines the functionality of SelectDeviceDialog to completely encapsulate image acquisition within a single API call.

parentWindowHandle: Handle of the window that owns the Get Image dialog box.
DeviceType: Specifies which type of WIA device to use. Is set to kDeviceTypeDefault, kDeviceTypeScanner, or kDeviceTypeDigitalCamera.
Flags: Specifies dialog box behavior. Can be set to the following constants: kSelectDeviceNoDefault, kDeviceDialogUseCommonUI and kDeviceDialogSingleImage.
Intent: Specifies what type of data the image is intended to represent. Use kIntent* constants.
rootitem: Returns the interface of the hierarchical tree of WiaItem objects returned by CreateDevice.
file: Specifies the name of the file to which the image data is written.

Invoking this method displays a dialog box that enables users to acquire images. It can also display the Select Device dialog box created by the SelectDeviceDlg method.

If the application passes nil for the value of the rootitem parameter, GetImageDlg displays the Select Device dialog box that lets the user select the WIA input device. If the application specifies a WIA input device by passing a pointer to the device's item tree through the pItemRoot parameter, GetImageDlg does not display the Select Device dialog box. Instead, it will use the specified input device to acquire the image.

When using the Select Device dialog box, applications can specify types of WIA input devices. To do so, they must set the rootitem parameter to NULL and pass the appropriate constants through the DeviceType parameter. If more than one device of the specified type is present, the GetImageDlg displays the Select Device dialog box to let the user select which device will be used.

If GetImageDlg finds only one matching device, it will not display the Select Device dialog box. Instead, it will select the matching device. You can override this behavior and force GetImageDlg to display the Select Device dialog box by passing kSelectDeviceNoDefault as the value for the lFlags parameter.

It is recommended that applications make device and image selection available through a menu item named From scanner or camera on the File menu.

The dialog must have sufficient rights to the folder for file that it can save the file with a unique file name. The folder should also be protected with an access control list (ACL) because it contains user data.

99.37.7 GetImageDialog(parentWindow as window, DeviceType as Integer, Flags as Integer, Intent as Integer, file as folderitem, rootitem as WIAItemMBS=nil)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop only.

Function: The GetImageDialog method displays one or more dialog boxes that enable a user to acquire an image from a Windows Image Acquisition (WIA) device and write the image to a specified file.
Notes: Lasterror is set.

This method combines the functionality of SelectDeviceDialog to completely encapsulate image acquisition within a single API call.

parentWindowHandle: Handle of the window that owns the Get Image dialog box.
DeviceType: Specifies which type of WIA device to use. Is set to kDeviceTypeDefault, kDeviceTypeScanner, or kDeviceTypeDigitalCamera.
Flags: Specifies dialog box behavior. Can be set to the following constants: kSelectDeviceNoDefault, kDeviceDialogUseCommonUI and kDeviceDialogSingleImage.
Intent: Specifies what type of data the image is intended to represent. Use kIntent* constants.
rootitem: Returns the interface of the hierarchical tree of WiaItem objects returned by CreateDevice.
file: Specifies the name of the file to which the image data is written.

Invoking this method displays a dialog box that enables users to acquire images. It can also display the Select Device dialog box created by the SelectDeviceDlg method.

If the application passes nil for the value of the rootitem parameter, GetImageDlg displays the Select Device dialog box that lets the user select the WIA input device. If the application specifies a WIA input device by passing a pointer to the device's item tree through the pItemRoot parameter, GetImageDlg does not display the Select Device dialog box. Instead, it will use the specified input device to acquire the image.

When using the Select Device dialog box, applications can specify types of WIA input devices. To do so, they must set the rootitem parameter to NULL and pass the appropriate constants through the DeviceType parameter. If more than one device of the specified type is present, the GetImageDlg displays the Select Device dialog box to let the user select which device will be used.

If GetImageDlg finds only one matching device, it will not display the Select Device dialog box. Instead, it will select the matching device. You can override this behavior and force GetImageDlg to display the Select Device dialog box by passing kSelectDeviceNoDefault as the value for the lFlags parameter.

It is recommended that applications make device and image selection available through a menu item named From scanner or camera on the File menu.

The dialog must have sufficient rights to the folder for file that it can save the file with a unique file name. The folder should also be protected with an access control list (ACL) because it contains user data.

99.37.9 SelectDeviceDialog(parentWindow as DesktopWindow, DeviceType as integer, Flags as integer) as WIAItemMBS

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays a dialog box that enables the user to select a hardware device for image acquisition.
Notes: parentWindow: Specifies the parent window of the Select Device dialog box.
DeviceType: Specifies which type of WIA 2.0 device to use. See WIA Device Type Specifiers for a list of possible values.
Flags: Specifies the behavior of the dialog box. The value can be one of the following constants: kSelectDeviceNoDefault
DeviceID: Optional, On output, receives a string which contains the device's identifier string. On input, pass the address of a pointer if this information is needed, or "" if it is not needed.

Returns the WIAItem which was selected.
Lasterror is set.

This method creates and displays the Select Device dialog box so the user can select a WIA device for image acquisition. If a device is successfully selected, the SelectDeviceDialog method creates a hierarchical tree of IWiaItem2 objects for the device. It returns the WiaItemMBS object of the root item.

The application can restrict the devices displayed to the user to particular types by specifying the device types through the DeviceType parameter. If only one device meets the specification, SelectDeviceDialog does not display the Select Device dialog box. Instead it returns the WiaItemMBS tree for the device. You can override this behavior and force SelectDeviceDialog to display the dialog box by specifying kSelectDeviceNoDefault as the value for the Flags parameter. If more than one WIA device matches the specification, all matching devices are displayed in the Select Device dialog box so the user may choose one.

It is recommended that applications make device and image selection available through a menu item named From scanner on the File menu.

99.37.11 SelectDeviceDialog(parentWindow as window, DeviceType as Integer, Flags as Integer) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop only.

Function: Displays a dialog box that enables the user to select a hardware device for image acquisition.
Example:

```
Var DeviceManager as new WIADeviceManager1MBS

if 0 = DeviceManager.Handle then
MessageBox "Failed to initialize device manager."
else
Var it as WIAItemMBS = DeviceManager.SelectDeviceDialog(Window1, DeviceManager.kDeviceTypeDefault, DeviceManager.kSelectDeviceNoDefault)

if it<>Nil then
Var p as WIAPropertyStorageMBS = it.PropertyStorage
Var name as string = p.Read(p.kItemPropertyItemNameString)
MessageBox name
end if
end if
```

Notes: parentWindow: Specifies the parent window of the Select Device dialog box.
DeviceType: Specifies which type of WIA 2.0 device to use. See WIA Device Type Specifiers for a list of possible values.
Flags: Specifies the behavior of the dialog box. The value can be one of the following constants: kSelectDeviceNoDefault
DeviceID: Optional, On output, receives a string which contains the device's identifier string. On input, pass

the address of a pointer if this information is needed, or "" if it is not needed.

Returns the WIAItem which was selected.

Notes: The handle for WIA 1.x.
(Read and Write property)

99.37.20 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

99.37.21 Constants

Constants

Constant	Value	Description
kDeviceDialogSingleImage	2	One of the constants for the GetImageDialog method. Restrict image selection to a single image in the device image acquisition dialog box. Only for WIA 2.x.
kDeviceDialogUseCommonUI	4	One of the constants for the GetImageDialog method. Use the system UI, if available, rather than the vendor-supplied UI. If the system UI is not available, the vendor UI is used. If neither UI is available, the function returns E_NOTIMPL.
kDeviceTypeDefault	0	One of the device type constants.
kDeviceTypeDigitalCamera	2	One of the device type constants.
kDeviceTypeScanner	1	One of the device type constants.
kDeviceTypeStreamingVideo	3	One of the device type constants.
kEnumAll	15	One of the constants for EnumDeviceInfo flags parameter. All devices are enumerated, both locally and remote, including inactive (disconnected) devices and legacy STI-only devices.
kEnumLocal	16	One of the constants for EnumDeviceInfo flags parameter. Only locally connected active scanner devices are enumerated.
kIntentBestPreview	&h40000	One of the intent constants for GetImageDialog. Specifies the best quality preview.
kIntentImageTypeColor	1	One of the intent constants for GetImageDialog. Preset properties for color content.
kIntentImageTypeGrayscale	2	One of the intent constants for GetImageDialog. Preset properties for grayscale content.
kIntentImageTypeMask	&hF	One of the intent constants for GetImageDialog. Mask for all of the image type flags.
kIntentImageTypeText	4	One of the intent constants for GetImageDialog. Preset properties for text content.
kIntentMaximizeQuality	&h20000	One of the intent constants for GetImageDialog. Preset properties to maximize image quality.
kIntentMinimizeSize	&h10000	One of the intent constants for GetImageDialog. Preset properties to minimize image size.
kIntentNone	0	One of the intent constants for GetImageDialog. Default value. Do not preset any properties.
kIntentSizeMask	&hF0000	One of the intent constants for GetImageDialog. Mask for all of the size/quality flags.
kSelectDeviceNoDefault	1	One of the constants for the GetImageDialog method. Force this method to display the Select Device dialog box. Only for WIA 2.x.

99.38 class WIADeviceManager2MBS

99.38.1 class WIADeviceManager2MBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WIADeviceManager2MBS interface is used to create and manage image acquisition devices and to register to receive device events.
Example:

```
// let the user pick a scanner on Windows
Var manager As New WIADeviceManager2MBS
Var deviceID As String
Var item As WIAItemMBS = manager.SelectDeviceDialog(0, WIADeviceManager2MBS.kDeviceTypeScanner, 0, deviceID)
If item <>Nil Then
MessageBox "Selected scanner: " + deviceID
End If
```

Notes: WIA 2.x is available on Windows Vista and newer.

99.38.2 Methods

99.38.3 Constructor

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new WIA 2.0 manager object.
Example:

```
Var DeviceManager as new WIADeviceManager2MBS

if 0 = DeviceManager.Handle then
MessageBox "Failed to initialize device manager."
else
MessageBox "OK"
end if
```

99.38.4 CreateDevice(DeviceID as string) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a hierarchical tree of WiaItem objects for a Windows Image Acquisition device.
Notes: DeviceID: Specifies the unique identifier of the WIA device.

Lasterror is set.

Applications use the CreateDevice method to create a device object for the WIA devices specified by the DeviceID parameter.

Returns the WIAItemMBS object for the root item. Applications can use this tree of objects to control and retrieve data from the WIA device.

99.38.5 EnumDeviceInfo(flags as Integer = &h10) as WIADeviceInfoEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates an enumerator of property information for each available Windows Image Acquisition device.
Example:

```
// This example needs a window with ListBox1.
Var DeviceManager2 as new WIADeviceManager2MBS

// Enumerate all local devices
Var e as WIADeviceInfoEnumeratorMBS = DeviceManager2.EnumDeviceInfo(DeviceManager2.kEnumLo-
cal)
if e<>Nil then

Var p as WIAPropertyStorageMBS = e.NextItem
while p<>Nil

// display the name of the device in a listbox
ListBox1.AddFolder p.Read(p.kDevicePropertyDevNameString)

p = e.NextItem
wend
end if
```

Notes: Flags: Specifies the types of WIA devices to enumerate. Should be set to kEnumLocal or kEnumAll.
Lasterror is set.

99.38.6 GetImageDialog(Flags as integer, DeviceID as string, parentWindow as DesktopWindow, FolderName as String, Filename as String, byref item as WIAItemMBS) as string()

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The GetImageDialog method displays one or more dialog boxes that enable a user to acquire an image from a Windows Image Acquisition (WIA) 2.0 device and write the image to a specified file. This method extends the functionality of SelectDeviceDlg to encapsulate image acquisition within a single API call.
Notes: Lasterror is set.

Flags: Specifies dialog box behavior. Can be set to the following values: kDeviceDialogUseCommonUI
DeviceID: Specifies the scanner to use.
parentWindowHandle: A handle of the window that owns the Get Image dialog box.
FolderName: Specifies the name of the folder ito store the scanned files in.
Filename: Specifies the name of the file to write the image data to.
item: The variable to return the WiaItem that the images were scanned from.

Returns an array with paths to the files that have been scanned.

If the application passes an emapty string for the value of the DeviceID parameter, GetImageDialog displays the Select Device dialog box so that the user can select the WIA 2.0 input device.

Use a menu item named From scanner on the File menu so that device and image selections are available in your application.

The dialog box must have sufficient rights to FolderName so that it can save the files with unique file names. Protect the folder with an access control list (ACL) because it contains user data.

99.38.7 GetImageDialog(Flags as Integer, DeviceID as string, parentWindow as window, FolderName as String, Filename as String, byref item as WIAItemMBS) as string()

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop only.

Function: The GetImageDialog method displays one or more dialog boxes that enable a user to acquire an image from a Windows Image Acquisition (WIA) 2.0 device and write the image to a specified file. This method extends the functionality of SelectDeviceDlg to encapsulate image acquisition within a single API call.
Notes: Lasterror is set.

Flags: Specifies dialog box behavior. Can be set to the following values: kDeviceDialogUseCommonUI
DeviceID: Specifies the scanner to use.
parentWindowHandle: A handle of the window that owns the Get Image dialog box.
FolderName: Specifies the name of the folder ito store the scanned files in.
Filename: Specifies the name of the file to write the image data to.
item: The variable to return the WiaItem that the images were scanned from.

Returns an array with paths to the files that have been scanned.

If the application passes an emapty string for the value of the DeviceID parameter, GetImageDialog displays the Select Device dialog box so that the user can select the WIA 2.0 input device.

Use a menu item named From scanner on the File menu so that device and image selections are available in your application.

The dialog box must have sufficient rights to FolderName so that it can save the files with unique file names. Protect the folder with an access control list (ACL) because it contains user data.

99.38.8 GetImageDialog(Flags as Integer, DeviceID as string, parentWindowHandle as Integer, FolderName as String, Filename as String, byref item as WIAItemMBS) as string()

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetImageDialog method displays one or more dialog boxes that enable a user to acquire

an image from a Windows Image Acquisition (WIA) 2.0 device and write the image to a specified file. This method extends the functionality of SelectDeviceDlg to encapsulate image acquisition within a single API call.
Notes: Lasterror is set.

Flags: Specifies dialog box behavior. Can be set to the following values: kDeviceDialogUseCommonUI
DeviceID: Specifies the scanner to use.
parentWindowHandle: A handle of the window that owns the Get Image dialog box.
FolderName: Specifies the name of the folder ito store the scanned files in.
Filename: Specifies the name of the file to write the image data to.
item: The variable to return the WiaItem that the images were scanned from.

Returns an array with paths to the files that have been scanned.

If the application passes an empty string for the value of the DeviceID parameter, GetImageDialog displays the Select Device dialog box so that the user can select the WIA 2.0 input device.

Use a menu item named From scanner on the File menu so that device and image selections are available in your application.

The dialog box must have sufficient rights to FolderName so that it can save the files with unique file names. Protect the folder with an access control list (ACL) because it contains user data.

- 99.38.7 GetImageDialog(Flags as Integer, DeviceID as string, parentWindow as window, FolderName as String, Filename as String, byref item as WIAItemMBS) as string() 15765

99.38.9 SelectDeviceDialog(parentWindow as DesktopWindow, DeviceType as integer, Flags as integer) as WIAItemMBS

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays a dialog box that enables the user to select a hardware device for image acquisition.
Notes: parentWindow: Specifies the parent window of the Select Device dialog box.
DeviceType: Specifies which type of WIA 2.0 device to use. See WIA Device Type Specifiers for a list of possible values.
Flags: Specifies the behavior of the dialog box. The value can be one of the following constants: kSelectDeviceNoDefault
DeviceID: Optional, On output, receives a string which contains the device's identifier string. On input, pass the address of a pointer if this information is needed, or "" if it is not needed.

Returns the WIAItem which was selected.
Lasterror is set.

This method creates and displays the Select Device dialog box so the user can select a WIA device for image acquisition. If a device is successfully selected, the SelectDeviceDialog method creates a hierarchical tree of IWiaItem2 objects for the device. It returns the WiaItemMBS object of the root item.

The application can restrict the devices displayed to the user to particular types by specifying the device types through the DeviceType parameter. If only one device meets the specification, SelectDeviceDialog does not display the Select Device dialog box. Instead it returns the WiaItemMBS tree for the device. You can override this behavior and force SelectDeviceDialog to display the dialog box by specifying kSelectDeviceNoDefault as the value for the Flags parameter. If more than one WIA device matches the specification, all matching devices are displayed in the Select Device dialog box so the user may choose one.

It is recommended that applications make device and image selection available through a menu item named From scanner on the File menu.

99.38.10 SelectDeviceDialog(parentWindow as DesktopWindow, DeviceType as integer, Flags as integer, byref DeviceID as string) as WIAItemMBS

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays a dialog box that enables the user to select a hardware device for image acquisition.
Notes: parentWindow: Specifies the parent window of the Select Device dialog box.
DeviceType: Specifies which type of WIA 2.0 device to use. See WIA Device Type Specifiers for a list of possible values.
Flags: Specifies the behavior of the dialog box. The value can be one of the following constants: kSelectDeviceNoDefault
DeviceID: Optional, On output, receives a string which contains the device's identifier string. On input, pass the address of a pointer if this information is needed, or "" if it is not needed.

Returns the WIAItem which was selected.
Lasterror is set.

This method creates and displays the Select Device dialog box so the user can select a WIA device for image acquisition. If a device is successfully selected, the SelectDeviceDialog method creates a hierarchical tree of IWiaItem2 objects for the device. It returns the WiaItemMBS object of the root item.

99.38.11 SelectDeviceDialog(parentWindow as window, DeviceType as Integer, Flags as Integer) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop only.

Function: Displays a dialog box that enables the user to select a hardware device for image acquisition.
Example:

```
Var DeviceManager as new WIADeviceManager2MBS

if 0 = DeviceManager.Handle then
MessageBox "Failed to initialize device manager."
else
```

```
Var it as WIAItemMBS = DeviceManager.SelectDeviceDialog(Window1, DeviceManager.kDeviceTypeDefault, DeviceManager.kSelectDeviceNoDefault)

if it<>Nil then
Var p as WIAPropertyStorageMBS = it.PropertyStorage
Var name as string = p.Read(p.kItemPropertyItemNameString)
MessageBox name
end if
end if
```

Notes: parentWindow: Specifies the parent window of the Select Device dialog box.
DeviceType: Specifies which type of WIA 2.0 device to use. See WIA Device Type Specifiers for a list of possible values.
Flags: Specifies the behavior of the dialog box. The value can be one of the following constants: kSelectDeviceNoDefault

99.38.21 Constants

Constants

Constant	Value	Description
kDeviceDialogSingleImage	2	One of the constants for the GetImageDialog method. Restrict image selection to a single image in the device image acquisition dialog box. Only for WIA 2.x.
kDeviceDialogUseCommonUI	4	One of the constants for the GetImageDialog method. Use the system UI, if available, rather than the vendor-supplied UI. If the system UI is not available, the vendor UI is used. If neither UI is available, the function returns E_NOTIMPL.
kDeviceTypeDefault	0	One of the device type constants.
kDeviceTypeDigitalCamera	2	One of the device type constants.
kDeviceTypeScanner	1	One of the device type constants.
kDeviceTypeStreamingVideo	3	One of the device type constants.
kEnumAll	15	One of the constants for EnumDeviceInfo flags parameter. All devices are enumerated, both locally and remote, including inactive (disconnected) devices and legacy STI-only devices.
kEnumLocal	16	One of the constants for EnumDeviceInfo flags parameter. Only locally connected active scanner devices are enumerated.
kIntentBestPreview	&h40000	One of the intent constants for GetImageDialog. Specifies the best quality preview.
kIntentImageTypeColor	1	One of the intent constants for GetImageDialog. Preset properties for color content.
kIntentImageTypeGrayscale	2	One of the intent constants for GetImageDialog. Preset properties for grayscale content.
kIntentImageTypeMask	&hF	One of the intent constants for GetImageDialog. Mask for all of the image type flags.
kIntentImageTypeText	4	One of the intent constants for GetImageDialog. Preset properties for text content.
kIntentMaximizeQuality	&h20000	One of the intent constants for GetImageDialog. Preset properties to maximize image quality.
kIntentMinimizeSize	&h10000	One of the intent constants for GetImageDialog. Preset properties to minimize image size.
kIntentNone	0	One of the intent constants for GetImageDialog. Default value. Do not preset any properties.
kIntentSizeMask	&hF0000	One of the intent constants for GetImageDialog. Mask for all of the size/quality flags.
kSelectDeviceNoDefault	1	One of the constants for the GetImageDialog method. Force this method to display the Select Device dialog box.

99.39 class WIAExtendedTransferInfoMBS

99.39.1 class WIAExtendedTransferInfoMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WIAExtendedTransferInfoMBS class specifies extended transfer information for the GetExtendedTransferInfo method.
Notes: Requires Windows 2000 Professional, Windows XP or Windows Server 2003.

99.39.2 Properties

99.39.3 MaxBufferSize as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Driver-recommended maximum buffer size the application could request in a call to GetBandedData.
Notes: Going over this limit is not detrimental, however, the driver can simply not use the whole buffer and limit each band of data to this maximum size.
(Read and Write property)

99.39.4 MinBufferSize as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Minimum buffer size the application should request in a call to GetBandedData.
Notes: (Read and Write property)

99.39.5 NumBuffers as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: This value is not used and should be ignored.
Notes: (Read and Write property)

99.39.6 OptimalBufferSize as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Driver-recommended buffer size the application should request in a call to GetBandedData.
Notes: (Read and Write property)

99.39.7 Size as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Size of this structure.
Notes: (Read and Write property)

99.40 class WIAFormatInfoEnumeratorMBS

99.40.1 class WIAFormatInfoEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Use the WIAFormatInfoEnumeratorMBS class to enumerate the format and media type information for a device.

99.40.2 Methods

99.40.3 Clone as WIAFormatInfoEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Clones this enumerator.
Notes: Lasterror is set.

99.40.4 Count as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the number of elements stored by this enumerator.
Notes: Lasterror is set.

99.40.5 NextItem as WIAFormatInfoMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the next item in the enumeration.

99.40.6 Reset

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resets the enumerator.
Notes: Lasterror is set.

99.40.7 Skip(celt as Integer)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Skips the specified number of structures in the enumeration.
Notes: Lasterror is set.

99.40.8 Properties

99.40.9 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: (Read and Write property)

99.40.10 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

99.41 class WIAFormatInfoMBS

99.41.1 class WIAFormatInfoMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WIAFormatInfoMBS class specifies valid format and media type pairs for a device.
Notes: Requires Windows 2000 Professional, Windows XP or Windows Server 2003.

99.41.2 Properties

99.41.3 FormatID as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: GUID that identifies the format.
Notes: (Read and Write property)

99.41.4 Tymed as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The media type that corresponds to the guidFormatID member.
Notes: (Read and Write property)

99.42 class WIAGUIDMBS

99.42.1 class WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a Windows unique ID.
Example:

Var w as WIAGUIDMBS = WIAPropertyStorageMBS.kImageFormatTIFF

MessageBox w.DisplayString

Notes: If you need to validate a GUID or UUID, please check the IsGUID function in our FAQ.
Blog Entries

- MBS Xojo Plugins, version 18.0pr6
- MBS Plugins 11.1 Release notes

99.42.2 Methods

99.42.3 Constructor

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a GUID with only zeros.
Example:

Var g as new WIAGUIDMBS

MessageBox g.DisplayString

See also:

- 99.42.4 Constructor(value1 as Integer, value2 as Integer, value3 as Integer, value4 as Integer, value5 as Integer, value6 as Integer, value7 as Integer, value8 as Integer, value9 as Integer, value10 as Integer, value11 as Integer, value12 as Integer, value13 as Integer, value14 as Integer, value15 as Integer, value16 as Integer)

99.42.4 Constructor(value1 as Integer, value2 as Integer, value3 as Integer, value4 as Integer, value5 as Integer, value6 as Integer, value7 as Integer, value8 as Integer, value9 as Integer, value10 as Integer, value11 as Integer, value12 as Integer, value13 as Integer, value14 as Integer, value15 as Integer, value16 as Integer)

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new GUID with the given byte values.
Example:

```
Var g as new WIAGUIDMBS(&h14, &h3e, &h4e, &h83, &h64, &h97, &h11, &hd2, &ha2, &h31, &h00, &hc0, &h4f, &ha3, &h18, &h09)

MessageBox g.DisplayString
```

See also:

- 99.42.3 Constructor 15782

99.42.5 DisplayString as string

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ID well formatted.
Example:

```
Var w as WIAGUIDMBS = WIAPropertyStorageMBS.kImageFormatTIFF

MessageBox w.DisplayString
```

99.42.6 Equal(other as WIAGUIDMBS) as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Checks whether two GUIDs are equal.
Example:

```
Var w as WIAGUIDMBS = WIAPropertyStorageMBS.kImageFormatTIFF
Var v as WIAGUIDMBS = WIAPropertyStorageMBS.kImageFormatTIFF

if w.Equal(v) then
MessageBox "Equal, right."
else
MessageBox "not equal, a bug."
end if
```

```
v = WIAPropertyStorageMBS.kImageFormatBMP

if w.Equal(v) then
MessageBox "Equal, a bug."
else
MessageBox "not equal, right."
end if
```

Notes: Returns true if both items are equals.

99.42.7 Parse(GUID as String) as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 18.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Parses GUID string into a GUID object.

99.42.8 Properties

99.42.9 Byte(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Read or write the byte value.
Example:

```
Var g as new WIAGUIDMBS

g.Byte(1) = 65

MessageBox str(g.Byte(1)) // shows 65
```

Notes: (Read and Write computed property)

99.42.10 Data as string

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The UID as binary string.
Example:

```
Var w as WIAGUIDMBS = WIAPropertyStorageMBS.kImageFormatTIFF
```

MessageBox EncodeBase64(w.Data)

Notes: (Read and Write computed property)

99.43 class WIAItemEnumeratorMBS

99.43.1 class WIAItemEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WIAItemEnumeratorMBS class is used by applications to enumerate WiaItemMBS objects in the tree's current folder.
Example:

```
Sub EnumerateItems(root as WIAItemMBS)
Var e as WIAItemEnumeratorMBS = Root.EnumerateChildItems

if e<>Nil then
Var it as WIAItemMBS = e.NextItem

while it<>nil

// do something with item

it = e.NextItem
wend

end if
End Sub
```

Notes: The Windows Image Acquisition (WIA) run-time system represents every WIA hardware device to applications as a hierarchical tree of WiaItemMBS objects.

99.43.2 Methods

99.43.3 Clone as WIAItemEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates an additional instance of the WIAItemEnumeratorMBS object.
Notes: Lasterror is set.

99.43.4 Count as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the number of elements stored by this enumerator.
Notes: Lasterror is set.

99.43.5 NextItem as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the next item in the enumeration.
Example:

```
Sub EnumerateItems(root as WIAItemMBS)
Var e as WIAItemEnumeratorMBS = Root.EnumerateChildItems

if e<>Nil then
Var it as WIAItemMBS = e.NextItem

while it<>nil

// do something with item

it = e.NextItem
wend

end if
End Sub
```

Notes: Lasterror is set.

99.43.6 Reset

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resets the enumeration.
Notes: Lasterror is set.

99.43.7 Skip(celt as Integer)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Skips the specified number of items during an enumeration of available WiaItemMBS objects.
Notes: Lasterror is set.

99.43.8 Properties

99.43.9 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: The handle for WIA 1.x or 2.x.
(Read and Write property)

99.43.10 Handle1 as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: The handle for WIA 1.x.
(Read and Write property)

99.43.11 Handle2 as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: The handle for WIA 2.x.
(Read and Write property)

99.43.12 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

99.44 class WIAItemMBS

99.44.1 class WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for an item.
Notes: Each Windows Image Acquisition (WIA) hardware device is represented to an application as a hierarchical tree of WiaItem objects. The WiaItem interface provides applications with the ability to query devices to discover their capabilities. It also provides access to data transfer interfaces and item properties. In addition, the WiaItem interface provides methods to enable applications to control the device.

This class encapsulates transparently the system classes for WIA 1.x and 2.x.
Blog Entries

- MBS Plugins 10.3 Release Notes

- MBS REALbasic Plugins, version 10.3pr4

99.44.2 Methods

99.44.3 AnalyzeItem

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The AnalyzeItem method causes the Windows Image Acquisition (WIA) hardware device to acquire and try to detect what data types are present.
Notes: This method is used with scanners to detect what type of data is on a page. When an application calls this method, the WIA hardware device driver scans and analyzes the current page. For each data type it detects, it creates an WiaItem object to represent the region on the page the data occupies.

Image processing and OCR software can use this capability to detect graphics and text on a page. This method adds the regions it creates into the WIA device's WiaItem tree. The application can select the individual regions and use the standard data transfer methods to acquire data from them.

If necessary, applications can override the regions created by this method.

Works only on WIA 1.x.
Lasterror is set.

99.44.4 CreateChildItem(ItemFlags as Integer, CreationFlags as Integer, ItemName as string, FullItemName as string) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CreateChildItem method is used by applications to add WiaItem objects to the WiaItem tree of a device.
Notes: ItemFlags: Specifies the WIA item type.
CreationFlags: Specifies how to create the new item. Only for WIA 2.x. Can be 0 to set the default values for the properties of the child. Can be &H40000000 to copy the values of all Read/Write properties from the parent.
ItemName: Specifies the WIA item name, such as "Top". You can think of this parameter as being equivalent to a file name.
FullItemName: Specifies the full WIA item name. You can think of this parameter as equivalent to a full path to a file, such as "003\Root\Top". Only for WIA 1.x.

Lasterror is set.
Returns nil on any error and the new item object on success.

Some WIA hardware devices allow applications to create new items in the WiaItem tree that represents the device. Applications must test the devices to see if they support this capability. Use the EnumerateDeviceCapabilities function to enumerate the current device's capabilities.

If the device allows the creation of new items in the WiaItem tree, invoking CreateChildItem creates a new WiaItem that is a child of the current node.

99.44.5 DataTransfer as WIADataTransferMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a Data transfer object.
Notes: Lasterror is set.
Only for WIA 1.x.
Returns nil on any error.

99.44.6 DeleteItem

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes the current IWiaItem object from the object tree of the device.
Notes: Lasterror is set.
Available on both WIA 1.x and 2.x.

The Windows Image Acquisition (WIA) run-time system represents each WIA hardware device connected to the user's computer as a hierarchical tree of IWiaItem objects. A given WIA device may or may not allow applications to delete IWiaItem objects from its tree. Use the EnumerateDeviceCapabilities function to query the device for item deletion capability.

If the device supports item deletion in its WiaItem tree, invoke the DeleteItem method to remove the WiaItem object. Note that this method will only delete an object after all references to the object have been released.

99.44.7 DeviceCommand(command as WIAGUIDMBS) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Issues a command to a Windows Image Acquisition (WIA) hardware device.
Example:

```
Var targetItem as WIAItemMBS // your item
Var resultItem as WIAItemMBS
resultItem = targetItem.DeviceCommand(targetItem.kCommandTakePicture)
```

Notes: Command: Specifies the command to send to the WIA 2.0 device. See kCommand* constants.
Works with WIA 1.x and 2.x.

Applications use this method to send WIA commands to hardware devices.

When the application sends the kCommandTakePicture command to the device, the WIA run-time system creates the WiaItem object to represent the image. The DeviceCommand method returns this new WIAItemMBS object.

99.44.8 DeviceDialog(Flags as integer, Win as DesktopWindow, FolderName as string, Filename as string, paths() as string, items() as WIAItemMBS)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays a dialog box to the user to prepare for image acquisition.
Notes: Lasterror is set.
Only for WIA 2.x.

Flags: Specifies a set of flags that control the dialog box's operation. The value can be either 0 to represent the default behavior or any of the following flags: kDeviceDialogSingleImage, kDeviceDialogUseCommonUI and kSelectDeviceNoDefault
Win: A handle to the parent window.
FolderName: Specifies the folder name where the files are to be transferred.

Filename: Specifies the template file name.
paths: An array to be filled with the file paths.
items: An array to be filled with the wia item objects.

This method displays a dialog box to the user that an application uses to gather all the information required for image acquisition. It is also used to specify image scan properties such as brightness and contrast.

After this method returns, the application can use the WiaTransferMBS class to acquire the image.

- 99.44.13 DeviceDialog(WindowHandle as Integer, Flags as Integer, Intent as Integer) as WIAItemMBS() 15795

99.44.9 DeviceDialog(Flags as Integer, Win as window, FolderName as string, Filename as string, paths() as string, items() as WIAItemMBS)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop only.

Function: Displays a dialog box to the user to prepare for image acquisition.
Notes: Lasterror is set.
Only for WIA 2.x.

Flags: Specifies a set of flags that control the dialog box's operation. The value can be either 0 to represent the default behavior or any of the following flags: kDeviceDialogSingleImage, kDeviceDialogUseCommonUI and kSelectDeviceNoDefault
Win: A handle to the parent window.
FolderName: Specifies the folder name where the files are to be transferred.
Filename: Specifies the template file name.
paths: An array to be filled with the file paths.
items: An array to be filled with the wia item objects.

This method displays a dialog box to the user that an application uses to gather all the information required for image acquisition. It is also used to specify image scan properties such as brightness and contrast.

After this method returns, the application can use the WiaTransferMBS class to acquire the image.

99.44.10 DeviceDialog(Flags as Integer, WindowHandle as Integer, FolderName as string, Filename as string, paths() as string, items() as WIAItemMBS)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Displays a dialog box to the user to prepare for image acquisition.
Notes: Lasterror is set.
Only for WIA 2.x.

Flags: Specifies a set of flags that control the dialog box's operation. The value can be either 0 to represent the default behavior or any of the following flags: kDeviceDialogSingleImage, kDeviceDialogUseCommonUI and kSelectDeviceNoDefault
WindowHandle: A handle to the parent window.
FolderName: Specifies the folder name where the files are to be transferred.
Filename: Specifies the template file name.
paths: An array to be filled with the file paths.
items: An array to be filled with the wia item objects.

This method displays a dialog box to the user that an application uses to gather all the information required for image acquisition. It is also used to specify image scan properties such as brightness and contrast.

After this method returns, the application can use the WiaTransferMBS class to acquire the image.

99.44.11 DeviceDialog(Win as DesktopWindow, Flags as integer, Intent as integer) as WIAItemMBS()

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The DeviceDialog method is used by applications to display a dialog box to the user to prepare for image acquisition.
Notes: win: Handle of the parent window of the dialog box.
Flags: Specifies a set of flags that control the dialog box's operation. Can be set to any of the following values: kDeviceDialogUseCommonUI and kDeviceDialogSingleImage.
Intent: Specifies what type of data the image is intended to represent. For a list of image intent values, kIntent* constants.

Lasterror is set.
Only for WIA 1.x.

This method displays a dialog box to the user that an application uses to gather all the information required for image acquisition. For instance, this dialog box enables the user to select images to download from a camera. When using a scanner, it is also used to specify image scan properties such as brightness and contrast.

After this method returns, the application can use the WiaDataTransferMBS interface to acquire the image.

It is recommended that applications make device and image selection available through a menu item named From scanner or camera on the File menu.

99.44.12 DeviceDialog(Win as window, Flags as Integer, Intent as Integer) as WIAItemMBS()

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop only.

Function: The DeviceDialog method is used by applications to display a dialog box to the user to prepare for image acquisition.
Notes: win: Handle of the parent window of the dialog box.
Flags: Specifies a set of flags that control the dialog box's operation. Can be set to any of the following values: kDeviceDialogUseCommonUI and kDeviceDialogSingleImage.
Intent: Specifies what type of data the image is intended to represent. For a list of image intent values, kIntent* constants.

Lasterror is set.
Only for WIA 1.x.

This method displays a dialog box to the user that an application uses to gather all the information required for image acquisition. For instance, this dialog box enables the user to select images to download from a camera. When using a scanner, it is also used to specify image scan properties such as brightness and contrast.

After this method returns, the application can use the WiaDataTransferMBS interface to acquire the image.

It is recommended that applications make device and image selection available through a menu item named From scanner or camera on the File menu.

99.44.13 DeviceDialog(WindowHandle as Integer, Flags as Integer, Intent as Integer) as WIAItemMBS()

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DeviceDialog method is used by applications to display a dialog box to the user to prepare for image acquisition.
Notes: WindowHandle: Handle of the parent window of the dialog box.
Flags: Specifies a set of flags that control the dialog box's operation. Can be set to any of the following values: kDeviceDialogUseCommonUI and kDeviceDialogSingleImage.
Intent: Specifies what type of data the image is intended to represent. For a list of image intent values, kIntent* constants.

Lasterror is set.
Only for WIA 1.x.

This method displays a dialog box to the user that an application uses to gather all the information required for image acquisition. For instance, this dialog box enables the user to select images to download from a camera. When using a scanner, it is also used to specify image scan properties such as brightness and contrast.

After this method returns, the application can use the WiaDataTransferMBS interface to acquire the image.

It is recommended that applications make device and image selection available through a menu item named From scanner or camera on the File menu.

99.44.14 EnumerateChildItems(CategoryGUID as WIAGUIDMBS=nil) as WIAItemEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates and returns an enumerator object for non-empty folders in a WiaItem tree of a Windows Image Acquisition (WIA) device.
Example:

```
Sub EnumerateItems(root as WIAItemMBS)
Var e as WIAItemEnumeratorMBS = Root.EnumerateChildItems
```

```
if e<>Nil then
Var it as WIAItemMBS = e.NextItem

while it<>nil

// do something with item

it = e.NextItem
wend

end if
End Sub
```

Notes: Lasterror is set.
Works for WIA 1.x and WIA 2.x.

CategoryGUID: Specifies a category for which child nodes are enumerated. If nil, then all child nodes are enumerated. This parameter is only used on WIA 2.x.

The WIA run-time system represents each WIA hardware device as a hierarchical tree of WiaItem objects. The EnumerateChildItems method enables applications to enumerate child items in the current item. However, it can only be applied to items that are folders.

If the folder is not empty, it contains a subtree of WiaItem objects. The EnumerateChildItems method enumerates all of the items contained in the folder.

99.44.15 EnumerateDeviceCapabilities(Flags as Integer) as WIADeviceCapabilitiesEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates an enumerator that is used to ascertain the commands and events a Windows Image Acquisition (WIA) device supports.
Notes: Flags: Specifies a flag that selects the type of capabilities to enumerate. Can be a combination of kDeviceCommands and kDeviceEvents.

Works for both WIA 1.x and 2.x
Lasterror is set.

Use this method to create an enumerator object to obtain the set of commands and events that a WIA device supports. You can use the Flags parameter to specify which kinds of device capabilities to enumerate.

99.44.16 FindItemByName(name as string) as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Searches an item's tree of subitems using the name as the search key.
Notes: name: Specifies the name fo the item to search for.

Lasterror is set.
Works with WIA 1.x and 2.x.

This method searches the current item's tree of sub-items using the name as the search key. If FindItemByName finds the item specified by name, it retruns the WiaItem object.

99.44.17 ItemCategory as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets an item's category information.
Notes: Lasterror is set. Only for WIA 2.x.

Every WiaItemMBS object in the hierarchical tree of objects associated with a Windows Image Acquisition (WIA) 2.0 hardware device has a specific category. This method enables applications to identify the category of any item in a hierarchical tree of item objects in a device.

Requires Windows Vista or Windows Server 2008.

99.44.18 ItemType as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets an item's type information.
Example:

```
Var it as WIAItemMBS // your item
if BitwiseAnd(it.ItemType,it.kTypeFolder)=it.kTypeFolder or BitwiseAnd(it.ItemType, it.kTypeHasAttachments)=it.kTypeHasAttachments then
MessageBox "may have children."
else
MessageBox "no children."
```

end if

Notes: Works with WIA 1.x and 2.x.
Lasterror is set.

Every WiaItemMBS object in the hierarchical tree of objects associated with a Windows Image Acquisition (WIA) 2.0 hardware device has a specific data type. Item objects represent folders and files. Folders contain file objects. File objects contain data acquired by the device such as images and sounds. This method enables applications to identify the type of any item in a hierarchical tree of item objects in a device.

An item may have more than one type. For example, an item that represents an audio file will have the type attributes WiaItemTypeAudio bitwiseor WiaItemTypeFile.

99.44.19 kCategoryFeeder as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA IPA item category constants
Example:

MessageBox WIAItemMBS.kCategoryFeeder.DisplayString

99.44.20 kCategoryFeederBack as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA IPA item category constants
Example:

MessageBox WIAItemMBS.kCategoryFeederBack.DisplayString

99.44.21 kCategoryFeederFront as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA IPA item category constants
Example:

MessageBox WIAItemMBS.kCategoryFeederFront.DisplayString

99.44.22 kCategoryFilm as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA IPA item category constants
Example:

MessageBox WIAItemMBS.kCategoryFilm.DisplayString

99.44.23 kCategoryFinishedFile as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA IPA item category constants
Example:

MessageBox WIAItemMBS.kCategoryFinishedFile.DisplayString

99.44.24 kCategoryFlatbed as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA IPA item category constants
Example:

MessageBox WIAItemMBS.kCategoryFlatbed.DisplayString

99.44.25 kCategoryFolder as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA IPA item category constants
Example:

MessageBox WIAItemMBS.kCategoryFolder.DisplayString

99.44.26 kCategoryRoot as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA IPA item category constants
Example:

MessageBox WIAItemMBS.kCategoryRoot.DisplayString

99.44.27 kCommandChangeDocument as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA command constants.
Example:

MessageBox WIAItemMBS.kCommandChangeDocument.DisplayString

99.44.28 kCommandDeleteAllItems as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA command constants.
Example:

MessageBox WIAItemMBS.kCommandDeleteAllItems.DisplayString

99.44.29 kCommandDiagnostic as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA command constants.
Example:

MessageBox WIAItemMBS.kCommandDiagnostic.DisplayString

99.44.30 kCommandSynchronize as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA command constants.
Example:

MessageBox WIAItemMBS.kCommandSynchronize.DisplayString

99.44.31 kCommandTakePicture as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA command constants.

99.44.32 kCommandUnloadDocument as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA command constants.
Example:

MessageBox WIAItemMBS.kCommandUnloadDocument.DisplayString

99.44.33 ParentItem as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the parent item in the tree that represents a Windows Image Acquisition (WIA) 2.0 hardware device.
Notes: Works only in WIA 2.x. Lasterror is set.
Given any WiaItem object in the object tree of a WIA 2.0 hardware device, the application retrieves a pointer to the parent item by calling this function.

99.44.34 PropertyStorage as WIAPropertyStorageMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries properties for this item.
Example:

```
Sub ListProperties(it as WIAItemMBS, plist as listbox)
// enumerate properties into a given listbox

// clear list
PList.DeleteAllRows

// get properties
Var p as WIAPropertyStorageMBS = it.PropertyStorage
if p<>Nil then
Var e as WIAPropertyEnumeratorMBS = p.Enumerate

if e<>nil then
Var ps as WIAPropertyMBS = e.NextItem

while ps<>Nil
// read the property value
```

```
Var v as Variant = p.Read(ps)

// get some identifier string for the listbox, name or id
Var k as string = ps.Name
if len(k)=0 then
k = str(ps.ID)
end if

PList.AddRow k

if v.Type = v.TypeObject then
if v isa WIAGUIDMBS then
Var g as WIAGUIDMBS = v
PList.CellTextAt(PList.LastAddedRowIndex,1)=g.DisplayString
else
PList.CellTextAt(PList.LastAddedRowIndex,1)="? some object" // should never happen
end if
else
PList.CellTextAt(PList.LastAddedRowIndex,1)=v.StringValue
end if

ps = e.NextItem
wend

end if
end if
End Sub
```

Notes: Lasterror is set.
Returns nil on any error.

99.44.35 RootItem as WIAItemMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the root item of a tree of item objects used to represent a Windows Image Acquisition (WIA) hardware device.
Notes: Lasterror is set.
Works with WIA 1.x and 2.x.

Given any WiaItem object in the object tree of a WIA hardware device, the application retrieves a pointer to the root item by calling this function.

99.44.36 Transfer as WIATransferMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a transfer object for this item.
Notes: Only available on WIA 2.x.
Lasterror is set.
Returns nil on any error.

99.44.37 Properties

99.44.38 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: The handle for WIA 1.x or 2.x.
(Read and Write property)

99.44.39 Handle1 as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: The handle for WIA 1.x.
(Read and Write property)

99.44.40 Handle2 as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: The handle for WIA 2.x.
(Read and Write property)

99.44.41 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

99.44.42 Constants

Constants

Constant	Value	Description
kDeviceCommands	1	One of the flag constants for the EnumerateDeviceCapabilities function. Enumerate device commands.
kDeviceDialogSingleImage	2	One of the DeviceDialog and ImageDialog flag constants. Only allow one image to be selected
kDeviceDialogUseCommonUI	4	One of the DeviceDialog and ImageDialog flag constants. Give preference to the system-provided UI, if available.
kDeviceEvents	2	One of the flag constants for the EnumerateDeviceCapabilities function. Enumerate device events.
kIntentBestPreview	&h40000	One of the intent constants for GetImageDialog. Specifies the best quality preview.
kIntentImageTypeColor	1	One of the intent constants for GetImageDialog. Preset properties for color content.
kIntentImageTypeGrayscale	2	One of the intent constants for GetImageDialog. Preset properties for grayscale content.
kIntentImageTypeMask	&hF	One of the intent constants for GetImageDialog. Mask for all of the image type flags.
kIntentImageTypeText	4	One of the intent constants for GetImageDialog. Preset properties for text content.
kIntentMaximizeQuality	&h20000	One of the intent constants for GetImageDialog. Preset properties to maximize image quality.
kIntentMinimizeSize	&h10000	One of the intent constants for GetImageDialog. Preset properties to minimize image size.
kIntentNone	0	One of the intent constants for GetImageDialog. Default value. Do not preset any properties.
kIntentSizeMask	&hF0000	One of the intent constants for GetImageDialog. Mask for all of the size/quality flags.
kSelectDeviceNoDefault	1	One of the Select Device Dialog and Image Dialog flag constants.
kTypeAnalyze	&h00000010	One of the WIA item type constants.
kTypeAudio	&h00000020	One of the WIA item type constants.
kTypeBurst	&h00000800	One of the WIA item type constants.
kTypeDeleted	&h00000080	One of the WIA item type constants.
kTypeDevice	&h00000040	One of the WIA item type constants.
kTypeDisconnected	&h00000100	One of the WIA item type constants.
kTypeFile	&h00000002	One of the WIA item type constants.
kTypeFolder	&h00000004	One of the WIA item type constants.
kTypeFree	&h00000000	One of the WIA item type constants.
kTypeGenerated	&h00004000	One of the WIA item type constants.
kTypeHasAttachments	&h00008000	One of the WIA item type constants.
kTypeHPanorama	&h00000200	One of the WIA item type constants.
kTypeImage	&h00000001	One of the WIA item type constants.
kTypeRoot	&h00000008	One of the WIA item type constants.
kTypeStorage	&h00001000	One of the WIA item type constants.
kTypeTransfer	&h00002000	One of the WIA item type constants.
kTypeVideo	&h00010000	One of the WIA item type constants.
kTypeVPanorama	&h00000400	One of the WIA item type constants.

99.45 class WIAPropertyEnumeratorMBS

99.45.1 class WIAPropertyEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a property enumerator.
Example:

```
Sub ListProperties(it as WIAItemMBS, plist as listbox)
// enumerate properties into a given listbox

// clear list
PList.DeleteAllRows

// get properties
Var p as WIAPropertyStorageMBS = it.PropertyStorage
if p<>Nil then
Var e as WIAPropertyEnumeratorMBS = p.Enumerate

if e<>nil then
Var ps as WIAPropertyMBS = e.NextItem

while ps<>Nil
// read the property value
Var v as Variant = p.Read(ps)

// get some identifier string for the listbox, name or id
Var k as string = ps.Name
if len(k)=0 then
k = str(ps.ID)
end if

PList.AddRow k

if v.Type = v.TypeObject then
if v isa WIAGUIDMBS then
Var g as WIAGUIDMBS = v
PList.CellTextAt(PList.LastAddedRowIndex,1)=g.DisplayString
else
PList.CellTextAt(PList.LastAddedRowIndex,1)="? some object" // should never happen
end if
else
PList.CellTextAt(PList.LastAddedRowIndex,1)=v.StringValue
end if

ps = e.NextItem
wend
```

```
end if
end if
End Sub
```

99.45.2 Methods

99.45.3 Clone as WIAPropertyEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a copy of the enumerator.
Notes: Lasterror is set.

99.45.4 NextItem as WIAPropertyMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the next item.
Example:

```
Sub ListProperties(it as WIAItemMBS, plist as listbox)
// enumerate properties into a given listbox

// clear list
PList.DeleteAllRows

// get properties
Var p as WIAPropertyStorageMBS = it.PropertyStorage
if p<>Nil then
Var e as WIAPropertyEnumeratorMBS = p.Enumerate

if e<>nil then
Var ps as WIAPropertyMBS = e.NextItem

while ps<>Nil
// read the property value
Var v as Variant = p.Read(ps)

// get some identifier string for the listbox, name or id
Var k as string = ps.Name
if len(k)=0 then
k = str(ps.ID)
end if
```

```
PList.AddRow k

if v.Type = v.TypeObject then
if v isa WIAGUIDMBS then
Var g as WIAGUIDMBS = v
PList.CellTextAt(PList.LastAddedRowIndex,1)=g.DisplayString
else
PList.CellTextAt(PList.LastAddedRowIndex,1)="? some object" // should never happen
end if
else
PList.CellTextAt(PList.LastAddedRowIndex,1)=v.StringValue
end if

ps = e.NextItem
wend

end if
end if
End Sub
```

Notes: Lasterror is set.

99.45.5 Reset

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resets the enumerator.
Notes: Lasterror is set.

99.45.6 Skip(celt as Integer)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Skips the next items.
Notes: Lasterror is set.

99.45.7 Properties

99.45.8 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: (Read and Write property)

99.45.9 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

99.46 class WIAPropertyMBS

99.46.1 class WIAPropertyMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WIAPropertyMBS class contains data about a single property in a property set. This data is the property ID and type tag, and the optional string name that may be associated with the property.
Example:

```
Sub ListProperties(it as WIAItemMBS, plist as listbox)
// enumerate properties into a given listbox

// clear list
PList.DeleteAllRows

// get properties
Var p as WIAPropertyStorageMBS = it.PropertyStorage
if p<>Nil then
Var e as WIAPropertyEnumeratorMBS = p.Enumerate

if e<>nil then
Var ps as WIAPropertyMBS = e.NextItem

while ps<>Nil
// read the property value
Var v as Variant = p.Read(ps)

// get some identifier string for the listbox, name or id
Var k as string = ps.Name
if len(k)=0 then
k = str(ps.ID)
end if

PList.AddRow k

if v.Type = v.TypeObject then
if v isa WIAGUIDMBS then
Var g as WIAGUIDMBS = v
PList.CellTextAt(PList.LastAddedRowIndex,1)=g.DisplayString
else
PList.CellTextAt(PList.LastAddedRowIndex,1)="? some object" // should never happen
end if
else
PList.CellTextAt(PList.LastAddedRowIndex,1)=v.StringValue
end if

ps = e.NextItem
```

```
wend

end if
end if
End Sub
```

99.46.2 Properties

99.46.3 ID as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A 32-bit identifier that uniquely identifies the property within the property set.
Example:

```
Var ps as WIAPropertyMBS // your property

Var k as string = ps.Name
if len(k)=0 then
k = str(ps.ID)
end if

MessageBox k
```

Notes: All properties within property sets must have unique property identifiers.
(Read and Write property)

99.46.4 Name as String

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string that contains the optional string name associated with the property
Example:

```
Var ps as WIAPropertyMBS // your property

Var k as string = ps.Name
if len(k)=0 then
k = str(ps.ID)
end if

MessageBox k
```

Notes: (Read and Write property)

99.46.5 Type as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The property type.
Notes: (Read and Write property)

99.47 class WIAPropertyStorageMBS

99.47.1 class WIAPropertyStorageMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WIAPropertyStorageMBS class manages the persistent properties of a single property set.
Example:

```
Var DeviceManager as new WIADeviceManager1MBS

if 0 = DeviceManager.Handle then
MessageBox "Failed to initialize device manager."
else
Var it as WIAItemMBS = DeviceManager.SelectDeviceDialog(Window1, DeviceManager.kDeviceTypeDefault, DeviceManager.kSelectDeviceNoDefault)

if it<>Nil then
Var p as WIAPropertyStorageMBS = it.PropertyStorage
Var name as string = p.Read(p.kItemPropertyItemNameString)
MessageBox name
end if
end if
```

Notes: Persistent properties consist of information that can be stored persistently in a property set, such as the summary information associated with a file. This contrasts with run-time properties associated with Controls and Automation, which can be used to affect system behavior. Use the methods of the WIAPropertyStorageMBS interface to create or open a persistent property set. An instance of the WIAPropertyStorageMBS interface can manage zero or more WIAPropertyStorageMBS instances.

Each property within a property set is identified by a property identifier (ID), a integer value unique to that set. You can also assign a string name to a property through the WIAPropertyStorageMBS interface.

The automatic conversion to variant supports:
nil, integer, uint32, int64, uint64, single, double, boolean, string and WIAGUIDMBS.

The automatic conversion from variant supports:
integer, boolean, single, double, Int64, string and WIAGUIDMBS.

99.47.2 Methods

99.47.3 Commit(flags as Integer)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Saves changes made to a property storage object to the parent storage object.
Notes: See kCommit* flags for the flags parameter.
Lasterror is set.

99.47.4 Count as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the number of properties stored in the property storage.
Notes: Lasterror is set.

99.47.5 Delete(id as Integer)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes an item by ID.
Notes: Lasterror is set.
See also:

- 99.47.6 Delete(name as string) 15815

99.47.6 Delete(name as string)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes an item by name.
Notes: Lasterror is set.
See also:

- 99.47.5 Delete(id as Integer) 15815

99.47.7 DeletePropertyName(id as Integer)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes specified string names from the current property set.
Notes: Lasterror is set.

id: Property identifier for which string name are to be deleted.

For each property identifier in rgpropid, DeletePropertyName removes any corresponding name-to-property ID mapping. An attempt is silently ignored to delete the name of a property that either does not exist or does not currently have a string name associated with it. This method has no effect on the properties themselves.

99.47.8 Enumerate as WIAPropertyEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enumerates the properties on this property storage.
Notes: Returns nil on any error. Lasterror is set.

99.47.9 kAudioFormatAIFF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA audio format constants.
Example:

MessageBox WIAPropertyStorageMBS.kAudioFormatAIFF.DisplayString

99.47.10 kAudioFormatMP3 as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA audio format constants.
Example:

MessageBox WIAPropertyStorageMBS.kAudioFormatMP3.DisplayString

99.47.11 kAudioFormatWAV as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA audio format constants.
Example:

MessageBox WIAPropertyStorageMBS.kAudioFormatWAV.DisplayString

99.47.12 kAudioFormatWMA as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA audio format constants.
Example:

MessageBox WIAPropertyStorageMBS.kAudioFormatWMA.DisplayString

99.47.13 kImageFormatASF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA misc format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatASF.DisplayString

99.47.14 kImageFormatAVI as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA audio format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatAVI.DisplayString

99.47.15 kImageFormatBMP as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatBMP.DisplayString

99.47.16 kImageFormatCIFF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatCIFF.DisplayString

99.47.17 kImageFormatDPOF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA misc format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatDPOF.DisplayString

99.47.18 kImageFormatEMF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatEMF.DisplayString

99.47.19 kImageFormatExec as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA misc format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatExec.DisplayString

99.47.20 kImageFormatEXIF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatEXIF.DisplayString

99.47.21 kImageFormatFlashPix as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatFlashPix.DisplayString

99.47.22 kImageFormatGIF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatGIF.DisplayString

99.47.23 kImageFormatHTML as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA document format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatHTML.DisplayString

99.47.24 kImageFormatICO as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatICO.DisplayString

99.47.25 kImageFormatJPEG as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatJPEG.DisplayString

99.47.26 kImageFormatJPEG2K as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatJPEG2K.DisplayString

99.47.27 kImageFormatJPEG2KX as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatJPEG2KX.DisplayString

99.47.28 kImageFormatMemoryBMP as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatMemoryBMP.DisplayString

99.47.29 kImageFormatMPG as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA audio format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatMPG.DisplayString

99.47.30 kImageFormatPhotoCD as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatPhotoCD.DisplayString

99.47.31 kImageFormatPICT as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatPICT.DisplayString

99.47.32 kImageFormatPNG as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatPNG.DisplayString

99.47.33 kImageFormatRawRGB as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatRawRGB.DisplayString

99.47.34 kImageFormatRTF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA document format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatRTF.DisplayString

99.47.35 kImageFormatScript as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA misc format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatScript.DisplayString

99.47.36 kImageFormatTIFF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatTIFF.DisplayString

99.47.37 kImageFormatTXT as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA document format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatTXT.DisplayString

99.47.38 kImageFormatUndefined as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatUndefined.DisplayString

99.47.39 kImageFormatUnicode16 as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA misc format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatUnicode16.DisplayString

99.47.40 kImageFormatWMF as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA image format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatWMF.DisplayString

99.47.41 kImageFormatXML as WIAGUIDMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: One of the WIA document format constants.
Example:

MessageBox WIAPropertyStorageMBS.kImageFormatXML.DisplayString

99.47.42 Read(id as Integer) as Variant

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads a property by id.
Notes: Lasterror is set.
See also:

- 99.47.43 Read(name as string) as Variant 15823
- 99.47.44 Read(p as WIAPropertyMBS) as Variant 15824

99.47.43 Read(name as string) as Variant

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads a property by name.
Example:

```
Var DeviceManager as new WIADeviceManager1MBS

if 0 = DeviceManager.Handle then
MessageBox "Failed to initialize device manager."
else
```

```
Var it as WIAItemMBS = DeviceManager.SelectDeviceDialog(Window1, DeviceManager.kDeviceTypeDefault, DeviceManager.kSelectDeviceNoDefault)

if it<>Nil then
Var p as WIAPropertyStorageMBS = it.PropertyStorage
Var name as string = p.Read(p.kItemPropertyItemNameString)
MessageBox name
end if
end if
```

Notes: Lasterror is set.
See also:

- 99.47.42 Read(id as Integer) as Variant 15823
- 99.47.44 Read(p as WIAPropertyMBS) as Variant 15824

99.47.44 Read(p as WIAPropertyMBS) as Variant

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads a property by a property specification.
Notes: Lasterror is set.
See also:

- 99.47.42 Read(id as Integer) as Variant 15823
- 99.47.43 Read(name as string) as Variant 15823

99.47.45 ReadPropertyName(id as Integer) as string

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves any existing string name for the specified property ID.
Notes: Lasterror is set.

99.47.46 Revert

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Revert method discards all changes to the named property set since it was last opened or discards changes that were last committed to the property set.
Notes: This method has no effect on a direct-mode property set.
Lasterror is set.

99.47.47 Write(id as Integer, value as Variant)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes a property by id.
Notes: Lasterror is set.
See also:

- 99.47.48 Write(name as string, value as Variant, id as Integer = 0) 15825
- 99.47.49 Write(p as WIAPropertyMBS, value as Variant) 15825

99.47.48 Write(name as string, value as Variant, id as Integer = 0)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes a property by name with optional id.
Example:

```
Var it As WIAItemMBS // points to Flatbed scanner
Var p as WIAPropertyStorageMBS = it.PropertyStorage

p.Write(p.kScannerItemPropertyXresString, 300)
p.Write(p.kScannerItemPropertyYresString, 300)
```

Notes: Lasterror is set.
See also:

- 99.47.47 Write(id as Integer, value as Variant) 15825
- 99.47.49 Write(p as WIAPropertyMBS, value as Variant) 15825

99.47.49 Write(p as WIAPropertyMBS, value as Variant)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes a property by property specification.
Notes: Lasterror is set.
See also:

- 99.47.47 Write(id as Integer, value as Variant) 15825
- 99.47.48 Write(name as string, value as Variant, id as Integer = 0) 15825

99.47.50 WritePropertyName(id as Integer, name as string)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Assigns string names to a specified array of property IDs in the current property set.
Notes: id: the property ID for which name is to be set.
name: The new name to be assigned to the corresponding property ID in the id parameter. This name may not exceed 255 characters.

Lasterror is set.

99.47.51 Properties

99.47.52 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: (Read and Write property)

99.47.53 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

99.48 class WIAStreamMBS

99.48.1 class WIAStreamMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WIAStreamMBS interface lets you read and write data to stream objects.
Example:

```
Var ItemName as string = "Hello.jpg"
Var f as FolderItem = SpecialFolder.Desktop.Child(ItemName)
Var s as new WIAStreamMBS(WIAStreamMBS.kModeWrite + WIAStreamMBS.kModeCreate, f)
```

Notes: Stream objects contain the data in a structured storage object, where storages provide the structure. Simple data can be written directly to a stream but, most frequently, streams are elements nested within a storage object. They are similar to standard files.

99.48.2 Methods

99.48.3 Clone as WIAStreamMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Clone method creates a new stream object with its own seek pointer that references the same bytes as the original stream.
Notes: The Clone method creates a new stream object for accessing the same bytes but using a separate seek pointer. The new stream object sees the same data as the source-stream object. Changes written to one object are immediately visible in the other. Range locking is shared between the stream objects.

The initial setting of the seek pointer in the cloned stream instance is the same as the current setting of the seek pointer in the original stream at the time of the clone operation.

Lasterror is set.

99.48.4 Commit(flags as Integer)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Commit method ensures that any changes made to a stream object open in transacted mode are reflected in the parent storage.
Notes: If the stream object is open in direct mode, Commit has no effect other than flushing all memory buffers to the next-level storage object. The COM compound file implementation of streams does not support opening streams in transacted mode.

Lasterror is set.

Possible flags: kCommitConsolidate, kCommitDangerouslyCommitMerelyToDiskCache, kCommitDefault, kCommitOnlyIfCurrent and kCommitOverwrite.

99.48.5 Constructor(mode as Integer, file as folderitem)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens or creates a file and retrieves a stream to read or write to that file.
Example:

```
Var ItemName as string = "Hello.jpg"
Var f as FolderItem = SpecialFolder.Desktop.Child(ItemName)
Var s as new WIAStreamMBS(WIAStreamMBS.kModeWrite + WIAStreamMBS.kModeCreate, f)
```

Notes: mode: the flags. Use the kMode* constants.
path: the file path.

Lasterror is set.
See also:

- 99.48.6 Constructor(mode as Integer, path as string) 15829

99.48.6 Constructor(mode as Integer, path as string)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens or creates a file and retrieves a stream to read or write to that file.
Notes: mode: the flags. Use the kMode* constants.
path: the file path.

Lasterror is set.
See also:

- 99.48.5 Constructor(mode as Integer, file as folderitem) 15829

99.48.7 CopyTo(other as WIAStreamMBS, length as UInt64)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CopyTo method copies a specified number of bytes from the current seek pointer in the stream to the current seek pointer in another stream.

Notes: other: The destination stream. The stream pointed to by pstm can be a new stream or a clone of the source stream.
length: The number of bytes to copy from the source stream.
ReadSize: Optional, a variable where the actual number of bytes read from the source.
WriteSize: Optional, a variable where the actual number of bytes written to the destination.

Lasterror is set.

The CopyTo method copies the specified bytes from one stream to another. It can also be used to copy a stream to itself. The seek pointer in each stream instance is adjusted for the number of bytes read or written. This method is equivalent to reading cb bytes into memory using Read and then immediately writing them to the destination stream using Write, although CopyTo will be more efficient.

The destination stream can be a clone of the source stream created by calling the Clone method.

If CopyTo returns an error, you cannot assume that the seek pointers are valid for either the source or destination. Additionally, the values of pcbRead and pcbWritten are not meaningful even though they are returned.

If CopyTo returns successfully, the actual number of bytes read and written are the same.

To copy the remainder of the source from the current seek pointer, specify the maximum large integer value for the cb parameter. If the seek pointer is the beginning of the stream, this operation copies the entire stream.
See also:

- 99.48.8 CopyTo(other as WIAStreamMBS, length as UInt64, byref ReadSize as UInt64, byref WriteSize as UInt64) 15830

99.48.8 CopyTo(other as WIAStreamMBS, length as UInt64, byref ReadSize as UInt64, byref WriteSize as UInt64)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CopyTo method copies a specified number of bytes from the current seek pointer in the stream to the current seek pointer in another stream.
Notes: other: The destination stream. The stream pointed to by pstm can be a new stream or a clone of the source stream.
length: The number of bytes to copy from the source stream.
ReadSize: Optional, a variable where the actual number of bytes read from the source.
WriteSize: Optional, a variable where the actual number of bytes written to the destination.

Lasterror is set.

The CopyTo method copies the specified bytes from one stream to another. It can also be used to copy a stream to itself. The seek pointer in each stream instance is adjusted for the number of bytes read or written. This method is equivalent to reading cb bytes into memory using Read and then immediately writing them to the destination stream using Write, although CopyTo will be more efficient.

The destination stream can be a clone of the source stream created by calling the Clone method.

If CopyTo returns an error, you cannot assume that the seek pointers are valid for either the source or destination. Additionally, the values of pcbRead and pcbWritten are not meaningful even though they are returned.

If CopyTo returns successfully, the actual number of bytes read and written are the same.

To copy the remainder of the source from the current seek pointer, specify the maximum large integer value for the cb parameter. If the seek pointer is the beginning of the stream, this operation copies the entire stream.
See also:

- 99.48.7 CopyTo(other as WIAStreamMBS, length as UInt64) 15829

99.48.9 Revert

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Revert method discards all changes that have been made to a transacted stream since the last Commit call.
Notes: On streams open in direct mode and streams using the COM compound file implementation of Revert, this method has no effect.
Lasterror is set.

99.48.10 Seek(value as Int64, Origin as Integer) as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Seek method changes the seek pointer to a new location.
Notes: The new location is relative to either the beginning of the stream, the end of the stream, or the current seek pointer.

value: The displacement to be added to the location indicated by the dwOrigin parameter. If dwOrigin is kSeekSet, this is interpreted as an unsigned value rather than a signed value.

Origin: The origin for the displacement specified in value. The origin can be the beginning of the file (kSeekSet), the current seek pointer (kSeekCur), or the end of the file (kSeekEnd). For more information about

values, see the kSeek* constants.

Retruns the new seek pointer from the beginning of the stream.

Seek changes the seek pointer so that subsequent read and write operations can be performed at a different location in the stream object. It is an error to seek before the beginning of the stream. It is not, however, an error to seek past the end of the stream. Seeking past the end of the stream is useful for subsequent write operations, as the stream byte range will be extended to the new seek position immediately before the write is complete.

You can also use this method to obtain the current value of the seek pointer by calling this method with the Origin parameter set to kSeekCur and the value parameter set to 0 so that the seek pointer is not changed. The current seek pointer is returned.

Lasterror is set.

99.48.11 SetSize(size as UInt64)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The SetSize method changes the size of the stream object.
Notes: SetSize changes the size of the stream object. Call this method to preallocate space for the stream. If the size parameter is larger than the current stream size, the stream is extended to the indicated size by filling the intervening space with bytes of undefined value. This operation is similar to the Write method if the seek pointer is past the current end of stream.

If the size parameter is smaller than the current stream, the stream is truncated to the indicated size.

The seek pointer is not affected by the change in stream size.

Calling SetSize can be an effective way to obtain a large chunk of contiguous space.

Lasterror is set.

99.48.12 Properties

99.48.13 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: (Read and Write property)

99.48.14 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

99.48.15 Constants

Constants

Constant	Value	Description
kCommitConsolidate	8	One of the flags for commit. Windows 2000 and Windows XP: Indicates that a stor dated after it is committed, resulting in a smaller file on only on the outermost storage object that has been open It is not valid for streams. The kCommitConsolidate flag any other kCommit* flags.
kCommitDangerouslyCommitMerelyToDiskCache	4	One of the flags for commit. Commits the changes to a write-behind disk cache, but d to the disk. In a write-behind disk cache, the operati actually writes to a disk cache, thus increasing perfor eventually written to the disk, but usually not until aft has already returned. The performance increase comes increased risk of losing data if a problem occurs before the data in the cache is lost. If you do not specify this value, then committing chang objects is robust even if a disk cache is used. The two- ensures that data is stored on the disk and not just to t
kCommitDefault	0	One of the flags for commit. You can specify this condition with kCommitConsolidate of the other three flags in this list of elements. Use thi readability of code.
kCommitOnlyIfCurrent	2	One of the flags for commit. Prevents multiple users of a storage object from ove changes. The commit operation occurs only if there to the saved storage object because the user most rece the saved version of the storage object is the same ver been editing. If other users have changed the storage o eration fails and returns the STG_E_NOTCURRENT behavior, call the Commit method again using the kCo
kCommitOverwrite	1	One of the flags for commit. The commit operation can overwrite existing data to r quirements. This value is not recommended for typic not as robust as the default value. In this case, it is p operation to fail after the old data is overwritten, but completely committed. Then, neither the old version n the storage object will be intact. You can use this value in the following cases: * The user is willing to risk losing the data. * The low-memory save sequence will be used to safely s to a smaller file. * A previous commit returned STG_E_MEDIUMFULL existing data would provide enough space to commit o object. Be aware that the commit operation verifies that adequ any overwriting occurs. Thus, even with this value sp operation fails due to space requirements, the old data however, for data loss to occur with the kCommitOver the commit operation fails for any reason other than lac
kModeConvert	&h20000	One of the mode constants for the file stream. Creates the new object while preserving existing data in tents". In the case of a storage object or a byte array, th into a stream regardless of whether the existing file or by tains a layered storage object. This flag can only be use storage object. It cannot be used within a storage objec ateStream. It is also not valid to use this flag and the k flag simultaneously.
kModeCreate	&h1000	One of the mode constants for the file stream. Undicates that an existing storage object or stream sho

99.49 class WIATransferCallbackMBS

99.49.1 class WIATransferCallbackMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for transfering data from the device into your application.
Notes: This class is only used for WIA 2.x.

99.49.2 Properties

99.49.3 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: (Read and Write property)

99.49.4 Events

99.49.5 GetNextStream(ItemName as string, FullItemName as string) as WIAStreamMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a new stream for the specified item.
Notes: ItemName: Specifies the name of the item to create stream for.
FullItemName: Specifies the full name of the item to create stream for.

Returns a new WIAStreamMBS object or nil for an error.

When this method is implemented by an image processing filter, the Windows Image Acquisition (WIA) 2.0 minidriver calls it during image acquisition to get the destination stream from the client.

A filter's WIATransferCallbackMBS.GetNextStream must delegate to the application's callback method. The filter uses the stream returned by the application callback's WIATransferCallbackMBS.GetNextStream implementation to create its own stream that it passes back to the WIA 2.0 service. The filtering is done when the filter's stream calls the IStream::Write method.

The filter's stream cannot make any assumptions on the number of bytes that are written to it on each write, since the unfiltered image data may come from the WIA 2.0 Preview Component rather than the driver.

The WIA 2.0 Preview Component always writes the whole unfiltered image data into the filter's stream only once, which means that the filter's stream has one source writing into it. If both the driver and the preview component write into the filter's stream, the filter's stream cannot assume, for example, that it will receive the full header the first time IStream::Write is called although its corresponding driver always writes the header data first in one write. Nor can it assume that a subsequent write contains exactly one scan line. So the filtering stream may have to count the number of bytes written to it to determine, for example, where the image data starts.

The image processing filter's WIATransferCallbackMBS.GetNextStream implementation should read the properties needed for its image processing from the item for which the image is being acquired. The filter does not read the properties directly from the pWiaItem2 passed into InitializeFilter. Instead the filter must call FindItemByName on this WIA 2.0 item to obtain the actual WIA 2.0 item. The reason for this is that the image being acquired may actually be a child item of pWiaItem2. For example, during a folder acquisition the filter uses pWiaItem2 to obtain pWiaItem2's child items in WIATransferCallbackMBS.GetNextStream (during a folder acquisition the driver returns the images represented by the child items of WiaItemMBS). The same is true when the WIA 2.0 Preview Component calls into the image processing filter passing a child WIA 2.0 item.

99.49.6 TransferCallback(w as WIATransferParamsMBS) as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides progress and other notifications during a transfer.
Notes: Returns an error value or zero on success.

99.50 class WIATransferMBS

99.50.1 class WIATransferMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WIATransferMBS class provides stream-based transfer of data.
Notes: This class is for WIA 2.x.

99.50.2 Methods

99.50.3 Cancel

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Cancels the current transfer operation.
Notes: Lasterror is set.

99.50.4 Download(TransferCallback as WIATransferCallbackMBS)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Initiates a data download to the caller.
Notes: TransferCallback: The WIATransferCallbackMBS object to receive progress details and specify the destination.

If a folder is downloaded, then all the child items of that folder are also transferred. Each item is transferred in a separate stream.

Lasterror is set.

99.50.5 EnumerateFormatInfo as WIAFormatInfoEnumeratorMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates an enumerator for the transfer formats that the Windows Image Acquisition (WIA) 2.0 device supports.
Notes: Lasterror is set.

99.50.6 Upload(Source as WIAStreamMBS, TransferCallback as WIATransferCallbackMBS)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Initiates a data upload of a single item from the caller.
Notes: Source: Specifies a pointer to the Stream data.
TransferCallback: Specifies a pointer to the caller's WIATransferCallbackMBS interface.

Lasterror is set.

99.50.7 Properties

99.50.8 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: (Read and Write property)

99.50.9 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

99.51 class WIATransferParamsMBS

99.51.1 class WIATransferParamsMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class you subclass to get progress of the image transfer.
Notes: The WiaTransferParams is transmitted to an application during a data transfer by the Windows Image Acquisition (WIA) run-time system to the WiaTransferCallbackMBS.TransferCallback method.

99.51.2 Properties

99.51.3 ErrorStatus as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The status, or error state, of the device set by the driver; for example, "warming up".
Notes: (Read and Write property)

99.51.4 Message as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the status of the data transfer.
Notes: See the kMessage* constants
(Read and Write property)

99.51.5 PercentComplete as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the progress of the data transfer as a percentage.
Example:

```
Var w as WIATransferParamsMBS // your parameters
ProgressBar1.maximum = 100
ProgressBar1.value = w.PercentComplete
```

Notes: (Read and Write property)

99.51.6 TransferredBytes as UInt64

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the amount of data transferred.
Notes: (Read and Write property)

99.51.7 Constants

Constants

Constant	Value	Description
kMessageDeviceStatus	4	One of the message constants.
kMessageEndOfStream	2	One of the message constants.
kMessageEndOfTransfer	3	One of the message constants.
kMessageNewPage	5	One of the message constants.
kMessageStatus	1	One of the message constants.

99.52 class WIAVideoMBS

99.52.1 class WIAVideoMBS

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IWiaVideo interface provides methods that allow an application that uses Windows Image Acquisition (WIA) services to acquire still images from a streaming video device.
Notes: Note WIA does not support video devices in Windows Server 2003, Windows Vista, and later. For those versions of the Windows, use DirectShow to acquire images from video.

99.52.2 Methods

99.52.3 Constructor

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: Requires Windows XP or Windows Server 2003.

99.52.4 CreateVideoByDevNum(DeviceNumber as integer, win as DesktopWindow, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The CreateVideoByDevNum method creates a connection to a streaming video device with the device number obtained from a Directshow enumeration.
Notes: DeviceNumber: Specifies the video device's Directshow device number.
win: Specifies the window in which to display the streaming video.
StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to TRUE to cause immediate playback; set it to false to require a call to Play before video playback begins.

Lasterror is set.
By default, the video is displayed in the video device's default resolution. If bStretchToFitParent is set to TRUE, the video display fills the window.

- 99.52.6 CreateVideoByDevNum(DeviceNumber as Integer, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15842

99.52.5 CreateVideoByDevNum(DeviceNumber as Integer, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop only.

Function: The CreateVideoByDevNum method creates a connection to a streaming video device with the device number obtained from a Directshow enumeration.
Notes: DeviceNumber: Specifies the video device's Directshow device number.
win: Specifies the window in which to display the streaming video.
StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to TRUE to cause immediate playback; set it to false to require a call to Play before video playback begins.

Lasterror is set.
By default, the video is displayed in the video device's default resolution. If bStretchToFitParent is set to TRUE, the video display fills the window.
See also:

- 99.52.4 CreateVideoByDevNum(DeviceNumber as integer, win as DesktopWindow, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15841
- 99.52.6 CreateVideoByDevNum(DeviceNumber as Integer, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15842

99.52.6 CreateVideoByDevNum(DeviceNumber as Integer, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CreateVideoByDevNum method creates a connection to a streaming video device with the device number obtained from a Directshow enumeration.
Notes: DeviceNumber: Specifies the video device's Directshow device number.
WindowHandle: Specifies the window in which to display the streaming video.
StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to TRUE to cause immediate playback; set it to false to require a call to Play before video playback begins.

Lasterror is set.
By default, the video is displayed in the video device's default resolution. If bStretchToFitParent is set to

TRUE, the video display fills the window.
See also:

- 99.52.4 CreateVideoByDevNum(DeviceNumber as integer, win as DesktopWindow, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15841
- 99.52.5 CreateVideoByDevNum(DeviceNumber as Integer, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15842

99.52.7 CreateVideoByName(FriendlyName as string, win as DesktopWindow, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The CreateVideoByName method creates a connection to a streaming video device with the friendly device name obtained from a Directshow enumeration.
Notes: FriendlyName: Specifies the video device's friendly name obtained from a Directshow device enumeration.
win: Specifies the window in which to display the streaming video.
StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to TRUE to cause immediate playback; set it to false to require a call to Play before video playback begins.

Lasterror is set.
By default, the video is displayed in the video device's default resolution. If bStretchToFitParent is set to TRUE, the video display fills the window.
See also:

- 99.52.8 CreateVideoByName(FriendlyName as string, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15843
- 99.52.9 CreateVideoByName(FriendlyName as string, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15844

99.52.8 CreateVideoByName(FriendlyName as string, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop only.

Function: The CreateVideoByName method creates a connection to a streaming video device with the friendly device name obtained from a Directshow enumeration.
Notes: FriendlyName: Specifies the video device's friendly name obtained from a Directshow device enumeration.
win: Specifies the window in which to display the streaming video.

StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to TRUE to cause immediate playback; set it to false to require a call to Play before video playback begins.

Lasterror is set.
By default, the video is displayed in the video device's default resolution. If bStretchToFitParent is set to TRUE, the video display fills the window.
See also:

- 99.52.7 CreateVideoByName(FriendlyName as string, win as DesktopWindow, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15843

- 99.52.9 CreateVideoByName(FriendlyName as string, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15844

99.52.9 CreateVideoByName(FriendlyName as string, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CreateVideoByName method creates a connection to a streaming video device with the friendly device name obtained from a Directshow enumeration.
Notes: FriendlyName: Specifies the video device's friendly name obtained from a Directshow device enumeration.
win: Specifies the window in which to display the streaming video.
StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to TRUE to cause immediate playback; set it to false to require a call to Play before video playback begins.

Lasterror is set.
By default, the video is displayed in the video device's default resolution. If bStretchToFitParent is set to TRUE, the video display fills the window.
See also:

- 99.52.7 CreateVideoByName(FriendlyName as string, win as DesktopWindow, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15843

- 99.52.8 CreateVideoByName(FriendlyName as string, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15843

99.52.10 CreateVideoByWiaDevID(WiaDeviceID as string, win as DesktopWindow, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The CreateVideoByWiaDevID method creates a connection to a streaming video device from its DeviceID.
Notes: WiaDeviceID: Specifies the value of the video device's DeviceID property.
win: Specifies the window in which to display the streaming video.
StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to true to cause immediate playback; set it to false to require a call to Play before video playback begins.

Lasterror is set.
By default, the video is displayed in the video device's default resolution. If bStretchToFitParent is set to TRUE, the video display fills the window.

In order for the function to succeed, the ImagesDirectory property must be specified first.
See also:

- 99.52.11 CreateVideoByWiaDevID(WiaDeviceID as string, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15845
- 99.52.12 CreateVideoByWiaDevID(WiaDeviceID as string, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15846

99.52.11 CreateVideoByWiaDevID(WiaDeviceID as string, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop only.

Function: The CreateVideoByWiaDevID method creates a connection to a streaming video device from its DeviceID.
Notes: WiaDeviceID: Specifies the value of the video device's DeviceID property.
win: Specifies the window in which to display the streaming video.
StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to true to cause immediate playback; set it to false to require a call to Play before video playback begins.

Lasterror is set.
By default, the video is displayed in the video device's default resolution. If bStretchToFitParent is set to

TRUE, the video display fills the window.

In order for the function to succeed, the ImagesDirectory property must be specified first.
See also:

- 99.52.10 CreateVideoByWiaDevID(WiaDeviceID as string, win as DesktopWindow, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15845
- 99.52.12 CreateVideoByWiaDevID(WiaDeviceID as string, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15846

99.52.12 CreateVideoByWiaDevID(WiaDeviceID as string, WindowHandle as Integer, StretchToFitParent as boolean, AutoBeginPlayback as boolean)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CreateVideoByWiaDevID method creates a connection to a streaming video device from its DeviceID.
Notes: WiaDeviceID: Specifies the value of the video device's DeviceID property.
win: Specifies the window in which to display the streaming video.
StretchToFitParent: Specifies whether the video display is stretched to fit the parent window. Set this parameter to true if the display should be stretched to fit the parent window; otherwise, set to false.
AutoBeginPlayback: Specifies whether the streaming video begins playback as soon as this method returns. Set this parameter to true to cause immediate playback; set it to false to require a call to Play before video playback begins.

Lasterror is set.
By default, the video is displayed in the video device's default resolution. If bStretchToFitParent is set to TRUE, the video display fills the window.

In order for the function to succeed, the ImagesDirectory property must be specified first.
See also:

- 99.52.10 CreateVideoByWiaDevID(WiaDeviceID as string, win as DesktopWindow, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15845
- 99.52.11 CreateVideoByWiaDevID(WiaDeviceID as string, win as window, StretchToFitParent as boolean, AutoBeginPlayback as boolean) 15845

99.52.13 CurrentState as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the state of the video stream.
Notes: See the kState* constants.

99.52.14 DestroyVideo

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DestroyVideo method shuts down the streaming video.
Notes: To restart video playback, the application must call one of the CreateVideo methods again.
Lasterror is set.

Call this method only after a successful call to CreateVideoByWiaDevID, CreateVideoByDevNum, or CreateVideoByName.

99.52.15 Pause

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Pause method pauses video playback.
Notes: Call this method only after a successful call to CreateVideoByWiaDevID, CreateVideoByDevNum, or CreateVideoByName.
Lasterror is set.

99.52.16 Play

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Begins playback of streaming video.
Notes: Call this method only after a successful call to CreateVideoByWiaDevID, CreateVideoByDevNum, or CreateVideoByName.
Lasterror is set.

99.52.17 ResizeVideo(StretchToFitParent as boolean)

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ResizeVideo method resizes the video playback to the largest supported resolution that fits inside the parent window.
Notes: Call this method whenever the parent window is moved or resized.

By default, the video is displayed in a supported resolution smaller than the parent window. If bStretchToFitParent is set to true, the video display fills the window.

Lasterror is set.

99.52.18 TakePicture as folderitem

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The TakePicture method extracts a still image from the video stream, and saves the image as a JPEG file.
Notes: Returns the full path and filename of the JPEG file that this method creates.
Lasterror is set.

The path and directory where the image file is saved are specified by the ImagesDirectory or ImageFolder property.
See also:

- 99.52.19 TakePicture as string 15848

99.52.19 TakePicture as string

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The TakePicture method extracts a still image from the video stream, and saves the image as a JPEG file.
Notes: Returns the full path and filename of the JPEG file that this method creates.
Lasterror is set.

The path and directory where the image file is saved are specified by the ImagesDirectory or ImageFolder property.
See also:

- 99.52.18 TakePicture as folderitem 15848

99.52.20 Properties

99.52.21 Handle as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes: (Read and Write property)

99.52.22 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

99.52.23 ImagesDirectory as string

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the full path and directory where images are stored when calling the TakePicture method.
Notes: Lasterror is set.
(Read and Write computed property)

99.52.24 ImagesFolder as folderitem

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the folder where TakePicture stores the images.
Notes: Lasterror is set.
(Read and Write computed property)

99.52.25 PreviewVisible as boolean

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The PreviewVisible property specifies whether the video playback is visible in its parent window.
Notes: This does not affect the state of the video.
Lasterror is set.
(Read and Write computed property)

99.52.26 Constants

Constants

Constant	Value	Description
kStateCreatingVideo	2	One of the constants for the video state. One of the WiaVideoMBS CreateVideo methods was called and WIA is in the process of creating the video stream.
kStateDestroyingVideo	6	One of the constants for the video state. The application called DestroyVideo method, and WIA is in the process of destroying the video stream.
kStateNoVideo	1	One of the constants for the video state. No video stream exists. Call CreateVideoByWiaDevID, CreateVideoByDevNum, or CreateVideoByName to create a video.
kStateVideoCreated	3	One of the constants for the video state. A video stream has been successfully created, but playback has not yet started.
kStateVideoPaused	5	One of the constants for the video state. A video stream has been successfully created, and the video is paused. The application can now call the TakePicture method.
kStateVideoPlaying	4	One of the constants for the video state. A video stream has been successfully created, and the video is playing. The application can now call the TakePicture method.

Chapter 100

Image Magick

100.1 class ImageMagickQ16MBS

100.1.1 class ImageMagickQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for global functions from the Image Magick library
Notes: Before using this class you need to load the ImageMagick dylib or dll.

Not all functions from the library are available through the plugin. If you need something special, please ask.

For Mac OS X you need the ImageMagick dylib/bundle and for Windows the normal ImageMagick installation with the DLL.

For more details please check the ImageMagick documentation.

The plugin implements three versions of this ImageMagick classes. One with Q8 for 8 bit quantum depth, one with Q16 for 16 bit depth and Q32 for 32 bit depth.

100.1.2 Methods

100.1.3 Copyright as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copyright notice for this format.

Notes: For more details please check the ImageMagick documentation.

100.1.4 Features as String

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick features.
Notes: For example whether library is compiled with OpenMP for faster performance.

100.1.5 HomeURL as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the home url of the library.
Notes: For more details please check the ImageMagick documentation.

100.1.6 InitializeMagick(path as string = "")

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the ImageMagick environment.
Example:

```
Var i as new ImageMagickQ16MBS
i.InitializeMagick("")
```

Notes: Path: The execution path of the current ImageMagick client.

For more details please check the ImageMagick documentation.
You need to call LoadLibrary functions to load the library before calling this.

100.1.7 IsMagickInstantiated as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the ImageMagick environment is currently instantiated.
Notes: In other words: True if InitializeMagick has been called before.

For more details please check the ImageMagick documentation.

100.1.8 LoadErrorString as string

MBS GraphicsMagick Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error message from loading the image magick library.

100.1.9 LoadLibrary(path as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the dll/bundle on the give path.
Example:

```
Var i as new ImageMagickQ16MBS

if TargetLinux then
if i.LoadLibrary("libMagick.so.6") then
//MessageBox "library loaded."
else
MessageBox "library failed."
end if
elseif TargetWin32 then
if i.LoadLibrary("CORE_RL_magick_.dll") then
//MessageBox "library loaded."
else
MessageBox "library failed."
end if
else
// Mac OS X
if i.LoadLibraryFile(New FolderItem("ImageMagick.bundle")) then
//MessageBox "library loaded."
else
MessageBox "The library failed to load."
end if
end if
```

Notes: In case the loading fails the library may be linked to some other libraries (e.g. X11) and you need to install them to get it working.

On Windows you can just pass the name of the library and the system will search it on the paths in the environment variable "PATH" (or the Windows folder).

On Linux, pass the path or name of the library and the system will search for it.

For more details please check the ImageMagick documentation.

With plugin version 6.1 the Mac OS X part accepts a path to a dylib file, too.
Changed to a shared method in plugin version 10.4.

100.1.10 LoadLibraryFile(path as folderitem) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the dll/bundle on the give path.
Example:

```
Var i as new ImageMagickQ16MBS

if TargetLinux then
if i.LoadLibrary("libMagick.so.6") then
//MessageBox "library loaded."
else
MessageBox "library failed."
end if
elseif TargetWin32 then
if i.LoadLibrary("CORE_RL_magick_.dll") then
//MessageBox "library loaded."
else
MessageBox "library failed."
end if
else
// Mac OS X
if i.LoadLibraryFile(New FolderItem("ImageMagick.bundle")) then
//MessageBox "library loaded."
else
MessageBox "The library failed to load."
end if
end if
```

Notes: In case the loading fails the library may be linked to some other libraries (e.g. X11) and you need to install them to get it working.

This is the preferred way for Mac OS X as paths may not be unique.

For more details please check the ImageMagick documentation.

With plugin version 6.1 the Mac OS X part accepts a folderitem for a dylib file, too.
Changed to a shared method in plugin version 10.4.

100.1.11 MagickInfoList as IMMagickInfoListQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the list of known image formats.
Notes: Sets the last exception property.
For more details please check the ImageMagick documentation.

100.1.12 MagickToMime(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the officially registered (or de facto) MIME media-type corresponding to a magick string.
Notes: If there is no registered media-type, then the string "image/x-magick" (all lower case) is returned.

For more details please check the ImageMagick documentation.

100.1.13 NewImageInfo as IMImageInfoQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new ImageInfo object.
Notes: Returns nil on low memory.
For more details please check the ImageMagick documentation.

100.1.14 NewImageList as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new empty image list.
Notes: For more details please check the ImageMagick documentation.

100.1.15 PackageName as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The package name of the library.
Notes: For more details please check the ImageMagick documentation.

100.1.16 QuantumDepth as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Quantum Depth of the library.
Notes: For more details please check the ImageMagick documentation.

100.1.17 QuantumDepthLibrary as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The quantum depth used to compile the library.
Notes: QuantumDepthLibrary and QuantumDepthPlugin must be equal for the plugin to work correctly. Currently it is compiled for 16bit support.

100.1.18 QuantumRange as String

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The quantum range used by this library.
Notes: Should be a string like "Q16".

100.1.19 ReadImage(info as IMImageInfoQ16MBS) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an image from a file.
Notes: Sets the last exception property.
Returns nil on any error.
You need to pass in an info object to describe the image.

For more details please check the ImageMagick documentation.

100.1.20 ReadImageFromString(info as IMImageInfoQ16MBS, data as string) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an image from a string.
Notes: Sets the last exception property.
Returns nil on any error.
You need to pass in an info object to describe the image.

For more details please check the ImageMagick documentation.

100.1.21 ReadImageHeaderFromString(info as IMImageInfoQ16MBS, data as string) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the image header.
Notes: Same as ReadImageFromString except the pixel data is not read.
Sets the last exception property.
For more details please check the ImageMagick documentation.

100.1.22 ReleaseDate as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The release date of the library.
Notes: For more details please check the ImageMagick documentation.

100.1.23 SetCurrentDirectory(path as folderitem) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current working directory.
Notes: This is needed for most installations to point to the folder with the libraries in order for LoadLibrary to find the dependencies.

100.1.24 Version as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of the library.
Notes: For more details please check the ImageMagick documentation.

100.1.25 Properties

100.1.26 LastError as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code reported.
Notes: If an exception is raised and it is not a warning exception, this exception code is saved in this property.
(Read and Write property)

100.1.27 LastException as IMExceptionQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last exception thrown by the Image Magick library.
Notes: You should check this value after every call to the library, process the error and set the property to nil.

For more details please check the ImageMagick documentation.
(Read and Write property)

100.2 class ImageMagickQ32MBS

100.2.1 class ImageMagickQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for global functions from the Image Magick library
Notes: Before using this class you need to load the ImageMagick dylib or dll.

Not all functions from the library are available through the plugin. If you need something special, please ask.

For Mac OS X you need the ImageMagick dylib/bundle and for Windows the normal ImageMagick installation with the DLL.

For more details please check the ImageMagick documentation.

The plugin implements three versions of this ImageMagick classes. One with Q8 for 8 bit quantum depth, one with Q16 for 16 bit depth and Q32 for 32 bit depth.

100.2.2 Methods

100.2.3 Copyright as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copyright notice for this format.
Notes: For more details please check the ImageMagick documentation.

100.2.4 Features as String

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick features.
Notes: For example whether library is compiled with OpenMP for faster performance.

100.2.5 HomeURL as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the home url of the library.

Notes: For more details please check the ImageMagick documentation.

100.2.6 InitializeMagick(path as string = "")

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the ImageMagick environment.
Example:

```
Var i as new ImageMagickQ32MBS
i.InitializeMagick("")
```

Notes: Path: The execution path of the current ImageMagick client.

For more details please check the ImageMagick documentation.
You need to call LoadLibrary functions to load the library before calling this.

100.2.7 IsMagickInstantiated as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the ImageMagick environment is currently instantiated.
Notes: In other words: True if InitializeMagick has been called before.

For more details please check the ImageMagick documentation.

100.2.8 LoadErrorString as string

MBS GraphicsMagick Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error message from loading the image magick library.

100.2.9 LoadLibrary(path as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the dll/bundle on the give path.
Example:

```
Var i as new ImageMagickQ32MBS
```

```
if TargetLinux then
if i.LoadLibrary("libMagick.so.6") then
//MessageBox "library loaded."
else
MessageBox "library failed."
end if
elseif TargetWin32 then
if i.LoadLibrary("CORE_RL_magick_.dll") then
//MessageBox "library loaded."
else
MessageBox "library failed."
end if
else
// Mac OS X
if i.LoadLibraryFile(New FolderItem("ImageMagick.bundle")) then
//MessageBox "library loaded."
else
MessageBox "The library failed to load."
end if
end if
```

Notes: In case the loading fails the library may be linked to some other libraries (e.g. X11) and you need to install them to get it working.

On Windows you can just pass the name of the library and the system will search it on the paths in the environment variable "PATH" (or the Windows folder).

On Linux, pass the path or name of the library and the system will search for it.

For more details please check the ImageMagick documentation.

With plugin version 6.1 the Mac OS X part accepts a path to a dylib file, too.
Changed to a shared method in plugin version 10.4.

100.2.10 LoadLibraryFile(path as folderitem) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the dll/bundle on the give path.
Example:

```
Var i as new ImageMagickQ32MBS
```

```
if TargetLinux then
if i.LoadLibrary("libMagick.so.6") then
//MessageBox "library loaded."
else
MessageBox "library failed."
end if
elseif TargetWin32 then
if i.LoadLibrary("CORE_RL_magick_.dll") then
//MessageBox "library loaded."
else
MessageBox "library failed."
end if
else
// Mac OS X
if i.LoadLibraryFile(New FolderItem("ImageMagick.bundle")) then
//MessageBox "library loaded."
else
MessageBox "The library failed to load."
end if
end if
```

Notes: In case the loading fails the library may be linked to some other libraries (e.g. X11) and you need to install them to get it working.

This is the preferred way for Mac OS X as paths may not be unique.

For more details please check the ImageMagick documentation.

With plugin version 6.1 the Mac OS X part accepts a folderitem for a dylib file, too.
Changed to a shared method in plugin version 10.4.

100.2.11 MagickInfoList as IMMagickInfoListQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the list of known image formats.
Notes: Sets the last exception property.
For more details please check the ImageMagick documentation.

100.2.12 MagickToMime(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the officially registered (or de facto) MIME media-type corresponding to a magick string.
Notes: If there is no registered media-type, then the string "image/x-magick" (all lower case) is returned.

For more details please check the ImageMagick documentation.

100.2.13 NewImageInfo as IMImageInfoQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new ImageInfo object.
Notes: Returns nil on low memory.
For more details please check the ImageMagick documentation.

100.2.14 NewImageList as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new empty image list.
Notes: For more details please check the ImageMagick documentation.

100.2.15 PackageName as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The package name of the library.
Notes: For more details please check the ImageMagick documentation.

100.2.16 QuantumDepth as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Quantum Depth of the library.
Notes: For more details please check the ImageMagick documentation.

100.2.17 QuantumDepthLibrary as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The quantum depth used to compile the library.
Notes: QuantumDepthLibrary and QuantumDepthPlugin must be equal for the plugin to work correctly. Currently it is compiled for 16bit support.

100.2.18 QuantumRange as String

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The quantum range used by this library.
Notes: Should be a string like "Q16".

100.2.19 ReadImage(info as IMImageInfoQ32MBS) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an image from a file.
Notes: Sets the last exception property.
Returns nil on any error.
You need to pass in an info object to describe the image.

For more details please check the ImageMagick documentation.

100.2.20 ReadImageFromString(info as IMImageInfoQ32MBS, data as string) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an image from a string.
Notes: Sets the last exception property.
Returns nil on any error.
You need to pass in an info object to describe the image.

For more details please check the ImageMagick documentation.

100.2.21 ReadImageHeaderFromString(info as IMImageInfoQ32MBS, data as string) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the image header.
Notes: Same as ReadImageFromString except the pixel data is not read.
Sets the last exception property.
For more details please check the ImageMagick documentation.

100.2.22 ReleaseDate as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The release date of the library.
Notes: For more details please check the ImageMagick documentation.

100.2.23 SetCurrentDirectory(path as folderitem) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current working directory.
Notes: This is needed for most installations to point to the folder with the libraries in order for LoadLibrary to find the dependencies.

100.2.24 Version as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of the library.
Notes: For more details please check the ImageMagick documentation.

100.2.25 Properties

100.2.26 LastError as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code reported.
Notes: If an exception is raised and it is not a warning exception, this exception code is saved in this property.
(Read and Write property)

100.2.27 LastException as IMExceptionQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last exception thrown by the Image Magick library.
Notes: You should check this value after every call to the library, process the error and set the property to nil.

For more details please check the ImageMagick documentation.
(Read and Write property)

100.3 class ImageMagickQ8MBS

100.3.1 class ImageMagickQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for global functions from the Image Magick library
Notes: Before using this class you need to load the ImageMagick dylib or dll.

Not all functions from the library are available through the plugin. If you need something special, please ask.

For Mac OS X you need the ImageMagick dylib/bundle and for Windows the normal ImageMagick installation with the DLL.

For more details please check the ImageMagick documentation.

The plugin implements three versions of this ImageMagick classes. One with Q8 for 8 bit quantum depth, one with Q16 for 16 bit depth and Q32 for 32 bit depth.

100.3.2 Methods

100.3.3 Copyright as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The copyright notice for this format.
Notes: For more details please check the ImageMagick documentation.

100.3.4 Features as String

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick features.
Notes: For example whether library is compiled with OpenMP for faster performance.

100.3.5 HomeURL as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the home url of the library.

Notes: For more details please check the ImageMagick documentation.

100.3.6 InitializeMagick(path as string = "")

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the ImageMagick environment.
Example:

```
Var i as new ImageMagickQ8MBS
i.InitializeMagick("")
```

Notes: Path: The execution path of the current ImageMagick client.

For more details please check the ImageMagick documentation.
You need to call LoadLibrary functions to load the library before calling this.

100.3.7 IsMagickInstantiated as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the ImageMagick environment is currently instantiated.
Notes: In other words: True if InitializeMagick has been called before.

For more details please check the ImageMagick documentation.

100.3.8 LoadErrorString as string

MBS GraphicsMagick Plugin, Plugin Version: 9.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error message from loading the image magick library.

100.3.9 LoadLibrary(path as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the dll/bundle on the give path.
Example:

```
Var i as new ImageMagickQ8MBS
```

```
if TargetLinux then
if i.LoadLibrary("libMagick.so.6") then
//MessageBox "library loaded."
else
MessageBox "library failed."
end if
elseif TargetWin32 then
if i.LoadLibrary("CORE_RL_magick_.dll") then
//MessageBox "library loaded."
else
MessageBox "library failed."
end if
else
// Mac OS X
if i.LoadLibraryFile(New FolderItem("ImageMagick.bundle")) then
//MessageBox "library loaded."
else
MessageBox "The library failed to load."
end if
end if
```

Notes: In case the loading fails the library may be linked to some other libraries (e.g. X11) and you need to install them to get it working.

On Windows you can just pass the name of the library and the system will search it on the paths in the environment variable "PATH" (or the Windows folder).

On Linux, pass the path or name of the library and the system will search for it.

For more details please check the ImageMagick documentation.

With plugin version 6.1 the Mac OS X part accepts a path to a dylib file, too.
Changed to a shared method in plugin version 10.4.

100.3.10 LoadLibraryFile(path as folderitem) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the dll/bundle on the give path.
Example:

```
Var i as new ImageMagickQ8MBS
```

```
if TargetLinux then
if i.LoadLibrary("libMagick.so.6") then
//MessageBox "library loaded."
else
MessageBox "library failed."
end if
elseif TargetWin32 then
if i.LoadLibrary("CORE_RL_magick_.dll") then
//MessageBox "library loaded."
else
MessageBox "library failed."
end if
else
// Mac OS X
if i.LoadLibraryFile(New FolderItem("ImageMagick.bundle")) then
//MessageBox "library loaded."
else
MessageBox "The library failed to load."
end if
end if
```

Notes: In case the loading fails the library may be linked to some other libraries (e.g. X11) and you need to install them to get it working.

This is the preferred way for Mac OS X as paths may not be unique.

For more details please check the ImageMagick documentation.

With plugin version 6.1 the Mac OS X part accepts a folderitem for a dylib file, too.
Changed to a shared method in plugin version 10.4.

100.3.11 MagickInfoList as IMMagickInfoListQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the list of known image formats.
Notes: Sets the last exception property.
For more details please check the ImageMagick documentation.

100.3.12 MagickToMime(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the officially registered (or de facto) MIME media-type corresponding to a magick string.
Notes: If there is no registered media-type, then the string "image/x-magick" (all lower case) is returned.

For more details please check the ImageMagick documentation.

100.3.13 NewImageInfo as IMImageInfoQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new ImageInfo object.
Notes: Returns nil on low memory.
For more details please check the ImageMagick documentation.

100.3.14 NewImageList as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new empty image list.
Notes: For more details please check the ImageMagick documentation.

100.3.15 PackageName as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The package name of the library.
Notes: For more details please check the ImageMagick documentation.

100.3.16 QuantumDepth as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Quantum Depth of the library.
Notes: For more details please check the ImageMagick documentation.

100.3.17 QuantumDepthLibrary as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The quantum depth used to compile the library.
Notes: QuantumDepthLibrary and QuantumDepthPlugin must be equal for the plugin to work correctly. Currently it is compiled for 16bit support.

100.3.18 QuantumRange as String

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The quantum range used by this library.
Notes: Should be a string like "Q16".

100.3.19 ReadImage(info as IMImageInfoQ8MBS) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an image from a file.
Notes: Sets the last exception property.
Returns nil on any error.
You need to pass in an info object to describe the image.

For more details please check the ImageMagick documentation.

100.3.20 ReadImageFromString(info as IMImageInfoQ8MBS, data as string) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an image from a string.
Notes: Sets the last exception property.
Returns nil on any error.
You need to pass in an info object to describe the image.

For more details please check the ImageMagick documentation.

100.3.21 ReadImageHeaderFromString(info as IMImageInfoQ8MBS, data as string) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads the image header.
Notes: Same as ReadImageFromString except the pixel data is not read.
Sets the last exception property.
For more details please check the ImageMagick documentation.

100.3.22 ReleaseDate as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The release date of the library.
Notes: For more details please check the ImageMagick documentation.

100.3.23 SetCurrentDirectory(path as folderitem) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current working directory.
Notes: This is needed for most installations to point to the folder with the libraries in order for LoadLibrary to find the dependencies.

100.3.24 Version as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version of the library.
Notes: For more details please check the ImageMagick documentation.

100.3.25 Properties

100.3.26 LastError as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code reported.
Notes: If an exception is raised and it is not a warning exception, this exception code is saved in this property.
(Read and Write property)

100.3.27 LastException as IMExceptionQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last exception thrown by the Image Magick library.
Notes: You should check this value after every call to the library, process the error and set the property to nil.

For more details please check the ImageMagick documentation.
(Read and Write property)

100.4 class IMColorQ16MBS

100.4.1 class IMColorQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Image Magick class to represent a color.
Example:

```
Var i as IMImageInfoQ16MBS
Var c as IMColorQ16MBS

c=i.BackgroundColor
c.red=65535 // full red
i.BackgroundColor=c
```

Notes: As you see above the IMColorQ16MBS object does not reference the original values, but contains a copy, so you must assign the modified color back to store it.
(Same as on the Xojo color class)

100.4.2 Methods

100.4.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a color object where all four properties are zero.
See also:

- 100.4.4 Constructor(c as color) 15875
- 100.4.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0) 15876

100.4.4 Constructor(c as color)

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color value and fills it with the given Xojo color.
See also:

- 100.4.3 Constructor 15875
- 100.4.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0) 15876

100.4.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0)

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color object with the given values.
See also:

- 100.4.3 Constructor 15875
- 100.4.4 Constructor(c as color) 15875

100.4.6 Properties

100.4.7 Blue as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue component.
Notes: Value from 0 to 65535.
(Read and Write property)

100.4.8 ColorValue as Color

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color as a Xojo color.
Notes: Please note that Xojo colors are 8 bit. So for Q16 and Q32 classes the colors are scaled up or down. This reads/writes the red, green and blue property, but not the opacity property.
(Read and Write property)

100.4.9 Green as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green component.
Notes: Value from 0 to 65535.
(Read and Write property)

100.4.10 Opacity as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The opacity part of the color.
Notes: Value from 0 to 65535.
(Read and Write property)

100.4.11 Red as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red component.
Notes: Value from 0 to 65535.
(Read and Write property)

100.5 class IMColorQ32MBS

100.5.1 class IMColorQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Image Magick class to represent a color.
Example:

```
Var i as IMImageInfoQ32MBS
Var c as IMColorQ32MBS

c=i.BackgroundColor
c.red=65535 // full red
i.BackgroundColor=c
```

Notes: As you see above the IMColorQ32MBS object does not reference the original values, but contains a copy, so you must assign the modified color back to store it.
(Same as on the Xojo color class)

100.5.2 Methods

100.5.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a color object where all four properties are zero.
See also:

- 100.5.4 Constructor(c as color) 15878
- 100.5.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0) 15879

100.5.4 Constructor(c as color)

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color value and fills it with the given Xojo color.
See also:

- 100.5.3 Constructor 15878
- 100.5.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0) 15879

100.5.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0)

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color object with the given values.
See also:

- 100.5.3 Constructor 15878
- 100.5.4 Constructor(c as color) 15878

100.5.6 Properties

100.5.7 Blue as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue component.
Notes: Value from 0 to 65535.
(Read and Write property)

100.5.8 ColorValue as Color

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color as a Xojo color.
Notes: Please note that Xojo colors are 8 bit. So for Q16 and Q32 classes the colors are scaled up or down. This reads/writes the red, green and blue property, but not the opacity property.
(Read and Write property)

100.5.9 Green as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green component.
Notes: Value from 0 to 65535.
(Read and Write property)

100.5.10 Opacity as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The opacity part of the color.
Notes: Value from 0 to 65535.
(Read and Write property)

100.5.11 Red as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red component.
Notes: Value from 0 to 65535.
(Read and Write property)

100.6 class IMColorQ8MBS

100.6.1 class IMColorQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Image Magick class to represent a color.
Example:

```
Var i as IMImageInfoQ8MBS
Var c as IMColorQ8MBS

c=i.BackgroundColor
c.red=65535 // full red
i.BackgroundColor=c
```

Notes: As you see above the IMColorQ8MBS object does not reference the original values, but contains a copy, so you must assign the modified color back to store it.
(Same as on the Xojo color class)

100.6.2 Methods

100.6.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a color object where all four properties are zero.
See also:

- 100.6.4 Constructor(c as color) 15881
- 100.6.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0) 15882

100.6.4 Constructor(c as color)

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color value and fills it with the given Xojo color.
See also:

- 100.6.3 Constructor 15881
- 100.6.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0) 15882

100.6.5 Constructor(red as UInt32, green as UInt32, blue as UInt32, Opacity as UInt32 = 0)

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new color object with the given values.
See also:

- 100.6.3 Constructor 15881
- 100.6.4 Constructor(c as color) 15881

100.6.6 Properties

100.6.7 Blue as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue component.
Notes: Value from 0 to 65535.
(Read and Write property)

100.6.8 ColorValue as Color

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color as a Xojo color.
Notes: Please note that Xojo colors are 8 bit. So for Q16 and Q32 classes the colors are scaled up or down. This reads/writes the red, green and blue property, but not the opacity property.
(Read and Write property)

100.6.9 Green as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green component.
Notes: Value from 0 to 65535.
(Read and Write property)

100.6.10 Opacity as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The opacity part of the color.
Notes: Value from 0 to 65535.
(Read and Write property)

100.6.11 Red as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red component.
Notes: Value from 0 to 65535.
(Read and Write property)

100.7 class IMExceptionQ16MBS

100.7.1 class IMExceptionQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for information about an Image Magick Exception.
Notes: Some functions can throw an exception and you find this exception object after calling the function inside the class. For Example after calling IMImageQ16MBS.resize, the IMImageQ16MBS.LastException property will be nil for no exception or just contain the exception from the resize operation.

For more details please check the ImageMagick documentation.
Subclass of the RuntimeException class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 14.2pr10

100.7.2 Methods

100.7.3 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources used by this object now without waiting for Xojo to do it for you.

100.7.4 Properties

100.7.5 Description as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The description of the exception.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.7.6 Reason as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The reason of the exception.
Notes: For more details please check the ImageMagick documentation.

(Read and Write property)

100.7.7 Severity as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception type.
Notes: some useful constants:

For more details please check the ImageMagick documentation.
(Read and Write property)

100.7.8 Signature as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The signature of the exception.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.10 class IMImageAffineMatrixQ16MBS

100.10.1 class IMImageAffineMatrixQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an Image Magick affine transformation matrix.

100.10.2 Methods

100.10.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an identity matrix.

100.10.4 Properties

100.10.5 RX as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rotate x value.
Notes: (Read and Write property)

100.10.6 RY as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rotate y value.
Notes: (Read and Write property)

100.10.7 SX as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The scale x value.
Notes: (Read and Write property)

100.10.8 SY as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The scale y value.
Notes: (Read and Write property)

100.10.9 TX as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The translate y value.
Notes: (Read and Write property)

100.10.10 TY as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The translate y value.
Notes: (Read and Write property)

100.11 class IMImageAffineMatrixQ32MBS

100.11.1 class IMImageAffineMatrixQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an Image Magick affine transformation matrix.

100.11.2 Methods

100.11.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an identity matrix.

100.11.4 Properties

100.11.5 RX as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rotate x value.
Notes: (Read and Write property)

100.11.6 RY as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rotate y value.
Notes: (Read and Write property)

100.11.7 SX as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The scale x value.
Notes: (Read and Write property)

100.11.8 SY as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The scale y value.
Notes: (Read and Write property)

100.11.9 TX as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The translate y value.
Notes: (Read and Write property)

100.11.10 TY as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The translate y value.
Notes: (Read and Write property)

100.12 class IMImageAffineMatrixQ8MBS

100.12.1 class IMImageAffineMatrixQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an Image Magick affine transformation matrix.

100.12.2 Methods

100.12.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an identity matrix.

100.12.4 Properties

100.12.5 RX as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rotate x value.
Notes: (Read and Write property)

100.12.6 RY as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rotate y value.
Notes: (Read and Write property)

100.12.7 SX as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The scale x value.
Notes: (Read and Write property)

100.12.8 SY as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The scale y value.
Notes: (Read and Write property)

100.12.9 TX as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The translate y value.
Notes: (Read and Write property)

100.12.10 TY as Double

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The translate y value.
Notes: (Read and Write property)

100.13 class IMImageAttributeQ16MBS

100.13.1 class IMImageAttributeQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for an image attribute.
Notes: Used only for reading the attributes.
Do not keep references over long times as memory of key/value pairs may be released.

100.13.2 Properties

100.13.3 Compression as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether compression is used.
Notes: (Read only property)

100.13.4 Key as String

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The key of this attribute.
Notes: String is in binary text encoding.
(Read only property)

100.13.5 Value as String

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of this attribute.
Notes: String is in binary text encoding.
(Read only property)

100.14 class IMImageAttributeQ32MBS

100.14.1 class IMImageAttributeQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for an image attribute.
Notes: Used only for reading the attributes.
Do not keep references over long times as memory of key/value pairs may be released.

100.14.2 Properties

100.14.3 Compression as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether compression is used.
Notes: (Read only property)

100.14.4 Key as String

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The key of this attribute.
Notes: String is in binary text encoding.
(Read only property)

100.14.5 Value as String

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of this attribute.
Notes: String is in binary text encoding.
(Read only property)

100.15 class IMImageAttributeQ8MBS

100.15.1 class IMImageAttributeQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for an image attribute.
Notes: Used only for reading the attributes.
Do not keep references over long times as memory of key/value pairs may be released.

100.15.2 Properties

100.15.3 Compression as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether compression is used.
Notes: (Read only property)

100.15.4 Key as String

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The key of this attribute.
Notes: String is in binary text encoding.
(Read only property)

100.15.5 Value as String

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of this attribute.
Notes: String is in binary text encoding.
(Read only property)

100.16 class IMImageInfoQ16MBS

100.16.1 class IMImageInfoQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for information about an image.
Notes: For more details please check the ImageMagick documentation.

100.16.2 Methods

100.16.3 Clone as IMImageInfoQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the ImageInfo object.
Notes: For more details please check the ImageMagick documentation.

100.16.4 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources used by this object now without waiting for Xojo to do it for you.

100.16.5 DestroyImageInfo

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Destroys the image info and sets the handle to 0.
Notes: For more details please check the ImageMagick documentation.
The destructor will call this for you if release=true.

100.16.6 HandleMemory as memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content of the whole ImageInfo structure copied into a memoryblock.
Notes: Returns nil on any error.

100.16.7 Properties

100.16.8 Adjoin as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Join images into a single multi-image file.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.16.9 Affirm as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unknown.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.16.10 Antialias as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Control antialiasing of rendered Postscript and Postscript or TrueType fonts.
Notes: Enabled by default.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.16.11 Authenticate as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.16.12 BackgroundColor as IMColorQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image background color.
Notes: (Read and Write property)

100.16.13 BorderColor as IMColorQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image border color.
Notes: (Read and Write property)

100.16.14 Channel as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The channel to use.
Notes: Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

(Read and Write property)

100.16.15 Colors as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.16.16 ColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image pixel interpretation.
Example:

```
Var im as ImageMagickQ16MBS // global

Function IMPictureToString(p as picture, magick as string, quality as Integer) As string
Var image as new IMImageQ16MBS
Var imageinfo as IMImageInfoQ16MBS
Var s,data as string
Var impp as new IMMagickPixelPacketQ16MBS

// empty string for nil picture
if p = nil then
Return ""
end if

// create a new picture info

imageinfo = im.NewImageInfo
imageinfo.ColorSpace=1
// only color space is needed. 1 for RGB.

// background color of image
impp.red = 0
impp.Green = 0
impp.Blue = 0

// creates a new image object
if not image.NewImage(imageinfo,p.Width,p.Height,impp) then
Return ""
end if

// copy RB picture into IM Image at position 0/0
image.ColorSpace = 1
image.SetPicture(p,0,0)

// set compression data
imageinfo.Magick = magick
imageinfo.Quality = quality

// and rendering intent: 2=PerceptualIntent
'image.RenderingIntent = 2

// create image data
data = image.ImageToBlob(imageinfo)

// release memory
image.DestroyImage
```

```
imageinfo.DestroyImageInfo

// return result
Return data

Exception
// in case of an exception return nothing
Return ""

End Function
```

Notes: If the colorspace is RGB the pixels are red, green, blue. If matte is true, then red, green, blue, and index. If it is CMYK, the pixels are cyan, yellow, magenta, black. Otherwise the colorspace is ignored.

constants:

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6
YCbCrColorspace	7
YCCColorspace	8
YIQColorspace	9
YPbPrColorspace	10
YUVColorspace	11
CMYKColorspace	12
sRGBColorspace	13
HSBColorspace	14
HSLColorspace	15
HWBColorspace	16

(Read and Write property)

100.16.17 Compression as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image compresion type.
Notes: useful constants:

```
const UndefinedCompression        = 0
const NoCompression               = 1
const BZipCompression             = 2
const FaxCompression              = 3
const Group4Compression           = 4
const JPEGCompression             = 5
const LosslessJPEGCompression     = 6
const LZWCompression              = 7
const RLECompression              = 8
const ZipCompression              = 9
```

The default is the compression type of the specified image file.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.16.18 Density as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Vertical and horizontal resolution in pixels of the image.
Notes: This option specifies an image density when decoding a Postscript or Portable Document page.
(Read and Write property)

100.16.19 Depth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image depth (8 or 16).
Notes: QuantumLeap must be defined before a depth of 16 is valid.
(Read and Write property)

100.16.20 Dither as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.16.21 Endian as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The endian setting to use.
Notes: constants:

UndefinedEndian	0	
LSBEndian	1	(Windows)
MSBEndian	2	(Mac)

e.g. tiff files support different endian settings.
(Read and Write property)

100.16.22 Extract as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.16.23 Filename as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file path/name.
Notes: The string must be in the encoding of the library and is limited to 4000 bytes.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.16.24 Font as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Text rendering font.
Notes: If the font is a fully qualified X server font name, the font is obtained from an X server. To use a TrueType font, precede the TrueType filename with an @. Otherwise, specify a Postscript font name (e.g. "helvetica").
(Read and Write property)

100.16.25 Group as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.16.26 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to a ImageInfo structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.16.27 HeaderOnly as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if only the header was read from the image data.
Notes: (Read and Write property)

100.16.28 Interlace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of interlacing scheme (default NoInterlace).
Notes: This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV. NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files (e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.

constants:

(Read and Write property)

UndefinedInterlace	0	Unset value.
NoInterlace	1	Don't interlace image (RGBRGBRGBRGBRGBRGB...)
LineInterlace	2	Use scanline interlacing (RRR...GGG...BBB...RRR...GGG...BBB...)
PlaneInterlace	3	Use plane interlacing (RRRRRR...GGGGGG...BBBBBB...)
PartitionInterlace	4	Similar to plane interlaing except that the different planes are saved to individual files (e.g. image.R, image.G, and image.B)

100.16.29 Magick as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image encoding format (e.g. "GIF").
Example:

```
Var imageinfo as IMImageInfoQ16MBS
Var blob as string
Var image as IMImageQ16MBS

// Now lets convert to tiff
imageinfo.Filename = "image"
imageinfo.Magick="JPEG"
imageinfo.Quality = 10 //since we are displaying, lets use highest quality, lowest compression
blob = image.ImageToBlob(imageinfo)
```

Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.16.30 MatteColor as IMColorQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image matte (transparent) color.
Notes: (Read and Write property)

100.16.31 Monochrome as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transform the image to black and white.
Notes: (Read and Write property)

100.16.32 Orientation as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The image orientation.
Notes: constants:

```
const UndefinedOrientation      = 0
const TopLeftOrientation        = 1
const TopRightOrientation       = 2
const BottomRightOrientation    = 3
const BottomLeftOrientation     = 4
const LeftTopOrientation        = 5
const RightTopOrientation       = 6
const RightBottomOrientation    = 7
const LeftBottomOrientation     = 8
```

For more details please check the ImageMagick documentation.
(Read and Write property)

100.16.33 Page as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Equivalent size of Postscript page.
Notes: (Read and Write property)

100.16.34 PointSize as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Text rendering font point size.
Notes: (Read and Write property)

100.16.35 Preview as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image manipulation preview option.
Notes: Used by 'display'.

constants:

UndefinedPreview	0
RotatePreview	1
ShearPreview	2
RollPreview	3
HuePreview	4
SaturationPreview	5
BrightnessPreview	6
GammaPreview	7
SpiffPreview	8
DullPreview	9
GrayscalePreview	10
QuantizePreview	11
DespecklePreview	12
ReduceNoisePreview	13
AddNoisePreview	14
SharpenPreview	15
BlurPreview	16
ThresholdPreview	17
EdgeDetectPreview	18
SpreadPreview	19
SolarizePreview	20
ShadePreview	21
RaisePreview	22
SegmentPreview	23
SwirlPreview	24
ImplodePreview	25
WavePreview	26
OilPaintPreview	27
CharcoalDrawingPreview	28
JPEGPreview	29

(Read and Write property)

100.16.36 Quality as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: JPEG/MIFF/PNG compression level.
Notes: Default value is 75.
(Read and Write property)

100.16.37 Release as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: If true, the destructor will release the handle.
Notes: (Read and Write property)

100.16.38 ResolutionUnits as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Units of image resolution.
Notes: constants:

UndefinedResolution	0	Unset value.
PixelsPerInchResolution	1	Density specifications are specified in units of pixels per inch (english units).
PixelsPerCentimeterResolution	2	Density specifications are specified in units of pixels per centimeter (metric units).

(Read and Write property)

100.16.39 SamplingFactor as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.16.40 Scene as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.16.41 SceneCount as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.16.42 Scenes as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.16.43 ServerName as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: X11 display to display to.
Notes: obtain fonts from, or to capture image from.
(Read and Write property)

100.16.44 Size as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Width and height of a raw image (an image which does not support width and height information).
Notes: Size may also be used to affect the image size read from a multi-resolution format (e.g. Photo CD, JBIG, or JPEG.
(Read and Write property)

100.16.45 Temporary as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unknown.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.16.46 Texture as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image filename to use as background texture.
Notes: (Read and Write property)

100.16.47 Type as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Image type.
Notes: constants:

UndefinedType	0
BilevelType	1
GrayscaleType	2
GrayscaleMatteType	3
PaletteType	4
PaletteMatteType	5
TrueColorType	6
TrueColorMatteType	7
ColorSeparationType	8
ColorSeparationMatteType	9
OptimizeType	10

(Read and Write property)

100.16.48 Verbose as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print detailed information about the image if True.
Notes: (Read and Write property)

100.16.49 View as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: FlashPix viewing parameters.
Notes: (Read and Write property)

100.17 class IMImageInfoQ32MBS

100.17.1 class IMImageInfoQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for information about an image.
Notes: For more details please check the ImageMagick documentation.

100.17.2 Methods

100.17.3 Clone as IMImageInfoQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the ImageInfo object.
Notes: For more details please check the ImageMagick documentation.

100.17.4 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources used by this object now without waiting for Xojo to do it for you.

100.17.5 DestroyImageInfo

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Destroys the image info and sets the handle to 0.
Notes: For more details please check the ImageMagick documentation.
The destructor will call this for you if release=true.

100.17.6 HandleMemory as memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content of the whole ImageInfo structure copied into a memoryblock.
Notes: Returns nil on any error.

100.17.7 Properties

100.17.8 Adjoin as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Join images into a single multi-image file.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.17.9 Affirm as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unknown.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.17.10 Antialias as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Control antialiasing of rendered Postscript and Postscript or TrueType fonts.
Notes: Enabled by default.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.17.11 Authenticate as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.17.12 BackgroundColor as IMColorQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image background color.
Notes: (Read and Write property)

100.17.13 BorderColor as IMColorQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image border color.
Notes: (Read and Write property)

100.17.14 Channel as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The channel to use.
Notes: Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

(Read and Write property)

100.17.15 Colors as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.17.16 ColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image pixel interpretation.
Example:

```
Var im as ImageMagickQ32MBS // global

Function IMPictureToString(p as picture, magick as string, quality as Integer) As string
Var image as new IMImageQ32MBS
Var imageinfo as IMImageInfoQ32MBS
Var s,data as string
Var impp as new IMMagickPixelPacketQ32MBS

// empty string for nil picture
if p = nil then
Return ""
end if

// create a new picture info

imageinfo = im.NewImageInfo
imageinfo.ColorSpace=1
// only color space is needed. 1 for RGB.

// background color of image
impp.red = 0
impp.Green = 0
impp.Blue = 0

// creates a new image object
if not image.NewImage(imageinfo,p.Width,p.Height,impp) then
Return ""
end if

// copy RB picture into IM Image at position 0/0
image.ColorSpace = 1
image.SetPicture(p,0,0)

// set compression data
imageinfo.Magick = magick
imageinfo.Quality = quality

// and rendering intent: 2=PerceptualIntent
'image.RenderingIntent = 2

// create image data
data = image.ImageToBlob(imageinfo)

// release memory
image.DestroyImage
```

```
imageinfo.DestroyImageInfo

// return result
Return data

Exception
// in case of an exception return nothing
Return ""

End Function
```

Notes: If the colorspace is RGB the pixels are red, green, blue. If matte is true, then red, green, blue, and index. If it is CMYK, the pixels are cyan, yellow, magenta, black. Otherwise the colorspace is ignored.

constants:

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6
YCbCrColorspace	7
YCCColorspace	8
YIQColorspace	9
YPbPrColorspace	10
YUVColorspace	11
CMYKColorspace	12
sRGBColorspace	13

HSLColorspace	15
HWBColorspace	16

(Read and Write property)

100.17.17 Compression as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image compresion type.
Notes: useful constants:

```
const UndefinedCompression        = 0
const NoCompression               = 1
const BZipCompression             = 2
const FaxCompression              = 3
const Group4Compression           = 4
const JPEGCompression             = 5
const LosslessJPEGCompression     = 6
const LZWCompression              = 7
const RLECompression              = 8
const ZipCompression              = 9
```

The default is the compression type of the specified image file.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.17.18 Density as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Vertical and horizontal resolution in pixels of the image.
Notes: This option specifies an image density when decoding a Postscript or Portable Document page.
(Read and Write property)

100.17.19 Depth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image depth (8 or 16).
Notes: QuantumLeap must be defined before a depth of 16 is valid.
(Read and Write property)

100.17.20 Dither as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.17.21 Endian as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The endian setting to use.
Notes: constants:

UndefinedEndian	0	
LSBEndian	1	(Windows)
MSBEndian	2	(Mac)

e.g. tiff files support different endian settings.
(Read and Write property)

100.17.22 Extract as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.17.23 Filename as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file path/name.
Notes: The string must be in the encoding of the library and is limited to 4000 bytes.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.17.24 Font as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Text rendering font.
Notes: If the font is a fully qualified X server font name, the font is obtained from an X server. To use a TrueType font, precede the TrueType filename with an @. Otherwise, specify a Postscript font name (e.g. "helvetica").
(Read and Write property)

100.17.25 Group as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.17.26 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to a ImageInfo structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.17.27 HeaderOnly as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if only the header was read from the image data.
Notes: (Read and Write property)

100.17.28 Interlace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of interlacing scheme (default NoInterlace).
Notes: This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV. NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files (e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.

constants:

(Read and Write property)

UndefinedInterlace	0	Unset value.
NoInterlace	1	Don't interlace image (RGBRGBRGBRGBRGBRGB...)
LineInterlace	2	Use scanline interlacing (RRR...GGG...BBB...RRR...GGG...BBB...)
PlaneInterlace	3	Use plane interlacing (RRRRRR...GGGGGG...BBBBBB...)
PartitionInterlace	4	Similar to plane interlaing except that the different planes are saved to individual files (e.g. image.R, image.G, and image.B)

100.17.29 Magick as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image encoding format (e.g. "GIF").
Example:

```
Var imageinfo as IMImageInfoQ32MBS
Var blob as string
Var image as IMImageQ32MBS

// Now lets convert to tiff
imageinfo.Filename = "image"
imageinfo.Magick="JPEG"
imageinfo.Quality = 10 //since we are displaying, lets use highest quality, lowest compression
blob = image.ImageToBlob(imageinfo)
```

Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.17.30 MatteColor as IMColorQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image matte (transparent) color.
Notes: (Read and Write property)

100.17.31 Monochrome as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transform the image to black and white.
Notes: (Read and Write property)

100.17.32 Orientation as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The image orientation.
Notes: constants:

```
const UndefinedOrientation      = 0
const TopLeftOrientation        = 1
const TopRightOrientation       = 2
const BottomRightOrientation    = 3
const BottomLeftOrientation     = 4
const LeftTopOrientation        = 5
const RightTopOrientation       = 6
const RightBottomOrientation    = 7
const LeftBottomOrientation     = 8
```

For more details please check the ImageMagick documentation.
(Read and Write property)

100.17.33 Page as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Equivalent size of Postscript page.
Notes: (Read and Write property)

100.17.34 PointSize as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Text rendering font point size.
Notes: (Read and Write property)

100.17.35 Preview as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image manipulation preview option.
Notes: Used by 'display'.

constants:

UndefinedPreview	0
RotatePreview	1
ShearPreview	2
RollPreview	3
HuePreview	4
SaturationPreview	5
BrightnessPreview	6
GammaPreview	7
SpiffPreview	8
DullPreview	9
GrayscalePreview	10
QuantizePreview	11
DespecklePreview	12
ReduceNoisePreview	13
AddNoisePreview	14
SharpenPreview	15
BlurPreview	16
ThresholdPreview	17
EdgeDetectPreview	18
SpreadPreview	19
SolarizePreview	20
ShadePreview	21
RaisePreview	22
SegmentPreview	23
SwirlPreview	24
ImplodePreview	25
WavePreview	26
OilPaintPreview	27
CharcoalDrawingPreview	28
JPEGPreview	29

(Read and Write property)

100.17.36 Quality as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: JPEG/MIFF/PNG compression level.
Notes: Default value is 75.
(Read and Write property)

100.17.37 Release as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: If true, the destructor will release the handle.
Notes: (Read and Write property)

100.17.38 ResolutionUnits as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Units of image resolution.
Notes: constants:

UndefinedResolution	0	Unset value.
PixelsPerInchResolution	1	Density specifications are specified in units of pixels per inch (english units).
PixelsPerCentimeterResolution	2	Density specifications are specified in units of pixels per centimeter (metric units).

(Read and Write property)

100.17.39 SamplingFactor as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.17.40 Scene as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.17.41 SceneCount as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.17.42 Scenes as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.17.43 ServerName as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: X11 display to display to.
Notes: obtain fonts from, or to capture image from.
(Read and Write property)

100.17.44 Size as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Width and height of a raw image (an image which does not support width and height information).
Notes: Size may also be used to affect the image size read from a multi-resolution format (e.g. Photo CD, JBIG, or JPEG.
(Read and Write property)

100.17.45 Temporary as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unknown.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.17.46 Texture as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image filename to use as background texture.
Notes: (Read and Write property)

100.17.47 Type as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Image type.
Notes: constants:

UndefinedType	0
BilevelType	1
GrayscaleType	2
GrayscaleMatteType	3
PaletteType	4
PaletteMatteType	5
TrueColorType	6
TrueColorMatteType	7
ColorSeparationType	8
ColorSeparationMatteType	9
OptimizeType	10

(Read and Write property)

100.17.48 Verbose as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print detailed information about the image if True.
Notes: (Read and Write property)

100.17.49 View as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: FlashPix viewing parameters.
Notes: (Read and Write property)

100.18 class IMImageInfoQ8MBS

100.18.1 class IMImageInfoQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for information about an image.
Notes: For more details please check the ImageMagick documentation.

100.18.2 Methods

100.18.3 Clone as IMImageInfoQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the ImageInfo object.
Notes: For more details please check the ImageMagick documentation.

100.18.4 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources used by this object now without waiting for Xojo to do it for you.

100.18.5 DestroyImageInfo

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Destroys the image info and sets the handle to 0.
Notes: For more details please check the ImageMagick documentation.
The destructor will call this for you if release=true.

100.18.6 HandleMemory as memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content of the whole ImageInfo structure copied into a memoryblock.
Notes: Returns nil on any error.

100.18.7 Properties

100.18.8 Adjoin as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Join images into a single multi-image file.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.18.9 Affirm as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unknown.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.18.10 Antialias as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Control antialiasing of rendered Postscript and Postscript or TrueType fonts.
Notes: Enabled by default.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.18.11 Authenticate as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.18.12 BackgroundColor as IMColorQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image background color.
Notes: (Read and Write property)

100.18.13 BorderColor as IMColorQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image border color.
Notes: (Read and Write property)

100.18.14 Channel as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The channel to use.
Notes: Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

(Read and Write property)

100.18.15 Colors as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.18.16 ColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image pixel interpretation.
Example:

```
Var im as ImageMagickQ8MBS // global

Function IMPictureToString(p as picture, magick as string, quality as Integer) As string
Var image as new IMImageQ8MBS
Var imageinfo as IMImageInfoQ8MBS
Var s,data as string
Var impp as new IMMagickPixelPacketQ8MBS

// empty string for nil picture
if p = nil then
Return ""
end if

// create a new picture info

imageinfo = im.NewImageInfo
imageinfo.ColorSpace=1
// only color space is needed. 1 for RGB.

// background color of image
impp.red = 0
impp.Green = 0
impp.Blue = 0

// creates a new image object
if not image.NewImage(imageinfo,p.Width,p.Height,impp) then
Return ""
end if

// copy RB picture into IM Image at position 0/0
image.ColorSpace = 1
image.SetPicture(p,0,0)

// set compression data
imageinfo.Magick = magick
imageinfo.Quality = quality

// and rendering intent: 2=PerceptualIntent
'image.RenderingIntent = 2

// create image data
data = image.ImageToBlob(imageinfo)

// release memory
image.DestroyImage
```

```
imageinfo.DestroyImageInfo

// return result
Return data

Exception
// in case of an exception return nothing
Return ""

End Function
```

Notes: If the colorspace is RGB the pixels are red, green, blue. If matte is true, then red, green, blue, and index. If it is CMYK, the pixels are cyan, yellow, magenta, black. Otherwise the colorspace is ignored.

constants:

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6
YCbCrColorspace	7
YCCColorspace	8
YIQColorspace	9
YPbPrColorspace	10
YUVColorspace	11
CMYKColorspace	12
sRGBColorspace	13
HSBColorspace	14
HSLColorspace	15
HWBColorspace	16

(Read and Write property)

100.18.17 Compression as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image compresion type.
Notes: useful constants:

```
const UndefinedCompression        = 0
const NoCompression               = 1
const BZipCompression             = 2
const FaxCompression              = 3
const Group4Compression           = 4
const JPEGCompression             = 5
const LosslessJPEGCompression     = 6
const LZWCompression              = 7
const RLECompression              = 8
const ZipCompression              = 9
```

The default is the compression type of the specified image file.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.18.18 Density as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Vertical and horizontal resolution in pixels of the image.
Notes: This option specifies an image density when decoding a Postscript or Portable Document page.
(Read and Write property)

100.18.19 Depth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image depth (8 or 16).
Notes: QuantumLeap must be defined before a depth of 16 is valid.
(Read and Write property)

100.18.20 Dither as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.18.21 Endian as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The endian setting to use.
Notes: constants:

UndefinedEndian	0	
LSBEndian	1	(Windows)
MSBEndian	2	(Mac)

e.g. tiff files support different endian settings.
(Read and Write property)

100.18.22 Extract as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.18.23 Filename as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file path/name.
Notes: The string must be in the encoding of the library and is limited to 4000 bytes.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.18.24 Font as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Text rendering font.
Notes: If the font is a fully qualified X server font name, the font is obtained from an X server. To use a TrueType font, precede the TrueType filename with an @. Otherwise, specify a Postscript font name (e.g. "helvetica").
(Read and Write property)

100.18.25 Group as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.18.26 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to a ImageInfo structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.18.27 HeaderOnly as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if only the header was read from the image data.
Notes: (Read and Write property)

100.18.28 Interlace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of interlacing scheme (default NoInterlace).
Notes: This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV. NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files (e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.

constants:

(Read and Write property)

UndefinedInterlace	0	Unset value.
NoInterlace	1	Don't interlace image (RGBRGBRGBRGBRGBRGB...)
LineInterlace	2	Use scanline interlacing (RRR...GGG...BBB...RRR...GGG...BBB...)
PlaneInterlace	3	Use plane interlacing (RRRRRR...GGGGGG...BBBBBB...)
PartitionInterlace	4	Similar to plane interlaing except that the different planes are saved to individual files (e.g. image.R, image.G, and image.B)

100.18.29 Magick as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image encoding format (e.g. "GIF").
Example:

```
Var imageinfo as IMImageInfoQ8MBS
Var blob as string
Var image as IMImageQ8MBS

// Now lets convert to tiff
imageinfo.Filename = "image"
imageinfo.Magick="JPEG"
imageinfo.Quality = 10 //since we are displaying, lets use highest quality, lowest compression
blob = image.ImageToBlob(imageinfo)
```

Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.18.30 MatteColor as IMColorQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image matte (transparent) color.
Notes: (Read and Write property)

100.18.31 Monochrome as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transform the image to black and white.
Notes: (Read and Write property)

100.18.32 Orientation as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The image orientation.
Notes: constants:

```
const UndefinedOrientation      = 0
const TopLeftOrientation        = 1
const TopRightOrientation       = 2
const BottomRightOrientation    = 3
const BottomLeftOrientation     = 4
const LeftTopOrientation        = 5
const RightTopOrientation       = 6
const RightBottomOrientation    = 7
const LeftBottomOrientation     = 8
```

For more details please check the ImageMagick documentation.
(Read and Write property)

100.18.33 Page as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Equivalent size of Postscript page.
Notes: (Read and Write property)

100.18.34 PointSize as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Text rendering font point size.
Notes: (Read and Write property)

100.18.35 Preview as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image manipulation preview option.
Notes: Used by 'display'.

constants:

UndefinedPreview	0
RotatePreview	1
ShearPreview	2

(Read and Write property)

100.18.36 Quality as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: JPEG/MIFF/PNG compression level.
Notes: Default value is 75.
(Read and Write property)

100.18.37 Release as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: If true, the destructor will release the handle.
Notes: (Read and Write property)

100.18.38 ResolutionUnits as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Units of image resolution.
Notes: constants:

UndefinedResolution	0	Unset value.
PixelsPerInchResolution	1	Density specifications are specified in units of pixels per inch (english units).
PixelsPerCentimeterResolution	2	Density specifications are specified in units of pixels per centimeter (metric units).

(Read and Write property)

100.18.39 SamplingFactor as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.18.40 Scene as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.18.41 SceneCount as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.18.42 Scenes as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.18.43 ServerName as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: X11 display to display to.
Notes: obtain fonts from, or to capture image from.
(Read and Write property)

100.18.44 Size as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Width and height of a raw image (an image which does not support width and height information).
Notes: Size may also be used to affect the image size read from a multi-resolution format (e.g. Photo CD, JBIG, or JPEG.
(Read and Write property)

100.18.45 Temporary as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unknown.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.18.46 Texture as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image filename to use as background texture.
Notes: (Read and Write property)

100.18.47 Type as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Image type.
Notes: constants:

UndefinedType	0
BilevelType	1
GrayscaleType	2
GrayscaleMatteType	3
PaletteType	4
PaletteMatteType	5
TrueColorType	6
TrueColorMatteType	7
ColorSeparationType	8
ColorSeparationMatteType	9
OptimizeType	10

(Read and Write property)

100.18.48 Verbose as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Print detailed information about the image if True.
Notes: (Read and Write property)

100.18.49 View as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: FlashPix viewing parameters.
Notes: (Read and Write property)

100.19 class IMImageQ16MBS

100.19.1 class IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for an Image Magick Image in memory.
Notes: Can exist with or without pixel data.

For more details please check the ImageMagick documentation.
Blog Entries

- ImageMagick 7 for Xojo
- MBS Xojo / Real Studio Plugins, version 15.1pr4

100.19.2 Methods

100.19.3 AdaptiveThreshold(width as Integer, height as Integer, offset as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: AdaptiveThreshold selects an individual threshold for each pixel based on the range of intensity values in its local neighborhood.
Notes: This allows for thresholding of an image whose global intensity histogram doesn't contain distinctive peaks.
Sets the last exception property.

width: The width of the local neighborhood.
height: The height of the local neighborhood.
offset: The mean offset.

For more details please check the ImageMagick documentation.

100.19.4 AddNoise(NoiseType as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds random noise to the image.
Notes: Constants

UndefinedNoise	=0
UniformNoise	=1
GaussianNoise	=2
MultiplicativeGaussianNoise	=3
ImpulseNoise	=4
LaplacianNoise	=5
PoissonNoise	=6

For more details please check the ImageMagick documentation.
Sets the last exception property.

100.19.5 AffineTransformImage(matrix as IMImageAffineMatrixQ16MBS) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transforms an image as dictated by the affine matrix.

100.19.6 AppendImageToList(img as IMImageQ16MBS)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an image to the image list.
Notes: For more details please check the ImageMagick documentation.

100.19.7 AutoGammaImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: AutoGammaImage extract the 'mean' from the image and adjust the image to try make set its gamma appropriatally.
Notes: Returns true on success or false on failure.

100.19.8 AutoGammaImageChannel(ChannelType as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: AutoGammaImage extract the 'mean' from the image and adjust the image to try make set its gamma appropriatally.

Notes: Returns true on success or false on failure.

channelType: The channels to auto-level. If the special 'SyncChannels' flag is set all given channels is adjusted in the same way using the mean average of those channels.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.19.9 AutoLevelImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: AutoLevelImage adjusts the levels of a particular image channel by scaling the minimum and maximum values to the full quantum range.
Notes: Returns true on success or false on failure.

100.19.10 AutoLevelImageChannel(ChannelType as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: AutoLevelImage adjusts the levels of a particular image channel by scaling the minimum and maximum values to the full quantum range.
Notes: Returns true on success or false on failure.

ChannelType: The channels to auto-level. If the special 'SyncChannels' flag is set the min/max/mean value of all given channels is used for all given channels, to all channels in the same way.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.19.11 Average as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Average() method takes a set of images and averages them together.
Notes: Each image in the set must have the same width and height. Average() returns a single image with each corresponding pixel component of each image averaged. On failure, a nil image is returned and exception describes the reason for the failure.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.19.12 BilevelChannel(channel as Integer, threshold as Double) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the value of individual pixels based on the intensity of each pixel channel.
Notes: The result is a high-contrast image.

channel: The channel type.
threshold: define the threshold values.

Constants for channel:

For more details please check the ImageMagick documentation.

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.19.13 BlackThreshold(threshold as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: BlackThreshold is like Threshold but forces all pixels below the threshold into black while leaving all pixels above the threshold unchanged.
Notes: No exceptions are generated.
threshold: Define the threshold value. (ASCII string)
For more details please check the ImageMagick documentation.

100.19.14 BlobSize as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The expected size for this image written to a file.
Notes: For more details please check the ImageMagick documentation.

100.19.15 Blur(radius as Double, sigma as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blurs an image.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, the radius should be larger than sigma. Use a radius of 0 and BlurImage selects a suitable radius for you.

radius: The radius of the Gaussian, in pixels, not counting the center pixel.
sigma: The standard deviation of the Gaussian, in pixels.

For more details please check the ImageMagick documentation.

100.19.16 BlurImageChannel(channel as Integer, radius as Double, sigma as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blurs an image.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, the radius should be larger than sigma. Use a radius of 0 and BlurImageChannel selects a suitable radius for you.

channel: The channel type.
radius: The radius of the Gaussian, in pixels, not counting the center pixel.
sigma: The standard deviation of the Gaussian, in pixels.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

For more details please check the ImageMagick documentation.

100.19.17 BorderImage(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Surrounds the image with a border of the color defined by the bordercolor member of the image.
Notes: The width and height of the border are defined by the corresponding parameters.

100.19.18 BrightnessContrastImage(brightness as Double, contrast as Double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the brightness and/or contrast of an image. It converts the brightness and contrast parameters into slope and intercept and calls a polynomical function to apply to the image.
Notes: Returns true on success or false on failure.

brightness: the brightness percent (-100 .. 100).
contrast: the contrast percent (-100 .. 100).

100.19.19 BrightnessContrastImageChannel(ChannelType as Integer, brightness as Double, contrast as Double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the brightness and/or contrast of an image. It converts the brightness and contrast parameters into slope and intercept and calls a polynomical function to apply to the image.
Notes: Returns true on success or false on failure.

brightness: the brightness percent (-100 .. 100).
contrast: the contrast percent (-100 .. 100).
ChannelType: The channels to use.

Constants for channel:

100.19.20 Charcoal(radius as Double, sigma as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Charcoal creates a new image that is a copy of an existing one with the edge highlighted.
Notes: radius: the radius of the pixel neighborhood.
sigma: The standard deviation of the Gaussian, in pixels.

Returns nil on any error.
Sets the last exception property.

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.19.21 Chop(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chop removes a region of an image and collapses the image to occupy the removed portion.
Notes: Returns nil on any error.
Sets the last exception property.

100.19.22 ClipPath(path as string, inside as boolean) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the image clip mask based any clipping path information if it exists.
Notes:

pathname:	name of clipping path resource. If name is preceded by #, use clipping path numbered by name.
inside:	if true, later operations take effect inside clipping path. Otherwise later operations take effect outside clipping path.

Returns true on success and false on any error.

100.19.23 Clone as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this image object.
Notes: For more details please check the ImageMagick documentation.

100.19.24 CloneImageAttributes(image as IMImageAttributeQ16MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: CloneImageAttributes() clones one or more image attributes.
Notes: Returns false on any error.

100.19.25 CloneImageProfiles(SourceImage as IMImageQ16MBS) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones one or more image profiles.
Notes: Returns false on any error and true on success.

100.19.26 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources used by this object now without waiting for Xojo to do it for you.

100.19.27 ClutImage(clutImage as IMImageQ16MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each color value in the given image, by using it as an index to lookup a replacement color value in a Color Look UP Table in the form of an image.
Notes: The values are extracted along a diagonal of the CLUT image so either a horizontal or vertial gradient image can be used.

Typically this is used to either re-color a gray-scale image according to a color gradient in the CLUT image, or to perform a freeform histogram (level) adjustment according to the (typically gray-scale) gradient in the CLUT image.

When the 'channel' mask includes the matte/alpha transparency channel but one image has no such channel it is assumed that that image is a simple gray-scale image that will effect the alpha channel values, either

for gray-scale coloring (with transparent or semi-transparent colors), or a histogram adjustment of existing alpha channel values. If both images have matte channels, direct and normal indexing is applied, which is rarely used.

ClutImage: the color lookup table image for replacement color values.

Returns true on success or false on failure.

100.19.28 ClutImageChannel(ChannelType as Integer, clutImage as IMImageQ16MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each color value in the given image, by using it as an index to lookup a replacement color value in a Color Look UP Table in the form of an image.
Notes: The values are extracted along a diagonal of the CLUT image so either a horizontal or vertial gradient image can be used.

Typically this is used to either re-color a gray-scale image according to a color gradient in the CLUT image, or to perform a freeform histogram (level) adjustment according to the (typically gray-scale) gradient in the CLUT image.

When the 'channel' mask includes the matte/alpha transparency channel but one image has no such channel it is assumed that that image is a simple gray-scale image that will effect the alpha channel values, either for gray-scale coloring (with transparent or semi-transparent colors), or a histogram adjustment of existing alpha channel values. If both images have matte channels, direct and normal indexing is applied, which is rarely used.

ClutImage: the color lookup table image for replacement color values.
ChannelType: The channels to use.

Returns true on success or false on failure.

Constants for channel:

100.19.29 CoalesceImages as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: CoalesceImages composites a set of images while respecting any page offsets and disposal meth-

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

ods.
Notes: GIF, MIFF, and MNG animation sequences typically start with an image background and each subsequent image varies in size and offset. CoalesceImages() returns a new sequence where each image in the sequence is the same size as the first and composited with the next image in the sequence.

Returns nil on any error.
Sets the last exception property.

100.19.30 Colorize(opacity as string, PenColorRed as Integer, PenColorGreen as Integer, PenColorBlue as Integer, PenColorOpacity as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method ColorizeImage creates a new image that is a copy of an existing one with the image pixels colorized.
Notes: The colorization is controlled with the pen color and the opacity levels.

opacity: A character string indicating the level of opacity as a percentage (0-100).
PenColorRed, PenColorGreen, PenColorBlue and PenColorOpacity define the pen color used.

Returns nil on any error.
Sets the last exception property.

100.19.31 Combine(channel as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines one or more images into a single image.
Notes: The grayscale value of the pixels of each image in the sequence is assigned in order to the specified channels of the combined image. The typical ordering would be image 1 =>Red, 2 =>Green, 3 =>Blue, etc.

The lastexception property is set.

100.19.32 CompareImageLayers(ImageLayerMethod as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: CompareImageLayers() compares each image with the next in a sequence and returns the minimum bounding region of all the pixel differences (of the mageLayerMethod specified) it discovers.
Notes: Images do NOT have to be the same size, though it is best that all the images are 'coalesced' (images are all the same size, on a flattened canvas, so as to represent exactly how an specific frame should look).

No GIF dispose methods are applied, so GIF animations must be coalesced before applying this image operator to find differences to them.

ImageLayerMethod:
the layers type to compare images with. Must be one of... CompareAnyLayer, CompareClearLayer, CompareOverlayLayer.

Can raise an exception.

100.19.33 Composite(ComposeOperator as Integer, Image as IMImageQ16MBS, x as Integer, y as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the second image composited onto the first at the specified offsets.
Notes: compose: Specifies an image composite operator.
Image: The second image.
x: An integer that specifies the column offset of the composited image.
y: An integer that specifies the row offset of the composited image.

No error code and exception!

100.19.34 ConsolidateCMYKImages as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Consolidates a sequence of CMYK images.
Notes: Returns nil on any error.
Sets the last exception property.

100.19.35 ContrastImage(sharpen as boolean) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enhances the intensity differences between the lighter and darker elements of the image.
Notes: Returns true on success or false on failure.
Set sharpen to true to increase the image contrast otherwise the contrast is reduced.

100.19.36 CopyPicture as picture

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the Image Magick Image and returns a Xojo picture.
Example:

```
// This example needs a window with Canvas1.
Var image as IMImageQ16MBS // your image
Canvas1.Backdrop=image.CopyPicture
```

Notes: Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
See also:

- 100.19.37 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture

100.19.37 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a portion of the Image Magick Image and returns a Xojo picture.
Example:

```
// This example needs a window with Canvas1.
Var image as IMImageQ16MBS // your image
```

```
Canvas1.Backdrop=image.CopyPicture(0,0,image.Width,image.Height)
```

Notes: Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
x and y are zero based.
See also:

- 100.19.36 CopyPicture as picture 15956

100.19.38 CopyPictureMask as picture

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the mask of the Image Magick Image and returns a Xojo picture.
Example:

```
// This example needs a window with Canvas1.
Var image as IMImageQ16MBS // your image
Canvas1.Backdrop=image.CopyPictureMask
```

Notes: Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
See also:

- 100.19.39 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture 15957

100.19.39 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a portion of the mask of the Image Magick Image and returns a Xojo picture.
Example:

```
// This example needs a window with Canvas1.
Var image as IMImageQ16MBS // your image
Canvas1.Backdrop=image.CopyPictureMask(0,0,image.Width,image.Height)
```

Notes: Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
x and y are zero based.
See also:

• 100.19.38 CopyPictureMask as picture 15957

100.19.40 CopyPixel(x as Integer, y as Integer) as IMColorQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a pixel.
Notes: Returns nil on any error.
This method works only for bitmap images.
x and y are zero based.

100.19.41 CreateHBITMAP as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Creates a HBITMAP for the image for use with Windows Declares.
Notes: The HBITMAP returned needs to be freed when you are done with it or you risk having a memory leak.

100.19.42 Crop(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Crop extracts a region of the image starting at the offset defined by geometry.
Notes: Returns nil on any error.
Sets the last exception property.

100.19.43 CropImageToTiles(CropGeometry as string) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Crops a single image, into a possible list of tiles.
Notes: This may include a single sub-region of the image. This basically applies all the normal geometry flags for Crop.

100.19.44 CycleColormap(displace as Integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Displaces an image's colormap by a given number of positions.
Notes: If you cycle the colormap a number of times you can produce a psychodelic effect.
Returns true on success.
displace: displace the colormap this amount.

100.19.45 DecipherImage(passkey as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts cipher pixels to plain pixels.
Notes: Passkey: decipher cipher pixels with this passphrase.
Returns true on success.

100.19.46 DeconstructImages as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeconstructImages() compares each image with the next in a sequence and returns the minimum bounding region of all differences from the first image.
Notes: Returns nil on any error.
Sets the last exception property.

100.19.47 DeleteImageAttribute(key as string) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteImageAttribute() deletes an attribute from the image.
Notes: Returns false on any error.

100.19.48 Despeckle() as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reduces the speckle noise in an image while perserving the edges of the original image.
Notes: Sets the last exception property.
For more details please check the ImageMagick documentation.

100.19.49 DestroyImage

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Releases the memory used for this image and sets handle to 0.
Notes: For more details please check the ImageMagick documentation.
The destructor will call this for you if release=true.

100.19.50 DestroyImageAttributes

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deallocates memory associated with the image attribute list.

100.19.51 DestroyImageList

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Destroys the image list and sets the handle to 0.
Notes: For more details please check the ImageMagick documentation.
The destructor will call this for you if release=true.

100.19.52 DestroyImageProfiles

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Releases memory associated with an image profile map.

100.19.53 DistortImage(DistortImageMethod as Integer, values() as Double, bestfit as boolean) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: DistortImage() distorts an image using various distortion methods, by mapping color lookups of the source image to a new destination image usally of the same size as the source image, unless 'bestfit' is set to true.
Notes: If 'bestfit' is enabled, and distortion allows it, the destination image is adjusted to ensure the whole source 'image' will just fit within the final destination image, which will be sized and offset accordingly. Also in many cases the virtual offset of the source image will be taken into account in the mapping.

If the '-verbose' control option has been set print to standard error the equicelent '-fx' formula with coefficients for the function, if practical.

A description of each parameter follows:
self: the image to be distorted.
m: the method of image distortion. ArcDistortion always ignores source image offset, and always 'bestfit' the destination image with the top left corner offset relative to the polar mapping center. Affine, Perspective, and Bilinear, do least squares fitting of the distrotion when more than the minimum number of control point pairs are provided. Perspective, and Bilinear, fall back to a Affine distortion when less than 4 control point pairs are provided. While Affine distortions let you use any number of control point pairs, that is Zero pairs is a No-Op (viewport only) distortion, one pair is a translation and two pairs of control points do a scale-rotate-translate, without any shearing.
values: arguments given.
bestfit: Attempt to 'bestfit' the size of the resulting image. This also forces the resulting image to be a 'layered' virtual canvas image. Can be overridden using 'distort:viewport' setting.

Extra Controls from Image meta-data (artifacts)...

- "verbose" Output to stderr alternatives, internal coefficents, and FX equivalents for the distortion operation (if feasible). This forms an extra check of the distortion method, and allows users access to the internal constants IM calculates for the distortion.
- "distort:viewport" Directly set the output image canvas area and offest to use for the resulting image, rather than use the original images canvas, or a calculated 'bestfit' canvas.
- "distort:scale" Scale the size of the output canvas by this amount to provide a method of Zooming, and for super-sampling the results.

Other settings that can effect results include

- 'interpolate' For source image lookups (scale enlargements)
- 'filter' Set filter to use for area-resampling (scale shrinking). Set to 'point' to turn off and use 'interpolate' lookup instead

- 100.19.53 DistortImage(DistortImageMethod as Integer, values() as Double, bestfit as boolean) as IMImageQ16MBS 15960

100.19.55 Edge(radius as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds edges in an image.
Notes: Radius defines the radius of the convolution filter. Use a radius of 0 and Edge selects a suitable radius for you.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.19.56 Emboss(radius as Double, sigma as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a grayscale image with a three-dimensional effect.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, radius should be larger than sigma. Use a radius of 0 and Emboss selects a suitable radius for you.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.19.57 EncipherImage(passkey as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts pixels to cipher-pixels.
Notes: passkey: encipher pixels with this passphrase.
Returns true on success.

100.19.58 EqualizeImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a histogram equalization to the image.
Notes: Returns true on success or false on failure.

ChannelType: The channels to use.

100.19.59 EqualizeImageChannel(ChannelType as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a histogram equalization to the image.
Notes: Returns true on success or false on failure.

ChannelType: The channels to use.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.19.60 ExcerptImage(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a excerpt of the image as defined by the geometry.
Notes: Define the region of the image to extend with x, y, width, and height.

100.19.61 ExtentImage(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extends the image as defined by the geometry, gravity, and image background color.
Notes: Define the region of the image to extend with x, y, width, and height.

Set the (x,y) offset of the geometry to move the original image relative to the extended image.

100.19.62 FlattenImages as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flatten composites all images from the current image pointer to the end of the image list and returns a single flattened image.
Notes: Returns nil on any error.
Sets the last exception property.

100.19.63 Flip as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flip creates a vertical mirror image by reflecting the pixels around the central x-axis.
Notes: Returns nil on any error.
Sets the last exception property.

100.19.64 Flop as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flop creates a horizontal mirror image by reflecting the pixels around the central y-axis.
Notes: Returns nil on any error.
Sets the last exception property.

100.19.65 FrameImage(x as Integer, y as Integer, width as Integer, height as Integer, innerBevel as Integer, OuterBevel as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a simulated three-dimensional border around the image.
Notes: The color of the border is defined by the MatteColor of image. Width and height specify the border width of the vertical and horizontal sides of the frame. innerBevel and OuterBevel indicate the width of the inner and outer shadows of the frame.

100.19.66 FxImage(expression as string) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: FxImage() applies a mathematical expression to the specified image.
Notes: Can raise an exception.

100.19.67 GaussianBlurChannel(channel as Integer, radius as Double, sigma as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blurs an image.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, the radius should be larger than sigma. Use a radius of 0 and GaussianBlur selects a suitable radius for you.
Sets the last exception property.

radius: the radius of the Gaussian, in pixels, not counting the center pixel.
channel: The channel type.
sigma: the standard deviation of the Gaussian, in pixels.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

For more details please check the ImageMagick documentation.

100.19.68 GetImageAttribute(key as string) as IMImageAttributeQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetImageAttribute searches the list of image attributes and returns a reference to the attribute if it exists otherwise nil.

100.19.69 GetImageClippingPathAttribute as IMImageAttributeQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetImageClippingPathAttribute searches the list of image attributes and returns a reference to a clipping path if it exists otherwise nil.

100.19.70 GetImageProfile(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a profile associated with an image by name.
Notes: Returns "" on any error.

100.19.71 GetNextImageAttribute as IMImageAttributeQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetNextImageAttribute() gets the next image attribute.
Notes: Returns nil on any error.

100.19.72 GetNextImageProfile as string

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the next profile name for an image.
Notes: Returns "" on any error.

100.19.73 HandleMemory as memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content of the whole Image structure copied into a memoryblock.
Notes: Returns nil on any error.

100.19.74 ImagesToBlob(info as IMImageInfoQ16MBS) as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: ImagesToBlob implements direct to memory image formats.
Notes: It returns the image sequence as a string. The magick member of the ImageInfo structure determines the format of the returned blob (GIF, JPEG, PNG, etc.)

Note, some image formats do not permit multiple images to the same image stream (e.g. JPEG). in this instance, just the first image of the sequence is returned as a blob.

Sets the last exception property and returns "" on any error.
For more details please check the ImageMagick documentation.

100.19.75 ImageToBlob(info as IMImageInfoQ16MBS) as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: ImagesToBlob implements direct to memory image formats.
Example:

```
Var im as ImageMagickQ16MBS // global

Function IMPictureToString(p as picture, magick as string, quality as Integer) As string
Var image as new IMImageQ16MBS
Var imageinfo as IMImageInfoQ16MBS
Var s,data as string
Var impp as new IMMagickPixelPacketQ16MBS

// empty string for nil picture
if p = nil then
Return ""
end if

// create a new picture info

imageinfo = im.NewImageInfo
imageinfo.ColorSpace=1
// only color space is needed. 1 for RGB.

// background color of image
```

```
impp.red = 0
impp.Green = 0
impp.Blue = 0

// creates a new image object
if not image.NewImage(imageinfo,p.Width,p.Height,impp) then
Return ""
end if

// copy RB picture into IM Image at position 0/0
image.ColorSpace = 1
image.SetPicture(p,0,0)

// set compression data
imageinfo.Magick = magick
imageinfo.Quality = quality

// and rendering intent: 2=PerceptualIntent
'image.RenderingIntent = 2

// create image data
data = image.ImageToBlob(imageinfo)

// release memory
image.DestroyImage
imageinfo.DestroyImageInfo

// return result
Return data

Exception
// in case of an exception return nothing
Return ""

End Function
```

Notes: It returns the image sequence as a string. The magick member of the ImageInfo structure determines the format of the returned blob (GIF, JPEG, PNG, etc.)

Note, some image formats do not permit multiple images to the same image stream (e.g. JPEG). in this instance, just the first image of the sequence is returned as a blob.

Sets the last exception property and returns "" on any error.
For more details please check the ImageMagick documentation.

100.19.76 Implode(factor as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method ImplodeImage creates a new image that is a copy of an existing one with the image pixels "implode" by the specified percentage.
Notes: factor: A double value that defines the extent of the implosion.

Returns nil on any error.
Sets the last exception property.

100.19.77 IsBlobExempt as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the blob is exempt.
Notes: For more details please check the ImageMagick documentation.

100.19.78 IsBlobSeekable as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the blob is seekable.
Notes: For more details please check the ImageMagick documentation.

100.19.79 IsBlobTemporary as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the blob is temporary.
Notes: For more details please check the ImageMagick documentation.

100.19.80 Magnify as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A convenience method that scales an image proportionally to twice its size.
Notes: Sets the last exception property.
For more details please check the ImageMagick documentation.

100.19.81 MedianFilter(radius as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a digital filter that improves the quality of a noisy image.
Notes: Each pixel is replaced by the median in a set of neighboring pixels as defined by radius.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.19.82 MergeImageLayers(ImageLayerMethod as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: MergeImageLayers() composes all the image layers from the current given image onward to produce a single image of the merged layers.
Notes: The inital canvas's size depends on the given ImageLayerMethod, and is initialized using the first images images background color. The images are then compositied onto that image in sequence using the given composition that has been assigned to each individual image.

ImageLayerMethod:
the method of selecting the size of the initial canvas.

MergeLayer: Merge all layers onto a canvas just large enough to hold all the actual images. The virtual canvas of the first image is preserved but otherwise ignored.

FlattenLayer: Use the virtual canvas size of first image. Images which fall outside this canvas is clipped. This can be used to 'fill out' a given virtual canvas.

MosaicLayer: Start with the virtual canvas of the first image, enlarging left and right edges to contain all images. Images with negative offsets will be clipped.

Can raise an exception.

100.19.83 Minify as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A convenience method that scales an image proportionally to half its size.
Notes: Sets the last exception property.
For more details please check the ImageMagick documentation.

100.19.84 MosaicImages as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: MosaicImages inlays an image sequence to form a single coherent picture.
Notes: It returns a single image with each image in the sequence composited at the location defined by the page member of the image structure.
Returns nil on any error.
Sets the last exception property.

100.19.85 MotionBlur(radius as Double, sigma as Double, angle as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Simulates motion blur.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and MotionBlur selects a suitable radius for you. Angle gives the angle of the blurring motion.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.19.86 NegateImage(gray as boolean = false) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates the colors in the reference image.
Notes: Returns true on success or false on failure.
The grayscale option means that only grayscale values within the image are negated.

gray: If true, only negate grayscale pixels within the image.

100.19.87 NegateImageChannel(ChannelType as Integer, gray as boolean = false) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates the colors in the reference image.
Notes: Returns true on success or false on failure.
The grayscale option means that only grayscale values within the image are negated.

ChannelType: The channels to use.
gray: If true, only negate grayscale pixels within the image.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.19.88 NewImage(info as IMImageInfoQ16MBS, width as Integer, height as Integer, background as IMMagickPixelPacketQ16MBS) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new image.
Example:

```
Var im as ImageMagickQ16MBS // global
Var p as picture
Var imageinfo as IMImageInfoQ16MBS
Var image as IMImageQ16MBS
Var b as new IMMagickPixelPacketQ16MBS
b.Blue=65535
b.ColorSpace=1 // RGB
b.Depth=16

imageinfo = im.NewImageInfo
imageinfo.Depth=16
imageinfo.ColorSpace=1
```

```
//this should read any image IM understands
image = new IMImageQ16MBS
if image.NewImage(imageinfo,500,500,b) then
p=New Picture(300,300,32)
p.Graphics.ForeColor=Rgb(255,0,0)
p.Graphics.FillOval 0,0,300,300
image.SetPicture p,0,0
else
MessageBox "failed"
end if
```

Notes: Returns false on failure and true on success.

100.19.89 NormalizeImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enhances the contrast of a color image by mapping the darkest 2 percent of all pixel to black and the brightest 1 percent to white.
Notes: Returns true on success or false on failure.

100.19.90 NormalizeImageChannel(ChannelType as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enhances the contrast of a color image by mapping the darkest 2 percent of all pixel to black and the brightest 1 percent to white.
Notes: Returns true on success or false on failure.

ChannelType: The channels to auto-level. If the special 'SyncChannels' flag is set the min/max/mean value of all given channels is used for all given channels, to all channels in the same way.

Constants for channel:

100.19.91 OilPaint(radius as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method OilPaintImage creates a new image that is a copy of an existing one with each pixel component replaced with the color of greatest frequency in a circular neighborhood.
Notes: radius parameter: radius of the circular neighborhood.

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

Returns nil on any error.
Sets the last exception property.

100.19.92 OptimizeImageLayers as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: OptimizeImageLayers() compares each image the GIF disposed forms of the previous image in the sequence.
Notes: From this it attempts to select the smallest cropped image to replace each frame, while preserving the results of the GIF animation.

Can raise an exception.

100.19.93 OptimizeImageTransparency

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: OptimizeImageTransparency() takes a frame optimized GIF animation, and compares the overlayed pixels against the disposal image resulting from all the previous frames in the animation.
Notes: Any pixel that does not change the disposal image (and thus does not effect the outcome of an overlay) is made transparent.

WARNING: This modifies the current images directly, rather than generate a new image sequence.

Can raise an exception.

100.19.94 OptimizePlusImageLayers as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: OptimizeImagePlusLayers() is exactly as OptimizeImageLayers(), but may also add or even remove extra frames in the animation, if it improves the total number of pixels in the resulting GIF animation.
Notes: Can raise an exception.

100.19.95 ProfileImage(name as string, ProfileData as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds or removes a ICC, IPTC, or generic profile from an image.
Notes: If the ProfileData is "", it is removed from the image otherwise added. Use a name of '*' and a ProfileData of "" to remove all profiles from the image.

Returns false on any error and true on success.

100.19.96 RadialBlur(angle as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: RadialBlur applies a radial blur to the image.
Notes: angle: The angle of the radial blur.

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.19.97 RaiseImage(x as Integer, y as Integer, width as Integer, height as Integer, raise as boolean) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a simulated three-dimensional button-like effect by lightening and darkening the edges of the image.
Notes: Width and height define the width of the vertical and horizontal edge of the effect.
raise: A value other than zero creates a 3-D raise effect, otherwise it has a lowered effect.

100.19.98 RandomThresholdChannel(channel as Integer, thresholds as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Canges the value of individual pixels based on the intensity of each pixel compared to a random threshold.
Notes: The result is a low-contrast, two color image.

channel: The channel or channels to be thresholded.
thresholds: a geometry string containing low,high thresholds. If the string contains 2x2, 3x3, or 4x4, an ordered dither of order 2, 3, or 4 is performed instead. (ASCII string)

Sets the last exception property.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

For more details please check the ImageMagick documentation.

100.19.99 ReduceNoise(radius as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Smooths the contours of an image while still preserving edge information.
Notes: The algorithm works by replacing each pixel with its neighbor closest in value. A neighbor is defined by radius. Use a radius of 0 and ReduceNoise selects a suitable radius for you.

For more details please check the ImageMagick documentation.

100.19.100 RemoveDuplicateLayers

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes any image that is exactly the same as the next image in the given image list.
Notes: Image size and virtual canvas offset must also match, though not the virtual canvas size itself.

No check is made with regards to image disposal setting, though it is the dispose setting of later image that is kept. Also any time delays are also added together. As such coalesced image animations should still produce the same result, though with duplicte frames merged into a single frame.

100.19.101 RemoveFirstImageFromList as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the first image from the image list and returns the image.
Notes: Returns nil on any error.
For more details please check the ImageMagick documentation.

100.19.102 RemoveImageProfile(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a profile from the image-map by its name.

100.19.103 RemoveZeroDelayLayers

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes any image that as a zero delay time.
Notes: Such images generally represent intermediate or partial updates in GIF animations used for file optimization. They are not ment to be displayed to users of the animation. Viewable images in an animation should have a time delay of 3 or more centi-seconds (hundredths of a second).

However if all the frames have a zero time delay, then either the animation is as yet incomplete, or it is not a GIF animation. This is a non-sensible situation, so no image will be removed and a 'Zero Time Animation' warning (exception) given.

No warning will be given if no image was removed because all images had an appropriate non-zero time delay set.

Due to the special requirements of GIF disposal handling, GIF animations should be coalesced first, before calling this function, though that is not a requirement.

100.19.104 ResetImageAttributeIterator

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: ResetImageAttributeIterator() resets the image attributes iterator.
Notes: Use it in conjunction with GetNextImageAttribute() to iterate over all the values associated with an image.

100.19.105 ResetImageProfileIterator

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the image profile iterator.
Notes: Use it in conjunction with GetNextImageProfile() to iterate over all the profiles associated with an image.

100.19.106 Resize(width as Integer, height as Integer, FilterID as Integer, blur as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales an image to the desired dimensions.

Notes: Constants for the FilterID:

```
const PointFilter      =1
const BoxFilter        =2
const TriangleFilter   =3
const HermiteFilter    =4
const HanningFilter    =5
const HammingFilter    =6
const BlackmanFilter   =7
const GaussianFilter   =8
const QuadraticFilter  =9
const CubicFilter      =10
const CatromFilter     =11
const MitchellFilter   =12
const LanczosFilter    =13
const BesselFilter     =14
const SincFilter       =15
```

Most of the filters are FIR (finite impulse response), however, Bessel, Gaussian, and Sinc are IIR (infinite impulse response). Bessel and Sinc are windowed (brought down to zero) with the Blackman filter.
Sets the last exception property.

100.19.107 RGBTransformImage(Colorspace as Integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method RGBTransformImage converts the reference image from RGB to an alternate colorspace.
Notes: The transformation matrices are not the standard ones: the weights are rescaled to normalized the range of the transformed values to be [0..MaxRGB] .

colorspace: An integer value that indicates which colorspace to transform the image.

Returns false on any error and true on success.

constants:

100.19.108 Roll(x as Integer, y as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Roll offsets an image as defined by x and y.

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6
YCbCrColorspace	7
YCCColorspace	8
YIQColorspace	9
YPbPrColorspace	10
YUVColorspace	11
CMYKColorspace	12
sRGBColorspace	13
HSBColorspace	14
HSLColorspace	15
HWBColorspace	16

Notes: Returns nil on any error.
Sets the last exception property.

100.19.109 Rotate(degrees as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rotation of an image.
Notes: Method RotateImage creates a new image that is a rotated copy of an existing one. Positive angles rotate counter-clockwise (right-hand rule), while negative angles rotate clockwise. Rotated images are usually larger than the originals and have 'empty' triangular corners. X axis. Empty triangles left over from shearing the image are filled with the color specified by the image background_color. RotateImage allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Method RotateImage is based on the paper "A Fast Algorithm for General Raster Rotatation" by Alan W. Paeth. RotateImage is adapted from a similar method based on the Paeth paper written by Michael Halle of the Spatial Imaging Group, MIT Media Lab.

degrees: Specifies the number of degrees to rotate the image.

Sets the lastexception property.
Returns nil on low memory.
For more details please check the ImageMagick documentation.

100.19.110 Sample(width as Integer, height as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales an image to the desired dimensions with pixel sampling.
Notes: Unlike other scaling methods, this method does not introduce any additional color into the scaled image.
For more details please check the ImageMagick documentation.
Sets the last exception property.

100.19.111 Scale(width as Integer, height as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the size of an image to the given dimensions.
Example:

```
Var image as IMImageQ16MBS // your image
image=Image.Scale(100,80)
```

Notes: This method was designed by Bob Friesenhahn as a low cost thumbnail generator.

columns: The number of columns in the scaled image.
rows: The number of rows in the scaled image.

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.19.112 SetImageAttribute(key as string, value as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetImageAttribute searches the list of image attributes and replaces the attribute value.
Notes: If it is not found in the list, the attribute name and value is added to the list. If the attribute exists in the list, the value is concatenated to the attribute. SetImageAttribute returns True if the attribute is successfully concatenated or added to the list, otherwise False. If the value is "", the matching key is deleted from the list.

100.19.113 SetImageColorspace(Colorspace as Integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colorspace member of the Image structure.
Notes: Returns false on any error and true on success.

100.19.114 SetImageProfile(name as string, ProfileData as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a named profile to the image.
Notes: If a profile with the same name already exists, it is replaced. This method differs from the ProfileImage() method in that it does not apply CMS color profiles.

name: The profile name.
profiledata: The binary data of the profile.

Returns false on any error and true on success.

100.19.115 SetPicture(pic as picture, x as Integer, y as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the pixels from a given Xojo picture into the Image Magick Image at the given location.
Example:

```
Var image as IMImageQ16MBS // your image
Var p as picture

p=New Picture(32,32,32)
p.Graphics.ForeColor=rgb(0,255,0)
p.Graphics.FillRect 0,0,32,32

image.SetPicture(p,30,30)
```

Notes: Sets the last exception property.
The method will do nothing on bad bounds.
This method works only for bitmap images.
x and y are zero based.

100.19.116 SetPictureMask(maskpic as picture, x as Integer, y as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the pixels from a given Xojo picture into the mask of the Image Magick Image at the given location.
Example:

```
Var i as IMImageQ16MBS // your image
Var p as picture

p=New Picture(32,32,32)
p.Graphics.ForeColor=rgb(0,255,0)
p.Graphics.FillRect 0,0,32,32

i.SetPictureMask(p,30,30)
```

Notes: Sets the last exception property.
The method will do nothing on bad bounds.
This method works only for bitmap images.
x and y are zero based.
You may need to set matte=True after this.

100.19.117 SetPixel(x as Integer, y as Integer, newPixel as IMColorQ16MBS)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a pixel value.
Example:

```
Var image as IMImageQ16MBS // your image
Var co as IMColorQ16MBS

co=new IMColorQ16MBS
co.blue=65535 // max value
image.SetPixel 50,50,co // Makes Pixel 50/50 blue
```

Notes: The method will fail silently if the values are out of bounds or the image is not a bitmap image.
This method works only for bitmap images.
x and y are zero based.

100.19.118 Shade(gray as boolean, azimuth as Double, elevation as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shines a distant light on an image to create a three-dimensional effect.
Notes: You control the positioning of the light with azimuth and elevation; azimuth is measured in degrees

off the x axis and elevation is measured in pixels above the Z axis.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.19.119 SharpenChannel(channel as Integer, radius as Double, sigma as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sharpens one or more image channels.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, radius should be larger than sigma. Use a radius of 0 and Sharpen selects a suitable radius for you.

channel: The channel type.
radius: The radius of the Gaussian, in pixels, not counting the center pixel.
sigma: The standard deviation of the Laplacian, in pixels.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.19.120 Shave(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shave shaves pixels from the image edges.
Notes: It allocates the memory necessary for the new Image structure and returns a pointer to the new image.
Returns nil on any error.
Sets the last exception property.

100.19.121 Shear(Xshear as Double, Yshear as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method ShearImage creates a new image that is a shear_image copy of an existing one.
Notes: Shearing slides one edge of an image along the X or Y axis, creating a parallelogram. An X direction shear slides an edge along the X axis, while a Y direction shear slides an edge along the Y axis. The amount of the shear is controlled by a shear angle. For X direction shears, x_shear is measured relative to the Y axis, and similarly, for Y direction shears y_shear is measured relative to the X axis. Empty triangles left over from shearing the image are filled with the color defined by the pixel at location (0,0). ShearImage allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Xshear and YYshear specify the number of degrees to shear the image.

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.19.122 Solarize(factor as Double) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method SolarizeImage produces a 'solarization' effect seen when exposing a photographic film to light during the development process.
Notes: factor: An double value that defines the extent of the solarization.
Returns nil on any error.
Sets the last exception property.

100.19.123 Splice(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Splice splices a solid color into the image as defined by the geometry.
Notes: Returns nil on any error.
Sets the last exception property.

100.19.124 Spread(radius as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: This is a special effects method that randomly displaces each pixel in a block defined by the radius parameter.
Notes: radius: Choose a random pixel in a neighborhood of this extent.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.19.125 Stegano(watermarkImage as IMImageQ16MBS) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method SteganoImage hides a digital watermark within the image.
Notes: Returns nil on any error.
Sets the last exception property.

100.19.126 Stereo(otherImage as IMImageQ16MBS) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method StereoImage combines two images and produces a single image that is the composite of a left and right image of a stereo pair.
Notes: The left image is converted to gray scale and written to the red channel of the stereo image. The right image is converted to gray scale and written to the blue channel of the stereo image. View the composite image with red-blue glasses to create a stereo effect.

left image = self
right image = otherImage parameter

Returns nil on any error.
Sets the last exception property.

100.19.127 Swirl(degrees as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method SwirlImage creates a new image that is a copy of an existing one with the image pixels "swirl" at a specified angle.
Notes: degrees: An double value that defines the tightness of the swirling.

Returns nil on any error.
Sets the last exception property.

100.19.128 Thumbnail(width as Integer, height as Integer) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the size of an image to the given dimensions.
Notes: Sets the last exception property.
This method was designed by Bob Friesenhahn as a low cost thumbnail generator.
For more details please check the ImageMagick documentation.

100.19.129 TransformImage(CropGeometry as string, ImageGeometry as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: TransformImage() is a convenience method that behaves like ResizeImage() or CropImage() but accepts scaling and/or cropping information as a region geometry specification. If the operation fails, the original image handle is left as is.
Notes: This should only be used for single images.

CropGeometry: A crop geometry string. This geometry defines a subregion of the image to crop.
ImageGeometry: An image geometry string. This geometry defines the final size of the image.

Returns true on success.

100.19.130 TransformImages(CropGeometry as string, ImageGeometry as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: TransformImages() calls TransformImage() on each image of a sequence.
Notes: TransformImage() is a convenience method that behaves like ResizeImage() or CropImage() but accepts scaling and/or cropping information as a region geometry specification. If the operation fails, the original image handle is left as is.

CropGeometry: A crop geometry string. This geometry defines a subregion of the image to crop.
ImageGeometry: An image geometry string. This geometry defines the final size of the image.

Returns true on success.

100.19.131 TransformRGBImage(Colorspace as Integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method TransformRGBImage converts the reference image from an alternate colorspace.
Notes: The transformation matrices are not the standard ones: the weights are rescaled to normalized the range of the transformed values to be [0..MaxRGB] .

colorspace: An integer value that indicates the colorspace the image is currently in. On return the image is in the RGB color space.

Returns false on any error and true on success.

constants:

100.19.132 TransposeImage as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: TransposeImage() creates a horizontal mirror image by reflecting the pixels around the central y-axis while rotating them by 90 degrees.

100.19.133 TransverseImage as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6
YCbCrColorspace	7
YCCColorspace	8
YIQColorspace	9
YPbPrColorspace	10
YUVColorspace	11
CMYKColorspace	12
sRGBColorspace	13
HSBColorspace	14
HSLColorspace	15
HWBColorspace	16

Function: TransverseImage() creates a vertical mirror image by reflecting the pixels around the central x-axis while rotating them by 270 degrees.

100.19.134 Trim as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Trim trims pixels from the image edges.
Notes: It allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Returns nil on any error.
Sets the last exception property.

100.19.135 UnsharpMaskChannel(channel as Integer, radius as Double, sigma as Double, amount as Double, threshold as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sharpens one or more image channels.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and UnsharpMask selects a suitable radius for you.

Constants for channel:

```
const UndefinedChannel = 0
const RedChannel = &h0001
const GrayChannel = &h0001
const CyanChannel = &h0001
const GreenChannel = &h0002
const MagentaChannel = &h0002
const BlueChannel = &h0004
const YellowChannel = &h0004
const AlphaChannel = &h0008
const OpacityChannel = &h0008
const BlackChannel = &h0020
const IndexChannel = &h0020
const AllChannels = &h7fffffff
```

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.19.136 Wave(amplitude as Double, wavelength as Double) as IMImageQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method Wave creates a new image that is a copy of an existing one with the image pixels altered along a sine wave.
Notes: Parameters are double values that indicates the amplitude and wavelength of the sine wave.
Returns nil on any error.
Sets the last exception property.

100.19.137 WhiteThreshold(threshold as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: WhiteThreshold is like Threshold but forces all pixels above the threshold into white while leaving all pixels below the threshold unchanged.
Notes: No exceptions are generated.
threshold: Define the threshold value. (ASCII string)
For more details please check the ImageMagick documentation.

100.19.138 WriteImage(info as IMImageInfoQ16MBS) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method WriteImage writes an image to a file as defined by image.filename.
Notes: You can specify a particular image format by prefixing the file with the image type and a colon (i.e. ps:image) or specify the image type as the filename suffix (i.e. image.ps). The image may be modified to adapt it to the requirements of the image format. For example, DirectClass images must be color-reduced to PseudoClass if the format is GIF.

WriteImage returns True if the image is written. False is returned if there is a memory shortage or if the image file fails to write.

100.19.139 Properties

100.19.140 BackgroundColor as IMColorQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image background color.
Notes: (Read and Write property)

100.19.141 Bias as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.19.142 BlurFactor as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blur factor to apply to the image when zooming. Default is 1.0 (no blur).
Notes: (Read and Write property)

100.19.143 BorderColor as IMColorQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image border color.
Notes: (Read and Write property)

100.19.144 Colors as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The desired number of colors.
Notes: Used by Quantize().
(Read and Write property)

100.19.145 ColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image pixel interpretation.
Notes: If the colorspace is RGB the pixels are red, green, blue. If matte is true, then red, green, blue, and index. If it is CMYK, the pixels are cyan, yellow, magenta, black. Otherwise the colorspace is ignored.

constants:

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6
YCbCrColorspace	7
YCCColorspace	8
YIQColorspace	9
YPbPrColorspace	10
YUVColorspace	11
CMYKColorspace	12
sRGBColorspace	13
HSBColorspace	14
HSLColorspace	15
HWBColorspace	16

(Read and Write property)

100.19.146 Compression as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image compresion type.
Notes: useful constants:

```
const UndefinedCompression      = 0
const NoCompression             = 1
const BZipCompression           = 2
const FaxCompression            = 3
const Group4Compression         = 4
const JPEGCompression           = 5
const LosslessJPEGCompression   = 6
const LZWCompression            = 7
const RLECompression            = 8
const ZipCompression            = 9
```

The default is the compression type of the specified image file.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.19.147 Depth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image depth (8 or 16).
Notes: QuantumLeap must be defined before a depth of 16 is valid.
(Read and Write property)

100.19.148 Directory as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tile names from within an image montage.
Notes: Only valid after calling MontageImages() or reading a MIFF file which contains a directory.
(Read and Write property)

100.19.149 Endian as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The endian setting to use.
Notes: constants:

UndefinedEndian	0	
LSBEndian	1	(Windows)
MSBEndian	2	(Mac)

e.g. tiff files support different endian settings.
(Read and Write property)

100.19.150 Filename as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file path/name.
Notes: The string must be in the encoding of the library and is limited to 4000 bytes.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.19.151 Filter as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Filter to use when resizing image.
Notes: Constants:

The reduction filter employed has a sipngicant effect on the time required to resize an image and the resulting quality. The default filter is Lanczos which has been shown to produce high quality results when reducing most images.
(Read and Write property)

100.19.152 Fuzz as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colors within this distance are considered equal.
Notes: A number of algorithms search for a target color. By default the color must be exact. Use this to match colors that are close to the target color in RGB space.
(Read and Write property)

const PointFilter	=1
const BoxFilter	=2
const TriangleFilter	=3
const HermiteFilter	=4
const HanningFilter	=5
const HammingFilter	=6
const BlackmanFilter	=7
const GaussianFilter	=8
const QuadraticFilter	=9
const CubicFilter	=10
const CatromFilter	=11
const MitchellFilter	=12
const LanczosFilter	=13
const BesselFilter	=14
const SincFilter	=15

100.19.153 Gamma as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gamma level of the image.
Notes: The same color image displayed on two different workstations may look different due to differences in the display monitor. Use gamma correction to adjust for this color difference.
(Read and Write property)

100.19.154 Geometry as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Preferred size of the image when encoding.
Notes: (Read and Write property)

100.19.155 Gravity as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.19.156 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to an Image structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.19.157 Height as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the image in pixels.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.19.158 Interlace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of interlacing scheme (default NoInterlace).
Notes: This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV. NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files (e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.

constants:

UndefinedInterlace	0	Unset value.
NoInterlace	1	Don't interlace image (RGBRGBRGBRGBRGBRGB...)
LineInterlace	2	Use scanline interlacing (RRR...GGG...BBB...RRR...GGG...BBB...)
PlaneInterlace	3	Use plane interlacing (RRRRRR...GGGGGG...BBBBBB...)
PartitionInterlace	4	Similar to plane interlaing except that the different planes are saved to individual files (e.g. image.R, image.G, and image.B)

(Read and Write property)

100.19.159 LastError as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code reported.
Notes: If an exception is raised and it is not a warning exception, this exception code is saved in this property.
(Read and Write property)

100.19.160 LastException as IMExceptionQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last exception thrown by the Image Magick library.
Notes: You should check this value after every call to the library, process the error and set the property to nil.

For more details please check the ImageMagick documentation.
(Read and Write property)

100.19.161 Magick as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image encoding format (e.g. "GIF").
Notes: (Read and Write property)

100.19.162 Matte as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether an alpha channel is used/present.
Notes: Set to true to enable masks.
(Read and Write property)

100.19.163 MatteColor as IMColorQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image matte (transparent) color.
Notes: (Read and Write property)

100.19.164 Montage as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tile size and offset within an image montage. Only valid for montage images.
Notes: (Read and Write property)

100.19.165 Offset as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of initial bytes to skip over when reading raw image.
Notes: (Read and Write property)

100.19.166 Orientation as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The image orientation.
Notes: constants:

```
const UndefinedOrientation      = 0
const TopLeftOrientation        = 1
const TopRightOrientation       = 2
const BottomRightOrientation    = 3
const BottomLeftOrientation     = 4
const LeftTopOrientation        = 5
const RightTopOrientation       = 6
const RightBottomOrientation    = 7
const LeftBottomOrientation     = 8
```

For more details please check the ImageMagick documentation.
(Read and Write property)

100.19.167 Quality as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: JPEG/MIFF/PNG compression level.
Example:

```
Var im as ImageMagickQ16MBS // global
```

```
Function TestJPEG(f as folderitem) As picture
// Reads an image, compresses in memory to JPEG, decompresses using JPEGlib and returns the image
// if quality setting works, you see it in the result.
// no error checking included!

// needs: im as ImageMagickQ16MBS ready initialized

Var image as IMImageQ16MBS
Var imageinfo as IMImageInfoQ16MBS
Var s,blob as string
Var p as Picture
Var i as Integer

if f = nil then
Return nil
end if

imageinfo = im.NewImageInfo

imageinfo.Filename = f.NativePath

//this should read any image IM understands
image = im.ReadImage(imageinfo)
//check for error
if im.lastexception <>nil and im.LastException.Severity >= 400 then
s = "LastError: "+Format(im.LastError,"-0")+" - Severity: "+str(im.LastException.Severity)+EndOfLine+im.Las-
tException.Reason
MessageBox s
Return nil
elseif image = nil then
MessageBox "image=nil"
Return nil
end if

// Now lets convert to jpeg
imageinfo.Filename = "image.jpg"
imageinfo.Quality = 10 // 100 is max
blob = image.ImageToBlob(imageinfo)

// It may fail
if blob.lenb = 0 then
Return nil
end if
p = JPEGStringToPictureMBS(blob,true)

image.DestroyImage
imageinfo.DestroyImageInfo
```

```
Return p
Exception
Return nil
End Function
```

Notes: Default value is 75.
(Read and Write property)

100.19.168 Release as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: If true, the destructor will release the handle.
Notes: (Read and Write property)

100.19.169 RenderingIntent as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rendering intent to use.
Notes: constants:

UndefinedIntent	0
SaturationIntent	1
PerceptualIntent	2
AbsoluteIntent	3
RelativeIntent	4

(Read and Write property)

100.19.170 ResolutionUnits as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Units of image resolution.
Notes: constants:

(Read and Write property)

UndefinedResolution	0	Unset value.
PixelsPerInchResolution	1	Density specifications are specified in units of pixels per inch (english units).
PixelsPerCentimeterResolution	2	Density specifications are specified in units of pixels per centimeter (metric units).

100.19.171 ResolutionX as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The horizontal resolution of the image.
Notes: The unit for resolution must be specified.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.19.172 ResolutionY as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The vertical resolution of the image.
Notes: The unit for resolution must be specified.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.19.173 Scene as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.19.174 StorageClass as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image storage class.
Notes: If DirectClass then the image packets contain valid RGB or CMYK colors. If PseudoClass then the image has a colormap referenced by pixel's index member.

constants:

UndefinedClass	0	Unset value.
DirectClass	1	Image is composed of pixels which represent literal color values.
PseudoClass	2	Image is composed of pixels which specify an index in a color palette.

(Read and Write property)

100.19.175 Taint as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set to True if the image pixels have been modified.
Notes: (Read and Write property)

100.19.176 Width as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the image in pixels.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.19.177 Constants

Constants

Constant	Value	Description
kBackgroundDispose	2	One of the Image layer Dispose Types.
kCoalesceLayer	1	One of the Image layer method constants.
kCompareAnyLayer	2	One of the Image layer method constants.
kCompareClearLayer	3	One of the Image layer method constants.
kCompareOverlayLayer	4	One of the Image layer method constants.
kCompositeLayer	12	One of the Image layer method constants.
kDisposeLayer	5	One of the Image layer method constants.
kFlattenLayer	14	One of the Image layer method constants.
kMergeLayer	13	One of the Image layer method constants.
kMosaicLayer	15	One of the Image layer method constants.
kNoneDispose	1	One of the Image layer Dispose Types.
kOptimizeImageLayer	7	One of the Image layer method constants.
kOptimizeLayer	6	One of the Image layer method constants.
kOptimizePlusLayer	8	One of the Image layer method constants.
kOptimizeTransLayer	9	One of the Image layer method constants.
kPreviousDispose	3	One of the Image layer Dispose Types.
kRemoveDupsLayer	10	One of the Image layer method constants.
kRemoveZeroLayer	11	One of the Image layer method constants.
kUndefinedDispose	0	One of the Image layer Dispose Types.
kUndefinedLayer	0	One of the Image layer method constants.
kUnrecognizedDispose	0	One of the Image layer Dispose Types.

Distortion Effects

Constant	Value	Description
kAffineDistortion	1	
kAffineDistortion	1	
kAffineProjectionDistortion	2	
kAffineProjectionDistortion	2	
kArcDistortion	9	
kArcDistortion	9	
kBarrelDistortion	14	
kBarrelDistortion	14	
kBarrelInverseDistortion	15	
kBarrelInverseDistortion	15	
kBilinearDistortion	6	
kBilinearDistortion	6	
kBilinearForwardDistortion	6	
kBilinearForwardDistortion	6	
kBilinearReverseDistortion	7	
kBilinearReverseDistortion	7	
kCylinder2PlaneDistortion	12	
kCylinder2PlaneDistortion	12	
kDePolarDistortion	11	
kDePolarDistortion	11	
kPerspectiveDistortion	4	
kPerspectiveDistortion	4	
kPerspectiveProjectionDistortion	5	
kPerspectiveProjectionDistortion	5	
kPlane2CylinderDistortion	13	
kPlane2CylinderDistortion	13	
kPolarDistortion	10	
kPolarDistortion	10	
kPolynomialDistortion	8	
kPolynomialDistortion	8	
kResizeDistortion	17	
kResizeDistortion	17	
kScaleRotateTranslateDistortion	3	
kScaleRotateTranslateDistortion	3	
kSentinelDistortion	18	
kSentinelDistortion	18	
kShepardsDistortion	16	
kShepardsDistortion	16	
kUndefinedDistortion	0	
kUndefinedDistortion	0	

Interpolate Modes

Constant	Value	Description
kBarycentricColorInterpolate	1	
kBarycentricColorInterpolate	1	
kBilinearColorInterpolate	7	
kBilinearColorInterpolate	7	
kInverseColorInterpolate	19	
kInverseColorInterpolate	19	
kPolynomialColorInterpolate	8	
kPolynomialColorInterpolate	8	
kShepardsColorInterpolate	16	
kShepardsColorInterpolate	16	
kUndefinedColorInterpolate	0	
kUndefinedColorInterpolate	0	
kVoronoiColorInterpolate	18	
kVoronoiColorInterpolate	18	

100.20 class IMImageQ32MBS

100.20.1 class IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for an Image Magick Image in memory.
Notes: Can exist with or without pixel data.

For more details please check the ImageMagick documentation.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.1pr4

100.20.2 Methods

100.20.3 AdaptiveThreshold(width as Integer, height as Integer, offset as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: AdaptiveThreshold selects an individual threshold for each pixel based on the range of intensity values in its local neighborhood.
Notes: This allows for thresholding of an image whose global intensity histogram doesn't contain distinctive peaks.
Sets the last exception property.

width: The width of the local neighborhood.
height: The height of the local neighborhood.
offset: The mean offset.

For more details please check the ImageMagick documentation.

100.20.4 AddNoise(NoiseType as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds random noise to the image.
Notes: Constants

For more details please check the ImageMagick documentation.
Sets the last exception property.

UndefinedNoise	=0
UniformNoise	=1
GaussianNoise	=2
MultiplicativeGaussianNoise	=3
ImpulseNoise	=4
LaplacianNoise	=5
PoissonNoise	=6

100.20.5 AffineTransformImage(matrix as IMImageAffineMatrixQ32MBS) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transforms an image as dictated by the affine matrix.

100.20.6 AppendImageToList(img as IMImageQ32MBS)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an image to the image list.
Notes: For more details please check the ImageMagick documentation.

100.20.7 AutoGammaImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: AutoGammaImage extract the 'mean' from the image and adjust the image to try make set its gamma appropriatally.
Notes: Returns true on success or false on failure.

100.20.8 AutoGammaImageChannel(ChannelType as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: AutoGammaImage extract the 'mean' from the image and adjust the image to try make set its gamma appropriatally.
Notes: Returns true on success or false on failure.

channelType: The channels to auto-level. If the special 'SyncChannels' flag is set all given channels is adjusted in the same way using the mean average of those channels.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.20.9 AutoLevelImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: AutoLevelImage adjusts the levels of a particular image channel by scaling the minimum and maximum values to the full quantum range.
Notes: Returns true on success or false on failure.

100.20.10 AutoLevelImageChannel(ChannelType as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: AutoLevelImage adjusts the levels of a particular image channel by scaling the minimum and maximum values to the full quantum range.
Notes: Returns true on success or false on failure.

ChannelType: The channels to auto-level. If the special 'SyncChannels' flag is set the min/max/mean value of all given channels is used for all given channels, to all channels in the same way.

Constants for channel:

```
const UndefinedChannel = 0
const RedChannel = &h0001
const GrayChannel = &h0001
const CyanChannel = &h0001
const GreenChannel = &h0002
const MagentaChannel = &h0002
const BlueChannel = &h0004
const YellowChannel = &h0004
const AlphaChannel = &h0008
const OpacityChannel = &h0008
const BlackChannel = &h0020
const IndexChannel = &h0020
const AllChannels = &h7fffffff
```

100.20.11 Average as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Average() method takes a set of images and averages them together.
Notes: Each image in the set must have the same width and height. Average() returns a single image with each corresponding pixel component of each image averaged. On failure, a nil image is returned and exception describes the reason for the failure.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.20.12 BilevelChannel(channel as Integer, threshold as Double) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the value of individual pixels based on the intensity of each pixel channel.
Notes: The result is a high-contrast image.

channel: The channel type.
threshold: define the threshold values.

Constants for channel:

For more details please check the ImageMagick documentation.

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.20.13 BlackThreshold(threshold as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: BlackThreshold is like Threshold but forces all pixels below the threshold into black while leaving all pixels above the threshold unchanged.
Notes: No exceptions are generated.
threshold: Define the threshold value. (ASCII string)
For more details please check the ImageMagick documentation.

100.20.14 BlobSize as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The expected size for this image written to a file.
Notes: For more details please check the ImageMagick documentation.

100.20.15 Blur(radius as Double, sigma as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blurs an image.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, the radius should be larger than sigma. Use a radius of 0 and BlurImage selects a suitable radius for you.

radius: The radius of the Gaussian, in pixels, not counting the center pixel.
sigma: The standard deviation of the Gaussian, in pixels.

For more details please check the ImageMagick documentation.

100.20.16 BlurImageChannel(channel as Integer, radius as Double, sigma as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blurs an image.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, the radius should be larger than sigma. Use a radius of 0 and BlurImageChannel selects a suitable radius for you.

channel: The channel type.
radius: The radius of the Gaussian, in pixels, not counting the center pixel.
sigma: The standard deviation of the Gaussian, in pixels.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

For more details please check the ImageMagick documentation.

100.20.17 BorderImage(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Surrounds the image with a border of the color defined by the bordercolor member of the image.
Notes: The width and height of the border are defined by the corresponding parameters.

100.20.18 BrightnessContrastImage(brightness as Double, contrast as Double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the brightness and/or contrast of an image. It converts the brightness and contrast parameters into slope and intercept and calls a polynomical function to apply to the image.
Notes: Returns true on success or false on failure.

brightness: the brightness percent (-100 .. 100).
contrast: the contrast percent (-100 .. 100).

100.20.19 BrightnessContrastImageChannel(ChannelType as Integer, brightness as Double, contrast as Double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the brightness and/or contrast of an image. It converts the brightness and contrast parameters into slope and intercept and calls a polynomical function to apply to the image.
Notes: Returns true on success or false on failure.

brightness: the brightness percent (-100 .. 100).
contrast: the contrast percent (-100 .. 100).
ChannelType: The channels to use.

Constants for channel:

100.20.20 Charcoal(radius as Double, sigma as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Charcoal creates a new image that is a copy of an existing one with the edge highlighted.
Notes: radius: the radius of the pixel neighborhood.
sigma: The standard deviation of the Gaussian, in pixels.

Returns nil on any error.
Sets the last exception property.

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.20.21 Chop(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chop removes a region of an image and collapses the image to occupy the removed portion.
Notes: Returns nil on any error.
Sets the last exception property.

100.20.22 ClipPath(path as string, inside as boolean) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the image clip mask based any clipping path information if it exists.
Notes:

pathname:	name of clipping path resource. If name is preceded by #, use clipping path numbered by name.
inside:	if true, later operations take effect inside clipping path. Otherwise later operations take effect outside clipping path.

Returns true on success and false on any error.

100.20.23 Clone as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this image object.
Notes: For more details please check the ImageMagick documentation.

100.20.24 CloneImageAttributes(image as IMImageAttributeQ32MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: CloneImageAttributes() clones one or more image attributes.
Notes: Returns false on any error.

100.20.25 CloneImageProfiles(SourceImage as IMImageQ32MBS) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones one or more image profiles.
Notes: Returns false on any error and true on success.

100.20.26 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources used by this object now without waiting for Xojo to do it for you.

100.20.27 ClutImage(clutImage as IMImageQ32MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each color value in the given image, by using it as an index to lookup a replacement color value in a Color Look UP Table in the form of an image.
Notes: The values are extracted along a diagonal of the CLUT image so either a horizontal or vertial gradient image can be used.

Typically this is used to either re-color a gray-scale image according to a color gradient in the CLUT image, or to perform a freeform histogram (level) adjustment according to the (typically gray-scale) gradient in the CLUT image.

When the 'channel' mask includes the matte/alpha transparency channel but one image has no such channel it is assumed that that image is a simple gray-scale image that will effect the alpha channel values, either

for gray-scale coloring (with transparent or semi-transparent colors), or a histogram adjustment of existing alpha channel values. If both images have matte channels, direct and normal indexing is applied, which is rarely used.

ClutImage: the color lookup table image for replacement color values.

Returns true on success or false on failure.

100.20.28 ClutImageChannel(ChannelType as Integer, clutImage as IMImageQ32MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each color value in the given image, by using it as an index to lookup a replacement color value in a Color Look UP Table in the form of an image.
Notes: The values are extracted along a diagonal of the CLUT image so either a horizontal or vertial gradient image can be used.

Typically this is used to either re-color a gray-scale image according to a color gradient in the CLUT image, or to perform a freeform histogram (level) adjustment according to the (typically gray-scale) gradient in the CLUT image.

When the 'channel' mask includes the matte/alpha transparency channel but one image has no such channel it is assumed that that image is a simple gray-scale image that will effect the alpha channel values, either for gray-scale coloring (with transparent or semi-transparent colors), or a histogram adjustment of existing alpha channel values. If both images have matte channels, direct and normal indexing is applied, which is rarely used.

ClutImage: the color lookup table image for replacement color values.
ChannelType: The channels to use.

Returns true on success or false on failure.

Constants for channel:

100.20.29 CoalesceImages as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: CoalesceImages composites a set of images while respecting any page offsets and disposal meth-

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

ods.
Notes: GIF, MIFF, and MNG animation sequences typically start with an image background and each subsequent image varies in size and offset. CoalesceImages() returns a new sequence where each image in the sequence is the same size as the first and composited with the next image in the sequence.

Returns nil on any error.
Sets the last exception property.

100.20.30 Colorize(opacity as string, PenColorRed as Integer, PenColorGreen as Integer, PenColorBlue as Integer, PenColorOpacity as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method ColorizeImage creates a new image that is a copy of an existing one with the image pixels colorized.
Notes: The colorization is controlled with the pen color and the opacity levels.

opacity: A character string indicating the level of opacity as a percentage (0-100).
PenColorRed, PenColorGreen, PenColorBlue and PenColorOpacity define the pen color used.

Returns nil on any error.
Sets the last exception property.

100.20.31 Combine(channel as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines one or more images into a single image.
Notes: The grayscale value of the pixels of each image in the sequence is assigned in order to the specified channels of the combined image. The typical ordering would be image 1 =>Red, 2 =>Green, 3 =>Blue, etc.

The lastexception property is set.

100.20.32 CompareImageLayers(ImageLayerMethod as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: CompareImageLayers() compares each image with the next in a sequence and returns the minimum bounding region of all the pixel differences (of the mageLayerMethod specified) it discovers.
Notes: Images do NOT have to be the same size, though it is best that all the images are 'coalesced' (images are all the same size, on a flattened canvas, so as to represent exactly how an specific frame should look).

No GIF dispose methods are applied, so GIF animations must be coalesced before applying this image operator to find differences to them.

ImageLayerMethod:
the layers type to compare images with. Must be one of... CompareAnyLayer, CompareClearLayer, CompareOverlayLayer.

Can raise an exception.

100.20.33 Composite(ComposeOperator as Integer, Image as IMImageQ32MBS, x as Integer, y as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the second image composited onto the first at the specified offsets.
Notes: compose: Specifies an image composite operator.
Image: The second image.
x: An integer that specifies the column offset of the composited image.
y: An integer that specifies the row offset of the composited image.

No error code and exception!

100.20.34 ConsolidateCMYKImages as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Consolidates a sequence of CMYK images.
Notes: Returns nil on any error.
Sets the last exception property.

100.20.35 ContrastImage(sharpen as boolean) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enhances the intensity differences between the lighter and darker elements of the image.
Notes: Returns true on success or false on failure.
Set sharpen to true to increase the image contrast otherwise the contrast is reduced.

100.20.36 CopyPicture as picture

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the Image Magick Image and returns a Xojo picture.
Example:

```
// This example needs a window with Canvas1.
Var image as IMImageQ32MBS // your image
Canvas1.Backdrop=image.CopyPicture
```

Notes: Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
See also:

- 100.20.37 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture 16019

100.20.37 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a portion of the Image Magick Image and returns a Xojo picture.
Example:

```
// This example needs a window with Canvas1.
Var image as IMImageQ32MBS // your image
```

```
Canvas1.Backdrop=image.CopyPicture(0,0,image.Width,image.Height)
```

Notes: Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
x and y are zero based.
See also:

- 100.20.36 CopyPicture as picture 16019

100.20.38 CopyPictureMask as picture

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the mask of the Image Magick Image and returns a Xojo picture.
Example:

```
// This example needs a window with Canvas1.
Var image as IMImageQ32MBS // your image
Canvas1.Backdrop=image.CopyPictureMask
```

Notes: Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
See also:

- 100.20.39 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture 16020

100.20.39 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a portion of the mask of the Image Magick Image and returns a Xojo picture.
Example:

```
// This example needs a window with Canvas1.
Var image as IMImageQ32MBS // your image
Canvas1.Backdrop=image.CopyPictureMask(0,0,image.Width,image.Height)
```

Notes: Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
x and y are zero based.
See also:

• 100.20.38 CopyPictureMask as picture 16020

100.20.40 CopyPixel(x as Integer, y as Integer) as IMColorQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a pixel.
Notes: Returns nil on any error.
This method works only for bitmap images.
x and y are zero based.

100.20.41 CreateHBITMAP as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Creates a HBITMAP for the image for use with Windows Declares.
Notes: The HBITMAP returned needs to be freed when you are done with it or you risk having a memory leak.

100.20.42 Crop(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Crop extracts a region of the image starting at the offset defined by geometry.
Notes: Returns nil on any error.
Sets the last exception property.

100.20.43 CropImageToTiles(CropGeometry as string) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Crops a single image, into a possible list of tiles.
Notes: This may include a single sub-region of the image. This basically applies all the normal geometry flags for Crop.

100.20.44 CycleColormap(displace as Integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Displaces an image's colormap by a given number of positions.
Notes: If you cycle the colormap a number of times you can produce a psychodelic effect.
Returns true on success.
displace: displace the colormap this amount.

100.20.45 DecipherImage(passkey as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts cipher pixels to plain pixels.
Notes: Passkey: decipher cipher pixels with this passphrase.
Returns true on success.

100.20.46 DeconstructImages as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeconstructImages() compares each image with the next in a sequence and returns the minimum bounding region of all differences from the first image.
Notes: Returns nil on any error.
Sets the last exception property.

100.20.47 DeleteImageAttribute(key as string) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteImageAttribute() deletes an attribute from the image.
Notes: Returns false on any error.

100.20.48 Despeckle() as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reduces the speckle noise in an image while perserving the edges of the original image.
Notes: Sets the last exception property.
For more details please check the ImageMagick documentation.

100.20.49 DestroyImage

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Releases the memory used for this image and sets handle to 0.
Notes: For more details please check the ImageMagick documentation.
The destructor will call this for you if release=true.

100.20.50 DestroyImageAttributes

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deallocates memory associated with the image attribute list.

100.20.51 DestroyImageList

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Destroys the image list and sets the handle to 0.
Notes: For more details please check the ImageMagick documentation.
The destructor will call this for you if release=true.

100.20.52 DestroyImageProfiles

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Releases memory associated with an image profile map.

100.20.53 DistortImage(DistortImageMethod as Integer, values() as Double, bestfit as boolean) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: DistortImage() distorts an image using various distortion methods, by mapping color lookups of the source image to a new destination image usally of the same size as the source image, unless 'bestfit' is set to true.
Notes: If 'bestfit' is enabled, and distortion allows it, the destination image is adjusted to ensure the whole source 'image' will just fit within the final destination image, which will be sized and offset accordingly. Also in many cases the virtual offset of the source image will be taken into account in the mapping.

If the '-verbose' control option has been set print to standard error the equicelent '-fx' formula with coefficients for the function, if practical.

A description of each parameter follows:
self: the image to be distorted.
m: the method of image distortion. ArcDistortion always ignores source image offset, and always 'bestfit' the destination image with the top left corner offset relative to the polar mapping center. Affine, Perspective, and Bilinear, do least squares fitting of the distrotion when more than the minimum number of control point pairs are provided. Perspective, and Bilinear, fall back to a Affine distortion when less than 4 control point pairs are provided. While Affine distortions let you use any number of control point pairs, that is Zero pairs is a No-Op (viewport only) distortion, one pair is a translation and two pairs of control points do a scale-rotate-translate, without any shearing.
values: arguments given.
bestfit: Attempt to 'bestfit' the size of the resulting image. This also forces the resulting image to be a 'layered' virtual canvas image. Can be overridden using 'distort:viewport' setting.

Extra Controls from Image meta-data (artifacts)...

- "verbose" Output to stderr alternatives, internal coefficents, and FX equivalents for the distortion operation (if feasible). This forms an extra check of the distortion method, and allows users access to the internal constants IM calculates for the distortion.
- "distort:viewport" Directly set the output image canvas area and offest to use for the resulting image, rather than use the original images canvas, or a calculated 'bestfit' canvas.
- "distort:scale" Scale the size of the output canvas by this amount to provide a method of Zooming, and for super-sampling the results.

Other settings that can effect results include

- 'interpolate' For source image lookups (scale enlargements)
- 'filter' Set filter to use for area-resampling (scale shrinking). Set to 'point' to turn off and use 'interpolate' lookup instead

See also:

100.20.55 Edge(radius as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds edges in an image.
Notes: Radius defines the radius of the convolution filter. Use a radius of 0 and Edge selects a suitable radius for you.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.20.56 Emboss(radius as Double, sigma as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a grayscale image with a three-dimensional effect.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, radius should be larger than sigma. Use a radius of 0 and Emboss selects a suitable radius for you.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.20.57 EncipherImage(passkey as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts pixels to cipher-pixels.
Notes: passkey: encipher pixels with this passphrase.
Returns true on success.

100.20.58 EqualizeImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a histogram equalization to the image.
Notes: Returns true on success or false on failure.

ChannelType: The channels to use.

100.20.59 EqualizeImageChannel(ChannelType as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a histogram equalization to the image.
Notes: Returns true on success or false on failure.

ChannelType: The channels to use.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.20.60 ExcerptImage(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a excerpt of the image as defined by the geometry.
Notes: Define the region of the image to extend with x, y, width, and height.

100.20.61 ExtentImage(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extends the image as defined by the geometry, gravity, and image background color.
Notes: Define the region of the image to extend with x, y, width, and height.

Set the (x,y) offset of the geometry to move the original image relative to the extended image.

100.20.62 FlattenImages as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flatten composites all images from the current image pointer to the end of the image list and returns a single flattened image.
Notes: Returns nil on any error.
Sets the last exception property.

100.20.63 Flip as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flip creates a vertical mirror image by reflecting the pixels around the central x-axis.
Notes: Returns nil on any error.
Sets the last exception property.

100.20.64 Flop as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flop creates a horizontal mirror image by reflecting the pixels around the central y-axis.
Notes: Returns nil on any error.
Sets the last exception property.

100.20.65 FrameImage(x as Integer, y as Integer, width as Integer, height as Integer, innerBevel as Integer, OuterBevel as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a simulated three-dimensional border around the image.
Notes: The color of the border is defined by the MatteColor of image. Width and height specify the border width of the vertical and horizontal sides of the frame. innerBevel and OuterBevel indicate the width of the inner and outer shadows of the frame.

100.20.66 FxImage(expression as string) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: FxImage() applies a mathematical expression to the specified image.
Notes: Can raise an exception.

100.20.67 GaussianBlurChannel(channel as Integer, radius as Double, sigma as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blurs an image.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, the radius should be larger than sigma. Use a radius of 0 and GaussianBlur selects a suitable radius for you.
Sets the last exception property.

radius: the radius of the Gaussian, in pixels, not counting the center pixel.
channel: The channel type.
sigma: the standard deviation of the Gaussian, in pixels.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

For more details please check the ImageMagick documentation.

100.20.68 GetImageAttribute(key as string) as IMImageAttributeQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetImageAttribute searches the list of image attributes and returns a reference to the attribute if it exists otherwise nil.

100.20.69 GetImageClippingPathAttribute as IMImageAttributeQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetImageClippingPathAttribute searches the list of image attributes and returns a reference to a clipping path if it exists otherwise nil.

100.20.70 GetImageProfile(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a profile associated with an image by name.
Notes: Returns "" on any error.

100.20.71 GetNextImageAttribute as IMImageAttributeQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetNextImageAttribute() gets the next image attribute.
Notes: Returns nil on any error.

100.20.72 GetNextImageProfile as string

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the next profile name for an image.
Notes: Returns "" on any error.

100.20.73 HandleMemory as memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content of the whole Image structure copied into a memoryblock.
Notes: Returns nil on any error.

100.20.74 ImagesToBlob(info as IMImageInfoQ32MBS) as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: ImagesToBlob implements direct to memory image formats.
Notes: It returns the image sequence as a string. The magick member of the ImageInfo structure determines the format of the returned blob (GIF, JPEG, PNG, etc.)

Note, some image formats do not permit multiple images to the same image stream (e.g. JPEG). in this instance, just the first image of the sequence is returned as a blob.

Sets the last exception property and returns "" on any error.
For more details please check the ImageMagick documentation.

100.20.75 ImageToBlob(info as IMImageInfoQ32MBS) as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: ImagesToBlob implements direct to memory image formats.
Example:

```
Var im as ImageMagickQ32MBS // global

Function IMPictureToString(p as picture, magick as string, quality as Integer) As string
Var image as new IMImageQ32MBS
Var imageinfo as IMImageInfoQ32MBS
Var s,data as string
Var impp as new IMMagickPixelPacketQ32MBS

// empty string for nil picture
if p = nil then
Return ""
end if

// create a new picture info

imageinfo = im.NewImageInfo
imageinfo.ColorSpace=1
// only color space is needed. 1 for RGB.

// background color of image
```

```
impp.red = 0
impp.Green = 0
impp.Blue = 0

// creates a new image object
if not image.NewImage(imageinfo,p.Width,p.Height,impp) then
Return ""
end if

// copy RB picture into IM Image at position 0/0
image.ColorSpace = 1
image.SetPicture(p,0,0)

// set compression data
imageinfo.Magick = magick
imageinfo.Quality = quality

// and rendering intent: 2=PerceptualIntent
'image.RenderingIntent = 2

// create image data
data = image.ImageToBlob(imageinfo)

// release memory
image.DestroyImage
imageinfo.DestroyImageInfo

// return result
Return data

Exception
// in case of an exception return nothing
Return ""

End Function
```

Notes: It returns the image sequence as a string. The magick member of the ImageInfo structure determines the format of the returned blob (GIF, JPEG, PNG, etc.)

Note, some image formats do not permit multiple images to the same image stream (e.g. JPEG). in this instance, just the first image of the sequence is returned as a blob.

Sets the last exception property and returns "" on any error.
For more details please check the ImageMagick documentation.

100.20.76 Implode(factor as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method ImplodeImage creates a new image that is a copy of an existing one with the image pixels "implode" by the specified percentage.
Notes: factor: A double value that defines the extent of the implosion.

Returns nil on any error.
Sets the last exception property.

100.20.77 IsBlobExempt as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the blob is exempt.
Notes: For more details please check the ImageMagick documentation.

100.20.78 IsBlobSeekable as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the blob is seekable.
Notes: For more details please check the ImageMagick documentation.

100.20.79 IsBlobTemporary as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the blob is temporary.
Notes: For more details please check the ImageMagick documentation.

100.20.80 Magnify as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A convenience method that scales an image proportionally to twice its size.
Notes: Sets the last exception property.
For more details please check the ImageMagick documentation.

100.20.81 MedianFilter(radius as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a digital filter that improves the quality of a noisy image.
Notes: Each pixel is replaced by the median in a set of neighboring pixels as defined by radius.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.20.82 MergeImageLayers(ImageLayerMethod as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: MergeImageLayers() composes all the image layers from the current given image onward to produce a single image of the merged layers.
Notes: The inital canvas's size depends on the given ImageLayerMethod, and is initialized using the first images images background color. The images are then compositied onto that image in sequence using the given composition that has been assigned to each individual image.

ImageLayerMethod:
the method of selecting the size of the initial canvas.

MergeLayer: Merge all layers onto a canvas just large enough to hold all the actual images. The virtual canvas of the first image is preserved but otherwise ignored.

FlattenLayer: Use the virtual canvas size of first image. Images which fall outside this canvas is clipped. This can be used to 'fill out' a given virtual canvas.

MosaicLayer: Start with the virtual canvas of the first image, enlarging left and right edges to contain all images. Images with negative offsets will be clipped.

Can raise an exception.

100.20.83 Minify as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A convenience method that scales an image proportionally to half its size.
Notes: Sets the last exception property.
For more details please check the ImageMagick documentation.

100.20.84 MosaicImages as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: MosaicImages inlays an image sequence to form a single coherent picture.
Notes: It returns a single image with each image in the sequence composited at the location defined by the page member of the image structure.
Returns nil on any error.
Sets the last exception property.

100.20.85 MotionBlur(radius as Double, sigma as Double, angle as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Simulates motion blur.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and MotionBlur selects a suitable radius for you. Angle gives the angle of the blurring motion.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.20.86 NegateImage(gray as boolean = false) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates the colors in the reference image.
Notes: Returns true on success or false on failure.
The grayscale option means that only grayscale values within the image are negated.

gray: If true, only negate grayscale pixels within the image.

100.20.87 NegateImageChannel(ChannelType as Integer, gray as boolean = false) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates the colors in the reference image.
Notes: Returns true on success or false on failure.
The grayscale option means that only grayscale values within the image are negated.

ChannelType: The channels to use.
gray: If true, only negate grayscale pixels within the image.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.20.88 NewImage(info as IMImageInfoQ32MBS, width as Integer, height as Integer, background as IMMagickPixelPacketQ32MBS) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new image.
Example:

```
Var im as ImageMagickQ32MBS // global
Var p as picture
Var imageinfo as IMImageInfoQ32MBS
Var image as IMImageQ32MBS
Var b as new IMMagickPixelPacketQ32MBS
b.Blue=65535
b.ColorSpace=1 // RGB
b.Depth=16

imageinfo = im.NewImageInfo
imageinfo.Depth=16
imageinfo.ColorSpace=1
```

```
//this should read any image IM understands
image = new IMImageQ32MBS
if image.NewImage(imageinfo,500,500,b) then
p=New Picture(300,300,32)
p.Graphics.ForeColor=Rgb(255,0,0)
p.Graphics.FillOval 0,0,300,300
image.SetPicture p,0,0
else
MessageBox "failed"
end if
```

Notes: Returns false on failure and true on success.

100.20.89 NormalizeImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enhances the contrast of a color image by mapping the darkest 2 percent of all pixel to black and the brightest 1 percent to white.
Notes: Returns true on success or false on failure.

100.20.90 NormalizeImageChannel(ChannelType as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enhances the contrast of a color image by mapping the darkest 2 percent of all pixel to black and the brightest 1 percent to white.
Notes: Returns true on success or false on failure.

ChannelType: The channels to auto-level. If the special 'SyncChannels' flag is set the min/max/mean value of all given channels is used for all given channels, to all channels in the same way.

Constants for channel:

100.20.91 OilPaint(radius as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method OilPaintImage creates a new image that is a copy of an existing one with each pixel component replaced with the color of greatest frequency in a circular neighborhood.
Notes: radius parameter: radius of the circular neighborhood.

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

Returns nil on any error.
Sets the last exception property.

100.20.92 OptimizeImageLayers as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: OptimizeImageLayers() compares each image the GIF disposed forms of the previous image in the sequence.
Notes: From this it attempts to select the smallest cropped image to replace each frame, while preserving the results of the GIF animation.

Can raise an exception.

100.20.93 OptimizeImageTransparency

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: OptimizeImageTransparency() takes a frame optimized GIF animation, and compares the overlayed pixels against the disposal image resulting from all the previous frames in the animation.
Notes: Any pixel that does not change the disposal image (and thus does not effect the outcome of an overlay) is made transparent.

WARNING: This modifies the current images directly, rather than generate a new image sequence.

Can raise an exception.

100.20.94 OptimizePlusImageLayers as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: OptimizeImagePlusLayers() is exactly as OptimizeImageLayers(), but may also add or even remove extra frames in the animation, if it improves the total number of pixels in the resulting GIF animation.
Notes: Can raise an exception.

100.20.95 ProfileImage(name as string, ProfileData as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds or removes a ICC, IPTC, or generic profile from an image.
Notes: If the ProfileData is "", it is removed from the image otherwise added. Use a name of '*' and a ProfileData of "" to remove all profiles from the image.

Returns false on any error and true on success.

100.20.96 RadialBlur(angle as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: RadialBlur applies a radial blur to the image.
Notes: angle: The angle of the radial blur.

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.20.97 RaiseImage(x as Integer, y as Integer, width as Integer, height as Integer, raise as boolean) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a simulated three-dimensional button-like effect by lightening and darkening the edges of the image.
Notes: Width and height define the width of the vertical and horizontal edge of the effect.
raise: A value other than zero creates a 3-D raise effect, otherwise it has a lowered effect.

100.20.98 RandomThresholdChannel(channel as Integer, thresholds as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Canges the value of individual pixels based on the intensity of each pixel compared to a random threshold.
Notes: The result is a low-contrast, two color image.

channel: The channel or channels to be thresholded.
thresholds: a geometry string containing low,high thresholds. If the string contains 2x2, 3x3, or 4x4, an ordered dither of order 2, 3, or 4 is performed instead. (ASCII string)

Sets the last exception property.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

For more details please check the ImageMagick documentation.

100.20.99 ReduceNoise(radius as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Smooths the contours of an image while still preserving edge information.
Notes: The algorithm works by replacing each pixel with its neighbor closest in value. A neighbor is defined by radius. Use a radius of 0 and ReduceNoise selects a suitable radius for you.

For more details please check the ImageMagick documentation.

100.20.100 RemoveDuplicateLayers

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes any image that is exactly the same as the next image in the given image list.
Notes: Image size and virtual canvas offset must also match, though not the virtual canvas size itself.

No check is made with regards to image disposal setting, though it is the dispose setting of later image that is kept. Also any time delays are also added together. As such coalesced image animations should still produce the same result, though with duplicte frames merged into a single frame.

100.20.101 RemoveFirstImageFromList as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the first image from the image list and returns the image.
Notes: Returns nil on any error.
For more details please check the ImageMagick documentation.

100.20.102 RemoveImageProfile(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a profile from the image-map by its name.

100.20.103 RemoveZeroDelayLayers

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes any image that as a zero delay time.
Notes: Such images generally represent intermediate or partial updates in GIF animations used for file optimization. They are not ment to be displayed to users of the animation. Viewable images in an animation should have a time delay of 3 or more centi-seconds (hundredths of a second).

However if all the frames have a zero time delay, then either the animation is as yet incomplete, or it is not a GIF animation. This is a non-sensible situation, so no image will be removed and a 'Zero Time Animation' warning (exception) given.

No warning will be given if no image was removed because all images had an appropriate non-zero time delay set.

Due to the special requirements of GIF disposal handling, GIF animations should be coalesced first, before calling this function, though that is not a requirement.

100.20.104 ResetImageAttributeIterator

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: ResetImageAttributeIterator() resets the image attributes iterator.
Notes: Use it in conjunction with GetNextImageAttribute() to iterate over all the values associated with an image.

100.20.105 ResetImageProfileIterator

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the image profile iterator.
Notes: Use it in conjunction with GetNextImageProfile() to iterate over all the profiles associated with an image.

100.20.106 Resize(width as Integer, height as Integer, FilterID as Integer, blur as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales an image to the desired dimensions.

Notes: Constants for the FilterID:

```
const PointFilter      =1
const BoxFilter        =2
const TriangleFilter   =3
const HermiteFilter    =4
const HanningFilter    =5
const HammingFilter    =6
const BlackmanFilter   =7
const GaussianFilter   =8
const QuadraticFilter  =9
const CubicFilter      =10
const CatromFilter     =11
const MitchellFilter   =12
const LanczosFilter    =13
const BesselFilter     =14
const SincFilter       =15
```

Most of the filters are FIR (finite impulse response), however, Bessel, Gaussian, and Sinc are IIR (infinite impulse response). Bessel and Sinc are windowed (brought down to zero) with the Blackman filter.
Sets the last exception property.

100.20.107 RGBTransformImage(Colorspace as Integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method RGBTransformImage converts the reference image from RGB to an alternate colorspace.
Notes: The transformation matrices are not the standard ones: the weights are rescaled to normalized the range of the transformed values to be [0..MaxRGB] .

colorspace: An integer value that indicates which colorspace to transform the image.

Returns false on any error and true on success.

constants:

100.20.108 Roll(x as Integer, y as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Roll offsets an image as defined by x and y.

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6
YCbCrColorspace	7
YCCColorspace	8
YIQColorspace	9
YPbPrColorspace	10
YUVColorspace	11
CMYKColorspace	12
sRGBColorspace	13
HSBColorspace	14
HSLColorspace	15
HWBColorspace	16

Notes: Returns nil on any error.
Sets the last exception property.

100.20.109 Rotate(degrees as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rotation of an image.
Notes: Method RotateImage creates a new image that is a rotated copy of an existing one. Positive angles rotate counter-clockwise (right-hand rule), while negative angles rotate clockwise. Rotated images are usually larger than the originals and have 'empty' triangular corners. X axis. Empty triangles left over from shearing the image are filled with the color specified by the image background_color. RotateImage allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Method RotateImage is based on the paper "A Fast Algorithm for General Raster Rotatation" by Alan W. Paeth. RotateImage is adapted from a similar method based on the Paeth paper written by Michael Halle of the Spatial Imaging Group, MIT Media Lab.

degrees: Specifies the number of degrees to rotate the image.

Sets the lastexception property.
Returns nil on low memory.
For more details please check the ImageMagick documentation.

100.20.110 Sample(width as Integer, height as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales an image to the desired dimensions with pixel sampling.
Notes: Unlike other scaling methods, this method does not introduce any additional color into the scaled image.
For more details please check the ImageMagick documentation.
Sets the last exception property.

100.20.111 Scale(width as Integer, height as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the size of an image to the given dimensions.
Example:

```
Var image as IMImageQ32MBS // your image
image=Image.Scale(100,80)
```

Notes: This method was designed by Bob Friesenhahn as a low cost thumbnail generator.

columns: The number of columns in the scaled image.
rows: The number of rows in the scaled image.

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.20.112 SetImageAttribute(key as string, value as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetImageAttribute searches the list of image attributes and replaces the attribute value.
Notes: If it is not found in the list, the attribute name and value is added to the list. If the attribute exists in the list, the value is concatenated to the attribute. SetImageAttribute returns True if the attribute is successfully concatenated or added to the list, otherwise False. If the value is "", the matching key is deleted from the list.

100.20.113 SetImageColorspace(Colorspace as Integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colorspace member of the Image structure.
Notes: Returns false on any error and true on success.

100.20.114 SetImageProfile(name as string, ProfileData as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a named profile to the image.
Notes: If a profile with the same name already exists, it is replaced. This method differs from the ProfileImage() method in that it does not apply CMS color profiles.

name: The profile name.
profiledata: The binary data of the profile.

Returns false on any error and true on success.

100.20.115 SetPicture(pic as picture, x as Integer, y as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the pixels from a given Xojo picture into the Image Magick Image at the given location.
Example:

```
Var image as IMImageQ32MBS // your image
Var p as picture

p=New Picture(32,32,32)
p.Graphics.ForeColor=rgb(0,255,0)
p.Graphics.FillRect 0,0,32,32

image.SetPicture(p,30,30)
```

Notes: Sets the last exception property.
The method will do nothing on bad bounds.
This method works only for bitmap images.
x and y are zero based.

100.20.116 SetPictureMask(maskpic as picture, x as Integer, y as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the pixels from a given Xojo picture into the mask of the Image Magick Image at the given location.
Example:

```
Var i as IMImageQ32MBS // your image
Var p as picture

p=New Picture(32,32,32)
p.Graphics.ForeColor=rgb(0,255,0)
p.Graphics.FillRect 0,0,32,32

i.SetPictureMask(p,30,30)
```

Notes: Sets the last exception property.
The method will do nothing on bad bounds.
This method works only for bitmap images.
x and y are zero based.
You may need to set matte=True after this.

100.20.117 SetPixel(x as Integer, y as Integer, newPixel as IMColorQ32MBS)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a pixel value.
Example:

```
Var image as IMImageQ32MBS // your image
Var co as IMColorQ32MBS

co=new IMColorQ32MBS
co.blue=65535 // max value
image.SetPixel 50,50,co // Makes Pixel 50/50 blue
```

Notes: The method will fail silently if the values are out of bounds or the image is not a bitmap image.
This method works only for bitmap images.
x and y are zero based.

100.20.118 Shade(gray as boolean, azimuth as Double, elevation as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shines a distant light on an image to create a three-dimensional effect.
Notes: You control the positioning of the light with azimuth and elevation; azimuth is measured in degrees

off the x axis and elevation is measured in pixels above the Z axis.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.20.119 SharpenChannel(channel as Integer, radius as Double, sigma as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sharpens one or more image channels.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, radius should be larger than sigma. Use a radius of 0 and Sharpen selects a suitable radius for you.

channel: The channel type.
radius: The radius of the Gaussian, in pixels, not counting the center pixel.
sigma: The standard deviation of the Laplacian, in pixels.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.20.120 Shave(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shave shaves pixels from the image edges.
Notes: It allocates the memory necessary for the new Image structure and returns a pointer to the new image.
Returns nil on any error.
Sets the last exception property.

100.20.121 Shear(Xshear as Double, Yshear as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method ShearImage creates a new image that is a shear_image copy of an existing one.
Notes: Shearing slides one edge of an image along the X or Y axis, creating a parallelogram. An X direction shear slides an edge along the X axis, while a Y direction shear slides an edge along the Y axis. The amount of the shear is controlled by a shear angle. For X direction shears, x_shear is measured relative to the Y axis, and similarly, for Y direction shears y_shear is measured relative to the X axis. Empty triangles left over from shearing the image are filled with the color defined by the pixel at location (0,0). ShearImage allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Xshear and YYshear specify the number of degrees to shear the image.

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.20.122 Solarize(factor as Double) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method SolarizeImage produces a 'solarization' effect seen when exposing a photographic film to light during the development process.
Notes: factor: An double value that defines the extent of the solarization.
Returns nil on any error.
Sets the last exception property.

100.20.123 Splice(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Splice splices a solid color into the image as defined by the geometry.
Notes: Returns nil on any error.
Sets the last exception property.

100.20.124 Spread(radius as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: This is a special effects method that randomly displaces each pixel in a block defined by the radius parameter.
Notes: radius: Choose a random pixel in a neighborhood of this extent.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.20.125 Stegano(watermarkImage as IMImageQ32MBS) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method SteganoImage hides a digital watermark within the image.
Notes: Returns nil on any error.
Sets the last exception property.

100.20.126 Stereo(otherImage as IMImageQ32MBS) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method StereoImage combines two images and produces a single image that is the composite of a left and right image of a stereo pair.
Notes: The left image is converted to gray scale and written to the red channel of the stereo image. The right image is converted to gray scale and written to the blue channel of the stereo image. View the composite image with red-blue glasses to create a stereo effect.

left image = self
right image = otherImage parameter

Returns nil on any error.
Sets the last exception property.

100.20.127 Swirl(degrees as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method SwirlImage creates a new image that is a copy of an existing one with the image pixels "swirl" at a specified angle.
Notes: degrees: An double value that defines the tightness of the swirling.

Returns nil on any error.
Sets the last exception property.

100.20.128 Thumbnail(width as Integer, height as Integer) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the size of an image to the given dimensions.
Notes: Sets the last exception property.
This method was designed by Bob Friesenhahn as a low cost thumbnail generator.
For more details please check the ImageMagick documentation.

100.20.129 TransformImage(CropGeometry as string, ImageGeometry as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: TransformImage() is a convenience method that behaves like ResizeImage() or CropImage() but accepts scaling and/or cropping information as a region geometry specification. If the operation fails, the original image handle is left as is.
Notes: This should only be used for single images.

CropGeometry: A crop geometry string. This geometry defines a subregion of the image to crop.
ImageGeometry: An image geometry string. This geometry defines the final size of the image.

Returns true on success.

100.20.130 TransformImages(CropGeometry as string, ImageGeometry as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: TransformImages() calls TransformImage() on each image of a sequence.
Notes: TransformImage() is a convenience method that behaves like ResizeImage() or CropImage() but accepts scaling and/or cropping information as a region geometry specification. If the operation fails, the original image handle is left as is.

CropGeometry: A crop geometry string. This geometry defines a subregion of the image to crop.
ImageGeometry: An image geometry string. This geometry defines the final size of the image.

Returns true on success.

100.20.131 TransformRGBImage(Colorspace as Integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method TransformRGBImage converts the reference image from an alternate colorspace.
Notes: The transformation matrices are not the standard ones: the weights are rescaled to normalized the range of the transformed values to be [0..MaxRGB] .

colorspace: An integer value that indicates the colorspace the image is currently in. On return the image is in the RGB color space.

Returns false on any error and true on success.

constants:

100.20.132 TransposeImage as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: TransposeImage() creates a horizontal mirror image by reflecting the pixels around the central y-axis while rotating them by 90 degrees.

100.20.133 TransverseImage as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6
YCbCrColorspace	7
YCCColorspace	8
YIQColorspace	9
YPbPrColorspace	10
YUVColorspace	11
CMYKColorspace	12
sRGBColorspace	13
HSBColorspace	14
HSLColorspace	15
HWBColorspace	16

Function: TransverseImage() creates a vertical mirror image by reflecting the pixels around the central x-axis while rotating them by 270 degrees.

100.20.134 Trim as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Trim trims pixels from the image edges.
Notes: It allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Returns nil on any error.
Sets the last exception property.

100.20.135 UnsharpMaskChannel(channel as Integer, radius as Double, sigma as Double, amount as Double, threshold as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sharpens one or more image channels.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and UnsharpMask selects a suitable radius for you.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.20.136 Wave(amplitude as Double, wavelength as Double) as IMImageQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method Wave creates a new image that is a copy of an existing one with the image pixels altered along a sine wave.
Notes: Parameters are double values that indicates the amplitude and wavelength of the sine wave.
Returns nil on any error.
Sets the last exception property.

100.20.137 WhiteThreshold(threshold as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: WhiteThreshold is like Threshold but forces all pixels above the threshold into white while leaving all pixels below the threshold unchanged.
Notes: No exceptions are generated.
threshold: Define the threshold value. (ASCII string)
For more details please check the ImageMagick documentation.

100.20.138 WriteImage(info as IMImageInfoQ32MBS) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method WriteImage writes an image to a file as defined by image.filename.
Notes: You can specify a particular image format by prefixing the file with the image type and a colon (i.e. ps:image) or specify the image type as the filename suffix (i.e. image.ps). The image may be modified to adapt it to the requirements of the image format. For example, DirectClass images must be color-reduced to PseudoClass if the format is GIF.

WriteImage returns True if the image is written. False is returned if there is a memory shortage or if the image file fails to write.

100.20.139 Properties

100.20.140 BackgroundColor as IMColorQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image background color.
Notes: (Read and Write property)

100.20.141 Bias as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.20.142 BlurFactor as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blur factor to apply to the image when zooming. Default is 1.0 (no blur).
Notes: (Read and Write property)

100.20.143 BorderColor as IMColorQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image border color.
Notes: (Read and Write property)

100.20.144 Colors as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The desired number of colors.
Notes: Used by Quantize().
(Read and Write property)

100.20.145 ColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image pixel interpretation.
Notes: If the colorspace is RGB the pixels are red, green, blue. If matte is true, then red, green, blue, and index. If it is CMYK, the pixels are cyan, yellow, magenta, black. Otherwise the colorspace is ignored.

constants:

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6
YCbCrColorspace	7
YCCColorspace	8
YIQColorspace	9
YPbPrColorspace	10
YUVColorspace	11
CMYKColorspace	12
sRGBColorspace	13
HSBColorspace	14
HSLColorspace	15
HWBColorspace	16

(Read and Write property)

100.20.146 Compression as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image compresion type.
Notes: useful constants:

```
const UndefinedCompression        = 0
const NoCompression               = 1
const BZipCompression             = 2
const FaxCompression              = 3
const Group4Compression           = 4
const JPEGCompression             = 5
const LosslessJPEGCompression     = 6
const LZWCompression              = 7
const RLECompression              = 8
const ZipCompression              = 9
```

The default is the compression type of the specified image file.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.20.147 Depth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image depth (8 or 16).
Notes: QuantumLeap must be defined before a depth of 16 is valid.
(Read and Write property)

100.20.148 Directory as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tile names from within an image montage.
Notes: Only valid after calling MontageImages() or reading a MIFF file which contains a directory.
(Read and Write property)

100.20.149 Endian as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The endian setting to use.
Notes: constants:

UndefinedEndian	0	
LSBEndian	1	(Windows)
MSBEndian	2	(Mac)

e.g. tiff files support different endian settings.
(Read and Write property)

100.20.150 Filename as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file path/name.
Notes: The string must be in the encoding of the library and is limited to 4000 bytes.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.20.151 Filter as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Filter to use when resizing image.
Notes: Constants:

The reduction filter employed has a sipngicant effect on the time required to resize an image and the resulting quality. The default filter is Lanczos which has been shown to produce high quality results when reducing most images.
(Read and Write property)

100.20.152 Fuzz as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colors within this distance are considered equal.
Notes: A number of algorithms search for a target color. By default the color must be exact. Use this to match colors that are close to the target color in RGB space.
(Read and Write property)

const PointFilter	=1
const BoxFilter	=2
const TriangleFilter	=3
const HermiteFilter	=4
const HanningFilter	=5
const HammingFilter	=6
const BlackmanFilter	=7
const GaussianFilter	=8
const QuadraticFilter	=9
const CubicFilter	=10
const CatromFilter	=11
const MitchellFilter	=12
const LanczosFilter	=13
const BesselFilter	=14
const SincFilter	=15

100.20.153 Gamma as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gamma level of the image.
Notes: The same color image displayed on two different workstations may look different due to differences in the display monitor. Use gamma correction to adjust for this color difference.
(Read and Write property)

100.20.154 Geometry as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Preferred size of the image when encoding.
Notes: (Read and Write property)

100.20.155 Gravity as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.20.156 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to an Image structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.20.157 Height as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the image in pixels.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.20.158 Interlace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of interlacing scheme (default NoInterlace).
Notes: This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV. NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files (e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.

constants:

UndefinedInterlace	0	Unset value.
NoInterlace	1	Don't interlace image (RGBRGBRGBRGBRGBRGB...)
LineInterlace	2	Use scanline interlacing (RRR...GGG...BBB...RRR...GGG...BBB...)
PlaneInterlace	3	Use plane interlacing (RRRRRR...GGGGGG...BBBBBB...)
PartitionInterlace	4	Similar to plane interlaing except that the different planes are saved to individual files (e.g. image.R, image.G, and image.B)

(Read and Write property)

100.20.159 LastError as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code reported.
Notes: If an exception is raised and it is not a warning exception, this exception code is saved in this property.
(Read and Write property)

100.20.160 LastException as IMExceptionQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last exception thrown by the Image Magick library.
Notes: You should check this value after every call to the library, process the error and set the property to nil.

For more details please check the ImageMagick documentation.
(Read and Write property)

100.20.161 Magick as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image encoding format (e.g. "GIF").
Notes: (Read and Write property)

100.20.162 Matte as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether an alpha channel is used/present.
Notes: Set to true to enable masks.
(Read and Write property)

100.20.163 MatteColor as IMColorQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image matte (transparent) color.
Notes: (Read and Write property)

100.20.164 Montage as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tile size and offset within an image montage. Only valid for montage images.
Notes: (Read and Write property)

100.20.165 Offset as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of initial bytes to skip over when reading raw image.
Notes: (Read and Write property)

100.20.166 Orientation as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The image orientation.
Notes: constants:

```
const UndefinedOrientation      = 0
const TopLeftOrientation        = 1
const TopRightOrientation       = 2
const BottomRightOrientation    = 3
const BottomLeftOrientation     = 4
const LeftTopOrientation        = 5
const RightTopOrientation       = 6
const RightBottomOrientation    = 7
const LeftBottomOrientation     = 8
```

For more details please check the ImageMagick documentation.
(Read and Write property)

100.20.167 Quality as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: JPEG/MIFF/PNG compression level.
Example:

```
Var im as ImageMagickQ32MBS // global
```

```
Function TestJPEG(f as folderitem) As picture
// Reads an image, compresses in memory to JPEG, decompresses using JPEGlib and returns the image
// if quality setting works, you see it in the result.
// no error checking included!

// needs: im as ImageMagickQ32MBS ready initialized

Var image as IMImageQ32MBS
Var imageinfo as IMImageInfoQ32MBS
Var s,blob as string
Var p as Picture
Var i as Integer

if f = nil then
Return nil
end if

imageinfo = im.NewImageInfo

imageinfo.Filename = f.NativePath

//this should read any image IM understands
image = im.ReadImage(imageinfo)
//check for error
if im.lastexception <>nil and im.LastException.Severity >= 400 then
s = "LastError: "+Format(im.LastError,"-0")+" - Severity: "+str(im.LastException.Severity)+EndOfLine+im.Las-
tException.Reason
MessageBox s
Return nil
elseif image = nil then
MessageBox "image=nil"
Return nil
end if

// Now lets convert to jpeg
imageinfo.Filename = "image.jpg"
imageinfo.Quality = 10 // 100 is max
blob = image.ImageToBlob(imageinfo)

// It may fail
if blob.lenb = 0 then
Return nil
end if
p = JPEGStringToPictureMBS(blob,true)

image.DestroyImage
imageinfo.DestroyImageInfo
```

```
Return p
Exception
Return nil
End Function
```

Notes: Default value is 75.
(Read and Write property)

100.20.168 Release as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: If true, the destructor will release the handle.
Notes: (Read and Write property)

100.20.169 RenderingIntent as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rendering intent to use.
Notes: constants:

UndefinedIntent	0
SaturationIntent	1
PerceptualIntent	2
AbsoluteIntent	3
RelativeIntent	4

(Read and Write property)

100.20.170 ResolutionUnits as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Units of image resolution.
Notes: constants:

(Read and Write property)

UndefinedResolution	0	Unset value.
PixelsPerInchResolution	1	Density specifications are specified in units of pixels per inch (english units).
PixelsPerCentimeterResolution	2	Density specifications are specified in units of pixels per centimeter (metric units).

100.20.171 ResolutionX as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The horizontal resolution of the image.
Notes: The unit for resolution must be specified.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.20.172 ResolutionY as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The vertical resolution of the image.
Notes: The unit for resolution must be specified.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.20.173 Scene as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.20.174 StorageClass as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image storage class.
Notes: If DirectClass then the image packets contain valid RGB or CMYK colors. If PseudoClass then the image has a colormap referenced by pixel's index member.

constants:

UndefinedClass	0	Unset value.
DirectClass	1	Image is composed of pixels which represent literal color values.
PseudoClass	2	Image is composed of pixels which specify an index in a color palette.

(Read and Write property)

100.20.175 Taint as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set to True if the image pixels have been modified.
Notes: (Read and Write property)

100.20.176 Width as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the image in pixels.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.20.177 Constants

Constants

Constant	Value	Description
kBackgroundDispose	2	One of the Image layer Dispose Types.
kCoalesceLayer	1	One of the Image layer method constants.
kCompareAnyLayer	2	One of the Image layer method constants.
kCompareClearLayer	3	One of the Image layer method constants.
kCompareOverlayLayer	4	One of the Image layer method constants.
kCompositeLayer	12	One of the Image layer method constants.
kDisposeLayer	5	One of the Image layer method constants.
kFlattenLayer	14	One of the Image layer method constants.
kMergeLayer	13	One of the Image layer method constants.
kMosaicLayer	15	One of the Image layer method constants.
kNoneDispose	1	One of the Image layer Dispose Types.
kOptimizeImageLayer	7	One of the Image layer method constants.
kOptimizeLayer	6	One of the Image layer method constants.
kOptimizePlusLayer	8	One of the Image layer method constants.
kOptimizeTransLayer	9	One of the Image layer method constants.
kPreviousDispose	3	One of the Image layer Dispose Types.
kRemoveDupsLayer	10	One of the Image layer method constants.
kRemoveZeroLayer	11	One of the Image layer method constants.
kUndefinedDispose	0	One of the Image layer Dispose Types.
kUndefinedLayer	0	One of the Image layer method constants.
kUnrecognizedDispose	0	One of the Image layer Dispose Types.

Distortion Effects

Constant	Value	Description
kAffineDistortion	1	
kAffineDistortion	1	
kAffineProjectionDistortion	2	
kAffineProjectionDistortion	2	
kArcDistortion	9	
kArcDistortion	9	
kBarrelDistortion	14	
kBarrelDistortion	14	
kBarrelInverseDistortion	15	
kBarrelInverseDistortion	15	
kBilinearDistortion	6	
kBilinearDistortion	6	
kBilinearForwardDistortion	6	
kBilinearForwardDistortion	6	
kBilinearReverseDistortion	7	
kBilinearReverseDistortion	7	
kCylinder2PlaneDistortion	12	
kCylinder2PlaneDistortion	12	
kDePolarDistortion	11	
kDePolarDistortion	11	
kPerspectiveDistortion	4	
kPerspectiveDistortion	4	
kPerspectiveProjectionDistortion	5	
kPerspectiveProjectionDistortion	5

kUndefinedColorInterpolate	0	
kUndefinedColorInterpolate	0	
kVoronoiColorInterpolate	18	
kVoronoiColorInterpolate	18	

100.21 class IMImageQ8MBS

100.21.1 class IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for an Image Magick Image in memory.
Notes: Can exist with or without pixel data.

For more details please check the ImageMagick documentation.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.1pr4

100.21.2 Methods

100.21.3 AdaptiveThreshold(width as Integer, height as Integer, offset as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: AdaptiveThreshold selects an individual threshold for each pixel based on the range of intensity values in its local neighborhood.
Notes: This allows for thresholding of an image whose global intensity histogram doesn't contain distinctive peaks.
Sets the last exception property.

width: The width of the local neighborhood.
height: The height of the local neighborhood.
offset: The mean offset.

For more details please check the ImageMagick documentation.

100.21.4 AddNoise(NoiseType as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds random noise to the image.
Notes: Constants

For more details please check the ImageMagick documentation.
Sets the last exception property.

UndefinedNoise	=0
UniformNoise	=1
GaussianNoise	=2
MultiplicativeGaussianNoise	=3
ImpulseNoise	=4
LaplacianNoise	=5
PoissonNoise	=6

100.21.5 AffineTransformImage(matrix as IMImageAffineMatrixQ8MBS) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transforms an image as dictated by the affine matrix.

100.21.6 AppendImageToList(img as IMImageQ8MBS)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds an image to the image list.
Notes: For more details please check the ImageMagick documentation.

100.21.7 AutoGammaImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: AutoGammaImage extract the 'mean' from the image and adjust the image to try make set its gamma appropriatally.
Notes: Returns true on success or false on failure.

100.21.8 AutoGammaImageChannel(ChannelType as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: AutoGammaImage extract the 'mean' from the image and adjust the image to try make set its gamma appropriatally.
Notes: Returns true on success or false on failure.

channelType: The channels to auto-level. If the special 'SyncChannels' flag is set all given channels is adjusted in the same way using the mean average of those channels.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.21.9 AutoLevelImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: AutoLevelImage adjusts the levels of a particular image channel by scaling the minimum and maximum values to the full quantum range.
Notes: Returns true on success or false on failure.

100.21.10 AutoLevelImageChannel(ChannelType as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: AutoLevelImage adjusts the levels of a particular image channel by scaling the minimum and maximum values to the full quantum range.
Notes: Returns true on success or false on failure.

ChannelType: The channels to auto-level. If the special 'SyncChannels' flag is set the min/max/mean value of all given channels is used for all given channels, to all channels in the same way.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.21.11 Average as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Average() method takes a set of images and averages them together.
Notes: Each image in the set must have the same width and height. Average() returns a single image with each corresponding pixel component of each image averaged. On failure, a nil image is returned and exception describes the reason for the failure.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.21.12 BilevelChannel(channel as Integer, threshold as Double) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the value of individual pixels based on the intensity of each pixel channel.
Notes: The result is a high-contrast image.

channel: The channel type.
threshold: define the threshold values.

Constants for channel:

For more details please check the ImageMagick documentation.

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.21.13 BlackThreshold(threshold as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: BlackThreshold is like Threshold but forces all pixels below the threshold into black while leaving all pixels above the threshold unchanged.
Notes: No exceptions are generated.
threshold: Define the threshold value. (ASCII string)
For more details please check the ImageMagick documentation.

100.21.14 BlobSize as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The expected size for this image written to a file.
Notes: For more details please check the ImageMagick documentation.

100.21.15 Blur(radius as Double, sigma as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blurs an image.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, the radius should be larger than sigma. Use a radius of 0 and BlurImage selects a suitable radius for you.

radius: The radius of the Gaussian, in pixels, not counting the center pixel.
sigma: The standard deviation of the Gaussian, in pixels.

For more details please check the ImageMagick documentation.

100.21.16 BlurImageChannel(channel as Integer, radius as Double, sigma as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blurs an image.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, the radius should be larger than sigma. Use a radius of 0 and BlurImageChannel selects a suitable radius for you.

channel: The channel type.
radius: The radius of the Gaussian, in pixels, not counting the center pixel.
sigma: The standard deviation of the Gaussian, in pixels.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

For more details please check the ImageMagick documentation.

100.21.17 BorderImage(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Surrounds the image with a border of the color defined by the bordercolor member of the image.
Notes: The width and height of the border are defined by the corresponding parameters.

100.21.18 BrightnessContrastImage(brightness as Double, contrast as Double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the brightness and/or contrast of an image. It converts the brightness and contrast parameters into slope and intercept and calls a polynomical function to apply to the image.
Notes: Returns true on success or false on failure.

brightness: the brightness percent (-100 .. 100).
contrast: the contrast percent (-100 .. 100).

100.21.19 BrightnessContrastImageChannel(ChannelType as Integer, brightness as Double, contrast as Double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the brightness and/or contrast of an image. It converts the brightness and contrast parameters into slope and intercept and calls a polynomical function to apply to the image.
Notes: Returns true on success or false on failure.

brightness: the brightness percent (-100 .. 100).
contrast: the contrast percent (-100 .. 100).
ChannelType: The channels to use.

Constants for channel:

100.21.20 Charcoal(radius as Double, sigma as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Charcoal creates a new image that is a copy of an existing one with the edge highlighted.
Notes: radius: the radius of the pixel neighborhood.
sigma: The standard deviation of the Gaussian, in pixels.

Returns nil on any error.
Sets the last exception property.

```
const UndefinedChannel = 0
const RedChannel = &h0001
const GrayChannel = &h0001
const CyanChannel = &h0001
const GreenChannel = &h0002
const MagentaChannel = &h0002
const BlueChannel = &h0004
const YellowChannel = &h0004
const AlphaChannel = &h0008
const OpacityChannel = &h0008
const BlackChannel = &h0020
const IndexChannel = &h0020
const AllChannels = &h7fffffff
```

100.21.21 Chop(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Chop removes a region of an image and collapses the image to occupy the removed portion.
Notes: Returns nil on any error.
Sets the last exception property.

100.21.22 ClipPath(path as string, inside as boolean) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the image clip mask based any clipping path information if it exists.
Notes:

pathname:	name of clipping path resource. If name is preceded by #, use clipping path numbered by name.
inside:	if true, later operations take effect inside clipping path. Otherwise later operations take effect outside clipping path.

Returns true on success and false on any error.

100.21.23 Clone as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this image object.
Notes: For more details please check the ImageMagick documentation.

100.21.24 CloneImageAttributes(image as IMImageAttributeQ8MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: CloneImageAttributes() clones one or more image attributes.
Notes: Returns false on any error.

100.21.25 CloneImageProfiles(SourceImage as IMImageQ8MBS) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones one or more image profiles.
Notes: Returns false on any error and true on success.

100.21.26 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources used by this object now without waiting for Xojo to do it for you.

100.21.27 ClutImage(clutImage as IMImageQ8MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each color value in the given image, by using it as an index to lookup a replacement color value in a Color Look UP Table in the form of an image.
Notes: The values are extracted along a diagonal of the CLUT image so either a horizontal or vertial gradient image can be used.

Typically this is used to either re-color a gray-scale image according to a color gradient in the CLUT image, or to perform a freeform histogram (level) adjustment according to the (typically gray-scale) gradient in the CLUT image.

When the 'channel' mask includes the matte/alpha transparency channel but one image has no such channel it is assumed that that image is a simple gray-scale image that will effect the alpha channel values, either

for gray-scale coloring (with transparent or semi-transparent colors), or a histogram adjustment of existing alpha channel values. If both images have matte channels, direct and normal indexing is applied, which is rarely used.

ClutImage: the color lookup table image for replacement color values.

Returns true on success or false on failure.

100.21.28 ClutImageChannel(ChannelType as Integer, clutImage as IMImageQ8MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each color value in the given image, by using it as an index to lookup a replacement color value in a Color Look UP Table in the form of an image.
Notes: The values are extracted along a diagonal of the CLUT image so either a horizontal or vertial gradient image can be used.

Typically this is used to either re-color a gray-scale image according to a color gradient in the CLUT image, or to perform a freeform histogram (level) adjustment according to the (typically gray-scale) gradient in the CLUT image.

When the 'channel' mask includes the matte/alpha transparency channel but one image has no such channel it is assumed that that image is a simple gray-scale image that will effect the alpha channel values, either for gray-scale coloring (with transparent or semi-transparent colors), or a histogram adjustment of existing alpha channel values. If both images have matte channels, direct and normal indexing is applied, which is rarely used.

ClutImage: the color lookup table image for replacement color values.
ChannelType: The channels to use.

Returns true on success or false on failure.

Constants for channel:

100.21.29 CoalesceImages as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: CoalesceImages composites a set of images while respecting any page offsets and disposal meth-

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

ods.
Notes: GIF, MIFF, and MNG animation sequences typically start with an image background and each subsequent image varies in size and offset. CoalesceImages() returns a new sequence where each image in the sequence is the same size as the first and composited with the next image in the sequence.

Returns nil on any error.
Sets the last exception property.

100.21.30 Colorize(opacity as string, PenColorRed as Integer, PenColorGreen as Integer, PenColorBlue as Integer, PenColorOpacity as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method ColorizeImage creates a new image that is a copy of an existing one with the image pixels colorized.
Notes: The colorization is controlled with the pen color and the opacity levels.

opacity: A character string indicating the level of opacity as a percentage (0-100).
PenColorRed, PenColorGreen, PenColorBlue and PenColorOpacity define the pen color used.

Returns nil on any error.
Sets the last exception property.

100.21.31 Combine(channel as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines one or more images into a single image.
Notes: The grayscale value of the pixels of each image in the sequence is assigned in order to the specified channels of the combined image. The typical ordering would be image 1 =>Red, 2 =>Green, 3 =>Blue, etc.

The lastexception property is set.

100.21.32 CompareImageLayers(ImageLayerMethod as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: CompareImageLayers() compares each image with the next in a sequence and returns the minimum bounding region of all the pixel differences (of the mageLayerMethod specified) it discovers.
Notes: Images do NOT have to be the same size, though it is best that all the images are 'coalesced' (images are all the same size, on a flattened canvas, so as to represent exactly how an specific frame should look).

No GIF dispose methods are applied, so GIF animations must be coalesced before applying this image operator to find differences to them.

ImageLayerMethod:
the layers type to compare images with. Must be one of... CompareAnyLayer, CompareClearLayer, CompareOverlayLayer.

Can raise an exception.

100.21.33 Composite(ComposeOperator as Integer, Image as IMImageQ8MBS, x as Integer, y as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the second image composited onto the first at the specified offsets.
Notes: compose: Specifies an image composite operator.
Image: The second image.
x: An integer that specifies the column offset of the composited image.
y: An integer that specifies the row offset of the composited image.

No error code and exception!

100.21.34 ConsolidateCMYKImages as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Consolidates a sequence of CMYK images.
Notes: Returns nil on any error.
Sets the last exception property.

100.21.35 ContrastImage(sharpen as boolean) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enhances the intensity differences between the lighter and darker elements of the image.
Notes: Returns true on success or false on failure.
Set sharpen to true to increase the image contrast otherwise the contrast is reduced.

100.21.36 CopyPicture as picture

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the Image Magick Image and returns a Xojo picture.
Example:

```
// This example needs a window with Canvas1.
Var image as IMImageQ8MBS // your image
Canvas1.Backdrop=image.CopyPicture
```

Notes: Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
See also:

- 100.21.37 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture

100.21.37 CopyPicture(x as Integer, y as Integer, width as Integer, height as Integer) as picture

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a portion of the Image Magick Image and returns a Xojo picture.
Example:

```
// This example needs a window with Canvas1.
Var image as IMImageQ8MBS // your image
```

```
Canvas1.Backdrop=image.CopyPicture(0,0,image.Width,image.Height)
```

Notes: Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
x and y are zero based.
See also:

- 100.21.36 CopyPicture as picture 16082

100.21.38 CopyPictureMask as picture

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the mask of the Image Magick Image and returns a Xojo picture.
Example:

```
// This example needs a window with Canvas1.
Var image as IMImageQ8MBS // your image
Canvas1.Backdrop=image.CopyPictureMask
```

Notes: Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
See also:

- 100.21.39 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture 16083

100.21.39 CopyPictureMask(x as Integer, y as Integer, width as Integer, height as Integer) as picture

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a portion of the mask of the Image Magick Image and returns a Xojo picture.
Example:

```
// This example needs a window with Canvas1.
Var image as IMImageQ8MBS // your image
Canvas1.Backdrop=image.CopyPictureMask(0,0,image.Width,image.Height)
```

Notes: Sets the last exception property.
Returns nil on any error.
This method works only for bitmap images.
x and y are zero based.
See also:

• 100.21.38 CopyPictureMask as picture 16083

100.21.40 CopyPixel(x as Integer, y as Integer) as IMColorQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a pixel.
Notes: Returns nil on any error.
This method works only for bitmap images.
x and y are zero based.

100.21.41 CreateHBITMAP as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Creates a HBITMAP for the image for use with Windows Declares.
Notes: The HBITMAP returned needs to be freed when you are done with it or you risk having a memory leak.

100.21.42 Crop(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Crop extracts a region of the image starting at the offset defined by geometry.
Notes: Returns nil on any error.
Sets the last exception property.

100.21.43 CropImageToTiles(CropGeometry as string) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Crops a single image, into a possible list of tiles.
Notes: This may include a single sub-region of the image. This basically applies all the normal geometry flags for Crop.

100.21.44 CycleColormap(displace as Integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Displaces an image's colormap by a given number of positions.
Notes: If you cycle the colormap a number of times you can produce a psychodelic effect.
Returns true on success.
displace: displace the colormap this amount.

100.21.45 DecipherImage(passkey as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts cipher pixels to plain pixels.
Notes: Passkey: decipher cipher pixels with this passphrase.
Returns true on success.

100.21.46 DeconstructImages as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeconstructImages() compares each image with the next in a sequence and returns the minimum bounding region of all differences from the first image.
Notes: Returns nil on any error.
Sets the last exception property.

100.21.47 DeleteImageAttribute(key as string) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteImageAttribute() deletes an attribute from the image.
Notes: Returns false on any error.

100.21.48 Despeckle() as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reduces the speckle noise in an image while perserving the edges of the original image.
Notes: Sets the last exception property.
For more details please check the ImageMagick documentation.

100.21.49 DestroyImage

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Releases the memory used for this image and sets handle to 0.
Notes: For more details please check the ImageMagick documentation.
The destructor will call this for you if release=true.

100.21.50 DestroyImageAttributes

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deallocates memory associated with the image attribute list.

100.21.51 DestroyImageList

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Destroys the image list and sets the handle to 0.
Notes: For more details please check the ImageMagick documentation.
The destructor will call this for you if release=true.

100.21.52 DestroyImageProfiles

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Releases memory associated with an image profile map.

100.21.53 DistortImage(DistortImageMethod as Integer, values() as Double, bestfit as boolean) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 12.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: DistortImage() distorts an image using various distortion methods, by mapping color lookups of the source image to a new destination image usally of the same size as the source image, unless 'bestfit' is set to true.
Notes: If 'bestfit' is enabled, and distortion allows it, the destination image is adjusted to ensure the whole source 'image' will just fit within the final destination image, which will be sized and offset accordingly. Also in many cases the virtual offset of the source image will be taken into account in the mapping.

If the '-verbose' control option has been set print to standard error the equicelent '-fx' formula with coefficients for the function, if practical.

A description of each parameter follows:
self: the image to be distorted.
m: the method of image distortion. ArcDistortion always ignores source image offset, and always 'bestfit' the destination image with the top left corner offset relative to the polar mapping center. Affine, Perspective, and Bilinear, do least squares fitting of the distrotion when more than the minimum number of control point pairs are provided. Perspective, and Bilinear, fall back to a Affine distortion when less than 4 control point pairs are provided. While Affine distortions let you use any number of control point pairs, that is Zero pairs is a No-Op (viewport only) distortion, one pair is a translation and two pairs of control points do a scale-rotate-translate, without any shearing.
values: arguments given.
bestfit: Attempt to 'bestfit' the size of the resulting image. This also forces the resulting image to be a 'layered' virtual canvas image. Can be overridden using 'distort:viewport' setting.

Extra Controls from Image meta-data (artifacts)...

- "verbose" Output to stderr alternatives, internal coefficents, and FX equivalents for the distortion operation (if feasible). This forms an extra check of the distortion method, and allows users access to the internal constants IM calculates for the distortion.
- "distort:viewport" Directly set the output image canvas area and offest to use for the resulting image, rather than use the original images canvas, or a calculated 'bestfit' canvas.
- "distort:scale" Scale the size of the output canvas by this amount to provide a method of Zooming, and for super-sampling the results.

Other settings that can effect results include

- 'interpolate' For source image lookups (scale enlargements)
- 'filter' Set filter to use for area-resampling (scale shrinking). Set to 'point' to turn off and use 'interpolate' lookup instead

100.21.54 Edge(radius as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds edges in an image.
Notes: Radius defines the radius of the convolution filter. Use a radius of 0 and Edge selects a suitable radius for you.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.21.55 Emboss(radius as Double, sigma as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a grayscale image with a three-dimensional effect.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, radius should be larger than sigma. Use a radius of 0 and Emboss selects a suitable radius for you.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.21.56 EncipherImage(passkey as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts pixels to cipher-pixels.
Notes: passkey: encipher pixels with this passphrase.
Returns true on success.

100.21.57 EqualizeImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a histogram equalization to the image.
Notes: Returns true on success or false on failure.

ChannelType: The channels to use.

100.21.58 EqualizeImageChannel(ChannelType as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a histogram equalization to the image.
Notes: Returns true on success or false on failure.

ChannelType: The channels to use.

Constants for channel:

```
const UndefinedChannel = 0
const RedChannel = &h0001
const GrayChannel = &h0001
const CyanChannel = &h0001
const GreenChannel = &h0002
const MagentaChannel = &h0002
const BlueChannel = &h0004
const YellowChannel = &h0004
const AlphaChannel = &h0008
const OpacityChannel = &h0008
const BlackChannel = &h0020
const IndexChannel = &h0020
const AllChannels = &h7fffffff
```

100.21.59 ExcerptImage(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a excerpt of the image as defined by the geometry.
Notes: Define the region of the image to extend with x, y, width, and height.

100.21.60 ExtentImage(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extends the image as defined by the geometry, gravity, and image background color.
Notes: Define the region of the image to extend with x, y, width, and height.

Set the (x,y) offset of the geometry to move the original image relative to the extended image.

100.21.61 FlattenImages as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flatten composites all images from the current image pointer to the end of the image list and returns a single flattened image.
Notes: Returns nil on any error.

Sets the last exception property.

100.21.62 Flip as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flip creates a vertical mirror image by reflecting the pixels around the central x-axis.
Notes: Returns nil on any error.
Sets the last exception property.

100.21.63 Flop as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Flop creates a horizontal mirror image by reflecting the pixels around the central y-axis.
Notes: Returns nil on any error.
Sets the last exception property.

100.21.64 FrameImage(x as Integer, y as Integer, width as Integer, height as Integer, innerBevel as Integer, OuterBevel as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a simulated three-dimensional border around the image.
Notes: The color of the border is defined by the MatteColor of image. Width and height specify the border width of the vertical and horizontal sides of the frame. innerBevel and OuterBevel indicate the width of the inner and outer shadows of the frame.

100.21.65 FxImage(expression as string) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: FxImage() applies a mathematical expression to the specified image.
Notes: Can raise an exception.

100.21.66 GaussianBlurChannel(channel as Integer, radius as Double, sigma as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blurs an image.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, the radius should be larger than sigma. Use a radius of 0 and GaussianBlur selects a suitable radius for you.
Sets the last exception property.

radius: the radius of the Gaussian, in pixels, not counting the center pixel.
channel: The channel type.
sigma: the standard deviation of the Gaussian, in pixels.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

For more details please check the ImageMagick documentation.

100.21.67 GetImageAttribute(key as string) as IMImageAttributeQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetImageAttribute searches the list of image attributes and returns a reference to the attribute if it exists otherwise nil.

100.21.68 GetImageClippingPathAttribute as IMImageAttributeQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetImageClippingPathAttribute searches the list of image attributes and returns a reference to a clipping path if it exists otherwise nil.

100.21.69 GetImageProfile(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a profile associated with an image by name.
Notes: Returns "" on any error.

100.21.70 GetNextImageAttribute as IMImageAttributeQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetNextImageAttribute() gets the next image attribute.
Notes: Returns nil on any error.

100.21.71 GetNextImageProfile as string

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the next profile name for an image.
Notes: Returns "" on any error.

100.21.72 HandleMemory as memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content of the whole Image structure copied into a memoryblock.
Notes: Returns nil on any error.

100.21.73 ImagesToBlob(info as IMImageInfoQ8MBS) as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: ImagesToBlob implements direct to memory image formats.
Notes: It returns the image sequence as a string. The magick member of the ImageInfo structure determines the format of the returned blob (GIF, JPEG, PNG, etc.)

Note, some image formats do not permit multiple images to the same image stream (e.g. JPEG). in this instance, just the first image of the sequence is returned as a blob.

Sets the last exception property and returns "" on any error.
For more details please check the ImageMagick documentation.

100.21.74 ImageToBlob(info as IMImageInfoQ8MBS) as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: ImagesToBlob implements direct to memory image formats.
Example:

```
Var im as ImageMagickQ8MBS // global

Function IMPictureToString(p as picture, magick as string, quality as Integer) As string
Var image as new IMImageQ8MBS
Var imageinfo as IMImageInfoQ8MBS
Var s,data as string
Var impp as new IMMagickPixelPacketQ8MBS

// empty string for nil picture
if p = nil then
Return ""
end if

// create a new picture info

imageinfo = im.NewImageInfo
imageinfo.ColorSpace=1
// only color space is needed. 1 for RGB.

// background color of image
impp.red = 0
impp.Green = 0
impp.Blue = 0

// creates a new image object
if not image.NewImage(imageinfo,p.Width,p.Height,impp) then
Return ""
end if
```

```
// copy RB picture into IM Image at position 0/0
image.ColorSpace = 1
image.SetPicture(p,0,0)

// set compression data
imageinfo.Magick = magick
imageinfo.Quality = quality

// and rendering intent: 2=PerceptualIntent
'image.RenderingIntent = 2

// create image data
data = image.ImageToBlob(imageinfo)

// release memory
image.DestroyImage
imageinfo.DestroyImageInfo

// return result
Return data

Exception
// in case of an exception return nothing
Return ""

End Function
```

Notes: It returns the image sequence as a string. The magick member of the ImageInfo structure determines the format of the returned blob (GIF, JPEG, PNG, etc.)

Note, some image formats do not permit multiple images to the same image stream (e.g. JPEG). in this instance, just the first image of the sequence is returned as a blob.

Sets the last exception property and returns "" on any error.
For more details please check the ImageMagick documentation.

100.21.75 Implode(factor as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method ImplodeImage creates a new image that is a copy of an existing one with the image pixels "implode" by the specified percentage.

Notes: factor: A double value that defines the extent of the implosion.

Returns nil on any error.
Sets the last exception property.

100.21.76 IsBlobExempt as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the blob is exempt.
Notes: For more details please check the ImageMagick documentation.

100.21.77 IsBlobSeekable as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the blob is seekable.
Notes: For more details please check the ImageMagick documentation.

100.21.78 IsBlobTemporary as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the blob is temporary.
Notes: For more details please check the ImageMagick documentation.

100.21.79 Magnify as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A convenience method that scales an image proportionally to twice its size.
Notes: Sets the last exception property.
For more details please check the ImageMagick documentation.

100.21.80 MedianFilter(radius as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a digital filter that improves the quality of a noisy image.
Notes: Each pixel is replaced by the median in a set of neighboring pixels as defined by radius.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.21.81 MergeImageLayers(ImageLayerMethod as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: MergeImageLayers() composes all the image layers from the current given image onward to produce a single image of the merged layers.
Notes: The inital canvas's size depends on the given ImageLayerMethod, and is initialized using the first images images background color. The images are then compositied onto that image in sequence using the given composition that has been assigned to each individual image.

ImageLayerMethod:
the method of selecting the size of the initial canvas.

MergeLayer: Merge all layers onto a canvas just large enough to hold all the actual images. The virtual canvas of the first image is preserved but otherwise ignored.

FlattenLayer: Use the virtual canvas size of first image. Images which fall outside this canvas is clipped. This can be used to 'fill out' a given virtual canvas.

MosaicLayer: Start with the virtual canvas of the first image, enlarging left and right edges to contain all images. Images with negative offsets will be clipped.

Can raise an exception.

100.21.82 Minify as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A convenience method that scales an image proportionally to half its size.
Notes: Sets the last exception property.
For more details please check the ImageMagick documentation.

100.21.83 MosaicImages as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: MosaicImages inlays an image sequence to form a single coherent picture.
Notes: It returns a single image with each image in the sequence composited at the location defined by the page member of the image structure.
Returns nil on any error.
Sets the last exception property.

100.21.84 MotionBlur(radius as Double, sigma as Double, angle as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Simulates motion blur.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and MotionBlur selects a suitable radius for you. Angle gives the angle of the blurring motion.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.21.85 NegateImage(gray as boolean = false) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates the colors in the reference image.
Notes: Returns true on success or false on failure.
The grayscale option means that only grayscale values within the image are negated.

gray: If true, only negate grayscale pixels within the image.

100.21.86 NegateImageChannel(ChannelType as Integer, gray as boolean = false) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates the colors in the reference image.
Notes: Returns true on success or false on failure.
The grayscale option means that only grayscale values within the image are negated.

ChannelType: The channels to use.
gray: If true, only negate grayscale pixels within the image.

Constants for channel:

```
const UndefinedChannel = 0
const RedChannel = &h0001
const GrayChannel = &h0001
const CyanChannel = &h0001
const GreenChannel = &h0002
const MagentaChannel = &h0002
const BlueChannel = &h0004
const YellowChannel = &h0004
const AlphaChannel = &h0008
const OpacityChannel = &h0008
const BlackChannel = &h0020
const IndexChannel = &h0020
const AllChannels = &h7fffffff
```

100.21.87 NewImage(info as IMImageInfoQ8MBS, width as Integer, height as Integer, background as IMMagickPixelPacketQ8MBS) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new image.
Example:

```
Var im as ImageMagickQ8MBS // global
Var p as picture
Var imageinfo as IMImageInfoQ8MBS
Var image as IMImageQ8MBS
Var b as new IMMagickPixelPacketQ8MBS
b.Blue=65535
b.ColorSpace=1 // RGB
b.Depth=16

imageinfo = im.NewImageInfo
imageinfo.Depth=16
imageinfo.ColorSpace=1

//this should read any image IM understands
image = new IMImageQ8MBS
if image.NewImage(imageinfo,500,500,b) then
p=New Picture(300,300,32)
p.Graphics.ForeColor=Rgb(255,0,0)
```

```
p.Graphics.FillOval 0,0,300,300
image.SetPicture p,0,0
else
MessageBox "failed"
end if
```

Notes: Returns false on failure and true on success.

100.21.88 NormalizeImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enhances the contrast of a color image by mapping the darkest 2 percent of all pixel to black and the brightest 1 percent to white.
Notes: Returns true on success or false on failure.

100.21.89 NormalizeImageChannel(ChannelType as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 15.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enhances the contrast of a color image by mapping the darkest 2 percent of all pixel to black and the brightest 1 percent to white.
Notes: Returns true on success or false on failure.

ChannelType: The channels to auto-level. If the special 'SyncChannels' flag is set the min/max/mean value of all given channels is used for all given channels, to all channels in the same way.

Constants for channel:

100.21.90 OilPaint(radius as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method OilPaintImage creates a new image that is a copy of an existing one with each pixel component replaced with the color of greatest frequency in a circular neighborhood.
Notes: radius parameter: radius of the circular neighborhood.
Returns nil on any error.
Sets the last exception property.

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

100.21.91 OptimizeImageLayers as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: OptimizeImageLayers() compares each image the GIF disposed forms of the previous image in the sequence.
Notes: From this it attempts to select the smallest cropped image to replace each frame, while preserving the results of the GIF animation.

Can raise an exception.

100.21.92 OptimizeImageTransparency

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: OptimizeImageTransparency() takes a frame optimized GIF animation, and compares the overlayed pixels against the disposal image resulting from all the previous frames in the animation.
Notes: Any pixel that does not change the disposal image (and thus does not effect the outcome of an overlay) is made transparent.

WARNING: This modifies the current images directly, rather than generate a new image sequence.

Can raise an exception.

100.21.93 OptimizePlusImageLayers as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: OptimizeImagePlusLayers() is exactly as OptimizeImageLayers(), but may also add or even remove extra frames in the animation, if it improves the total number of pixels in the resulting GIF animation.
Notes: Can raise an exception.

100.21.94 ProfileImage(name as string, ProfileData as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds or removes a ICC, IPTC, or generic profile from an image.
Notes: If the ProfileData is "", it is removed from the image otherwise added. Use a name of '*' and a ProfileData of "" to remove all profiles from the image.

Returns false on any error and true on success.

100.21.95 RadialBlur(angle as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: RadialBlur applies a radial blur to the image.
Notes: angle: The angle of the radial blur.

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.21.96 RaiseImage(x as Integer, y as Integer, width as Integer, height as Integer, raise as boolean) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a simulated three-dimensional button-like effect by lightening and darkening the edges of the image.
Notes: Width and height define the width of the vertical and horizontal edge of the effect.
raise: A value other than zero creates a 3-D raise effect, otherwise it has a lowered effect.

100.21.97 RandomThresholdChannel(channel as Integer, thresholds as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Canges the value of individual pixels based on the intensity of each pixel compared to a random threshold.
Notes: The result is a low-contrast, two color image.

channel: The channel or channels to be thresholded.
thresholds: a geometry string containing low,high thresholds. If the string contains 2x2, 3x3, or 4x4, an ordered dither of order 2, 3, or 4 is performed instead. (ASCII string)

Sets the last exception property.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

For more details please check the ImageMagick documentation.

100.21.98 ReduceNoise(radius as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Smooths the contours of an image while still preserving edge information.
Notes: The algorithm works by replacing each pixel with its neighbor closest in value. A neighbor is defined by radius. Use a radius of 0 and ReduceNoise selects a suitable radius for you.

For more details please check the ImageMagick documentation.

100.21.99 RemoveDuplicateLayers

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes any image that is exactly the same as the next image in the given image list.
Notes: Image size and virtual canvas offset must also match, though not the virtual canvas size itself.

No check is made with regards to image disposal setting, though it is the dispose setting of later image that is kept. Also any time delays are also added together. As such coalesced image animations should still produce the same result, though with duplicte frames merged into a single frame.

100.21.100 RemoveFirstImageFromList as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the first image from the image list and returns the image.
Notes: Returns nil on any error.
For more details please check the ImageMagick documentation.

100.21.101 RemoveImageProfile(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a profile from the image-map by its name.

100.21.102 RemoveZeroDelayLayers

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes any image that as a zero delay time.
Notes: Such images generally represent intermediate or partial updates in GIF animations used for file optimization. They are not ment to be displayed to users of the animation. Viewable images in an animation should have a time delay of 3 or more centi-seconds (hundredths of a second).

However if all the frames have a zero time delay, then either the animation is as yet incomplete, or it is not a GIF animation. This is a non-sensible situation, so no image will be removed and a 'Zero Time Animation' warning (exception) given.

No warning will be given if no image was removed because all images had an appropriate non-zero time delay set.

Due to the special requirements of GIF disposal handling, GIF animations should be coalesced first, before calling this function, though that is not a requirement.

100.21.103 ResetImageAttributeIterator

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: ResetImageAttributeIterator() resets the image attributes iterator.
Notes: Use it in conjunction with GetNextImageAttribute() to iterate over all the values associated with an image.

100.21.104 ResetImageProfileIterator

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the image profile iterator.
Notes: Use it in conjunction with GetNextImageProfile() to iterate over all the profiles associated with an image.

100.21.105 Resize(width as Integer, height as Integer, FilterID as Integer, blur as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales an image to the desired dimensions.
Notes: Constants for the FilterID:

```
const PointFilter      =1
const BoxFilter        =2
const TriangleFilter   =3
const HermiteFilter    =4
const HanningFilter    =5
const HammingFilter    =6
const BlackmanFilter   =7
const GaussianFilter   =8
const QuadraticFilter  =9
const CubicFilter      =10
const CatromFilter     =11
const MitchellFilter   =12
const LanczosFilter    =13
const BesselFilter     =14
const SincFilter       =15
```

Most of the filters are FIR (finite impulse response), however, Bessel, Gaussian, and Sinc are IIR (infinite impulse response). Bessel and Sinc are windowed (brought down to zero) with the Blackman filter.

Sets the last exception property.

100.21.106 RGBTransformImage(Colorspace as Integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method RGBTransformImage converts the reference image from RGB to an alternate colorspace.
Notes: The transformation matrices are not the standard ones: the weights are rescaled to normalized the range of the transformed values to be [0..MaxRGB] .

colorspace: An integer value that indicates which colorspace to transform the image.

Returns false on any error and true on success.

constants:

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6
YCbCrColorspace	7
YCCColorspace	8
YIQColorspace	9
YPbPrColorspace	10
YUVColorspace	11
CMYKColorspace	12
sRGBColorspace	13
HSBColorspace	14
HSLColorspace	15
HWBColorspace	16

100.21.107 Roll(x as Integer, y as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Roll offsets an image as defined by x and y.
Notes: Returns nil on any error.
Sets the last exception property.

100.21.108 Rotate(degrees as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rotation of an image.
Notes: Method RotateImage creates a new image that is a rotated copy of an existing one. Positive angles rotate counter-clockwise (right-hand rule), while negative angles rotate clockwise. Rotated images are usually larger than the originals and have 'empty' triangular corners. X axis. Empty triangles left over from shearing the image are filled with the color specified by the image background_color. RotateImage allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Method RotateImage is based on the paper "A Fast Algorithm for General Raster Rotatation" by Alan W. Paeth. RotateImage is adapted from a similar method based on the Paeth paper written by Michael Halle of the Spatial Imaging Group, MIT Media Lab.

degrees: Specifies the number of degrees to rotate the image.

Sets the lastexception property.
Returns nil on low memory.
For more details please check the ImageMagick documentation.

100.21.109 Sample(width as Integer, height as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales an image to the desired dimensions with pixel sampling.
Notes: Unlike other scaling methods, this method does not introduce any additional color into the scaled image.
For more details please check the ImageMagick documentation.
Sets the last exception property.

100.21.110 Scale(width as Integer, height as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the size of an image to the given dimensions.
Example:

```
Var image as IMImageQ8MBS // your image
image=Image.Scale(100,80)
```

Notes: This method was designed by Bob Friesenhahn as a low cost thumbnail generator.

columns: The number of columns in the scaled image.
rows: The number of rows in the scaled image.

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.21.111 SetImageAttribute(key as string, value as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetImageAttribute searches the list of image attributes and replaces the attribute value.
Notes: If it is not found in the list, the attribute name and value is added to the list. If the attribute exists in the list, the value is concatenated to the attribute. SetImageAttribute returns True if the attribute is successfully concatenated or added to the list, otherwise False. If the value is "", the matching key is deleted from the list.

100.21.112 SetImageColorspace(Colorspace as Integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colorspace member of the Image structure.
Notes: Returns false on any error and true on success.

100.21.113 SetImageProfile(name as string, ProfileData as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a named profile to the image.
Notes: If a profile with the same name already exists, it is replaced. This method differs from the ProfileImage() method in that it does not apply CMS color profiles.

name: The profile name.
profiledata: The binary data of the profile.

Returns false on any error and true on success.

100.21.114 SetPicture(pic as picture, x as Integer, y as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the pixels from a given Xojo picture into the Image Magick Image at the given location.
Example:

```
Var image as IMImageQ8MBS // your image
Var p as picture

p=New Picture(32,32,32)
p.Graphics.ForeColor=rgb(0,255,0)
p.Graphics.FillRect 0,0,32,32

image.SetPicture(p,30,30)
```

Notes: Sets the last exception property.
The method will do nothing on bad bounds.
This method works only for bitmap images.
x and y are zero based.

100.21.115 SetPictureMask(maskpic as picture, x as Integer, y as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the pixels from a given Xojo picture into the mask of the Image Magick Image at the given location.
Example:

```
Var i as IMImageQ8MBS // your image
Var p as picture

p=New Picture(32,32,32)
p.Graphics.ForeColor=rgb(0,255,0)
p.Graphics.FillRect 0,0,32,32

i.SetPictureMask(p,30,30)
```

Notes: Sets the last exception property.
The method will do nothing on bad bounds.
This method works only for bitmap images.
x and y are zero based.
You may need to set matte=True after this.

100.21.116 SetPixel(x as Integer, y as Integer, newPixel as IMColorQ8MBS)

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a pixel value.
Example:

```
Var image as IMImageQ8MBS // your image
Var co as IMColorQ8MBS

co=new IMColorQ8MBS
co.blue=65535 // max value
image.SetPixel 50,50,co // Makes Pixel 50/50 blue
```

Notes: The method will fail silently if the values are out of bounds or the image is not a bitmap image.
This method works only for bitmap images.
x and y are zero based.

100.21.117 Shade(gray as boolean, azimuth as Double, elevation as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shines a distant light on an image to create a three-dimensional effect.
Notes: You control the positioning of the light with azimuth and elevation; azimuth is measured in degrees off the x axis and elevation is measured in pixels above the Z axis.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.21.118 SharpenChannel(channel as Integer, radius as Double, sigma as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sharpens one or more image channels.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma) . For reasonable results, radius should be larger than sigma. Use a radius of 0 and Sharpen selects a suitable radius for you.

channel: The channel type.
radius: The radius of the Gaussian, in pixels, not counting the center pixel.
sigma: The standard deviation of the Laplacian, in pixels.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.21.119 Shave(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shave shaves pixels from the image edges.
Notes: It allocates the memory necessary for the new Image structure and returns a pointer to the new image.
Returns nil on any error.
Sets the last exception property.

100.21.120 Shear(Xshear as Double, Yshear as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method ShearImage creates a new image that is a shear_image copy of an existing one.
Notes: Shearing slides one edge of an image along the X or Y axis, creating a parallelogram. An X direction shear slides an edge along the X axis, while a Y direction shear slides an edge along the Y axis. The amount of the shear is controlled by a shear angle. For X direction shears, x_shear is measured relative to the Y axis, and similarly, for Y direction shears y_shear is measured relative to the X axis. Empty triangles left over from shearing the image are filled with the color defined by the pixel at location (0,0). ShearImage allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Xshear and YYshear specify the number of degrees to shear the image.

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.21.121 Solarize(factor as Double) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method SolarizeImage produces a 'solarization' effect seen when exposing a photographic film to light during the development process.
Notes: factor: An double value that defines the extent of the solarization.
Returns nil on any error.
Sets the last exception property.

100.21.122 Splice(x as Integer, y as Integer, width as Integer, height as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Splice splices a solid color into the image as defined by the geometry.
Notes: Returns nil on any error.
Sets the last exception property.

100.21.123 Spread(radius as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: This is a special effects method that randomly displaces each pixel in a block defined by the radius parameter.
Notes: radius: Choose a random pixel in a neighborhood of this extent.
Sets the last exception property.

For more details please check the ImageMagick documentation.

100.21.124 Stegano(watermarkImage as IMImageQ8MBS) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method SteganoImage hides a digital watermark within the image.
Notes: Returns nil on any error.
Sets the last exception property.

100.21.125 Stereo(otherImage as IMImageQ8MBS) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method StereoImage combines two images and produces a single image that is the composite of a left and right image of a stereo pair.
Notes: The left image is converted to gray scale and written to the red channel of the stereo image. The right image is converted to gray scale and written to the blue channel of the stereo image. View the composite image with red-blue glasses to create a stereo effect.

left image = self
right image = otherImage parameter

Returns nil on any error.
Sets the last exception property.

100.21.126 Swirl(degrees as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method SwirlImage creates a new image that is a copy of an existing one with the image pixels "swirl" at a specified angle.
Notes: degrees: An double value that defines the tightness of the swirling.

Returns nil on any error.
Sets the last exception property.

100.21.127 Thumbnail(width as Integer, height as Integer) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the size of an image to the given dimensions.
Notes: Sets the last exception property.
This method was designed by Bob Friesenhahn as a low cost thumbnail generator.
For more details please check the ImageMagick documentation.

100.21.128 TransformImage(CropGeometry as string, ImageGeometry as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: TransformImage() is a convenience method that behaves like ResizeImage() or CropImage() but accepts scaling and/or cropping information as a region geometry specification. If the operation fails, the original image handle is left as is.
Notes: This should only be used for single images.

CropGeometry: A crop geometry string. This geometry defines a subregion of the image to crop.
ImageGeometry: An image geometry string. This geometry defines the final size of the image.

Returns true on success.

100.21.129 TransformImages(CropGeometry as string, ImageGeometry as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: TransformImages() calls TransformImage() on each image of a sequence.
Notes: TransformImage() is a convenience method that behaves like ResizeImage() or CropImage() but accepts scaling and/or cropping information as a region geometry specification. If the operation fails, the original image handle is left as is.

CropGeometry: A crop geometry string. This geometry defines a subregion of the image to crop.
ImageGeometry: An image geometry string. This geometry defines the final size of the image.

Returns true on success.

100.21.130 TransformRGBImage(Colorspace as Integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method TransformRGBImage converts the reference image from an alternate colorspace.
Notes: The transformation matrices are not the standard ones: the weights are rescaled to normalized the range of the transformed values to be [0..MaxRGB] .

colorspace: An integer value that indicates the colorspace the image is currently in. On return the image is in the RGB color space.

Returns false on any error and true on success.

constants:

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6
YCbCrColorspace	7
YCCColorspace	8
YIQColorspace	9
YPbPrColorspace	10
YUVColorspace	11
CMYKColorspace	12
sRGBColorspace	13
HSBColorspace	14
HSLColorspace	15
HWBColorspace	16

100.21.131 TransposeImage as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: TransposeImage() creates a horizontal mirror image by reflecting the pixels around the central y-axis while rotating them by 90 degrees.

100.21.132 TransverseImage as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: TransverseImage() creates a vertical mirror image by reflecting the pixels around the central x-axis while rotating them by 270 degrees.

100.21.133 Trim as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 6.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Trim trims pixels from the image edges.
Notes: It allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Returns nil on any error.
Sets the last exception property.

100.21.134 UnsharpMaskChannel(channel as Integer, radius as Double, sigma as Double, amount as Double, threshold as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sharpens one or more image channels.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and UnsharpMask selects a suitable radius for you.

Constants for channel:

```
const UndefinedChannel   = 0
const RedChannel         = &h0001
const GrayChannel        = &h0001
const CyanChannel        = &h0001
const GreenChannel       = &h0002
const MagentaChannel     = &h0002
const BlueChannel        = &h0004
const YellowChannel      = &h0004
const AlphaChannel       = &h0008
const OpacityChannel     = &h0008
const BlackChannel       = &h0020
const IndexChannel       = &h0020
const AllChannels        = &h7fffffff
```

Sets the last exception property.
For more details please check the ImageMagick documentation.

100.21.135 Wave(amplitude as Double, wavelength as Double) as IMImageQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method Wave creates a new image that is a copy of an existing one with the image pixels altered along a sine wave.
Notes: Parameters are double values that indicates the amplitude and wavelength of the sine wave.
Returns nil on any error.
Sets the last exception property.

100.21.136 WhiteThreshold(threshold as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: WhiteThreshold is like Threshold but forces all pixels above the threshold into white while leaving all pixels below the threshold unchanged.
Notes: No exceptions are generated.
threshold: Define the threshold value. (ASCII string)
For more details please check the ImageMagick documentation.

100.21.137 WriteImage(info as IMImageInfoQ8MBS) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method WriteImage writes an image to a file as defined by image.filename.
Notes: You can specify a particular image format by prefixing the file with the image type and a colon (i.e. ps:image) or specify the image type as the filename suffix (i.e. image.ps). The image may be modified to adapt it to the requirements of the image format. For example, DirectClass images must be color-reduced to PseudoClass if the format is GIF.

WriteImage returns True if the image is written. False is returned if there is a memory shortage or if the image file fails to write.

100.21.138 Properties

100.21.139 BackgroundColor as IMColorQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image background color.
Notes: (Read and Write property)

100.21.140 Bias as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.21.141 BlurFactor as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blur factor to apply to the image when zooming. Default is 1.0 (no blur).

Notes: (Read and Write property)

100.21.142 BorderColor as IMColorQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image border color.
Notes: (Read and Write property)

100.21.143 Colors as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The desired number of colors.
Notes: Used by Quantize().
(Read and Write property)

100.21.144 ColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image pixel interpretation.
Notes: If the colorspace is RGB the pixels are red, green, blue. If matte is true, then red, green, blue, and index. If it is CMYK, the pixels are cyan, yellow, magenta, black. Otherwise the colorspace is ignored.

constants:

(Read and Write property)

100.21.145 Compression as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image compresion type.
Notes: useful constants:

The default is the compression type of the specified image file.
For more details please check the ImageMagick documentation.
(Read and Write property)

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6
YCbCrColorspace	7
YCCColorspace	8
YIQColorspace	9
YPbPrColorspace	10
YUVColorspace	11
CMYKColorspace	12
sRGBColorspace	13
HSBColorspace	14
HSLColorspace	15
HWBColorspace	16

const UndefinedCompression	= 0
const NoCompression	= 1
const BZipCompression	= 2
const FaxCompression	= 3
const Group4Compression	= 4
const JPEGCompression	= 5
const LosslessJPEGCompression	= 6
const LZWCompression	= 7
const RLECompression	= 8
const ZipCompression	= 9

100.21.146 Depth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image depth (8 or 16).
Notes: QuantumLeap must be defined before a depth of 16 is valid.
(Read and Write property)

100.21.147 Directory as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tile names from within an image montage.
Notes: Only valid after calling MontageImages() or reading a MIFF file which contains a directory.
(Read and Write property)

100.21.148 Endian as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The endian setting to use.
Notes: constants:

UndefinedEndian	0	
LSBEndian	1	(Windows)
MSBEndian	2	(Mac)

e.g. tiff files support different endian settings.
(Read and Write property)

100.21.149 Filename as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file path/name.
Notes: The string must be in the encoding of the library and is limited to 4000 bytes.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.21.150 Filter as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Filter to use when resizing image.
Notes: Constants:

The reduction filter employed has a sipngicant effect on the time required to resize an image and the resulting quality. The default filter is Lanczos which has been shown to produce high quality results when reducing most images.
(Read and Write property)

100.21.151 Fuzz as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colors within this distance are considered equal.
Notes: A number of algorithms search for a target color. By default the color must be exact. Use this to

const PointFilter	=1
const BoxFilter	=2
const TriangleFilter	=3
const HermiteFilter	=4
const HanningFilter	=5
const HammingFilter	=6
const BlackmanFilter	=7
const GaussianFilter	=8
const QuadraticFilter	=9
const CubicFilter	=10
const CatromFilter	=11
const MitchellFilter	=12
const LanczosFilter	=13
const BesselFilter	=14
const SincFilter	=15

match colors that are close to the target color in RGB space.
(Read and Write property)

100.21.152 Gamma as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gamma level of the image.
Notes: The same color image displayed on two different workstations may look different due to differences in the display monitor. Use gamma correction to adjust for this color difference.
(Read and Write property)

100.21.153 Geometry as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Preferred size of the image when encoding.
Notes: (Read and Write property)

100.21.154 Gravity as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.21.155 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to an Image structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.21.156 Height as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the image in pixels.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.21.157 Interlace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of interlacing scheme (default NoInterlace).
Notes: This option is used to specify the type of interlacing scheme for raw image formats such as RGB or YUV. NoInterlace means do not interlace, LineInterlace uses scanline interlacing, and PlaneInterlace uses plane interlacing. PartitionInterlace is like PlaneInterlace except the different planes are saved to individual files (e.g. image.R, image.G, and image.B). Use LineInterlace or PlaneInterlace to create an interlaced GIF or progressive JPEG image.

constants:

UndefinedInterlace	0	Unset value.
NoInterlace	1	Don't interlace image (RGBRGBRGBRGBRGBRGB...)
LineInterlace	2	Use scanline interlacing (RRR...GGG...BBB...RRR...GGG...BBB...)
PlaneInterlace	3	Use plane interlacing (RRRRRR...GGGGGG...BBBBBB...)
PartitionInterlace	4	Similar to plane interlaing except that the different planes are saved to individual files (e.g. image.R, image.G, and image.B)

(Read and Write property)

100.21.158 LastError as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code reported.
Notes: If an exception is raised and it is not a warning exception, this exception code is saved in this property.
(Read and Write property)

100.21.159 LastException as IMExceptionQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last exception thrown by the Image Magick library.
Notes: You should check this value after every call to the library, process the error and set the property to nil.

For more details please check the ImageMagick documentation.
(Read and Write property)

100.21.160 Magick as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image encoding format (e.g. "GIF").
Notes: (Read and Write property)

100.21.161 Matte as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether an alpha channel is used/present.
Notes: Set to true to enable masks.
(Read and Write property)

100.21.162 MatteColor as IMColorQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image matte (transparent) color.
Notes: (Read and Write property)

100.21.163 Montage as String

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tile size and offset within an image montage. Only valid for montage images.
Notes: (Read and Write property)

100.21.164 Offset as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of initial bytes to skip over when reading raw image.
Notes: (Read and Write property)

100.21.165 Orientation as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The image orientation.
Notes: constants:

```
const UndefinedOrientation      = 0
const TopLeftOrientation        = 1
const TopRightOrientation       = 2
const BottomRightOrientation    = 3
const BottomLeftOrientation     = 4
const LeftTopOrientation        = 5
const RightTopOrientation       = 6
const RightBottomOrientation    = 7
const LeftBottomOrientation     = 8
```

For more details please check the ImageMagick documentation.
(Read and Write property)

100.21.166 Quality as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: JPEG/MIFF/PNG compression level.
Example:

```
Var im as ImageMagickQ8MBS // global
```

```
Function TestJPEG(f as folderitem) As picture
// Reads an image, compresses in memory to JPEG, decompresses using JPEGlib and returns the image
// if quality setting works, you see it in the result.
// no error checking included!

// needs: im as ImageMagickQ8MBS ready initialized

Var image as IMImageQ8MBS
Var imageinfo as IMImageInfoQ8MBS
Var s,blob as string
Var p as Picture
Var i as Integer

if f = nil then
Return nil
end if

imageinfo = im.NewImageInfo

imageinfo.Filename = f.NativePath

//this should read any image IM understands
image = im.ReadImage(imageinfo)
//check for error
if im.lastexception <>nil and im.LastException.Severity >= 400 then

Notes: Default value is 75.
(Read and Write property)

100.21.167 Release as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: If true, the destructor will release the handle.
Notes: (Read and Write property)

100.21.168 RenderingIntent as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rendering intent to use.
Notes: constants:

UndefinedIntent	0
SaturationIntent	1
PerceptualIntent	2
AbsoluteIntent	3
RelativeIntent	4

(Read and Write property)

100.21.169 ResolutionUnits as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Units of image resolution.
Notes: constants:

(Read and Write property)

UndefinedResolution	0	Unset value.
PixelsPerInchResolution	1	Density specifications are specified in units of pixels per inch (english units).
PixelsPerCentimeterResolution	2	Density specifications are specified in units of pixels per centimeter (metric units).

100.21.170 ResolutionX as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The horizontal resolution of the image.
Notes: The unit for resolution must be specified.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.21.171 ResolutionY as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The vertical resolution of the image.
Notes: The unit for resolution must be specified.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.21.172 Scene as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: An undocumented property.
Notes: (Read and Write property)

100.21.173 StorageClass as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image storage class.
Notes: If DirectClass then the image packets contain valid RGB or CMYK colors. If PseudoClass then the image has a colormap referenced by pixel's index member.

constants:

UndefinedClass	0	Unset value.
DirectClass	1	Image is composed of pixels which represent literal color values.
PseudoClass	2	Image is composed of pixels which specify an index in a color palette.

(Read and Write property)

100.21.174 Taint as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set to True if the image pixels have been modified.
Notes: (Read and Write property)

100.21.175 Width as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the image in pixels.
Notes: For more details please check the ImageMagick documentation.
(Read and Write property)

100.21.176 Constants

Constants

Constant	Value	Description
kBackgroundDispose	2	One of the Image layer Dispose Types.
kCoalesceLayer	1	One of the Image layer method constants.
kCompareAnyLayer	2	One of the Image layer method constants.
kCompareClearLayer	3	One of the Image layer method constants.
kCompareOverlayLayer	4	One of the Image layer method constants.
kCompositeLayer	12	One of the Image layer method constants.
kDisposeLayer	5	One of the Image layer method constants.
kFlattenLayer	14	One of the Image layer method constants.
kMergeLayer	13	One of the Image layer method constants.
kMosaicLayer	15	One of the Image layer method constants.
kNoneDispose	1	One of the Image layer Dispose Types.
kOptimizeImageLayer	7	One of the Image layer method constants.
kOptimizeLayer	6	One of the Image layer method constants.
kOptimizePlusLayer	8	One of the Image layer method constants.
kOptimizeTransLayer	9	One of the Image layer method constants.
kPreviousDispose	3	One of the Image layer Dispose Types.
kRemoveDupsLayer	10	One of the Image layer method constants.
kRemoveZeroLayer	11	One of the Image layer method constants.
kUndefinedDispose	0	One of the Image layer Dispose Types.
kUndefinedLayer	0	One of the Image layer method constants.
kUnrecognizedDispose	0	One of the Image layer Dispose Types.

Distortion Effects

Constant	Value	Description
kAffineDistortion	1	
kAffineProjectionDistortion	2	
kArcDistortion	9	
kBarrelDistortion	14	
kBarrelInverseDistortion	15	
kBilinearDistortion	6	
kBilinearForwardDistortion	6	
kBilinearReverseDistortion	7

kDePolarDistortion	11	
kPerspectiveDistortion	4	
kPerspectiveProjectionDistortion	5	
kPlane2CylinderDistortion	13	
kPolarDistortion	10	
kPolynomialDistortion	8	
kResizeDistortion	17	
kScaleRotateTranslateDistortion	3	
kSentinelDistortion	18	
kShepardsDistortion	16	
kUndefinedDistortion	0	

Interpolate Modes

Constant	Value	Description
kBarycentricColorInterpolate	1	
kBilinearColorInterpolate	7	
kInverseColorInterpolate	19	
kPolynomialColorInterpolate	8	
kShepardsColorInterpolate	16	
kUndefinedColorInterpolate	0	
kVoronoiColorInterpolate	18	

100.22 class IMMagickInfoListQ16MBS

100.22.1 class IMMagickInfoListQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class with the list of the image formats supported in Image Magick.
Notes: For more details please check the ImageMagick documentation.

100.22.2 Methods

100.22.3 Item(index as Integer) as IMMagickInfoQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The items inside this list.
Notes: Index goes from 0 to count-1.
Returns nil on invalid index.

100.22.4 Properties

100.22.5 Count as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items.
Notes: Index goes from 0 to count-1.
(Read only property)

100.22.6 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to a MagickInfo list.
For more details please check the ImageMagick documentation.
(Read only property)

100.23 class IMMagickInfoListQ32MBS

100.23.1 class IMMagickInfoListQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class with the list of the image formats supported in Image Magick.
Notes: For more details please check the ImageMagick documentation.

100.23.2 Methods

100.23.3 Item(index as Integer) as IMMagickInfoQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The items inside this list.
Notes: Index goes from 0 to count-1.
Returns nil on invalid index.

100.23.4 Properties

100.23.5 Count as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items.
Notes: Index goes from 0 to count-1.
(Read only property)

100.23.6 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to a MagickInfo list.
For more details please check the ImageMagick documentation.
(Read only property)

100.24 class IMMagickInfoListQ8MBS

100.24.1 class IMMagickInfoListQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class with the list of the image formats supported in Image Magick.
Notes: For more details please check the ImageMagick documentation.

100.24.2 Methods

100.24.3 Item(index as Integer) as IMMagickInfoQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The items inside this list.
Notes: Index goes from 0 to count-1.
Returns nil on invalid index.

100.24.4 Properties

100.24.5 Count as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of items.
Notes: Index goes from 0 to count-1.
(Read only property)

100.24.6 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to a MagickInfo list.
For more details please check the ImageMagick documentation.
(Read only property)

100.25 class IMMagickInfoQ16MBS

100.25.1 class IMMagickInfoQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for information about a file import/export format Image Magick can handle.
Notes: For more details please check the ImageMagick documentation.

100.25.2 Methods

100.25.3 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources used by this object now without waiting for Xojo to do it for you.

100.25.4 Properties

100.25.5 Adjoin as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if this file format supports multi-frame images.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.25.6 BlobSupport as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the encoder and decoder for this format supports operating on arbitrary BLOBs (rather than only disk files).
Notes: As currently disc read/write does not work with the 5.1 plugins, we really need that to use the classes.
Returns false for an invalid MagickInfo (handle=0).

For more details please check the ImageMagick documentation.

(Read only property)

100.25.7 Description as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Long form image format description (e.g. "CompuServe graphics interchange format").
Notes: For more details please check the ImageMagick documentation.
Returns "" for an invalid MagickInfo (handle=0).
(Read only property)

100.25.8 EndianSupport as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether endian support is available.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.25.9 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to a MagickInfo structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.25.10 ModuleName as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Name of module (e.g. "GIF") which registered this format.
Notes: Value is "" if format is not registered by a module.
For more details please check the ImageMagick documentation.
Returns "" for an invalid MagickInfo (handle=0).
(Read only property)

100.25.11 Name as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Magick string (e.g. "GIF") which identifies this format.
Notes: For more details please check the ImageMagick documentation.
Returns "" for an invalid MagickInfo (handle=0).
(Read only property)

100.25.12 Note as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Additional notes for this format.
Notes: e.g. compilation parameters or copyright notices.
Returns "" for an invalid MagickInfo (handle=0).

For more details please check the ImageMagick documentation.
(Read only property)

100.25.13 Raw as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if Image format does not contain size (must be specified in ImageInfo).
Notes: Returns false for an invalid MagickInfo (handle=0).
For more details please check the ImageMagick documentation.
(Read only property)

100.25.14 SeekableStream as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if the magick supports a seekable stream.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.25.15 Stealth as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unknown.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.25.16 ThreadSupport as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if threading is supported.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.25.17 Version as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Version string.
Notes: For more details please check the ImageMagick documentation.
Returns "" for an invalid MagickInfo (handle=0).
(Read only property)

100.26 class IMMagickInfoQ32MBS

100.26.1 class IMMagickInfoQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for information about a file import/export format Image Magick can handle.
Notes: For more details please check the ImageMagick documentation.

100.26.2 Methods

100.26.3 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources used by this object now without waiting for Xojo to do it for you.

100.26.4 Properties

100.26.5 Adjoin as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if this file format supports multi-frame images.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.26.6 BlobSupport as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the encoder and decoder for this format supports operating on arbitrary BLOBs (rather than only disk files).
Notes: As currently disc read/write does not work with the 5.1 plugins, we really need that to use the classes.
Returns false for an invalid MagickInfo (handle=0).

For more details please check the ImageMagick documentation.

(Read only property)

100.26.7 Description as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Long form image format description (e.g. "CompuServe graphics interchange format").
Notes: For more details please check the ImageMagick documentation.
Returns "" for an invalid MagickInfo (handle=0).
(Read only property)

100.26.8 EndianSupport as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether endian support is available.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.26.9 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to a MagickInfo structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.26.10 ModuleName as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Name of module (e.g. "GIF") which registered this format.
Notes: Value is "" if format is not registered by a module.
For more details please check the ImageMagick documentation.
Returns "" for an invalid MagickInfo (handle=0).
(Read only property)

100.26.11 Name as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Magick string (e.g. "GIF") which identifies this format.
Notes: For more details please check the ImageMagick documentation.
Returns "" for an invalid MagickInfo (handle=0).
(Read only property)

100.26.12 Note as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Additional notes for this format.
Notes: e.g. compilation parameters or copyright notices.
Returns "" for an invalid MagickInfo (handle=0).

For more details please check the ImageMagick documentation.
(Read only property)

100.26.13 Raw as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if Image format does not contain size (must be specified in ImageInfo).
Notes: Returns false for an invalid MagickInfo (handle=0).
For more details please check the ImageMagick documentation.
(Read only property)

100.26.14 SeekableStream as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if the magick supports a seekable stream.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.26.15 Stealth as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unknown.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.26.16 ThreadSupport as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if threading is supported.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.26.17 Version as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Version string.
Notes: For more details please check the ImageMagick documentation.
Returns "" for an invalid MagickInfo (handle=0).
(Read only property)

100.27 class IMMagickInfoQ8MBS

100.27.1 class IMMagickInfoQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: A class for information about a file import/export format Image Magick can handle.
Notes: For more details please check the ImageMagick documentation.

100.27.2 Methods

100.27.3 Close

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources used by this object now without waiting for Xojo to do it for you.

100.27.4 Properties

100.27.5 Adjoin as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if this file format supports multi-frame images.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.27.6 BlobSupport as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if the encoder and decoder for this format supports operating on arbitrary BLOBs (rather than only disk files).
Notes: As currently disc read/write does not work with the 5.1 plugins, we really need that to use the classes.
Returns false for an invalid MagickInfo (handle=0).

(Read only property)

100.27.7 Description as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Long form image format description (e.g. "CompuServe graphics interchange format").
Notes: For more details please check the ImageMagick documentation.
Returns "" for an invalid MagickInfo (handle=0).
(Read only property)

100.27.8 EndianSupport as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether endian support is available.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.27.9 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to a MagickInfo structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.27.10 ModuleName as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Name of module (e.g. "GIF") which registered this format.
Notes: Value is "" if format is not registered by a module.
For more details please check the ImageMagick documentation.
Returns "" for an invalid MagickInfo (handle=0).
(Read only property)

100.27.11 Name as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Magick string (e.g. "GIF") which identifies this format.
Notes: For more details please check the ImageMagick documentation.
Returns "" for an invalid MagickInfo (handle=0).
(Read only property)

100.27.12 Note as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Additional notes for this format.
Notes: e.g. compilation parameters or copyright notices.
Returns "" for an invalid MagickInfo (handle=0).

For more details please check the ImageMagick documentation.
(Read only property)

100.27.13 Raw as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if Image format does not contain size (must be specified in ImageInfo).
Notes: Returns false for an invalid MagickInfo (handle=0).
For more details please check the ImageMagick documentation.
(Read only property)

100.27.14 SeekableStream as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns True if the magick supports a seekable stream.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.27.15 Stealth as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unknown.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.27.16 ThreadSupport as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if threading is supported.
Notes: For more details please check the ImageMagick documentation.
Returns false for an invalid MagickInfo (handle=0).
(Read only property)

100.27.17 Version as String

MBS GraphicsMagick Plugin, Plugin Version: 5.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Version string.
Notes: For more details please check the ImageMagick documentation.
Returns "" for an invalid MagickInfo (handle=0).
(Read only property)

100.28 class IMMagickPixelPacketQ16MBS

100.28.1 class IMMagickPixelPacketQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to describe a picture background.
Notes: Needed for IMImageQ16MBS.NewImage function.

100.28.2 Methods

100.28.3 HandleMemory as memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content of the whole ImageInfo structure copied into a memoryblock.
Notes: Returns nil on any error.

100.28.4 Properties

100.28.5 Blue as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue color value.
Notes: (Read and Write property)

100.28.6 ColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image pixel interpretation.
Notes: If the colorspace is RGB the pixels are red, green, blue. If matte is true, then red, green, blue, and index. If it is CMYK, the pixels are cyan, yellow, magenta, black. Otherwise the colorspace is ignored.

constants:

(Read and Write property)

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6
YCbCrColorspace	7
YCCColorspace	8
YIQColorspace	9
YPbPrColorspace	10
YUVColorspace	11
CMYKColorspace	12
sRGBColorspace	13
HSBColorspace	14
HSLColorspace	15
HWBColorspace	16

100.28.7 Depth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image depth (8 or 16).
Notes: (Read and Write property)

100.28.8 Fuzz as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colors within this distance are considered equal.
Notes: A number of algorithms search for a target color. By default the color must be exact. Use this to match colors that are close to the target color in RGB space.
(Read and Write property)

100.28.9 Green as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green color value.
Notes: (Read and Write property)

100.28.10 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to an MagickPixelPacket structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.28.11 Index as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The index color value.
Notes: Only for indexed color spaces.
(Read and Write property)

100.28.12 Matte as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether an alpha channel is used/present.
Notes: Set to true to enable masks.
(Read and Write property)

100.28.13 Opacity as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The opacity part of the color value.
Notes: (Read and Write property)

100.28.14 Red as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red color value.
Notes: (Read and Write property)

100.29 class IMMagickPixelPacketQ32MBS

100.29.1 class IMMagickPixelPacketQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to describe a picture background.
Notes: Needed for IMImageQ32MBS.NewImage function.

100.29.2 Methods

100.29.3 HandleMemory as memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content of the whole ImageInfo structure copied into a memoryblock.
Notes: Returns nil on any error.

100.29.4 Properties

100.29.5 Blue as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue color value.
Notes: (Read and Write property)

100.29.6 ColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image pixel interpretation.
Notes: If the colorspace is RGB the pixels are red, green, blue. If matte is true, then red, green, blue, and index. If it is CMYK, the pixels are cyan, yellow, magenta, black. Otherwise the colorspace is ignored.

constants:

(Read and Write property)

UndefinedColorspace	0
RGBColorspace	1
GRAYColorspace	2
TransparentColorspace	3
OHTAColorspace	4
LABColorspace	5
XYZColorspace	6

100.29.7 Depth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image depth (8 or 16).
Notes: (Read and Write property)

100.29.8 Fuzz as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colors within this distance are considered equal.
Notes: A number of algorithms search for a target color. By default the color must be exact. Use this to match colors that are close to the target color in RGB space.
(Read and Write property)

100.29.9 Green as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green color value.
Notes: (Read and Write property)

100.29.10 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to an MagickPixelPacket structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.29.11 Index as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The index color value.
Notes: Only for indexed color spaces.
(Read and Write property)

100.29.12 Matte as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether an alpha channel is used/present.
Notes: Set to true to enable masks.
(Read and Write property)

100.29.13 Opacity as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The opacity part of the color value.
Notes: (Read and Write property)

100.29.14 Red as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red color value.
Notes: (Read and Write property)

100.30 class IMMagickPixelPacketQ8MBS

100.30.1 class IMMagickPixelPacketQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to describe a picture background.
Notes: Needed for IMImageQ8MBS.NewImage function.

100.30.2 Methods

100.30.3 HandleMemory as memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The content of the whole ImageInfo structure copied into a memoryblock.
Notes: Returns nil on any error.

100.30.4 Properties

100.30.5 Blue as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue color value.
Notes: (Read and Write property)

100.30.6 ColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image pixel interpretation.
Notes: If the colorspace is RGB the pixels are red, green, blue. If matte is true, then red, green, blue, and index. If it is CMYK, the pixels are cyan, yellow, magenta, black. Otherwise the colorspace is ignored.

100.30.7 Depth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image depth (8 or 16).
Notes: (Read and Write property)

100.30.8 Fuzz as Double

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colors within this distance are considered equal.
Notes: A number of algorithms search for a target color. By default the color must be exact. Use this to match colors that are close to the target color in RGB space.
(Read and Write property)

100.30.9 Green as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green color value.
Notes: (Read and Write property)

100.30.10 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The handle used internally by the plugin.
Notes: A pointer to an MagickPixelPacket structure.
For more details please check the ImageMagick documentation.
(Read and Write property)

100.30.11 Index as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The index color value.
Notes: Only for indexed color spaces.
(Read and Write property)

100.30.12 Matte as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether an alpha channel is used/present.
Notes: Set to true to enable masks.
(Read and Write property)

100.30.13 Opacity as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The opacity part of the color value.
Notes: (Read and Write property)

100.30.14 Red as Single

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red color value.
Notes: (Read and Write property)

100.31 class IMMissingFunctionExceptionQ16MBS

100.31.1 class IMMissingFunctionExceptionQ16MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A class for an exception in Image Magick.
Notes: This exception is raised on every IM function if the library function behind is not available.
(this can be a plugin bug or a bad compiled library or simply a too old library.)
Subclass of the RuntimeException class.

100.32 class IMMissingFunctionExceptionQ32MBS

100.32.1 class IMMissingFunctionExceptionQ32MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A class for an exception in Image Magick.
Notes: This exception is raised on every IM function if the library function behind is not available.
(this can be a plugin bug or a bad compiled library or simply a too old library.)
Subclass of the RuntimeException class.

100.33 class IMMissingFunctionExceptionQ8MBS

100.33.1 class IMMissingFunctionExceptionQ8MBS

MBS GraphicsMagick Plugin, Plugin Version: 5.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: A class for an exception in Image Magick.
Notes: This exception is raised on every IM function if the library function behind is not available.
(this can be a plugin bug or a bad compiled library or simply a too old library.)
Subclass of the RuntimeException class.

Chapter 101

ImageKit

101.1 control DesktopIKImageBrowserViewControlMBS

101.1.1 control DesktopIKImageBrowserViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control to wrap a IKImageBrowserViewMBS.
Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo / Real Studio Plugins, version 16.5pr2
- MBS Xojo / Real Studio Plugins, version 14.2pr3

101.1.2 Properties

101.1.3 Scrollview as NSScrollViewMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The scrollview we embed the image browser view inside.
Notes: (Read only property)

101.1.4 View as IKImageBrowserViewMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The image browser view.
Notes: (Read only property)

101.1.5 Events

101.1.6 backgroundWasRightClickedWithEvent(e as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Performs custom tasks when the user right-clicks the image browser view background.
Notes: event: The event that invoked the method.

This method signals that the user either right-clicked the background or left-clicked it with the Alt key pressed. You can implement this method if you want to perform custom tasks at that time.
Available in OS X v10.5 and later.

101.1.7 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

101.1.8 cellWasDoubleClickedAtIndex(index as Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Performs custom tasks when the user double-clicks an item in the image browser view.
Notes: index: The index of the cell.

This method signals that the user double-clicked an item in the image browser view. You can implement this method if you want to perform custom tasks at that time.
Available in OS X v10.5 and later.

101.1.9 cellWasRightClickedAtIndex(index as Integer, e as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Performs custom tasks when the user right-clicks an item in the image browser view.
Notes: index: The index of the cell.

event: The event that invoked the method.

This method signals that the user either right-clicked an item in the browser or left-clicked the item with the Alt key pressed. You can implement this method if you want to perform custom tasks at that time. Available in OS X v10.5 and later.

101.1.10 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

101.1.11 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

101.1.12 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

101.1.13 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

101.1.14 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

101.1.15 draggingEnded(sender as NSDraggingInfoMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.
This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

101.1.16 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered: message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated: and draggingExited: even if NSDragOperationNone is returned by this method.

101.1.17 draggingExited(sender as NSDraggingInfoMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

101.1.18 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Returns one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered: message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

101.1.19 FocusLost

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

101.1.20 FocusReceived

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

101.1.21 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

101.1.22 groupAtIndex(index as Integer) as Dictionary

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the group at the specified index.
Notes: index: The index of the group you want to retrieve.

Returns a dictionary that defines the group. The keys in this dictionary can be any of the following constants: IKImageBrowserGroupStyle, IKImageBrowserGroupBackgroundColorKey, IKImageBrowserGroupTitleKey, and IKImageBrowserGroupRangeKey. For more information on these constants, see IKImageBrowserView Class Reference.

This method is optional.
Available in OS X v10.5 and later.

101.1.23 itemAtIndex(index as Integer) as IKImageBrowserItemMBS

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns an object for the item in an image browser view that corresponds to the specified index.
Notes: index: The index of the item you want to retrieve.

Return an IKImageBrowserItem object.

Your data source must implement this method. The returned object must implement the required methods of the IKImageBrowserItem protocol.
Available in OS X v10.5 and later.

101.1.24 MenuBarSelected

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

101.1.25 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.

- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

101.1.26 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

101.1.27 MouseUp(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

101.1.28 moveItemsAtIndexes(indexes as NSIndexSetMBS, destinationIndex as Integer) as boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Signals that the specified items should be moved to the specified destination.
Notes: indexes: The indexes of the items that should be reordered.
destinationIndex: The starting index of the destination the items should be moved to.

Returns true if successful; false otherwise.

This method is optional. It is invoked by the image browser view after Image Kit determines that a reordering operation should be applied. The data source should update itself by reordering its elements.
Available in OS X v10.5 and later.

101.1.29 numberOfGroups as Integer

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the number of groups in an image browser view.
Notes: Return the number of groups.

This method is optional.
Available in OS X v10.5 and later.

101.1.30 numberOfItems as Integer

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Returns the number of records managed by the data source object.
Notes: Return the number of records managed by the image browser view.

Your data source must implement this method. An IKImageView object uses this method to determine how many cells it should create and display.
Available in OS X v10.5 and later.

101.1.31 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

101.1.32 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Returns if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

101.1.33 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return true if the receiver agrees to perform the drag operation and false if not.

This method is invoked only if the most recent draggingEntered or draggingUpdated event returned an acceptable drag-operation value.

If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this event.

101.1.34 removeItemsAtIndexes(indexes as NSIndexSetMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Signals that a remove operation should be applied to the specified items.
Notes: indexes: The indexes of the items that should be removed.

This method is optional. It is invoked by the image browser after Image Kit determines that a remove operation should be applied. In response, the data source should update itself by removing the specified items.
Available in OS X v10.5 and later.

101.1.35 ScaleFactorChanged(NewFactor as Double)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

101.1.36 selectionDidChange

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Performs custom tasks when the selection changes.
Notes: This method signals that the user changes the selection in the image browser view. You can implement this method if you want to perform custom tasks at that time.
Available in OS X v10.5 and later.

101.1.37 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging images should be changed.
Notes: sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

During enumerateDraggingItemsWithOptions you may set non-acceptable drag items images to nil to hide them or use the enumeration option of NSDraggingItemEnumerationClearNonenumeratedImages If there are items that you hide, then after enumeration, you need to set the numberOfValidItemsForDrop to the number of non-hidden drag items. However, if the valid item count is 0, then it is better to return NSDragOperationNone from your implementation of draggingEntered and, or draggingUpdated instead of hiding all drag items during enumeration.
Available in OS X v10.7 and later.

101.1.38 wantsPeriodicDraggingUpdates as boolean

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Asks the destination object whether it wants to receive periodic draggingUpdated events.
Notes: Returns true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated events even if nothing changes.

101.1.39 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

101.1.40 writeItemsAtIndexes(indexes as NSIndexSetMBS, pasteboard as NSPasteboardMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Signals that a drag should begin.
Notes: itemIndexes: The indexes of the items that should be dragged.
pasteboard: The pasteboard to copy the items to.

Returns the number of items written to the pasteboard.

This method is optional. It is invoked after Image Kit determines that a drag should begin, but before the drag has been started.
Available in OS X v10.5 and later.

101.2 control DesktopIKImageViewControlMBS

101.2.1 control DesktopIKImageViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use ImageWell control instead.
Function: The Xojo control to host a IKImageView.
Blog Entries

- MBS Xojo Plugins, version 26.4pr4

101.2.2 Properties

101.2.3 View as IKImageViewMBS

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The image view used in this control.
Notes: (Read only property)

101.2.4 Events

101.2.5 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

101.2.6 Closing

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

101.2.7 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

101.2.8 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

101.2.9 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

101.2.10 FocusLost

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

101.2.11 FocusReceived

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

101.2.12 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

101.2.13 MenuBarSelected

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

101.2.14 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

101.2.15 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

101.2.16 MouseUp(x As Integer, y As Integer)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

101.2.17 Opening

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

101.2.18 ScaleFactorChanged(NewFactor as double)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

101.2.19 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

101.3 class IKImageBrowserCellMBS

101.3.1 class IKImageBrowserCellMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The class for an image browser cell.
Notes: The IKImageBrowserCellMBS class is used to display a cell conforming to the IKImageBrowserItemMBS protocol in an IKImageBrowserViewMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr9

101.3.2 Methods

101.3.3 cellState as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the current cell state of the receiver.
Notes: The IKImageBrowserView creates thumbnails asynchronously. This method returns the current state.
Available in OS X v10.6 and later.

101.3.4 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

101.3.5 frame as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's frame rectangle, which defines its position in its IKImageBrowserView.
Notes: Available in OS X v10.6 and later.

101.3.6 IKImageBrowserCellBackgroundLayer as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the layer types you can pass to layerForType.
Notes: Layer displayed in the background.
Available in OS X v10.6 and later.

101.3.7 IKImageBrowserCellForegroundLayer as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the layer types you can pass to layerForType.
Notes: Layer displayed in the foreground.
Available in OS X v10.6 and later.

101.3.8 IKImageBrowserCellPlaceHolderLayer as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the layer types you can pass to layerForType.
Notes: Layer displayed as a placeholder when an image is not yet available.
Available in OS X v10.6 and later.

101.3.9 IKImageBrowserCellSelectionLayer as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the layer types you can pass to layerForType.
Notes: Layer displayed as the selection.
Available in OS X v10.6 and later.

101.3.10 imageAlignment as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the position of the cell's image in the frame.

101.3.11 imageBrowserView as IKImageBrowserViewMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the view the receiver uses to display the cell.
Notes: Available in OS X v10.6 and later.

101.3.12 imageContainerFrame as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's image container frame rectangle, which defines the position of the container of the thumbnail.
Notes: The coordinates of image container frame, in the IKImageBrowserView coordinate space.
The image frame is computed automatically from the image container frame by taking in account the image alignment and the image aspect ratio.
Subclasses can override this method to customize the position of the thumbnail container.
Available in OS X v10.6 and later.

101.3.13 imageFrame as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's image frame rectangle, which defines the position of the thumbnail in its IKImageBrowserView.
Notes: Returns the coordinates of the frame, in the IKImageBrowserView coordinate space.
It is the developer's responsibility to compute the imageFrame such that it lies entirely within the cell's frame rectangle.
Subclasses can override this method to customize the position of the thumbnail.
Available in OS X v10.6 and later.

101.3.14 indexOfRepresentedItem as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the receiver's represented object in the datasource.
Notes: Available in OS X v10.6 and later.

101.3.15 isSelected as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether the cell is selected.
Notes: Returns true if the cell is selected, otherwise false.
Subclasses should not override this method.
Available in OS X v10.6 and later.

101.3.16 layerForType(type as string) as CALayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns a layer for the specified position.
Notes: type: A string representing the layer location. See Cell Layer Positions for possible values.
Return the CALayer to display in the specified position.
Subclasses can override this method to add a Core Animation layer to the cell
Available in OS X v10.6 and later.

101.3.17 opacity as Double

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the opacity of the receiver.
Notes: Possible values are between 0.0 (transparent) and 1.0 (opaque).
Subclasses can override this method to customize the opacity of the cell.
Available in OS X v10.6 and later.

101.3.18 representedItem as Variant

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's represented object.
Notes: Subclasses should not override this method.
Available in OS X v10.6 and later.

101.3.19 selectionFrame as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's selection frame rectangle, which defines the position of the selection rectangle in its IKImageBrowserView.
Notes: Subclasses can override this method to customize the position of the selection frame.
Available in OS X v10.6 and later.

101.3.20 subtitleFrame as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's subtitle frame rectangle.
Notes: The coordinates of the subtitle frame, in the IKImageBrowserView coordinate space.

It is the developer's responsibility to compute the subtitleFrame such that it lies entirely within the cell's frame rectangle.
Subclasses can override this method to customize the position of the subtitle.

Available in OS X v10.6 and later.

101.3.21 titleFrame as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's title frame rectangle.
Notes: The coordinates of the title frame, in the IKImageBrowserView coordinate space.

It is the developer's responsibility to compute the titleFrame such that it lies entirely within the cell's frame rectangle.
Subclasses can override this method to customize the position of the title.

Available in OS X v10.6 and later.

101.3.22 Properties

101.3.23 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

101.3.24 Constants

Cell States

Constant	Value	Description
IKImageStateInvalid	1	The thumbnail is invalid. For example, an unsupported image is provided. Available in OS X v10.6 and later.
IKImageStateNoImage	0	Returned until a thumbnail has been created from the represented object. Available in OS X v10.6 and later.
IKImageStateReady	2	The receiver's represented object has been set and the cell is ready to display. Available in OS X v10.6 and later.

101.4 class IKImageBrowserItemMBS

101.4.1 class IKImageBrowserItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The class for items in image browser.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr9

101.4.2 Methods

101.4.3 Constructor(imageUID as string, imageRepresentationType as string, imageRepresentation as Variant, imageVersion as Integer = 1, imageTitle as string = """, imageSubtitle as string = """, isSelectable as boolean = true)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new item with given values.

101.4.4 ItemWithCGImage(imageUID as string, Image as Variant, imageVersion as Integer = 1, imageTitle as string = """, imageSubtitle as string = """, isSelectable as boolean = true) as IKImageBrowserItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new item with given image.

101.4.5 ItemWithData(imageUID as string, Data as Memoryblock, imageVersion as Integer = 1, imageTitle as string = """, imageSubtitle as string = """, isSelectable as boolean = true) as IKImageBrowserItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new item with given data.

101.4.6 ItemWithFile(imageUID as string, file as folderitem, imageVersion as Integer = 1, imageTitle as string = "", imageSubtitle as string = "", isSelectable as boolean = true) as IKImageBrowserItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new item with given file.

101.4.7 ItemWithNSImage(imageUID as string, Image as NSImageMBS, imageVersion as Integer = 1, imageTitle as string = "", imageSubtitle as string = "", isSelectable as boolean = true) as IKImageBrowserItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new item with given image.

101.4.8 ItemWithPath(imageUID as string, path as string, imageVersion as Integer = 1, imageTitle as string = "", imageSubtitle as string = "", isSelectable as boolean = true) as IKImageBrowserItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new item with given path.

101.4.9 ItemWithURL(imageUID as string, URL as string, imageVersion as Integer = 1, imageTitle as string = "", imageSubtitle as string = "", isSelectable as boolean = true) as IKImageBrowserItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new item with given URL.

101.4.10 Properties

101.4.11 Handle as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The internal object handle.
Notes: (Read and Write property)

101.4.12 imageRepresentation as Variant

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the image to display.
Notes: (Read and Write computed property)

101.4.13 imageRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the representation type of the image to display.
Notes: (Read and Write computed property)

101.4.14 imageSubtitle as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the display subtitle of the image.
Notes: (Read and Write computed property)

101.4.15 imageTitle as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the display title of the image.
Notes: (Read and Write computed property)

101.4.16 imageUID as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns a unique string that identifies the data source item.
Notes: The image browser view uses this identifier to associate the data source item and its cache.
(Read and Write computed property)

101.4.17 imageVersion as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the version of the item.
Notes: The receiver can return a new version to let the image browser know that it should not use its cache for the item.
(Read and Write computed property)

101.4.18 isSelectable as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether this item is selectable.
Notes: True if the item is selectable; false otherwise.
(Read and Write computed property)

101.5 control IKImageBrowserViewControlMBS

101.5.1 control IKImageBrowserViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The control to wrap a IKImageBrowserViewMBS.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.5pr2
- MBS Xojo / Real Studio Plugins, version 14.2pr3

101.5.2 Properties

101.5.3 Scrollview as NSScrollViewMBS

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The scrollview we embed the image browser view inside.
Notes: (Read only property)

101.5.4 View as IKImageBrowserViewMBS

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The image browser view.
Notes: (Read only property)

101.5.5 Events

101.5.6 backgroundWasRightClickedWithEvent(e as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Performs custom tasks when the user right-clicks the image browser view background.
Notes: event: The event that invoked the method.

This method signals that the user either right-clicked the background or left-clicked it with the Alt key pressed. You can implement this method if you want to perform custom tasks at that time.

Available in OS X v10.5 and later.

101.5.7 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

101.5.8 cellWasDoubleClickedAtIndex(index as Integer)

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Performs custom tasks when the user double-clicks an item in the image browser view.
Notes: index: The index of the cell.

This method signals that the user double-clicked an item in the image browser view. You can implement this method if you want to perform custom tasks at that time.
Available in OS X v10.5 and later.

101.5.9 cellWasRightClickedAtIndex(index as Integer, e as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Performs custom tasks when the user right-clicks an item in the image browser view.
Notes: index: The index of the cell.
event: The event that invoked the method.

This method signals that the user either right-clicked an item in the browser or left-clicked the item with the Alt key pressed. You can implement this method if you want to perform custom tasks at that time.
Available in OS X v10.5 and later.

101.5.10 Close

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

101.5.11 Closing

Plugin Version: 14.2, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

101.5.12 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

101.5.13 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

101.5.14 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or

false to give others a chance.

101.5.15 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

101.5.16 draggingEnded(sender as NSDraggingInfoMBS)

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.
This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

101.5.17 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered: message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated: and draggingExited: even if NSDragOperationNone is returned by this method.

101.5.18 draggingExited(sender as NSDraggingInfoMBS)

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

101.5.19 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Returns one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered: message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

101.5.20 EnableMenuItems

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

101.5.21 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

101.5.22 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

101.5.23 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

101.5.24 GotFocus

MBS AVFoundation Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

101.5.25 groupAtIndex(index as Integer) as Dictionary

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Returns the group at the specified index.
Notes: index: The index of the group you want to retrieve.

Returns a dictionary that defines the group. The keys in this dictionary can be any of the following constants: IKImageBrowserGroupStyle, IKImageBrowserGroupBackgroundColorKey, IKImageBrowserGroupTitleKey, and IKImageBrowserGroupRangeKey. For more information on these constants, see IKImageBrowserView Class Reference.

This method is optional.
Available in OS X v10.5 and later.

101.5.26 itemAtIndex(index as Integer) as IKImageBrowserItemMBS

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Returns an object for the item in an image browser view that corresponds to the specified index.
Notes: index: The index of the item you want to retrieve.

Return an IKImageBrowserItem object.

Your data source must implement this method. The returned object must implement the required methods of the IKImageBrowserItem protocol.
Available in OS X v10.5 and later.

101.5.27 LostFocus

MBS AVFoundation Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

101.5.28 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

101.5.29 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

101.5.30 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

101.5.31 MouseUp(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

101.5.32 moveItemsAtIndexes(indexes as NSIndexSetMBS, destinationIndex as Integer) as boolean

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Signals that the specified items should be moved to the specified destination.
Notes: indexes: The indexes of the items that should be reordered.
destinationIndex: The starting index of the destination the items should be moved to.

Returns true if successful; false otherwise.

This method is optional. It is invoked by the image browser view after Image Kit determines that a reordering operation should be applied. The data source should update itself by reordering its elements.
Available in OS X v10.5 and later.

101.5.33 numberOfGroups as Integer

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Returns the number of groups in an image browser view.
Notes: Return the number of groups.

This method is optional.
Available in OS X v10.5 and later.

101.5.34 numberOfItems as Integer

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Returns the number of records managed by the data source object.
Notes: Return the number of records managed by the image browser view.

Your data source must implement this method. An IKImageView object uses this method to determine how

many cells it should create and display.
Available in OS X v10.5 and later.

101.5.35 Open

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

101.5.36 Opening

Plugin Version: 14.2, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

101.5.37 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Returns if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

101.5.38 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return true if the receiver agrees to perform the drag operation and false if not.

This method is invoked only if the most recent draggingEntered or draggingUpdated event returned an acceptable drag-operation value.

If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this event.

101.5.39 removeItemsAtIndexes(indexes as NSIndexSetMBS)

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Signals that a remove operation should be applied to the specified items.
Notes: indexes: The indexes of the items that should be removed.

This method is optional. It is invoked by the image browser after Image Kit determines that a remove operation should be applied. In response, the data source should update itself by removing the specified items.
Available in OS X v10.5 and later.

101.5.40 ScaleFactorChanged(NewFactor as Double)

MBS AVFoundation Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

101.5.41 selectionDidChange

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Performs custom tasks when the selection changes.
Notes: This method signals that the user changes the selection in the image browser view. You can implement this method if you want to perform custom tasks at that time.

Available in OS X v10.5 and later.

101.5.42 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging images should be changed.
Notes: sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

During enumerateDraggingItemsWithOptions you may set non-acceptable drag items images to nil to hide them or use the enumeration option of NSDraggingItemEnumerationClearNonenumeratedImages If there are items that you hide, then after enumeration, you need to set the numberOfValidItemsForDrop to the number of non-hidden drag items. However, if the valid item count is 0, then it is better to return NSDragOperationNone from your implementation of draggingEntered and, or draggingUpdated instead of hiding all drag items during enumeration.
Available in OS X v10.7 and later.

101.5.43 wantsPeriodicDraggingUpdates as boolean

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Asks the destination object whether it wants to receive periodic draggingUpdated events.
Notes: Returns true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated events even if nothing changes.

101.5.44 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

101.5.45 writeItemsAtIndexes(indexes as NSIndexSetMBS, pasteboard as NSPasteboardMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Signals that a drag should begin.
Notes: itemIndexes: The indexes of the items that should be dragged.
pasteboard: The pasteboard to copy the items to.

Returns the number of items written to the pasteboard.

This method is optional. It is invoked after Image Kit determines that a drag should begin, but before the drag has been started.
Available in OS X v10.5 and later.

101.6 class IKImageBrowserViewMBS

101.6.1 class IKImageBrowserViewMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The IKImageBrowserView class is a view for displaying and browsing a large amount of images and movies efficiently.
Notes: Available in OS X v10.5 and later.
Subclass of the NSViewMBS class.
Blog Entries

- MBS Real Studio Plugins, version 13.1pr14
- MBS Real Studio Plugins, version 13.1pr9

101.6.2 Methods

101.6.3 cellForItemAtIndex(index as Integer) as IKImageBrowserCellMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the browser cell for the item at the specified index.
Notes: Subclasses must not override this method.
Available in OS X v10.6 and later.

101.6.4 collapseGroupAtIndex(index as Integer)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Collapses a group at the specified index.
Notes: index: The index of the group you want to collapse.

101.6.5 columnIndexesInRect(rect as NSRectMBS) as NSIndexSetMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the column indexes in the specified rectangle.
Notes: rect: The rectangle in the view's coordinate system.
Returns an index set containing the cell indexes.
Available in OS X v10.6 and later.

101.6.6 Constructor

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with size 100/100 and position 0/0
Example:

```
Var t as new IKImageBrowserViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 101.6.7 Constructor(Handle as Integer) 16198
- 101.6.8 Constructor(left as Double, top as Double, width as Double, height as Double) 16198

101.6.7 Constructor(Handle as Integer)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given IKImageBrowserView handle.
Example:

```
Var t as new IKImageBrowserViewMBS(0, 0, 100, 100)
Var v as new IKImageBrowserViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a IKImageBrowserView and the plugin retains this handle.
See also:

- 101.6.6 Constructor 16198
- 101.6.8 Constructor(left as Double, top as Double, width as Double, height as Double) 16198

101.6.8 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with the given size and position.
Example:

```
Var x as new IKImageBrowserViewMBS(0, 0, 100, 20)
```

Notes: On success the handle property is not zero.
See also:

- 101.6.6 Constructor 16198
- 101.6.7 Constructor(Handle as Integer) 16198

101.6.9 Destructor

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The destructor.

101.6.10 dropOperation as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the current drop operation.
Notes: Returns IKImageBrowserDropOn if the drop occurs on an item, otherwise IKImageBrowserDropBefore.
The returned value is valid when a drop occurred and until next drop.
For example, given a browser with N cells , a cell of N-1 and operation of IKImageBrowserDropOn would specify a drop on the last cell. To specify a drop after the last cell, one would use an index of N and IKImageBrowserDropBefore for the operation.
Available in OS X v10.6 and later.

101.6.11 expandGroupAtIndex(index as Integer)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Expands a group at the specified index.
Notes: index: The index of the group you want to expand.
Available in OS X v10.5 and later.

101.6.12 getValue(name as String) as Variant

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Queries a value for a given key.

101.6.13 IKImageBrowserBackgroundColorKey as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for image browser view options.
Notes: A key for the background color of the image browser view. The associated value is a NSColorMBS object.
Available in OS X v10.5 and later.

101.6.14 IKImageBrowserCellsHighlightedTitleAttributesKey as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for image browser view options.
Notes: A key for the highlighted title attribute for an item in the image browser view. The associated value is a Dictionary.
Available in OS X v10.5 and later.

101.6.15 IKImageBrowserCellsOutlineColorKey as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for image browser view options.
Notes: A key for the outline color for an item in the image browser view. The associated value is an NSColorMBS object.
Available in OS X v10.5 and later.

101.6.16 IKImageBrowserCellsSubtitleAttributesKey as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for image browser view options.
Notes: A key for a subtitle attribute for an item in the image browser view. The associated value is a dictionary.
Available in OS X v10.5 and later.

101.6.17 IKImageBrowserCellsTitleAttributesKey as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for image browser view options.
Example:

```
Var Imagebrowser as IKImageBrowserViewMBS // your control
Var d as new Dictionary
d.Value(NSAttributedStringMBS.NSForegroundColorAttributeName) = NSColorMBS.redColor
```

Imagebrowser.setValue Imagebrowser.IKImageBrowserCellsTitleAttributesKey, d

Notes: A key for title attribute of an item in the image browser view. The associated value is a dDictionary.
Available in OS X v10.5 and later.

101.6.18 IKImageBrowserCGImageRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: A CGImageRef object.

101.6.19 IKImageBrowserCGImageSourceRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: A CGImageSourceRef object.

101.6.20 IKImageBrowserGroupBackgroundColorKey as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the group attribute keys.
Notes: A key for the background color of a group. The associated value is an NSColor object. This color is used only for the bezel style.
Available in OS X v10.5 and later.

101.6.21 IKImageBrowserGroupFooterLayer as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the group attribute keys.
Notes: A key for the header layer of the group. The associated value is a CALayer.
Available in OS X v10.6 and later.

101.6.22 IKImageBrowserGroupHeaderLayer as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the group attribute keys.
Notes: A key for the header layer of the group. The associated value is a CALayer.
Available in OS X v10.6 and later.

101.6.23 IKImageBrowserGroupRangeKey as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the group attribute keys.
Notes: A key for the range of a group. The associated value is a NSRangeMBS. This is required if the view uses grouping
Available in OS X v10.5 and later.

101.6.24 IKImageBrowserGroupStyleKey as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the group attribute keys.
Notes: A key for the style of a group. The associated value is one of the constants defined in "Group Style Attributes".
Available in OS X v10.5 and later.

101.6.25 IKImageBrowserGroupTitleKey as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the group attribute keys.
Notes: A key for the title of a group. The associated value is a string. This string is used for the disclosure style only.
Available in OS X v10.5 and later.

101.6.26 IKImageBrowserIconRefPathRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: A path to an icon.

101.6.27 IKImageBrowserIconRefRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: An icon.

101.6.28 IKImageBrowserNSBitmapImageRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: An NSBitmapImageRep object.

101.6.29 IKImageBrowserNSDataRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: Value for this key is a memoryblock.

101.6.30 IKImageBrowserNSImageRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: An NSImage object.

101.6.31 IKImageBrowserNSURLRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: An NSURL object.

101.6.32 IKImageBrowserPathRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: A path representation (string).

101.6.33 IKImageBrowserPDFPageRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: A PDFPage instance or a CGPDFPageRef.

101.6.34 IKImageBrowserQCCompositionPathRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: A path (String) or URL (NSURL) to a Quartz Composer composition.

101.6.35 IKImageBrowserQCCompositionRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: A QCComposition object.

101.6.36 IKImageBrowserQTMoviePathRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: A path (string) or URL to a QuickTime movie.

101.6.37 IKImageBrowserQTMovieRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: A QTMovie object.

101.6.38 IKImageBrowserQuickLookPathRepresentationType as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the image representation types.
Notes: A path (string) or URL (NSURL) to load data using QuickLook.

101.6.39 IKImageBrowserSelectionColorKey as string

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: One of the keys for image browser view options.
Notes: A key for the color that indicates a selection. The associated value is an NSColorMBS object.
Available in OS X v10.5 and later.

101.6.40 indexAtLocationOfDroppedItem as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the cell where the drop operation occurred.
Notes: Returns the index of the cell where the drop operation occurred.
The returned index is valid until the next drop occurs.
Available in OS X v10.5 and later.

101.6.41 indexOfItemAtPoint(point as NSPointMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the item at the specified location.
Notes: Returns the index of the item or NSNotFound (-1) if no item at this location.

101.6.42 isGroupExpandedAtIndex(index as Integer) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns whether the group at the provided index is expanded.
Notes: Return true if the group is expanded; false otherwise.

101.6.43 itemFrameAtIndex(index as Integer) as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the frame rectangle for the item located at the specified index.
Notes: index: The index of the item whose frame rectangle you want to obtain.
Return the frame rectangle of the item.

101.6.44 newCellForRepresentedItem(item as IKImageBrowserItemMBS) as IKImageBrowserCellMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the cell to use for the specified item.
Notes: Subclasses can override this method to customize the appearance of the cell that will represent anItem.
Available in OS X v10.6 and later.

101.6.45 numberOfColumns as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the current number of columns.
Notes: Available in OS X v10.6 and later.

101.6.46 numberOfRows as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the current number of rows.
Notes: Available in OS X v10.6 and later.

101.6.47 rectOfColumn(columnIndex as Integer) as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle containing the specified column.
Notes: Return a rectangle containing the column. Specified in the view's coordinate system.
Available in OS X v10.6 and later.

101.6.48 rectOfRow(rowIndex as Integer) as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle containing the specified row.
Notes: Returns a rectangle containing the column. Specified in the view's coordinate system.
Available in OS X v10.6 and later.

101.6.49 reloadData

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Marks the receiver as needing its data reloaded.

101.6.50 rowIndexesInRect(rect as NSRectMBS) as NSIndexSetMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the row indexes in the specified rectangle.
Notes: rect: A rectangle in the view's coordinate system.
Returns an index set containing the item indexes.
Available in OS X v10.6 and later.

101.6.51 scrollIndexToVisible(index as Integer)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Scrolls the receiver to the item at the specified index.

101.6.52 selectionIndexes as NSIndexSetMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the indexes of the selected cells.

101.6.53 setDropIndex(index as Integer, operation as Integer)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Allows the class to retarget the drop action.
Notes: index: The requested drop index.
operation: The requested drop operation. The possible values are described in IKImageBrowserDropOperation.

For example, To specify a drop on the second item, one would specify index as 1, and operation as IKImageBrowserDropOn. To specify a drop after the last item, one would specify index as the number of items and operation as IKImageBrowserDropBefore.

Passing a value of –1 for index, and IKImageBrowserDropOn as the operation causes the entire browser view to be highlighted rather than a specific item. This is useful if the data displayed by the receiver does not allow the user to drop items at a specific item location.

101.6.54 setSelectionIndexes(indexes as NSIndexSetMBS, extendSelection as boolean = false)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Selects cells at the specified indexes.
Notes: indexes: The indexes of the cells you want to select.
extendSelection: A boolean value that specifies whether to extend the current selection. Pass true to extends the selection; false replaces the current selection.
Available in OS X v10.5 and later.

101.6.55 setValue(name as String, value as Variant)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Sets a value for a given key.

101.6.56 visibleItemIndexes as NSIndexSetMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the indexes of the view's currently visible items.
Notes: Available in OS X v10.6 and later.

101.6.57 Properties

101.6.58 allowsDroppingOnItems as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Whether the user can drop on items.
Notes: True if the user is able to drop on items, otherwise false.
Available in OS X v10.6 and later.
(Read and Write computed property)

101.6.59 allowsEmptySelection as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Whether an empty selection is allowed.
Notes: (Read and Write computed property)

101.6.60 allowsMultipleSelection as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Whether the user can select more than one cell at a time.
Notes: (Read and Write computed property)

101.6.61 allowsReordering as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Whether the user can reorder items.
Notes: (Read and Write computed property)

101.6.62 animates as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver animates reordering and changes of the data source.
Notes: (Read and Write computed property)

101.6.63 backgroundLayer as CALayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The Core Animation layer used as the view's background.
Notes: The background layer can have sublayers. Additionally, the layers can also contain animations.
The layer is optional.
Available in OS X v10.6 and later.
(Read and Write computed property)

101.6.64 canControlQuickLookPanel as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Whether the view can automatically take control of the QuickLook panel.
Notes: When the browser view displays the QuickLook panel it sets itself as the QuickLook datasource. If the browser cells returned by the datasource return items that are URLs or paths, then the QuickLook panel will display the image at that location. Otherwise, the browser cell must implement the QLPreviewItem protocol and return the requested URL for the custom cell.
Available in OS X v10.6 and later.
(Read and Write computed property)

101.6.65 cellSize as NSSizeMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The cell size.
Notes: You must use CellSize or ZoomValue, but not both. Setting the zoom value changes the cell size, and vice versa.
Available in OS X v10.5 and later.
(Read and Write computed property)

101.6.66 cellsStyleMask as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The appearance style of the cells.
Notes: (Read and Write computed property)

101.6.67 constrainsToOriginalSize as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver constrains the cell's image to its original size.
Notes: The default value is false.
(Read and Write computed property)

101.6.68 contentResizingMask as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The content resizing mask, which determines how its content is resized while zooming.
Notes: You specify a mask by combining any of the following options using the bitwise OR operator: NSViewWidthSizable (2), NSViewHeightSizable (16). Other values are ignored.
(Read and Write computed property)

101.6.69 foregroundLayer as CALayerMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the foreground Core Animation layer
Notes: Returns a CALayer instance.
Available in OS X v10.6 and later.
(Read and Write computed property)

101.6.70 intercellSpacing as NSSizeMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the spacing between cells in the view.
Notes: Returns the vertical and horizontal spacing between cells.
Available in OS X v10.6 and later.
(Read and Write computed property)

101.6.71 zoomValue as Double

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: The zoom value.
Notes: The zoom value. This value should be greater or equal to zero and less or equal than one. A zoom value of zero corresponds to the minimum size (40x40 pixels). A zoom value of one means images fits the

browser bounds. Other values are interpolated.
Discussion
You must use ZoomValue or CellSize, but not both. Setting the zoom value changes the cell size, and vice versa.
Available in OS X v10.5 and later.
(Read and Write computed property)

101.6.72 Events

101.6.73 backgroundWasRightClickedWithEvent(e as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Performs custom tasks when the user right-clicks the image browser view background.
Notes: event: The event that invoked the method.

This method signals that the user either right-clicked the background or left-clicked it with the Alt key pressed. You can implement this method if you want to perform custom tasks at that time.
Available in OS X v10.5 and later.

101.6.74 cellWasDoubleClickedAtIndex(index as Integer)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Performs custom tasks when the user double-clicks an item in the image browser view.
Notes: index: The index of the cell.

This method signals that the user double-clicked an item in the image browser view. You can implement this method if you want to perform custom tasks at that time.
Available in OS X v10.5 and later.

101.6.75 cellWasRightClickedAtIndex(index as Integer, e as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Performs custom tasks when the user right-clicks an item in the image browser view.
Notes: index: The index of the cell.
event: The event that invoked the method.

This method signals that the user either right-clicked an item in the browser or left-clicked the item with the Alt key pressed. You can implement this method if you want to perform custom tasks at that time.

Available in OS X v10.5 and later.

101.6.76 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

101.6.77 draggingEnded(sender as NSDraggingInfoMBS)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes: sender: The object sending the message; use it to get details about the dragging operation.
This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

101.6.78 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered: message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated: and draggingExited: even if NSDragOperationNone is returned by this method.

101.6.79 draggingExited(sender as NSDraggingInfoMBS)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

101.6.80 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Returns one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered: message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the

time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

101.6.81 groupAtIndex(index as Integer) as Dictionary

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the group at the specified index.
Notes: index: The index of the group you want to retrieve.

Returns a dictionary that defines the group. The keys in this dictionary can be any of the following constants: IKImageBrowserGroupStyle, IKImageBrowserGroupBackgroundColorKey, IKImageBrowserGroupTitleKey, and IKImageBrowserGroupRangeKey. For more information on these constants, see IKImageBrowserView Class Reference.

This method is optional.
Available in OS X v10.5 and later.

101.6.82 itemAtIndex(index as Integer) as IKImageBrowserItemMBS

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns an object for the item in an image browser view that corresponds to the specified index.
Notes: index: The index of the item you want to retrieve.

Return an IKImageBrowserItem object.

Your data source must implement this method. The returned object must implement the required methods of the IKImageBrowserItem protocol.
Available in OS X v10.5 and later.

101.6.83 moveItemsAtIndexes(indexes as NSIndexSetMBS, destinationIndex as Integer) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Signals that the specified items should be moved to the specified destination.
Notes: indexes: The indexes of the items that should be reordered.
destinationIndex: The starting index of the destination the items should be moved to.

Returns true if successful; false otherwise.

This method is optional. It is invoked by the image browser view after Image Kit determines that a reordering operation should be applied. The data source should update itself by reordering its elements.
Available in OS X v10.5 and later.

101.6.84 numberOfGroups as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the number of groups in an image browser view.
Notes: Return the number of groups.

This method is optional.
Available in OS X v10.5 and later.

101.6.85 numberOfItems as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the number of records managed by the data source object.
Notes: Return the number of records managed by the image browser view.

Your data source must implement this method. An IKImageView object uses this method to determine how many cells it should create and display.
Available in OS X v10.5 and later.

101.6.86 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked after the released image has been removed from the screen, signaling the receiver to

import the pasteboard data.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Returns if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

101.6.87 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes: sender: The object sending the message; use it to get details about the dragging operation.

Return true if the receiver agrees to perform the drag operation and false if not.

This method is invoked only if the most recent draggingEntered or draggingUpdated event returned an acceptable drag-operation value.

If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this event.

101.6.88 removeItemsAtIndexes(indexes as NSIndexSetMBS)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Signals that a remove operation should be applied to the specified items.
Notes: indexes: The indexes of the items that should be removed.

This method is optional. It is invoked by the image browser after Image Kit determines that a remove operation should be applied. In response, the data source should update itself by removing the specified items.
Available in OS X v10.5 and later.

101.6.89 selectionDidChange

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Performs custom tasks when the selection changes.
Notes: This method signals that the user changes the selection in the image browser view. You can implement this method if you want to perform custom tasks at that time.
Available in OS X v10.5 and later.

101.6.90 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Invoked when the dragging images should be changed.
Notes: sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

During enumerateDraggingItemsWithOptions you may set non-acceptable drag items images to nil to hide them or use the enumeration option of NSDraggingItemEnumerationClearNonenumeratedImages If there are items that you hide, then after enumeration, you need to set the numberOfValidItemsForDrop to the number of non-hidden drag items. However, if the valid item count is 0, then it is better to return NSDragOperationNone from your implementation of draggingEntered and, or draggingUpdated instead of hiding all drag items during enumeration.
Available in OS X v10.7 and later.

101.6.91 wantsPeriodicDraggingUpdates as boolean

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Asks the destination object whether it wants to receive periodic draggingUpdated events.
Notes: Returns true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated events even

if nothing changes.

101.6.92 writeItemsAtIndexes(indexes as NSIndexSetMBS, pasteboard as NSPasteboardMBS) as Integer

MBS AVFoundation Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Signals that a drag should begin.
Notes: itemIndexes: The indexes of the items that should be dragged.
pasteboard: The pasteboard to copy the items to.

Returns the number of items written to the pasteboard.

This method is optional. It is invoked after Image Kit determines that a drag should begin, but before the drag has been started.
Available in OS X v10.5 and later.

101.6.93 Constants

Constants

Constant	Value	Description
IKImageBrowserDropBefore	1	One of the constants to specify the locations for dropping items onto the browser view. Drop the item before the cell. Available in OS X v10.6 and later. Used by the method setDropIndex.
IKImageBrowserDropOn	0	One of the constants to specify the locations for dropping items onto the browser view. Drop the item on the cell. Available in OS X v10.6 and later. Used by the method setDropIndex.

Cell Styles

Constant	Value	Description
IKCellsStyleNone	0	No style.
IKCellsStyleOutlined	2	Cells are outlined.
IKCellsStyleShadowed	1	Cells use shadows.
IKCellsStyleSubtitled	8	Cells display a subtitle.
IKCellsStyleTitled	4	Cells display a title.

Bevel Styles

Constant	Value	Description
IKGroupBezelStyle	0	A bezel style. Available in OS X v10.5 and later.
IKGroupDisclosureStyle	1	A disclosure triangle. Available in OS X v10.5 and later.

101.7 class IKImageEditPanelMBS

101.7.1 class IKImageEditPanelMBS

MBS AVFoundation Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop only.

Function: The class for the image edit panel from Mac OS X 10.5.
Notes: Subclass of the NSPanelMBS class.
Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.5pr8
- MonkeyBread Software Releases the MBS Plugins 8.1

101.7.2 Methods

101.7.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The constructor to create a new image edit panel.

101.7.4 reloadData

MBS AVFoundation Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop only.

Function: Requests the panel to reload the image.
Notes: Do call this if you have a new image to return in the image event.

101.7.5 Properties

101.7.6 LastImage as Picture

MBS AVFoundation Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop only.

Function: The last image passed to you or requested from you.
Notes: This property is set with the picture you return with the image event and is set with the image sent to you useing the Changed event.
(Read and Write property)

101.7.7 Events

101.7.8 Changed(pic as picture, CGImageHandle as Integer, metaData as dictionary)

MBS AVFoundation Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop only.

Function: The image changed and you should update your GUI.
Notes: pic: The image as a picture.
CGImageHandle: The internal handle to the original CGImage which is used to make the picture.
metaData: additional image data.

101.7.9 hasAdjustMode as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Returns whether the adjust mode view tab should be displayed.
Notes: Return true if the tab should be displayed, otherwise false.
Available on Mac OS X 10.6 or newer.

101.7.10 hasDetailsMode as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Returns whether the details mode view tab should be displayed.
Notes: True if the tab should be displayed, otherwise false.
Available on Mac OS X 10.6 or newer.

101.7.11 hasEffectsMode as Boolean

MBS AVFoundation Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Returns whether the effects mode view tab should be displayed.
Notes: True if the tab should be displayed, otherwise false.
Available on Mac OS X 10.6 or newer.

101.7.12 Image as picture

MBS AVFoundation Plugin, Plugin Version: 8.1, Platform: macOS, Targets: Desktop only.

Function: The panel needs an image to start with.
Notes: Return your image in this event whenever the panel needs it.

101.7.13 imageProperties as Dictionary

MBS AVFoundation Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Returns a dictionary of the image properties associated with the image in the image edit panel.
Notes: Available on Mac OS X 10.5 or newer.

101.7.14 thumbnailWithMaximumSize(Width as Double, Height as Double) as picture

MBS AVFoundation Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Returns a thumbnail image whose size is no larger than the specified size.
Notes: Available in OS X v 10.5 and later.

101.8 control IKImageViewControlMBS

101.8.1 control IKImageViewControlMBS

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use ImageWell control instead.
Function: The Xojo control to host a IKImageView.
Blog Entries

- MBS Xojo Plugins, version 26.4pr4

101.8.2 Properties

101.8.3 View as IKImageViewMBS

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The image view used in this control.
Notes: (Read only property)

101.8.4 Events

101.8.5 BoundsChanged

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the bounds, but not the frame, changed.

101.8.6 Close

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

101.8.7 Closing

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

101.8.8 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event is called when it is appropriate to display a contextual menu for the control.

101.8.9 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Called when a menuitem is chosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

101.8.10 didCloseContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Did close contextual menu.
Notes: Allows you to restart any animation you may have stopped in the willShowContextualMenu event.

101.8.11 EnableMenuItems

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

101.8.12 FocusLost

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes:

This only fires if the control itself lost focus and not a sub control.

101.8.13 FocusReceived

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes:

This only fires if the control itself got focus and not a sub control.

101.8.14 FrameChanged

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

101.8.15 GotFocus

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes:

This only fires if the control itself got focus and not a sub control.

101.8.16 LostFocus

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes:

This only fires if the control itself lost focus and not a sub control.

101.8.17 MenuBarSelected

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

101.8.18 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes: The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

101.8.19 MouseDrag(x as Integer, y as Integer)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes: Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

101.8.20 MouseUp(x As Integer, y As Integer)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

101.8.21 Open

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

101.8.22 Opening

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

101.8.23 ScaleFactorChanged(NewFactor as double)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

101.8.24 willShowContextualMenu(menu as NSMenuMBS, NSEvent as NSEventMBS)

MBS AVFoundation Plugin, Plugin Version: 24.1, Platform: macOS, Targets: Desktop only.

Function: Will show contextual menu.
Notes: Your chance to modify the menu before it is shown, e.g. to add menu entries.

101.9 class IKImageViewMBS

101.9.1 class IKImageViewMBS

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. You can use ImageWell control instead.
Function: An advanced image view in ImageKit.
Notes: The IKImageViewMBS class provides an efficient way to display images in a view while at the same time supporting a number of image editing operations such as rotating, zooming, and cropping. It supports drag and drop for the NSFilenamesPboardType flavor so that the user can drag an image to the view. If possible, image rendering uses hardware acceleration to achieve optimal performance. The IKImageViewMBS class is implemented as a subclass of NSView. Similar to NSImageViewMBS, the IKImageViewMBS class is used to display a single image.
Subclass of the NSViewMBS class.

101.9.2 Methods

101.9.3 Constructor

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new box view with size 100/100 and position 0/0
Example:

```
Var x as new IKImageViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 101.9.4 Constructor(Handle as Integer) 16229
- 101.9.5 Constructor(left as double, top as double, width as double, height as double) 16230

101.9.4 Constructor(Handle as Integer)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSView handle.
Example:

```
Var t as new IKImageViewMBS(0, 0, 100, 100)
Var v as new IKImageViewMBS(t.handle)

MessageBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a IKImageView and the plugin retains this handle.
See also:

- 101.9.3 Constructor 16229
- 101.9.5 Constructor(left as double, top as double, width as double, height as double) 16230

101.9.5 Constructor(left as double, top as double, width as double, height as double)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with the given size and position.
Example:

```
Var left,top,width,height as Integer
// define rectangle
Var x as new IKImageViewMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:

- 101.9.3 Constructor 16229
- 101.9.4 Constructor(Handle as Integer) 16229

101.9.6 convertImagePointToViewPoint(imagePoint as NSPointMBS) as NSPointMBS

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Converts an image coordinate to an image view coordinate.
Notes: imagePoint: A point specified in coordinates relative to the image.

Returns a point specified in coordinates relative to the image view.

101.9.7 convertImageRectToViewRect(ImageRect as NSRectMBS) as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Converts an image rectangle to an image view rectangle.
Notes: ImageRect: An rectangle specified in coordinates relative to the image.

Returns an rectangle specified in coordinates relative to the image view.

101.9.8 convertViewPointToImagePoint(viewPoint as NSPointMBS) as NSPointMBS

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Converts an image view coordinate to an image coordinate.
Notes: viewPoint: A point specified in coordinates relative to the image view.

Returns the point specified in coordinates relative to the image.

101.9.9 convertViewRectToImageRect(viewRect as NSRectMBS) as NSRectMBS

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Converts an image view rectangle to an image rectangle.
Notes: viewRect: An rectangle specified in coordinates relative to the image view.

The rectangle specified in coordinates relative to the image.

101.9.10 crop

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Crops the image using the current selection.

101.9.11 flipImageHorizontal

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Flips an image along the horizontal axis.

101.9.12 flipImageVertical

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Flips an image along the vertical axis.

101.9.13 IKOverlayTypeBackground as String

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: A layer level.
Notes: A background.

101.9.14 IKOverlayTypeImage as String

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: A layer level.
Notes: An image.

101.9.15 IKToolModeAnnotate as String

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: One of the tool modes.
Notes: The annotation tool.

101.9.16 IKToolModeCrop as String

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: One of the tool modes.
Notes: The crop tool.

101.9.17 IKToolModeMove as String

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: One of the tool modes.
Notes: The move tool.

101.9.18 IKToolModeNone as String

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: One of the tool modes.
Notes: No tool is set.

101.9.19 IKToolModeRotate as String

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: One of the tool modes.
Notes: The rotation tool.

101.9.20 IKToolModeSelect as String

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: One of the tool modes.
Notes: The selection tool.

101.9.21 IKToolModeSelectEllipse as String

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: One of the tool modes.
Notes: The selection ellipse.

101.9.22 IKToolModeSelectLasso as String

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: One of the tool modes.
Notes: The selection lasso.

101.9.23 IKToolModeSelectRect as String

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: One of the tool modes.
Notes: Same as IKToolModeSelect.

101.9.24 rotateImageLeft

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Rotates the image left (counter-clockwise).

101.9.25 rotateImageRight

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Rotates the image right (clockwise).

101.9.26 scrollToPoint(point as NSPointMBS)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Scrolls the view to the specified point.
Notes: point: The point to scroll to.

101.9.27 scrollToRect(rect as NSRectMBS)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Scrolls the view so that it includes the provided rectangular area.
Notes: Rect: The rectangular area to include in the view.

101.9.28 SetImage(image as CGImageMBS, metaData as Dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Sets the image to display in an image view.
Notes: image: The image to set.
metaData: A dictionary that contains metadata that describes the image.

101.9.29 SetImageFile(File as FolderItem)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Initializes an image view with the image specified by a folderitem.
Notes: File: The file that specifies the location of the image.

This method is the preferred initializer for RAW images. If you use this method for a TIFF file that contains multiple images, only the first image is displayed.

101.9.30 SetImageURL(URL as String)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Initializes an image view with the image specified by a URL.
Notes: url: The URL that specifies the location of the image.

This method is the preferred initializer for RAW images. If you use this method for a TIFF file that contains multiple images, only the first image is displayed.

101.9.31 setImageZoomFactor(zoomFactor as Double, centerPoint as NSPointMBS)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Sets the zoom factor at the provided origin.
Notes: zoomFactor: The zoom factor to apply to the image.
centerPoint: The point that specifies the origin of the zoom factor.

101.9.32 SetPicture(picture as Picture, metaData as Dictionary = nil)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Sets the picture to display in an image view.
Notes: picture: The picture to set.
metaData: A dictionary that contains metadata that describes the image.

101.9.33 setRotationAngle(rotationAngle as Double, centerPoint as NSPointMBS)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Sets the rotation angle at the provided origin.
Notes: rotationAngle: The rotation angle to apply to the image.
centerPoint: The point that specifies the origin of the rotation angle.

101.9.34 zoomImageToActualSize

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Zooms the image so that it is displayed using its true size.

101.9.35 zoomImageToFit

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Zooms the image so that it fits in the image view.

101.9.36 zoomImageToRect(rect as NSRectMBS)

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Zooms the image so that it fits in the specified rectangle.
Notes: rect: The rectangle to fit the image in.

101.9.37 zoomIn

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Zooms the image in.

101.9.38 zoomOut

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Zooms the image out.

101.9.39 Properties

101.9.40 autohidesScrollers as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the automatic-hiding scroll bar state for the image view.
Notes: (Read and Write property)

101.9.41 autoresizes as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the automatic resizing state for the image view.
Notes: (Read and Write property)

101.9.42 backgroundColor as NSColorMBS

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the background color for the image view.
Notes: (Read and Write property)

101.9.43 currentToolMode as String

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the current tool mode for the image view.
Notes: (Read and Write property)

101.9.44 doubleClickOpensImageEditPanel as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the image-opening state of the editing pane in the image view.
Notes: (Read and Write property)

101.9.45 editable as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the editable state for the image view.
Notes: (Read and Write property)

101.9.46 hasHorizontalScroller as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the horizontal scroll bar state for the image view.
Notes: (Read and Write property)

101.9.47 hasVerticalScroller as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the vertical scroll bar state for the image view.
Notes: (Read and Write property)

101.9.48 Image as CGImageMBS

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Returns the image associated with the view, after any image corrections.
Notes: (Read only property)

101.9.49 imageCorrection as Variant

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Specifies a Core Image filter for image correction.
Notes: (Read and Write property)

101.9.50 imageHeight as Integer

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Returns the height of the image in the image view.
Notes: The image size changes whenever an image is rotates or cropped.
(Read only property)

101.9.51 imageProperties as Dictionary

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Returns the metadata for the image in the view.
Notes: A dictionary of metadata that specifies the image properties.
(Read only property)

101.9.52 imageWidth as Integer

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Returns the width of the image in the image view.
Notes: The image size changes whenever an image is rotates or cropped.
(Read only property)

101.9.53 Picture as Picture

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Returns the image associated with the view, after any image corrections.
Notes: Converted to picture for your convenience.
(Read only property)

101.9.54 rotationAngle as Double

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the rotation angle for the image view.
Notes: (Read and Write property)

101.9.55 supportsDragAndDrop as Boolean

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the drag-and-drop support state for the image view.
Notes: (Read and Write property)

101.9.56 zoomFactor as Double

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the zoom factor for the image view.
Notes: (Read and Write property)

101.9.57 Overlay(layerType as string) as Variant

MBS AVFoundation Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Get or set the overlay layer.
Notes: The Core Animation layer associated with a layer type.
Value is a CALayerMBS object.
(Read and Write computed property)

101.10 class IKPictureTakerMBS

101.10.1 class IKPictureTakerMBS

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: An IKPictureTaker object is a panel that allows users to choose and crop an image.
Example:

```
// let the user take a picture with the camera or choose a file, and crop it to a square
Var taker As New IKPictureTakerMBS
taker.AllowsVideoCapture = True
taker.AllowsFileChoosing = True
taker.AllowsEditing = True // crop and zoom

If taker.runModal = 1 Then // OK
Var image As NSImageMBS = taker.outputImage
If image <>Nil Then
Var pic As Picture = image.CopyPicture
// use pic as user picture
End If
End If
```

Notes: It supports browsing of the file system and includes a recents popup-menu. The IKPictureTaker lets the user to crop a chosen image or to take snapshot from a camera like the built-in iSight.

Requires Mac OS X 10.5.

Works fine up to macOS 15, but fails in macOS 26 due to a security problem with a remote view controller.
Subclass of the NSPanelMBS class.

101.10.2 Methods

101.10.3 Available as boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether the picture taker is available on that platform or not.
Example:

```
Var n as Integer

Var p as new IKPictureTakerMBS

if not p.Available then
```

```
MessageBox "This application requires Mac OS X 10.5 and a Macho Target"
Return
end if
```

Notes: True on Mac OS X 10.5.

101.10.4 beginPictureTaker as boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Launch the PictureTaker.
Example:

```
Var p as IKPictureTakerMBS // your picture taker

if not p.beginPictureTaker then
MessageBox "Can't show picture taker!?"
end if
```

Notes: You will later receive an event for the case the user clicks on OK or Cancel buttons.
Returns true on success and false on failure.

101.10.5 beginPictureTakerSheet(parent as DesktopWindow) as boolean

MBS AVFoundation Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Opens a picture taker as a sheet whose parent is the specified window.
Notes: parent: The parent window of the picture taker sheet.

You will later receive an event for the case the user clicks on OK or Cancel buttons.

Available in Mac OS X v10.5 and later.
See also:

- 101.10.6 beginPictureTakerSheet(parent as NSWindowMBS) as boolean 16242
- 101.10.7 beginPictureTakerSheet(parent as window) as boolean 16243

101.10.6 beginPictureTakerSheet(parent as NSWindowMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Opens a picture taker as a sheet whose parent is the specified window.
Notes: parent: The parent window of the picture taker sheet.

You will later receive an event for the case the user clicks on OK or Cancel buttons.

Available in Mac OS X v10.5 and later.
See also:

- 101.10.5 beginPictureTakerSheet(parent as DesktopWindow) as boolean 16242
- 101.10.7 beginPictureTakerSheet(parent as window) as boolean 16243

101.10.7 beginPictureTakerSheet(parent as window) as boolean

MBS AVFoundation Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Opens a picture taker as a sheet whose parent is the specified window.
Notes: parent: The parent window of the picture taker sheet.

You will later receive an event for the case the user clicks on OK or Cancel buttons.

Available in Mac OS X v10.5 and later.
See also:

- 101.10.5 beginPictureTakerSheet(parent as DesktopWindow) as boolean 16242
- 101.10.6 beginPictureTakerSheet(parent as NSWindowMBS) as boolean 16242

101.10.8 Constructor

MBS AVFoundation Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The constructor to create a new picture taker panel.

101.10.9 CropAreaSizeHeight as Double

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The height of the crop area.

101.10.10 CropAreaSizeWidth as Double

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The width of the crop area.

101.10.11 outputImage as NSImageMBS

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Return the edited image.

101.10.12 OutputImageMaxSizeKeyHeight as Double

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The maximum height of the output image.

101.10.13 OutputImageMaxSizeKeyWidth as Double

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The maximum width of the output image.

101.10.14 popUpRecentsMenuForView(parent as NSViewMBS) as boolean

MBS AVFoundation Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Displays the Open Recent popup menu associated with the picture taker.
Notes: You will later receive an event for the case the user clicks on OK or Cancel buttons.

Available in Mac OS X v10.5 and later.

101.10.15 runModal as Integer

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Launches a modal PictureTaker session.
Example:

```
Var p as IKPictureTakerMBS // global property
Var n as Integer

p=new IKPictureTakerMBS

if not p.Available then
MessageBox "This application requires Mac OS X 10.5 and a Macho Target"
Return
end if

p.AllowsFileChoosing=true
p.AllowsEditing=true
p.AllowsVideoCapture=true
p.ShowEffects=FALSE // disable if you run modal!
p.ShowRecentPicture=true
p.UpdateRecentPicture=true
p.InformationalText="Please take a picture"

n=p.runModal

if n=1 then // ok
Backdrop=p.outputImage.CopyPictureWithMask
else
Title=Str(n)
end if
```

Notes: Returns NSOKButton (1) if the user edits or chooses an image and confirm panel, NSCancelButton (0) if the user canceled or didn't change the image.

You may want to disable effects as they won't work in Xojo in a modal picture taker dialog.

101.10.16 SetCropAreaSize(width as Double, height as Double)

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Sets the crop area.

101.10.17 SetOutputImageMaxSize(width as Double, height as Double)

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Sets the maximum output image size.

101.10.18 Properties

101.10.19 AllowsEditing as boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether editing is allowed or not.
Notes: (Read and Write computed property)

101.10.20 AllowsFileChoosing as boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether choosing a file is allowed or not.
Notes: (Read and Write computed property)

101.10.21 AllowsVideoCapture as boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether video capture is allowed or not.
Notes: (Read and Write computed property)

101.10.22 InformationalText as NSAttributedStringMBS

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The information text as a plain string.
Notes: On getting the value the plugin will check whether the value is a formatted or a plain text. if it is a plain text, it will return the plain text as a NSAttributedStringMBS.
(Read and Write computed property)
See also:

- 101.10.23 InformationalText as string 16246

101.10.23 InformationalText as string

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The information text as a plain string.
Example:

```
Var p as IKPictureTakerMBS // your picture taker
p.InformationalText="Please take a picture"
```

Notes: On getting the value the plugin will check whether the value is a formatted or a plain text. if it is a formatted text, it will return the formatted text as plain text.
(Read and Write computed property)
See also:

- 101.10.22 InformationalText as NSAttributedStringMBS 16246

101.10.24 inputImage as NSImageMBS

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The input image.
Notes: The input image is never modified by the PictureTaker.
(Read and Write computed property)

101.10.25 mirroring as boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: True if video mirroring is enabled, false otherwise.
Notes: Controls whether the receiver enable/disable video mirroring durring snapshots (default is true).
(Read and Write computed property)

101.10.26 RemainOpenAfterValidate as boolean

MBS AVFoundation Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether the picture taker reamins open.
Notes: Requires Mac OS X 10.6.
(Read and Write computed property)

101.10.27 ShowAddressBookPicture as boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether the addressbook picture is shown or not.
Notes: (Read and Write computed property)

101.10.28 ShowEffects as boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether effects are shown or not.
Notes: (Read and Write computed property)

101.10.29 ShowEmptyPicture as NSImageMBS

MBS AVFoundation Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The image to use for an empty image.
Notes: (Read and Write computed property)

101.10.30 ShowRecentPicture as boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether recent pictures should be shown.
Notes: (Read and Write computed property)

101.10.31 UpdateRecentPicture as boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether recent pictures should be updated.
Notes: (Read and Write computed property)

101.10.32 Events

101.10.33 Finished(returnCode as Integer)

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: beginPictureTaker has finished work.
Notes: ReturnCode is 1 if the user clicked OK and 0 if the user clicked false.

101.10.34 Screenshots

101.10.35 PictureTaker1.jpg

Function: The picture taker with an image choosed.

101.10.36 PictureTaker2.jpg

Function: The picture taker doing effects on a photo taken with the iSight.

101.10.37 QuartzFilterPanel.jpg

Function: The Quartz filter manager panel.

101.11 class IKSlideshowMBS

101.11.1 class IKSlideshowMBS

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The ImageKit class for a slideshow.
Notes: Requires Mac OS X 10.5.
Slideshows can be only with pictures, with PDF pages or with file references.
Those files can be picture files, pdf files or anything you want.
Blog Entries

- MBS REALbasic plug-in 9.6

101.11.2 Methods

101.11.3 addFile(file as folderitem, name as string="")

MBS AVFoundation Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Adds a file to the items list.

101.11.4 addImage(image as NSImageMBS, name as string="")

MBS AVFoundation Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Adds an image to the items list.
Example:

```
Var p as picture
Var n as NSImageMBS
Var s as new IKSlideshowMBS

// get picture to p
n=new NSImageMBS(p)
s.addImage n
```

101.11.5 addPage(page as Variant, name as string="")

MBS AVFoundation Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Adds a PDF page to the items list.
Notes: Page must be a PDFPageMBS object.

101.11.6 Available as boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether the slide show functions are available.
Example:

```
if IKSlideshowMBS.Available=False then
MessageBox "You need Mac OS X 10.5 for this and a MachO application."
quit
end if
```

Notes: Value is true for Mac OS X 10.5.

101.11.7 canExportToApplication(applicationBundleIdentifier as string) as boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: is exporting to a given application possible?
Notes: (application installed?, right version?, ...)

101.11.8 exportSlideshowItems(applicationBundleIdentifier as string)

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Export items to the given application.
Example:

```
Var i,c as Integer
Var s as new IKSlideshowMBS

// add items here

if false=IKSlideshowMBS.canExportToApplication(IKSlideshowMBS.iPhotoBundleIdentifier) then
MessageBox "Can't export to iPhoto."
else

if s.itemcount>0 then

s.exportSlideshowItems IKSlideshowMBS.iPhotoBundleIdentifier

else
MessageBox "no slides?"
end if
end if
```

101.11.9 indexOfCurrentSlideshowItem as Integer

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The index of the current slide.
Notes: Index is from 0 to count-1.

101.11.10 ItemCount as Integer

MBS AVFoundation Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Returns the number of items.

101.11.11 reloadData

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Reloads all slides.

101.11.12 reloadSlideshowItemAtIndex(index as Integer)

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Reloads the slide show with the given index.

101.11.13 removeItem(index as Integer)

MBS AVFoundation Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Removes an item from the item list.

101.11.14 removeItems

MBS AVFoundation Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Removes all items from the item list.

101.11.15 runSlideshow

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Start the slideshow.
Example:

```
Var s as new IKSlideshowMBS
// add items
s.runSlideshow
```

Notes: You may want to set all the properties before.

101.11.16 setFile(index as Integer, file as folderitem, name as string="")

MBS AVFoundation Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sets the file in the items list with the given index.

101.11.17 setImage(index as Integer, image as NSImageMBS, name as string="")

MBS AVFoundation Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sets the image in the items list with the given index.

101.11.18 setPage(index as Integer, page as Variant, name as string="")

MBS AVFoundation Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sets a PDF page in the items list with the given index.
Notes: Page must be a PDFPageMBS object.

101.11.19 stopSlideshow

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Stops the slideshow.

101.11.20 Properties

101.11.21 AudioFile as FolderItem

MBS AVFoundation Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Optional audio file to play while running slide show.
Notes: Only used for Mac OS X 10.6.
(Read and Write property)

101.11.22 PDFDisplayBox as Integer

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The PDF display box mode to use.
Notes: Default value is -1 which means that we use the framework default mode.
(Read and Write property)

101.11.23 PDFDisplayMode as Integer

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The PDF display mode you want.
Notes: Default value is -1 which means that we use the framework default mode.
(Read and Write property)

101.11.24 PDFDisplaysAsBook as Boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether PDF should display as book.
Notes: Default value is false.
(Read and Write property)

101.11.25 ScreenIndex as Integer

MBS AVFoundation Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The screen to use.
Notes: Default is main screen.
Only used for Mac OS X 10.6.

(Read and Write property)

101.11.26 StartIndex as Integer

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The index of the first slide to show.
Notes: Index is from 0 to count-1.
Default value is -1 which means that we use the framework default mode.
(Read and Write property)

101.11.27 StartPaused as Boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether to start paused.
Notes: Default is false.
(Read and Write property)

101.11.28 WrapAround as Boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether to wrap around when the slideshow runs.
Notes: Default is false.
(Read and Write property)

101.11.29 autoPlayDelay as Double

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: The time to wait before the slideshow will start automatically.
Notes: Value is in seconds.
(Read and Write computed property)

101.11.30 Events

101.11.31 canExportSlideshowItemAtIndex(index as Integer, applicationBundleIdentifier as string) as boolean

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Should the export button be enabled for a given item at index?
Notes: This event is optional.

101.11.32 slideshowDidChangeCurrentIndex(newIndex as Integer)

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Slideshow did change current item index.

101.11.33 slideshowDidStop

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Slideshow did stop
Notes: This event is optional.

101.11.34 slideshowWillStart

MBS AVFoundation Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Slideshow will start.
Notes: This event is optional.

101.11.35 Constants

Constants

Constant	Value	Description
iPhotoBundleIdentifier	"com.apple.iPhoto"	The iPhoto application identifier. May be used on the export functions.
kPDFDisplayBoxArtBox	4	One of the possible values for the PDFDisplayBox property.
kPDFDisplayBoxBleedBox	2	One of the possible values for the PDFDisplayBox property.
kPDFDisplayBoxCropBox	1	One of the possible values for the PDFDisplayBox property.
kPDFDisplayBoxMediaBox	0	One of the possible values for the PDFDisplayBox property.
kPDFDisplayBoxTrimBox	3	One of the possible values for the PDFDisplayBox property.
kPDFDisplaySinglePage	0	One of the PDF display mode constants.
kPDFDisplaySinglePageContinuous	1	One of the PDF display mode constants.
kPDFDisplayTwoUp	2	One of the PDF display mode constants.
kPDFDisplayTwoUpContinuous	3	One of the PDF display mode constants.

Chapter 102

ImageMagick7

102.1 module ImageMagick7MBS

102.1.1 module ImageMagick7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module for global functions.
Example:

```
// load the ImageMagick library and show version and features
If Not ImageMagick7MBS.LoadLibrary(SpecialFolder.Resources.Child("libMagickWand-7.dylib").NativePath)
Then
MessageBox "Can't load ImageMagick."
Return
End If
MessageBox ImageMagick7MBS.Version + EndOfLine + "Features: " + ImageMagick7MBS.Features +
EndOfLine + ImageMagick7MBS.Copyright
```

Notes: The MBS Plugin can load 8, 16, 32 or 64 bit ImageMagick libraries with or without HDRI support. We detect what library is loaded and adjust in various functions. Check QuantumDepth, QuantumSize and HDRI properties.

All class names have currently 7 in the class name to give users of the older classes time for the transition. Currently we use ImageMagick 7.0.9. The plugin may work with older/newer versions of 7.x.

We do have functions to use Xojo pictures with CopyPicture and SetPicture. Those move pixels as they are, so it is up to you to do proper color management. As Xojo pictures are just 8bit RGB, you may loose information on conversion. ExportPixels and ImportPixels functions can move pixel data into/from memory blocks.

Best to avoid Xojo pictures and load image here, modify it and save it again.
Blog Entries

- MBS Xojo Plugins, version 19.6pr1

102.1.2 Methods

102.1.3 ClampToQuantum(value as Double) as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clamps given value to the range for quantum.
Notes: Limits range between 0 and QuantumRange and for non-HDRI rounds value.

102.1.4 InitializeMagick(path as string = "")

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the MagickCore environment.
Notes: path: the execution path of the current ImageMagick client.

See MagickCoreGenesis function in ImageMagick documentation.

102.1.5 LoadLibrary(path as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the MagickCore library file.
Example:

```
#If TargetMacOS Then

// installed via homebrew
Var f As New FolderItem("/opt/homebrew/Cellar/imagemagick/7.1.1-6/lib/libMagickCore-7.Q16HDRI.10.dylib",
FolderItem.PathModes.Native)

If ImageMagick7MBS.LoadLibraryFile(f) Then

'MessageBox "loaded"

Else
```

```
MessageBox "failed to load: "+ImageMagick7MBS.LoadErrorString

End If

#Else
If ImageMagick7MBS.LoadLibrary("CORE_RL_MagickCore_.dll") Then

'MessageBox "loaded"

Else

MessageBox "failed to load: "+ImageMagick7MBS.LoadErrorString

End If
#EndIf
```

Notes: Returns true on success and false on failure.
LoadErrorString is set with error string if available.

102.1.6 LoadLibraryFile(path as folderitem) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the MagickCore library file.
Example:

```
Var f As FolderItem = SpecialFolder.Desktop.Child("libMagickCore-7.Q16HDRI.7.dylib")

If ImageMagick7MBS.LoadLibraryFile(f) Then

MessageBox "loaded"

Else

MessageBox "failed to load: "+ImageMagick7MBS.LoadErrorString

End If
```

Notes: Returns true on success and false on failure.
LoadErrorString is set with error string if available.

102.1.7 MagickInfoList as IMMagickInfoList7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of MagickInfo objects.
Notes: See GetMagickInfoList function in ImageMagick documentation.

102.1.8 MagickToMime(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the officially registered (or de facto) MIME media-type corresponding to a magick string.
Notes: If there is no registered media-type, then the string "image/x-magick" (all lower case) is returned.

See MagickToMime function in ImageMagick documentation.

102.1.9 NewImageInfo as IMImageInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates new image info object.
Notes: See CloneImageInfo function in ImageMagick documentation.

102.1.10 NewImageList as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an empty image list.
Notes: See NewImageList function in ImageMagick documentation.

102.1.11 PrintMagickVersion

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Identifies the ImageMagick version by printing its attributes to the file. Attributes include the copyright, features, and delegates.
Notes: See ListMagickVersion function in ImageMagick documentation.

102.1.12 ScaleQuantumToChar(value as Double) as UInt8

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales a quantum value to 8 bit unsigned integer.
Notes: Depending on which library is loaded a quantum is an UInt8, UInt16, UInt32, Single or Double value.
This function normalizes and rounds values to nearest 8 bit integer value.

102.1.13 SetCurrentDirectory(path as folderitem) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the current working directory.
Notes: This is needed for most installations to point to the folder with the libraries in order for LoadLibrary to find the dependencies.

102.1.14 Properties

102.1.15 Copyright as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick API copyright as a string.
Notes: See GetMagickCopyright function in ImageMagick documentation.
(Read only property)

102.1.16 Delegates as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick delegate libraries.
Notes: See GetMagickDelegates function in ImageMagick documentation.
(Read only property)

102.1.17 Epsilon as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Small value.
Notes: Two values are considered equal if the difference is smaller than epsilon.

(Read only property)

102.1.18 Features as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick features.
Example:

MessageBox ImageMagick7MBS.Features

Notes: See GetMagickFeatures function in ImageMagick documentation.
e.g. "Cipher DPC Modules OpenCL OpenMP(2.0)".
(Read only property)

102.1.19 HDRI as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether HDRI is used.
Notes: If the plugin detects HDRI mode for the library, we use floats (8 and 16 bit depth) or doubles (32 and 64 bit depth).
(Read only property)

102.1.20 HomeURL as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick home URL.
Notes: See GetMagickHomeURL function in ImageMagick documentation.
(Read only property)

102.1.21 Huge as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Huge value.
Notes: Values bigger than Huge are far over the range of a quantum.
(Read only property)

102.1.22 License as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick API license as a string.
Notes: See GetMagickLicense function in ImageMagick documentation.
(Read only property)

102.1.23 LoadErrorString as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error from LoadLibrary call.
Notes: (Read only property)

102.1.24 MagickPrecision as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the maximum number of significant digits to be printed.
Notes: See GetMagickPrecision function in ImageMagick documentation.
(Read and Write property)

102.1.25 MagickSignature as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a signature that uniquely encodes the MagickCore libary version, quantum depth, HDRI status, OS word size, and endianness.
Notes: See GetMagickSignature function in ImageMagick documentation.
(Read only property)

102.1.26 MaxColormapSize as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum size of a color map.
Notes: Value is 256 for 8 bit or 65536 for higher bit depths.
(Read only property)

102.1.27 MaxMap as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum index in a color map.
Notes: Either 255 for 8 bit or 65535 for 16 bit or higher.
(Read only property)

102.1.28 PackageName as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick package name.
Notes: See GetMagickPackageName function in ImageMagick documentation.
(Read only property)

102.1.29 QuantumDepth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The quantum depth.
Notes: Can be 8, 16, 32 or 64 bit depending on the loaded image magick library.
(Read only property)

102.1.30 QuantumDepthString as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick quantum depth.
Notes: Returns the quantum depth is returned as a number.
See GetMagickQuantumDepth function in ImageMagick documentation.
(Read only property)

102.1.31 QuantumRange as UInt32

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The maximum value for the range of quantums.
Notes: Depending on quantum depth ranges from 255 to &hFFFFFFFF.
(Read only property)

102.1.32 QuantumRangeString as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick quantum range.
Notes: See GetMagickQuantumRange function in ImageMagick documentation.
e.g. "((Quantum) 65535)"
(Read only property)

102.1.33 QuantumSize as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of a quantum value in bytes.
Notes: Used to allocate memoryblocks of right size.
e.g. Width * Height * QuantumSize * ChannelCount.
(Read only property)

102.1.34 ReleaseDate as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick release date.
Notes: See GetMagickReleaseDate function in ImageMagick documentation.
(Read only property)

102.1.35 Version as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick API version as a string.
Example:

```
MessageBox ImageMagick7MBS.Version
// e.g. "ImageMagick 7.0.9-2 Q16 x86 2019-10-30 http://www.imagemagick.org"
```

Notes: See GetMagickVersion function in ImageMagick documentation.
(Read only property)

102.1.36 VersionNumber as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the ImageMagick API version as a number.
Notes: See GetMagickVersion function in ImageMagick documentation.
e.g. &h709 for 7.0.9.
(Read only property)

102.2 class IMChannelStatistics7MBS

102.2.1 class IMChannelStatistics7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for channel statistics.
Notes: Obtain image statistics. Statistics are normalized to the range of 0.0 to 1.0 and are output into this class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

102.2.2 Methods

102.2.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

102.2.4 Properties

102.2.5 Area as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Area.
Notes: (Read only property)

102.2.6 Depth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The depth.
Notes: (Read only property)

102.2.7 Entropy as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Entropy.
Notes: (Read only property)

102.2.8 Kurtosis as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Kurtosis
Notes: (Read only property)

102.2.9 Maxima as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum value observed.
Notes: (Read only property)

102.2.10 Mean as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Average (mean) value observed.
Notes: (Read only property)

102.2.11 Minima as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Minimum value observed.
Notes: (Read only property)

102.2.12 Skewness as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Skewness.
Notes: (Read only property)

102.2.13 StandardDeviation as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Standard deviation, sqrt(variance)
Notes: (Read only property)

102.2.14 Sum as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sum.
Notes: (Read only property)

102.2.15 SumCubed as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sum cubed
Notes: (Read only property)

102.2.16 SumFourthPower as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sum fourth power.
Notes: (Read only property)

102.2.17 SumSquared as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sum squared.
Notes: (Read only property)

102.2.18 Variance as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Variance.
Notes: (Read only property)

102.3 class IMException7MBS

102.3.1 class IMException7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an exception.
Notes: Subclass of the RuntimeException class.

102.3.2 Properties

102.3.3 Description as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The description text.
Notes: (Read and Write property)

102.3.4 Reason as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The reason text.
Notes: (Read and Write property)

102.3.5 Severity as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error code for exception.
Notes: (Read and Write property)

102.3.6 Constants

Error Types

Constant	Value	Description

102.4 class IMFrameInfo7MBS

102.4.1 class IMFrameInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a frame.
Example:

```
// add a 3D frame around a picture with ImageMagick
Var pic As Picture = Picture.Open(SpecialFolder.Desktop.Child("photo.jpg"))
Var image As New IMImage7MBS(pic)

Var frame As New IMFrameInfo7MBS(20, 20, image.Width + 40, image.Height + 40) // 20 pixels on each side
frame.InnerBevel = 5
frame.OuterBevel = 5

Var framed As IMImage7MBS = image.Frame(frame, IMImage7MBS.kOverCompositeOp)
If framed <>Nil Then
Var result As Picture = framed.CopyPicture
// show result in a Canvas or ImageViewer
End If
```

102.4.2 Methods

102.4.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the point object with zero values.
See also:

- 102.4.4 Constructor(X as Integer, Y as Integer, Width as Integer, Heigth as Integer) 16277

102.4.4 Constructor(X as Integer, Y as Integer, Width as Integer, Heigth as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the point object with given values.
See also:

- 102.4.3 Constructor 16277

102.4.5 Properties

102.4.6 Height as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the rectangle.
Notes: (Read and Write property)

102.4.7 InnerBevel as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The inner bevel size.
Notes: (Read and Write property)

102.4.8 OuterBevel as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The outer bevel size.
Notes: (Read and Write property)

102.4.9 Width as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the rectangle.
Notes: (Read and Write property)

102.4.10 X as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x coordinate of the rectangle.
Notes: (Read and Write property)

102.4.11 Y as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y coordinate of the rectangle.
Notes: (Read and Write property)

102.5 class IMGeometryInfo7MBS

102.5.1 class IMGeometryInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for geometry info.
Example:

```
// build a blur kernel with radius and sigma and apply it
Var geometry As New IMGeometryInfo7MBS
geometry.rho = 5 // radius
geometry.sigma = 2

Var kernel As New IMKernelInfo7MBS(IMKernelInfo7MBS.KernelBlur, geometry)
Var image As New IMImage7MBS(Picture.Open(SpecialFolder.Desktop.Child("photo.jpg")))
Var blurred As IMImage7MBS = image.Convolve(kernel)
```

102.5.2 Methods

102.5.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

102.5.4 Properties

102.5.5 chi as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The chi value.
Notes: (Read and Write property)

102.5.6 psi as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The psi value.
Notes: (Read and Write property)

102.5.7 rho as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rho value.
Notes: (Read and Write property)

102.5.8 sigma as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sigma value.
Notes: (Read and Write property)

102.5.9 xi as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The xi value.
Notes: (Read and Write property)

102.6 class IMImage7MBS

102.6.1 class IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an ImageMagick image.
Example:

```
// make a blurred thumbnail of a picture with ImageMagick
Var pic As Picture = LogoMBS(500)
Var image As New IMImage7MBS(pic)

Var thumb As IMImage7MBS = image.Thumbnail(200, 200)
Var blurred As IMImage7MBS = thumb.Blur(0, 3)

Var result As Picture = blurred.CopyPicture
MessageBox "Size: " + blurred.Width.ToString + " x " + blurred.Height.ToString
// show result in a Canvas or ImageViewer
```

Notes: See xx function in ImageMagick documentation.

102.6.2 Methods

102.6.3 AcquireImageColormap(count as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Allocates an image colormap and initializes it to a linear gray colorspace.
Notes: If the image already has a colormap, it is replaced. AcquireImageColormap() returns true if successful, otherwise false if there is not enough memory.

colors: the number of colors in the image colormap.

See AcquireImageColormap function in ImageMagick documentation.

102.6.4 AdaptiveBlur(radius as double, sigma as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adaptively blurs the image by blurring less intensely near image edges and more intensely far from edges.
Notes: We blur the image with a Gaussian operator of the given radius and standard deviation (sigma).

For reasonable results, radius should be larger than sigma. Use a radius of 0 and AdaptiveBlur selects a suitable radius for you.

radius: the radius of the Gaussian, in pixels, not counting the center pixel.
sigma: the standard deviation of the Laplacian, in pixels.

See AdaptiveBlurImage function in ImageMagick documentation.

102.6.5 AdaptiveResize(columns as Integer, Rows as Integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adaptively resize image with pixel resampling.
Notes: This is shortcut function for a fast interpolative resize using mesh interpolation. It works well for small resizes of less than +/- 50 of the original image size. For larger resizing on images a full filtered and slower resize function should be used instead.

columns: the number of columns in the resized image.
rows: the number of rows in the resized image.

See AdaptiveResizeImage function in ImageMagick documentation.

102.6.6 AdaptiveSharpen(radius as double, sigma as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adaptively sharpens the image by sharpening more intensely near image edges and less intensely far from edges.
Notes: We sharpen the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and AdaptiveSharpen selects a suitable radius for you.

radius: the radius of the Gaussian, in pixels, not counting the center pixel.
sigma: the standard deviation of the Laplacian, in pixels.

See AdaptiveSharpenImage function in ImageMagick documentation.

102.6.7 AdaptiveThreshold(width as Integer, height as integer, bias as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selects an individual threshold for each pixel based on the range of intensity values in its local neighborhood.
Notes: This allows for thresholding of an image whose global intensity histogram doesn't contain distinctive peaks.

width: the width of the local neighborhood.
height: the height of the local neighborhood.
bias: the mean bias.

See AdaptiveThresholdImage function in ImageMagick documentation.

102.6.8 AddNoise(NoiseType as integer, value as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds random noise to the image.
Notes: channel: the channel type.
noise_type: The type of noise: Uniform, Gaussian, Multiplicative, Impulse, Laplacian, or Poisson.
attenuate: attenuate the random distribution.

See AddNoiseImage function in ImageMagick documentation.

102.6.9 AffineTransform(matrix as IMImageAffineMatrix7MBS) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transforms an image as dictated by the affine matrix.
Notes: It allocates the memory necessary for the new Image structure and returns a pointer to the new image.

See xx function in ImageMagick documentation.

102.6.10 AppendImageToList(img as IMImage7MBS)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends the second image list to the end of the first list. The given image list pointer is left unchanged, unless it was empty.
Notes: See xx function in ImageMagick documentation.

102.6.11 AuthenticPixels(X as Integer, Y as Integer, Width as Integer, Height as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtains a pixel region for read/write access.
Notes: If the region is successfully accessed, a pointer to a Quantum array representing the region is returned, otherwise NULL is returned.

The returned pointer may point to a temporary working copy of the pixels or it may point to the original pixels in memory. Performance is maximized if the selected region is part of one row, or one or more full rows, since then there is opportunity to access the pixels in-place (without a copy) if the image is in memory, or in a memory-mapped file. The returned pointer must *never* be deallocated by the user.

Pixels accessed via the returned pointer represent a simple array of type Quantum. If the image has corresponding metacontent,call GetAuthenticMetacontent() after invoking GetAuthenticPixels() to obtain the meta-content corresponding to the region. Once the Quantum array has been updated, the changes must be saved back to the underlying image using SyncAuthenticPixels() or they may be lost.

See xx function in ImageMagick documentation.

102.6.12 AutoGamma as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extract the 'mean' from the image and adjust the image to try make set its gamma appropriatally.
Notes: See AutoGammaImage function in ImageMagick documentation.

102.6.13 AutoLevel as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adjusts the levels of a particular image channel by scaling the minimum and maximum values to the full quantum range.
Notes: See AutoLevelImage function in ImageMagick documentation.

102.6.14 AutoOrient(OrientationType as Integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adjusts an image so that its orientation is suitable for viewing (i.e. top-left orientation).
Notes: orientation: Current image orientation.

See AutoOrientImage function in ImageMagick documentation.

102.6.15 AutoThreshold(autoThresholdMethod as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Automatically performs image thresholding dependent on which method you specify.
Notes: method: choose from Kapur, OTSU, or Triangle.

See AutoThresholdImage function in ImageMagick documentation.

102.6.16 Bilevel(threshold as double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the value of individual pixels based on the intensity of each pixel channel.
Notes: The result is a high-contrast image.

More precisely each channel value of the image is 'thresholded' so that if it is equal to or less than the given value it is set to zero, while any value greater than that give is set to it maximum or QuantumRange.

This function is what is used to implement the "-threshold" operator for the command line API.

If the default channel setting is given the image is thresholded using just the gray 'intensity' of the image, rather than the individual channels.

threshold: define the threshold values.

See BilevelImage function in ImageMagick documentation.

102.6.17 BlackThreshold(thresholds as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Is like Threshold but forces all pixels below the threshold into black while leaving all pixels at or above the threshold unchanged.
Notes: threshold: define the threshold value.

See BlackThresholdImage function in ImageMagick documentation.

102.6.18 BlueShift(factor as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Mutes the colors of the image to simulate a scene at nighttime in the moonlight.
Notes: factor: the shift factor.

See BlueShiftImage function in ImageMagick documentation.

102.6.19 Blur(radius as double, sigma as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blurs an image.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, the radius should be larger than sigma. Use a radius of 0 and Blur selects a suitable radius for you.

radius: the radius of the Gaussian, in pixels, not counting the center pixel.
sigma: the standard deviation of the Gaussian, in pixels.

See BlurImage function in ImageMagick documentation.

102.6.20 Border(rectangle as IMRectangleInfo7MBS, CompositeOperator as integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Surrounds the image with a border of the color defined by the bordercolor member of the image structure.

Notes: The width and height of the border are defined by the corresponding members of the rectangle.

rectangle: define the width and height of the border.
CompositeOperator: the composite operator.

See BorderImage function in ImageMagick documentation.

102.6.21 BrightnessContrast(brightness as double, contrast as double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the brightness and/or contrast of an image.
Notes: It converts the brightness and contrast parameters into slope and intercept and calls a polynomical function to apply to the image.

brightness: the brightness percent (-100 .. 100).
contrast: the contrast percent (-100 .. 100).

See BrightnessContrastImage function in ImageMagick documentation.

102.6.22 Charcoal(radius as double, sigma as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new image that is a copy of an existing one with the edge highlighted.
Notes: It allocates the memory necessary for the new Image structure and returns a pointer to the new image.

radius: the radius of the pixel neighborhood.
sigma: the standard deviation of the Gaussian, in pixels.

See CharcoalImage function in ImageMagick documentation.

102.6.23 Chop(rect as IMRectangleInfo7MBS) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a region of an image and collapses the image to occupy the removed portion.
Notes: rect: Define the region of the image to chop.

See ChopImage function in ImageMagick documentation.

102.6.24 CLAHE(Width as Integer, Height as Integer, NumberBins as Integer, ClipLimit as double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Is a variant of adaptive histogram equalization in which the contrast amplification is limited, so as to reduce this problem of noise amplification.
Notes: width: the width of the tile divisions to use in horizontal direction.
height: the height of the tile divisions to use in vertical direction.
NumberBins: number of bins for histogram ("dynamic range").
ClipLimit: contrast limit for localised changes in contrast. A limit less than 1 results in standard non-contrast limited AHE.

See CLAHEImage function in ImageMagick documentation.

102.6.25 Clamp as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clamps image pixels.
Notes: Set each pixel whose value is below zero to zero and any the pixel whose value is above the quantum range to the quantum range (e.g. 65535) otherwise the pixel value remains unchanged.

See xx function in ImageMagick documentation.

102.6.26 ClampToQuantum(value as Double) as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clamps given value to the range for quantum.
Notes: Limits range between 0 and QuantumRange and for non-HDRI rounds value.

102.6.27 Clip as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clips along the first path from the 8BIM profile, if present.
Notes: See ClipImage function in ImageMagick documentation.

102.6.28 Clone as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies an image and returns the copy as a new image object.
Notes: See CloneImage function in ImageMagick documentation.

102.6.29 CloneImageProfiles(SourceImage as IMImage7MBS) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones one or more image profiles.
Notes: See xx function in ImageMagick documentation.

102.6.30 CloneProperties(Source as IMImage7MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones all the image properties from source image to current image.
Notes: See CloneImageProperties function in ImageMagick documentation.

102.6.31 Clut(clutImage as IMImage7MBS, pixelInterpolateMethod as integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces each color value in the given image, by using it as an index to lookup a replacement color value in a Color Look UP Table in the form of an image.
Notes: The values are extracted along a diagonal of the CLUT image so either a horizontal or vertial gradient image can be used.

Typically this is used to either re-color a gray-scale image according to a color gradient in the CLUT image, or to perform a freeform histogram (level) adjustment according to the (typically gray-scale) gradient in the CLUT image.

When the 'channel' mask includes the matte/alpha transparency channel but one image has no such channel it is assumed that that image is a simple gray-scale image that will effect the alpha channel values, either

for gray-scale coloring (with transparent or semi-transparent colors), or a histogram adjustment of existing alpha channel values. If both images have matte channels, direct and normal indexing is applied, which is rarely used.

clutImage: the color lookup table image for replacement color values.
method: the pixel interpolation method.

See ClutImage function in ImageMagick documentation.

102.6.32 CoalesceImages as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composites a set of images while respecting any page offsets and disposal methods.
Notes: GIF, MIFF, and MNG animation sequences typically start with an image background and each subsequent image varies in size and offset. A new image sequence is returned with all images the same size as the first images virtual canvas and composited with the next image in the sequence.

See CoalesceImages function in ImageMagick documentation.

102.6.33 ColorDecisionList(ColorCorrectionCollection as string) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Accepts a lightweight Color Correction Collection (CCC) file which solely contains one or more color corrections and applies the correction to the image.
Notes: Here is a sample CCC file:

```
<ColorCorrectionCollection xmlns="urn:ASC:CDL:v1.2">
<ColorCorrection id="cc03345">
<SOPNode>
<Slope>0.9 1.2 0.5 </Slope>
<Offset>0.4 -0.5 0.6 </Offset>
<Power>1.0 0.8 1.5 </Power>
</SOPNode>
<SATNode>
<Saturation>0.85 </Saturation>
</SATNode>
</ColorCorrection>
</ColorCorrectionCollection>
```

which includes the slop, offset, and power for each of the RGB channels as well as the saturation.

ColorCorrectionCollection: the color correction collection in XML.

See ColorDecisionListImage function in ImageMagick documentation.

102.6.34 Colorize(opacity as string, pixelInfo as IMPixelInfo7MBS) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blends the fill color with each pixel in the image.
Notes: A percentage blend is specified with opacity. Control the application of different color components by specifying a different percentage for each component (e.g. 90/100/10 is 90 red, 100 green, and 10 blue).

blend: A character string indicating the level of blending as a percentage.
colorize: A color value.

See ColorizeImage function in ImageMagick documentation.

102.6.35 ColorspaceType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the potential type of image: sRGBColorspaceType, RGBColorspaceType, GRAYColorspaceType, etc.
Notes: See xx function in ImageMagick documentation.

102.6.36 Combine(Colorspace as integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines one or more images into a single image.
Notes: The grayscale value of the pixels of each image in the sequence is assigned in order to the specified channels of the combined image. The typical ordering would be image 1 =>Red, 2 =>Green, 3 =>Blue, etc.

See CombineImages function in ImageMagick documentation.

102.6.37 CompareImagesLayers(ImageLayerMethod as integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares each image with the next in a sequence and returns the minimum bounding region of all the pixel differences (of the LayerMethod specified) it discovers.
Notes: Images do NOT have to be the same size, though it is best that all the images are 'coalesced' (images are all the same size, on a flattened canvas, so as to represent exactly how an specific frame should look).

No GIF dispose methods are applied, so GIF animations must be coalesced before applying this image operator to find differences to them.

method: the layers type to compare images with. Must be one of... CompareAnyLayer, CompareClearLayer, CompareOverlayLayer.

See xx function in ImageMagick documentation.

102.6.38 ComplexImages(ComplexOperator as Integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Performs complex mathematics on an image sequence.
Notes: See ComplexImages function in ImageMagick documentation.

102.6.39 Composite(ComposeOperator as integer, Image as IMImage7MBS, ClipToSelf as boolean, xOffset as integer, yOffset as integer)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the second image composited onto the first at the specified offset, using the specified composite method.
Notes: See xx function in ImageMagick documentation.

102.6.40 CompositeLayers(CompositeOperator as Integer, Source as IMImage7MBS, XOffset as Integer, YOffset as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the source image sequence over the destination image sequence, starting with the current image in both lists.
Notes: Each layer from the two image lists are composted together until the end of one of the image lists

is reached. The offset of each composition is also adjusted to match the virtual canvas offsets of each layer. As such the given offset is relative to the virtual canvas, and not the actual image.

Composition uses given x and y offsets, as the 'origin' location of the source images virtual canvas (not the real image) allowing you to compose a list of 'layer images' into the destiantioni images. This makes it well sutiable for directly composing 'Clears Frame Animations' or 'Coaleased Animations' onto a static or other 'Coaleased Animation' destination image list. GIF disposal handling is not looked at.

Special case:- If one of the image sequences is the last image (just a single image remaining), that image is repeatally composed with all the images in the other image list. Either the source or destination lists may be the single image, for this situation.

In the case of a single destination image (or last image given), that image will ve cloned to match the number of images remaining in the source image list.

This is equivelent to the "-layer Composite" Shell API operator.

See xx function in ImageMagick documentation.

102.6.41 CompressColormap as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: compresses an image colormap by removing any duplicate or unused color entries.
Notes: Returns true on success.
See CompressImageColormap function in ImageMagick documentation.

102.6.42 ConsolidateCMYKImages as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Consolidates separate C, M, Y, and K planes into a single image.
Notes: See ConsolidateCMYKImages function in ImageMagick documentation.

102.6.43 Constructor(columns as Integer, Rows as Integer, map as String, StorageType as Integer, Pixels as MemoryBlock)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an image from the pixel data you supply.

Notes: The pixel data must be in scanline order top-to-bottom. The data can be char, short int, int, float, or double. Float and double require the pixels to be normalized [0..1] , otherwise [0..QuantumRange] . For example, to create a 640x480 image from unsigned red-green-blue character data, use:

image = new IMImage7MBS(640,480,"RGB", kCharPixel, pixels)

columns: width in pixels of the image.
rows: height in pixels of the image.
map: This string reflects the expected ordering of the pixel array. It can be any combination or order of R = red, G = green, B = blue, A = alpha (0 is transparent), O = opacity (0 is opaque), C = cyan, Y = yellow, M = magenta, K = black, I = intensity (for grayscale), P = pad.
storage: Define the data type of the pixels. Float and double types are expected to be normalized [0..1] otherwise [0..QuantumRange] . Choose from these types: CharPixel, DoublePixel, FloatPixel, IntegerPixel, LongPixel, QuantumPixel, or ShortPixel.
pixels: This array of values contain the pixel components as defined by map and type. You must preallocate this array where the expected length varies depending on the values of width, height, map, and type.

See ConstituteImage function in ImageMagick documentation.

- 102.6.44 Constructor(info as IMImageInfo7MBS) 16295
- 102.6.45 Constructor(info as IMImageInfo7MBS, width as integer, height as integer, background as IMPixelInfo7MBS) 16296
- 102.6.46 Constructor(Pic as Picture) 16296

102.6.44 Constructor(info as IMImageInfo7MBS)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new image.
Notes: Returns a pointer to an image initialized to default values.
Many of the image default values are set from the image info. For example, filename, compression, depth, background color, and others.

See AcquireImage function in ImageMagick documentation.
See also:

- 102.6.43 Constructor(columns as Integer, Rows as Integer, map as String, StorageType as Integer, Pixels as MemoryBlock) 16294
- 102.6.45 Constructor(info as IMImageInfo7MBS, width as integer, height as integer, background as IMPixelInfo7MBS) 16296
- 102.6.46 Constructor(Pic as Picture) 16296

102.6.45 Constructor(info as IMImageInfo7MBS, width as integer, height as integer, background as IMPixelInfo7MBS)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a blank image canvas of the specified size and background color.
Notes: info: the image details.
width: the image width.
height: the image height.
background: the image color.

See NewMagickImage function in ImageMagick documentation.
See also:

- 102.6.43 Constructor(columns as Integer, Rows as Integer, map as String, StorageType as Integer, Pixels as MemoryBlock) 16294
- 102.6.44 Constructor(info as IMImageInfo7MBS) 16295
- 102.6.46 Constructor(Pic as Picture) 16296

102.6.46 Constructor(Pic as Picture)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new picture based on Xojo picture.
Notes: Creates a new image and uses SetPicture method to fill it.

See NewMagickImage function in ImageMagick documentation.
See also:

- 102.6.43 Constructor(columns as Integer, Rows as Integer, map as String, StorageType as Integer, Pixels as MemoryBlock) 16294
- 102.6.44 Constructor(info as IMImageInfo7MBS) 16295
- 102.6.45 Constructor(info as IMImageInfo7MBS, width as integer, height as integer, background as IMPixelInfo7MBS) 16296

102.6.47 Contrast(sharpen as boolean) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Enhances the intensity differences between the lighter and darker elements of the image.
Notes: Set sharpen to a True to increase the image contrast otherwise the contrast is reduced.

sharpen: Increase or decrease image contrast.

See ContrastImage function in ImageMagick documentation.

102.6.48 ContrastStretch(BlackPoint as double, WhitePoint as double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Is a simple image enhancement technique that attempts to improve the contrast in an image by 'stretching' the range of intensity values it contains to span a desired range of values.
Notes: It differs from the more sophisticated histogram equalization in that it can only apply a linear scaling function to the image pixel values. As a result the 'enhancement' is less harsh.

BlackPoint: the black point.
WhitePoint: the white point.

See ContrastStretchImage function in ImageMagick documentation.

102.6.49 Convolve(kernelInfo as IMKernelInfo7MBS) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a custom convolution kernel to the image.
Notes: See ConvolveImage function in ImageMagick documentation.

102.6.50 CopyPicture as Picture

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies RGB or gray pixels into a new Xojo picture.
Notes: You must make sure you have the right color space to make this work well with colorspaces.
Xojo on Mac uses Generic RGB, while Windows may use the colorspace of the display.

As conversion between various quantum depths can be slow, please use rarely.

See also ExportPixels and ImportPixels to read/write pixel data to/from memory blocks.
See GetAuthenticPixels function in ImageMagick documentation.

102.6.51 CreateHBITMAP as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a Windows HBITMAP from an image.
Notes: See ImageToHBITMAP function in ImageMagick documentation.

102.6.52 Crop(rect as IMRectangleInfo7MBS) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts a region of the image starting at the offset defined by geometry.
Notes: Region must be fully defined, and no special handling of geometry flags is performed.

See CropImage function in ImageMagick documentation.

102.6.53 CropToTiles(CropGeometry as string) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Crops a single image, into a possible list of tiles.
Notes: This may include a single sub-region of the image. This basically applies all the normal geometry flags for Crop.

CropGeometry: A crop geometry string.

See CropImageToTiles function in ImageMagick documentation.

102.6.54 CycleColormap(displace as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Displaces an image's colormap by a given number of positions.
Notes: If you cycle the colormap a number of times you can produce a psychodelic effect.

WARNING: this assumes an images colormap is in a well know and defined order. Currently Imagemagick has no way of setting that order.

displace: displace the colormap this amount.

See CycleColormap function in ImageMagick documentation.

102.6.55 Decipher(passkey as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts cipher pixels to plain pixels.
Notes: See xx function in ImageMagick documentation.

102.6.56 DefineProperty(PropertyKeyValue as String) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Associates an assignment string of the form "key=value" with an artifact or options.
Notes: It is equivelent to SetProperty().
See DefineImageProperty function in ImageMagick documentation.

102.6.57 DeleteImageProfile(Name as String) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes a profile from the image by its name.
Notes: See xx function in ImageMagick documentation.

102.6.58 DeleteProperty(Key as String) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes an image property.
Notes: key: the image property.
See DeleteImageProperty function in ImageMagick documentation.

102.6.59 Deskew(x as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes skew from the image.
Notes: Skew is an artifact that occurs in scanned images because of the camera being misaligned, imperfections in the scanning or surface, or simply because the paper was not placed completely flat when scanned.

The result will be auto-croped if the artifact "deskew:auto-crop" is defined, while the amount the image is to be deskewed, in degrees is also saved as the artifact "deskew:angle".

threshold: separate background from foreground.

See DeskewImage function in ImageMagick documentation.

102.6.60 Despeckle as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reduces the speckle noise in an image while perserving the edges of the original image.
Notes: A speckle removing filter uses a complementary hulling technique (raising pixels that are darker than their surrounding neighbors, then complementarily lowering pixels that are brighter than their surrounding neighbors) to reduce the speckle index of that image (reference Crimmins speckle removal).

See DespeckleImage function in ImageMagick documentation.

102.6.61 DestroyImageList

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Destroys an image list.
Notes: See DestroyImageList function in ImageMagick documentation.

102.6.62 DestroyImageProfiles

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Releases memory associated with an image profile map.
Notes: See xx function in ImageMagick documentation.

102.6.63 DestroyProperties

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Destroys all properties and associated memory attached to the given image.
Notes: See DestroyImageProperties function in ImageMagick documentation.

102.6.64 DisposeImages as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the coalesced frames of a GIF animation as it would appear after the GIF dispose method of that frame has been applied.
Notes: That is it returned the appearance of each frame before the next is overlaid.

See DisposeImages function in ImageMagick documentation.

102.6.65 Distort(DistortImageMethod as integer, values() as double, bestfit as boolean) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Distorts an image using various distortion methods, by mapping color lookups of the source image to a new destination image usally of the same size as the source image, unless 'bestfit' is set to true.
Notes: If 'bestfit' is enabled, and distortion allows it, the destination image is adjusted to ensure the whole source 'image' will just fit within the final destination image, which will be sized and offset accordingly. Also in many cases the virtual offset of the source image will be taken into account in the mapping.

If the '-verbose' control option has been set print to standard error the equicelent '-fx' formula with coefficients for the function, if practical.

method: the method of image distortion.
ArcDistortion always ignores source image offset, and always 'bestfit' the destination image with the top left corner offset relative to the polar mapping center.
Affine, Perspective, and Bilinear, do least squares fitting of the distrotion when more than the minimum number of control point pairs are provided.
Perspective, and Bilinear, fall back to a Affine distortion when less than 4 control point pairs are provided. While Affine distortions let you use any number of control point pairs, that is Zero pairs is a No-Op (viewport only) distortion, one pair is a translation and two pairs of control points do a scale-rotate-translate, without any shearing.

values: an array of floating point arguments for this method.

bestfit: Attempt to 'bestfit' the size of the resulting image. This also forces the resulting image to be a 'layered' virtual canvas image. Can be overridden using 'distort:viewport' setting.

Extra Controls from Image meta-data (artifacts)...

- "verbose" Output to stderr alternatives, internal coefficents, and FX equivalents for the distortion

operation (if feasible). This forms an extra check of the distortion method, and allows users access to the internal constants IM calculates for the distortion.

- ”distort:viewport” Directly set the output image canvas area and offest to use for the resulting image, rather than use the original images canvas, or a calculated ’bestfit’ canvas.
- ”distort:scale” Scale the size of the output canvas by this amount to provide a method of Zooming, and for super-sampling the results.

Other settings that can effect results include

- ’interpolate’ For source image lookups (scale enlargements)
- ’filter’ Set filter to use for area-resampling (scale shrinking). Set to ’point’ to turn off and use ’interpolate’ lookup instead

See DistortImage function in ImageMagick documentation.

102.6.66 DistortResize(x as Integer, y as Integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image using the equivalent but slower image distortion operator.
Notes: The filter is applied using a EWA cylindrical resampling. But like resize the final image size is limited to whole pixels with no effects by virtual-pixels on the result.

Note that images containing a transparency channel will be twice as slow to resize as images one without transparency.

See DistortResizeImage function in ImageMagick documentation.

102.6.67 Edge(radius as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Finds edges in an image.
Notes: Radius defines the radius of the convolution filter. Use a radius of 0 and Edge selects a suitable radius for you.

radius: the radius of the pixel neighborhood.

See EdgeImage function in ImageMagick documentation.

102.6.68 Emboss(radius as double, sigma as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a grayscale image with a three-dimensional effect.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and Emboss() selects a suitable radius for you.

radius: the radius of the pixel neighborhood.
sigma: the standard deviation of the Gaussian, in pixels.

See EmbossImage function in ImageMagick documentation.

102.6.69 Encipher(passkey as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts pixels to cipher-pixels.
Notes: See xx function in ImageMagick documentation.

102.6.70 Enhance as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a digital filter that improves the quality of a noisy image.
Notes: See xx function in ImageMagick documentation.

102.6.71 Equalize as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a histogram equalization to the image.
Notes: See xx function in ImageMagick documentation.

102.6.72 Excerpt(rect as IMRectangleInfo7MBS) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a excerpt of the image as defined by the geometry.

Notes: geometry: Define the region of the image to extend with members x, y, width, and height.

See ExcerptImage function in ImageMagick documentation.

102.6.73 ExportPixels(x as integer, y as integer, width as integer, height as integer, map as string, storageType as integer, data as Ptr) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts pixel data from an image and returns it to you.
Notes: The method returns MagickTrue on success otherwise MagickFalse if an error is encountered. The data is returned as char, short int, Quantum, unsigned int, unsigned long long, float, or double in the order specified by map.

Suppose you want to extract the first scanline of a 640x480 image as character data in red-green-blue order:

image.ExportImagePixels(0, 0, 640, 480, "RGB", kCharPixel, pixels)

- x,y,width,height: These values define the perimeter of a region of pixels you want to extract.
- map: This string reflects the expected ordering of the pixel array. It can be any combination or order of R = red, G = green, B = blue, A = alpha (0 is transparent), O = opacity (0 is opaque), C = cyan, Y = yellow, M = magenta, K = black, I = intensity (for grayscale), P = pad.
- type: Define the data type of the pixels. Float and double types are normalized to [0..1] otherwise [0..QuantumRange] . Choose from these types: CharPixel (char *), DoublePixel (double *), FloatPixel (float *), LongPixel (unsigned int *), LongLongPixel (unsigned long long *), QuantumPixel (Quantum *), or ShortPixel (unsigned short *).

pixels: This array of values contain the pixel components as defined by map and type. You must preallocate this array where the expected length varies depending on the values of width, height, map, and type.

See ExportImagePixels function in ImageMagick documentation.

102.6.74 Extent(rect as IMRectangleInfo7MBS) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extends the image as defined by the geometry, gravity, and image background color.
Notes: Set the (x,y) offset of the geometry to move the original image relative to the extended image.

rect: Define the region of the image to extend with members x, y, width, and height.

See ExtentImage function in ImageMagick documentation.
See also:

- 102.6.235 extent as Integer 16352

102.6.75 Flip as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a vertical mirror image by reflecting the pixels around the central x-axis.
Notes: See FlipImage function in ImageMagick documentation.

102.6.76 Flop as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a horizontal mirror image by reflecting the pixels around the central y-axis.
Notes: See FlopImage function in ImageMagick documentation.

102.6.77 ForwardFourierTransformImage(modulus as Boolean) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Implements the discrete Fourier transform (DFT) of the image either as a magnitude / phase or real / imaginary image pair.
Notes: modulus: if true, return as transform as a magnitude / phase pair otherwise a real / imaginary image pair.
See ForwardFourierTransformImage function in ImageMagick documentation.

102.6.78 Frame(frameInfo as IMFrameInfo7MBS, CompositeOperator as integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a simulated three-dimensional border around the image.
Notes: The color of the border is defined by the matte_color member of image. Members width and height of frame_info specify the border width of the vertical and horizontal sides of the frame. Members inner and outer indicate the width of the inner and outer shadows of the frame.

frameInfo: Define the width and height of the frame and its bevels.
CompositeOperator: the composite operator.

See FrameImage function in ImageMagick documentation.

102.6.79 Fx(expression as string) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a mathematical expression to the specified image.
Notes: expression: A mathematical expression.

See FxImage function in ImageMagick documentation.

102.6.80 Gamma(level as double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gamma-corrects a particular image channel.
Notes: The same image viewed on different devices will have perceptual differences in the way the image's intensities are represented on the screen. Specify individual gamma levels for the red, green, and blue channels, or adjust all three with the gamma parameter. Values typically range from 0.8 to 2.3.

You can also reduce the influence of a particular channel with a gamma value of 0.

level: the image gamma as a string (e.g. 1.6,1.2,1.0).

See GammaImage function in ImageMagick documentation.
See also:

- 102.6.240 Gamma as Double 16353

102.6.81 GaussianBlur(radius as double, sigma as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Blurs an image.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, the radius should be larger than sigma. Use a radius of 0 and GaussianBlur selects a suitable radius for you

radius: the radius of the Gaussian, in pixels, not counting the center pixel.
sigma: the standard deviation of the Gaussian, in pixels.

See GaussianBlurImage function in ImageMagick documentation.

102.6.82 GetImageDynamicThreshold(clusterThreshold as Double, smoothThreshold as Double, byref pixelinfo as IMPixelInfo7MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the dynamic threshold for an image.
Notes: clusterThreshold: This double represents the minimum number of pixels contained in a hexahedra before it can be considered valid (expressed as a percentage).
smoothThreshold: the smoothing threshold eliminates noise in the second derivative of the histogram. As the value is increased, you can expect a smoother second derivative.
pixelinfo: return the dynamic threshold here.

Returns true on success.
See GetImageDynamicThreshold function in ImageMagick documentation.

102.6.83 GetImageProfile(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a profile associated with an image by name.
Notes: See xx function in ImageMagick documentation.

102.6.84 GetImageQuantizeError as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Measures the difference between the original and quantized images.
Notes: This difference is the total quantization error.
The error is computed by summing over all pixels in an image the distance squared in RGB space between each reference pixel value and its quantized value. These values are computed:

- mean_error_per_pixel: This value is the mean error for any single pixel in the image.
- normalized_mean_square_error: This value is the normalized mean quantization error for any single pixel in the image. This distance measure is normalized to a range between 0 and 1. It is independent of the range of red, green, and blue values in the image.

- normalized_maximum_square_error: This value is the normalized maximum quantization error for any single pixel in the image. This distance measure is normalized to a range between 0 and 1. It is independent of the range of red, green, and blue values in your image.

See GetImageQuantizeError function in ImageMagick documentation.

102.6.85 GetMagickProperty(ImageInfo as IMImageInfo7MBS = nil, embedText as String) as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets attributes or calculated values that is associated with a fixed known property name, or single letter property.
Notes: It may be called if no image is defined (IMv7), in which case only global ImageInfo values are available:

\n newline
\r carriage return
<less-than character.
>greater-than character.
& ampersand character.
%% a percent sign
%b file size of image read in
%c comment meta-data property
%d directory component of path
%e filename extension or suffix
%f filename (including suffix)
%g layer canvas page geometry (equivalent to "%Wx%H%X%Y")
%h current image height in pixels
%i image filename (note: becomes output filename for "info:")
%k CALCULATED: number of unique colors
%l label meta-data property
%m image file format (file magic)
%n number of images in current image sequence
%o output filename (used for delegates)
%p index of image in current image list
%q quantum depth (compile-time constant)
%r image class and colorspace
%s scene number (from input unless re-assigned)
%t filename without directory or extension (suffix)
%u unique temporary filename (used for delegates)
%w current width in pixels
%x x resolution (density)
%y y resolution (density)
%z image depth (as read in unless modified, image save depth)

%A image transparency channel enabled (true/false)
%B file size of image in bytes
%C image compression type
%D image GIF dispose method
%G original image size (%wx%h; before any resizes)
%H page (canvas) height
%M Magick filename (original file exactly as given, including read mods)
%O page (canvas) offset (= %X%Y)
%P page (canvas) size (= %Wx%H)
%Q image compression quality (0 = default)
%S ?? scenes ??
%T image time delay (in centi-seconds)
%U image resolution units
%W page (canvas) width
%X page (canvas) x offset (including sign)
%Y page (canvas) y offset (including sign)
%Z unique filename (used for delegates)
%@ CALCULATED: trim bounding box (without actually trimming)
%# CALCULATED: 'signature' hash of image values

This routine only handles specifically known properties. It does not handle special prefixed properties, profiles, or expressions. Nor does it return any free-form property strings.

The returned string is stored in a structure somewhere, and should not be directly freed. If the string was generated (common) the string will be stored as as either as artifact or option 'get-property'. These may be deleted (cleaned up) when no longer required, but neither artifact or option is guranteed to exist.
See GetMagickProperty function in ImageMagick documentation.

102.6.86 GetNextImageProfile as string

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the next profile name for an image.
Notes: See xx function in ImageMagick documentation.

102.6.87 GetNextImageProperty as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the next free-form string property name.
Notes: See GetNextImageProperty function in ImageMagick documentation.

102.6.88 GetProperty(PropertyKey as String) as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets a value associated with an image property.
Notes: This includes, profile prefixes, such as "exif:", "iptc:" and "8bim:" It does not handle non-prifile prefixes, such as "fx:", "option:", or "artifact:".

The returned string is stored as a properity of the same name for faster lookup later.
See GetImageProperty function in ImageMagick documentation.

102.6.89 Grayscale(PixelIntensityMethod as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts the image to grayscale.
Notes: PixelIntensityMethod: the pixel intensity method.

See GrayscaleImage function in ImageMagick documentation.

102.6.90 HaldClut(clutImage as IMImage7MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a Hald color lookup table to the image.
Notes: A Hald color lookup table is a 3-dimensional color cube mapped to 2 dimensions. Create it with the HALD coder. You can apply any color transformation to the Hald image and then use this method to apply the transform to the image.

clutImage: the color lookup table image for replacement color values.

See HaldClutImage function in ImageMagick documentation.

102.6.91 HandleMemory as memoryblock

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a memoryblock with a copy of the internal image structure.
Notes: See xx function in ImageMagick documentation.

102.6.92 Histogram as IMPixelInfo7MBS()

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the unique colors in an image.
Notes: Returns array of colors.
See GetImageHistogram function in ImageMagick documentation.

102.6.93 IdentifyImageGray as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns grayscale if all the pixels in the image have the same red, green, and blue intensities, and bi-level is the intensity is either 0 or QuantumRange.
Notes: Returns one of the image type constants.
Otherwise undefined is returned.
See IdentifyImageGray function in ImageMagick documentation.

102.6.94 IdentifyImageMonochrome as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if all the pixels in the image have the same red, green, and blue intensities and the intensity is either 0 or QuantumRange.
Notes: See IdentifyImageMonochrome function in ImageMagick documentation.

102.6.95 IdentifyImageType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the potential type of image.
Notes: Bilevel Grayscale GrayscaleMatte Palette PaletteMatte TrueColor TrueColorMatte ColorSeparation ColorSeparationMatte

To ensure the image type matches its potential, use SetImageType.

See IdentifyImageType function in ImageMagick documentation.

102.6.96 IdentifyPaletteImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the image has 256 unique colors or less.
Notes: See IdentifyPaletteImage function in ImageMagick documentation.

102.6.97 ImageDepth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the depth of a particular image channel.
Notes: See GetImageDepth function in ImageMagick documentation.

102.6.98 ImageQuantumDepth(constrain as Boolean = false) as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the depth of the image rounded to a legal quantum depth: 8, 16, or 32.
Notes: constrain: A value other than false, constrains the depth to a maximum of MAGICKCORE_QUANTUM_DEPTH.

See GetImageQuantumDepth function in ImageMagick documentation.

102.6.99 ImageStatistics as IMChannelStatistics7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns statistics for each channel in the image.
Notes: The statistics include the channel depth, its minima, maxima, mean, standard deviation, kurtosis and skewness.

See GetImageStatistics function in ImageMagick documentation.

102.6.100 ImagesToBlob(info as IMImageInfo7MBS) as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: ImageToBlobs saves multiple images in a blob.
Notes: It returns the image as a formatted blob. The magick member of the Image determines the format

of the returned blob (GIF, JPEG, PNG, etc.). This method is the equivalent of WriteImage, but writes the formatted "file" to a memory buffer rather than to an actual file.
See ImagesToBlob function in ImageMagick documentation.

102.6.101 ImageToBlob(info as IMImageInfo7MBS) as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: ImageToBlob implements direct to memory image formats.
Notes: It returns the image as a formatted blob. The magick member of the Image determines the format of the returned blob (GIF, JPEG, PNG, etc.). This method is the equivalent of WriteImage, but writes the formatted "file" to a memory buffer rather than to an actual file.
See ImageToBlob function in ImageMagick documentation.

102.6.102 Implode(amount as double, pixelInterpolateMethod as integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new image that is a copy of an existing one with the image pixels "implode" by the specified percentage.
Notes: It allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Method ImplodeImage returns a pointer to the image after it is implode. A null image is returned if there is a memory shortage.

amount: Define the extent of the implosion.
method: the pixel interpolation method.

See ImplodeImage function in ImageMagick documentation.

102.6.103 ImportPixels(x as integer, y as integer, width as integer, height as integer, map as string, storageType as integer, data as Ptr) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Accepts pixel data and stores in the image at the location you specify.
Notes: The method returns true on success otherwise false if an error is encountered. The pixel data can be either char, Quantum, short int, unsigned int, unsigned long long, float, or double in the order specified by map.

Suppose your want to upload the first scanline of a 640x480 image from character data in red-green-blue order:

image.ImportImagePixels(0, 0, 640, 480, "RGB", kCharPixel, pixels)

- x,y,width,height: These values define the perimeter of a region of pixels you want to define.
- map: This string reflects the expected ordering of the pixel array. It can be any combination or order of R = red, G = green, B = blue, A = alpha (0 is transparent), O = opacity (0 is opaque), C = cyan, Y = yellow, M = magenta, K = black, I = intensity (for grayscale), P = pad.
- type: Define the data type of the pixels. Float and double types are normalized to [0..1] otherwise [0..QuantumRange] . Choose from these types: CharPixel (char *), DoublePixel (double *), FloatPixel (float *), LongPixel (unsigned int *), LongLongPixel (unsigned long long *), QuantumPixel (Quantum *), or ShortPixel (unsigned short *).
- pixels: This array of values contain the pixel components as defined by map and type. You must preallocate this array where the expected length varies depending on the values of width, height, map, and type.

See ImportImagePixels function in ImageMagick documentation.

102.6.104 IntegralRotate(degrees as Integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rotates the image an integral of 90 degrees.
Notes: It allocates the memory necessary for the new Image structure and returns a pointer to the rotated image.

rotations: Specifies the number of 90 degree rotations.

See IntegralRotateImage function in ImageMagick documentation.

102.6.105 InterpolativeResize(columns as Integer, Rows as Integer, PixelInterpolateMethod as Integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resizes an image using the specified interpolation method.
Notes: columns: the number of columns in the resized image.
rows: the number of rows in the resized image.
method: the pixel interpolation method.

See xx function in ImageMagick documentation.

102.6.106 InterpretProperties(ImageInfo as IMImageInfo7MBS = nil, embedText as String) as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces any embedded formatting characters with the appropriate image property and returns the interpreted text.
Notes: This searches for and replaces \n \r \replaced by newline, return, and percent resp. < > & replaced by '<', '>', '&' resp. replaced by percent

x [x] where 'x' is a single letter properity, case sensitive). [type:name] where 'type' a is special and known prefix. [name] where 'name' is a specifically known attribute, calculated value, or a per-image property string name, or a per-image 'artifact' (as generated from a global option). It may contain ':' as long as the prefix is not special.

Single letter substitutions will only happen if the character before the percent is NOT a number. But braced substitutions will always be performed. This prevents the typical usage of percent in a interpreted geometry argument from being substituted when the percent is a geometry flag.

If 'glob-expresions' ('*' or '?' characters) is used for 'name' it may be used as a search pattern to print multiple lines of "name=value\n" pairs of the associated set of properties.

ImageInfo: the image info. (required)
image: the image.
embedText: the address of a character string containing the embedded formatting characters.
See InterpretImageProperties function in ImageMagick documentation.

102.6.107 InverseFourierTransformImage(phaseImage as IMImage7MBS, modulus as Boolean) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Implements the inverse discrete Fourier transform (DFT) of the image either as a magnitude / phase or real / imaginary image pair.
Notes: self: the magnitude or real image.
phaseImage: the phase or imaginary image.
modulus: if true, return transform as a magnitude / phase pair otherwise a real / imaginary image pair.
See InverseFourierTransformImage function in ImageMagick documentation.

102.6.108 IsEqual(other as IMImage7MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compare the pixels of two images and returns immediately if any pixel is not identical.
Notes: See IsImagesEqual function in ImageMagick documentation.

102.6.109 IsHighDynamicRangeImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns MagickTrue if any pixel component is non-integer or exceeds the bounds of the quantum depth.
Notes: e.g. for Q16 0..65535.

See IsHighDynamicRangeImage function in ImageMagick documentation.

102.6.110 IsHistogram as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns MagickTrue if the image has 1024 unique colors or less.
Notes: See IsHistogramImage function in ImageMagick documentation.

102.6.111 IsImageOpaque as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if none of the pixels in the image have an alpha value other than OpaqueAlpha (QuantumRange).
Notes: Will return true immediatally if alpha channel is not available.

See IsImageOpaque function in ImageMagick documentation.

102.6.112 Kuwahara(radius as double, sigma as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Kuwahara is an edge preserving noise reduction filter.
Notes: radius: the square window radius.
sigma: the standard deviation of the Gaussian, in pixels.

See KuwaharaImage function in ImageMagick documentation.

102.6.113 Level(BlackPoint as double, WhitePoint as double, gamma as Double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adjusts the levels of a particular image channel by scaling the colors falling between specified white and black points to the full available quantum range.
Notes: The parameters provided represent the black, and white points. The black point specifies the darkest color in the image. Colors darker than the black point are set to zero. White point specifies the lightest color in the image. Colors brighter than the white point are set to the maximum quantum value.

If a '!' flag is given, map black and white colors to the given levels rather than mapping those levels to black and white. See LevelizeImage() below.

Gamma specifies a gamma correction to apply to the image.

BlackPoint: The level to map zero (black) to.
WhitePoint: The level to map QuantumRange (white) to.

See LevelImage function in ImageMagick documentation.

102.6.114 LevelImageColors(BlackColor as IMPixelInfo7MBS, WhiteColor as IMPixelInfo7MBS, invert as Boolean) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Levels image colors.
Notes: Maps the given color to "black" and "white" values, linearly spreading out the colors, and level values on a channel by channel bases, as per LevelImage(). The given colors allows you to specify different level ranges for each of the color channels separately.

If the boolean 'invert' is set true the image values will modifyed in the reverse direction. That is any existing "black" and "white" colors in the image will become the color values given, with all other values compressed appropriatally. This effectively maps a greyscale gradient into the given color gradient.

BlackColor: The color to map black to/from
WhiteColor: The color to map white to/from
invert: if true map the colors (levelize), rather than from (level)

See LevelImageColors function in ImageMagick documentation.

102.6.115 Levelize(BlackPoint as double, WhitePoint as double, gamma as Double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies the reversed LevelImage() operation to just the specific channels specified.
Notes: It compresses the full range of color values, so that they lie between the given black and white points. Gamma is applied before the values are mapped.

LevelizeImage() can be called with by using a +level command line API option, or using a '!' on a -level or LevelImage() geometry string.

It can be used to de-contrast a greyscale image to the exact levels specified. Or by using specific levels for each channel of an image you can convert a gray-scale image to any linear color gradient, according to those levels.

BlackPoint: The level to map zero (black) to.
WhitePoint: The level to map QuantumRange (white) to.
gamma: adjust gamma by this factor before mapping values.

See LevelizeImage function in ImageMagick documentation.

102.6.116 LinearStretch(BlackPoint as double, WhitePoint as double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Discards any pixels below the black point and above the white point and levels the remaining pixels.
Notes: blackPoint: the black point.
whitePoint: the white point.

See LinearStretchImage function in ImageMagick documentation.

102.6.117 LiquidRescale(columns as Integer, Rows as Integer, deltaX as Double, rigidity as Double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Rescales image with seam carving.
Notes: columns: the number of columns in the rescaled image.
rows: the number of rows in the rescaled image.
deltaX: maximum seam transversal step (0 means straight seams).
rigidity: introduce a bias for non-straight seams (typically 0).

See LiquidRescaleImage function in ImageMagick documentation.

102.6.118 LocalContrast(radius as double, strength as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Attempts to increase the appearance of large-scale light-dark transitions.
Notes: Local contrast enhancement works similarly to sharpening with an unsharp mask, however the mask is instead created using an image with a greater blur distance.

radius: the radius of the Gaussian blur, in percentage with 100 resulting in a blur radius of 20 of largest dimension.
strength: the strength of the blur mask in percentage.

See LocalContrastImage function in ImageMagick documentation.

102.6.119 Magnify as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Doubles the size of the image with a pixel art scaling algorithm.
Notes: See xx function in ImageMagick documentation.

102.6.120 MergeImageLayers(ImageLayerMethod as integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Composes all the image layers from the current given image onward to produce a single image of the merged layers.
Notes: The inital canvas's size depends on the given LayerMethod, and is initialized using the first images background color. The images are then compositied onto that image in sequence using the given composition that has been assigned to each individual image.

method: the method of selecting the size of the initial canvas.
MergeLayer: Merge all layers onto a canvas just large enough to hold all the actual images. The virtual canvas of the first image is preserved but otherwise ignored.
FlattenLayer: Use the virtual canvas size of first image. Images which fall outside this canvas is clipped. This can be used to 'fill out' a given virtual canvas.
MosaicLayer: Start with the virtual canvas of the first image, enlarging left and right edges to contain all images. Images with negative offsets will be clipped.
TrimBoundsLayer: Determine the overall bounds of all the image layers just as in "MergeLayer", then adjust the canvas and offsets to be relative to those bounds, without overlaying the images.
WARNING: a new image is not returned, the original image sequence page data is modified instead.

See MergeImageLayers function in ImageMagick documentation.

102.6.121 Minify as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Is a convenience method that scales an image proportionally to half its size.
Notes: See xx function in ImageMagick documentation.

102.6.122 MinMaxStretch(black as double, white as double, gamma as double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Stretches image colors.
Notes: Uses the exact minimum and maximum values found in each of the channels given, as the BlackPoint and WhitePoint to linearly stretch the colors (and histogram) of the image. The stretch points are also moved further inward by the adjustment values given.

If the adjustment values are both zero this function is equivalent to a perfect normalization (or autolevel) of the image.

Each channel is stretched independantally of each other (producing color distortion) unless the special 'SyncChannels' flag is also provided in the channels setting. If this flag is present the minimum and maximum point will be extracted from all the given channels, and those channels will be stretched by exactly the same amount (preventing color distortion).

In the special case that only ONE value is found in a channel of the image that value is not stretched, that value is left as is.

The 'SyncChannels' is turned on in the 'DefaultChannels' setting by default.

See MinMaxStretchImage function in ImageMagick documentation.

black, white: move the black / white point inward from the minimum and maximum points by this color value.
gamma: the gamma.

102.6.123 Modify as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Ensures that there is only a single reference to the image to be modified, updating the provided image pointer to point to a clone of the original image if necessary.
Notes: See ModifyImage function in ImageMagick documentation.

102.6.124 Modulate(modulate as String) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Lets you control the brightness, saturation, and hue of an image.
Notes: Modulate represents the brightness, saturation, and hue as one parameter (e.g. 90,150,100). If the image colorspace is HSL, the modulation is lightness, saturation, and hue. For HWB, use blackness, whiteness, and hue. And for HCL, use chrome, luma, and hue.

modulate: Define the percent change in brightness, saturation, and hue.

See ModulateImage function in ImageMagick documentation.

102.6.125 Morphology(MorphologyMethod as Integer, iterations as Integer, kernel as IMKernelInfo7MBS) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a user supplied kernel to the image according to the given mophology method.
Notes: This function applies any and all user defined settings before calling the above internal function MorphologyApply().

User defined settings include... * Output Bias for Convolution and correlation (”-define convolve:bias=??”) * Kernel Scale/normalize settings (”-define convolve:scale=??”) This can also includes the addition of a scaled unity kernel. * Show Kernel being applied (”-define morphology:showKernel=1”)

Other operators that do not want user supplied options interfering, especially ”convolve:bias” and ”morphology:showKernel” should use MorphologyApply() directly.

See MorphologyImage function in ImageMagick documentation.

102.6.126 MotionBlur(radius as double, sigma as double, angle as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Simulates motion blur.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and MotionBlurImage() selects a suitable radius for you. Angle gives the angle of the blurring motion.

radius: the radius of the Gaussian, in pixels, not counting the center pixel.
sigma: the standard deviation of the Gaussian, in pixels.
angle: Apply the effect along this angle.

See MotionBlurImage function in ImageMagick documentation.

102.6.127 Negate(gray as boolean = false) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Negates the colors in the reference image.
Notes: The grayscale option means that only grayscale values within the image are negated.

grayscale: If True, only negate grayscale pixels within the image.

See xx function in ImageMagick documentation.

102.6.128 Normalize as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Normalize method enhances the contrast of a color image by mapping the darkest 2 percent of all pixel to black and the brightest 1 percent to white.
Notes: See NormalizeImage function in ImageMagick documentation.

102.6.129 NumberColors as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of unique colors in an image.
Notes: See GetNumberColors function in ImageMagick documentation.

102.6.130 OilPaint(radius as double, sigma as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a special effect filter that simulates an oil painting.
Notes: Each pixel is replaced by the most frequent color occurring in a circular region defined by radius.

radius: the radius of the circular neighborhood.
sigma: the standard deviation of the Gaussian, in pixels.

See xx function in ImageMagick documentation.

102.6.131 OneAuthenticPixel(X as Integer, Y as Integer) as MemoryBlock

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a single pixel at the specified (x,y) location.
Notes: The image background color is returned if an error occurs.
See GetOneAuthenticPixel function in ImageMagick documentation.

Memoryblock should have size of ChannelCount * QuantumSize.
Format of pixel values depend on what quantum size/type your library copy uses!

Use OneVirtualPixelInfo for a type independent color information.

102.6.132 OneVirtualPixel(X as Integer, Y as Integer) as MemoryBlock

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a single virtual pixel at the specified (x,y) location.
Notes: The image background color is returned if an error occurs.
If you plan to modify the pixel, use GetOneAuthenticPixel() instead.
See GetOneVirtualPixel function in ImageMagick documentation.

Memoryblock should have size of ChannelCount * QuantumSize.
Format of pixel values depend on what quantum size/type your library copy uses!

Use OneVirtualPixelInfo for a type independent color information.

102.6.133 OneVirtualPixelInfo(virtualPixelMethod as Integer, X as Integer, Y as Integer) as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a single pixel at the specified (x,y) location.
Notes: The image background color is returned if an error occurs.
If you plan to modify the pixel, use GetOneAuthenticPixel() instead.
See GetOneVirtualPixelInfo function in ImageMagick documentation.

102.6.134 OptimizeImageLayers as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compares each image the GIF disposed forms of the previous image in the sequence.
Notes: From this it attempts to select the smallest cropped image to replace each frame, while preserving the results of the GIF animation.

See OptimizeImageLayers function in ImageMagick documentation.

102.6.135 OptimizeImageTransparency

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Takes a frame optimized GIF animation, and compares the overlayed pixels against the disposal image resulting from all the previous frames in the animation.
Notes: Any pixel that does not change the disposal image (and thus does not effect the outcome of an overlay) is made transparent.

WARNING: This modifies the current images directly, rather than generate a new image sequence.

See OptimizeImageTransparency function in ImageMagick documentation.

102.6.136 OptimizePlusImageLayers as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: OptimizePlusImageLayers is exactly as OptimizeImageLayers(), but may also add or even remove extra frames in the animation, if it improves the total number of pixels in the resulting GIF animation.
Notes: See OptimizeImagePlusLayers function in ImageMagick documentation.

102.6.137 OrderedDither(threshold as string) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Will perform a ordered dither based on a number of pre-defined dithering threshold maps, but over multiple intensity levels, which can be different for different channels, according to the input argument.
Notes: threshold: A string containing the name of the threshold dither map to use, followed by zero or more numbers representing the number of color levels tho dither between.
Any level number less than 2 will be equivalent to 2, and means only binary dithering will be applied to each color channel.
No numbers also means a 2 level (bitmap) dither will be applied to all channels, while a single number is the number of levels applied to each channel in sequence. More numbers will be applied in turn to each of the color channels.
For example: "o3x3,6" will generate a 6 level posterization of the image with a ordered 3x3 diffused pixel

dither being applied between each level. While checker,8,8,4 will produce a 332 colormaped image with only a single checkerboard hash pattern (50 grey) between each color level, to basically double the number of color levels with a bare minimim of dithering.

See OrderedDitherImage function in ImageMagick documentation.

102.6.138 Perceptible(epsilon as Double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set each pixel whose value is less than | epsilon | to epsilon or -epsilon (whichever is closer) otherwise the pixel value remains unchanged.
Notes: epsilon: the epsilon threshold (e.g. 1.0e-9).

See PerceptibleImage function in ImageMagick documentation.

102.6.139 Ping(path as string) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the properties of an image or image sequence except for the pixels.
Notes: It is much faster and consumes far less memory than Read(). On failure, a nil image is returned and exception describes the reason for the failure.

See PingImage function in ImageMagick documentation.
See also:

- 102.6.273 Ping as Boolean 16360

102.6.140 Posterize(levels as Integer, DitherMethod as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reduces the image to a limited number of colors for a "poster" effect.
Notes: levels: Number of color levels allowed in each channel. Very low values (2, 3, or 4) have the most visible effect.
DitherMethod: choose from UndefinedDitherMethod, NoDitherMethod, RiemersmaDitherMethod, Floyd-SteinbergDitherMethod.

Returns true on success.
See PosterizeImage function in ImageMagick documentation.

102.6.141 Preview(PreviewType as Integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tiles 9 thumbnails of the specified image with an image processing operation applied with varying parameters.
Notes: This may be helpful pin-pointing an appropriate parameter for a particular image processing operation.

preview: the image processing operation. See preview constants.

See xx function in ImageMagick documentation.

102.6.142 Profile(name as string, ProfileData as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Associates, applies, or removes an ICM, IPTC, or generic profile with / to / from an image.
Notes: If the profile is nil, it is removed from the image otherwise added or applied. Use a name of '*' and a profile of nil to remove all profiles from the image.

ICC and ICM profiles are handled as follows: If the image does not have an associated color profile, the one you provide is associated with the image and the image pixels are not transformed. Otherwise, the colorspace transform defined by the existing and new profile are applied to the image pixels and the new profile is associated with the image.

name: Name of profile to add or remove: ICC, IPTC, or generic profile.
ProfileData: the profile data.

See ProfileImage function in ImageMagick documentation.

102.6.143 Properties as Dictionary

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all properties with values.
Example:

```
Var f As FolderItem = New FolderItem("/Users/cs/Pictures/IMG_3625.jpg", FolderItem.PathModes.Native)
Var i As New IMImageInfo7MBS
```

```
i.Filename = f.NativePath

Var p As IMImage7MBS = i.ReadImage
Var d As Dictionary = p.Properties
Break // see in debugger
```

Notes: See ResetImagePropertyIterator, GetNextImageProperty and GetImageProperty functions in ImageMagick documentation.

102.6.144 Quantize(quantizeInfo as IMQuantizeInfo7MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Analyzes the colors within a reference image and chooses a fixed number of colors to represent the image.
Notes: The goal of the algorithm is to minimize the color difference between the input and output image while minimizing the processing time.

quantizeInfo: Specifies a QuantizeInfo object.

Returns true on success.
See QuantizeImage function in ImageMagick documentation.

102.6.145 QuantizeImages(quantizeInfo as IMQuantizeInfo7MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: analyzes the colors within a set of reference images and chooses a fixed number of colors to represent the set.
Notes: The goal of the algorithm is to minimize the color difference between the input and output images while minimizing the processing time.

quantizeInfo: Specifies an QuantizeInfo structure.
self: Specifies a list of Images.
See QuantizeImages function in ImageMagick documentation.

102.6.146 QueueAuthenticPixels(X as Integer, Y as Integer, Width as Integer, Height as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queues a mutable pixel region.
Notes: If the region is successfully initialized a pointer to a Quantum array representing the region is returned, otherwise nil is returned. The returned pointer may point to a temporary working buffer for the pixels or it may point to the final location of the pixels in memory.

Write-only access means that any existing pixel values corresponding to the region are ignored. This is useful if the initial image is being created from scratch, or if the existing pixel values are to be completely replaced without need to refer to their pre-existing values. The application is free to read and write the pixel buffer returned by QueueAuthenticPixels() any way it pleases. QueueAuthenticPixels() does not initialize the pixel array values. Initializing pixel array values is the application's responsibility.

Performance is maximized if the selected region is part of one row, or one or more full rows, since then there is opportunity to access the pixels in-place (without a copy) if the image is in memory, or in a memory-mapped file. The returned pointer must *never* be deallocated by the user.

Pixels accessed via the returned pointer represent a simple array of type Quantum. If the image type is CMYK or the storage class is PseudoClass, call GetAuthenticMetacontent() after invoking GetAuthenticPixels() to obtain the meta-content (of type void) corresponding to the region. Once the Quantum (and/or Quantum) array has been updated, the changes must be saved back to the underlying image using SyncAuthenticPixels() or they may be lost.

x, y, width and height define the perimeter of a region of pixels.

See QueueAuthenticPixels function in ImageMagick documentation.
Format of pixel values depend on what quantum size/type your library copy uses!

102.6.147 RaiseImage(rectangle as IMRectangleInfo7MBS, raise as boolean) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a simulated three-dimensional button-like effect by lightening and darkening the edges of the image.
Notes: Members width and height of raise_info define the width of the vertical and horizontal edge of the effect.

rectangle: Define the width and height of the raise area.
raise: A value other than zero creates a 3-D raise effect, otherwise it has a lowered effect.

See RaiseImage function in ImageMagick documentation.

102.6.148 RandomThreshold(minThreshold as Double, maxThreshold as double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the value of individual pixels based on the intensity of each pixel compared to a random threshold.
Notes: The result is a low-contrast, two color image.

low,high: Specify the high and low thresholds. These values range from 0 to QuantumRange.

See xx function in ImageMagick documentation.

102.6.149 RangeThreshold(lowBlack as Double, lowWhite as double, highWhite as double, highBlack as double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies soft and hard thresholding.
Notes: lowBlack: Define the minimum black threshold value.
lowWhite: Define the minimum white threshold value.
highWhite: Define the maximum white threshold value.
highBlack: Define the maximum black threshold value.

See RangeThresholdImage function in ImageMagick documentation.

102.6.150 Read(path as string) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an image or image sequence from a file or file handle.
Notes: The method returns a nil if there is a memory shortage or if the image cannot be read. On failure, a nil image is returned and exception describes the reason for the failure.

See ReadImage function in ImageMagick documentation.

102.6.151 Remap(quantizeInfo as IMQuantizeInfo7MBS, remapImage as IMImage7MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces the colors of an image with the closest of the colors from the reference image.
Notes: quantizeInfo: Specifies an QuantizeInfo object.
remapImage: the reference image.

Returns true on success.
See RemapImage function in ImageMagick documentation.

102.6.152 RemapImages(quantizeInfo as IMQuantizeInfo7MBS, remapImage as IMImage7MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces the colors of a sequence of images with the closest color from a reference image.
Notes: quantizeInfo: Specifies an QuantizeInfo object.
remapImage: the reference image.

Returns true on success.
See RemapImages function in ImageMagick documentation.

102.6.153 RemoveDuplicateLayers

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes any image that is exactly the same as the next image in the given image list.
Notes: Image size and virtual canvas offset must also match, though not the virtual canvas size itself.

No check is made with regards to image disposal setting, though it is the dispose setting of later image that is kept. Also any time delays are also added together. As such coalesced image animations should still produce the same result, though with duplicte frames merged into a single frame.

See xx function in ImageMagick documentation.

102.6.154 RemoveFirstImageFromList as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes and returns the first image in the list.
Notes: If the given image list pointer pointed to the removed first image, it is set to the new first image of list, or nil if list was emptied, otherwise it is left as is.

See RemoveFirstImageFromList function in ImageMagick documentation.

102.6.155 RemoveImageProfile(name as string) as string

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a named profile from the image and returns its value.
Notes: See xx function in ImageMagick documentation.

102.6.156 RemoveProperty(Key as String)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a property from the image and returns its value.
Notes: See RemoveImageProperty function in ImageMagick documentation.

102.6.157 RemoveZeroDelayLayers

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes any image that as a zero delay time.
Notes: Such images generally represent intermediate or partial updates in GIF animations used for file optimization. They are not ment to be displayed to users of the animation. Viewable images in an animation should have a time delay of 3 or more centi-seconds (hundredths of a second).

However if all the frames have a zero time delay, then either the animation is as yet incomplete, or it is not a GIF animation. This a non-sensible situation, so no image will be removed and a 'Zero Time Animation' warning (exception) given.

No warning will be given if no image was removed because all images had an appropriate non-zero time delay set.

Due to the special requirements of GIF disposal handling, GIF animations should be coalesced first, before calling this function, though that is not a requirement.

See RemoveZeroDelayLayers function in ImageMagick documentation.

102.6.158 Resample(xResolution as Double, yResolution as Double, filter as Integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize image in terms of its pixel size, so that when displayed at the given resolution it will be the same size in terms of real world units as the original image at the original resolution.
Notes: xResolution: the new image x resolution.
yResolution: the new image y resolution.
filter: Image filter to use.

See ResampleImage function in ImageMagick documentation.

102.6.159 ResetImageProfileIterator

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the image profile iterator.
Notes: Use it in conjunction with GetNextImageProfile to iterate over all the profiles associated with an image.

See ResetImageProfileIterator function in ImageMagick documentation.

102.6.160 ResetPropertyIterator

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the image properties iterator.
Notes: Use it in conjunction with GetNextImageProperty() to iterate over all the values associated with an image property.
See ResetImagePropertyIterator function in ImageMagick documentation.

102.6.161 Resize(columns as integer, rows as integer, FilterID as integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales an image to the desired dimensions, using the given filter (see AcquireFilterInfo()).
Notes: If an undefined filter is given the filter defaults to Mitchell for a colormapped image, a image with a matte channel, or if the image is enlarged. Otherwise the filter defaults to a Lanczos.

columns: the number of columns in the scaled image.
rows: the number of rows in the scaled image.
filterID: Image filter to use.

See ResizeImage function in ImageMagick documentation.

102.6.162 Roll(x as integer, y as integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Offsets an image as defined by x and y offsets.
Notes: x: the number of columns to roll in the horizontal direction.
y: the number of rows to roll in the vertical direction.

See RollImage function in ImageMagick documentation.

102.6.163 Rotate(degrees as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new image that is a rotated copy of an existing one.
Notes: Positive angles rotate counter-clockwise (right-hand rule), while negative angles rotate clockwise. Rotated images are usually larger than the originals and have 'empty' triangular corners. X axis. Empty triangles left over from shearing the image are filled with the background color defined by member 'background_color' of the image. RotateImage allocates the memory necessary for the new Image structure and returns a pointer to the new image.

degrees: Specifies the number of degrees to rotate the image.

See RotateImage function in ImageMagick documentation.

102.6.164 RotationalBlur(Angle as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a radial blur to the image.
Notes: angle: the angle of the radial blur.
blur: the blur.

See RotationalBlurImage function in ImageMagick documentation.

102.6.165 Sample(columns as integer, rows as integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales an image to the desired dimensions with pixel sampling.
Notes: Unlike other scaling methods, this method does not introduce any additional color into the scaled image.

columns: the number of columns in the sampled image.
rows: the number of rows in the sampled image.

See SampleImage function in ImageMagick documentation.

102.6.166 Scale(columns as integer, rows as integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the size of an image to the given dimensions.
Notes: columns: the number of columns in the scaled image.
rows: the number of rows in the scaled image.

See ScaleImage function in ImageMagick documentation.

102.6.167 ScaleQuantumToChar(value as Double) as UInt8

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales a quantum value to 8 bit unsigned integer.
Notes: Depending on which library is loaded a quantum is an UInt8, UInt16, UInt32, Single or Double value.
This function normalizes and rounds values to nearest 8 bit integer value.

102.6.168 Segment(colorspaceType as Integer, verbose as Boolean, clusterThreshold as Double, smoothThreshold as Double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Segment an image by analyzing the histograms of the color components and identifying units

that are homogeneous with the fuzzy C-means technique.
Notes: colorspace: Indicate the colorspace.
verbose: Set to true to print detailed information about the identified classes.
clusterThreshold: This represents the minimum number of pixels contained in a hexahedra before it can be considered valid (expressed as a percentage).
smoothThreshold: the smoothing threshold eliminates noise in the second derivative of the histogram. As the value is increased, you can expect a smoother second derivative.

Returns true on success.
See SegmentImage function in ImageMagick documentation.

102.6.169 SelectiveBlur(radius as double, sigma as double, threshold as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Selectively blur pixels within a contrast threshold.
Notes: It is similar to the unsharpen mask that sharpens everything with contrast above a certain threshold.

radius: the radius of the Gaussian, in pixels, not counting the center pixel.
sigma: the standard deviation of the Gaussian, in pixels.
threshold: only pixels within this contrast threshold are included in the blur operation.

See SelectiveBlurImage function in ImageMagick documentation.

102.6.170 Separate(ChannelType as Integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Separates a channel from the image and returns it as a grayscale image.
Notes: See ChannelType constants for parameter.
See SeparateImage function in ImageMagick documentation.

102.6.171 SeparateImages as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a separate grayscale image for each channel specified.
Notes: See SeparateImages function in ImageMagick documentation.

102.6.172 SetGray as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if all the pixels in the image have the same red, green, and blue intensities and changes the type of the image to bi-level or grayscale.
Notes: See xx function in ImageMagick documentation.

102.6.173 SetImageAlphaChannel(AlphaChannelOption as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Activates, deactivates, resets, or sets the alpha channel.
Notes: The alpha channel types: ActivateAlphaChannel, AssociateAlphaChannel, CopyAlphaChannel, DeactivateAlphaChannel, DisassociateAlphaChannel, ExtractAlphaChannel, OffAlphaChannel, OnAlphaChannel, OpaqueAlphaChannel, SetAlphaChannel, ShapeAlphaChannel, and TransparentAlphaChannel.

see AlphaChannel constants.

See SetImageAlphaChannel function in ImageMagick documentation.

102.6.174 SetImageColorMetric(other as IMImage7MBS) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Measures the difference between colors at each pixel location of two images.
Notes: A value other than 0 means the colors match exactly. Otherwise an error measure is computed by summing over all pixels in an image the distance squared in RGB space between each image pixel and its corresponding pixel in the reconstruct image. The error measure is assigned to these image members:

- mean_error_per_pixel: The mean error for any single pixel in the image.
- normalized_mean_error: The normalized mean quantization error for any single pixel in the image. This distance measure is normalized to a range between 0 and 1. It is independent of the range of red, green, and blue values in the image.
- normalized_maximum_error: The normalized maximum quantization error for any single pixel in the image. This distance measure is normalized to a range between 0 and 1. It is independent of the range of red, green, and blue values in your image.

A small normalized mean square error, accessed as image->normalized_mean_error, suggests the images are very similar in spatial layout and color.

See SetImageColorMetric function in ImageMagick documentation.

102.6.175 SetImageColorspace(Colorspace as integer) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the colorspace member of the Image object.
Notes: See SetImageColorspace function in ImageMagick documentation.

102.6.176 SetImageDepth(depth as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the depth of the image.
Notes: See SetImageDepth function in ImageMagick documentation.

102.6.177 SetImageProfile(name as string, ProfileData as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a named profile to the image.
Notes: If a profile with the same name already exists, it is replaced. This method differs from the ProfileImage() method in that it does not apply CMS color profiles.

name: the profile name, for example icc, exif, and 8bim (8bim is the Photoshop wrapper for iptc profiles).
profile: A String that contains the named profile.

See SetImageProfile function in ImageMagick documentation.

102.6.178 SetImageType(type as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the type of image.
Notes: Choose from these types:
Bilevel Grayscale GrayscaleMatte Palette PaletteMatte TrueColor TrueColorMatte ColorSeparation ColorSeparationMatte OptimizeType

See SetImageType function in ImageMagick documentation.

102.6.179 SetMonochrome as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if image is monochrome and changes type to black & white.
Notes: Returns true if all the pixels in the image have the same red, green, and blue intensities and the intensity is either 0 or QuantumRange and changes the type of the image to bi-level.

See SetImageMonochrome function in ImageMagick documentation.

102.6.180 SetPicture(pic as Picture) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets pixel to the values in the picture.
Notes: You must make sure you have the right color space to make this work well with colorspaces.
Xojo on Mac uses Generic RGB, while Windows may use the colorspace of the display.

Returns true in case of success and false in case of failure.
As conversion between various quantum depths can be slow, please use rarely.

See also ExportPixels and ImportPixels to read/write pixel data to/from memory blocks.
See GetAuthenticPixels and SyncAuthenticPixels functions in ImageMagick documentation.

102.6.181 SetProperty(PropertyKey as String, Value as String) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves the given string value either to specific known attribute or to a freeform property string.
Notes: Attempting to set a property that is normally calculated will produce an exception.
See SetImageProperty function in ImageMagick documentation.

102.6.182 Shade(gray as boolean, azimuth as double, elevation as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shines a distant light on an image to create a three-dimensional effect.
Notes: You control the positioning of the light with azimuth and elevation; azimuth is measured in degrees off the x axis and elevation is measured in pixels above the Z axis.

gray: A value other than zero shades the intensity of each pixel.
azimuth, elevation: Define the light source direction.

See ShadeImage function in ImageMagick documentation.

102.6.183 Sharpen(radius as double, sigma as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sharpens the image.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and Sharpen selects a suitable radius for you.

Using a separable kernel would be faster, but the negative weights cancel out on the corners of the kernel producing often undesirable ringing in the filtered result; this can be avoided by using a 2D gaussian shaped image sharpening kernel instead.

radius: the radius of the Gaussian, in pixels, not counting the center pixel.
sigma: the standard deviation of the Laplacian, in pixels.

See SharpenImage function in ImageMagick documentation.

102.6.184 Shave(rect as IMRectangleInfo7MBS) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Shaves pixels from the image edges.
Notes: It allocates the memory necessary for the new Image structure and returns a pointer to the new image.

Shave returns a pointer to the shaved image. A null image is returned if there is a memory shortage or if the image width or height is zero.

rect: Specifies a RectangleInfo which defines the region of the image to crop.

See ShaveImage function in ImageMagick documentation.

102.6.185 Shear(Xshear as double, Yshear as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new image that is an image copy of an existing one.
Notes: Shearing slides one edge of an image along the X or Y axis, creating a parallelogram. An X direction shear slides an edge along the X axis, while a Y direction shear slides an edge along the Y axis. The amount of the shear is controlled by a shear angle. For X direction shears, Xshear is measured relative to the Y axis, and similarly, for Y direction shears Yshear is measured relative to the X axis. Empty triangles left over from shearing the image are filled with the background color defined by member 'backgroundColor' of the image.. Shear() allocates the memory necessary for the new Image structure and returns a pointer to the new image.

See ShearImage function in ImageMagick documentation.

102.6.186 ShearRotate(degrees as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new image that is a rotated copy of an existing one.
Notes: Positive angles rotate counter-clockwise (right-hand rule), while negative angles rotate clockwise. Rotated images are usually larger than the originals and have 'empty' triangular corners. X axis. Empty triangles left over from shearing the image are filled with the background color defined by member 'background_color' of the image. ShearRotateImage allocates the memory necessary for the new Image structure and returns a pointer to the new image.

degrees: Specifies the number of degrees to rotate the image.

See ShearRotateImage function in ImageMagick documentation.

102.6.187 SigmoidalContrast(sharpen as boolean, contrast as Double, midpoint as Double) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: adjusts the contrast of an image with a non-linear sigmoidal contrast algorithm.
Notes: Increase the contrast of the image using a sigmoidal transfer function without saturating highlights or shadows. Contrast indicates how much to increase the contrast (0 is none; 3 is typical; 20 is pushing it); mid-point indicates where midtones fall in the resultant image (0 is white; 50 is middle-gray; 100 is black). Set sharpen to MagickTrue to increase the image contrast otherwise the contrast is reduced.

sharpen: Increase or decrease image contrast.

contrast: strength of the contrast, the larger the number the more 'threshold-like' it becomes.
midpoint: midpoint of the function as a color value 0 to QuantumRange.

See SigmoidalContrastImage function in ImageMagick documentation.

102.6.188 Solarize(threshold as double) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies a special effect to the image, similar to the effect achieved in a photo darkroom by selectively exposing areas of photo sensitive paper to light.
Notes: Threshold ranges from 0 to QuantumRange and is a measure of the extent of the solarization.

threshold: Define the extent of the solarization.

See SolarizeImage function in ImageMagick documentation.

102.6.189 SortColormapByIntensity as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: sorts the colormap of a PseudoClass image by decreasing color intensity.
Notes: See SortColormapByIntensity function in ImageMagick documentation.

102.6.190 SparseColor(SparseColorMethod as Integer, arguments() as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Given a set of coordinates, interpolates the colors found at those coordinates, across the whole image, using various methods.
Notes: method: the method to fill in the gradient between the control points.
The methods used for SparseColor() are often simular to methods used for DistortImage(), and even share the same code for determination of the function coefficents, though with more dimensions (or resulting values).
values: array of floating point arguments for this method– x,y,color_values– with color_values given as normalized values.

See SparseColorImage function in ImageMagick documentation.

102.6.191 Splice(rect as IMRectangleInfo7MBS) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Splices a solid color into the image as defined by the geometry.
Notes: rect: Define the region of the image to splice with members x, y, width, and height.

See SpliceImage function in ImageMagick documentation.

102.6.192 Spread(pixelInterpolateMethod as integer, radius as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Is a special effects method that randomly displaces each pixel in a square area defined by the radius parameter.
Notes: method: intepolation method.
radius: choose a random pixel in a neighborhood of this extent.

See SpreadImage function in ImageMagick documentation.

102.6.193 Stegano(watermarkImage as IMImage7MBS) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Hides a digital watermark within the image.
Notes: Recover the hidden watermark later to prove that the authenticity of an image. Offset defines the start position within the image to hide the watermark.

See SteganoImage function in ImageMagick documentation.

102.6.194 Stereo(otherImage as IMImage7MBS) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Combines two images and produces a single image that is the composite of a left and right image of a stereo pair.
Notes: Special red-green stereo glasses are required to view this effect.

See StereoImage function in ImageMagick documentation.

102.6.195 Strip as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Strips an image of all profiles and comments.
Notes: See StripImage function in ImageMagick documentation.

102.6.196 Swirl(degrees as double, pixelInterpolateMethod as integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Swirls the pixels about the center of the image, where degrees indicates the sweep of the arc through which each pixel is moved.
Notes: You get a more dramatic effect as the degrees move from 1 to 360.

degrees: Define the tightness of the swirling effect.
method: the pixel interpolation method.

See xx function in ImageMagick documentation.

102.6.197 Sync as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Synchronizes image properties.
Notes: See SyncImage function in ImageMagick documentation.

102.6.198 SyncAuthenticPixels as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves the image pixels to the in-memory or disk cache.
Notes: The method returns MagickTrue if the pixel region is flushed, otherwise MagickFalse.
See SyncAuthenticPixels function in ImageMagick documentation.

102.6.199 Texture(Image as IMImage7MBS)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Layer a texture on pixels matching image background color.
Notes: See xx function in ImageMagick documentation.

102.6.200 Thumbnail(columns as integer, rows as integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Changes the size of an image to the given dimensions and removes any associated profiles.
Notes: The goal is to produce small low cost thumbnail images suited for display on the Web.

columns: the number of columns in the scaled image.
rows: the number of rows in the scaled image.

See ThumbnailImage function in ImageMagick documentation.

102.6.201 TransformColorspace(ColorSpace as Integer) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Transforms an image colorspace, changing the image data to reflect the new colorspace.
Notes: See TransformImageColorspace function in ImageMagick documentation.

102.6.202 Transpose as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a horizontal mirror image by reflecting the pixels around the central y-axis while rotating them by 90 degrees.
Notes: See TransposeImage function in ImageMagick documentation.

102.6.203 Transverse as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a vertical mirror image by reflecting the pixels around the central x-axis while rotating them by 270 degrees.
Notes: See TransverseImage function in ImageMagick documentation.

102.6.204 Trim as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Trims pixels from the image edges.
Notes: It allocates the memory necessary for the new Image structure and returns a pointer to the new image.

See TrimImage function in ImageMagick documentation.

102.6.205 UniqueColors as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the unique colors of an image.
Notes: See UniqueImageColors function in ImageMagick documentation.

102.6.206 UnsharpMask(radius as double, sigma as double, amount as double, threshold as double) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sharpens one or more image channels.
Notes: We convolve the image with a Gaussian operator of the given radius and standard deviation (sigma). For reasonable results, radius should be larger than sigma. Use a radius of 0 and UnsharpMask selects a suitable radius for you.

radius: the radius of the Gaussian, in pixels, not counting the center pixel.
sigma: the standard deviation of the Gaussian, in pixels.
gain: the percentage of the difference between the original and the blur image that is added back into the original.
threshold: the threshold in pixels needed to apply the diffence gain.

See UnsharpMaskImage function in ImageMagick documentation.

102.6.207 VirtualPixels(X as Integer, Y as Integer, Width as Integer, Height as Integer) as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns an immutable pixel region.
Notes: If the region is successfully accessed, a pointer to it is returned, otherwise nil is returned. The returned pointer may point to a temporary working copy of the pixels or it may point to the original pixels in memory. Performance is maximized if the selected region is part of one row, or one or more full rows, since there is opportunity to access the pixels in-place (without a copy) if the image is in memory, or in a memory-mapped file. The returned pointer must *never* be deallocated by the user.

Pixels accessed via the returned pointer represent a simple array of type Quantum. If the image type is CMYK or the storage class is PseudoClass, call AuthenticMetacontent after invoking AuthenticPixels to access the meta-content (of type void) corresponding to the region.

If you plan to modify the pixels, use GetAuthenticPixels() instead.

Note, the VirtualPixels() and AuthenticPixels() methods are not thread-safe. In a threaded environment, use CacheViewVirtualPixels() or CacheViewAuthenticPixels() instead.

See GetVirtualPixels function in ImageMagick documentation.
Format of pixel values depend on what quantum size/type your library copy uses!

102.6.208 Wave(amplitude as double, wavelength as double, pixelInterpolateMethod as integer) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a "ripple" effect in the image by shifting the pixels vertically along a sine wave whose amplitude and wavelength is specified by the given parameters.
Notes: amplitude, wavelength: Define the amplitude and wave length of the sine wave.
pixelInterpolateMethod: the pixel interpolation method.

See WaveImage function in ImageMagick documentation.

102.6.209 WhiteThreshold(thresholds as string) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Is like ThresholdImage() but forces all pixels above the threshold into white while leaving all pixels at or below the threshold unchanged.
Notes: threshold: Define the threshold value.

See WhiteThresholdImage function in ImageMagick documentation.

102.6.210 Properties

102.6.211 AlphaColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The alpha color.
Notes: When you query this value, you get a copy in a new object.
To modify, you need to change copy and assign back.
(Read and Write property)

102.6.212 AlphaTrait as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The pixel trait for alpha channel.
Notes: Is transparency channel defined and active?
(Read and Write property)

102.6.213 AuthenticMetacontent as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the authentic metacontent corresponding with the last call to QueueAuthenticPixels() or GetVirtualPixels().
Notes: Nil is returned if the associated pixels are not available.
See GetAuthenticMetacontent function in ImageMagick documentation.
(Read only property)

102.6.214 AuthenticPixelQueue as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the authentic pixels associated corresponding with the last call to QueueAuthenticPixels or GetAuthenticPixels.
Notes: See GetAuthenticPixelQueue function in ImageMagick documentation.
(Read only property)

102.6.215 BackgroundColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Current background color attribute.
Notes: When you query this value, you get a copy in a new object.
To modify, you need to change copy and assign back.
(Read and Write property)

102.6.216 BlackPointCompensation as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to enable black point compensation for color space conversions.
Notes: (Read and Write property)

102.6.217 BlobSize as UInt64

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of the blob.
Notes: (Read only property)

102.6.218 BorderColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Current bordercolor attribute.
Notes: When you query this value, you get a copy in a new object.
To modify, you need to change copy and assign back.
(Read and Write property)

102.6.219 ChannelMask as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The channel mask field.
Notes: See Channel constants.
(Read and Write property)

102.6.220 Channels as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The channel mask.
Notes: (Read and Write property)

102.6.221 Colors as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Size of color table, or actual color count.
Notes: Only valid if image is not DirectClass.
(Read only property)

102.6.222 Colorspace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colorspace of image data.
Notes: (Read only property)

102.6.223 Columns as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Physical width of image in pixel.
Notes: (Read only property)

102.6.224 Compose as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Alpha composition method for layered images.
Notes: (Read and Write property)

102.6.225 CompositeMask as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to composite with mask.
Notes: (Read and Write property)

102.6.226 Compression as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compression of image when read/write.
Notes: (Read and Write property)

102.6.227 Debug as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Debug output attribute.
Notes: (Read and Write property)

102.6.228 Delay as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Animation delay time.
Notes: (Read and Write property)

102.6.229 Depth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Depth of image on read/write.
Notes: (Read only property)

102.6.230 Directory as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The directory.
Notes: (Read and Write property)

102.6.231 Dispose as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: GIF animation disposal method.
Notes: (Read and Write property)

102.6.232 Dither as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Dithering on/off.
Notes: (Read and Write property)

102.6.233 Duration as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Total animation duration.
Notes: sum(delay*iterations)
(Read and Write property)

102.6.234 Endian as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Raw data integer ordering on read/write.
Notes: (Read and Write property)

102.6.235 extent as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Size of image read from disk.
Notes: (Read only property)
See also:

- 102.6.74 Extent(rect as IMRectangleInfo7MBS) as IMImage7MBS 16304

102.6.236 ExtractInfo as IMRectangleInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extract Info.
Notes: (Read and Write property)

102.6.237 Filename as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file path of the image.
Notes: (Read and Write property)

102.6.238 Filter as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resize/distort filter to apply.
Notes: (Read and Write property)

102.6.239 Fuzz as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Current color fuzz attribute.
Notes: (Read and Write property)

102.6.240 Gamma as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The gamme of the image.
Notes: (Read only property)
See also:

- 102.6.80 Gamma(level as double) as Boolean 16306

102.6.241 Geometry as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The geomtry.
Notes: (Read and Write property)

102.6.242 Gravity as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gravity attribute for positioning in image.
Notes: (Read and Write property)

102.6.243 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

102.6.244 HasAlphaChannel as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns false if the image alpha channel is not activated.
Notes: That is, the image is RGB rather than RGBA or CMYK rather than CMYKA.
See GetImageAlphaChannel function in ImageMagick documentation.
(Read only property)

102.6.245 Height as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Physical height of image in pixel.
Notes: (Read only property)

102.6.246 ImageExtent as UInt64

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries image extent.
Notes: See GetImageExtent function in ImageMagick documentation.
(Read only property)

102.6.247 ImageType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The image type.
Notes: See Type constants like TrueColorType for RGB images.
(Read only property)

102.6.248 Intensity as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Method to generate an intensity value from a pixel.
Notes: (Read and Write property)

102.6.249 Interlace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The interlace setting.
Notes: (Read and Write property)

102.6.250 Interpolate as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Interpolation of color for between pixel lookups.
Notes: (Read and Write property)

102.6.251 IsBlobExempt as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the blob is exempt.
Notes: See IsBlobExempt function in ImageMagick documentation.
(Read only property)

102.6.252 IsBlobSeekable as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the blob is seekable.
Notes: See IsBlobSeekable function in ImageMagick documentation.
(Read only property)

102.6.253 IsBlobTemporary as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the blob is temporary.
Notes: See IsBlobTemporary function in ImageMagick documentation.
(Read only property)

102.6.254 IsImageGray as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the type of the image is grayscale or bi-level.
Notes: See IsImageGray function in ImageMagick documentation.
(Read only property)

102.6.255 IsImageMonochrome as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if type of the image is bi-level.
Notes: See IsImageMonochrome function in ImageMagick documentation.
(Read only property)

102.6.256 IsImageObject as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if the image sequence contains a valid set of image objects.
Notes: See IsImageObject function in ImageMagick documentation.
(Read only property)

102.6.257 IsPaletteImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns MagickTrue if the image is PseudoClass and has 256 unique colors or less.
Notes: See IsPaletteImage function in ImageMagick documentation.
(Read only property)

102.6.258 IsTaintImage as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true any pixel in the image has been altered since it was first constituted.
Notes: has image been modified since reading
(Read only property)

102.6.259 Iterations as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of interations for GIF animations.
Notes: (Read and Write property)

102.6.260 LastError as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

102.6.261 LastException as IMException7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last exception raised.
Notes: (Read and Write property)

102.6.262 ListImage as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image list links.
Notes: (Read only property)

102.6.263 Magick as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The magick module to use for encode/decode.
Notes: (Read and Write property)

102.6.264 MaskTrait as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The pixel trait for the mask.
Notes: Apply the clip or composite mask .
(Read and Write property)

102.6.265 MatteColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The matte color.
Notes: When you query this value, you get a copy in a new object.
To modify, you need to change copy and assign back.
(Read and Write property)

102.6.266 MetacontentExtent as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of meta content.
Notes: (Read only property)

102.6.267 Montage as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The montage setting.
Notes: (Read and Write property)

102.6.268 NextImage as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image list links.
Notes: (Read only property)

102.6.269 NumberChannels as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of channels.
Notes: (Read only property)

102.6.270 NumberMetaChannels as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of meta channels..
Notes: (Read only property)

102.6.271 Orientation as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Photo orientation of image.
Notes: (Read and Write property)

102.6.272 Page as IMRectangleInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Virtual canvas size and offset of image.
Notes: (Read and Write property)

102.6.273 Ping as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: No image data read, just attributes.
Notes: (Read only property)
See also:

- 102.6.139 Ping(path as string) as IMImage7MBS 16326

102.6.274 PixelCacheFilename as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries file path for cache file.
Notes: See GetPixelCacheFilename function in ImageMagick documentation.
(Read only property)

102.6.275 PixelCacheType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries pixel cache type.
Notes: See GetImagePixelCacheType function in ImageMagick documentation.
(Read only property)

102.6.276 PreviousImage as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image list links.
Notes: (Read only property)

102.6.277 Quality as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compression quality setting, meaning varies.
Notes: (Read and Write property)

102.6.278 ReadMask as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to read mask.
Notes: (Read and Write property)

102.6.279 ReferenceCount as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns reference count for this image.
Notes: Several image objects can share pixel memory.
Calling Modify function makes sure you have your own pixels to modify.
(Read only property)

102.6.280 Release as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to release the object in destructor.
Notes: (Read and Write property)

102.6.281 RenderingIntent as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rendering intent.
Notes: (Read and Write property)

102.6.282 Resolution as IMPointInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image resolution/density.
Notes: See also Units property for the resolution unit.

(Read and Write property)

102.6.283 Rows as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Physical height of image in pixel.
Notes: (Read only property)

102.6.284 Scene as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Index of image in multi-image file.
Notes: (Read and Write property)

102.6.285 StartLoop as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The start loop value.
Notes: For GIF.
(Read and Write property)

102.6.286 StorageClass as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The storage class of the image.
Notes: (Read only property)

102.6.287 Taint as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Has image been modified since reading.
Notes: (Read and Write property)

102.6.288 TicksPerSecond as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Units for delay time, default 100 for GIF.
Notes: (Read and Write property)

102.6.289 TileOffset as IMRectangleInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tile offset.
Notes: (Read and Write property)

102.6.290 TotalColors as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Total number of colors.
Notes: (Read and Write property)

102.6.291 TransparentColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Color for 'transparent' color index in GIF.
Notes: When you query this value, you get a copy in a new object.
To modify, you need to change copy and assign back.
(Read and Write property)

102.6.292 Type as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The image type.
Notes: (Read only property)

102.6.293 Units as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resolution/density ppi or ppc.
Notes: (Read and Write property)

102.6.294 VirtualMetacontent as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the virtual metacontent corresponding with the last call to QueueAuthenticPixels or GetVirtualPixels.
Notes: Nil is returned if the meta-content are not available.
See GetVirtualMetacontent function in ImageMagick documentation.
(Read only property)

102.6.295 VirtualPixelQueue as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the virtual pixels associated corresponding with the last call to QueueAuthenticPixels or GetVirtualPixels.
Notes: See GetVirtualPixelQueue function in ImageMagick documentation.
(Read only property)

102.6.296 Width as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Physical width of image in pixel.
Notes: (Read only property)

102.6.297 WriteMask as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to write mask.
Notes: (Read and Write property)

102.6.298 Constants

Constants

Constant	Value	Description
kTransparentAlpha	0	The value for transparent alpha.

Intent

Constant	Value	Description
kAbsoluteIntent	3	
kPerceptualIntent	2	
kRelativeIntent	4	
kSaturationIntent	1	
kUndefinedIntent	0	

Alpha Channel

Constant	Value	Description
kActivateAlphaChannel	1	
kAssociateAlphaChannel	2	
kBackgroundAlphaChannel	3	
kCopyAlphaChannel	4	
kDeactivateAlphaChannel	5	
kDisassociateAlphaChannel	7	
kDiscreteAlphaChannel	6	
kExtractAlphaChannel	8	
kOffAlphaChannel	9	
kOnAlphaChannel	10	
kOpaqueAlphaChannel	11	
kRemoveAlphaChannel	12	
kSetAlphaChannel	13	
kShapeAlphaChannel	14	
kTransparentAlphaChannel	15	
kUndefinedAlphaChannel	0	

Complex Operators

Constant	Value	Description
kAddComplexOperator	1	Add
kConjugateComplexOperator	2	ConjugateC
kDivideComplexOperator	3	Divide
kMagnitudePhaseComplexOperator	4	Magnitude Phase
kMultiplyComplexOperator	5	Multiply
kRealImaginaryComplexOperator	6	Real Imaginary
kSubtractComplexOperator	7	Subtract
kUndefinedComplexOperator	0	Undefined

Preview

Constant	Value	Description
kAddNoisePreview	14	
kBlurPreview	16	
kBrightnessPreview	6	
kCharcoalDrawingPreview	28	
kDespecklePreview	12	
kDullPreview	9	
kEdgeDetectPreview	18	
kGammaPreview	7	
kGrayscalePreview	10	
kHuePreview	4	
kImplodePreview	25	
kJPEGPreview	29	
kOilPaintPreview	27	
kQuantizePreview	11	
kRaisePreview	22	
kReduceNoisePreview	13	
kRollPreview	3	
kRotatePreview	1	
kSaturationPreview	5	
kSegmentPreview	23	
kShadePreview	21	
kSharpenPreview	15	
kShearPreview	2	
kSolarizePreview	20	
kSpiffPreview	8	
kSpreadPreview	19	
kSwirlPreview	24	
kThresholdPreview	17	
kUndefinedPreview	0	
kWavePreview	26	

Distortion

Constant	Value	Description
kAffineDistortion	1	
kAffineProjectionDistortion	2	
kArcDistortion	9	
kBarrelDistortion	14	
kBarrelInverseDistortion	15	
kBilinearDistortion	6	
kBilinearForwardDistortion	6	
kBilinearReverseDistortion	7	
kCylinder2PlaneDistortion	12	
kDePolarDistortion	11	
kPerspectiveDistortion	4	
kPerspectiveProjectionDistortion	5	
kPlane2CylinderDistortion	13	
kPolarDistortion	10	
kPolynomialDistortion	8	
kResizeDistortion	17	
kScaleRotateTranslateDistortion	3	
kSentinelDistortion	18	
kShepardsDistortion	16	
kUndefinedDistortion	0	

Composite Operators

Constant	Value	Description
kAlphaCompositeOp	1	
kAtopCompositeOp	2	
kBlendCompositeOp	3	
kBlurCompositeOp	4	
kBumpmapCompositeOp	5	
kChangeMaskCompositeOp	6	
kClearCompositeOp	7	
kColorBurnCompositeOp	8	
kColorDodgeCompositeOp	9	
kColorizeCompositeOp	10	
kCopyAlphaCompositeOp	17	
kCopyBlackCompositeOp	11	
kCopyBlueCompositeOp	12	
kCopyCompositeOp	13	
kCopyCyanCompositeOp	14	
kCopyGreenCompositeOp	15	
kCopyMagentaCompositeOp	16	
kCopyRedCompositeOp	18	
kCopyYellowCompositeOp	19	
kDarkenCompositeOp	20	
kDarkenIntensityCompositeOp	21	
kDifferenceCompositeOp	22	
kDisplaceCompositeOp	23	
kDissolveCompositeOp	24	
kDistortCompositeOp	25	
kDivideDstCompositeOp	26	
kDivideSrcCompositeOp	27	
kDstAtopCompositeOp	28	
kDstCompositeOp	29	
kDstInCompositeOp	30	
kDstOutCompositeOp	31	
kDstOverCompositeOp	32	
kExclusionCompositeOp	33	
kHardLightCompositeOp	34	
kHardMixCompositeOp	35	
kHueCompositeOp	36	
kInCompositeOp	37	
kIntensityCompositeOp	38	
kLightenCompositeOp	39	
kLightenIntensityCompositeOp	40	
kLinearBurnCompositeOp	41	
kLinearDodgeCompositeOp	42	
kLinearLightCompositeOp	43	
kLuminizeCompositeOp	44	
kMathematicsCompositeOp	45	
kMinusDstCompositeOp	46	
kMinusSrcCompositeOp	47	
kModulateCompositeOp	48	
kModulusAddCompositeOp	49	
kModulusSubtractCompositeOp	50	
kMultiplyCompositeOp	51	
kNoCompositeOp	52	
kOutCompositeOp	53	
kOverCompositeOp	54	
kOverlayCompositeOp	55	
kPegtopLightCompositeOp	56	
kPinLightCompositeOp	57	
kPlusCompositeOp	58	

Dispose

Constant	Value	Description
kBackgroundDispose	2	
kNoneDispose	1	
kPreviousDispose	3	
kUndefinedDispose	0	
kUnrecognizedDispose	0	

Color Interpolate

Constant	Value	Description
kBarycentricColorInterpolate	1	
kBilinearColorInterpolate	7	
kInverseColorInterpolate	19	
kManhattanColorInterpolate	20	
kPolynomialColorInterpolate	8	
kShepardsColorInterpolate	16	
kUndefinedColorInterpolate	0	
kVoronoiColorInterpolate	18	

Color Types

Constant	Value	Description
kBilevelType	1	
kColorSeparationAlphaType	9	
kColorSeparationType	8	
kGrayscaleAlphaType	3	
kGrayscaleType	2	
kOptimizeType	10	
kPaletteAlphaType	5	
kPaletteBilevelAlphaType	11	
kPaletteType	4	
kTrueColorAlphaType	7	
kTrueColorType	6	
kUndefinedType	0	

Orientations

Constant	Value	Description
kBottomLeftOrientation	4	
kBottomRightOrientation	3	
kLeftBottomOrientation	8	
kLeftTopOrientation	5	
kRightBottomOrientation	7	
kRightTopOrientation	6	
kTopLeftOrientation	1	
kTopRightOrientation	2	
kUndefinedOrientation	0	

Color Spaces

Constant	Value	Description
kCMYColorspace	1	
kCMYKColorspace	2	
kGRAYColorspace	3	
kHCLColorspace	4	
kHCLpColorspace	5	
kHSBColorspace	6	
kHSIColorspace	7	
kHSLColorspace	8	
kHSVColorspace	9	
kHWBColorspace	10	
kLabColorspace	11	
kLCHabColorspace	13	
kLCHColorspace	12	
kLCHuvColorspace	14	
kLinearGRAYColorspace	33	
kLMSColorspace	16	
kLogColorspace	15	
kLuvColorspace	17	
kOHTAColorspace	18	
kRec601YCbCrColorspace	19	
kRec709YCbCrColorspace	20	
kRGBColorspace	21	
kscRGBColorspace	22	
ksRGBColorspace	23	
kTransparentColorspace	24	
kUndefinedColorspace	0	
kxyYColorspace	25	
kXYZColorspace	26	
kYCbCrColorspace	27	
kYCCColorspace	28	
kYDbDrColorspace	29	
kYIQColorspace	30	
kYPbPrColorspace	31	
kYUVColorspace	32	

Layers

Constant	Value	Description
kCoalesceLayer	1	
kCompareAnyLayer	2	
kCompareClearLayer	3	
kCompareOverlayLayer	4	
kCompositeLayer	12	
kDisposeLayer	5	
kFlattenLayer	14	
kMergeLayer	13	
kMosaicLayer	15	
kOptimizeImageLayer	7	
kOptimizeLayer	6	
kOptimizePlusLayer	8	
kOptimizeTransLayer	9	
kRemoveDupsLayer	10	
kRemoveZeroLayer	11	
kTrimBoundsLayer	16	
kUndefinedLayer	0	

Cache

Constant	Value	Description
kDiskCache	1	
kDistributedCache	2	
kMapCache	3	
kMemoryCache	4	
kPingCache	5	
kUndefinedCache	0	

Interlace

Constant	Value	Description
kGIFInterlace	5	
kJPEGInterlace	6	
kLineInterlace	2	
kNoInterlace	1	
kPartitionInterlace	4	
kPlaneInterlace	3	
kPNGInterlace	7	
kUndefinedInterlace	0	

Threshold Methods

Constant	Value	Description
kKapurThresholdMethod	1	
kOTSUThresholdMethod	2	
kTriangleThresholdMethod	3	
kUndefinedThresholdMethod	0	

Resolutions

Constant	Value	Description
kPixelsPerCentimeterResolution	2	
kPixelsPerInchResolution	1	
kUndefinedResolution	0	

102.7 class IMImageAffineMatrix7MBS

102.7.1 class IMImageAffineMatrix7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an affine transformation matrix.
Example:

```
// scale a picture to half the width and skew it a bit with an affine matrix
Var m As New IMImageAffineMatrix7MBS
m.SX = 0.5 // horizontal scale
m.SY = 1.0 // vertical scale
m.RX = 0.2 // skew
m.RY = 0.0

Var image As New IMImage7MBS(Picture.Open(SpecialFolder.Desktop.Child("photo.jpg")))
Var result As IMImage7MBS = image.AffineTransform(m)
If result <>Nil Then MessageBox result.Width.ToString + " x " + result.Height.ToString
```

102.7.2 Methods

102.7.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Initializes with an identity matrix.

102.7.4 Properties

102.7.5 RX as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rotation-x part of the affine transformation.
Notes: (Read and Write property)

102.7.6 RY as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The rotation-y part of the affine transformation.
Notes: (Read and Write property)

102.7.7 SX as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The scale-x part of the affine transformation.
Notes: (Read and Write property)

102.7.8 SY as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The scale-y part of the affine transformation.
Notes: (Read and Write property)

102.7.9 TX as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The translate-x part of the affine transformation.
Notes: (Read and Write property)

102.7.10 TY as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The translate-y part of the affine transformation.
Notes: (Read and Write property)

102.8 class IMImageInfo7MBS

102.8.1 class IMImageInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for image info.
Example:

```
// read only the size of an image file without loading all pixels
Var info As New IMImageInfo7MBS
info.Filename = SpecialFolder.Desktop.Child("huge.tif").NativePath
Var image As IMImage7MBS = info.PingImage
If image <>Nil Then
MessageBox image.Width.ToString + " x " + image.Height.ToString + " pixels"
End If
```

Notes: This represents usually an image you want to load or save.

102.8.2 Methods

102.8.3 BlobToImage(Data as MemoryBlock) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: BlobToImage implements direct to memory image formats. It returns the blob as an image.
Notes: See BlobToImage function in ImageMagick documentation.
See also:

- 102.8.4 BlobToImage(Data as String) as IMImage7MBS 16376

102.8.4 BlobToImage(Data as String) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: BlobToImage implements direct to memory image formats. It returns the blob as an image.
Notes: See BlobToImage function in ImageMagick documentation.
See also:

- 102.8.3 BlobToImage(Data as MemoryBlock) as IMImage7MBS 16376

102.8.5 Clone as IMImageInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Makes a copy of the given image info object.
Notes: See CloneImageInfo function in ImageMagick documentation.

102.8.6 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an empty image info.
Notes: See CloneImageInfo function in ImageMagick documentation.

- 102.8.7 Constructor(ImageInfo as IMImageInfo7MBS) 16377

102.8.7 Constructor(ImageInfo as IMImageInfo7MBS)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of an existing image info.
Notes: See CloneImageInfo function in ImageMagick documentation.
See also:

- 102.8.6 Constructor 16377

102.8.8 PingBlob(Data as MemoryBlock) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pings a blob.
Notes: Reads image attributes, but not image data.
See PingBlob function in ImageMagick documentation.
See also:

- 102.8.9 PingBlob(Data as String) as IMImage7MBS 16377

102.8.9 PingBlob(Data as String) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pings a blob.
Notes: Reads image attributes, but not image data.

See PingBlob function in ImageMagick documentation.
See also:

- 102.8.8 PingBlob(Data as MemoryBlock) as IMImage7MBS 16377

102.8.10 PingImage as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns all the properties of an image or image sequence except for the pixels.
Notes: It is much faster and consumes far less memory than ReadImage. On failure, a nil image is returned and exception describes the reason for the failure.

See PingImage function in ImageMagick documentation.

102.8.11 PingImages(filename as String) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Pings one or more images and returns them as an image list.
Notes: See xx function in ImageMagick documentation.

102.8.12 ReadImage as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads an image or image sequence from a file or file handle.
Notes: The method returns a nil if there is a memory shortage or if the image cannot be read. On failure, a nil image is returned and exception describes the reason for the failure.

See ReadImage function in ImageMagick documentation.

102.8.13 ReadImages(filename as String) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads one or more images and returns them as an image list.
Notes: See xx function in ImageMagick documentation.

102.8.14 ReadInlineImage(filename as String) as IMImage7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a Base64-encoded inline image or image sequence.
Notes: The method returns a nil if there is a memory shortage or if the image cannot be read. On failure, a nil image is returned and exception describes the reason for the failure.

See ReadInlineImage function in ImageMagick documentation.

102.8.15 WriteImage(image as IMImage7MBS) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes an image or an image sequence to a file or file handle.
Notes: If writing to a file is on disk, the name is defined by the filename member of the image object. WriteImage returns False is there is a memory shortage or if the image cannot be written. Check the exception member of image to determine the cause for any failure.

See WriteImage function in ImageMagick documentation.

102.8.16 WriteImages(image as IMImage7MBS, filename as String) as boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes an image sequence into one or more files.
Notes: While WriteImage can write an image sequence, it is limited to writing the sequence into a single file using a format which supports multiple frames. WriteImages, however, does not have this limitation, instead it generates multiple output files if necessary (or when requested). When ImageInfo's adjoin flag is set to False, the file name is expected to include a printf-style formatting string for the frame number (e.g. "image02d.png").

See WriteImages function in ImageMagick documentation.

102.8.17 Properties

102.8.18 Adjoin as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Save images to separate scene files.
Notes: (Read and Write property)

102.8.19 Affirm as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Affirm flag.
Notes: (Read and Write property)

102.8.20 AlphaColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The alpha color value.
Notes: (Read and Write property)

102.8.21 Antialias as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The anti alias flag.
Notes: (Read and Write property)

102.8.22 BackgroundColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The background color.
Notes: (Read and Write property)

102.8.23 BorderColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The border color.
Notes: (Read and Write property)

102.8.24 Channel as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The channel types.
Notes: See ChannelType constants.
(Read and Write property)

102.8.25 ColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Colorspace of image data.
Notes: See Colorspace constants.
(Read and Write property)

102.8.26 Compose as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Alpha composition method for layered images.
Notes: (Read and Write property)

102.8.27 Compression as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compression of image when read/write.
Notes: (Read and Write property)

102.8.28 Debug as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Debug enabled.
Notes: (Read and Write property)

102.8.29 Density as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: DUP for image and draw_info.
Notes: (Read and Write property)

102.8.30 Depth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Depth of image on read/write.
Notes: (Read and Write property)

102.8.31 Dither as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: dithering on/off.
Notes: (Read and Write property)

102.8.32 Endian as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: raw data integer ordering on read/write.
Notes: (Read and Write property)

102.8.33 Extract as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Crop/resize string on image read.
Notes: (Read and Write property)

102.8.34 Filename as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The file path of the image.
Notes: (Read and Write property)

102.8.35 Font as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Font name for drawing functions.
Notes: (Read and Write property)

102.8.36 Fuzz as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Current color fuzz attribute.
Notes: (Read and Write property)

102.8.37 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

102.8.38 Interlace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Interlace for image write.
Notes: See Interlace constants.
(Read and Write property)

102.8.39 LastError as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

102.8.40 LastException as IMException7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last exception raised.
Notes: (Read and Write property)

102.8.41 Length as UInt64

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Length of data.
Notes: (Read and Write property)

102.8.42 Magick as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The magick module to use for encode/decode.
Notes: (Read and Write property)

102.8.43 MatteColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The matte color.
Notes: (Read and Write property)

102.8.44 Monochrome as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to read/write pcl,pdf,ps,xps as monocrome image.
Notes: (Read and Write property)

102.8.45 Orientation as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The orientation of the image.
Notes: See orientation constants.
(Read and Write property)

102.8.46 Page as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The page number.
Notes: (Read and Write property)

102.8.47 Ping as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: If enabled only fast read image attributes, not image data.
Notes: (Read and Write property)

102.8.48 PointSize as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The point size.
Notes: (Read and Write property)

102.8.49 Quality as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compression quality setting, meaning varies.
Notes: (Read and Write property)

102.8.50 Release as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to release the object in destructor.
Notes: (Read and Write property)

102.8.51 SamplingFactor as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: JPEG write sampling factor.
Notes: (Read and Write property)

102.8.52 Scene as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Starting value for image save numbering.
Notes: (Read and Write property)

102.8.53 SceneCount as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Total number of images in list - for escapes.
Notes: (Read and Write property)

102.8.54 Scenes as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scene numbers that is to be read in.
Notes: (Read and Write property)

102.8.55 ServerName as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: X windows server name - display/animate.
Notes: (Read and Write property)

102.8.56 Size as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Image generation size.
Notes: (Read and Write property)

102.8.57 Synchronize as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The Synchronize flag.
Notes: (Read and Write property)

102.8.58 Temporary as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether image file is temporary.
Notes: image file to be deleted after read "empemeral:".
(Read and Write property)

102.8.59 Texture as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: montage/display background tile.
Notes: (Read and Write property)

102.8.60 TransparentColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: color for transparent index in color tables.
Notes: (Read and Write property)

102.8.61 Type as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The image type.
Notes: e.g. TrueColorAlphaType.
(Read and Write property)

102.8.62 Unique as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unique tempory filename - delegates.
Notes: (Read and Write property)

102.8.63 Units as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The resolution unit.
Notes: Density pixels/inch or pixel/cm.
Either kPixelsPerInchResolution or kPixelsPerCentimeterResolution.
(Read and Write property)

102.8.64 Verbose as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Verbose output enable/disable.
Notes: (Read and Write property)

102.9 class IMKernelInfo7MBS

102.9.1 class IMKernelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The kernel information details.
Example:

```
// sharpen a picture with a 3x3 convolution kernel
Var image As New IMImage7MBS(Picture.Open(SpecialFolder.Desktop.Child("photo.jpg")))
Var kernel As New IMKernelInfo7MBS("3x3: 0,-1,0 -1,5,-1 0,-1,0")
Var sharp As IMImage7MBS = image.Convolve(kernel)
If sharp <>Nil Then
Var result As Picture = sharp.CopyPicture
// show result in a Canvas or ImageViewer
End If
```

102.9.2 Methods

102.9.3 Clone as IMKernelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clones the kernel info object.
Notes: Creates a new clone of the given Kernel List so that its can be modified without effecting the original.

102.9.4 Constructor(KernelInfo as IMKernelInfo7MBS)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the kernel.
See also:

- 102.9.5 Constructor(kernelString as String) 16389
- 102.9.6 Constructor(Type as Integer, GeometryInfo as IMGeometryInfo7MBS) 16391

102.9.5 Constructor(kernelString as String)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Takes the given string (generally supplied by the user) and converts it into a Morphology/Convolution Kernel.

Notes: This allows users to specify a kernel from a number of pre-defined kernels, or to fully specify their own kernel for a specific Convolution or Morphology Operation.

The kernel so generated can be any rectangular array of floating point values (doubles) with the 'control point' or 'pixel being affected' anywhere within that array of values.

Previously IM was restricted to a square of odd size using the exact center as origin, this is no longer the case, and any rectangular kernel with any value being declared the origin. This in turn allows the use of highly asymmetrical kernels.

The floating point values in the kernel can also include a special value known as 'nan' or 'not a number' to indicate that this value is not part of the kernel array. This allows you to shaped the kernel within its rectangular area. That is 'nan' values provide a 'mask' for the kernel shape. However at least one non-nan value must be provided for correct working of a kernel.

The returned kernel should be freed using the DestroyKernelInfo() when you are finished with it. Do not free this memory yourself.

Input kernel defintion strings can consist of any of three types.

"name:args [[@><] " Select from one of the built in kernels, using the name and geometry arguments supplied. See AcquireKernelBuiltIn()

"WxH [+X+Y] [@><] :num, num, num ..." a kernel of size W by H, with W*H floating point numbers following. the 'center' can be optionally be defined at +X+Y (such that +0+0 is top left corner). If not defined the pixel in the center, for odd sizes, or to the immediate top or left of center for even sizes is automatically selected.

"num, num, num, num, ..." list of floating point numbers defining an 'old style' odd sized square kernel. At least 9 values should be provided for a 3x3 square kernel, 25 for a 5x5 square kernel, 49 for 7x7, etc. Values can be space or comma separated. This is not recommended.

You can define a 'list of kernels' which can be used by some morphology operators A list is defined as a semi-colon separated list kernels.

" kernel ; kernel ; kernel ; "

Any extra ';' characters, at start, end or between kernel defintions are simply ignored.

The special flags will expand a single kernel, into a list of rotated kernels. A '@' flag will expand a 3x3 kernel into a list of 45-degree cyclic rotations, while a '>' will generate a list of 90-degree rotations. The '<' also

exands using 90-degree rotates, but giving a 180-degree reflected kernel before the +/- 90-degree rotations, which can be important for Thinning operations.

Note that 'name' kernels will start with an alphabetic character while the new kernel specification has a ':' character in its specification string. If neither is the case, it is assumed an old style of a simple list of numbers generating a odd-sized square kernel has been given.

kernelString: the Morphology/Convolution kernel wanted.

See also AcquireKernelInfo in ImageMagick documentation.
See also:

- 102.9.4 Constructor(KernelInfo as IMKernelInfo7MBS) 16389
- 102.9.6 Constructor(Type as Integer, GeometryInfo as IMGeometryInfo7MBS) 16391

102.9.6 Constructor(Type as Integer, GeometryInfo as IMGeometryInfo7MBS)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns one of the 'named' built-in types of kernels used for special purposes such as gaussian blurring, skeleton pruning, and edge distance determination.
Notes: They take a KernelType, and a set of geometry style arguments, which were typically decoded from a user supplied string, or from a more complex Morphology Method that was requested.

A description of each parameter follows:

type: the pre-defined type of kernel wanted
args: arguments defining or modifying the kernel

Convolution Kernels
Unity The a No-Op or Scaling single element kernel.
Gaussian: { radius } , { sigma } Generate a two-dimensional gaussian kernel, as used by -gaussian. The sigma for the curve is required. The resulting kernel is normalized,
If 'sigma' is zero, you get a single pixel on a field of zeros.
NOTE: that the 'radius' is optional, but if provided can limit (clip) the final size of the resulting kernel to a square 2*radius+1 in size. The radius should be at least 2 times that of the sigma value, or sever clipping and aliasing may result. If not given or set to 0 the radius will be determined so as to produce the best minimal error result, which is usally much larger than is normally needed.
LoG: { radius } , { sigma } "Laplacian of a Gaussian" or "Mexician Hat" Kernel. The supposed ideal edge detection, zero-summing kernel.
An alternative to this kernel is to use a "DoG" with a sigma ratio of approx 1.6 (according to wikipedia).
DoG: { radius } , { sigma1 } , { sigma2 } "Difference of Gaussians" Kernel. As "Gaussian" but with a gaussian produced by 'sigma2' subtracted from the gaussian produced by 'sigma1'. Typically sigma2 >sigma1.

The result is a zero-summing kernel.
Blur: { radius } , { sigma } [, { angle }] Generates a 1 dimensional or linear gaussian blur, at the angle given (current restricted to orthogonal angles). If a 'radius' is given the kernel is clipped to a width of 2*radius+1. Kernel can be rotated by a 90 degree angle.
If 'sigma' is zero, you get a single pixel on a field of zeros.
Note that two convolutions with two "Blur" kernels perpendicular to each other, is equivalent to a far larger "Gaussian" kernel with the same sigma value, However it is much faster to apply. This is how the "-blur" operator actually works.
Comet: { width } , { sigma } , { angle } Blur in one direction only, much like how a bright object leaves a comet like trail. The Kernel is actually half a gaussian curve, Adding two such blurs in opposite directions produces a Blur Kernel. Angle can be rotated in multiples of 90 degrees.
Note that the first argument is the width of the kernel and not the radius of the kernel.
Binomial: [{ radius }] Generate a discrete kernel using a 2 dimentional Pascel's Triangle of values. Used for special forma of image filters.
Still to be implemented... # # Filter2D # Filter1D # Set kernel values using a resize filter, and given scale (sigma) # Cylindrical or Linear. Is this possible with an image?
Named Constant Convolution Kernels
All these are unscaled, zero-summing kernels by default. As such for non-HDRI version of ImageMagick some form of normalization, user scaling, and biasing the results is recommended, to prevent the resulting image being 'clipped'.
The 3x3 kernels (most of these) can be circularly rotated in multiples of 45 degrees to generate the 8 angled varients of each of the kernels.
Laplacian: { type } Discrete Lapacian Kernels, (without normalization) Type 0 : 3x3 with center:8 surounded by -1 (8 neighbourhood) Type 1 : 3x3 with center:4 edge:-1 corner:0 (4 neighbourhood) Type 2 : 3x3 with center:4 edge:1 corner:-2 Type 3 : 3x3 with center:4 edge:-2 corner:1 Type 5 : 5x5 laplacian Type 7 : 7x7 laplacian Type 15 : 5x5 LoG (sigma approx 1.4) Type 19 : 9x9 LoG (sigma approx 1.4)
Sobel: { angle } Sobel 'Edge' convolution kernel (3x3) | -1, 0, 1 | | -2, 0,-2 | | -1, 0, 1 |
Roberts: { angle } Roberts convolution kernel (3x3) | 0, 0, 0 | | -1, 1, 0 | | 0, 0, 0 |
Prewitt: { angle } Prewitt Edge convolution kernel (3x3) | -1, 0, 1 | | -1, 0, 1 | | -1, 0, 1 |
Compass: { angle } Prewitt's "Compass" convolution kernel (3x3) | -1, 1, 1 | | -1,-2, 1 | | -1, 1, 1 |
Kirsch: { angle } Kirsch's "Compass" convolution kernel (3x3) | -3,-3, 5 | | -3, 0, 5 | | -3,-3, 5 |
FreiChen: { angle } Frei-Chen Edge Detector is based on a kernel that is similar to the Sobel Kernel, but is designed to be isotropic. That is it takes into account the distance of the diagonal in the kernel.
| 1, 0, -1 | | sqrt(2), 0, -sqrt(2) | | 1, 0, -1 |
FreiChen: { type } , { angle }
Frei-Chen Pre-weighted kernels...
Type 0: default un-nomalized version shown above.
Type 1: Orthogonal Kernel (same as type 11 below) | 1, 0, -1 | | sqrt(2), 0, -sqrt(2) | / 2*sqrt(2) | 1, 0, -1 |
Type 2: Diagonal form of Kernel... | 1, sqrt(2), 0 | | sqrt(2), 0, -sqrt(2) | / 2*sqrt(2) | 0, -sqrt(2) -1 |
However this kernel is als at the heart of the FreiChen Edge Detection Process which uses a set of 9 specially weighted kernel. These 9 kernels not be normalized, but directly applied to the image. The results is then added together, to produce the intensity of an edge in a specific direction. The square root of the pixel value can then be taken as the cosine of the edge, and at least 2 such runs at 90 degrees from each other, both the direction and the strength of the edge can be determined.
Type 10: All 9 of the following pre-weighted kernels...
Type 11: | 1, 0, -1 | | sqrt(2), 0, -sqrt(2) | / 2*sqrt(2) | 1, 0, -1 |
Type 12: | 1, sqrt(2), 1 | | 0, 0, 0 | / 2*sqrt(2) | 1, sqrt(2), 1 |
Type 13: | sqrt(2), -1, 0 | | -1, 0, 1 | / 2*sqrt(2) | 0, 1, -sqrt(2) |

Type 14: | 0, 1, -sqrt(2) | | -1, 0, 1 | / 2*sqrt(2) | sqrt(2), -1, 0 |
Type 15: | 0, -1, 0 | | 1, 0, 1 | / 2 | 0, -1, 0 |
Type 16: | 1, 0, -1 | | 0, 0, 0 | / 2 | -1, 0, 1 |
Type 17: | 1, -2, 1 | | -2, 4, -2 | / 6 | -1, -2, 1 |
Type 18: | -2, 1, -2 | | 1, 4, 1 | / 6 | -2, 1, -2 |
Type 19: | 1, 1, 1 | | 1, 1, 1 | / 3 | 1, 1, 1 |
The first 4 are for edge detection, the next 4 are for line detection and the last is to add a average component to the results.
Using a special type of '-1' will return all 9 pre-weighted kernels as a multi-kernel list, so that you can use them directly (without normalization) with the special "-set option:morphology:compose Plus" setting to apply the full FreiChen Edge Detection Technique.
If 'type' is large it will be taken to be an actual rotation angle for the default FreiChen (type 0) kernel. As such FreiChen:45 will look like a Sobel:45 but with 'sqrt(2)' instead of '2' values.
WARNING: The above was layed out as per http://www.math.tau.ac.il/
textasciitilde turkel/notes/edge_detectors.pdf But rotated 90 degrees so direction is from left rather than the top. I have yet to find any secondary confirmation of the above. The only other source found was actual source code at http://ltswww.epfl.ch/
textasciitilde courstiv/exos_labos/sol3.pdf Neigher paper defineds the kernels in a way that looks locical or correct when taken as a whole.
Boolean Kernels
Diamond: [{ radius } [, { scale }]] Generate a diamond shaped kernel with given radius to the points. Kernel size will again be radius*2+1 square and defaults to radius 1, generating a 3x3 kernel that is slightly larger than a square.
Square: [{ radius } [, { scale }]] Generate a square shaped kernel of size radius*2+1, and defaulting to a 3x3 (radius 1).
Octagon: [{ radius } [, { scale }]] Generate octagonal shaped kernel of given radius and constant scale. Default radius is 3 producing a 7x7 kernel. A radius of 1 will result in "Diamond" kernel.
Disk: [{ radius } [, { scale }]] Generate a binary disk, thresholded at the radius given, the radius may be a float-point value. Final Kernel size is floor(radius)*2+1 square. A radius of 5.3 is the default.
NOTE: That a low radii Disk kernels produce the same results as many of the previously defined kernels, but differ greatly at larger radii. Here is a table of equivalences... "Disk:1" =>"Diamond", "Octagon:1", or "Cross:1" "Disk:1.5" =>"Square" "Disk:2" =>"Diamond:2" "Disk:2.5" =>"Octagon" "Disk:2.9" =>"Square:2" "Disk:3.5" =>"Octagon:3" "Disk:4.5" =>"Octagon:4" "Disk:5.4" =>"Octagon:5" "Disk:6.4" =>"Octagon:6"
All other Disk shapes are unique to this kernel, but because a "Disk" is more circular when using a larger radius, using a larger radius is preferred over iterating the morphological operation.
Rectangle: { geometry } Simply generate a rectangle of 1's with the size given. You can also specify the location of the 'control point', otherwise the closest pixel to the center of the rectangle is selected.
Properly centered and odd sized rectangles work the best.
Symbol Dilation Kernels
These kernel is not a good general morphological kernel, but is used more for highlighting and marking any single pixels in an image using, a "Dilate" method as appropriate.
For the same reasons iterating these kernels does not produce the same result as using a larger radius for the symbol.
Plus: [{ radius } [, { scale }]] Cross: [{ radius } [, { scale }]] Generate a kernel in the shape of a 'plus' or a 'cross' with a each arm the length of the given radius (default 2).
NOTE: "plus:1" is equivalent to a "Diamond" kernel.
Ring: { radius1 } , { radius2 } [, { scale }] A ring of the values given that falls between the two radii. Defaults to a ring of approximataly 3 radius in a 7x7 kernel. This is the 'edge' pixels of the default "Disk"

kernel, More specifically, ”Ring” ->”Ring:2.5,3.5,1.0”
Hit and Miss Kernels
Peak:radius1,radius2 Find any peak larger than the pixels the fall between the two radii. The default ring of pixels is as per ”Ring”. Edges Find flat orthogonal edges of a binary shape Corners Find 90 degree corners of a binary shape Diagonals:type A special kernel to thin the ’outside’ of diagonals LineEnds:type Find end points of lines (for pruning a skeletion) Two types of lines ends (default to both) can be searched for Type 0: All line ends Type 1: single kernel for 4-conneected line ends Type 2: single kernel for simple line ends LineJunctions Find three line junctions (within a skeletion) Type 0: all line junctions Type 1: Y Junction kernel Type 2: Diagonal T Junction kernel Type 3: Orthogonal T Junction kernel Type 4: Diagonal X Junction kernel Type 5: Orthogonal + Junction kernel Ridges:type Find single pixel ridges or thin lines Type 1: Fine single pixel thick lines and ridges Type 2: Find two pixel thick lines and ridges ConvexHull Octagonal Thickening Kernel, to generate convex hulls of 45 degrees Skeleton:type Traditional skeleton generating kernels. Type 1: Tradional Skeleton kernel (4 connected skeleton) Type 2: HIPR2 Skeleton kernel (8 connected skeleton) Type 3: Thinning skeleton based on a ressearch paper by Dan S. Bloomberg (Default Type) ThinSE:type A huge variety of Thinning Kernels designed to preserve conectivity. many other kernel sets use these kernels as source definitions. Type numbers are 41-49, 81-89, 481, and 482 which are based on the super and sub notations used in the source research paper.
Distance Measuring Kernels
Different types of distance measuring methods, which are used with the a ’Distance’ morphology method for generating a gradient based on distance from an edge of a binary shape, though there is a technique for handling a anti-aliased shape.
See the ’Distance’ Morphological Method, for information of how it is applied.
Chebyshev: [{ radius }] [x { scale } [!]] Chebyshev Distance (also known as Tchebychev or Chessboard distance) is a value of one to any neighbour, orthogonal or diagonal. One why of thinking of it is the number of squares a ’King’ or ’Queen’ in chess needs to traverse reach any other position on a chess board. It results in a ’square’ like distance function, but one where diagonals are given a value that is closer than expected.
Manhattan: [{ radius }] [x { scale } [!]] Manhattan Distance (also known as Rectilinear, City Block, or the Taxi Cab distance metric), it is the distance needed when you can only travel in horizontal or vertical directions only. It is the distance a ’Rook’ in chess would have to travel, and results in a diamond like distances, where diagonals are further than expected.
Octagonal: [{ radius }] [x { scale } [!]] An interleving of Manhatten and Chebyshev metrics producing an increasing octagonally shaped distance. Distances matches those of the ”Octagon” shaped kernel of the same radius. The minimum radius and default is 2, producing a 5x5 kernel.
Euclidean: [{ radius }] [x { scale } [!]] Euclidean distance is the ’direct’ or ’as the crow flys’ distance. However by default the kernel size only has a radius of 1, which limits the distance to ’Knight’ like moves, with only orthogonal and diagonal measurements being correct. As such for the default kernel you will get octagonal like distance function.
However using a larger radius such as ”Euclidean:4” you will get a much smoother distance gradient from the edge of the shape. Especially if the image is pre-processed to include any anti-aliasing pixels. Of course a larger kernel is slower to use, and not always needed.
The first three Distance Measuring Kernels will only generate distances of exact multiples of { scale } in binary images. As such you can use a scale of 1 without loosing any information. However you also need some scaling when handling non-binary anti-aliased shapes.
The ”Euclidean” Distance Kernel however does generate a non-integer fractional results, and as such scaling is vital even for binary shapes.

- 102.9.4 Constructor(KernelInfo as IMKernelInfo7MBS) 16389

• 102.9.5 Constructor(kernelString as String) 16389

102.9.7 Scale(scaleFactor as double, GeometryFlags as integer)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales the given kernel.
Notes: Scales the given kernel list by the given amount, with or without normalization of the sum of the kernel values (as per given flags).

By default (no flags given) the values within the kernel is scaled directly using given scaling factor without change.

If either of the two 'normalize_flags' are given the kernel will first be normalized and then further scaled by the scaling factor value given.

Kernel normalization ('normalize_flags' given) is designed to ensure that any use of the kernel scaling factor with 'Convolve' or 'Correlate' morphology methods will fall into -1.0 to +1.0 range. Note that for non-HDRI versions of IM this may cause images to have any negative results clipped, unless some 'bias' is used.

More specifically. Kernels which only contain positive values (such as a 'Gaussian' kernel) will be scaled so that those values sum to +1.0, ensuring a 0.0 to +1.0 output range for non-HDRI images.

For Kernels that contain some negative values, (such as 'Sharpen' kernels) the kernel will be scaled by the absolute of the sum of kernel values, so that it will generally fall within the +/- 1.0 range.

For kernels whose values sum to zero, (such as 'Laplician' kernels) kernel will be scaled by just the sum of the postive values, so that its output range will again fall into the +/- 1.0 range.

For special kernels designed for locating shapes using 'Correlate', (often only containing +1 and -1 values, representing foreground/brackground matching) a special normalization method is provided to scale the positive values separately to those of the negative values, so the kernel will be forced to become a zero-sum kernel better suited to such searches.

WARNING: Correct normalization of the kernel assumes that the '*_range' attributes within the kernel structure have been correctly set during the kernels creation.

NOTE: The values used for 'normalize_flags' have been selected specifically to match the use of geometry options, so that '!' means NormalizeValue, '^' means CorrelateNormalizeValue. All other GeometryFlags values are ignored.

scaleFactor: zero. If the kernel is normalized regardless of any flags.
GeometryFlags: specifically: NormalizeValue, CorrelateNormalizeValue, and/or PercentValue.

See also ScaleKernelInfo in ImageMagick documentation.

102.9.8 ScaleGeometry(Geometry as string)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scales using a geometry.
Notes: Takes a geometry argument string, typically provided as a "-set option:convolve:scale { geometry } " user setting, and modifies the kernel according to the parsed arguments of that setting.

The first argument (and any normalization flags) are passed to ScaleKernelInfo() to scale/normalize the kernel. The second argument is then passed to UnityAddKernelInfo() to add a scled unity kernel into the scaled/normalized kernel.

geometry: "-set option:convolve:scale { geometry } " setting.

See also ScaleGeometryKernelInfo in ImageMagick documentation.

102.9.9 UnityAddKernelInfo(scale as double)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a given amount of the 'Unity' Convolution Kernel to the given pre-scaled and normalized Kernel.
Notes: This in effect adds that amount of the original image into the resulting convolution kernel. This value is usually provided by the user as a percentage value in the 'convolve:scale' setting.

The resulting effect is to convert the defined kernels into blended soft-blurs, unsharp kernels or into sharpening kernels.

See also UnityAdditionKernelInfo in ImageMagick documentation.

102.9.10 Properties

102.9.11 Angle as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The angle parameter.
Notes: (Read and Write property)

102.9.12 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

102.9.13 Height as UInt64

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height value.
Notes: (Read and Write property)

102.9.14 LastError as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Last error code.
Notes: (Read and Write property)

102.9.15 LastException as IMException7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Last exception raised.
Notes: (Read and Write property)

102.9.16 Maximum as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Maximum parameter.
Notes: (Read and Write property)

102.9.17 Minimum as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Minimum parameter.
Notes: (Read and Write property)

102.9.18 NegativeRange as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The negative range parameter.
Notes: (Read and Write property)

102.9.19 NextKernel as IMKernelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Next kernel in a list of kernels.
Notes: (Read only property)

102.9.20 PositiveRange as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The postive range parameter.
Notes: (Read and Write property)

102.9.21 Release as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to release to kernel info structure in destructor.
Notes: (Read and Write property)

102.9.22 Type as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of kernel.
Notes: See Kernel constants.
(Read and Write property)

102.9.23 Values as Ptr

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The pointer to the values.
Notes: (Read only property)

102.9.24 Width as UInt64

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Width value.
Notes: (Read and Write property)

102.9.25 X as UInt64

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: X coordinate.
Notes: (Read and Write property)

102.9.26 Y as UInt64

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Y coordinate.
Notes: (Read and Write property)

102.9.27 Constants

Kernel

Constant	Value	Description
KernelBinomial	7	Binomial
KernelBlur	5	Convolution Kernels, Gaussian Based.
KernelChebyshev	33	One Distance Measuring Kernel.
KernelComet	6	Convolution Kernels, Gaussian Based.
KernelCompass	13	Convolution Kernel.
KernelConvexHull	30	A Hit And Miss Kernel.
KernelCorners	25	A Hit And Miss Kernel.
KernelCross	21	A shape kernel.
KernelDiagonals	26	A Hit And Miss Kernel.
KernelDiamond	15	A shape kernel.
KernelDisk	19	A shape kernel.
KernelDoG	3	Convolution Kernels, Gaussian Based.
KernelEdges	24	A Hit And Miss Kernel.
KernelEuclidean	36	One Distance Measuring Kernel.
KernelFreiChen	10	Convolution Kernel.
KernelGaussian	2	Convolution Kernels, Gaussian Based.
KernelKirsch	14	Convolution Kernel.
KernelLaplacian	8	Convolution Kernel.
KernelLineEnds	27	A Hit And Miss Kernel.
KernelLineJunctions	28	A Hit And Miss Kernel.
KernelLoG	4	Convolution Kernels, Gaussian Based.
KernelManhattan	34	One Distance Measuring Kernel.
KernelOctagon	18	A shape kernel.
KernelOctagonal	35	One Distance Measuring Kernel.
KernelPeaks	23	A Hit And Miss Kernel.
KernelPlus	20	A shape kernel.
KernelPrewitt	12	Convolution Kernel.
KernelRectangle	17	A shape kernel.
KernelRidges	29	A Hit And Miss Kernel.
KernelRing	22	A shape kernel.
KernelRoberts	11	Convolution Kernel.
KernelSkeleton	32	A Hit And Miss Kernel.
KernelSobel	9	Convolution Kernel.
KernelSquare	16	A shape kernel.
KernelThinSE	31	A Hit And Miss Kernel.
KernelUndefined	0	equivalent to Unity Kernel
KernelUnity	1	The no-op or 'original image' kernel
KernelUserDefinedKernel	37	User Specified Kernel Array

102.10 class IMMagickInfo7MBS

102.10.1 class IMMagickInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an encoder/decoder module.

102.10.2 Properties

102.10.3 Description as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The description field.
Notes: e.g. "Joint Photographic Experts Group JFIF format" for JPEG format.
(Read only property)

102.10.4 flags as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Various flags.
Notes: (Read only property)

102.10.5 FormatType as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of format defined.
Notes: (Read only property)

102.10.6 MimeType as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The mime type.
Notes: e.g. "image/jpeg" for JPEG format.
(Read only property)

102.10.7 ModuleName as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The module name.
Notes: (Read only property)

102.10.8 Name as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the encoder/decoder.
Notes: (Read only property)

102.10.9 Note as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The note for this magick.
Notes: (Read only property)

102.10.10 Version as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The version number.
Notes: e.g. "libjpeg 90" for JPEG library.
(Read only property)

102.10.11 Constants

Flags

Constant	Value	Description
FlagAdjoin	&h0001	Supports adjoin.
FlagBlobSupport	&h0002	Supports blob handling, e.g. reading image from memory.
FlagDecoderSeekableStream	&h0200	Decoder supports seakable streams.
FlagDecoderThreadSupport	&h0004	Supports decoding with threads.
FlagEncoderSeekableStream	&h0400	Encoder supports seekable streams.
FlagEncoderThreadSupport	&h0008	Supports encoding with threads.
FlagEndianSupport	&h0010	Supports endian.
FlagNone	&h0000	No flags set.
FlagRawSupport	&h0020	Whether RAW processing is supported.
FlagSeekableStream	&h0040	Supports seakable streams.
FlagStealth	&h0080	Stealth flag (hidden).
FlagUseExtension	&h0100	Uses extension.

Format Types

Constant	Value	Description
FormatTypeExplicit	2	Explicit defined format type.
FormatTypeImplicit	1	Implicit defined format type.
FormatTypeUndefined	0	Not defined.

102.11 class IMMagickInfoList7MBS

102.11.1 class IMMagickInfoList7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an array of magick info objects.

102.11.2 Methods

102.11.3 Item(index as integer) as IMMagickInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries an item by the index.
Notes: Index is zero based to Count-1.

102.11.4 Properties

102.11.5 Count as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of entries.
Notes: (Read only property)

102.11.6 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

102.12 class IMMissingFunctionException7MBS

102.12.1 class IMMissingFunctionException7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The exception for a missing function.
Notes: Subclass of the RuntimeException class.

102.13 class IMMontageInfo7MBS

102.13.1 class IMMontageInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for montage settings.

102.13.2 Methods

102.13.3 Clone(ImageInfo as IMImageInfo7MBS) as IMMontageInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the montage settings.

102.13.4 Close

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Closes object.
Notes: Same as destructor.

102.13.5 Constructor(ImageInfo as IMImageInfo7MBS)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

102.13.6 Properties

102.13.7 AlphaColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The alpha color.
Notes: (Read and Write property)

102.13.8 BackgroundColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The background color.
Notes: (Read and Write property)

102.13.9 BorderColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The border color.
Notes: (Read and Write property)

102.13.10 BorderWidth as UInt64

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The border width.
Notes: (Read and Write property)

102.13.11 Debug as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to output debug messages.
Notes: (Read and Write property)

102.13.12 Filename as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The filename.
Notes: (Read and Write property)

102.13.13 Fill as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The fill color.
Notes: (Read and Write property)

102.13.14 Font as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font name.
Notes: (Read and Write property)

102.13.15 Frame as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The frame.
Notes: (Read and Write property)

102.13.16 Geometry as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The geometry.
Notes: (Read and Write property)

102.13.17 Gravity as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The gravity setting.
Notes: (Read and Write property)

102.13.18 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

102.13.19 LastError as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

102.13.20 LastException as IMException7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last exception raised.
Notes: (Read and Write property)

102.13.21 MatteColor as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The matte color.
Notes: (Read and Write property)

102.13.22 PointSize as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The point size.
Notes: (Read and Write property)

102.13.23 Release as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to release object in destructor.
Notes: (Read and Write property)

102.13.24 Shadow as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to use shadow.
Notes: (Read and Write property)

102.13.25 Stroke as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The stroke color.
Notes: (Read and Write property)

102.13.26 Texture as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The texture string.
Notes: (Read and Write property)

102.13.27 Tile as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tile string.
Notes: (Read and Write property)

102.13.28 Title as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The title string.
Notes: (Read and Write property)

102.13.29 Constants

Montage Modes

Constant	Value	Description
MontageModeConcatenate	3	Concatenate
MontageModeFrame	1	Frame
MontageModeUndefined	0	Undefined
MontageModeUnframe	2	Unframe

102.14 class IMOptionInfo7MBS

102.14.1 class IMOptionInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for options.
Example:

```
// check whether a name is a valid ImageMagick command line option
For Each name As String In Array("-resize", "-blur", "-foo")
Var valid As Boolean = IMOptionInfo7MBS.IsCommandOption(name)
System.DebugLog name + ": " + valid.ToString
Next

Var info As IMOptionInfo7MBS = IMOptionInfo7MBS.GetCommandOptionInfo("-resize")
If info <>Nil Then MessageBox "-resize: " + info.Mnemonic + ", type " + info.Type.ToString
```

102.14.2 Methods

102.14.3 CommandOptionToMnemonic(option as integer, type as integer) as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries command name for a given option number.

102.14.4 GetCommandOptionInfo(name as string) as IMOptionInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Queries option info for given command code.

102.14.5 IsCommandOption(name as string) as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Whether the given option is a command option.

102.14.6 Properties

102.14.7 Flags as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The flags.
Notes: (Read and Write property)

102.14.8 Mnemonic as String

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the option.
Notes: (Read and Write property)

102.14.9 Stealth as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The stealth property.
Notes: This option is hidden.
(Read and Write property)

102.14.10 Type as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The type of option.
Notes: (Read and Write property)

102.14.11 Constants

Validate Types

Constant	Value	Description

Flags

Constant	Value	Description
AlwaysInterpretArgsFlag	&h0400	Always Interpret escapes in Args. CF: "convert" compatibility mode
DeprecateOptionFlag	&h4000	Deprecate option (no code).
DrawInfoOptionFlag	&h0002	Setting stored in DrawInfo
FireOptionFlag	&h2000	Convert operation seq firing point
GenesisOptionFlag	&h0080	MagickCommandGenesis() Only Option
GlobalOptionFlag	&h0008	Global Setting or Control
ImageInfoOptionFlag	&h0001	Setting stored in ImageInfo
ListOperatorFlag	&h0040	Multi-Image processing operator
NeverInterpretArgsFlag	&h0800	Never Interpret escapes in Args. EG: filename, or delayed escapes.
NoImageOperatorFlag	&h0010	Images not required operator
NonMagickOptionFlag	&h1000	Option not used by Magick Command.
QuantizeInfoOptionFlag	&h0004	Setting stored in QuantizeInfo
ReplacedOptionFlag	&h8800	Replaced Option (but still works).
SettingOptionFlags	&h000F	mask any setting option
SimpleOperatorFlag	&h0020	Simple Image processing operator
SpecialOptionFlag	&h0100	Operator with Special Requirements. EG: for specific CLI commands
UndefinedOptionFlag	&h0000	option flag is not in use

102.15 class IMPixelInfo7MBS

102.15.1 class IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a pixel info.
Example:

```
// create a new 300 x 200 image filled with orange
Var info As New IMImageInfo7MBS
Var orange As New IMPixelInfo7MBS
orange.red = 65535 // values from 0 to QuantumRange, 65535 for 16-bit builds
orange.green = 42000
orange.blue = 0
orange.alpha = 65535

Var image As New IMImage7MBS(info, 300, 200, orange)
Var pic As Picture = image.CopyPicture
// show pic in a Canvas or ImageViewer
```

Blog Entries

- MBS Xojo Plugins, version 20.5pr6

102.15.2 Methods

102.15.3 Clone as IMPixelInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the object.

102.15.4 Constructor(Image as IMImage7MBS = nil)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.

102.15.5 Properties

102.15.6 alpha as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The alpha quantum.
Notes: Defaults to opaque value, e.g. 65535 for 16 bit.
(Read and Write property)

102.15.7 AlphaTrait as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The alpha channel pixel trait.
Notes: If zero, no alpha.
(Read and Write property)

102.15.8 black as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The black color quantum.
Notes: (Read and Write property)

102.15.9 blue as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The blue color quantum.
Notes: (Read and Write property)

102.15.10 ColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color space.
Notes: Defaults to ksRGBColorspace.
(Read and Write property)

102.15.11 Count as UInt64

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The count value.
Notes: (Read and Write property)

102.15.12 Depth as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color depth.
Notes: Defaults to quantum depth.
(Read and Write property)

102.15.13 fuzz as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The fuzz value.
Notes: (Read and Write property)

102.15.14 green as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The green color quantum.
Notes: (Read and Write property)

102.15.15 index as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The index quantum.
Notes: (Read and Write property)

102.15.16 red as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The red color quantum.
Notes: (Read and Write property)

102.15.17 StorageClass as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The storage class.
Notes: Defaults to kDirectClass.
(Read and Write property)

102.16 class IMPointInfo7MBS

102.16.1 class IMPointInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a x/y point.

102.16.2 Methods

102.16.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the point object with 0/0 values.
See also:

- 102.16.4 Constructor(X as Double, Y as Double) 16421

102.16.4 Constructor(X as Double, Y as Double)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the point object with given values.
See also:

- 102.16.3 Constructor 16421

102.16.5 Properties

102.16.6 X as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x coordinate.
Notes: (Read and Write property)

102.16.7 Y as Double

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y coordinate.
Notes: (Read and Write property)

102.17 class IMQuantizeInfo7MBS

102.17.1 class IMQuantizeInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for quantize settings.
Example:

```
// reduce a picture to 16 colors with dithering, e.g. for a GIF
Var pic As Picture = Picture.Open(SpecialFolder.Desktop.Child("photo.jpg"))
Var image As New IMImage7MBS(pic)

Var q As New IMQuantizeInfo7MBS
q.NumberColors = 16
q.DitherMethod = IMQuantizeInfo7MBS.DitherMethodFloydSteinberg

If image.Quantize(q) Then
Var result As Picture = image.CopyPicture
// show result in a Canvas or ImageViewer
End If
```

102.17.2 Methods

102.17.3 Clone as IMQuantizeInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Makes a copy of the given quantize info object.
Notes: See CloneQuantizeInfo function in ImageMagick documentation.

102.17.4 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an empty quantize info.
Notes: See AcquireQuantizeInfo function in ImageMagick documentation.
See also:

- 102.17.5 Constructor(ImageInfo as IMImageInfo7MBS) 16424

- 102.17.6 Constructor(QuantizeInfo as IMQuantizeInfo7MBS) 16424

102.17.5 Constructor(ImageInfo as IMImageInfo7MBS)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new quantize info.
Notes: If ImageInfo is not empty, copies a few settings from there.
See AcquireQuantizeInfo function in ImageMagick documentation.
See also:

- 102.17.4 Constructor 16423
- 102.17.6 Constructor(QuantizeInfo as IMQuantizeInfo7MBS) 16424

102.17.6 Constructor(QuantizeInfo as IMQuantizeInfo7MBS)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Makes a copy of the given quantize info object.
Notes: See CloneQuantizeInfo function in ImageMagick documentation.
See also:

- 102.17.4 Constructor 16423
- 102.17.5 Constructor(ImageInfo as IMImageInfo7MBS) 16424

102.17.7 Properties

102.17.8 ColorSpace as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color space.
Notes: (Read and Write property)

102.17.9 DitherMethod as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The dither method.
Notes: (Read and Write property)

102.17.10 Handle as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

102.17.11 LastError as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error code.
Notes: (Read and Write property)

102.17.12 LastException as IMException7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last exception raised.
Notes: (Read and Write property)

102.17.13 MeasureError as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to measure error.
Notes: (Read and Write property)

102.17.14 NumberColors as UInt64

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number of colors.
Notes: (Read and Write property)

102.17.15 Release as Boolean

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to release memory in destructor.
Notes: (Read and Write property)

102.17.16 TreeDepth as UInt64

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Tree depth.
Notes: (Read and Write property)

102.17.17 Constants

Dither Methods

Constant	Value	Description
DitherMethodFloydSteinberg	3	FloydSteinberg
DitherMethodNo	1	No
DitherMethodRiemersma	2	Riemersma
DitherMethodUndefined	0	Undefined

102.18 class IMRectangleInfo7MBS

102.18.1 class IMRectangleInfo7MBS

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a rectangle.
Example:

```
// crop a 200 x 100 area starting at 50/50 from a picture
Var pic As Picture = Picture.Open(SpecialFolder.Desktop.Child("photo.jpg"))
Var image As New IMImage7MBS(pic)

Var area As New IMRectangleInfo7MBS(50, 50, 200, 100) // x, y, width, height
Var cropped As IMImage7MBS = image.Crop(area)
If cropped <>Nil Then
Var result As Picture = cropped.CopyPicture
MessageBox "Cropped to " + cropped.Width.ToString + " x " + cropped.Height.ToString
End If
```

102.18.2 Methods

102.18.3 Constructor

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the point object with zero values.
See also:

- 102.18.4 Constructor(X as Integer, Y as Integer, Width as Integer, Heigth as Integer) 16427

102.18.4 Constructor(X as Integer, Y as Integer, Width as Integer, Heigth as Integer)

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Initializes the point object with given values.
See also:

- 102.18.3 Constructor 16427

102.18.5 Properties

102.18.6 Height as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The height of the rectangle.
Notes: (Read and Write property)

102.18.7 Width as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The width of the rectangle.
Notes: (Read and Write property)

102.18.8 X as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The x coordinate of the rectangle.
Notes: (Read and Write property)

102.18.9 Y as Integer

MBS GraphicsMagick Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The y coordinate of the rectangle.
Notes: (Read and Write property)

Chapter 103

ImagePlayground

103.1 class ImagePlaygroundMBS

103.1.1 class ImagePlaygroundMBS

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The class to use the Image Playground.
Notes: The image playground to generate images with Apple Intelligence.
Requires macOS 15.2 or iOS 18.2.
Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 25.0
- MBS Xojo Plugins, version 24.6pr6
- Use Image Playground in Xojo

103.1.2 Methods

103.1.3 AddConcept(text as String)

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Adds a concept.
Example:

```
Var controller as New ImagePlaygroundMBS
controller.AddConcept "Cat"
controller.AddConcept "New Year"
```

controller.Present

Notes: Builds a playground concept by parsing a short text that describes the contents of the image.

103.1.4 AddExtractedConcept(text as String, Title as String = "")

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Adds a concept.
Notes: Builds a playground concept by extracting multiple concepts from a long text that describes the contents of the image and a title that concisely summarizes the contents of the text.

Text: Suitable for long strings, like paragraphs or entire documents.
The system will try to extract important or interesting concepts from the string and add them to the playground, so that each concept becomes an input prompt to the diffusion models.
However, if the string does not meet the minimum length required for concept extraction, it might decide to use the string as-is as input prompt.

Title: Helps guiding the extraction of concepts from text by providing a summary of the contents of text.

103.1.5 Available as Integer

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Checks for availability.
Example:

```
Var a As Integer = ImagePlaygroundMBS.Available

Select Case a

Case ImagePlaygroundMBS.AvailabilityAvailable
AvailableLabel.Text = "Available"

Case ImagePlaygroundMBS.AvailabilityNotAvailable
AvailableLabel.Text = "Not Available"

Case ImagePlaygroundMBS.AvailabilityOldOS
AvailableLabel.Text = "OldOS"

Case ImagePlaygroundMBS.AvailabilityUnknown
AvailableLabel.Text = "Unknown"
```

```
Case ImagePlaygroundMBS.AvailabilityUnsupportedPlatform
AvailableLabel.Text = "Unsupported Platform"

End Select
```

Notes: The value of this property is AvailabilityAvailable when the current device supports image generation. A device might not support this feature if the device or system doesn,Äôt have the resources necessary to generate the images.

Returns AvailabilityOldOS if called on older macOS versions.

103.1.6 ClearConcepts

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Clears the list of concepts.

103.1.7 Constructor

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The constructor.
Example:

```
Var controller as New ImagePlaygroundMBS
controller.Present
```

103.1.8 Destructor

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: The destructor.

103.1.9 Present

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: Desktop & iOS.

Function: Shows the image playground.
Notes: Will create a dialog to show the user the playground.

103.1.10 Properties

103.1.11 ConceptCount as Integer

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: Queries the number of concepts.
Notes: (Read only property)

103.1.12 Handle as Integer

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: This is an UIViewController or NSViewController.
(Read and Write property)

103.1.13 ImageFile as FolderItem

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The last image file created.
Notes: This gets deleted in the destructor.
(Read only property)

103.1.14 SourceImage as Picture

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: the source image.
Notes: An image to use as source input for generating the new image.
If you have an existing image that you want to use as a starting point for the new image, add it to this property. If you don,Äôt supply a source image, the system creates the new image from the prompt text you provide.
Typically, you provide an image big enough to fit the device,Äôs display. The expected minimum size is 384 x 384 pixels, and the recommended maximum size is 4096 x 4096 pixels.
(Read and Write property)

103.1.15 Events

103.1.16 Cancelled

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The image playground was cancelled.

103.1.17 CreatedImage(file as FolderItem)

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The event raised when we got an image.
Example:

```
Sub CreatedImage(file as FolderItem) Handles CreatedImage
MainWindow.ShowPicture Picture.Open(file)
End Sub
```

103.1.18 Hidden

MBS Swift Plugin, Plugin Version: 25.0, Platforms: macOS, iOS, Targets: All.

Function: The Popover was hidden by clicking away.

103.1.19 Constants

Availability

Constant	Value	Description
AvailabilityAvailable	1	Image Playground is available.
AvailabilityNotAvailable	2	Not available.
AvailabilityOldOS	3	You have an older operating system.
AvailabilityUnknown	0	Status not yet checked.
AvailabilityUnsupportedPlatform	4	Unsupported platform, e.g. Windows

Chapter 104

Instant Message

104.1 class IMServiceMBS

104.1.1 class IMServiceMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Deprecated: This item is deprecated and should no longer be used. **Function:** An IMService object represents a service available to a user through iChat, such as AIM, Jabber, and Bonjour.
Notes: Each IMService object represents one service available through iChat. Class methods such as allServices and serviceWithName will return these objects. Each object acts as the liaison to its single service, allowing you to access the individual user's global status, the user's list of acquaintances, and other information which can be integrated into your application.

You may want to subclass the InstantMessageMBS class to get events for changes.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
Blog Entries

- Cleanup Xojo Plugins

- MBS Xojo Plugins, version 20.5pr8

104.1.2 Methods

104.1.3 imageFileForStatus(status as Integer) as folderitem

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the folderitem of the image corresponding to the IMPersonStatus specified by status.
Notes: Convenience function which does the same as InstantMessageMBS.imageFileForStatus.

104.1.4 imageNameForStatus(status as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the image name for the given status.
Example:

MessageBox IMServiceMBS.imageNameForStatus(IMServiceMBS.IMPersonStatusIdle)

Notes: Mac OS X 10.5 only.
On Mac OS X the NSImage class can be used to access system images by name and there you can use this name.

104.1.5 imageURLForStatus(status as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the URL of the image corresponding to the IMPersonStatus specified by status.
Notes: Convenience function which does the same as InstantMessageMBS.imageURLForStatus.

104.1.6 IMCapabilityAudioConference as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.

104.1.7 IMCapabilityDirectIM as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.

104.1.8 IMCapabilityFileSharing as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.

104.1.9 IMCapabilityFileTransfer as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.

104.1.10 IMCapabilityText as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.

104.1.11 IMCapabilityVideoConference as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.

104.1.12 IMPersonAVBusyKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.
Notes: Used to obtain a person's busy status. The value is a number set to 0 if the person's audio/video capabilities are available, or 1 if they are busy.

104.1.13 IMPersonCapabilitiesKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.
Notes: Used to obtain a person's iChat capabilities. The value is an array of capability properties. Check for IMCapability* strings in this array.

104.1.14 IMPersonEmailKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.
Notes: Used to obtain a person's email address. The value is a string containing the person's email address. This is a key used directly by Bonjour; however, if a person has an Address Book entry associated with a relevant AIM account, this key reflects the first email address of that person.

104.1.15 IMPersonFirstNameKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.
Notes: Used to obtain a person's first name. The value is a string containing the person's first name. This is a key used directly by Bonjour; however, if a person has an Address Book entry associated with a relevant AIM account, this key reflects the first name of that person.

104.1.16 IMPersonIdleSinceKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.
Notes: Used to obtain a person's idle status. The value is a date containing the time, in seconds, since the last user activity. Available if the person's status is idle.

104.1.17 IMPersonLastNameKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.
Notes: Used to obtain a person's last name. The value is a string containing the person's last name. This is a key used directly by Bonjour; however, if a person has an Address Book entry associated with a relevant AIM account, this key reflects the last name of that person.

104.1.18 IMPersonPictureDataKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.
Notes: Used to obtain a person's image. The value is a string containing the image for the person's icon.

104.1.19 IMPersonScreenNameKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.
Notes: Used to obtain a person's screen name. The value is a string containing the service-specific identifier for a person. For example, "User123" or "steve@mac.com" for AIM, and "John Doe" for Bonjour.

104.1.20 IMPersonServiceNameKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.
Notes: Used to obtain a person's service name. The value is a string containing the name of the service this person belongs to.

104.1.21 IMPersonStatusKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.
Notes: Used to obtain a person's online status. The value is a number representing the current online status of the person, if known.

104.1.22 IMPersonStatusMessageKey as string

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: One of the keys for the info dictionaries.
Notes: Used to obtain a person's status message. The value is a string containing the person's current status message.

104.1.23 infoForAllScreenNames as dictionary()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns information about all people and all accounts currently logged in to the service.
Notes: If a person is logged in on multiple accounts (determined by the user's Address Book), this method will return the information for all of the logged-in accounts.

Returns an Array of the dictionaries. Use IMPerson*Key strings for the keys in that dictionary.

104.1.24 infoForPreferredScreenNames as dictionary()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns information about all people and their primary accounts currently logged in to the service.
Notes: If a person is logged in on multiple accounts (determined by the user's Address Book), this method will only return the information for the preferred account. The preferred account is determined by iChat, using a combination of capabilities (video chat capability, audio chat capability, and so on), status (available, idle, away), and other user attributes.

Returns an Array of the dictionaries for all people and is guaranteed to provide only one array entry for any logged-in person. Use IMPerson*Key strings for the keys in that dictionary.

104.1.25 infoForScreenName(name as string) as dictionary

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns information about the person specified by his/her screenName.
Notes: screenName: A string containing the screen name identifier of a person.

Returns a dictionary on success and nil on failure. Use IMPerson*Key strings for the keys in that dictionary.

104.1.26 LocalizedName as String

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the user-visible localized name of the service.
Example:

```
Var services() as IMServiceMBS = InstantMessageMBS.allServices

for each service as IMServiceMBS in Services
MessageBox service.LocalizedName
next
```

Notes: Returns a String. Will contain the localized service name, such as "AOL Instant Messenger", "Jabber", or "Bonjour", for example. This string will be localized if required.

104.1.27 LocalizedShortName as String

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns a shorter version, if available, of the user-visible localized name of the service.
Example:

```
Var services() as IMServiceMBS = InstantMessageMBS.allServices

for each service as IMServiceMBS in Services
MessageBox service.LocalizedShortName
next
```

Notes: Returns a "" on failure. Will return a localized string if required.

104.1.28 Name as String

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the fixed canonical name of the service.
Example:

```
Var services() as IMServiceMBS = InstantMessageMBS.allServices

for each service as IMServiceMBS in Services
MessageBox service.Name
next
```

Notes: Returns a "" on failure. This string is not localized.

104.1.29 peopleWithScreenName(screenName as string) as ABPersonMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns the Address Book person objects that correspond to the person with the screenName matched by screenName.
Notes: screenName: An string containing the screen name identifier of a person or persons.

Returns an array of ABPersonMBS objects that match the screen name matched by screenName. Can return an empty array or an array with one or more items.

Returns empty array on failure.

104.1.30 screenNamesForPerson(person as ABPersonMBS) as string()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns a list of valid screen names for any given person.
Example:

```
// show my screennames on all services

Var AddressBook as new ABAddressBookMBS
Var owner as ABPersonMBS = AddressBook.owner
Var services() as IMServiceMBS = InstantMessageMBS.allServices

for each service as IMServiceMBS in Services
MessageBox service.LocalizedName+":"+EndOfLine+join(service.screenNamesForPerson(owner), EndOfLine)
next
```

Notes: person: An Address Book ABPerson object.
Returns an Array of Strings that are valid screen names for the person specified by person. See Address Book documentation for more information on ABPerson and accessing the user's address book. Can return an empty array or an array with one or more items.

Returns an empty array on failure.

104.1.31 Status as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the login status of the service.
Notes: Returns the appropriate IMServiceStatus number.

104.1.32 Properties

104.1.33 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Handle to the internal used IMService reference.
Notes: (Read and Write property)

104.1.34 Constants

Constants

Constant	Value	Description
IMPersonStatusAvailable	4	A status constant.
IMPersonStatusAway	3	A status constant.
IMPersonStatusIdle	2	A status constant.
IMPersonStatusNoStatus	5	The status constant for persons where the status is unknown. Mac OS X 10.5 only.
IMPersonStatusOffline	1	A status constant.
IMPersonStatusUnknown	0	A status constant.
IMServiceStatusDisconnected	1	A status constant.
IMServiceStatusLoggedIn	4	A status constant.
IMServiceStatusLoggedOut	0	A status constant.
IMServiceStatusLoggingIn	3	A status constant.
IMServiceStatusLoggingOut	2	A status constant.

104.2 class InstantMessageMBS

104.2.1 class InstantMessageMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: The class to handle Instant Message support for Mac OS X 10.4 and newer.
Notes: This class is based on the Instant Message framework from Apple.
it can be used to get the status of iChat.
Blog Entries

- Addressbook classes updated

104.2.2 Methods

104.2.3 allServices as IMServiceMBS()

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Returns the list of services currently available to the user, regardless of their status.
Notes: Returns nil on failure.

Returns a array with IMServiceMBS objects corresponding to the current available services (AIM, Bonjour, Jabber, and so on.)

104.2.4 Available as boolean

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Whether the InstantMessaging framework is available or not.
Notes: Should be true on Mac OS X 10.4.

104.2.5 imageFileForStatus(status as Integer) as folderitem

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the folderitem of the image corresponding to the IMPersonStatus specified by status.
Notes: This image reflects the status of the user, and is usually reflected by a colored bubble or triangle.

Returns nil on failure.
This is a convenience function which will call imageFileForStatus and return the folderitem matching the

URL in case it points to a disc file.

For Mac OS X 10.4 all images are stored as TIFF files on hard disc. Use the TiffPictureMBS class to load them (OpenAsPicture will not work because of the masks).

values:

IMPersonStatusUnknown	= 0
IMPersonStatusOffline	= 1
IMPersonStatusIdle	= 2
IMPersonStatusAway	= 3
IMPersonStatusAvailable	= 4

104.2.6 imageNameForStatus(status as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns the image name for the given status.
Notes: Mac OS X 10.5 only.
On Mac OS X the NSImage class can be used to access system images by name and there you can use this name.

104.2.7 imageURLForStatus(status as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns the URL of the image corresponding to the IMPersonStatus specified by status.
Notes: This image reflects the status of the user, and is usually reflected by a colored bubble or triangle.

Returns nil on failure.

values:

IMPersonStatusUnknown	= 0
IMPersonStatusOffline	= 1
IMPersonStatusIdle	= 2
IMPersonStatusAway	= 3
IMPersonStatusAvailable	= 4

104.2.8 myIdleTime as Double

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Class method to return the idle time of the active user.
Notes: Returns in seconds the time since the currently active user went idle.

104.2.9 myStatus as Integer

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Class method to return the status of the currently active user.
Notes: This status is global across all services.

values:

IMPersonStatusUnknown	= 0
IMPersonStatusOffline	= 1
IMPersonStatusIdle	= 2
IMPersonStatusAway	= 3
IMPersonStatusAvailable	= 4

104.2.10 notificationCenter as NSNotificationCenterMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Returns the custom notification center for the service.
Notes: A custom notification center that manages IMService notifications.
Available in Mac OS X v10.4 and later.

104.2.11 serviceWithName(name as string) as IMServiceMBS

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Returns only the service specified by a given name.
Notes: name: A String containing a service name as returned by a previous call to name.
Hard-coding the service names internally is not recommended.

Returns an IMService object corresponding to the available service specified by name.
Returns nil on any failure.

104.2.12 Events

104.2.13 MyStatusChanged

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: This event is called when the local user changes online status.
Notes: The client should call myStatus function to get the new status.

104.2.14 PersonInfoChanged(info as dictionary)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Event sent when a screenName changes some aspect of their published information.
Notes: The user information dictionary will always contain an ScreenName and may contain any of the following values: StatusMessage, IdleSince, FirstName, LastName, IMPersonEmailKey, PictureData, AVAvailable and AVBusy, Capabilities values.

104.2.15 PersonStatusChanged(info as dictionary)

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Event sent when a different user (screenName) logs in, logs off, goes away, and so on.
Notes: The info object knows the ScreenName and the Status of the person.

104.2.16 ServiceStatusChanged

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Event sent when the user logs in, logs off, goes away, and so on.
Notes: Call MyStatus to get the new state.

104.2.17 StatusImagesChangedAppearance

MBS MacCocoa Plugin, Plugin Version: 7.1, Platform: macOS, Targets: Desktop only.

Function: Event sent when the user changes their preferred images for displaying status.
Notes: Clients that display status information graphically (using the green/yellow/red dots) should call imageURLForStatus to get the new image.

Chapter 105

IO Registry

105.1 class DarwinDriveStatisticsMBS

105.1.1 class DarwinDriveStatisticsMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for an iterator over the IORegistry drives.
Example:

```
Var d as DarwinDriveStatisticsMBS
Var l as CFDictionaryMBS

d=new DarwinDriveStatisticsMBS
l=d.NextDrive
while l<>Nil
CFShowMBS l
l=d.NextDrive
wend
```

105.1.2 Methods

105.1.3 close

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

105.1.4 kIOBlockStorageDriverStatisticsBytesReadKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the statistics dictionary.
Notes: Describes the number of bytes read since the block storage driver was instantiated.

This property describes the number of bytes read since the block storage driver was instantiated. It is one of the statistic entries listed under the top-level kIOBlockStorageDriverStatisticsKey property table. It has an CFNumber value.

105.1.5 kIOBlockStorageDriverStatisticsBytesWrittenKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the statistics dictionary.
Notes: Describes the number of bytes written since the block storage driver was instantiated.

This property describes the number of bytes written since the block storage driver was instantiated. It is one of the statistic entries listed under the top-level kIOBlockStorageDriverStatisticsKey property table. It has an CFNumber value.

105.1.6 kIOBlockStorageDriverStatisticsKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The key value used to get a statistics dictionary from the drive information dictionary.

105.1.7 kIOBlockStorageDriverStatisticsLatentReadTimeKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the statistics dictionary.
Notes: Describes the number of nanoseconds of latency during reads since the block storage driver was instantiated.

This property describes the number of nanoseconds of latency during reads since the block storage driver was instantiated. It is one of the statistic entries listed under the top-level kIOBlockStorageDriverStatisticsKey property table. It has an CFNumber value.

105.1.8 kIOBlockStorageDriverStatisticsLatentWriteTimeKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the statistics dictionary.
Notes: Describes the number of nanoseconds of latency during writes since the block storage driver was instantiated.

This property describes the number of nanoseconds of latency during writes since the block storage driver was instantiated. It is one of the statistic entries listed under the top-level kIOBlockStorageDriverStatisticsKey property table. It has an CFNumber value.

105.1.9 kIOBlockStorageDriverStatisticsReadErrorsKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the statistics dictionary.
Notes: Describes the number of read errors encountered since the block storage driver was instantiated.
This property describes the number of read errors encountered since the block storage driver was instantiated. It is one of the statistic entries listed under the top-level kIOBlockStorageDriverStatisticsKey property table. It has an CFNumber value.

105.1.10 kIOBlockStorageDriverStatisticsReadRetriesKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the statistics dictionary.
Notes: Describes the number of read retries required since the block storage driver was instantiated.

This property describes the number of read retries required since the block storage driver was instantiated. It is one of the statistic entries listed under the top-level kIOBlockStorageDriverStatisticsKey property table. It has an CFNumber value.

105.1.11 kIOBlockStorageDriverStatisticsReadsKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the statistics dictionary.
Notes: Describes the number of read operations processed since the block storage driver was instantiated.

This property describes the number of read operations processed since the block storage driver was instanti-

ated. It is one of the statistic entries listed under the top-level kIOBlockStorageDriverStatisticsKey property table. It has an CFNumber value.

105.1.12 kIOBlockStorageDriverStatisticsTotalReadTimeKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the statistics dictionary.
Notes: Describes the number of nanoseconds spent performing reads since the block storage driver was instantiated.

This property describes the number of nanoseconds spent performing reads since the block storage driver was instantiated. It is one of the statistic entries listed under the top-level kIOBlockStorageDriverStatisticsKey property table. It has an CFNumber value.

105.1.13 kIOBlockStorageDriverStatisticsTotalWriteTimeKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the statistics dictionary.
Notes: Describes the number of nanoseconds spent performing writes since the block storage driver was instantiated.

This property describes the number of nanoseconds spent performing writes since the block storage driver was instantiated. It is one of the statistic entries listed under the top-level kIOBlockStorageDriverStatisticsKey property table. It has an OSNumber value.

105.1.14 kIOBlockStorageDriverStatisticsWriteErrorsKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the statistics dictionary.
Notes: Describes the number of write errors encountered since the block storage driver was instantiated.
This property describes the number of write errors encountered since the block storage driver was instantiated. It is one of the statistic entries listed under the top-level kIOBlockStorageDriverStatisticsKey property table. It has an CFNumber value.

105.1.15 kIOBlockStorageDriverStatisticsWriteRetriesKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the statistics dictionary.
Notes: Describes the number of write retries required since the block storage driver was instantiated.

This property describes the number of write retries required since the block storage driver was instantiated. It is one of the statistic entries listed under the top-level kIOBlockStorageDriverStatisticsKey property table. It has an OSNumber value.

105.1.16 kIOBlockStorageDriverStatisticsWritesKey as CFStringMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for the statistics dictionary.
Notes: Describes the number of write operations processed since the block storage driver was instantiated.

This property describes the number of write operations processed since the block storage driver was instantiated. It is one of the statistic entries listed under the top-level kIOBlockStorageDriverStatisticsKey property table. It has an CFNumber value.

105.1.17 NextDrive as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the dictionary describing the next drive in the list.

105.1.18 Reset

MBS MacCF Plugin, Plugin Version: 4.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Moves you back to the beginning of the list.

105.1.19 Properties

105.1.20 Handle as Integer

MBS MacCF Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

105.2 module IORegistryMBS

105.2.1 module IORegistryMBS

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A module for accessing the Mac OS X IO Registry.
Example:

```
// list the serial ports of the Mac via the IO Registry
Var lines() As String
For Each node As IORegistryNodeMBS In IORegistryMBS.MatchingServices("IOSerialBSDClient")
Var props As Dictionary = node.Properties
lines.Add props.Lookup("IOCalloutDevice", node.Name).StringValue
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: The IORegistryMBS stores information about the installed hardware.

105.2.2 Methods

105.2.3 AudioRoot as IORegistryNodeMBS

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the root of the Audio tree inside the IO Registry.

105.2.4 DeviceRoot as IORegistryNodeMBS

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the root of the Device tree inside the IO Registry.

105.2.5 FirewireRoot as IORegistryNodeMBS

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the root of the Firewire tree inside the IO Registry.

105.2.6 MatchingServices(servicename as string) as IORegistryNodeMBS()

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the nodes matching the servicename.
Example:

```
// search for Serial devices
Var devices() as IORegistryNodeMBS = IORegistryMBS.MatchingServices("IOSerialBSDClient")
Var names(-1) as string

// check devices and query names
for each dev as IORegistryNodeMBS in devices
Var dic as Dictionary = dev.Properties
names.Add dic.Lookup("IOTTYBaseName","")
next

// show all names
MessageBox Join(names,EndOfLine)
```

105.2.7 PerformanceStatistics(index as Integer = 0) as Dictionary

MBS MacCF Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries performance statistics for first graphics card on a Mac.
Example:

```
Var d as Dictionary = IORegistryMBS.PerformanceStatistics

if d <>nil then

Var gpuCoreUse as Int64 = d.Value("GPU Core Utilization")
Var freeVramCount as Int64 = d.Value("vramFreeBytes")
Var usedVramCount as Int64 = d.Value("vramUsedBytes")

Var sum as int64 = (freeVramCount+usedVramCount)

List.AddRow format(gpuCoreUse/1000000000.0, "0%"), Format(freeVramCount/1024.0/1024.0, "0")+" MB
of "+Format(sum/1024.0/1024.0, "0")+" MB", Format(usedVramCount / sum, "0%")
list.ScrollPosition = list.ListCount
```

```
else
Break
end if
```

Notes: The dictionary contains details about performance of graphics card.
This includes vramFreeBytes and vramUsedBytes for memory usage as well as "GPU Core Utilization" key with GPU time used.
Returns nil on any error.

Index is zero for first graphics card.
Or 1 for second graphics card.

105.2.8 PowerRoot as IORegistryNodeMBS

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the root of the Power tree inside the IO Registry.

105.2.9 Present as Boolean

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Is the IORegistryMBS working?
Notes: Returns true on Mac OS X and false on other platforms.

105.2.10 Root(plane as string) as IORegistryNodeMBS

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the root of the IORegistry tree with the given plane name.
Example:

```
// shows names of all USB devices
Var u as IORegistryNodeMBS = IORegistryMBS.Root("IOUSB") // same as USBRoot function

// now loop over all devices with all children (non recursive)
Var names(-1) as string
Var nodes(-1) as IORegistryNodeMBS = array(u)

while nodes.LastIndex>=0
Var p as IORegistryNodeMBS = nodes.pop
```

```
names.Add p.Name
for each c as IORegistryNodeMBS in p.Children
nodes.Add c
next
wend

// and display array with names
MessageBox Join(names,EndOfLine)
```

105.2.11 ServiceRoot as IORegistryNodeMBS

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the root of the Service tree inside the IO Registry.

105.2.12 USBRoot as IORegistryNodeMBS

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the root of the USB tree inside the IO Registry.
Example:

```
// shows names of all USB devices
Var u as IORegistryNodeMBS = IORegistryMBS.USBRoot

// now loop over all devices with all children (non recursive)
Var names(-1) as string
Var nodes(-1) as IORegistryNodeMBS = array(u)

while nodes.LastIndex>=0
Var p as IORegistryNodeMBS = nodes.pop

names.Add p.Name
for each c as IORegistryNodeMBS in p.Children
nodes.Add c
next
wend

// and display array with names
MessageBox Join(names,EndOfLine)
```

105.3 class IORegistryNodeMBS

105.3.1 class IORegistryNodeMBS

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a node inside the IO Registry.
Example:

```
// list the names and vendor IDs of USB devices in the IO Registry
Var lines() As String
For Each node As IORegistryNodeMBS In IORegistryMBS.MatchingServices("IOUSBHostDevice")
Var props As Dictionary = node.Properties
lines.Add node.Name + " (" + node.IOClass + "), vendor " + props.Lookup("idVendor", "?").StringValue
Next
MessageBox String.FromArray(lines, EndOfLine)
```

105.3.2 Methods

105.3.3 CFProperties as CFDictionaryMBS

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a CFDictionary object with all the properties of this note.

105.3.4 Child(index as Integer) as IORegistryNodeMBS

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the IORegistryNodeMBS with the given index.
Notes: Index from 0 to ChildCount-1.

105.3.5 Children as IORegistryNodeMBS()

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array with all child nodes.

105.3.6 Parents as IORegistryNodeMBS()

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array with all parent nodes.

105.3.7 Properties as Dictionary

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a Xojo dictionary with all the properties of this note.

105.3.8 Properties

105.3.9 Busy as Integer

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the busyState of an IOService.
Notes: Many activities in IOService are asynchronous. When registration, matching, or termination is in progress on an IOService, its busyState is increased by one. Change in busyState to or from zero also changes the IOService's provider's busyState by one, which means that an IOService is marked busy when any of the above activities is ocurring on it or any of its clients.
(Read only property)

105.3.10 ChildCount as Integer

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Count of sub nodes.
Notes: (Read only property)

105.3.11 DataCount as Integer

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Count of data items.
Notes: (Read only property)

105.3.12 IOClass as String

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the IOKit class.
Notes: (Read only property)

105.3.13 Name as String

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of this node.
Notes: (Read only property)

105.3.14 ParentCount as Integer

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The number of parent nodes for this node.
Notes: Typically one.
(Read only property)

105.3.15 Path as String

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The path of this node.
Notes: Useful for finding a node again.
(Read only property)

105.3.16 RetainCount as Integer

MBS MacCF Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Retain count of this object.
Notes: (Read only property)

Chapter 106

iOS

106.1 class UIDeviceMBS

106.1.1 class UIDeviceMBS

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: A representation of the current device.
Example:

Var currentDevice As UIDeviceMBS = UIDeviceMBS.currentDevice

MessageBox currentDevice.SystemName + EndOfLine+ currentDevice.SystemVersion

Notes: Use a UIDevice object to get information about the device such as assigned name, device model, and operating-system name and version. You also use the UIDevice instance to detect changes in the device,Äôs characteristics, such as physical orientation. You get the current orientation using the orientation property or receive change notifications by using the OrientationDidChange event. Before using either of these techniques to get orientation data, you must enable data delivery using the beginGeneratingDeviceOrientationNotifications method. When you no longer need to track the device orientation, call the endGeneratingDeviceOrientationNotifications method to disable the delivery of notifications.

Similarly, you can use the UIDevice instance to obtain information and notifications about changes to the battery,Äôs charge state (described by the batteryState property) and charge level (described by the batteryLevel property). The UIDevice instance also provides access to the proximity sensor state (described by the proximityState property). The proximity sensor detects whether the user is holding the device close to their face. Enable battery monitoring or proximity sensing only when you need it.

You can also use the playInputClick instance method to play keyboard input clicks in custom input and keyboard accessory views.

- MBS Xojo Plugins, version 24.3pr6
- MBS Xojo Plugins, version 24.3pr4

106.1.2 Methods

106.1.3 beginGeneratingDeviceOrientationNotifications

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: Begins the generation of notifications of device orientation changes.
Notes: You must call this method before attempting to get orientation data from the device. This method enables the device,Äôs accelerometer hardware and begins the delivery of acceleration events to the device. The device subsequently uses these events to post UIDeviceOrientationDidChangeNotification notifications when the device orientation changes and to update the orientation property.
You may nest calls to this method safely, but you should always match each call with a corresponding call to the endGeneratingDeviceOrientationNotifications method.

106.1.4 Constructor

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: The constructor.

106.1.5 currentDevice as UIDeviceMBS

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: An object that represents the current device.

106.1.6 Destructor

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: The destructor.

106.1.7 endGeneratingDeviceOrientationNotifications

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: Ends the generation of notifications of device orientation changes.
Notes: This method stops the posting of UIDeviceOrientationDidChangeNotification notifications and notifies the system that it can power down the accelerometer hardware if it isn,Äôt in use elsewhere. You call this method after a previous call to the beginGeneratingDeviceOrientationNotifications method.

106.1.8 Properties

106.1.9 BatteryLevel as Double

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: The battery charge level for the device.
Notes: Battery level ranges from 0.0 (fully discharged) to 1.0 (100% charged). Before accessing this property, ensure that battery monitoring is enabled.

If battery monitoring is not enabled, battery state is BatteryStateUnknown and the value of this property is –1.0.
(Read only property)

106.1.10 BatteryMonitoringEnabled as Boolean

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether battery monitoring is enabled.
Notes: Enable battery monitoring if your app needs to be notified of changes to the battery state, or if you want to check the battery charge level.

The default value of this property is false, which:

- Disables the posting of battery-related notifications
- Disables the ability to read battery charge level and battery state

(Read and Write property)

106.1.11 BatteryState as Integer

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: The battery state for the device.
Example:

```
Var currentDevice As UIDeviceMBS = UIDeviceMBS.currentDevice

Var s As String
Select Case currentDevice.BatteryState
Case UIDeviceMBS.BatteryStateCharging
s = "Charging"
Case UIDeviceMBS.BatteryStateUnplugged
s = "Unplugged"
Case UIDeviceMBS.BatteryStateFull
s = "Full"
Case UIDeviceMBS.BatteryStateUnknown
s = "Unknown"
End Select

MessageBox s
```

Notes: The value for batteryState is one of the constants.

If battery monitoring is not enabled, the value of this property is BatteryStateUnknown.
(Read only property)

106.1.12 Handle as Integer

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: The internal object reference.
Notes: (Read and Write property)

106.1.13 identifierForVendor as String

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: An alphanumeric string that uniquely identifies a device to the app,Äôs vendor.
Notes: The value of this property is the same for apps that come from the same vendor running on the same device. A different value is returned for apps on the same device that come from different vendors, and for apps on different devices regardless of vendor.

Normally, the vendor is determined by data provided by the App Store. If the app wasn,Äôt installed from the app store (such as enterprise apps and apps still in development), then a vendor identifier is calculated based on the app,Äôs bundle ID. The bundle ID is assumed to be in reverse-DNS format.

In iOS 7 or later, all components of the bundle except for the last component are used to generate the vendor ID. If the bundle ID only has a single component, then the entire bundle ID is used.

The following table shows a collection of bundle IDs and which portions of the bundle ID the system uses to calculate the vendor ID.

For example, com.example.app1 and com.example.app2 would appear to have the same vendor ID.
If the value is nil, wait and get the value again later. This happens, for example, after the device has been restarted but before the user has unlocked the device.
The value in this property remains the same while the app (or another app from the same vendor) is installed on the iOS device. The value changes when the user deletes all of that vendor,Äôs apps from the device and subsequently reinstalls one or more of them. The value can also change when installing test builds using Xcode or when installing an app on a device using ad-hoc distribution. Therefore, if your app stores the value of this property anywhere, you should gracefully handle situations where the identifier changes.
(Read only property)

106.1.14 InterfaceOrientation as Integer

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: The current orientation of the front window.
Notes: Little helper method to check what the front window has as device orientation.
(Read only property)

106.1.15 isGeneratingDeviceOrientationNotifications as Boolean

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the device generates orientation notifications.
Notes: If the value of this property is YES, the shared UIDevice object posts a UIDeviceOrientationDidChangeNotification notification when the device changes orientation (and raises event). If the value is false, it generates no orientation notifications. Device orientation notifications can only be generated between calls to the beginGeneratingDeviceOrientationNotifications and endGeneratingDeviceOrientationNotifications methods.
(Read only property)

106.1.16 isMultitaskingSupported as Boolean

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the current device supports multitasking.
Example:

```
Var currentDevice As UIDeviceMBS = UIDeviceMBS.currentDevice

MessageBox currentDevice.isMultitaskingSupported.ToString
```

Notes: (Read only property)

106.1.17 LocalizedModel as String

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: The model of the device as a localized string.
Example:

```
Var currentDevice As UIDeviceMBS = UIDeviceMBS.currentDevice

MessageBox currentDevice.Model + EndOfLine+ currentDevice.LocalizedModel
```

Notes: The value of this property is a string that contains a localized version of the string returned from model.
(Read only property)

106.1.18 Model as String

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: The model of the device.
Example:

```
Var currentDevice As UIDeviceMBS = UIDeviceMBS.currentDevice

MessageBox currentDevice.Model + EndOfLine+ currentDevice.LocalizedModel
```

Notes: Possible examples of model strings are ‚ÄùiPhone‚Äù and ‚ÄùiPod touch‚Äù.
(Read only property)

106.1.19 Name as String

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: The name of the device.
Example:

```
Var currentDevice As UIDeviceMBS = UIDeviceMBS.currentDevice

MessageBox currentDevice.Name + EndOfLine+ currentDevice.Model
```

Notes: The default value of this property varies according to the device,Äôs operating system version number.

Real name until iOS 15, otherwise just "iPhone"

In iOS, the user-assigned device name is available in the Settings app under General >About >Name. To access the user-assigned device name through this property in iOS 16 and later, your app must meet certain criteria and be assigned an entitlement. For information, see com.apple.developer.device-information.user-assigned-device-name.
(Read only property)

106.1.20 Orientation as Integer

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: The physical orientation of the device.
Example:

```
Var currentDevice As UIDeviceMBS = UIDeviceMBS.currentDevice

Var s As String
Select Case currentDevice.Orientation
Case UIDeviceMBS.DeviceOrientationFaceDown
s = "FaceDown"
Case UIDeviceMBS.DeviceOrientationFaceUp
s = "FaceUp"
Case UIDeviceMBS.DeviceOrientationLandscapeLeft
s = "LandscapeLeft"
Case UIDeviceMBS.DeviceOrientationLandscapeRight
s = "LandscapeRight"
Case UIDeviceMBS.DeviceOrientationPortrait
s = "Portrait"
Case UIDeviceMBS.DeviceOrientationPortraitUpsideDown
s = "PortraitUpsideDown"
```

```
Case UIDeviceMBS.DeviceOrientationUnknown
s = "Unknown"
End Select

MessageBox s
```

Notes: The value of the property is a constant that indicates the current orientation of the device. This value represents the physical orientation of the device and may be different from the current orientation of your application,Äôs user interface. See DeviceOrientation constants for descriptions of the possible values. The value of this property always returns 0 unless orientation notifications have been enabled by calling beginGeneratingDeviceOrientationNotifications.
(Read only property)

106.1.21 ProximityMonitoringEnabled as Boolean

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether proximity monitoring is enabled.
Notes: Enable proximity monitoring only when your application needs to be notified of changes to the proximity state. Otherwise, disable proximity monitoring. The default value is false.

Not all iOS devices have proximity sensors. To determine if proximity monitoring is available, attempt to enable it. If the value of the proximityMonitoringEnabled property remains NO, proximity monitoring isn,Äôt available.
(Read and Write property)

106.1.22 ProximityState as Boolean

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: A Boolean value that indicates whether the proximity sensor is close to the user.
Notes: (Read only property)

106.1.23 SystemName as String

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: The name of the operating system running on the device.
Example:

```
Var currentDevice As UIDeviceMBS = UIDeviceMBS.currentDevice
MessageBox currentDevice.SystemName
```

Notes: (Read only property)

106.1.24 SystemVersion as String

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: The current version of the operating system.
Example:

```
Var currentDevice As UIDeviceMBS = UIDeviceMBS.currentDevice

MessageBox currentDevice.SystemName + EndOfLine+ currentDevice.SystemVersion
```

Notes: (Read only property)

106.1.25 UserInterfaceIdiom as Integer

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: The style of interface to use on the current device.
Notes: For universal applications, you can use this property to tailor the behavior of your application for a specific type of device. For example, iPhone and iPad devices have different screen sizes, so you might want to create different views and controls based on the type of the current device.
(Read only property)

106.1.26 Events

106.1.27 BatteryLevelDidChange

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: An event raised when the battery level changes.
Notes: For this notification to be sent, you must set the batteryMonitoringEnabled property to true.

Notifications for battery level change are sent no more frequently than once per minute. Don,Äôt attempt to calculate battery drainage rate or battery time remaining; drainage rate can change frequently depending on built-in applications as well as your application.

You can obtain the battery level by getting the value of the batteryLevel property.

106.1.28 BatteryStateDidChange

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: An even raised when battery state changes.
Notes: For this notification to be sent, you must set the batteryMonitoringEnabled property to true.

You can obtain the battery state by getting the value of the batteryState property.

106.1.29 OrientationDidChange

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: An even raised when the orientation of the device changes.
Notes: You can obtain the new orientation by getting the value of the orientation property.

106.1.30 ProximityStateDidChange

MBS iOS Plugin, Plugin Version: 24.3, Platform: iOS, Targets: iOS only.

Function: An event raied when the state of the proximity sensor changes.
Notes: You can obtain the proximity state by getting the value of the proximityState property.

106.1.31 Constants

Battery States

Constant	Value	Description
BatteryStateCharging	2	The device is plugged into power and the battery is less than 100% charged.
BatteryStateFull	3	The device is plugged into power and the battery is 100% charged.
BatteryStateUnknown	0	The battery state for the device can,Äôt be determined.
BatteryStateUnplugged	1	The device isn,Äôt plugged into power; the battery is discharging.

Device Orientations

Constant	Value	Description
DeviceOrientationFaceDown	6	The device is held parallel to the ground with the screen facing downwa
DeviceOrientationFaceUp	5	The device is held parallel to the ground with the screen facing upwards
DeviceOrientationLandscapeLeft	3	The device is in landscape mode, with the device held upright and the facing camera on the left side.
DeviceOrientationLandscapeRight	4	The device is in landscape mode, with the device held upright and the facing camera on the right side.
DeviceOrientationPortrait	1	The device is in portrait mode, with the device held upright and the front-camera at the top.
DeviceOrientationPortraitUpsideDown	2	The device is in portrait mode but upside down, with the device held u and the front-facing camera at the bottom.
DeviceOrientationUnknown	0	The orientation of the device can,Äôt be determined.

User Interface Idioms

Constant	Value	Description
UserInterfaceIdiomCarPlay	3	An interface designed for an in-car experience.
UserInterfaceIdiomMac	5	An interface designed for the Mac.
UserInterfaceIdiomPad	1	An interface designed for iPad.
UserInterfaceIdiomPhone	0	An interface designed for iPhone and iPod touch.
UserInterfaceIdiomTV	2	An interface designed for tvOS and Apple TV.
UserInterfaceIdiomUnspecified	-1	An unspecified idiom.
UserInterfaceIdiomVision	6	An interface designed for visionOS and Apple Vision Pro.

Chapter 107

iTunes

107.1 class iTunesLibraryAlbumMBS

107.1.1 class iTunesLibraryAlbumMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Represents an album where a given media item (MediaItem) is contained.
Example:

```
// count the songs per album in the Music library
Var error As NSErrorMBS
Var library As New iTunesLibraryMBS("1.0", error)
If error <>Nil Then Return

Var counts As New Dictionary
For Each item As iTunesLibraryMediaItemMBS In library.allMediaItems
Var album As iTunesLibraryAlbumMBS = item.album
If album = Nil Or album.Title = "" Then Continue
Var key As String = album.Title + " - " + album.AlbumArtist
counts.Value(key) = counts.Lookup(key, 0).IntegerValue + 1
Next
System.DebugLog counts.KeyCount.ToString + " albums"
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

107.1.2 Methods

107.1.3 Constructor

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

107.1.4 Properties

107.1.5 AlbumArtist as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The artist associated with this album.
Notes: (Read only property)

107.1.6 Artist as iTunesLibraryArtistMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The artist.
Notes: Deprecated. Will be removed in future versions.
(Read only property)

107.1.7 Compilation as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether this album is a compilation.
Notes: (Read only property)

107.1.8 DiscCount as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The number of discs in this album.
Notes: (Read only property)

107.1.9 DiscNumber as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The index (i.e. 1, 2, 3, etc.) of the disc this album refers to within a compilation.0
Notes: (Read only property)

107.1.10 Gapless as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether this track's album is gapless.
Notes: (Read only property)

107.1.11 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The internal object handle.
Notes: (Read and Write property)

107.1.12 Rating as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The rating of this track's album.
Notes: (Read only property)

107.1.13 RatingComputed as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The rating of this track's album.
Notes: (Read only property)

107.1.14 SortAlbumArtist as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The artist associated with this album. This field should be used when sorting.
Notes: (Read only property)

107.1.15 SortTitle as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The name of this that should be used for sorting purposes.
Notes: (Read only property)

107.1.16 Title as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The name of this album.
Notes: (Read only property)

107.1.17 TrackCount as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Number of tracks in this album.
Notes: (Read only property)

107.2 class iTunesLibraryArtistMBS

107.2.1 class iTunesLibraryArtistMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Represents an artist, such as the performer of a song.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

107.2.2 Methods

107.2.3 Constructor

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

107.2.4 Properties

107.2.5 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The internal object handle.
Notes: (Read and Write property)

107.2.6 name as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The name of this artist.
Notes: (Read only property)

107.2.7 sortName as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The name of this artist that should be used for sorting purposes.
Notes: (Read only property)

107.3 class iTunesLibraryArtworkMBS

107.3.1 class iTunesLibraryArtworkMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Represents a media item artwork.
Example:

```
// show the cover artwork of the first song in the Music library that has one
Var error As NSErrorMBS
Var library As New iTunesLibraryMBS("1.0", error)
If error <>Nil Then Return

For Each item As iTunesLibraryMediaItemMBS In library.allMediaItems
If item.artwork <>Nil And item.artwork.image <>Nil Then
Var cover As Picture = item.artwork.image.CopyPictureWithAlpha
System.DebugLog "Cover of " + item.title + ": " + cover.Width.ToString + " x " + cover.Height.ToString
Exit
End If
Next
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

107.3.2 Methods

107.3.3 Constructor

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

107.3.4 Properties

107.3.5 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The internal object handle.
Notes: (Read and Write property)

107.3.6 image as NSImageMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The NSImage formed by using image Data.
Notes: (Read only property)

107.3.7 imageData as Memoryblock

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The data (bytes) of this artwork image.
Notes: (Read only property)

107.3.8 imageDataFormat as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The fortmat of the data returned by the imageData method.
Notes: (Read only property)

107.3.9 Constants

Constants

Constant	Value	Description
ITLibArtworkFormatBitmap	1	One of the constants to specify the possible formats of the data returned by ITLibArtwork's imageData method. The image data format is a bitmap.
ITLibArtworkFormatBMP	6	One of the constants to specify the possible formats of the data returned by ITLibArtwork's imageData method. The image data corresponds to a BMP image.
ITLibArtworkFormatGIF	4	One of the constants to specify the possible formats of the data returned by ITLibArtwork's imageData method. The image data corresponds to a GIF image.
ITLibArtworkFormatJPEG	2	One of the constants to specify the possible formats of the data returned by ITLibArtwork's imageData method. The image data corresponds to a JPEG image.
ITLibArtworkFormatJPEG2000	3	One of the constants to specify the possible formats of the data returned by ITLibArtwork's imageData method. The image data corresponds to a JPEG2000 image.
ITLibArtworkFormatNone	0	One of the constants to specify the possible formats of the data returned by ITLibArtwork's imageData method. The image data format is unknown.
ITLibArtworkFormatPICT	8	One of the constants to specify the possible formats of the data returned by ITLibArtwork's imageData method. The image data corresponds to a PICT image.
ITLibArtworkFormatPNG	5	One of the constants to specify the possible formats of the data returned by ITLibArtwork's imageData method. The image data corresponds to a PNG image.
ITLibArtworkFormatTIFF	7	One of the constants to specify the possible formats of the data returned by ITLibArtwork's imageData method. The image data corresponds to a TIFF image.

107.4 class iTunesLibraryMBS

107.4.1 class iTunesLibraryMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: A class representing an iTunes library whose metadata is being queried.
Example:

```
// list the playlists of the Music library
Var error As NSErrorMBS
Var library As iTunesLibraryMBS = iTunesLibraryMBS.libraryWithAPIVersion("1.0", error)
If library = Nil Then
MessageBox "Failed: " + error.localizedDescription
Return
End If

Var lines() As String
For Each playlist As iTunesLibraryPlaylistMBS In library.allPlaylists
lines.Add playlist.name + ": " + playlist.items.Count.ToString + " items"
Next

MessageBox library.allMediaItems.Count.ToString + " media items" + EndOfLine + String.FromArray(lines,
EndOfLine)
```

Notes: Requires iTunes 11 on Mac OS X. And your app must be code signed.

107.4.2 Methods

107.4.3 allMediaItems as iTunesLibraryMediaItemMBS()

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: All media items in the library.

107.4.4 allPlaylists as iTunesLibraryPlaylistMBS()

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: All playlists in the library.

107.4.5 artworkForMediaFile(mediaFile as folderitem) as iTunesLibraryArtworkMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Retrieves the artwork from a media file.
Notes: mediaFile: The folderitem of the media file whose artwork should be extracted.
Returns a iTunesLibraryArtworkMBS instance represeting the media file artwork, or nil if the artwork was not found or could not be extracted.
See also:

- 107.4.6 artworkForMediaFile(mediaFileURL as string) as iTunesLibraryArtworkMBS 16483

107.4.6 artworkForMediaFile(mediaFileURL as string) as iTunesLibraryArtworkMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Retrieves the artwork from a media file.
Notes: mediaFileURL: The URL of the media file whose artwork should be extracted.
Returns a iTunesLibraryArtworkMBS instance represeting the media file artwork, or nil if the artwork was not found or could not be extracted.
See also:

- 107.4.5 artworkForMediaFile(mediaFile as folderitem) as iTunesLibraryArtworkMBS 16483

107.4.7 Constructor(requestedAPIVersion as string, byref error as NSErrorMBS, threaded as boolean = false)

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Initializes an instance of ITLibrary which can be used to retrieve media entities.
Notes: Upon initialization of the library class, the default iTunes database for the current user will be read and parsed.
At this point all media entities will be cached in memory until the time the object is deallocated.
requestedAPIVersion: The version of the iTunesLibrary API that the application is requesting, provide "1.0" if unknown.

error: A variable that will receive an NSError if this method fails. May be nil if caller does not care about error.

If handle is 0, the initialization failed.
Requires that your app is code signed.

Added threaded parameter in version 20.0 of the MBS Plugins. If true, the work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

107.4.8 libraryWithAPIVersion(requestedAPIVersion as string, byref error as NSErrorMBS) as iTunesLibraryMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Initializes an instance of ITLibrary which can be used to retrieve media entities.
Notes: Upon initialization of the library class, the default iTunes database for the current user will be read and parsed.
At this point all media entities will be cached in memory until the time the object is deallocated.
requestedAPIVersion: The version of the iTunesLibrary API that the application is requesting, provide "1.0" if unknown.
error: A variable that will receive an NSError if this method fails. May be nil if caller does not care about error.

Returns a Library instance, or nil if this method fails.
Requires that your app is code signed.

107.4.9 Properties

107.4.10 apiMajorVersion as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The major version number of this API.
Notes: (Read only property)

107.4.11 apiMinorVersion as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The minor version number of this API.
Notes: (Read only property)

107.4.12 applicationVersion as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The version of iTunes being accessed.
Notes: (Read only property)

107.4.13 features as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: A bitwise OR combination of the features of this library.
Notes: (Read only property)

107.4.14 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The internal object handle.
Notes: (Read and Write property)

107.4.15 musicFolderLocation as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The location of the iTunes music folder.
Notes: (Read only property)

107.4.16 showContentRating as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether to show content rating labels.
Notes: (Read only property)

107.4.17 Constants

Constants

Constant	Value	Description
ITLibExportFeatureNone	0	One of the constants describe the features supported by a given iTunes library. No features are supported.

107.5 class iTunesLibraryMediaEntityMBS

107.5.1 class iTunesLibraryMediaEntityMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Abstract superclass for MediaItem and Playlist instances.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- MBS Xojo Plugins, version 19.3pr2

107.5.2 Methods

107.5.3 Constructor

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

107.5.4 enumerateValuesExceptForProperties(propertyNames() as string) as dictionary

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Queries all keys and values for all properties except the given property names.

107.5.5 enumerateValuesForAllProperties as dictionary

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Queries all keys and values.

107.5.6 enumerateValuesForProperties(propertyNames() as string) as dictionary

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Queries all keys and values with the given property names.

107.5.7 ITLibMediaEntityPropertyPersistentID as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The property key for the persistent id.

107.5.8 valueForProperty(PropertyName as string) as Variant

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Gets the value for a specified media property key.
Notes: The media property keys you can use with this property are listed in this document and in Media Item Property Keys and Playlist Property Keys.
property: The media property key that you want the corresponding value of.
Returns the value for the media property key.

107.5.9 Properties

107.5.10 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The internal object handle.
Notes: (Read and Write property)

107.5.11 persistentID as Int64

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The unique identifier of this media entity.
Notes: (Read only property)

107.6 class iTunesLibraryMediaItemMBS

107.6.1 class iTunesLibraryMediaItemMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: A media item represents a single piece of media (such as a song, a video, a podcast, etc) in the iTunes library.
Example:

```
// list the 10 most played songs from the Music app
Var error As NSErrorMBS
Var library As New iTunesLibraryMBS("1.0", error)
If error <>Nil Then
MessageBox error.localizedDescription
Return
End If

Var items() As iTunesLibraryMediaItemMBS = library.allMediaItems
Var counts() As Integer
For Each item As iTunesLibraryMediaItemMBS In items
counts.Add item.playCount
Next
counts.SortWith(items)

Var lines() As String
For i As Integer = items.LastIndex DownTo Max(0, items.LastIndex - 9)
Var item As iTunesLibraryMediaItemMBS = items(i)
Var artist As String
If item.artist <>Nil Then artist = item.artist.name
lines.Add item.playCount.ToString + "x " + item.title + " - " + artist
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: A media item has an overall unique identifier, accessed using the persistentID property. The media item metadata may be accessed through its individual properties or via the iTunesLibraryMediaEntityMBS general property accessor methods.
Subclass of the iTunesLibraryMediaEntityMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

107.6.2 Methods

107.6.3 Constructor

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

107.6.4 ITLibMediaItemPropertyAddedDate as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.5 ITLibMediaItemPropertyAlbumArtist as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.6 ITLibMediaItemPropertyAlbumDiscCount as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.7 ITLibMediaItemPropertyAlbumDiscNumber as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.8 ITLibMediaItemPropertyAlbumIsCompilation as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.9 ITLibMediaItemPropertyAlbumIsGapless as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.10 ITLibMediaItemPropertyAlbumRating as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.11 ITLibMediaItemPropertyAlbumRatingComputed as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.12 ITLibMediaItemPropertyAlbumTitle as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.13 ITLibMediaItemPropertyAlbumTrackCount as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.14 ITLibMediaItemPropertyArtistName as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.15 ITLibMediaItemPropertyArtwork as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.16 ITLibMediaItemPropertyBeatsPerMinute as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.17 ITLibMediaItemPropertyBitRate as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.18 ITLibMediaItemPropertyCategory as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.19 ITLibMediaItemPropertyComments as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.20 ITLibMediaItemPropertyComposer as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.21 ITLibMediaItemPropertyContentRating as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.22 ITLibMediaItemPropertyDescription as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.23 ITLibMediaItemPropertyFileType as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.24 ITLibMediaItemPropertyGenre as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.25 ITLibMediaItemPropertyGrouping as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.26 ITLibMediaItemPropertyHasArtwork as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.27 ITLibMediaItemPropertyIsDRMProtected as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.28 ITLibMediaItemPropertyIsPurchased as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.29 ITLibMediaItemPropertyIsUserDisabled as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.30 ITLibMediaItemPropertyIsVideo as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.31 ITLibMediaItemPropertyKind as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.32 ITLibMediaItemPropertyLastPlayDate as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.33 ITLibMediaItemPropertyLocation as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.34 ITLibMediaItemPropertyLocationType as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.35 ITLibMediaItemPropertyLyricsContentRating as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.36 ITLibMediaItemPropertyMediaKind as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.37 ITLibMediaItemPropertyModifiedDate as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.38 ITLibMediaItemPropertyPlayCount as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.39 ITLibMediaItemPropertyRating as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.40 ITLibMediaItemPropertyRatingComputed as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.41 ITLibMediaItemPropertyReleaseDate as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.42 ITLibMediaItemPropertySampleRate as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.43 ITLibMediaItemPropertySize as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.44 ITLibMediaItemPropertySkipDate as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.45 ITLibMediaItemPropertySortAlbumArtist as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.46 ITLibMediaItemPropertySortAlbumTitle as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.47 ITLibMediaItemPropertySortArtistName as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.48 ITLibMediaItemPropertySortComposer as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.49 ITLibMediaItemPropertySortTitle as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.50 ITLibMediaItemPropertyStartTime as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.51 ITLibMediaItemPropertyStopTime as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.52 ITLibMediaItemPropertyTitle as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.53 ITLibMediaItemPropertyTotalTime as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.54 ITLibMediaItemPropertyTrackNumber as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.55 ITLibMediaItemPropertyUserSkipCount as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.56 ITLibMediaItemPropertyVideoEpisode as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.57 ITLibMediaItemPropertyVideoEpisodeOrder as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.58 ITLibMediaItemPropertyVideoHeight as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.59 ITLibMediaItemPropertyVideoIsHD as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.60 ITLibMediaItemPropertyVideoSeason as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.61 ITLibMediaItemPropertyVideoSeries as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.62 ITLibMediaItemPropertyVideoSortSeries as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.63 ITLibMediaItemPropertyVideoWidth as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.64 ITLibMediaItemPropertyVoiceOverLanguage as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.65 ITLibMediaItemPropertyVolumeAdjustment as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.66 ITLibMediaItemPropertyVolumeNormalizationEnergy as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.67 ITLibMediaItemPropertyYear as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the constants for properties.

107.6.68 Properties

107.6.69 addedDate as Date

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and media item this media item was added to the iTunes database.
Notes: (Read only property)

107.6.70 addedDateTime as DateTime

MBS MacExtras Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The date and media item this media item was added to the iTunes database.
Notes: (Read only property)

107.6.71 album as iTunesLibraryAlbumMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The album where this media item belongs.
Notes: (Read only property)

107.6.72 artist as iTunesLibraryArtistMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The artist associated with this media item.
Notes: (Read only property)

107.6.73 artwork as iTunesLibraryArtworkMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether this media item has artwork.
Notes: (Read only property)

107.6.74 ArtworkAvailable as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether this media item has artwork.
Notes: (Read only property)

107.6.75 beatsPerMinute as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The BPM (beats per minute) of this media item.
Notes: (Read only property)

107.6.76 bitrate as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The bitrate of this media item in kbps.
Notes: (Read only property)

107.6.77 category as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The podcast category of this media item (implies this media item is a podcast).
Notes: (Read only property)

107.6.78 comments as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Any comments associated with this media item.
Notes: (Read only property)

107.6.79 composer as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The name of the composer associated with this media item.
Notes: (Read only property)

107.6.80 contentRating as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The extended content rating of this media item.
Notes: (Read only property)

107.6.81 description as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Any podcast description of with this media item (implies this media item is a podcast).
Notes: (Read only property)

107.6.82 DRMProtected as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether this media item is DRM protected.
Notes: (Read only property)

107.6.83 fileType as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The type of the file this media item refers to.
Notes: (Read only property)

107.6.84 genre as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The genre associated with this media item.
Notes: (Read only property)

107.6.85 grouping as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The grouping of this media item.
Notes: (Read only property)

107.6.86 kind as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: This media item's file kind (ex. MPEG audio file).
Notes: (Read only property)

107.6.87 lastPlayedDate as Date

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time this media item was last played in iTunes, or nil if this media item has not been played.
Notes: (Read only property)

107.6.88 lastPlayedDateTime as DateTime

MBS MacExtras Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The date and time this media item was last played in iTunes, or nil if this media item has not been played.
Notes: (Read only property)

107.6.89 location as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The location of this media item on disk.
Notes: (Read only property)

107.6.90 locationFile as FolderItem

MBS MacExtras Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: The location of this media item on disk.
Notes: For your convenience we provide this folderitem if location points to a valid file.
(Read only property)

107.6.91 locationType as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The type of this media item with respect to its location.
Notes: (Read only property)

107.6.92 lyricsContentRating as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The content rating of this media item's lyrics.
Notes: (Read only property)

107.6.93 mediaKind as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: This media item's media kind.
Notes: (Read only property)

107.6.94 modifiedDate as Date

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time this media item was last modified.
Notes: (Read only property)

107.6.95 modifiedDateTime as DateTime

MBS MacExtras Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The date and time this media item was last modified.
Notes: (Read only property)

107.6.96 playCount as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The number of times this media item has been played in iTunes.
Notes: (Read only property)

107.6.97 Purchased as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether this media item was purchased.
Notes: (Read only property)

107.6.98 rating as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The rating of this media item.
Notes: (Read only property)

107.6.99 RatingComputed as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether this media item's rating is computed.
Notes: (Read only property)

107.6.100 releaseDate as Date

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date this media item was released.
Notes: (Read only property)

107.6.101 releaseDateTime as DateTime

MBS MacExtras Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The date this media item was released.
Notes: (Read only property)

107.6.102 sampleRate as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The sample rate of this media item in samples per second.
Notes: (Read only property)

107.6.103 size as UInt64

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The size in bytes of this media item on disk.
Notes: (Read only property)

107.6.104 skipCount as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The number of times this media item has been skiped.
Notes: (Read only property)

107.6.105 skipDate as Date

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date and time when this media item was last skipped.
Notes: (Read only property)

107.6.106 skipDateTime as DateTime

MBS MacExtras Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The date and time when this media item was last skipped.
Notes: (Read only property)

107.6.107 sortComposer as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The name of the composer associated with this media item that should be used for sorting purposes.
Notes: (Read only property)

107.6.108 sortTitle as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The title of this media item that should be used for sorting purposes.
Notes: (Read only property)

107.6.109 startTime as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The start time of this media item given that the media item is a podcast.
Notes: (Read only property)

107.6.110 stopTime as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The stop time of this media item given that the media item is a podcast.
Notes: (Read only property)

107.6.111 title as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The title of this media item.
Notes: (Read only property)

107.6.112 totalTime as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The length of this media item in seconds.
Notes: (Read only property)

107.6.113 trackNumber as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The position of this media item within its album.
Notes: (Read only property)

107.6.114 userDisabled as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether the user has disabled this media item.
Notes: (Read only property)

107.6.115 video as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether this media item is a video media item (video podcast, movie, etc).
Notes: (Read only property)

107.6.116 videoInfo as iTunesLibraryMediaItemVideoInfoMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The video information of this media item (implies this media item is a video media item).
Notes: (Read only property)

107.6.117 voiceOverLanguage as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The voice-over language of this media item.
Notes: (Read only property)

107.6.118 volumeAdjustment as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The volume adjustment used for this media item if any.
Notes: (Read only property)

107.6.119 volumeNormalizationEnergy as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The volume normalization energy applied to this media item.
Notes: (Read only property)

107.6.120 year as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The year when this media item was released.
Notes: (Read only property)

107.6.121 Constants

Constants

Constant	Value	Description
ITLibMediaItemLocationTypeFile	1	One of the constants to specify possible the type of a media item to its location. The media item location refers to a local file.
ITLibMediaItemLocationTypeRemote	3	One of the constants to specify possible the type of a media item to its location. The media item location refers to a remote file.
ITLibMediaItemLocationTypeUnknown	0	One of the constants to specify possible the type of a media item to its location. The media item type is not known.
ITLibMediaItemLocationTypeURL	2	One of the constants to specify possible the type of a media item to its location. The media item location refers to a URL (for example, a podcas
ITLibMediaItemLyricsContentRatingClean	2	One of the constants to specify the possible ratings of media iter The media item lyrics do not contain explicit language.
ITLibMediaItemLyricsContentRatingExplicit	1	One of the constants to specify the possible ratings of media iter The media item lyrics contain explicit language.
ITLibMediaItemLyricsContentRatingNone	0	One of the constants to specify the possible ratings of media iter No rating information for the media item lyrics.
ITLibMediaItemMediaKindAlertTone	21	One of the constants to specify the possible media kinds of a item. The media item is an audio tone on an iOS device which is no ringtone.
ITLibMediaItemMediaKindAudiobook	5	One of the constants to specify the possible media kinds of a item. The media item is an audiobook.
ITLibMediaItemMediaKindBook	19	One of the constants to specify the possible media kinds of a item. The media item is an EPUB or iBooks Author book.
ITLibMediaItemMediaKindDigitalBooklet	15	One of the constants to specify the possible media kinds of a item. The media item is an iTunes Extra or an iTunes LP.
ITLibMediaItemMediaKindHomeVideo	12	One of the constants to specify the possible media kinds of a item. The media item is a non-iTunes Store movie.
ITLibMediaItemMediaKindInteractiveBooklet	9	One of the constants to specify the possible media kinds of a item. The media item is a QuickTime movie with embedded flash (dep
ITLibMediaItemMediaKindIOSApplication	16	One of the constants to specify the possible media kinds of a item. The media item is an iPhone or iPod touch application.
ITLibMediaItemMediaKindiTunesU	18	One of the constants to specify the possible media kinds of a item. The media item is an iTunesU audio of video file.
ITLibMediaItemMediaKindMovie	3	One of the constants to specify the possible media kinds of a item. The media item is a movie.
ITLibMediaItemMediaKindMusicVideo	7	One of the constants to specify the possible media kinds of a item. The media item is a music video.
ITLibMediaItemMediaKindPDFBook	20	One of the constants to specify the possible media kinds of a item. The media item is a PDF treated as Books in the UI unless over user.
ITLibMediaItemMediaKindPDFBooklet	6	One of the constants to specify the possible media kinds of a item. The media item is an unwrapped PDF file that is part of a Musi
ITLibMediaItemMediaKindPodcast	4	One of the constants to specify the possible media kinds of a item.

107.7 class iTunesLibraryMediaItemVideoInfoMBS

107.7.1 class iTunesLibraryMediaItemVideoInfoMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Encapsulates the video information of a video media item.
Example:

```
// list the TV show episodes in the TV app library
Var error As NSErrorMBS
Var library As New iTunesLibraryMBS("1.0", error)
If error <>Nil Then Return

For Each item As iTunesLibraryMediaItemMBS In library.allMediaItems
Var v As iTunesLibraryMediaItemVideoInfoMBS = item.videoInfo
If v = Nil Or v.series = "" Then Continue
System.DebugLog v.series + " S" + Format(v.season, "00") + "E" + Format(v.episodeOrder, "00") + ": "
+ item.title + _
" (" + v.videoWidth.ToString + "x" + v.videoHeight.ToString + If(v.HD, ", HD", "") + ")"
Next
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

107.7.2 Methods

107.7.3 Constructor

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

107.7.4 Properties

107.7.5 episode as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The TV episode the video is associated with (implies the track is a TV show).
Notes: (Read only property)

107.7.6 episodeOrder as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The TV episode order the video is associated with (implies the track is a TV show).
Notes: (Read only property)

107.7.7 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The internal object handle.
Notes: (Read and Write property)

107.7.8 HD as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether the video is high definition.
Notes: (Read only property)

107.7.9 season as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The name of TV season the video is associated with (implies the track is a TV show).
Notes: (Read only property)

107.7.10 series as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The name of TV series the video is associated with (implies track is a TV show).
Notes: (Read only property)

107.7.11 sortSeries as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The name of the TV series the video is associated with that should be used for when sorting (implies the track is a TV show).
Notes: (Read only property)

107.7.12 videoHeight as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The height of the video.
Notes: (Read only property)

107.7.13 videoWidth as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The width of the video.
Notes: (Read only property)

107.8 class iTunesLibraryPlaylistMBS

107.8.1 class iTunesLibraryPlaylistMBS

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: A playlist is a collection of related media items.
Example:

```
// list the playlists of the Music app with the number of songs
Var error As NSErrorMBS
Var library As New iTunesLibraryMBS("1.0", error)
If error <>Nil Then Return

Var lines() As String
For Each p As iTunesLibraryPlaylistMBS In library.allPlaylists
lines.Add p.name + ": " + p.items.Count.ToString + " items"
Next
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: (Media items are described in iTunesLibraryMediaItemMBS Class Reference.)
Each playlist has a name, a set of attributes, and a unique identifier that persists across application launches.
Subclass of the iTunesLibraryMediaEntityMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

107.8.2 Methods

107.8.3 Constructor

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The private constructor.

107.8.4 items(threaded as boolean = false) as iTunesLibraryMediaItemMBS()

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The media items contained within this playlist.

107.8.5 ITLibPlaylistPropertyAllItemsPlaylist as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the playlist property.

107.8.6 ITLibPlaylistPropertyDistinguisedKind as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the playlist property.

107.8.7 ITLibPlaylistPropertyItems as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the playlist property.

107.8.8 ITLibPlaylistPropertyMaster as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the playlist property.

107.8.9 ITLibPlaylistPropertyName as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the playlist property.

107.8.10 ITLibPlaylistPropertyParentPersistentID as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the playlist property.

107.8.11 ITLibPlaylistPropertyVisible as string

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: One of the playlist property.

107.8.12 Properties

107.8.13 AllItemsPlaylist as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether this playlist is an "all items" playlist.
Notes: i.e. marked items in playlist exceeds the total tracks in the playlist so the playlist is a discreet object.
(Read only property)

107.8.14 DistinguishedKind as Integer

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The distinguished kind of this playlist.
Notes: (Read only property)

107.8.15 Master as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether this playlist is a master playlist.
Notes: (Read only property)

107.8.16 name as String

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The name or title of this playlist.
Notes: (Read only property)

107.8.17 ParentID as Int64

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The unique identifier of this playlist' parent.
Notes: Changed to Int64 for MBS Plugin 19.5.
(Read only property)

107.8.18 Visible as Boolean

MBS MacExtras Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Whether this playlist is visible.
Notes: (Read only property)

107.8.19 Constants

Constants

Constant	Value	Description
ITLibDistinguishedPlaylistKind90sMusic	42	One of the constants to specify the possible kinds of playli The playlist is the default 90's music iTunes playlist.
ITLibDistinguishedPlaylistKindBooks	4	One of the constants to specify the possible kinds of playli The playlist contains all the books in the iTunes Library
ITLibDistinguishedPlaylistKindClassicalMusic	48	One of the constants to specify the possible kinds of playli The playlist is the default Classical Music smart playlist g
ITLibDistinguishedPlaylistKindHomeVideos	50	One of the constants to specify the possible kinds of playli The playlist contains all homes videos in the iTunes Librar
ITLibDistinguishedPlaylistKindiTunesU	26	One of the constants to specify the possible kinds of playli The playlist contains the user's iTunesU items.
ITLibDistinguishedPlaylistKindLibraryMusicVideos	49	One of the constants to specify the possible kinds of playli The playlist contains all music videos in the iTunes Librar same as the default Music Videos smart playlist.
ITLibDistinguishedPlaylistKindMovies	1	One of the constants to specify the possible kinds of playli The playlist contains all the movies in the iTunes Library.
ITLibDistinguishedPlaylistKindMusic	3	One of the constants to specify the possible kinds of playli The playlist contains all the music items in the iTunes Lib
ITLibDistinguishedPlaylistKindMusicVideos	47	One of the constants to specify the possible kinds of playli The playlist is the default Music Videos smart playlist gen
ITLibDistinguishedPlaylistKindMyTopRated	43	One of the constants to specify the possible kinds of playli The playlist is the default Top Rated smart playlist genera
ITLibDistinguishedPlaylistKindNone	0	One of the constants to specify the possible kinds of playli The playlist is not a distinguished playlist.
ITLibDistinguishedPlaylistKindPodcasts	7	One of the constants to specify the possible kinds of playli The playlist contains all the podcasts in the iTunes library
ITLibDistinguishedPlaylistKindPurchases	16	One of the constants to specify the possible kinds of playli The playlist contains all the user's purchases in the iTunes
ITLibDistinguishedPlaylistKindRecentlyAdded	46	One of the constants to specify the possible kinds of playli The playlist is the default Recently Added smart playlist g
ITLibDistinguishedPlaylistKindRecentlyPlayed	45	One of the constants to specify the possible kinds of playli The playlist is the default Recently Played smart playlist g .
ITLibDistinguishedPlaylistKindRingtones	5	One of the constants to specify the possible kinds of playli The playlist contains all the ringtones in the iTunes Librar
ITLibDistinguishedPlaylistKindTop25MostPlayed	44	One of the constants to specify the possible kinds of playli The playlist is the default 25 Most Played smart playlist g
ITLibDistinguishedPlaylistKindTVShows	2	One of the constants to specify the possible kinds of playli The playlists contains all the TV shows in the iTunes Libr
ITLibDistinguishedPlaylistKindVoiceMemos	14	One of the constants to specify the possible kinds of playli The playlist contains all voice memos.

Chapter 108

Java

108.1 class JavaArrayMBS

108.1.1 class JavaArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for a java array object.
Notes: Subclass of the JavaObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Upgrading our Java Support for Xojo
- MBS Xojo Plugins, version 19.2pr5

108.1.2 Methods

108.1.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.1.4 Properties

108.1.5 Length as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The number of items in the array.
Notes: Returns 0 on any error.
(Read only property)

108.2 class JavaBooleanArrayMBS

108.2.1 class JavaBooleanArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java boolean array object.
Notes: Subclass of the JavaArrayMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.2.2 Methods

108.2.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.2.4 Elements as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: All the elements in this array as one memoryblock.
Notes: Use memoryblock.byte(index) to access.

108.2.5 Values as Boolean()

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns a Xojo array with values.

108.2.6 Properties

108.2.7 Region(start as Integer, len as Integer) as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set a region of the array.
Notes: Start is the starting index (0 based) and len the number of items to copy.
Throws ArrayIndexOutOfBoundsException if (start + len - 1) does not specify a valid index in the array.
(Read and Write computed property)

108.2.8 Value(index as Integer) as Boolean

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value with given index.
Notes: May raise OutOfBoundsException if index is out of range.
(Read and Write computed property)

108.3 class JavaByteArrayMBS

108.3.1 class JavaByteArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java byte array object.
Notes: Subclass of the JavaArrayMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.3.2 Methods

108.3.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.3.4 Elements as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: All the elements in this array as one memoryblock.
Notes: Use memoryblock.Byte(index) to access.

108.3.5 Values as Int8()

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns a Xojo array with values.

108.3.6 Properties

108.3.7 Region(start as Integer, len as Integer) as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set a region of the array.
Notes: Start is the starting index (0 based) and len the number of items to copy.
Throws ArrayIndexOutOfBoundsException if (start + len - 1) does not specify a valid index in the array.
(Read and Write computed property)

108.3.8 Value(index as Integer) as Int8

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value with given index.
Notes: May raise OutOfBoundsException if index is out of range.
(Read and Write computed property)

108.4 class JavaCharArrayMBS

108.4.1 class JavaCharArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java char array object.
Notes: Subclass of the JavaArrayMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.4.2 Methods

108.4.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.4.4 Elements as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: All the elements in this array as one memoryblock.
Notes: Use memoryblock.UShortMBS(index*2) to access.

108.4.5 Values as UInt16()

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns a Xojo array with values.

108.4.6 Properties

108.4.7 Region(start as Integer, len as Integer) as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set a region of the array.
Notes: Start is the starting index (0 based) and len the number of items to copy.
Throws ArrayIndexOutOfBoundsException if (start + len - 1) does not specify a valid index in the array.
(Read and Write computed property)

108.4.8 Value(index as Integer) as UInt16

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value with given index.
Notes: May raise OutOfBoundsException if index is out of range.
(Read and Write computed property)

108.5 class JavaClassMBS

108.5.1 class JavaClassMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for a Java class.
Notes: Subclass of the JavaObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.5.2 Methods

108.5.3 AllocateObject as JavaObjectMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Allocates a new Java object without invoking any of the constructors for the object. #
Notes: Returns a reference to the object or nil on any error.

Does not work for array classes.
Throws InstantiationException if the class is an interface or an abstract class.

108.5.4 CallStaticBooleanMethod(MethodID as JavaMethodMBS, args as memoryblock) as boolean

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a static method with a boolean return value.
Notes: This call invokes a static method on a Java object, according to the specified method ID. The

methodID argument must be obtained by calling JavaClassMBS.GetMethod().

The method ID must be derived from this class, not from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.5.5 CallStaticByteMethod(MethodID as JavaMethodMBS, args as memoryblock) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a static method with a byte return value.
Notes: This call invokes a static method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling JavaClassMBS.GetMethod().

The method ID must be derived from this class, not from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.5.6 CallStaticCharMethod(MethodID as JavaMethodMBS, args as memoryblock) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a static method with a char return value.
Notes: This call invokes a static method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling JavaClassMBS.GetMethod().

The method ID must be derived from this class, not from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on

platform)

108.5.7 CallStaticDoubleMethod(MethodID as JavaMethodMBS, args as memoryblock) as Double

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a static method with a double return value.
Notes: This call invokes a static method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling JavaClassMBS.GetMethod().

The method ID must be derived from this class, not from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.5.8 CallStaticFloatMethod(MethodID as JavaMethodMBS, args as memoryblock) as single

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a static method with a float return value.
Notes: This call invokes a static method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling JavaClassMBS.GetMethod().

The method ID must be derived from this class, not from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.5.9 CallStaticIntMethod(MethodID as JavaMethodMBS, args as memoryblock) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a static method with an integer return value.
Notes: This call invokes a static method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling JavaClassMBS.GetMethod().

The method ID must be derived from this class, not from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.5.10 CallStaticLongMethod(MethodID as JavaMethodMBS, args as memoryblock) as Int64

MBS Java Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a static method with a long return value.
Notes: This call invokes a static method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling JavaClassMBS.GetMethod().

The method ID must be derived from this class, not from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.5.11 CallStaticMain(args() as string)

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a static main method and passes the String array.

108.5.12 CallStaticMethod(MethodID as JavaMethodMBS, args() as Variant) as Variant

MBS Java Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a static method.
Example:

```
Var vm As JavaVMMBS // your initialized VM

// 1. Find class
Var jclass As JavaClassMBS =vm.FindClass("stringtest")

if jclass=nil then
MessageBox "Can't find stringtest class"
Return
end if

// 2. lookup method
Var jmethod3 As JavaMethodMBS = jclass.GetStaticMethod("setValue","(Ljava/lang/String;)V")
if jmethod3=nil then
MessageBox "Failed to find setValue method."
Return
end if

// 3. Call static method
Var param3() As Variant
param3.Add "Hello World"
Call jclass.CallStaticMethod(jmethod3,param3)

MessageBox "done"
```

Notes: This call invokes a static method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling JavaClassMBS.GetMethod().

The method ID must be derived from this class, not from one of its superclasses.

Programmers place all arguments to the method in an args variant array that immediately follows the methodID argument.

This is generic version, where our plugin translates between native Xojo data types and Java data types. We support conversion of boolean, byte (integer), char (integer), short (integer), int (integer), long (int64), double, float (single) and Java objects. Objects can be JavaObjectMBS or subclasses including JavaStringMBS and the JavaArrayMBS subclasses. For your convenience you can pass in string and we convert to JavaStringMBS for you.

108.5.13 CallStaticObjectMethod(MethodID as JavaMethodMBS, args as memoryblock) as JavaObjectMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a static method with an object return value.
Example:

```
Var e as JavaVMMBS // global

// Call "public static String getMessage()" and "public static void setMessage(String theMessage)" from class "test".

Var jclass, sclass as JavaClassMBS
Var jmethod as JavaMethodMBS
Var jstring as JavaStringMBS
Var args as JavaObjectArrayMBS
Var m as MemoryBlock
Var s as String
Var jfield as JavaFieldMBS

jclass=e.FindClass("test")

if jclass=nil then
MessageBox "Can't find test class"
else
jmethod = jclass.GetStaticMethod("setMessage", "(Ljava/lang/String;)V")

if jmethod=nil then
MessageBox "Can't find HelloWorld.setMessage"
else
jstring = e.NewStringUTF8("Hello from Xojo!")
if jstring=nil then
MessageBox "Out of memory"

if jmethod=nil then
MessageBox "Can't find HelloWorld.getMessage"
```

```
else
m=NewMemoryBlock(8) // 8 bytes per parameter
m.Int64Value(0)=jstring.Handle

jstring=JavaStringMBS(jclass.CallStaticObjectMethod(jmethod,m))

MessageBox jstring.CopyStringUTF
end if
end if
end if
end if
```

Notes: This call invokes a static method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling JavaClassMBS.GetMethod().

The method ID must be derived from this class, not from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.5.14 CallStaticShortMethod(MethodID as JavaMethodMBS, args as memoryblock) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a static method with a short return value.
Notes: This call invokes a static method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling JavaClassMBS.GetMethod().

The method ID must be derived from this class, not from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.5.15 CallStaticVoidMethod(MethodID as JavaMethodMBS, args as memoryblock)

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a static method with no return value.
Notes: This call invokes a static method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling JavaClassMBS.GetMethod().

The method ID must be derived from this class, not from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.5.16 Constructor

MBS Java Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.5.17 Fields as JavaFieldMBS()

MBS Java Plugin, Plugin Version: 25.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the list of fields in the class.
Example:

```
// List field names

Var vm as JavaVMMBS // your VM
Var jclass As JavaClassMBS = vm.FindClass("test")
Var fields() As JavaFieldMBS = jclass.Fields
Var fieldNames() As String

For Each field As JavaFieldMBS In fields
fieldNames.add field.Name
Next

MessageBox String.FromArray(fieldNames, EndOfLine)
```

Notes: This includes static fields.
Does not include items from super class.

108.5.18 GetField(name as string, sig as string) as JavaFieldMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Searches for the Field with the given Name and Signature.
Notes: Nil on any error.

The signature is a string derived from the field's type or method's arguments and return type, as shown here:

Java Type	Signature
boolean	Z
byte	B
char	C
short	S
int	I
long	L
float	F
double	D
void	V
objects	Lfully-qualified-class-name;
arrays	[array-type
methods	(argument-types)return-type

108.5.19 GetMethod(name as string, sig as string) as JavaMethodMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Searches the method with the given name and signature.
Example:

```
Var jclass as JavaClassMBS
Var method as JavaMethodMBS

method=jclass.GetMethod("mymethod", "( [ Ljava/lang/String;)V")
```

Notes: Returns the method ID for an instance (non-static) method of a class or interface. The method may be defined in one of the class's super classes and inherited by the class. The method is determined by its name and signature.

To obtain the method ID of a constructor, supply <init>as the method name and void (V) as the return type.

Nil on any error.

Throws NoSuchMethodError if the specified method cannot be found.

The signature is a string derived from the field's type or method's arguments and return type, as shown here:

Java Type	Signature
boolean	Z
byte	B
char	C
short	S
int	I
long	L
float	F
double	D
void	V
objects	Lfully-qualified-class-name;
arrays	[array-type
methods	(argument-types)return-type

108.5.20 GetStaticField(name as string, sig as string) as JavaFieldMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Searches the static field with the given name and signature.
Notes: Nil on any error.

108.5.21 GetStaticMethod(name as string, sig as string) as JavaMethodMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the method ID for a static method of a class. The method is specified by its name and signature.
Example:

```
Var jclass as JavaClassMBS
Var method as JavaMethodMBS

method=jclass.GetStaticMethod("main", "( [ Ljava/lang/String;)V")
```

Notes: Nil on any error.
e.g. the signature of the default static main method is "([Ljava/lang/String;)V" which means return type void at the end and before an array of string.

108.5.22 Methods as JavaMethodMBS()

MBS Java Plugin, Plugin Version: 25.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the list of methods in this class.
Example:

```
// List method names

Var vm as JavaVMMBS // your VM
Var jclass As JavaClassMBS = vm.FindClass("test")
Var Methods() As JavaMethodMBS = jclass.Methods
Var MethodNames() As String

For Each Method As JavaMethodMBS In Methods
MethodNames.add Method.Name
Next

MessageBox String.FromArray(MethodNames, EndOfLine)
```

Notes: This includes constructors with name "<init>", private, protected, public and static methods.
Does not include items from super class.

108.5.23 NewObject(methodID as JavaMethodMBS, args as memoryblock) as JavaObjectMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Constructs a new Java object.

Notes: The method ID indicates which constructor method to invoke. This ID must be obtained by calling GetMethod with <init>as the method name and void (V) as the return type.

Returns nil on any error.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

Throws Java InstantiationException if the class is an interface or an abstract class.
See also:

- 108.5.24 NewObject(MethodID as JavaMethodMBS, args() as Variant) as JavaObjectMBS 16540

108.5.24 NewObject(MethodID as JavaMethodMBS, args() as Variant) as JavaObjectMBS

MBS Java Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Constructs a new Java object.
Example:

```
Var vm as JavaVMMBS // your initialized VM

// 1. Find class
Var jclass As JavaClassMBS=vm.FindClass("stringtest")

If jclass = Nil Then
MessageBox "Can't find stringtest class"
Return
End If

// 2. Call constructor
Var jmethod As JavaMethodMBS = jclass.GetMethod("<init>", "(ILjava/lang/String;D)V")

If jmethod = Nil Then
MessageBox "Can't find constructor"
Return
End If

Var param() As Variant
// 1. Parameter with Integer: I
param.Add 123
// 2. Parameter with string: Ljava/lang/String;
```

```
param.Add "Hello World"
// 3. Parameter with double: D
param.Add 3.14
Var jobject As JavaObjectMBS = jclass.NewObject(jmethod, param)

If jobject = Nil Then
MessageBox "Constructor failed!?"
Else
MessageBox "OK: "+jobject.ClassName
End If
```

Notes: The method ID indicates which constructor method to invoke. This ID must be obtained by calling GetMethod with <init>as the method name and void (V) as the return type.

Returns nil on any error.

Programmers place all arguments to the method in an args variant array that immediately follows the methodID argument.

Throws Java InstantiationException if the class is an interface or an abstract class.

This is generic version, where our plugin translates between native Xojo data types and Java data types. We support conversion of boolean, byte (integer), char (integer), short (integer), int (integer), long (int64), double, float (single) and Java objects. Objects can be JavaObjectMBS or subclasses including JavaStringMBS and the JavaArrayMBS subclasses. For your convenience you can pass in string and we convert to JavaStringMBS for you.
See also:

- 108.5.23 NewObject(methodID as JavaMethodMBS, args as memoryblock) as JavaObjectMBS 16539

108.5.25 Superclass as JavaClassMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Points to the superclass of this class.
Notes: Nil if no superclass exists.

108.5.26 Properties

108.5.27 StaticBooleanField(TheField as JavaFieldMBS) as boolean

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a static boolean field in this class.
Notes: (Read and Write computed property)

108.5.28 StaticByteField(TheField as JavaFieldMBS) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a static byte field in this class.
Notes: (Read and Write computed property)

108.5.29 StaticCharField(TheField as JavaFieldMBS) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a static char field in this class.
Notes: (Read and Write computed property)

108.5.30 StaticDoubleField(TheField as JavaFieldMBS) as Double

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a static double field in this class.
Notes: (Read and Write computed property)

108.5.31 StaticField(TheField as JavaFieldMBS) as Variant

MBS Java Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a static field in this class.
Example:

```
Var jclass As JavaClassMBS=vm.FindClass("stringtest")

If jclass = Nil Then
MessageBox "Can't find stringtest class"
Return
End If

Var field As JavaFieldMBS = jclass.GetField("Name", "Ljava/lang/String;")
Var v As Variant = jclass.StaticField(field)
Var js As JavaStringMBS = v
MessageBox js
```

Notes: This is generic version, where our plugin translates between native Xojo data types and Java data types. We support conversion of boolean, byte (integer), char (integer), short (integer), int (integer), long (int64), double, float (single) and Java objects. Objects can be JavaObjectMBS or subclasses including JavaStringMBS and the JavaArrayMBS subclasses. For your convenience you can pass in string and we convert to JavaStringMBS for you.

Do not use for generic fields!
(Read and Write computed property)

108.5.32 StaticFloatField(TheField as JavaFieldMBS) as single

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a static float field in this class.
Notes: (Read and Write computed property)

108.5.33 StaticIntField(TheField as JavaFieldMBS) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a static integer field in this class.
Example:

```
Var f as FolderItem

f=SpecialFolder.Desktop.Child("ojdbc14.jar")

Var j as new JavaVMMBS(f)

Var c as JavaClassMBS = j.FindClass("oracle/jdbc/driver/OracleTypes")
```

```
Var field as JavaFieldMBS

// this are all static integer fields in this class:

field = c.GetStaticField("CURSOR","I")
MessageBox str(c.StaticIntField(field))

field = c.GetStaticField("BLOB","I")
MessageBox str(c.StaticIntField(figield))

field = c.GetStaticField("DOUBLE","I")
MessageBox str(c.StaticIntField(field))
```

Notes: (Read and Write computed property)

108.5.34 StaticLongField(TheField as JavaFieldMBS) as Int64

MBS Java Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a static long field in this class.
Notes: (Read and Write computed property)

108.5.35 StaticObjectField(TheField as JavaFieldMBS) as JavaObjectMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a static object field in this class.
Notes: (Read and Write computed property)

108.5.36 StaticShortField(TheField as JavaFieldMBS) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a static short field in this class.
Notes: (Read and Write computed property)

108.6 class JavaDoubleArrayMBS

108.6.1 class JavaDoubleArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java double array object.
Notes: Subclass of the JavaArrayMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.6.2 Methods

108.6.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.6.4 Elements as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: All the elements in this array as one memoryblock.
Notes: Use memoryblock.DoubleValue(index*4) to access.

108.6.5 Values as Double()

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns a Xojo array with values.

108.6.6 Properties

108.6.7 Region(start as Integer, len as Integer) as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set a region of the array.
Notes: Start is the starting index (0 based) and len the number of items to copy.
Throws ArrayIndexOutOfBoundsException if (start + len - 1) does not specify a valid index in the array.
(Read and Write computed property)

108.6.8 Value(index as Integer) as Double

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value with given index.
Notes: May raise OutOfBoundsException if index is out of range.
(Read and Write computed property)

108.7 class JavaFieldMBS

108.7.1 class JavaFieldMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java field ID.
Example:

```
Var f as FolderItem

f=SpecialFolder.Desktop.Child("ojdbc14.jar")

Var j as new JavaVMMBS(f)

Var c as JavaClassMBS = j.FindClass("oracle/jdbc/driver/OracleTypes")

Var field as JavaFieldMBS

// this are all static integer fields in this class:

field = c.GetStaticField("CURSOR","I")
MessageBox str(c.StaticIntField(field))

field = c.GetStaticField("BLOB","I")
MessageBox str(c.StaticIntField(figield))

field = c.GetStaticField("DOUBLE","I")
MessageBox str(c.StaticIntField(field))
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.7.2 Methods

108.7.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.7.4 Properties

108.7.5 Handle as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The fieldID of this field.
Notes: (Read only property)

108.7.6 Name as String

MBS Java Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The name of the field.
Notes: This is the name you passed in to GetField or GetStaticField functions.
(Read only property)

108.7.7 Signature as String

MBS Java Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The signature of the field.
Notes: This is the signature you passed in to GetField or GetStaticField functions.
(Read only property)

108.8 class JavaFloatArrayMBS

108.8.1 class JavaFloatArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java float array object.
Notes: Subclass of the JavaArrayMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.8.2 Methods

108.8.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.8.4 Elements as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: All the elements in this array as one memoryblock.
Notes: Use memoryblock.SingleValue(index*4) to access.

108.8.5 Values as Single()

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns a Xojo array with values.

108.8.6 Properties

108.8.7 Region(start as Integer, len as Integer) as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set a region of the array.
Notes: Start is the starting index (0 based) and len the number of items to copy.
Throws ArrayIndexOutOfBoundsException if (start + len - 1) does not specify a valid index in the array.
(Read and Write computed property)

108.8.8 Value(index as Integer) as Single

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value with given index.
Notes: May raise OutOfBoundsException if index is out of range.
(Read and Write computed property)

108.9 class JavaHandleNilExceptionMBS

108.9.1 class JavaHandleNilExceptionMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The exception which is raised whenever a Java function is operations on an object and there is none.
Notes: For example if you call a method on the JavaObjectMBS class which requires the handle value being not zero, the exception raises if the handle value is zero.
Subclass of the RuntimeException class.

108.10 class JavaIntArrayMBS

108.10.1 class JavaIntArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java int array object.
Notes: Subclass of the JavaArrayMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.10.2 Methods

108.10.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.10.4 Elements as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: All the elements in this array as one memoryblock.
Notes: Use memoryblock.Long(index*4) to access.

108.10.5 Values as Integer()

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns a Xojo array with values.

108.10.6 Properties

108.10.7 Region(start as Integer, len as Integer) as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set a region of the array.
Notes: Start is the starting index (0 based) and len the number of items to copy.
Throws ArrayIndexOutOfBoundsException if (start + len - 1) does not specify a valid index in the array.
(Read and Write computed property)

108.10.8 Value(index as Integer) as Int32

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value with given index.
Notes: May raise OutOfBoundsException if index is out of range.
(Read and Write computed property)

108.11 class JavaLongArrayMBS

108.11.1 class JavaLongArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java long array object.
Notes: Subclass of the JavaArrayMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.11.2 Methods

108.11.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.11.4 Elements as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: All the elements in this array as one memoryblock.
Notes: Use memoryblock.Int64DoubleMBS(index*8) to access.

108.11.5 Values as Int64()

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns a Xojo array with values.

108.11.6 Properties

108.11.7 Region(start as Integer, len as Integer) as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set a region of the array.
Notes: Start is the starting index (0 based) and len the number of items to copy.
Throws ArrayIndexOutOfBoundsException if (start + len - 1) does not specify a valid index in the array.
(Read and Write computed property)

108.11.8 Value(index as Integer) as Int64

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value with given index.
Notes: May raise OutOfBoundsException if index is out of range.
(Read and Write computed property)

108.12 class JavaMethodMBS

108.12.1 class JavaMethodMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java method ID.
Notes: In terminal you can use "javap -s <classname>" to display the class with the method names and parameters.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.12.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.12.4 Properties

108.12.5 Handle as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The methodID of this method.
Notes: (Read only property)

108.12.6 Name as String

MBS Java Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The name of the method.
Notes: This is the name you passed in to GetMethod or GetStaticMethod functions.
(Read only property)

108.12.7 Signature as String

MBS Java Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The signature of the method.
Notes: This is the signature you passed in to GetMethod or GetStaticMethod functions.
(Read only property)

108.13 class JavaNotInitializedExceptionMBS

108.13.1 class JavaNotInitializedExceptionMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The exception which is raised whenever a Java function is called which requires you to initialize the JVM before calling it.
Notes: Subclass of the RuntimeException class.

108.14 class JavaObjectArrayMBS

108.14.1 class JavaObjectArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java object array object.
Notes: Subclass of the JavaArrayMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.14.2 Methods

108.14.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.14.4 Values as JavaObjectMBS()

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns a Xojo array with values.

108.14.5 Properties

108.14.6 ArrayElement(index as Integer) as JavaObjectMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use Value instead. **Function:** The object at the given index in the array.
Notes: May return nil if the array is empty on the given index or if the index is out of bounds or any other error occurs.

Index is 0 based.

Throws
ArrayIndexOutOfBoundsException: if index does not specify a valid index in the array.
ArrayStoreException: if the class of value is not a subclass of the element class of the array.
(Read and Write computed property)

108.14.7 Value(index as Integer) as JavaObjectMBS

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value with given index.
Notes: May raise OutOfBoundsException if index is out of range.
(Read and Write computed property)

108.15 class JavaObjectMBS

108.15.1 class JavaObjectMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java object.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.15.2 Methods

108.15.3 CallBooleanMethod(MethodID as JavaMethodMBS, args as memoryblock) as boolean

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a virtual method with a boolean value.
Notes: This family of operations invokes an instance (non-static) method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling GetMethodID.

When this function is used to call private methods and constructors, the method ID must be derived from the real class of obj, not from one of its super classes.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.4 CallByteMethod(MethodID as JavaMethodMBS, args as memoryblock) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a virtual method with a byte value.
Notes: This family of operations invokes an instance (non-static) method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling GetMethodID.

When this function is used to call private methods and constructors, the method ID must be derived from the real class of obj, not from one of its super classes.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.5 CallCharMethod(MethodID as JavaMethodMBS, args as memoryblock) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a virtual method with a char value.
Notes: This family of operations invokes an instance (non-static) method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling GetMethodID.

When this function is used to call private methods and constructors, the method ID must be derived from the real class of obj, not from one of its super classes.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.6 CallDoubleMethod(MethodID as JavaMethodMBS, args as memoryblock) as Double

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a virtual method with a double value.
Notes: This family of operations invokes an instance (non-static) method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling GetMethodID.

When this function is used to call private methods and constructors, the method ID must be derived from the real class of obj, not from one of its super classes.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.7 CallFloatMethod(MethodID as JavaMethodMBS, args as memoryblock) as single

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a virtual method with a float value.
Notes: This family of operations invokes an instance (non-static) method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling GetMethodID.

When this function is used to call private methods and constructors, the method ID must be derived from the real class of obj, not from one of its super classes.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.8 CallIntMethod(MethodID as JavaMethodMBS, args as memoryblock) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a virtual method with an integer value.
Notes: This family of operations invokes an instance (non-static) method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling GetMethodID.

When this function is used to call private methods and constructors, the method ID must be derived from

the real class of obj, not from one of its super classes.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.9 CallLongMethod(MethodID as JavaMethodMBS, args as memoryblock) as Int64

MBS Java Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a virtual method with a long value.
Notes: This family of operations invokes an instance (non-static) method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling GetMethodID.

When this function is used to call private methods and constructors, the method ID must be derived from the real class of obj, not from one of its super classes.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.10 CallMethod(MethodID as JavaMethodMBS, args() as Variant) as Variant

MBS Java Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a non virtual method.
Example:

```
Var vm As JavaVMMBS // your initialized VM

// 1. Find class
Var jclass As JavaClassMBS =vm.FindClass("stringtest")

if jclass=nil then
MessageBox "Can't find stringtest class"
Return
end if
```

```
// 2. Call constructor
Var jmethod1 as JavaMethodMBS = jclass.GetMethod("<init>", "()V")

if jmethod1=nil then
MessageBox "Can't find constructor"
Return
end if

// 3. Create object
Var param1() As Variant
Var jobject1 as JavaObjectMBS=jclass.NewObject(jmethod1, param1)

if jobject1=nil then
MessageBox "Constructor failed!?"
Return
end if

// 4. lookup method
Var jmethod3 As JavaMethodMBS = jclass.GetMethod("setValue","(Ljava/lang/String;)V")
if jmethod3=nil then
MessageBox "Failed to find setValue method."
Return
end if

// 5. Call method
Var param3() As Variant
param3.Add "Hello World"
Call jobject1.CallMethod(jmethod3,param3)

MessageBox "done"
```

Notes: This call invokes an instance (non-static) method on a Java object, according to the specified class and method ID. The methodID argument must be obtained by calling GetMethodID on the class TheClass.

The CallNonvirtualMethod family of routines and the CallMethod family of routines are different. CallMethod routines invoke the method based on the class of the object, while CallNonvirtualMethod routines invoke the method based on the class, designated by the TheClass parameter, from which the method ID is obtained. The method ID must be obtained from the real class of the object or from one of its superclasses.

Programmers place all arguments to the method in an args variant array that immediately follows the methodID argument.

This is generic version, where our plugin translates between native Xojo data types and Java data types. We support conversion of boolean, byte (integer), char (integer), short (integer), int (integer), long (int64), dou-

ble, float (single) and Java objects. Objects can be JavaObjectMBS or subclasses including JavaStringMBS and the JavaArrayMBS subclasses. For your convenience you can pass in string and we convert to JavaStringMBS for you.

108.15.11 CallNonvirtualBooleanMethod(TheClass as JavaClassMBS, MethodID as JavaMethodMBS, args as memoryblock) as boolean

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a non virtual method with a boolean value.
Notes: This call invokes an instance (non-static) method on a Java object, according to the specified class and method ID. The methodID argument must be obtained by calling GetMethodID on the class TheClass.

The CallNonvirtualMethod family of routines and the CallMethod family of routines are different. CallMethod routines invoke the method based on the class of the object, while CallNonvirtualMethod routines invoke the method based on the class, designated by the TheClass parameter, from which the method ID is obtained. The method ID must be obtained from the real class of the object or from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.12 CallNonvirtualByteMethod(TheClass as JavaClassMBS, MethodID as JavaMethodMBS, args as memoryblock) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a non virtual method with a byte value.
Notes: This call invokes an instance (non-static) method on a Java object, according to the specified class and method ID. The methodID argument must be obtained by calling GetMethodID on the class TheClass.

The CallNonvirtualMethod family of routines and the CallMethod family of routines are different. CallMethod routines invoke the method based on the class of the object, while CallNonvirtualMethod routines invoke the method based on the class, designated by the TheClass parameter, from which the method ID is obtained. The method ID must be obtained from the real class of the object or from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on

platform)

108.15.13 CallNonvirtualCharMethod(TheClass as JavaClassMBS, MethodID as JavaMethodMBS, args as memoryblock) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a non virtual method with a char value.
Notes: This call invokes an instance (non-static) method on a Java object, according to the specified class and method ID. The methodID argument must be obtained by calling GetMethodID on the class TheClass.

The CallNonvirtualMethod family of routines and the CallMethod family of routines are different. CallMethod routines invoke the method based on the class of the object, while CallNonvirtualMethod routines invoke the method based on the class, designated by the TheClass parameter, from which the method ID is obtained. The method ID must be obtained from the real class of the object or from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.14 CallNonvirtualDoubleMethod(TheClass as JavaClassMBS, MethodID as JavaMethodMBS, args as memoryblock) as Double

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a non virtual method with a double value.
Notes: This call invokes an instance (non-static) method on a Java object, according to the specified class and method ID. The methodID argument must be obtained by calling GetMethodID on the class TheClass.

The CallNonvirtualMethod family of routines and the CallMethod family of routines are different. CallMethod routines invoke the method based on the class of the object, while CallNonvirtualMethod routines invoke the method based on the class, designated by the TheClass parameter, from which the method ID is obtained. The method ID must be obtained from the real class of the object or from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.15 CallNonvirtualFloatMethod(TheClass as JavaClassMBS, MethodID as JavaMethodMBS, args as memoryblock) as single

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a non virtual method with a float value.
Notes: This call invokes an instance (non-static) method on a Java object, according to the specified class and method ID. The methodID argument must be obtained by calling GetMethodID on the class TheClass.

The CallNonvirtualMethod family of routines and the CallMethod family of routines are different. CallMethod routines invoke the method based on the class of the object, while CallNonvirtualMethod routines invoke the method based on the class, designated by the TheClass parameter, from which the method ID is obtained. The method ID must be obtained from the real class of the object or from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.16 CallNonvirtualIntMethod(TheClass as JavaClassMBS, MethodID as JavaMethodMBS, args as memoryblock) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a non virtual method with an integer value.
Notes: This call invokes an instance (non-static) method on a Java object, according to the specified class and method ID. The methodID argument must be obtained by calling GetMethodID on the class TheClass.

The CallNonvirtualMethod family of routines and the CallMethod family of routines are different. CallMethod routines invoke the method based on the class of the object, while CallNonvirtualMethod routines invoke the method based on the class, designated by the TheClass parameter, from which the method ID is obtained. The method ID must be obtained from the real class of the object or from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.17 CallNonvirtualLongMethod(TheClass as JavaClassMBS, MethodID as JavaMethodMBS, args as memoryblock) as Int64

MBS Java Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a non virtual method with a long value.
Notes: This call invokes an instance (non-static) method on a Java object, according to the specified class and method ID. The methodID argument must be obtained by calling GetMethodID on the class TheClass.

The CallNonvirtualMethod family of routines and the CallMethod family of routines are different. CallMethod routines invoke the method based on the class of the object, while CallNonvirtualMethod routines invoke the method based on the class, designated by the TheClass parameter, from which the method ID is obtained. The method ID must be obtained from the real class of the object or from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.18 CallNonvirtualMethod(TheClass as JavaClassMBS, MethodID as JavaMethodMB args() as Variant) as Variant

MBS Java Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a non virtual method.
Notes: This call invokes an instance (non-static) method on a Java object, according to the specified class and method ID. The methodID argument must be obtained by calling GetMethodID on the class TheClass.

The CallNonvirtualMethod family of routines and the CallMethod family of routines are different. CallMethod routines invoke the method based on the class of the object, while CallNonvirtualMethod routines invoke the method based on the class, designated by the TheClass parameter, from which the method ID is obtained. The method ID must be obtained from the real class of the object or from one of its superclasses.

Programmers place all arguments to the method in an args variant array that immediately follows the methodID argument.

This is generic version, where our plugin translates between native Xojo data types and Java data types. We support conversion of boolean, byte (integer), char (integer), short (integer), int (integer), long (int64), double, float (single) and Java objects. Objects can be JavaObjectMBS or subclasses including JavaStringMBS and the JavaArrayMBS subclasses. For your convenience you can pass in string and we convert to JavaStringMBS for you.

108.15.19 CallNonvirtualObjectMethod(TheClass as JavaClassMBS, MethodID as JavaMethodMBS, args as memoryblock) as JavaObjectMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a non virtual method with an object value.
Notes: This call invokes an instance (non-static) method on a Java object, according to the specified class and method ID. The methodID argument must be obtained by calling GetMethodID on the class TheClass.

The CallNonvirtualMethod family of routines and the CallMethod family of routines are different. CallMethod routines invoke the method based on the class of the object, while CallNonvirtualMethod routines invoke the method based on the class, designated by the TheClass parameter, from which the method ID is obtained. The method ID must be obtained from the real class of the object or from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.20 CallNonvirtualShortMethod(TheClass as JavaClassMBS, MethodID as JavaMethodMBS, args as memoryblock) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a non virtual method with a short value.
Notes: This call invokes an instance (non-static) method on a Java object, according to the specified class and method ID. The methodID argument must be obtained by calling GetMethodID on the class TheClass.

The CallNonvirtualMethod family of routines and the CallMethod family of routines are different. CallMethod routines invoke the method based on the class of the object, while CallNonvirtualMethod routines invoke the method based on the class, designated by the TheClass parameter, from which the method ID is obtained. The method ID must be obtained from the real class of the object or from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.21 CallNonvirtualVoidMethod(TheClass as JavaClassMBS, MethodID as JavaMethodMBS, args as memoryblock)

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a non virtual method with no return value.
Notes: This call invokes an instance (non-static) method on a Java object, according to the specified class and method ID. The methodID argument must be obtained by calling GetMethodID on the class TheClass.

The CallNonvirtualMethod family of routines and the CallMethod family of routines are different. CallMethod routines invoke the method based on the class of the object, while CallNonvirtualMethod routines invoke the method based on the class, designated by the TheClass parameter, from which the method ID is obtained. The method ID must be obtained from the real class of the object or from one of its superclasses.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.22 CallObjectMethod(MethodID as JavaMethodMBS, args as memoryblock) as JavaObjectMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a virtual method with an object value.
Notes: This family of operations invokes an instance (non-static) method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling GetMethodID.

When this function is used to call private methods and constructors, the method ID must be derived from the real class of obj, not from one of its super classes.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.23 CallShortMethod(MethodID as JavaMethodMBS, args as memoryblock) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a virtual method with a short value.
Notes: This family of operations invokes an instance (non-static) method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling GetMethodID.

When this function is used to call private methods and constructors, the method ID must be derived from the real class of obj, not from one of its super classes.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.24 CallVoidMethod(MethodID as JavaMethodMBS, args as memoryblock)

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Calls a virtual method with no return value.
Notes: This family of operations invokes an instance (non-static) method on a Java object, according to the specified method ID. The methodID argument must be obtained by calling GetMethodID.

When this function is used to call private methods and constructors, the method ID must be derived from the real class of obj, not from one of its super classes.

Programmers place all arguments to the method in an args memoryblock that immediately follows the methodID argument.
In the memoryblock you need to use 8 bytes per argument and align them correctly. (alignment depends on platform)

108.15.25 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.15.26 GetDirectBufferAddress(directbuffer as JavaObjectMBS) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the address of the memory from a directbuffer object.
Notes: Returns 0 on any error.

108.15.27 GetDirectBufferCapacity(directbuffer as JavaObjectMBS) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the size of the memory from a directbuffer object.
Notes: Returns 0 on any error.

108.15.28 IsInstanceOf(TheClass as JavaClassMBS) as boolean

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Tests whether an object is an instance of a class.
Notes: Returns true if obj can be cast to TheClass; otherwise, returns false. A nil object can be cast to any class.

108.15.29 IsSameObject(obj as JavaObjectMBS) as boolean

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Tests whether two references refer to the same Java object.
Notes: Returns true if ref1 and ref2 refer to the same Java object, or are both nil; otherwise, returns false.

False on any error.

108.15.30 ObjectClass as JavaClassMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the class of an object.
Notes: Returns nil on any error.

108.15.31 Properties

108.15.32 ClassName as String

MBS Java Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries class name of object.
Notes: (Read only property)

108.15.33 Database as Variant

MBS Java Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The reference to the database object.
Notes: The variant is a JavaDatabaseMBS.
Do not assign new values, please.
This is set for all database classes, so the database isn't release from memory before you finished using this object.
(Read and Write property)

108.15.34 Handle as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The handle to the jobject.
Notes: (Read only property)

108.15.35 Lasterror as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The last error code reported.
Notes: (Read and Write property)

108.15.36 Tag as Variant

MBS Java Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: This is a property you can use for whatever you like.
Notes: The property value is stored as long as the RB object lives. The Java object may live longer.
(Read and Write property)

108.15.37 VM as JavaVMMBS

MBS Java Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The reference to the virtual machine.
Notes: Please do not assign new value unless you know what you do.
(Read and Write property)

108.15.38 BooleanField(TheField as JavaFieldMBS) as boolean

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a boolean field in this class.
Notes: Do not use for static fields!
(Read and Write computed property)

108.15.39 ByteField(TheField as JavaFieldMBS) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a byte field in this class.
Notes: Do not use for static fields!

(Read and Write computed property)

108.15.40 CharField(TheField as JavaFieldMBS) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a char field in this class.
Notes: Do not use for static fields!
(Read and Write computed property)

108.15.41 DoubleField(TheField as JavaFieldMBS) as Double

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a double field in this class.
Notes: Do not use for static fields!
(Read and Write computed property)

108.15.42 Field(TheField as JavaFieldMBS) as Variant

MBS Java Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a field in this class.
Notes: This is generic version, where our plugin translates between native Xojo data types and Java data types. We support conversion of boolean, byte (integer), char (integer), short (integer), int (integer), long (int64), double, float (single) and Java objects. Objects can be JavaObjectMBS or subclasses including JavaStringMBS and the JavaArrayMBS subclasses. For your convenience you can pass in string and we convert to JavaStringMBS for you.

Do not use for static fields!
(Read and Write computed property)

108.15.43 FloatField(TheField as JavaFieldMBS) as single

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a single field in this class.
Notes: Do not use for static fields!
(Read and Write computed property)

108.15.44 IntField(TheField as JavaFieldMBS) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for an integer field in this class.
Notes: Do not use for static fields!
(Read and Write computed property)

108.15.45 LongField(TheField as JavaFieldMBS) as Int64

MBS Java Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a long field in this class.
Notes: Do not use for static fields!
(Read and Write computed property)

108.15.46 ObjectField(TheField as JavaFieldMBS) as JavaObjectMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for an object field in this class.
Notes: Do not use for static fields!
(Read and Write computed property)

108.15.47 ShortField(TheField as JavaFieldMBS) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value for a short field in this class.
Notes: Do not use for static fields!
(Read and Write computed property)

108.16 class JavaShortArrayMBS

108.16.1 class JavaShortArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java short array object.
Notes: Subclass of the JavaArrayMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.16.2 Methods

108.16.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.16.4 Elements as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: All the elements in this array as one memoryblock.
Notes: Use memoryblock.short(index*2) to access.

108.16.5 Values as Int16()

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns a Xojo array with values.

108.16.6 Properties

108.16.7 Region(start as Integer, len as Integer) as memoryblock

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set a region of the array.
Notes: Start is the starting index (0 based) and len the number of items to copy.
Throws ArrayIndexOutOfBoundsException if (start + len - 1) does not specify a valid index in the array.
(Read and Write computed property)

108.16.8 Value(index as Integer) as Int16

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Get or set the value with given index.
Notes: May raise OutOfBoundsException if index is out of range.
(Read and Write computed property)

108.17 class JavaStringMBS

108.17.1 class JavaStringMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java string class.
Notes: Subclass of the JavaObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.17.2 Methods

108.17.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

108.17.4 CopyString as string

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use StringValue instead.
Function: Copies the content of the string into a Xojo string.
Notes: Returns "" on any error. The string returned is marked as being Unicode (16bit).
Deprecated in favor of StringValue property and auto conversion with Operator_Convert.
See also:

- 108.17.5 CopyString(start as Integer, len as Integer) as string

108.17.5 CopyString(start as Integer, len as Integer) as string

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Copies the content of the string into a Xojo string.
Example:

```
Var s as string
Var js as JavaStringMBS // your java string

s=js.CopyString(0,1) // copies first character
s=js.CopyString(3,6) // copies six characters from starting at the forth
```

Notes: Returns "" on any error. The string returned is marked as being Unicode (16bit).
For the first character to be the start use start=0.
For the first character to be the end use len=1 and start=0.
May crash on bad values for start and len.
See also:

- 108.17.4 CopyString as string 16580

108.17.6 CopyStringUTF as string

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use StringValue instead.
Function: Copies the content of the string into a Xojo string.
Notes: Returns "" on any error. The string returned is marked as being UTF8.
Deprecated in favor of StringValue property and auto conversion with Operator_Convert.
See also:

- 108.17.7 CopyStringUTF(start as Integer, len as Integer) as string 16581

108.17.7 CopyStringUTF(start as Integer, len as Integer) as string

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use CopyString instead.
Function: Copies the content of the string into a Xojo string.
Notes: Returns "" on any error. The string returned is marked as being UTF8.
Start is 0 based.
May crash on bad values for start and len.
See also:

- 108.17.6 CopyStringUTF as string 16581

108.17.8 Operator_Convert as string

MBS Java Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Converts to a string automatically.
Notes: Do not call it, just assign JavaStringMBS to a string an Xojo calls this internally.

108.17.9 UTFLength as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use StringValue instead.
Function: The length of the string in bytes encoded as UTF8.
Notes: Returns 0 on any error.

108.17.10 Properties

108.17.11 Length as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The length of this string in unicode characters.
Notes: Returns 0 on any error.
(Read only property)

108.17.12 StringValue as String

MBS Java Plugin, Plugin Version: 19.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The string value as property.
Notes: Uses UTF-8 internally.
(Read only property)

108.18 class JavaThrowableMBS

108.18.1 class JavaThrowableMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The wrapper class for the java throwable object.
Notes: Subclass of the JavaObjectMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

108.19 class JavaVMMBS

108.19.1 class JavaVMMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The class for a java virtual machine.
Example:

```
Var vm as JavaVMMBS // global

const JNI_VERSION_1_1 = &h00010001
const JNI_VERSION_1_2 = &h00010002
const JNI_VERSION_1_4 = &h00010004

if TargetLinux then
// change path for your Linux PC!
JavaVMMBS.SetLibraryPath("/home/cs/jre1.6.0_05/lib/i386/client/libjvm.so")
end if

Var options(-1) as string
Var f as FolderItem=New FolderItem("test.jar")

vm=new JavaVMMBS(JNI_VERSION_1_4, options, f, false)

if vm.Handle = 0 then
MessageBox "Can't create Java VM"
else
MessageBox "Java Initialized."
end if
```

Notes: Add Linux support plugin version 8.7.

Releasing the java vm (by releasing all java objects), and reinitializing can fail.

Please make sure this Java VM object stays alive until you are done with all your java stuff. So all the java objects go away and this vm object is destroyed on the end. Because if some java code is still running like an background java thread, quitting the VM can lead into crashes.

While the plugin supports to have several instances, it seems like JNI does not support that.

On Windows, we look into Local Machine\SOFTWARE\JavaSoft\Java Runtime Environment in registry to find the newest entry and the path to the jvm.dll file. Please note that on Windows you can install 32-bit

and 64-bit version of Java and you need the matching bit number to FileMaker application.

If you get error 126 on Windows, maybe MSVCR100.DLL is missing. So install Visual Studio 2010 runtime libraries. You can download them from Microsoft website. Do not download them from other websites spreading malware!

108.19.2 Methods

108.19.3 Constructor(path as folderitem)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Initializes the Java virtual machine.
Notes: This is a convenience function which initializes the java with version=JNI_VERSION_1_4 and no options except the specified path.
The path can be a folderitem pointing to a jar file or a folder with class files.

This method raises UnsupportedOperationException with error about missing CreateJavaVM function if there is no Java found. Either because it is not installed or the bit number (32 vs. 64) does not match.

Since version 16.5 the plugin will no longer raise exception if an existing JavaVM was found. In that case we use that JavaVM and return normally. Lasterror will be set to -5 which indicates this. In that case your

options and paths are not passed to VM.
See also:

- 108.19.4 Constructor(path as string) 16586
- 108.19.5 Constructor(version as Integer, options() as string, ignoreUnrecognizedOptions as boolean) 16587
- 108.19.6 Constructor(version as Integer, options() as string, path as folderitem, ignoreUnrecognizedOptions as boolean) 16588
- 108.19.7 Constructor(version as Integer, options() as string, path as string, ignoreUnrecognizedOptions as boolean) 16589

108.19.4 Constructor(path as string)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Initializes the Java virtual machine.
Notes: This is a convenience function which initializes the java engine with version=JNI_VERSION_1_4 and no options except the specified path.
The path can be a path pointing to a jar file or a folder with class files. If you use more than one path, you need to separate them with ";". Seems like on Mac OS X and Linux the separator is ":".

This method raises UnsupportedOperationException with error about missing CreateJavaVM function if there is no Java found. Either because it is not installed or the bit number (32 vs. 64) does not match.

Since version 16.5 the plugin will no longer raise exception if an existing JavaVM was found. In that case we use that JavaVM and return normally. Lasterror will be set to -5 which indicates this. In that case your options and paths are not passed to VM.
See also:

- 108.19.3 Constructor(path as folderitem) 16585
- 108.19.5 Constructor(version as Integer, options() as string, ignoreUnrecognizedOptions as boolean) 16587
- 108.19.6 Constructor(version as Integer, options() as string, path as folderitem, ignoreUnrecognizedOptions as boolean) 16588
- 108.19.7 Constructor(version as Integer, options() as string, path as string, ignoreUnrecognizedOptions as boolean) 16589

108.19.5 Constructor(version as Integer, options() as string, ignoreUnrecognizedOptions as boolean)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Initializes the java virtual machine.
Notes: Only one VM can run at a time with this plugin.
You can specify whatever command line options you need in the options array.
Version must be one of the JNI_VERSION_1_x constants.

A note for Mac OS X and Java versions:

To specify the current preferred JDK in a family of JVM's, say the 1.5.x family, applications should set the environment variable JAVA_JVM_VERSION to 1.5, and then pass JNI_VERSION_1_4 into JNI_CreateJavaVM as the vm_args.version. To get a specific Java 1.5 JVM, say Java 1.5.0, set the environment variable JAVA_JVM_VERSION to 1.5.0. For Java 1.6 it will be the same in that applications will need to set the environment variable JAVA_JVM_VERSION to 1.6 to specify the current preferred 1.6 Java VM, and to get a specific Java 1.6 JVM, say Java 1.6.1, set the environment variable JAVA_JVM_VERSION to 1.6.1.

To make this sample bring up the current preferred 1.5 JVM, set the environment variable JAVA_JVM_VERSION to 1.5 before calling JNI_CreateJavaVM as shown below. Applications must currently check for availability of JDK 1.5 before requesting it. If your application requires JDK 1.5 and it is not found, it is your responsibility to report an error to the user. To verify if a JVM is installed, check to see if the symlink, or directory exists for the JVM in /System/Library/Frameworks/JavaVM.framework/Versions/ before setting the environment variable JAVA_JVM_VERSION.

If the environment variable JAVA_JVM_VERSION is not set, and JNI_VERSION_1_4 is passed into JNI_CreateJavaVM as the vm_args.version, JNI_CreateJavaVM will return the current preferred JDK. Java 1.4.2 is the preferred JDK as of the release of this sample and the release of Mac OS X 10.4.

Useful option strings:

"-verbose:jni"	show debug output on the console
"-Xms256M"	initial memory
"-Xmx512M"	maximum memory

This method raises UnsupportedOperationException with error about missing CreateJavaVM function if there is no Java found. Either because it is not installed or the bit number (32 vs. 64) does not match.

Since version 16.5 the plugin will no longer raise exception if an existing JavaVM was found. In that case we use that JavaVM and return normally. Lasterror will be set to -5 which indicates this. In that case your

options and paths are not passed to VM.

If you get error 126 on Windows, maybe MSVCR100.DLL is missing. So install Visual Studio 2010 runtime libraries. You can download them from Microsoft website. Do not download them from other websites spreading malware!

108.19.6 Constructor(version as Integer, options() as string, path as folderitem, ignoreUnrecognizedOptions as boolean)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Initializes the Java virtual machine.
Example:

```
Var JarPath as folderitem = specialfolder.desktop.child("test.jar")
Var options() as string

options.Add "-Xms256M"
options.Add "-Xmx512M"

Var v as new JavaVMMBS( JavaVMMBS.JNI_VERSION_1_4, options, JarPath, false)
```

Notes: This is a convenience function which initializes the java engine with adding the given path to the options.

Only one VM can run at a time with this plugin.
You can specify whatever command line options you need in the options array.
Version must be one of the JNI_VERSION_1_x constants.
The path can be a folderitem pointing to a jar file or a folder with class files.

Useful option strings:

This method raises UnsupportedOperationException with error about missing CreateJavaVM function if

"-verbose:jni"	show debug output on the console
"-Xms256M"	initial memory
"-Xmx512M"	maximum memory

there is no Java found. Either because it is not installed or the bit number (32 vs. 64) does not match.

Since version 16.5 the plugin will no longer raise exception if an existing JavaVM was found. In that case we use that JavaVM and return normally. Lasterror will be set to -5 which indicates this. In that case your options and paths are not passed to VM.

108.19.7 Constructor(version as Integer, options() as string, path as string, ignoreUnrecognizedOptions as boolean)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Initializes the java virtual machine.
Notes: This is a convenience function which initializes the java engine with adding the given path to the options.

Only one VM can run at a time with this plugin.
You can specify whatever command line options you need in the options array.
Version must be one of the JNI_VERSION_1_x constants.
The path can be a path pointing to a jar file or a folder with class files. If you use more than one path, you need to separate them with ";". Seems like on Mac OS X and Linux the separator is ":".

108.19.8 DefineClass(name as string, Data as MemoryBlock) as JavaClassMBS

MBS Java Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Loads a class from a buffer of raw class data.
Notes: Returns nil in case of error or valid class object on success.
You may want to load a class file and pass it here as String or MemoryBlock.
To read jar file, you can use our archive classes to expand zip archives.
See also:

- 108.19.9 DefineClass(name as string, Data as String) as JavaClassMBS 16590

108.19.9 DefineClass(name as string, Data as String) as JavaClassMBS

MBS Java Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Loads a class from a buffer of raw class data.
Notes: Returns nil in case of error or valid class object on success.
You may want to load a class file and pass it here as String or MemoryBlock.
To read jar file, you can use our archive classes to expand zip archives.
See also:

- 108.19.8 DefineClass(name as string, Data as MemoryBlock) as JavaClassMBS 16590

108.19.10 FindClass(name as string) as JavaClassMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Searches a class based on the name.
Example:

```
Var e as JavaVMMBS // global
Var c as JavaClassMBS
c=e.FindClass("java/lang/String")
```

Notes: This function loads a locally defined class. It searches the directories and zip files specified by the CLASSPATH environment variable for the class with the specified name.

name: a fully qualified class name (that is, a package name, delimited by "/", followed by the class name). If the name begins with " [" (the array signature character), it returns an array class.

Returns nil on any error.

If your class is not found, it may be possible that it can't be loaded as the jar archive has dependencies to other jar archives.

108.19.11 FreeCurrentThread

MBS Java Plugin, Plugin Version: 8.4, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Releases the thread in Java.
Example:

```
Var w as JavaVMMBS // your vm object
w.FreeCurrentThread
```

Notes: The plugin is written to detect if you use it in a thread. But when the thread ends you need to deregister it with the Java runtime.

108.19.12 FromReflectedField(field as JavaObjectMBS) as JavaFieldMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Searchs the field which matches the reflected field object.

108.19.13 FromReflectedMethod(method as JavaObjectMBS) as JavaMethodMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Searchs the method which matches the reflected method object.

108.19.14 IsAssignableFrom(TheSubClass as JavaClassMBS, TheSuperClass as JavaClassMBS) as boolean

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: True if the class is assignable from the other class.
Notes: That means that the sub class is somewhere down the class tree from the super class.

108.19.15 LoadedClasses as JavaClassMBS()

MBS Java Plugin, Plugin Version: 25.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries the list of classes.
Example:

```
// show all class names

var vm as JavaVMMBS // your VM
Var arg As New MemoryBlock(8)
Var LoadedClassNames() As String
Var LoadedClasses() As JavaClassMBS = vm.LoadedClasses
For Each c As JavaClassMBS In LoadedClasses
Var jc As JavaClassMBS = c.ObjectClass
Var jm As JavaMethodMBS = jc.GetMethod("getName", "()Ljava/lang/String;")
Var jo As Variant = c.CallObjectMethod(jm, arg)
Var js As JavaStringMBS = jo
Var name As String = js.StringValue
LoadedClassNames.Add name
Next
MessageBox String.FromArray(LoadedClassNames, EndOfLine)
```

Notes: Does not include items from super class.

108.19.16 MonitorEnter(obj as JavaObjectMBS) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Enters the monitor associated with the underlying Java object referred to by obj.
Notes: Returns zero on success; otherwise, returns a negative value on failure.

Each Java objects has a monitor associated with it. If the current thread already owns the monitor associated with ref, it increments a counter in the monitor indicating the number of times this thread has entered the monitor. If the monitor associated with ref is not owned by any thread, the current thread becomes the owner of the monitor, setting the entry count of this monitor to 1. If another thread already owns the monitor associated with ref, the current thread waits until the monitor is released, then tries again to gain ownership.

108.19.17 MonitorExit(obj as JavaObjectMBS) as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Releases the monitor.
Notes: The current thread must be the owner of the monitor associated with the underlying Java object referred to by ref. The thread decrements the counter indicating the number of times it has entered this monitor. If as a result the value of the counter becomes zero, the current thread releases the montior.

Returns zero on success; otherwise, returns a negative value on failure.

108.19.18 NewBooleanArray(ref as JavaObjectMBS) as JavaBooleanArrayMBS

MBS Java Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array object based on the given java object.
Notes: This function is a convenience function to convert a java object array reference to a java array object in Xojo. It can crash if the java object used is not the array of the requested type.
See also:

- 108.19.19 NewBooleanArray(size as Integer) as JavaBooleanArrayMBS 16594
- 108.19.20 NewBooleanArray(values() as Boolean) as JavaBooleanArrayMBS 16594

108.19.19 NewBooleanArray(size as Integer) as JavaBooleanArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array for booleans with the given size.
Notes: Returns nil on any error.
See also:

- 108.19.18 NewBooleanArray(ref as JavaObjectMBS) as JavaBooleanArrayMBS 16593
- 108.19.20 NewBooleanArray(values() as Boolean) as JavaBooleanArrayMBS 16594

108.19.20 NewBooleanArray(values() as Boolean) as JavaBooleanArrayMBS

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates new boolean array with given values.
See also:

- 108.19.18 NewBooleanArray(ref as JavaObjectMBS) as JavaBooleanArrayMBS 16593
- 108.19.19 NewBooleanArray(size as Integer) as JavaBooleanArrayMBS 16594

108.19.21 NewByteArray(ref as JavaObjectMBS) as JavaByteArrayMBS

MBS Java Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array object based on the given java object.
Notes: This function is a convenience function to convert a java object array reference to a java array object in Xojo. It can crash if the java object used is not the array of the requested type.
See also:

- 108.19.22 NewByteArray(size as Integer) as JavaByteArrayMBS 16594
- 108.19.23 NewByteArray(values() as UInt8) as JavaBooleanArrayMBS 16595

108.19.22 NewByteArray(size as Integer) as JavaByteArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array for bytes with the given size.
Notes: Returns nil on any error.
See also:

- 108.19.21 NewByteArray(ref as JavaObjectMBS) as JavaByteArrayMBS 16594
- 108.19.23 NewByteArray(values() as UInt8) as JavaBooleanArrayMBS 16595

108.19.23 NewByteArray(values() as UInt8) as JavaBooleanArrayMBS

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates new byte array with given values.
See also:

- 108.19.21 NewByteArray(ref as JavaObjectMBS) as JavaByteArrayMBS 16594
- 108.19.22 NewByteArray(size as Integer) as JavaByteArrayMBS 16594

108.19.24 NewCharArray(ref as JavaObjectMBS) as JavaCharArrayMBS

MBS Java Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array object based on the given java object.
Notes: This function is a convenience function to convert a java object array reference to a java array object in Xojo. It can crash if the java object used is not the array of the requested type.
See also:

- 108.19.25 NewCharArray(size as Integer) as JavaCharArrayMBS 16595
- 108.19.26 NewCharArray(values() as UInt16) as JavaCharArrayMBS 16595

108.19.25 NewCharArray(size as Integer) as JavaCharArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array for chars (16bit) with the given size.
Notes: Returns nil on any error.
See also:

- 108.19.24 NewCharArray(ref as JavaObjectMBS) as JavaCharArrayMBS 16595
- 108.19.26 NewCharArray(values() as UInt16) as JavaCharArrayMBS 16595

108.19.26 NewCharArray(values() as UInt16) as JavaCharArrayMBS

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates new char array with given values.
See also:

- 108.19.24 NewCharArray(ref as JavaObjectMBS) as JavaCharArrayMBS 16595
- 108.19.25 NewCharArray(size as Integer) as JavaCharArrayMBS 16595

108.19.27 NewDirectByteBuffer(address as Integer, size as Integer) as JavaObjectMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new DirectBuffer object based on the values in address and size.
See also:

- 108.19.28 NewDirectByteBuffer(mem as memoryblock) as JavaObjectMBS 16596

108.19.28 NewDirectByteBuffer(mem as memoryblock) as JavaObjectMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new DirectBuffer object based on a memoryblock.
Notes: Keep the memoryblock until this object is destroyed.
See also:

- 108.19.27 NewDirectByteBuffer(address as Integer, size as Integer) as JavaObjectMBS 16596

108.19.29 NewDoubleArray(ref as JavaObjectMBS) as JavaDoubleArrayMBS

MBS Java Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array object based on the given java object.
Notes: This function is a convenience function to convert a java object array reference to a java array object in Xojo. It can crash if the java object used is not the array of the requested type.
See also:

- 108.19.30 NewDoubleArray(size as Integer) as JavaDoubleArrayMBS 16597
- 108.19.31 NewDoubleArray(values() as Double) as JavaDoubleArrayMBS 16597

108.19.30 NewDoubleArray(size as Integer) as JavaDoubleArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array for doubles with the given size.
Notes: Returns nil on any error.
See also:

- 108.19.29 NewDoubleArray(ref as JavaObjectMBS) as JavaDoubleArrayMBS 16596
- 108.19.31 NewDoubleArray(values() as Double) as JavaDoubleArrayMBS 16597

108.19.31 NewDoubleArray(values() as Double) as JavaDoubleArrayMBS

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates new double array with given values.
See also:

- 108.19.29 NewDoubleArray(ref as JavaObjectMBS) as JavaDoubleArrayMBS 16596
- 108.19.30 NewDoubleArray(size as Integer) as JavaDoubleArrayMBS 16597

108.19.32 NewFloatArray(ref as JavaObjectMBS) as JavaFloatArrayMBS

MBS Java Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array object based on the given java object.
Notes: This function is a convenience function to convert a java object array reference to a java array object in Xojo. It can crash if the java object used is not the array of the requested type.
See also:

- 108.19.33 NewFloatArray(size as Integer) as JavaFloatArrayMBS 16597
- 108.19.34 NewFloatArray(values() as Single) as JavaFloatArrayMBS 16598

108.19.33 NewFloatArray(size as Integer) as JavaFloatArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array for singles with the given size.
Notes: Returns nil on any error.
See also:

- 108.19.32 NewFloatArray(ref as JavaObjectMBS) as JavaFloatArrayMBS 16597
- 108.19.34 NewFloatArray(values() as Single) as JavaFloatArrayMBS 16598

108.19.34 NewFloatArray(values() as Single) as JavaFloatArrayMBS

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates new float array with given values.
See also:

- 108.19.32 NewFloatArray(ref as JavaObjectMBS) as JavaFloatArrayMBS 16597
- 108.19.33 NewFloatArray(size as Integer) as JavaFloatArrayMBS 16597

108.19.35 NewIntArray(ref as JavaObjectMBS) as JavaIntArrayMBS

MBS Java Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array object based on the given java object.
Notes: This function is a convenience function to convert a java object array reference to a java array object in Xojo. It can crash if the java object used is not the array of the requested type.
See also:

- 108.19.36 NewIntArray(size as Integer) as JavaIntArrayMBS 16598
- 108.19.37 NewIntArray(values() as Int32) as JavaIntArrayMBS 16598

108.19.36 NewIntArray(size as Integer) as JavaIntArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array for integers with the given size.
Notes: Returns nil on any error.
See also:

- 108.19.35 NewIntArray(ref as JavaObjectMBS) as JavaIntArrayMBS 16598
- 108.19.37 NewIntArray(values() as Int32) as JavaIntArrayMBS 16598

108.19.37 NewIntArray(values() as Int32) as JavaIntArrayMBS

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates new Int32 array with given values.
See also:

- 108.19.35 NewIntArray(ref as JavaObjectMBS) as JavaIntArrayMBS 16598
- 108.19.36 NewIntArray(size as Integer) as JavaIntArrayMBS 16598

108.19.38 NewLongArray(ref as JavaObjectMBS) as JavaLongArrayMBS

MBS Java Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array object based on the given java object.
Notes: This function is a convenience function to convert a java object array reference to a java array object in Xojo. It can crash if the java object used is not the array of the requested type.
See also:

- 108.19.39 NewLongArray(size as Integer) as JavaLongArrayMBS 16599
- 108.19.40 NewLongArray(values() as Int64) as JavaLongArrayMBS 16599

108.19.39 NewLongArray(size as Integer) as JavaLongArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array for 64 bit integers with the given size.
Notes: Returns nil on any error.
See also:

- 108.19.38 NewLongArray(ref as JavaObjectMBS) as JavaLongArrayMBS 16599
- 108.19.40 NewLongArray(values() as Int64) as JavaLongArrayMBS 16599

108.19.40 NewLongArray(values() as Int64) as JavaLongArrayMBS

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates new Int64 array with given values.
See also:

- 108.19.38 NewLongArray(ref as JavaObjectMBS) as JavaLongArrayMBS 16599
- 108.19.39 NewLongArray(size as Integer) as JavaLongArrayMBS 16599

108.19.41 NewObjectArray(ref as JavaObjectMBS) as JavaObjectArrayMBS

MBS Java Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array object based on the given java object.
Notes: This function is a convenience function to convert a java object array reference to a java array object in Xojo. It can crash if the java object used is not the array of the requested type.
See also:

- 108.19.42 NewObjectArray(size as Integer, TheClass as JavaClassMBS, InitialValue as JavaObjectMBS = nil) as JavaObjectArrayMBS 16600
- 108.19.43 NewObjectArray(values() as JavaObjectMBS) as JavaObjectArrayMBS 16600

108.19.42 NewObjectArray(size as Integer, TheClass as JavaClassMBS, InitialValue as JavaObjectMBS = nil) as JavaObjectArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Constructs a new array holding objects in class elementClass.
Notes: All elements are initially set to initialElement.
Returns nil on any error.
See also:

- 108.19.41 NewObjectArray(ref as JavaObjectMBS) as JavaObjectArrayMBS 16600
- 108.19.43 NewObjectArray(values() as JavaObjectMBS) as JavaObjectArrayMBS 16600

108.19.43 NewObjectArray(values() as JavaObjectMBS) as JavaObjectArrayMBS

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new Java object array with given size.
See also:

- 108.19.41 NewObjectArray(ref as JavaObjectMBS) as JavaObjectArrayMBS 16600
- 108.19.42 NewObjectArray(size as Integer, TheClass as JavaClassMBS, InitialValue as JavaObjectMBS = nil) as JavaObjectArrayMBS 16600

108.19.44 NewShortArray(ref as JavaObjectMBS) as JavaShortArrayMBS

MBS Java Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array object based on the given java object.
Notes: This function is a convenience function to convert a java object array reference to a java array object in Xojo. It can crash if the java object used is not the array of the requested type.
See also:

- 108.19.45 NewShortArray(size as Integer) as JavaShortArrayMBS 16601
- 108.19.46 NewShortArray(values() as Int16) as JavaShortArrayMBS 16601

108.19.45 NewShortArray(size as Integer) as JavaShortArrayMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new array for shorts with the given size.
Notes: Returns nil on any error.
See also:

- 108.19.44 NewShortArray(ref as JavaObjectMBS) as JavaShortArrayMBS 16600
- 108.19.46 NewShortArray(values() as Int16) as JavaShortArrayMBS 16601

108.19.46 NewShortArray(values() as Int16) as JavaShortArrayMBS

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates new short array with given values.
See also:

- 108.19.44 NewShortArray(ref as JavaObjectMBS) as JavaShortArrayMBS 16600
- 108.19.45 NewShortArray(size as Integer) as JavaShortArrayMBS 16601

108.19.47 NewStringArray(size as integer, InitialValue as JavaStringMBS = nil) as JavaObjectArrayMBS

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new Java string array with given size.
See also:

- 108.19.48 NewStringArray(values() as String) as JavaObjectArrayMBS 16602

108.19.48 NewStringArray(values() as String) as JavaObjectArrayMBS

MBS Java Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates new string array with given values.
See also:

- 108.19.47 NewStringArray(size as integer, InitialValue as JavaStringMBS = nil) as JavaObjectArrayMBS 16601

108.19.49 NewStringUnicode(s as string) as JavaStringMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new string.
Notes: Preferres an Unicode encoded string.

108.19.50 NewStringUTF8(s as string) as JavaStringMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. You can use NewString instead.
Function: Creates a new string.
Example:

```
// init Java
Var options() as string
Var javaVm as new JavaVMMBS(JavaVMMBS.JNI_VERSION_1_4, options, true)

// Get system class
Var system As JavaClassMBS = javaVm.FindClass("java/lang/System")

If system <>Nil Then

// query method
Var transfomerGetPropertyId as JavaMethodMBS = system.GetStaticMethod("getProperty", "(Ljava/lang/String;)Ljava/lan
If transfomerGetPropertyId <>Nil Then

// make parameters
Var keyString As JavaStringMBS = javaVm.NewStringUTF8("os.version")
Var m as New MemoryBlock(8)
m.Int64Value(0)=keyString.Handle
```

```
// run it
Var r as JavaObjectMBS = system.CallStaticObjectMethod(transfomerGetPropertyId, m)

if r<>Nil then
// show result
Var s as JavaStringMBS = JavaStringMBS(r)
MessageBox s.CopyStringUTF
end if

End If
End If
```

Notes: Preferres an UTF8 encoded string.

108.19.51 Runtime as JavaRuntimeMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the runtime object for the current VM so you can query the memory statistics.

108.19.52 SetLibraryPath(path as folderitem)

MBS Java Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Defines the path where to find the java library.
Notes: Must be called before you use the constructor.
If this is empty on Windows, we will look into registry.
If this is empty on MacOS, we ask the Java.framework for the functions.
See also:

- 108.19.53 SetLibraryPath(path as string) 16603

108.19.53 SetLibraryPath(path as string)

MBS Java Plugin, Plugin Version: 8.7, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Defines the path where to find the java library.
Example:

```
if TargetLinux then
// change path for your Linux PC!
```

```
JavaVMMBS.SetLibraryPath("/home/cs/jre1.6.0_05/lib/i386/client/libjvm.so")
end if
```

Notes: Must be called before you use the constructor.
If this is empty on Windows, we will look into registry.
If this is empty on MacOS, we ask the Java.framework for the functions.
See also:

- 108.19.52 SetLibraryPath(path as folderitem) 16603

108.19.54 ToReflectedField(TheClass as JavaClassMBS, fieldID as JavaFieldMBS, isStatic as boolean) as JavaObjectMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new reflected field object for the given field.

108.19.55 ToReflectedMethod(TheClass as JavaClassMBS, methodID as JavaMethodMBS, isStatic as boolean) as JavaObjectMBS

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new reflected method object for the given method.

108.19.56 Version as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the version of the java engine.
Notes: Currently the plugin always uses version 1.4.

Returns the major version number in the higher 16 bits and the minor version number in the lower 16 bits.

In JDK1.1, GetVersion() returns 0x00010001.

108.19.57 Properties

108.19.58 Handle as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The handle of the JavaVM.
Notes: (Read only property)

108.19.59 Lasterror as Integer

MBS Java Plugin, Plugin Version: 4.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The last error code reported.
Notes: (Read and Write property)

108.19.60 Constants

Constants

Constant	Value	Description
JNI_VERSION_1_1	&h00010001	One of the constants to specify the JNI version in the constructor.
JNI_VERSION_1_2	&h00010002	One of the constants to specify the JNI version in the constructor.
JNI_VERSION_1_4	&h00010004	One of the constants to specify the JNI version in the constructor.
JNI_VERSION_1_6	&h00010006	One of the constants to specify the JNI version in the constructor.

Chapter 109

Java Database

109.1 class JavaBlobMBS

109.1.1 class JavaBlobMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The java class for a binary large object.
Notes: Subclass of the JavaObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

109.1.2 Methods

109.1.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

109.1.4 getBytes(Position as Int64, Length as Integer) as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves all or part of the BLOB value that this Blob object represents, as an array of bytes.
Notes: This byte array contains up to length consecutive bytes starting at position pos.

pos: the ordinal position of the first byte in the BLOB value to be extracted; the first byte is at position 1
length: the number of consecutive bytes to be copied

Returns a byte array (as string) containing up to length consecutive bytes from the BLOB value designated by this Blob object, starting with the byte at position pos

109.1.5 length as int64

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Returns the number of bytes in the BLOB value designated by this Blob object.

109.1.6 position(SearchString as JavaBlobMBS, Position as Int64) as Int64

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the byte position in the BLOB value designated by this Blob object at which pattern begins. The search begins at position start.
Notes: pattern: the Blob object designating the BLOB value for which to search
start: the position in the BLOB value at which to begin searching; the first position is 1

Returns the position at which the pattern begins, else -1
See also:

- 109.1.7 position(SearchString as String, Position as Int64) as Int64 16608

109.1.7 position(SearchString as String, Position as Int64) as Int64

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the byte position at which the specified byte array pattern begins within the BLOB value that this Blob object represents.
Notes: The search for pattern begins at position start.

pattern: the byte array for which to search
start: the position at which to begin searching; the first position is 1

Returns the position at which the pattern appears, else -1
See also:

- 109.1.6 position(SearchString as JavaBlobMBS, Position as Int64) as Int64 16608

109.1.8 setBytes(Position as Int64, Value as String) as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes the given array of bytes to the BLOB value that this Blob object represents, starting at position pos, and returns the number of bytes written.
Notes: pos: the position in the BLOB object at which to start writing
bytes: the array of bytes to be written to the BLOB value that this Blob object represents

Returns the number of bytes written
See also:

- 109.1.9 setBytes(Position as Int64, Value as String, Offset as Integer, Length as Integer) as Integer 16609

109.1.9 setBytes(Position as Int64, Value as String, Offset as Integer, Length as Integer) as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes all or part of the given byte array to the BLOB value that this Blob object represents and returns the number of bytes written.
Notes: Writing starts at position pos in the BLOB value; len bytes from the given byte array are written.

pos: the position in the BLOB object at which to start writing
bytes: the array of bytes to be written to this BLOB object
offset: the offset into the array bytes at which to start reading the bytes to be set
len: the number of bytes to be written to the BLOB value from the array of bytes bytes

Returns the number of bytes written
See also:

- 109.1.8 setBytes(Position as Int64, Value as String) as Integer 16609

109.1.10 truncate(len as int64)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Truncates the BLOB value that this Blob object represents to be len bytes in length.
Notes: len: the length, in bytes, to which the BLOB value that this Blob object represents should be truncated

109.2 class JavaCallableStatementMBS

109.2.1 class JavaCallableStatementMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The Xojo class to handle a CallableStatement in Java.
Notes: The interface used to execute SQL stored procedures. The JDBC API provides a stored procedure SQL escape syntax that allows stored procedures to be called in a standard way for all RDBMSs. This escape syntax has one form that includes a result parameter and one that does not. If used, the result parameter must be registered as an OUT parameter. The other parameters can be used for input, output or both. Parameters are referred to sequentially, by number, with the first parameter being 1.

{ ?= call <procedure-name>[<arg1>,<arg2>, ...] }
{ call <procedure-name>[<arg1>,<arg2>, ...] }

IN parameter values are set using the set methods inherited from PreparedStatement. The type of all OUT parameters must be registered prior to executing the stored procedure; their values are retrieved after execution via the get methods provided here.

A CallableStatement can return one ResultSet object or multiple ResultSet objects. Multiple ResultSet objects are handled using operations inherited from Statement.

For maximum portability, a call's ResultSet objects and update counts should be processed prior to getting the values of output parameters.
Subclass of the JavaStatementMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

109.2.2 Methods

109.2.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

109.2.4 getBlob(parameterIndex as Integer) as JavaBlobMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the designated JDBC BLOB parameter as a Blob object in the Java programming language.
Notes: Parameters:
i - the first parameter is 1, the second is 2, and so on
Returns:
the parameter value as a Blob object in the Java programming language. If the value was SQL NULL, the value null is returned.
See also:

- 109.2.5 getBlob(parameterName as string) as JavaBlobMBS 16612

109.2.5 getBlob(parameterName as string) as JavaBlobMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of a JDBC BLOB parameter as a Blob object in the Java programming language.
Notes: Parameters:
parameterName - the name of the parameter
Returns:
the parameter value as a Blob object in the Java programming language. If the value was SQL NULL, the value null is returned.
See also:

- 109.2.4 getBlob(parameterIndex as Integer) as JavaBlobMBS 16612

109.2.6 getBoolean(parameterIndex as Integer) as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the designated JDBC BIT parameter as a boolean in the Java programming language.
Notes: Parameters:
parameterIndex - the first parameter is 1, the second is 2, and so on
Returns:
the parameter value. If the value is SQL NULL, the result is false.
See also:

- 109.2.7 getBoolean(parameterName as string) as boolean 16613

109.2.7 getBoolean(parameterName as string) as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of a JDBC BIT parameter as a boolean in the Java programming language.
Notes: Parameters:
parameterName - the name of the parameter
Returns:
the parameter value. If the value is SQL NULL, the result is false.
See also:

- 109.2.6 getBoolean(parameterIndex as Integer) as boolean 16612

109.2.8 getByte(parameterIndex as Integer) as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the designated JDBC TINYINT parameter as a byte in the Java programming language.
Notes: Parameters:
parameterIndex - the first parameter is 1, the second is 2, and so on
Returns:
the parameter value. If the value is SQL NULL, the result is 0.
See also:

- 109.2.9 getByte(parameterName as string) as Integer 16613

109.2.9 getByte(parameterName as string) as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of a JDBC TINYINT parameter as a byte in the Java programming language.
Notes: Parameters:
parameterName - the name of the parameter
Returns:
the parameter value. If the value is SQL NULL, the result is 0.
See also:

- 109.2.8 getByte(parameterIndex as Integer) as Integer 16613

109.2.10 getClob(parameterIndex as Integer) as JavaClobMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the designated JDBC CLOB parameter as a Clob object in the Java programming language.
Notes: Parameters:
i - the first parameter is 1, the second is 2, and so on
Returns:
the parameter value as a Clob object in the Java programming language. If the value was SQL NULL, the value null is returned.
See also:

- 109.2.11 getClob(parameterName as string) as JavaClobMBS 16614

109.2.11 getClob(parameterName as string) as JavaClobMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of a JDBC CLOB parameter as a Clob object in the Java programming language.
Notes: Parameters:
parameterName - the name of the parameter
Returns:
the parameter value as a Clob object in the Java programming language. If the value was SQL NULL, the value null is returned.
See also:

- 109.2.10 getClob(parameterIndex as Integer) as JavaClobMBS 16614

109.2.12 getDouble(parameterIndex as Integer) as Double

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the designated JDBC DOUBLE parameter as a double in the Java programming language.
Notes: Parameters:
parameterIndex - the first parameter is 1, the second is 2, and so on
Returns:
the parameter value. If the value is SQL NULL, the result is 0.
See also:

- 109.2.13 getDouble(parameterName as string) as Double 16615

109.2.13 getDouble(parameterName as string) as Double

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of a JDBC DOUBLE parameter as a double in the Java programming language.
Notes: Parameters:
parameterName - the name of the parameter
Returns:
the parameter value. If the value is SQL NULL, the result is 0.
See also:

- 109.2.12 getDouble(parameterIndex as Integer) as Double 16614

109.2.14 getFloat(parameterIndex as Integer) as single

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the designated JDBC FLOAT parameter as a float in the Java programming language.
Notes: Parameters:
parameterIndex - the first parameter is 1, the second is 2, and so on
Returns:
the parameter value. If the value is SQL NULL, the result is 0.
See also:

- 109.2.15 getFloat(parameterName as string) as single 16615

109.2.15 getFloat(parameterName as string) as single

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of a JDBC FLOAT parameter as a float in the Java programming language.
Notes: Parameters:
parameterName - the name of the parameter
Returns:
the parameter value. If the value is SQL NULL, the result is 0.
See also:

- 109.2.14 getFloat(parameterIndex as Integer) as single 16615

109.2.16 getInt(parameterIndex as Integer) as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the designated JDBC INTEGER parameter as an int in the Java programming language.
Notes: Parameters:
parameterIndex - the first parameter is 1, the second is 2, and so on
Returns:
the parameter value. If the value is SQL NULL, the result is 0.
See also:

- 109.2.17 getInt(parameterName as string) as Integer 16616

109.2.17 getInt(parameterName as string) as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of a JDBC INTEGER parameter as an int in the Java programming language.
Notes: Parameters:
parameterName - the name of the parameter
Returns:
the parameter value. If the value is SQL NULL, the result is 0.
See also:

- 109.2.16 getInt(parameterIndex as Integer) as Integer 16616

109.2.18 getLong(parameterIndex as Integer) as Int64

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the designated JDBC BIGINT parameter as a long in the Java programming language.
Notes: Parameters:
parameterIndex - the first parameter is 1, the second is 2, and so on
Returns:
the parameter value. If the value is SQL NULL, the result is 0.
See also:

- 109.2.19 getLong(parameterName as string) as Int64 16617

109.2.19 getLong(parameterName as string) as Int64

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of a JDBC BIGINT parameter as a long in the Java programming language.
Notes: Parameters:
parameterName - the name of the parameter
Returns:
the parameter value. If the value is SQL NULL, the result is 0.
See also:

- 109.2.18 getLong(parameterIndex as Integer) as Int64 16616

109.2.20 getShort(parameterIndex as Integer) as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the designated JDBC SMALLINT parameter as a short in the Java programming language.
Notes: Parameters:
parameterIndex - the first parameter is 1, the second is 2, and so on
Returns:
the parameter value. If the value is SQL NULL, the result is 0.
See also:

- 109.2.21 getShort(parameterName as string) as Integer 16617

109.2.21 getShort(parameterName as string) as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of a JDBC SMALLINT parameter as a short in the Java programming language.
Notes: Parameters:
parameterName - the name of the parameter
Returns:
the parameter value. If the value is SQL NULL, the result is 0.
See also:

- 109.2.20 getShort(parameterIndex as Integer) as Integer 16617

109.2.22 getString(parameterIndex as Integer) as String

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of the designated JDBC CHAR, VARCHAR, or LONGVARCHAR parameter as a String in the Java programming language.
Notes: For the fixed-length type JDBC CHAR, the String object returned has exactly the same value the JDBC CHAR value had in the database, including any padding added by the database.

Parameters:
parameterIndex - the first parameter is 1, the second is 2, and so on
Returns:
the parameter value. If the value is SQL NULL, the result is null.
See also:

- 109.2.23 getString(parameterName as string) as String 16618

109.2.23 getString(parameterName as string) as String

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the value of a JDBC CHAR, VARCHAR, or LONGVARCHAR parameter as a String in the Java programming language.
Notes: For the fixed-length type JDBC CHAR, the String object returned has exactly the same value the JDBC CHAR value had in the database, including any padding added by the database.

Parameters:
parameterName - the name of the parameter
Returns:
the parameter value. If the value is SQL NULL, the result is null.
See also:

- 109.2.22 getString(parameterIndex as Integer) as String 16618

109.2.24 registerOutParameter(parameterIndex as Integer, sqlType as Integer)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Registers the OUT parameter in ordinal position parameterIndex to the JDBC type sqlType.
Notes: All OUT parameters must be registered before a stored procedure is executed.
The JDBC type specified by sqlType for an OUT parameter determines the Java type that must be used in the get method to read the value of that parameter.

If the JDBC type expected to be returned to this output parameter is specific to this particular database, sqlType should be java.sql.Types.OTHER. The method getObject(int) retrieves the value.

parameterIndex - the first parameter is 1, the second is 2, and so on
sqlType - the JDBC type code defined by java.sql.Types. If the parameter is of JDBC type NUMERIC or DECIMAL, the version of registerOutParameter that accepts a scale value should be used.
See also:

- 109.2.25 registerOutParameter(parameterIndex as Integer, sqlType as Integer, scale as Integer) 16619
- 109.2.26 registerOutParameter(parameterIndex as Integer, sqlType as Integer, typeName as string) 16620
- 109.2.27 registerOutParameter(parameterName as string, sqlType as Integer) 16620
- 109.2.28 registerOutParameter(parameterName as string, sqlType as Integer, scale as Integer) 16621
- 109.2.29 registerOutParameter(parameterName as string, sqlType as Integer, typeName as string) 16622

109.2.25 registerOutParameter(parameterIndex as Integer, sqlType as Integer, scale as Integer)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Registers the parameter in ordinal position parameterIndex to be of JDBC type sqlType.
Notes: This method must be called before a stored procedure is executed.
The JDBC type specified by sqlType for an OUT parameter determines the Java type that must be used in the get method to read the value of that parameter.

This version of registerOutParameter should be used when the parameter is of JDBC type NUMERIC or DECIMAL.

parameterIndex - the first parameter is 1, the second is 2, and so on
sqlType - the SQL type code defined by java.sql.Types.
scale - the desired number of digits to the right of the decimal point. It must be greater than or equal to zero.
See also:

- 109.2.24 registerOutParameter(parameterIndex as Integer, sqlType as Integer) 16618
- 109.2.26 registerOutParameter(parameterIndex as Integer, sqlType as Integer, typeName as string) 16620
- 109.2.27 registerOutParameter(parameterName as string, sqlType as Integer) 16620
- 109.2.28 registerOutParameter(parameterName as string, sqlType as Integer, scale as Integer) 16621

- 109.2.29 registerOutParameter(parameterName as string, sqlType as Integer, typeName as string) 16622

109.2.26 registerOutParameter(parameterIndex as Integer, sqlType as Integer, typeName as string)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Registers the designated output parameter.
Notes: This version of the method registerOutParameter should be used for a user-defined or REF output parameter. Examples of user-defined types include: STRUCT, DISTINCT, JAVA_OBJECT, and named array types. Before executing a stored procedure call, you must explicitly call registerOutParameter to register the type from java.sql.Types for each OUT parameter. For a user-defined parameter, the fully-qualified SQL type name of the parameter should also be given, while a REF parameter requires that the fully-qualified type name of the referenced type be given. A JDBC driver that does not need the type code and type name information may ignore it. To be portable, however, applications should always provide these values for user-defined and REF parameters. Although it is intended for user-defined and REF parameters, this method may be used to register a parameter of any JDBC type. If the parameter does not have a user-defined or REF type, the typeName parameter is ignored.
Note: When reading the value of an out parameter, you must use the getter method whose Java type corresponds to the parameter's registered SQL type.

Parameters:
paramIndex - the first parameter is 1, the second is 2,...
sqlType - a value from Types
typeName - the fully-qualified name of an SQL structured type
See also:

- 109.2.24 registerOutParameter(parameterIndex as Integer, sqlType as Integer) 16618
- 109.2.25 registerOutParameter(parameterIndex as Integer, sqlType as Integer, scale as Integer) 16619
- 109.2.27 registerOutParameter(parameterName as string, sqlType as Integer) 16620
- 109.2.28 registerOutParameter(parameterName as string, sqlType as Integer, scale as Integer) 16621
- 109.2.29 registerOutParameter(parameterName as string, sqlType as Integer, typeName as string) 16622

109.2.27 registerOutParameter(parameterName as string, sqlType as Integer)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Registers the OUT parameter named parameterName to the JDBC type sqlType.
Notes: Registers the OUT parameter named parameterName to the JDBC type sqlType. All OUT parameters must be registered before a stored procedure is executed.

The JDBC type specified by sqlType for an OUT parameter determines the Java type that must be used in the get method to read the value of that parameter.

If the JDBC type expected to be returned to this output parameter is specific to this particular database, sqlType should be java.sql.Types.OTHER. The method getObject(int) retrieves the value.

Parameters:
parameterName - the name of the parameter
sqlType - the JDBC type code defined by java.sql.Types. If the parameter is of JDBC type NUMERIC or DECIMAL, the version of registerOutParameter that accepts a scale value should be used.
See also:

- 109.2.24 registerOutParameter(parameterIndex as Integer, sqlType as Integer) 16618
- 109.2.25 registerOutParameter(parameterIndex as Integer, sqlType as Integer, scale as Integer) 16619
- 109.2.26 registerOutParameter(parameterIndex as Integer, sqlType as Integer, typeName as string) 16620
- 109.2.28 registerOutParameter(parameterName as string, sqlType as Integer, scale as Integer) 16621
- 109.2.29 registerOutParameter(parameterName as string, sqlType as Integer, typeName as string) 16622

109.2.28 registerOutParameter(parameterName as string, sqlType as Integer, scale as Integer)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Registers the parameter named parameterName to be of JDBC type sqlType.
Notes: This method must be called before a stored procedure is executed.
The JDBC type specified by sqlType for an OUT parameter determines the Java type that must be used in the get method to read the value of that parameter.

This version of registerOutParameter should be used when the parameter is of JDBC type NUMERIC or DECIMAL.

Parameters:
parameterName - the name of the parameter
sqlType - SQL type code defined by java.sql.Types.
scale - the desired number of digits to the right of the decimal point. It must be greater than or equal to zero.
See also:

- 109.2.24 registerOutParameter(parameterIndex as Integer, sqlType as Integer) 16618

- 109.2.25 registerOutParameter(parameterIndex as Integer, sqlType as Integer, scale as Integer) 16619
- 109.2.26 registerOutParameter(parameterIndex as Integer, sqlType as Integer, typeName as string) 16620
- 109.2.27 registerOutParameter(parameterName as string, sqlType as Integer) 16620
- 109.2.29 registerOutParameter(parameterName as string, sqlType as Integer, typeName as string) 16622

109.2.29 registerOutParameter(parameterName as string, sqlType as Integer, typeName as string)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Registers the designated output parameter.
Notes: This version of the method registerOutParameter should be used for a user-named or REF output parameter. Examples of user-named types include: STRUCT, DISTINCT, JAVA_OBJECT, and named array types. Before executing a stored procedure call, you must explicitly call registerOutParameter to register the type from java.sql.Types for each OUT parameter. For a user-named parameter the fully-qualified SQL type name of the parameter should also be given, while a REF parameter requires that the fully-qualified type name of the referenced type be given. A JDBC driver that does not need the type code and type name information may ignore it. To be portable, however, applications should always provide these values for user-named and REF parameters. Although it is intended for user-named and REF parameters, this method may be used to register a parameter of any JDBC type. If the parameter does not have a user-named or REF type, the typeName parameter is ignored.
Note: When reading the value of an out parameter, you must use the getXXX method whose Java type XXX corresponds to the parameter's registered SQL type.

Parameters:
parameterName - the name of the parameter
sqlType - a value from Types
typeName - the fully-qualified name of an SQL structured type
See also:

- 109.2.24 registerOutParameter(parameterIndex as Integer, sqlType as Integer) 16618
- 109.2.25 registerOutParameter(parameterIndex as Integer, sqlType as Integer, scale as Integer) 16619
- 109.2.26 registerOutParameter(parameterIndex as Integer, sqlType as Integer, typeName as string) 16620
- 109.2.27 registerOutParameter(parameterName as string, sqlType as Integer) 16620
- 109.2.28 registerOutParameter(parameterName as string, sqlType as Integer, scale as Integer) 16621

109.2.30 setBoolean(parameterName as string, x as boolean)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the designated parameter to the given Java boolean value.
Notes: The driver converts this to an SQL BIT value when it sends it to the database.
Parameters:
parameterName - the name of the parameter
x - the parameter value

109.2.31 setByte(parameterName as string, x as Integer)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the designated parameter to the given Java byte value.
Notes: The driver converts this to an SQL TINYINT value when it sends it to the database.
Parameters:
parameterName - the name of the parameter
x - the parameter value

109.2.32 setDouble(parameterName as string, x as Double)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the designated parameter to the given Java double value.
Notes: The driver converts this to an SQL DOUBLE value when it sends it to the database.
Parameters:
parameterName - the name of the parameter
x - the parameter value

109.2.33 setFloat(parameterName as string, x as single)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the designated parameter to the given Java float value.
Notes: The driver converts this to an SQL FLOAT value when it sends it to the database.
Parameters:
parameterName - the name of the parameter

x - the parameter value

109.2.34 setInt(parameterName as string, x as Integer)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the designated parameter to the given Java int value.
Notes: The driver converts this to an SQL INTEGER value when it sends it to the database.
Parameters:
parameterName - the name of the parameter
x - the parameter value

109.2.35 setLong(parameterName as string, x as int64)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the designated parameter to the given Java long value.
Notes: The driver converts this to an SQL BIGINT value when it sends it to the database.
Parameters:
parameterName - the name of the parameter
x - the parameter value

109.2.36 setNull(parameterName as string, sqlType as Integer)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the designated parameter to SQL NULL.
Notes: Note: You must specify the parameter's SQL type.

Parameters:
parameterName - the name of the parameter
sqlType - the SQL type code defined in java.sql.Types
See also:

- 109.2.37 setNull(parameterName as string, sqlType as Integer, typeName as string)

109.2.37 setNull(parameterName as string, sqlType as Integer, typeName as string)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the designated parameter to SQL NULL.
Notes: This version of the method setNull should be used for user-defined types and REF type parameters. Examples of user-defined types include: STRUCT, DISTINCT, JAVA_OBJECT, and named array types. Note: To be portable, applications must give the SQL type code and the fully-qualified SQL type name when specifying a NULL user-defined or REF parameter. In the case of a user-defined type the name is the type name of the parameter itself. For a REF parameter, the name is the type name of the referenced type. If a JDBC driver does not need the type code or type name information, it may ignore it. Although it is intended for user-defined and Ref parameters, this method may be used to set a null parameter of any JDBC type. If the parameter does not have a user-defined or REF type, the given typeName is ignored.

Parameters:
parameterName - the name of the parameter
sqlType - a value from java.sql.Types
typeName - the fully-qualified name of an SQL user-defined type; ignored if the parameter is not a user-defined type or SQL REF value
See also:

- 109.2.36 setNull(parameterName as string, sqlType as Integer) 16624

109.2.38 setShort(parameterName as string, x as Integer)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the designated parameter to the given Java short value.
Notes: The driver converts this to an SQL SMALLINT value when it sends it to the database.
Parameters:
parameterName - the name of the parameter
x - the parameter value

109.2.39 setString(parameterName as string, x as string)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets the designated parameter to the given Java String value.
Notes: The driver converts this to an SQL VARCHAR or LONGVARCHAR value (depending on the argument's size relative to the driver's limits on VARCHAR values) when it sends it to the database.
Parameters:

parameterName - the name of the parameter
x - the parameter value

109.2.40 wasNull as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether the last OUT parameter read had the value of SQL NULL.
Notes: Note that this method should be called only after calling a getter method; otherwise, there is no value to use in determining whether it is null or not.

Returns:
true if the last parameter read was SQL NULL; false otherwise

109.3 class JavaClobMBS

109.3.1 class JavaClobMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The java class for large character objects.
Notes: Subclass of the JavaObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

109.3.2 Methods

109.3.3 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

109.3.4 getSubString(Position as int64, Length as Integer) as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a copy of the specified substring in the CLOB value designated by this Clob object.
Notes: The substring begins at position pos and has up to length consecutive characters.

Parameters:
pos: the first character of the substring to be extracted. The first character is at position 1.
length: the number of consecutive characters to be copied

Returns a String that is the specified substring in the CLOB value designated by this Clob object

109.3.5 length as int64

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the number of characters in the CLOB value designated by this Clob object.
Notes: Returns length of the CLOB in characters.

109.3.6 position(SearchString as JavaClobMBS, Start as Int64) as Int64

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the character position at which the specified Clob object searchstr appears in this Clob object.
Notes: The search begins at position start.

SearchString: the Clob object for which to search
start: the position at which to begin searching; the first position is 1

Returns the position at which the Clob object appears or -1 if it is not present; the first position is 1
See also:

- 109.3.7 position(SearchString as String, Start as Int64) as Int64 16628

109.3.7 position(SearchString as String, Start as Int64) as Int64

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the character position at which the specified substring searchstr appears in the SQL CLOB value represented by this Clob object.
Notes: The search begins at position start.

searchstr: the substring for which to search
start: the position at which to begin searching; the first position is 1

Returns the position at which the substring appears or -1 if it is not present; the first position is 1
See also:

- 109.3.6 position(SearchString as JavaClobMBS, Start as Int64) as Int64 16628

109.3.8 setString(Position as Int64, Value as String) as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes the given Java String to the CLOB value that this Clob object designates at the position pos.

Notes: Position: the position at which to start writing to the CLOB value that this Clob object represents
Value: the string to be written to the CLOB value that this Clob designates

Returns the number of characters written
See also:

- 109.3.9 setString(Position as Int64, Value as String, Offset as Integer, Length as Integer) as Integer 16629

109.3.9 setString(Position as Int64, Value as String, Offset as Integer, Length as Integer) as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes Length characters of Value, starting at character offset, to the CLOB value that this Clob represents.
Notes: Position: the position at which to start writing to this CLOB object
Value: the string to be written to the CLOB value that this Clob object represents
Offset: the offset into str to start reading the characters to be written
Length: the number of characters to be written

Returns the number of characters written
See also:

- 109.3.8 setString(Position as Int64, Value as String) as Integer 16628

109.3.10 truncate(len as int64)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Truncates the CLOB value that this Clob designates to have a length of len characters.
Notes: len: the length, in bytes, to which the CLOB value should be truncated

109.4 class JavaConnectionMBS

109.4.1 class JavaConnectionMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The class for a java connection.
Example:

```
// insert two records in a transaction over a JDBC connection
// conn is a JavaConnectionMBS from JavaDatabaseMBS.getConnection, see there
Var conn As JavaConnectionMBS // your connection
If conn = Nil Then Return

conn.AutoCommit = False
Var statement As JavaPreparedStatementMBS = conn.prepareStatement("INSERT INTO customers (name, city) VALUES (?, ?)")
statement.setString(1, "Miller")
statement.setString(2, "Berlin")
Call statement.executeUpdate
statement.setString(1, "Smith")
statement.setString(2, "London")
Call statement.executeUpdate
conn.commit
conn.AutoCommit = True
```

Notes: Subclass of the JavaObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.
Blog Entries

- Encrypted Access database in Xojo
- MBS Real Studio Plugins, version 11.3pr11

109.4.2 Methods

109.4.3 clearWarnings

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Clears all warnings reported for this Connection object.
Notes: After a call to this method, the method getWarnings returns null until a new warning is reported for this Connection object.

109.4.4 close

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Releases this Connection object's database and JDBC resources immediately instead of waiting for them to be automatically released.

109.4.5 CLOSE_CURSORS_AT_COMMIT as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant indicating that ResultSet objects should be closed when the method Connection.commit is called.

109.4.6 commit

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Makes all changes made since the previous commit/rollback permanent and releases any database locks currently held by the Connection.
Notes: See the java documentation for details on java.sql.Connection.Commit.

109.4.7 CONCUR_READ_ONLY as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant indicating the concurrency mode for a ResultSet object that may NOT be updated.

109.4.8 CONCUR_UPDATABLE as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant indicating the concurrency mode for a ResultSet object that may be updated.

109.4.9 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

109.4.10 createBlob as JavaBlobMBS

MBS Java Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Constructs an object that implements the Blob interface.
Notes: The object returned initially contains no data. The setBinaryStream and setBytes methods of the Blob interface may be used to add data to the Blob.

109.4.11 createClob as JavaClobMBS

MBS Java Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Constructs an object that implements the Clob interface.
Notes: The object returned initially contains no data. The setAsciiStream, setCharacterStream and setString methods of the Clob interface may be used to add data to the Clob.

109.4.12 createStatement as JavaStatementMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a Statement object for sending SQL statements to the database.
Notes: SQL statements without parameters are normally executed using Statement objects. If the same SQL statement is executed many times, it may be more efficient to use a PreparedStatement object.
Result sets created using the returned Statement object will by default be type TYPE_FORWARD_ONLY and have a concurrency level of CONCUR_READ_ONLY.

Returns:
a new default Statement object
See also:

- 109.4.13 createStatement(resultSetType as Integer, resultSetConcurrency as Integer) as JavaStatementMBS

- 109.4.14 createStatement(resultSetType as Integer, resultSetConcurrency as Integer, resultSetHoldability as Integer) as JavaStatementMBS 16633

109.4.13 createStatement(resultSetType as Integer, resultSetConcurrency as Integer) as JavaStatementMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a Statement object that will generate ResultSet objects with the given type and concurrency.
Notes: This method is the same as the createStatement method above, but it allows the default result set type and concurrency to be overridden.
Parameters:
resultSetType - a result set type; one of ResultSet.TYPE_FORWARD_ONLY, ResultSet.TYPE_SCROLL_INSENSITIVE, or ResultSet.TYPE_SCROLL_SENSITIVE
resultSetConcurrency - a concurrency type; one of ResultSet.CONCUR_READ_ONLY or ResultSet.CONCUR_UPDATABLE
Returns:
a new Statement object that will generate ResultSet objects with the given type and concurrency
See also:

- 109.4.12 createStatement as JavaStatementMBS 16632
- 109.4.14 createStatement(resultSetType as Integer, resultSetConcurrency as Integer, resultSetHoldability as Integer) as JavaStatementMBS 16633

109.4.14 createStatement(resultSetType as Integer, resultSetConcurrency as Integer, resultSetHoldability as Integer) as JavaStatementMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a Statement object that will generate ResultSet objects with the given type, concurrency, and holdability.
Notes: This method is the same as the createStatement method above, but it allows the default result set type, concurrency, and holdability to be overridden.
Parameters:
resultSetType - one of the following ResultSet constants: ResultSet.TYPE_FORWARD_ONLY, ResultSet.TYPE_SCROLL_INSENSITIVE, or ResultSet.TYPE_SCROLL_SENSITIVE
resultSetConcurrency - one of the following ResultSet constants: ResultSet.CONCUR_READ_ONLY or ResultSet.CONCUR_UPDATABLE
resultSetHoldability - one of the following ResultSet constants: ResultSet.HOLD_CURSORS_OVER_COMMIT or ResultSet.CLOSE_CURSORS_AT_COMMIT
Returns:
a new Statement object that will generate ResultSet objects with the given type, concurrency, and holdabil-

ity
See also:

- 109.4.12 createStatement as JavaStatementMBS 16632
- 109.4.13 createStatement(resultSetType as Integer, resultSetConcurrency as Integer) as JavaStatementMBS 16633

109.4.15 FETCH_FORWARD as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant indicating that the rows in a result set will be processed in a forward direction; first-to-last.
Notes: This constant is used by the method setFetchDirection as a hint to the driver, which the driver may ignore.

109.4.16 FETCH_REVERSE as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant indicating that the rows in a result set will be processed in a reverse direction; last-to-first.
Notes: This constant is used by the method setFetchDirection as a hint to the driver, which the driver may ignore.

109.4.17 FETCH_UNKNOWN as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant indicating that the order in which rows in a result set will be processed is unknown.
Notes: This constant is used by the method setFetchDirection as a hint to the driver, which the driver may ignore.

109.4.18 getMetaData as JavaDatabaseMetaDataMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a DatabaseMetaData object that contains metadata about the database to which this Connection object represents a connection.
Notes: The metadata includes information about the database's tables, its supported SQL grammar, its stored procedures, the capabilities of this connection, and so on.
Returns:
a DatabaseMetaData object for this Connection object

109.4.19 HOLD_CURSORS_OVER_COMMIT as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant indicating that ResultSet objects should not be closed when the method Connection.commit is called.

109.4.20 isClosed as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether this Connection object has been closed.
Notes: A connection is closed if the method close has been called on it or if certain fatal errors have occurred. This method is guaranteed to return true only when it is called after the method Connection.close has been called.
This method generally cannot be called to determine whether a connection to a database is valid or invalid. A typical client can determine that a connection is invalid by catching any exceptions that might be thrown when an operation is attempted.

Returns:
true if this Connection object is closed; false if it is still open

109.4.21 nativeSQL(sql as string) as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Converts the given SQL statement into the system's native SQL grammar.
Notes: A driver may convert the JDBC SQL grammar into its system's native SQL grammar prior to sending it. This method returns the native form of the statement that the driver would have sent.
Parameters:
sql - an SQL statement that may contain one or more '?' parameter placeholders
Returns:

the native form of this statement

109.4.22 prepareCall(sql as string) as JavaCallableStatementMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a CallableStatement object for calling database stored procedures.
Notes: The CallableStatement object provides methods for setting up its IN and OUT parameters, and methods for executing the call to a stored procedure.
Note: This method is optimized for handling stored procedure call statements. Some drivers may send the call statement to the database when the method prepareCall is done; others may wait until the CallableStatement object is executed. This has no direct effect on users; however, it does affect which method throws certain SQLExceptions.

Result sets created using the returned CallableStatement object will by default be type TYPE_FORWARD_ONLY and have a concurrency level of CONCUR_READ_ONLY.

Parameters:
sql - an SQL statement that may contain one or more '?' parameter placeholders. Typically this statement is a JDBC function call escape string.
Returns:
a new default CallableStatement object containing the pre-compiled SQL statement
See also:

- 109.4.23 prepareCall(sql as string, resultSetType as Integer, resultSetConcurrency as Integer) as JavaCallableStatementMBS 16636
- 109.4.24 prepareCall(sql as string, resultSetType as Integer, resultSetConcurrency as Integer, resultSetHoldability as Integer) as JavaCallableStatementMBS 16637

109.4.23 prepareCall(sql as string, resultSetType as Integer, resultSetConcurrency as Integer) as JavaCallableStatementMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a CallableStatement object that will generate ResultSet objects with the given type and concurrency.
Notes: This method is the same as the prepareCall method above, but it allows the default result set type and concurrency to be overridden.
Parameters:
sql - a String object that is the SQL statement to be sent to the database; may contain on or more ? parameters

resultSetType - a result set type; one of ResultSet.TYPE_FORWARD_ONLY, ResultSet.TYPE_SCROLL_INSENSITIVE, or ResultSet.TYPE_SCROLL_SENSITIVE
resultSetConcurrency - a concurrency type; one of ResultSet.CONCUR_READ_ONLY or ResultSet.CONCUR_UPDATABLE
Returns:
a new CallableStatement object containing the pre-compiled SQL statement that will produce ResultSet objects with the given type and concurrency
See also:

- 109.4.22 prepareCall(sql as string) as JavaCallableStatementMBS 16636
- 109.4.24 prepareCall(sql as string, resultSetType as Integer, resultSetConcurrency as Integer, resultSetHoldability as Integer) as JavaCallableStatementMBS 16637

109.4.24 prepareCall(sql as string, resultSetType as Integer, resultSetConcurrency as Integer, resultSetHoldability as Integer) as JavaCallableStatementMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a CallableStatement object that will generate ResultSet objects with the given type and concurrency.
Notes: This method is the same as the prepareCall method above, but it allows the default result set type, result set concurrency type and holdability to be overridden.
Parameters:
sql - a String object that is the SQL statement to be sent to the database; may contain on or more ? parameters
resultSetType - one of the following ResultSet constants: ResultSet.TYPE_FORWARD_ONLY, ResultSet.TYPE_SCROLL_INSENSITIVE, or ResultSet.TYPE_SCROLL_SENSITIVE
resultSetConcurrency - one of the following ResultSet constants: ResultSet.CONCUR_READ_ONLY or ResultSet.CONCUR_UPDATABLE
resultSetHoldability - one of the following ResultSet constants: ResultSet.HOLD_CURSORS_OVER_COMMIT or ResultSet.CLOSE_CURSORS_AT_COMMIT
Returns:
a new CallableStatement object, containing the pre-compiled SQL statement, that will generate ResultSet objects with the given type, concurrency, and holdability
See also:

- 109.4.22 prepareCall(sql as string) as JavaCallableStatementMBS 16636
- 109.4.23 prepareCall(sql as string, resultSetType as Integer, resultSetConcurrency as Integer) as JavaCallableStatementMBS 16636

109.4.25 prepareStatement(sql as string) as JavaPreparedStatementMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a PreparedStatement object for sending parameterized SQL statements to the database.
Notes: A SQL statement with or without IN parameters can be pre-compiled and stored in a PreparedStatement object. This object can then be used to efficiently execute this statement multiple times.

Note: This method is optimized for handling parametric SQL statements that benefit from precompilation. If the driver supports precompilation, the method prepareStatement will send the statement to the database for precompilation. Some drivers may not support precompilation. In this case, the statement may not be sent to the database until the PreparedStatement object is executed. This has no direct effect on users; however, it does affect which methods throw certain SQLException objects.

Result sets created using the returned PreparedStatement object will by default be type TYPE_FORWARD_ONLY and have a concurrency level of CONCUR_READ_ONLY.

Parameters:
sql - an SQL statement that may contain one or more '?' IN parameter placeholders
See also:

- 109.4.26 prepareStatement(sql as string, autoGeneratedKeys as Integer) as JavaPreparedStatementMBS 16638
- 109.4.27 prepareStatement(sql as string, resultSetType as Integer, resultSetConcurrency as Integer) as JavaPreparedStatementMBS 16639
- 109.4.28 prepareStatement(sql as string, resultSetType as Integer, resultSetConcurrency as Integer, resultSetHoldability as Integer) as JavaPreparedStatementMBS 16640

109.4.26 prepareStatement(sql as string, autoGeneratedKeys as Integer) as JavaPreparedStatementMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a default PreparedStatement object that has the capability to retrieve auto-generated keys.
Notes: The given constant tells the driver whether it should make auto-generated keys available for retrieval. This parameter is ignored if the SQL statement is not an INSERT statement.
Note: This method is optimized for handling parametric SQL statements that benefit from precompilation. If the driver supports precompilation, the method prepareStatement will send the statement to the database for precompilation. Some drivers may not support precompilation. In this case, the statement may not be sent to the database until the PreparedStatement object is executed. This has no direct effect on users; however, it does affect which methods throw certain SQLExceptions.

Result sets created using the returned PreparedStatement object will by default be type TYPE_FORWARD_ONLY and have a concurrency level of CONCUR_READ_ONLY.

Parameters:
sql - an SQL statement that may contain one or more '?' IN parameter placeholders
autoGeneratedKeys - a flag indicating whether auto-generated keys should be returned; one of Statement.RETURN_GENERATED_KEYS or Statement.NO_GENERATED_KEYS
Returns:
a new PreparedStatement object, containing the pre-compiled SQL statement, that will have the capability of returning auto-generated keys
See also:

- 109.4.25 prepareStatement(sql as string) as JavaPreparedStatementMBS 16638
- 109.4.27 prepareStatement(sql as string, resultSetType as Integer, resultSetConcurrency as Integer) as JavaPreparedStatementMBS 16639
- 109.4.28 prepareStatement(sql as string, resultSetType as Integer, resultSetConcurrency as Integer, resultSetHoldability as Integer) as JavaPreparedStatementMBS 16640

109.4.27 prepareStatement(sql as string, resultSetType as Integer, resultSetConcurrency as Integer) as JavaPreparedStatementMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a PreparedStatement object that will generate ResultSet objects with the given type and concurrency.
Notes: This method is the same as the prepareStatement method above, but it allows the default result set type and concurrency to be overridden.
Parameters:
sql - a String object that is the SQL statement to be sent to the database; may contain one or more ? IN parameters
resultSetType - a result set type; one of ResultSet.TYPE_FORWARD_ONLY, ResultSet.TYPE_SCROLL_INSENSITIVE, or ResultSet.TYPE_SCROLL_SENSITIVE
resultSetConcurrency - a concurrency type; one of ResultSet.CONCUR_READ_ONLY or ResultSet.CONCUR_UPDATABLE
Returns:
a new PreparedStatement object containing the pre-compiled SQL statement that will produce ResultSet objects with the given type and concurrency
See also:

- 109.4.25 prepareStatement(sql as string) as JavaPreparedStatementMBS 16638
- 109.4.26 prepareStatement(sql as string, autoGeneratedKeys as Integer) as JavaPreparedStatementMBS 16638
- 109.4.28 prepareStatement(sql as string, resultSetType as Integer, resultSetConcurrency as Integer, resultSetHoldability as Integer) as JavaPreparedStatementMBS 16640

109.4.28 prepareStatement(sql as string, resultSetType as Integer, resultSetConcurrency as Integer, resultSetHoldability as Integer) as JavaPreparedStatementMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a PreparedStatement object that will generate ResultSet objects with the given type, concurrency, and holdability.
Notes: This method is the same as the prepareStatement method above, but it allows the default result set type, concurrency, and holdability to be overridden.

Parameters:
sql - a String object that is the SQL statement to be sent to the database; may contain one or more ? IN parameters
resultSetType - one of the following ResultSet constants: ResultSet.TYPE_FORWARD_ONLY, ResultSet.TYPE_SCROLL_INSENSITIVE, or ResultSet.TYPE_SCROLL_SENSITIVE
resultSetConcurrency - one of the following ResultSet constants: ResultSet.CONCUR_READ_ONLY or ResultSet.CONCUR_UPDATABLE
resultSetHoldability - one of the following ResultSet constants: ResultSet.HOLD_CURSORS_OVER_COMMIT or ResultSet.CLOSE_CURSORS_AT_COMMIT
Returns:
a new PreparedStatement object, containing the pre-compiled SQL statement, that will generate ResultSet objects with the given type, concurrency, and holdability
See also:

- 109.4.25 prepareStatement(sql as string) as JavaPreparedStatementMBS 16638
- 109.4.26 prepareStatement(sql as string, autoGeneratedKeys as Integer) as JavaPreparedStatementMBS 16638
- 109.4.27 prepareStatement(sql as string, resultSetType as Integer, resultSetConcurrency as Integer) as JavaPreparedStatementMBS 16639

109.4.29 releaseSavepoint(safepoint as JavaSavepointMBS)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Removes the given Savepoint object from the current transaction.
Notes: Any reference to the savepoint after it have been removed will cause an SQLException to be thrown.

savepoint: the Savepoint object to be removed

109.4.30 rollback

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Drops all changes made since the previous commit/rollback and releases any database locks currently held by this Connection.
Notes: This method should be used only when auto- commit has been disabled.

See the java documentation for details on java.sql.Connection.Rollback.
See also:

- 109.4.31 rollback(safepoint as JavaSavepointMBS) 16641

109.4.31 rollback(safepoint as JavaSavepointMBS)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Undoes all changes made after the given Savepoint object was set.
Notes: This method should be used only when auto-commit has been disabled.

savepoint: the Savepoint object to roll back to
See also:

- 109.4.30 rollback 16641

109.4.32 setSavepoint as JavaSavepointMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates an unnamed savepoint in the current transaction and returns the new Savepoint object that represents it.
See also:

- 109.4.33 setSavepoint(name as string) as JavaSavepointMBS 16641

109.4.33 setSavepoint(name as string) as JavaSavepointMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a savepoint with the given name in the current transaction and returns the new Savepoint object that represents it.

Notes: name: a String containing the name of the savepoint
returns the new Savepoint object
See also:

- 109.4.32 setSavepoint as JavaSavepointMBS 16641

109.4.34 TRANSACTION_NONE as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A constant indicating that transactions are not supported.

109.4.35 TRANSACTION_READ_COMMITTED as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A constant indicating that dirty reads are prevented; non-repeatable reads and phantom reads can occur.
Notes: This level only prohibits a transaction from reading a row with uncommitted changes in it.

109.4.36 TRANSACTION_READ_UNCOMMITTED as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A constant indicating that dirty reads, non-repeatable reads and phantom reads can occur.
Notes: This level allows a row changed by one transaction to be read by another transaction before any changes in that row have been committed (a "dirty read"). If any of the changes are rolled back, the second transaction will have retrieved an invalid row.

109.4.37 TRANSACTION_REPEATABLE_READ as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A constant indicating that dirty reads and non-repeatable reads are prevented; phantom reads can occur.
Notes: This level prohibits a transaction from reading a row with uncommitted changes in it, and it also prohibits the situation where one transaction reads a row, a second transaction alters the row, and the first

transaction rereads the row, getting different values the second time (a "non-repeatable read").

109.4.38 TRANSACTION_SERIALIZABLE as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: A constant indicating that dirty reads, non-repeatable reads and phantom reads are prevented.
Notes: This level includes the prohibitions in TRANSACTION_REPEATABLE_READ and further prohibits the situation where one transaction reads all rows that satisfy a WHERE condition, a second transaction inserts a row that satisfies that WHERE condition, and the first transaction rereads for the same condition, retrieving the additional "phantom" row in the second read.

109.4.39 typeARRAY as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type ARRAY.

109.4.40 typeBIGINT as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type BIGINT.
Example:

```
Var d as JavaConnectionMBS
MessageBox str(d.typeBIGINT)
```

109.4.41 typeBINARY as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type BINARY.

109.4.42 typeBIT as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type BIT.

109.4.43 typeBLOB as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type BLOB.

109.4.44 typeCHAR as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type CHAR.

109.4.45 typeCLOB as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type CLOB.

109.4.46 typeDATE as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type DATE.

109.4.47 typeDECIMAL as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type DECIMAL.

109.4.48 typeDISTINCT as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type DISTINCT.

109.4.49 typeDOUBLE as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type DOUBLE.

109.4.50 typeFLOAT as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type FLOAT.

109.4.51 typeINTEGER as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type INTEGER.

109.4.52 typeJAVA_OBJECT as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type JAVA_OBJECT.

109.4.53 typeLONGVARBINARY as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type LONGVARBINARY.

109.4.54 typeLONGVARCHAR as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type LONGVARCHAR.

109.4.55 typeNULL as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type NULL.

109.4.56 typeNUMERIC as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type NUMERIC.

109.4.57 typeOTHER as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language that indicates that the SQL type is database-specific and gets mapped to a Java object that can be accessed via the methods getObject and setObject.

109.4.58 typeREAL as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type REAL.

109.4.59 typeREF as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type REF.

109.4.60 typeSMALLINT as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type SMALLINT.

109.4.61 typeSTRUCT as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type STRUCT.

109.4.62 typeTIME as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type TIME.

109.4.63 typeTIMESTAMP as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type TIMESTAMP.

109.4.64 typeTINYINT as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type TINYINT.

109.4.65 typeVARBINARY as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type VARBINARY.

109.4.66 typeVARCHAR as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant in the Java programming language, sometimes referred to as a type code, that identifies the generic SQL type VARCHAR.

109.4.67 TYPE_FORWARD_ONLY as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant indicating the type for a ResultSet object whose cursor may move only forward.

109.4.68 TYPE_SCROLL_INSENSITIVE as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant indicating the type for a ResultSet object that is scrollable but generally not sensitive to changes made by others.

109.4.69 TYPE_SCROLL_SENSITIVE as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The constant indicating the type for a ResultSet object that is scrollable and generally sensitive to changes made by others.

109.4.70 Properties

109.4.71 AutoCommit as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The current auto-commit state.
Notes: See the java documentation for details on java.sql.Connection.SetAutoCommit.
(Read and Write computed property)

109.4.72 Catalog as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Sets or gets the given catalog name in order to select a subspace of this Connection object's database in which to work.

Notes: If the driver does not support catalogs, it will silently ignore this request.
(Read and Write computed property)

109.4.73 Holdability as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Changes or retrieves the holdability of ResultSet objects created using this Connection object to the given holdability.
Notes: Parameters:
holdability - a ResultSet holdability constant; one of ResultSet.HOLD_CURSORS_OVER_COMMIT or ResultSet.CLOSE_CURSORS_AT_COMMIT
(Read and Write computed property)

109.4.74 ReadOnly as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether this connection in read-only mode as a hint to enable database optimizations.
Notes: See the java documentation for details on java.sql.Connection.SetReadOnly.
(Read and Write computed property)

109.4.75 TransactionIsolation as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Attempts to change the transaction isolation level for this Connection object to the one given.
Notes: The constants defined in the interface Connection are the possible transaction isolation levels.
Note: If this method is called during a transaction, the result is implementation-defined.

Parameters:
level - one of the following Connection constants: Connection.TRANSACTION_READ_UNCOMMITTED, Connection.TRANSACTION_READ_COMMITTED, Connection.TRANSACTION_REPEATABLE_READ, or Connection.TRANSACTION_SERIALIZABLE. (Note that Connection.TRANSACTION_NONE cannot be used because it specifies that transactions are not supported.)
(Read and Write computed property)

109.5 class JavaDatabaseMBS

109.5.1 class JavaDatabaseMBS

MBS Java Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The class to handle database access using JDBC drivers.
Example:

```
// query a database through a JDBC driver in a Java VM
// The JDBC driver jar must be in the class path of the Java VM, see JavaVMMBS.
Var options() As String = Array("-Djava.class.path=" + SpecialFolder.Desktop.Child("mysql-connector.jar").NativePath)
Var vm As New JavaVMMBS(JavaVMMBS.JNI_VERSION_1_6, options, True)

Var db As New JavaDatabaseMBS(vm, "com.mysql.cj.jdbc.Driver")
Var conn As JavaConnectionMBS = db.getConnection("jdbc:mysql://localhost/test", "user", "password")
If conn = Nil Then Return

Var rs As JavaResultSetMBS = conn.createStatement.executeQuery("SELECT name FROM customers")
While rs.NextRecord
System.DebugLog rs.getString("name")
Wend
```

Notes: This class is not a subclass of RB's database class, so you can use it with Xojo Standard Edition.

Nearly all methods on this class can raise java exceptions which you can get using the error property. (and errorstring and errorcode)

Add Linux support plugin version 8.7.

Please make sure this Java VM object stays alive until you are done with all your java stuff. So all the java objects go away and this vm object is destroyed on the end. Because if some java code is still running like an background java thread, quitting the VM can lead into crashes.
Subclass of the JavaObjectMBS class.

109.5.2 Methods

109.5.3 connect(url as string) as JavaConnectionMBS

MBS Java Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Connects directly to the database calling the Drivers's connect method.
Notes: While getConnection calls DriverManager, this calls directly the driver.

Attempts to make a database connection to the given URL. The driver should return "null" if it realizes it is the wrong kind of driver to connect to the given URL. This will be common, as when the JDBC driver manager is asked to connect to a given URL it passes the URL to each loaded driver in turn.
The driver should throw an SQLException if it is the right driver to connect to the given URL but has trouble connecting to the database.

The java.util.Properties argument can be used to pass arbitrary string tag/value pairs as connection arguments. Normally at least "user" and "password" properties should be included in the Properties object. (the plugin passes empty Properties object)

url - the URL of the database to which to connect

Returns a Connection object that represents a connection to the URL
Throws SQLException - if a database access error occurs

109.5.4 Constructor(vm as JavaVMMBS, driverclass as string)

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Creates a new java database object.
Example:

```
Var vm as JavaVMMBS // your VM
Var db as JavaDatabaseMBS

db=new JavaDatabaseMBS(vm,"com.mysql.jdbc.Driver")
```

Notes: The driverclass is the name of the main class of the jdbc driver.

109.5.5 getConnection(url as string) as JavaConnectionMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Attempts to establish a connection to the given database URL.
Example:

```
Var d as JavaDatabaseMBS
Var c as JavaConnectionMBS

// get database

// connect to Oracle database using service name:
c=d.getConnection("jdbc:oracle:thin:@//192.168.10.20:1521/adbprod","user","pw")

// connect with SID:
c=d.getConnection("jdbc:oracle:thin:@192.168.10.20:1521:adbprod","user","pw")
```

Notes: The DriverManager attempts to select an appropriate driver from the set of registered JDBC drivers.

Parameters:
url - a database url of the form jdbc:subprotocol:subname
Returns:
a connection to the URL
See also:

- 109.5.6 getConnection(url as string, username as string, password as string) as JavaConnectionMBS 16653

109.5.6 getConnection(url as string, username as string, password as string) as JavaConnectionMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Attempts to establish a connection to the given database URL.
Example:

```
Var d as JavaDatabaseMBS
Var c as JavaConnectionMBS

// get database

// connect to Oracle database using service name:
c=d.getConnection("jdbc:oracle:thin:@//192.168.10.20:1521/adbprod","user","pw")
```

```
// connect with SID:
c=d.getConnection("jdbc:oracle:thin:@192.168.10.20:1521:adbprod","user","pw")
```

Notes: The DriverManager attempts to select an appropriate driver from the set of registered JDBC drivers.

Parameters:
url - a database url of the form jdbc:subprotocol:subname
user - the database user on whose behalf the connection is being made
password - the user's password

Returns:
a connection to the URL
See also:

- 109.5.5 getConnection(url as string) as JavaConnectionMBS 16653

109.5.7 IsDriverLoaded as Boolean

MBS Java Plugin, Plugin Version: 8.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Whether a driver has been loaded.

109.5.8 println(message as string)

MBS Java Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Prints a message to the current JDBC log stream.

109.5.9 Properties

109.5.10 LoginTimeout as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The maximum time in seconds that a driver will wait while attempting to connect to a database.
Notes: The login time limit in seconds.
(Read and Write computed property)

109.6 class JavaDatabaseMetaDataMBS

109.6.1 class JavaDatabaseMetaDataMBS

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Comprehensive information about the database as a whole.
Example:

```
// show database product and the list of tables over JDBC
// conn is a JavaConnectionMBS from JavaDatabaseMBS.getConnection, see there
Var conn As JavaConnectionMBS // your connection
If conn = Nil Then Return

Var meta As JavaDatabaseMetaDataMBS = conn.getMetaData
Var lines() As String
lines.Add meta.getDatabaseProductName + " " + meta.getDatabaseProductVersion + " with " + meta.get-
DriverName

Var tables As JavaResultSetMBS = meta.getTables("", "", "%")
While tables.NextRecord
lines.Add "Table: " + tables.getString("TABLE_NAME")
Wend
MessageBox String.FromArray(lines, EndOfLine)
```

Notes: This interface is implemented by driver vendors to let users know the capabilities of a Database Management System (DBMS) in combination with the driver based on JDBCTM technology ("JDBC driver") that is used with it. Different relational DBMSs often support different features, implement features in different ways, and use different data types. In addition, a driver may implement a feature on top of what the DBMS offers. Information returned by methods in this interface applies to the capabilities of a particular driver and a particular DBMS working together. Note that as used in this documentation, the term "database" is used generically to refer to both the driver and DBMS.

A user for this interface is commonly a tool that needs to discover how to deal with the underlying DBMS. This is especially true for applications that are intended to be used with more than one DBMS. For example, a tool might use the method getTypeInfo to find out what data types can be used in a CREATE TABLE statement. Or a user might call the method supportsCorrelatedSubqueries to see if it is possible to use a correlated subquery or supportsBatchUpdates to see if it is possible to use batch updates.

Some DatabaseMetaData methods return lists of information in the form of ResultSet objects. Regular ResultSet methods, such as getString and getInt, can be used to retrieve the data from these ResultSet objects. If a given form of metadata is not available, the ResultSet getter methods throw an SQLException.

Some DatabaseMetaData methods take arguments that are String patterns. These arguments all have names

such as fooPattern. Within a pattern String, "%" means match any substring of 0 or more characters, and "_" means match any one character. Only metadata entries matching the search pattern are returned. If a search pattern argument is set to null, that argument's criterion will be dropped from the search.

A method that gets information about a feature that the driver does not support will throw an SQLException. In the case of methods that return a ResultSet object, either a ResultSet object (which may be empty) is returned or an SQLException is thrown.
Subclass of the JavaObjectMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

109.6.2 Methods

109.6.3 allProceduresAreCallable as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether the current user can call all the procedures returned by the method getProcedures.
Notes: Returns true if so; false otherwise

109.6.4 allTablesAreSelectable as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether the current user can use all the tables returned by the method getTables in a SELECT statement.
Notes: Returns true if so; false otherwise

109.6.5 attributeNoNulls as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that NULL values might not be allowed.
Notes: A possible value for the column NULLABLE in the ResultSet object returned by the method getAttributes.

109.6.6 attributeNullable as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that NULL values are definitely allowed.
Notes: A possible value for the column NULLABLE in the ResultSet object returned by the method getAttributes.

109.6.7 attributeNullableUnknown as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that whether NULL values are allowed is not known.
Notes: A possible value for the column NULLABLE in the ResultSet object returned by the method getAttributes.

109.6.8 bestRowNotPseudo as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that the best row identifier is NOT a pseudo column.
Notes: A possible value for the column PSEUDO_COLUMN in the ResultSet object returned by the method getBestRowIdentifier.

109.6.9 bestRowPseudo as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that the best row identifier is a pseudo column.
Notes: A possible value for the column PSEUDO_COLUMN in the ResultSet object returned by the method getBestRowIdentifier.

109.6.10 bestRowSession as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that the scope of the best row identifier is the remainder of the current session.
Notes: A possible value for the column SCOPE in the ResultSet object returned by the method getBestRowIdentifier.

109.6.11 bestRowTemporary as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that the scope of the best row identifier is very temporary, lasting only while the row is being used.
Notes: A possible value for the column SCOPE in the ResultSet object returned by the method getBestRowIdentifier.

109.6.12 bestRowTransaction as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that the scope of the best row identifier is the remainder of the current transaction.
Notes: A possible value for the column SCOPE in the ResultSet object returned by the method getBestRowIdentifier.

109.6.13 bestRowUnknown as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that the best row identifier may or may not be a pseudo column.
Notes: A possible value for the column PSEUDO_COLUMN in the ResultSet object returned by the method getBestRowIdentifier.

109.6.14 columnNoNulls as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that the column might not allow NULL values.
Notes: A possible value for the column NULLABLE in the ResultSet returned by the method getColumns.

109.6.15 columnNullable as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that the column definitely allows NULL values.
Notes: A possible value for the column NULLABLE in the ResultSet returned by the method getColumns.

109.6.16 columnNullableUnknown as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates that the nullability of columns is unknown.
Notes: A possible value for the column NULLABLE in the ResultSet returned by the method getColumns.

109.6.17 Constructor

MBS Java Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

109.6.18 dataDefinitionCausesTransactionCommit as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether a data definition statement within a transaction forces the transaction to commit.

109.6.19 dataDefinitionIgnoredInTransactions as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether this database ignores a data definition statement within a transaction.

109.6.20 deletesAreDetected(type as Integer) as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether or not a visible row delete can be detected by calling the method ResultSet.rowDeleted.
Notes: If the method deletesAreDetected returns false, it means that deleted rows are removed from the result set.

Parameters:
type - the ResultSet type; one of ResultSet.TYPE_FORWARD_ONLY, ResultSet.TYPE_SCROLL_INSENSITIVE, or ResultSet.TYPE_SCROLL_SENSITIVE

Returns:
true if deletes are detected by the given result set type; false otherwise

109.6.21 doesMaxRowSizeIncludeBlobs as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether the return value for the method getMaxRowSize includes the SQL data types LONGVARCHAR and LONGVARBINARY.
Notes: Returns true if so; false otherwise.

109.6.22 getAttributes(catalog as string, schemaPattern as string, typeNamePattern as string, attributeNamePattern as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the given attribute of the given type for a user-defined type (UDT) that is available in the given schema and catalog.
Notes: Descriptions are returned only for attributes of UDTs matching the catalog, schema, type, and attribute name criteria. They are ordered by TYPE_SCHEM, TYPE_NAME and ORDINAL_POSITION. This description does not contain inherited attributes.

The ResultSet object that is returned has the following columns:

TYPE_CAT String =>type catalog (may be null)
TYPE_SCHEM String =>type schema (may be null)

TYPE_NAME String =>type name
ATTR_NAME String =>attribute name
DATA_TYPE int =>attribute type SQL type from java.sql.Types
ATTR_TYPE_NAME String =>Data source dependent type name. For a UDT, the type name is fully qualified. For a REF, the type name is fully qualified and represents the target type of the reference type.
ATTR_SIZE int =>column size. For char or date types this is the maximum number of characters; for numeric or decimal types this is precision.
DECIMAL_DIGITS int =>the number of fractional digits
NUM_PREC_RADIX int =>Radix (typically either 10 or 2)
NULLABLE int =>whether NULL is allowed
attributeNoNulls - might not allow NULL values
attributeNullable - definitely allows NULL values
attributeNullableUnknown - nullability unknown
REMARKS String =>comment describing column (may be null)
ATTR_DEF String =>default value (may be null)
SQL_DATA_TYPE int =>unused
SQL_DATETIME_SUB int =>unused
CHAR_OCTET_LENGTH int =>for char types the maximum number of bytes in the column
ORDINAL_POSITION int =>index of column in table (starting at 1)
IS_NULLABLE String =>"false" means column definitely does not allow NULL values; "true" means the column might allow NULL values. An empty string means unknown.
SCOPE_CATALOG String =>catalog of table that is the scope of a reference attribute (null if DATA_TYPE isn't REF)
SCOPE_SCHEMA String =>schema of table that is the scope of a reference attribute (null if DATA_TYPE isn't REF)
SCOPE_TABLE String =>table name that is the scope of a reference attribute (null if the DATA_TYPE isn't REF)
SOURCE_DATA_TYPE short =>source type of a distinct type or user-generated Ref type,SQL type from java.sql.Types (null if DATA_TYPE isn't DISTINCT or user-generated REF)
Parameters:
catalog - a catalog name; must match the catalog name as it is stored in the database; "" retrieves those without a catalog; null means that the catalog name should not be used to narrow the search
schemaPattern - a schema name pattern; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means that the schema name should not be used to narrow the search
typeNamePattern - a type name pattern; must match the type name as it is stored in the database
attributeNamePattern - an attribute name pattern; must match the attribute name as it is declared in the database

Returns:
a ResultSet object in which each row is an attribute description

Throws:
SQLException - if a database access error occurs

109.6.23 getCatalogs as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the catalog names available in this database. The results are ordered by catalog name.
Notes: The catalog column is:

TABLE_CAT String =>catalog name

Returns:
a ResultSet object in which each row has a single String column that is a catalog name

Throws:
SQLException - if a database access error occurs

109.6.24 getCatalogSeparator as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the String that this database uses as the separator between a catalog and table name.

109.6.25 getCatalogTerm as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the database vendor's preferred term for "catalog".

109.6.26 getColumnPrivileges(catalog as string, schema as string, table as string, columnNamePattern as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the access rights for a table's columns.
Notes: Only privileges matching the column name criteria are returned. They are ordered by COLUMN_NAME and PRIVILEGE.

Each privilige description has the following columns:

TABLE_CAT String =>table catalog (may be null)
TABLE_SCHEM String =>table schema (may be null)
TABLE_NAME String =>table name
COLUMN_NAME String =>column name
GRANTOR =>grantor of access (may be null)
GRANTEE String =>grantee of access
PRIVILEGE String =>name of access (SELECT, INSERT, UPDATE, REFRENCES, ...)
IS_GRANTABLE String =>"true" if grantee is permitted to grant to others; "false" if not; null if unknown
Parameters:
catalog - a catalog name; must match the catalog name as it is stored in the database; "" retrieves those without a catalog; null means that the catalog name should not be used to narrow the search
schema - a schema name; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means that the schema name should not be used to narrow the search
table - a table name; must match the table name as it is stored in the database
columnNamePattern - a column name pattern; must match the column name as it is stored in the database

Returns:
ResultSet - each row is a column privilege description

Throws:
SQLException - if a database access error occurs

109.6.27 getColumns(catalog as string, schemaPattern as string, tableNamePattern as string, columnNamePattern as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of table columns available in the specified catalog.
Notes: Only column descriptions matching the catalog, schema, table and column name criteria are returned. They are ordered by TABLE_SCHEM, TABLE_NAME, and ORDINAL_POSITION.

Each column description has the following columns:

TABLE_CAT String =>table catalog (may be null)
TABLE_SCHEM String =>table schema (may be null)
TABLE_NAME String =>table name
COLUMN_NAME String =>column name
DATA_TYPE int =>SQL type from java.sql.Types
TYPE_NAME String =>Data source dependent type name, for a UDT the type name is fully qualified
COLUMN_SIZE int =>column size. For char or date types this is the maximum number of characters, for

numeric or decimal types this is precision.
BUFFER_LENGTH is not used.
DECIMAL_DIGITS int =>the number of fractional digits
NUM_PREC_RADIX int =>Radix (typically either 10 or 2)
NULLABLE int =>is NULL allowed.
columnNoNulls - might not allow NULL values
columnNullable - definitely allows NULL values
columnNullableUnknown - nullability unknown
REMARKS String =>comment describing column (may be null)
COLUMN_DEF String =>default value (may be null)
SQL_DATA_TYPE int =>unused
SQL_DATETIME_SUB int =>unused
CHAR_OCTET_LENGTH int =>for char types the maximum number of bytes in the column
ORDINAL_POSITION int =>index of column in table (starting at 1)
IS_NULLABLE String =>"false" means column definitely does not allow NULL values; "true" means the column might allow NULL values. An empty string means nobody knows.
SCOPE_CATLOG String =>catalog of table that is the scope of a reference attribute (null if DATA_TYPE isn't REF)
SCOPE_SCHEMA String =>schema of table that is the scope of a reference attribute (null if the DATA_TYPE isn't REF)
SCOPE_TABLE String =>table name that this the scope of a reference attribute (null if the DATA_TYPE isn't REF)
SOURCE_DATA_TYPE short =>source type of a distinct type or user-generated Ref type, SQL type from java.sql.Types (null if DATA_TYPE isn't DISTINCT or user-generated REF)
Parameters:
catalog - a catalog name; must match the catalog name as it is stored in the database; "" retrieves those without a catalog; null means that the catalog name should not be used to narrow the search
schemaPattern - a schema name pattern; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means that the schema name should not be used to narrow the search
tableNamePattern - a table name pattern; must match the table name as it is stored in the database
columnNamePattern - a column name pattern; must match the column name as it is stored in the database

Returns:
ResultSet - each row is a column description

Throws:
SQLException - if a database access error occurs

109.6.28 getConnection as JavaConnectionMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the connection that produced this metadata object.

109.6.29 getCrossReference(primaryCatalog as string, primarySchema as string, primaryTable as string, foreignCatalog as string, foreignSchema as string, foreignTable as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the foreign key columns in the given foreign key table that reference the primary key columns of the given primary key table (describe how one table imports another's key).
Notes: This should normally return a single foreign key/primary key pair because most tables import a foreign key from a table only once. They are ordered by FKTABLE_CAT, FKTABLE_SCHEM, FKTABLE_NAME, and KEY_SEQ.
Each foreign key column description has the following columns:

PKTABLE_CAT String =>primary key table catalog (may be null)
PKTABLE_SCHEM String =>primary key table schema (may be null)
PKTABLE_NAME String =>primary key table name
PKCOLUMN_NAME String =>primary key column name
FKTABLE_CAT String =>foreign key table catalog (may be null) being exported (may be null)
FKTABLE_SCHEM String =>foreign key table schema (may be null) being exported (may be null)
FKTABLE_NAME String =>foreign key table name being exported
FKCOLUMN_NAME String =>foreign key column name being exported
KEY_SEQ short =>sequence number within foreign key
UPDATE_RULE short =>What happens to foreign key when primary is updated:
importedNoAction - do not allow update of primary key if it has been imported
importedKeyCascade - change imported key to agree with primary key update
importedKeySetNull - change imported key to NULL if its primary key has been updated
importedKeySetDefault - change imported key to default values if its primary key has been updated
importedKeyRestrict - same as importedKeyNoAction (for ODBC 2.x compatibility)
DELETE_RULE short =>What happens to the foreign key when primary is deleted.
importedKeyNoAction - do not allow delete of primary key if it has been imported
importedKeyCascade - delete rows that import a deleted key
importedKeySetNull - change imported key to NULL if its primary key has been deleted
importedKeyRestrict - same as importedKeyNoAction (for ODBC 2.x compatibility)
importedKeySetDefault - change imported key to default if its primary key has been deleted
FK_NAME String =>foreign key name (may be null)
PK_NAME String =>primary key name (may be null)
DEFERRABILITY short =>can the evaluation of foreign key constraints be deferred until commit
importedKeyInitiallyDeferred - see SQL92 for definition
importedKeyInitiallyImmediate - see SQL92 for definition
importedKeyNotDeferrable - see SQL92 for definition
Parameters:
primaryCatalog - a catalog name; must match the catalog name as it is stored in the database; "" retrieves those without a catalog; null means drop catalog name from the selection criteria
primarySchema - a schema name; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means drop schema name from the selection criteria
primaryTable - the name of the table that exports the key; must match the table name as it is stored in the

database
foreignCatalog - a catalog name; must match the catalog name as it is stored in the database; "" retrieves those without a catalog; null means drop catalog name from the selection criteria
foreignSchema - a schema name; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means drop schema name from the selection criteria
foreignTable - the name of the table that imports the key; must match the table name as it is stored in the database
Returns:
ResultSet - each row is a foreign key column description
Throws:
SQLException - if a database access error occurs

109.6.30 getDatabaseMajorVersion as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the major version number of the underlying database.

109.6.31 getDatabaseMinorVersion as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the minor version number of the underlying database.

109.6.32 getDatabaseProductName as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the name of this database product.

109.6.33 getDatabaseProductVersion as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the version number of this database product.

109.6.34 getDefaultTransactionIsolation as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves this database's default transaction isolation level.
Notes: The possible values are defined in java.sql.Connection.

109.6.35 getDriverMajorVersion as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves this JDBC driver's major version number.

109.6.36 getDriverMinorVersion as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves this JDBC driver's minor version number.

109.6.37 getDriverName as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the name of this JDBC driver.

109.6.38 getDriverVersion as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the version number of this JDBC driver as a String.

109.6.39 getExportedKeys(catalog as string, schema as string, table as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the foreign key columns that reference the given table's primary key columns (the foreign keys exported by a table).
Notes: They are ordered by FKTABLE_CAT, FKTABLE_SCHEM, FKTABLE_NAME, and KEY_SEQ. Each foreign key column description has the following columns:

PKTABLE_CAT String =>primary key table catalog (may be null)
PKTABLE_SCHEM String =>primary key table schema (may be null)
PKTABLE_NAME String =>primary key table name
PKCOLUMN_NAME String =>primary key column name
FKTABLE_CAT String =>foreign key table catalog (may be null) being exported (may be null)
FKTABLE_SCHEM String =>foreign key table schema (may be null) being exported (may be null)
FKTABLE_NAME String =>foreign key table name being exported
FKCOLUMN_NAME String =>foreign key column name being exported
KEY_SEQ short =>sequence number within foreign key
UPDATE_RULE short =>What happens to foreign key when primary is updated:
importedNoAction - do not allow update of primary key if it has been imported
importedKeyCascade - change imported key to agree with primary key update
importedKeySetNull - change imported key to NULL if its primary key has been updated
importedKeySetDefault - change imported key to default values if its primary key has been updated
importedKeyRestrict - same as importedKeyNoAction (for ODBC 2.x compatibility)
DELETE_RULE short =>What happens to the foreign key when primary is deleted.
importedKeyNoAction - do not allow delete of primary key if it has been imported
importedKeyCascade - delete rows that import a deleted key
importedKeySetNull - change imported key to NULL if its primary key has been deleted
importedKeyRestrict - same as importedKeyNoAction (for ODBC 2.x compatibility)
importedKeySetDefault - change imported key to default if its primary key has been deleted
FK_NAME String =>foreign key name (may be null)
PK_NAME String =>primary key name (may be null)
DEFERRABILITY short =>can the evaluation of foreign key constraints be deferred until commit
importedKeyInitiallyDeferred - see SQL92 for definition
importedKeyInitiallyImmediate - see SQL92 for definition
importedKeyNotDeferrable - see SQL92 for definition

Parameters:
catalog - a catalog name; must match the catalog name as it is stored in this database; "" retrieves those without a catalog; null means that the catalog name should not be used to narrow the search
schema - a schema name; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means that the schema name should not be used to narrow the search
table - a table name; must match the table name as it is stored in this database

Returns:
a ResultSet object in which each row is a foreign key column description

Throws:
SQLException - if a database access error occurs

109.6.40 getExtraNameCharacters as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves all the "extra" characters that can be used in unquoted identifier names (those beyond a-z, A-Z, 0-9 and _).

109.6.41 getIdentifierQuoteString as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the string used to quote SQL identifiers. This method returns a space " " if identifier quoting is not supported.

109.6.42 getImportedKeys(catalog as string, schema as string, table as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the primary key columns that are referenced by a table's foreign key columns (the primary keys imported by a table).
Notes: They are ordered by PKTABLE_CAT, PKTABLE_SCHEM, PKTABLE_NAME, and KEY_SEQ. Each primary key column description has the following columns:

PKTABLE_CAT String =>primary key table catalog being imported (may be null)
PKTABLE_SCHEM String =>primary key table schema being imported (may be null)
PKTABLE_NAME String =>primary key table name being imported
PKCOLUMN_NAME String =>primary key column name being imported
FKTABLE_CAT String =>foreign key table catalog (may be null)
FKTABLE_SCHEM String =>foreign key table schema (may be null)
FKTABLE_NAME String =>foreign key table name
FKCOLUMN_NAME String =>foreign key column name
KEY_SEQ short =>sequence number within a foreign key

UPDATE_RULE short =>What happens to a foreign key when the primary key is updated:
importedNoAction - do not allow update of primary key if it has been imported
importedKeyCascade - change imported key to agree with primary key update
importedKeySetNull - change imported key to NULL if its primary key has been updated
importedKeySetDefault - change imported key to default values if its primary key has been updated
importedKeyRestrict - same as importedKeyNoAction (for ODBC 2.x compatibility)
DELETE_RULE short =>What happens to the foreign key when primary is deleted.
importedKeyNoAction - do not allow delete of primary key if it has been imported
importedKeyCascade - delete rows that import a deleted key
importedKeySetNull - change imported key to NULL if its primary key has been deleted
importedKeyRestrict - same as importedKeyNoAction (for ODBC 2.x compatibility)
importedKeySetDefault - change imported key to default if its primary key has been deleted
FK_NAME String =>foreign key name (may be null)
PK_NAME String =>primary key name (may be null)
DEFERRABILITY short =>can the evaluation of foreign key constraints be deferred until commit
importedKeyInitiallyDeferred - see SQL92 for definition
importedKeyInitiallyImmediate - see SQL92 for definition
importedKeyNotDeferrable - see SQL92 for definition
Parameters:
catalog - a catalog name; must match the catalog name as it is stored in the database; "" retrieves those without a catalog; null means that the catalog name should not be used to narrow the search
schema - a schema name; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means that the schema name should not be used to narrow the search
table - a table name; must match the table name as it is stored in the database

Returns:
ResultSet - each row is a primary key column description

Throws:
SQLException - if a database access error occurs

109.6.43 getJDBCMajorVersion as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the major JDBC version number for this driver.

109.6.44 getJDBCMinorVersion as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the minor JDBC version number for this driver.

109.6.45 getMaxBinaryLiteralLength as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of hex characters this database allows in an inline binary literal.
Notes: Returns the maximum length (in hex characters) for a binary literal; a result of zero means that there is no limit or the limit is not known

109.6.46 getMaxCatalogNameLength as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of characters that this database allows in a catalog name.
Notes: Returns the maximum number of characters allowed in a catalog name; a result of zero means that there is no limit or the limit is not known

109.6.47 getMaxCharLiteralLength as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of characters this database allows for a character literal.
Notes: Returns the maximum number of characters allowed for a character literal; a result of zero means that there is no limit or the limit is not known

109.6.48 getMaxColumnNameLength as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of characters this database allows for a column name.
Notes: Returns the maximum number of characters allowed for a column name; a result of zero means that there is no limit or the limit is not known

109.6.49 getMaxColumnsInGroupBy as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of columns this database allows in a GROUP BY clause.
Notes: Returns the maximum number of columns allowed; a result of zero means that there is no limit or the limit is not known

109.6.50 getMaxColumnsInIndex as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of columns this database allows in an index.
Notes: Returns the maximum number of columns allowed; a result of zero means that there is no limit or the limit is not known

109.6.51 getMaxColumnsInOrderBy as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of columns this database allows in an ORDER BY clause.
Notes: Returns the maximum number of columns allowed; a result of zero means that there is no limit or the limit is not known

109.6.52 getMaxColumnsInSelect as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of columns this database allows in a SELECT list.
Notes: Returns the maximum number of columns allowed; a result of zero means that there is no limit or the limit is not known

109.6.53 getMaxColumnsInTable as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of columns this database allows in a table.
Notes: Returns the maximum number of columns allowed; a result of zero means that there is no limit or the limit is not known

109.6.54 getMaxConnections as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of concurrent connections to this database that are possible.
Notes: Returns the maximum number of active connections possible at one time; a result of zero means that there is no limit or the limit is not known

109.6.55 getMaxCursorNameLength as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of characters that this database allows in a cursor name.
Notes: Returns the maximum number of characters allowed in a cursor name; a result of zero means that there is no limit or the limit is not known

109.6.56 getMaxIndexLength as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of bytes this database allows for an index, including all of the parts of the index.
Notes: Returns the maximum number of bytes allowed; this limit includes the composite of all the constituent parts of the index; a result of zero means that there is no limit or the limit is not known

109.6.57 getMaxProcedureNameLength as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of characters that this database allows in a procedure name.
Notes: Returns the maximum number of characters allowed in a procedure name; a result of zero means that there is no limit or the limit is not known

109.6.58 getMaxRowSize as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of bytes this database allows in a single row.
Notes: Returns the maximum number of bytes allowed for a row; a result of zero means that there is no limit or the limit is not known

109.6.59 getMaxSchemaNameLength as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of characters that this database allows in a schema name.
Notes: Returns the maximum number of characters allowed in a schema name; a result of zero means that there is no limit or the limit is not known

109.6.60 getMaxStatementLength as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of characters this database allows in an SQL statement.
Notes: Returns the maximum number of characters allowed for an SQL statement; a result of zero means that there is no limit or the limit is not known

109.6.61 getMaxStatements as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of active statements to this database that can be open at the same time.
Notes: Returns the maximum number of statements that can be open at one time; a result of zero means that there is no limit or the limit is not known

109.6.62 getMaxTableNameLength as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of characters this database allows in a table name.
Notes: Returns the maximum number of characters allowed for a table name; a result of zero means that there is no limit or the limit is not known

109.6.63 getMaxTablesInSelect as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of tables this database allows in a SELECT statement.
Notes: Returns the maximum number of tables allowed in a SELECT statement; a result of zero means that there is no limit or the limit is not known

109.6.64 getMaxUserNameLength as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the maximum number of characters this database allows in a user name.
Notes: Returns the maximum number of characters allowed for a user name; a result of zero means that there is no limit or the limit is not known

109.6.65 getNumericFunctions as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a comma-separated list of math functions available with this database.
Notes: These are the Open /Open CLI math function names used in the JDBC function escape clause.

109.6.66 getPrimaryKeys(catalog as string, schema as string, table as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the given table's primary key columns. They are ordered by COLUMN_NAME.
Notes: Each primary key column description has the following columns:

TABLE_CAT String =>table catalog (may be null)
TABLE_SCHEM String =>table schema (may be null)
TABLE_NAME String =>table name
COLUMN_NAME String =>column name
KEY_SEQ short =>sequence number within primary key
PK_NAME String =>primary key name (may be null)
Parameters:
catalog - a catalog name; must match the catalog name as it is stored in the database; "" retrieves those without a catalog; null means that the catalog name should not be used to narrow the search
schema - a schema name; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means that the schema name should not be used to narrow the search
table - a table name; must match the table name as it is stored in the database

Returns:
ResultSet - each row is a primary key column description

109.6.67 getProcedureColumns(catalog as string, schemaPattern as string, procedureNamePattern as string, columnNamePattern as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the given catalog's stored procedure parameter and result columns.
Notes: Only descriptions matching the schema, procedure and parameter name criteria are returned. They are ordered by PROCEDURE_SCHEM and PROCEDURE_NAME. Within this, the return value, if any, is first. Next are the parameter descriptions in call order. The column descriptions follow in column number order.

Each row in the ResultSet is a parameter description or column description with the following fields:

PROCEDURE_CAT String =>procedure catalog (may be null)
PROCEDURE_SCHEM String =>procedure schema (may be null)
PROCEDURE_NAME String =>procedure name
COLUMN_NAME String =>column/parameter name
COLUMN_TYPE Short =>kind of column/parameter:
procedureColumnUnknown - nobody knows
procedureColumnIn - IN parameter
procedureColumnInOut - INOUT parameter
procedureColumnOut - OUT parameter
procedureColumnReturn - procedure return value
procedureColumnResult - result column in ResultSet
DATA_TYPE int =>SQL type from java.sql.Types
TYPE_NAME String =>SQL type name, for a UDT type the type name is fully qualified

PRECISION int =>precision
LENGTH int =>length in bytes of data
SCALE short =>scale
RADIX short =>radix
NULLABLE short =>can it contain NULL.
procedureNoNulls - does not allow NULL values
procedureNullable - allows NULL values
procedureNullableUnknown - nullability unknown
REMARKS String =>comment describing parameter/column
Note: Some databases may not return the column descriptions for a procedure. Additional columns beyond REMARKS can be defined by the database.

Parameters:
catalog - a catalog name; must match the catalog name as it is stored in the database; "" retrieves those without a catalog; null means that the catalog name should not be used to narrow the search
schemaPattern - a schema name pattern; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means that the schema name should not be used to narrow the search
procedureNamePattern - a procedure name pattern; must match the procedure name as it is stored in the database
columnNamePattern - a column name pattern; must match the column name as it is stored in the database
Returns:
ResultSet - each row describes a stored procedure parameter or column
Throws:
SQLException - if a database access error occurs

109.6.68 getProcedures(catalog as string, schemaPattern as string, procedureNamePattern as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the stored procedures available in the given catalog.
Notes: Only procedure descriptions matching the schema and procedure name criteria are returned. They are ordered by PROCEDURE_SCHEM and PROCEDURE_NAME.

Each procedure description has the following columns:

PROCEDURE_CAT String =>procedure catalog (may be null)
PROCEDURE_SCHEM String =>procedure schema (may be null)
PROCEDURE_NAME String =>procedure name
reserved for future use
reserved for future use
reserved for future use
REMARKS String =>explanatory comment on the procedure

PROCEDURE_TYPE short =>kind of procedure:
procedureResultUnknown - May return a result
procedureNoResult - Does not return a result
procedureReturnsResult - Returns a result
Parameters:
catalog - a catalog name; must match the catalog name as it is stored in the database; "" retrieves those without a catalog; null means that the catalog name should not be used to narrow the search
schemaPattern - a schema name pattern; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means that the schema name should not be used to narrow the search
procedureNamePattern - a procedure name pattern; must match the procedure name as it is stored in the database

Returns:
ResultSet - each row is a procedure description

Throws:
SQLException - if a database access error occurs

109.6.69 getProcedureTerm as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the database vendor's preferred term for "procedure".

109.6.70 getResultSetHoldability as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the default holdability of this ResultSet object.
Notes: Returns:
the default holdability; either ResultSet.HOLD_CURSORS_OVER_COMMIT or ResultSet.CLOSE_CURSORS_AT_COMMIT

109.6.71 getSchemas as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the schema names available in this database.
Notes: The results are ordered by schema name.

The schema column is:

TABLE_SCHEM String =>schema name
TABLE_CATALOG String =>catalog name (may be null)
Returns:
a ResultSet object in which each row is a schema decription

Throws:
SQLException - if a database access error occurs

109.6.72 getSchemaTerm as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the database vendor's preferred term for "schema".

109.6.73 getSearchStringEscape as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the string that can be used to escape wildcard characters.
Notes: This is the string that can be used to escape '_' or '%' in the catalog search parameters that are a pattern (and therefore use one of the wildcard characters).
The '_' character represents any single character; the '%' character represents any sequence of zero or more characters.

109.6.74 getSQLKeywords as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a comma-separated list of all of this database's SQL keywords that are NOT also SQL92 keywords.

109.6.75 getSQLStateType as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates whether the SQLSTATE returned by SQLException.getSQLState is X/Open (now known as Open Group) SQL CLI or SQL99.
Notes: Returns:
the type of SQLSTATE; one of: sqlStateXOpen or sqlStateSQL99

109.6.76 getStringFunctions as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a comma-separated list of string functions available with this database.
Notes: These are the Open Group CLI string function names used in the JDBC function escape clause.

109.6.77 getSuperTables(catalog as string, schemaPattern as string, tableNamePattern as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the table hierarchies defined in a particular schema in this database.
Notes: Only supertable information for tables matching the catalog, schema and table name are returned. The table name parameter may be a fully- qualified name, in which case, the catalog and schemaPattern parameters are ignored. If a table does not have a super table, it is not listed here. Supertables have to be defined in the same catalog and schema as the sub tables. Therefore, the type description does not need to include this information for the supertable.

Each type description has the following columns:

TABLE_CAT String =>the type's catalog (may be null)
TABLE_SCHEM String =>type's schema (may be null)
TABLE_NAME String =>type name
SUPERTABLE_NAME String =>the direct super type's name
Note: If the driver does not support type hierarchies, an empty result set is returned.

Parameters:
catalog - a catalog name; "" retrieves those without a catalog; null means drop catalog name from the selection criteria
schemaPattern - a schema name pattern; "" retrieves those without a schema

tableNamePattern - a table name pattern; may be a fully-qualified name

Returns:
a ResultSet object in which each row is a type description

Throws:
SQLException - if a database access error occurs

109.6.78 getSuperTypes(catalog as string, schemaPattern as string, typeNamePattern as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the user-defined type (UDT) hierarchies defined in a particular schema in this database.
Notes: Only the immediate super type/ sub type relationship is modeled.
Only supertype information for UDTs matching the catalog, schema, and type name is returned. The type name parameter may be a fully-qualified name. When the UDT name supplied is a fully-qualified name, the catalog and schemaPattern parameters are ignored.

If a UDT does not have a direct super type, it is not listed here. A row of the ResultSet object returned by this method describes the designated UDT and a direct supertype. A row has the following columns:

TYPE_CAT String =>the UDT's catalog (may be null)
TYPE_SCHEM String =>UDT's schema (may be null)
TYPE_NAME String =>type name of the UDT
SUPERTYPE_CAT String =>the direct super type's catalog (may be null)
SUPERTYPE_SCHEM String =>the direct super type's schema (may be null)
SUPERTYPE_NAME String =>the direct super type's name
Note: If the driver does not support type hierarchies, an empty result set is returned.

Parameters:
catalog - a catalog name; "" retrieves those without a catalog; null means drop catalog name from the selection criteria
schemaPattern - a schema name pattern; "" retrieves those without a schema
typeNamePattern - a UDT name pattern; may be a fully-qualified name

Returns:
a ResultSet object in which a row gives information about the designated UDT

Throws:

SQLException - if a database access error occurs

109.6.79 getSystemFunctions as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a comma-separated list of system functions available with this database.
Notes: These are the Open Group CLI system function names used in the JDBC function escape clause.

109.6.80 getTablePrivileges(catalog as string, schemaPattern as string, tableNamePattern as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the access rights for each table available in a catalog.
Notes: Note that a table privilege applies to one or more columns in the table. It would be wrong to assume that this privilege applies to all columns (this may be true for some systems but is not true for all.)
Only privileges matching the schema and table name criteria are returned. They are ordered by TABLE_SCHEM, TABLE_NAME, and PRIVILEGE.

Each privilige description has the following columns:

TABLE_CAT String =>table catalog (may be null)
TABLE_SCHEM String =>table schema (may be null)
TABLE_NAME String =>table name
GRANTOR =>grantor of access (may be null)
GRANTEE String =>grantee of access
PRIVILEGE String =>name of access (SELECT, INSERT, UPDATE, REFRENCES, ...)
IS_GRANTABLE String =>"true" if grantee is permitted to grant to others; "false" if not; null if unknown
Parameters:
catalog - a catalog name; must match the catalog name as it is stored in the database; "" retrieves those without a catalog; null means that the catalog name should not be used to narrow the search
schemaPattern - a schema name pattern; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means that the schema name should not be used to narrow the search
tableNamePattern - a table name pattern; must match the table name as it is stored in the database

Returns:
ResultSet - each row is a table privilege description

Throws:

SQLException - if a database access error occurs

109.6.81 getTables(catalog as string, schemaPattern as string, tableNamePattern as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the tables available in the given catalog.
Notes: Only table descriptions matching the catalog, schema, table name and type criteria are returned. They are ordered by TABLE_TYPE, TABLE_SCHEM and TABLE_NAME.
Each table description has the following columns:

TABLE_CAT String =>table catalog (may be null)
TABLE_SCHEM String =>table schema (may be null)
TABLE_NAME String =>table name
TABLE_TYPE String =>table type. Typical types are "TABLE", "VIEW", "SYSTEM TABLE", "GLOBAL TEMPORARY", "LOCAL TEMPORARY", "ALIAS", "SYNONYM".
REMARKS String =>explanatory comment on the table
TYPE_CAT String =>the types catalog (may be null)
TYPE_SCHEM String =>the types schema (may be null)
TYPE_NAME String =>type name (may be null)
SELF_REFERENCING_COL_NAME String =>name of the designated "identifier" column of a typed table (may be null)
REF_GENERATION String =>specifies how values in SELF_REFERENCING_COL_NAME are created. Values are "SYSTEM", "USER", "DERIVED". (may be null)
Note: Some databases may not return information for all tables.

Parameters:
catalog - a catalog name; must match the catalog name as it is stored in the database; "" retrieves those without a catalog; null means that the catalog name should not be used to narrow the search
schemaPattern - a schema name pattern; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means that the schema name should not be used to narrow the search
tableNamePattern - a table name pattern; must match the table name as it is stored in the database
types - a list of table types to include (optionally)

Returns:
ResultSet - each row is a table description

Throws:
SQLException - if a database access error occurs
See also:

- 109.6.82 getTables(catalog as string, schemaPattern as string, tableNamePattern as string, types() as

string) as JavaResultSetMBS 16684

109.6.82 getTables(catalog as string, schemaPattern as string, tableNamePattern as string, types() as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of the tables available in the given catalog.
Notes: Only table descriptions matching the catalog, schema, table name and type criteria are returned. They are ordered by TABLE_TYPE, TABLE_SCHEM and TABLE_NAME.
Each table description has the following columns:

TABLE_CAT String =>table catalog (may be null)
TABLE_SCHEM String =>table schema (may be null)
TABLE_NAME String =>table name
TABLE_TYPE String =>table type. Typical types are "TABLE", "VIEW", "SYSTEM TABLE", "GLOBAL TEMPORARY", "LOCAL TEMPORARY", "ALIAS", "SYNONYM".
REMARKS String =>explanatory comment on the table
TYPE_CAT String =>the types catalog (may be null)
TYPE_SCHEM String =>the types schema (may be null)
TYPE_NAME String =>type name (may be null)
SELF_REFERENCING_COL_NAME String =>name of the designated "identifier" column of a typed table (may be null)
REF_GENERATION String =>specifies how values in SELF_REFERENCING_COL_NAME are created. Values are "SYSTEM", "USER", "DERIVED". (may be null)
Note: Some databases may not return information for all tables.

Parameters:
catalog - a catalog name; must match the catalog name as it is stored in the database; "" retrieves those without a catalog; null means that the catalog name should not be used to narrow the search
schemaPattern - a schema name pattern; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means that the schema name should not be used to narrow the search
tableNamePattern - a table name pattern; must match the table name as it is stored in the database
types - a list of table types to include (optionally)

Returns:
ResultSet - each row is a table description

Throws:
SQLException - if a database access error occurs
See also:

- 109.6.81 getTables(catalog as string, schemaPattern as string, tableNamePattern as string) as JavaResultSetMBS 16683

109.6.83 getTableTypes as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the table types available in this database.
Notes: The table type is:

TABLE_TYPE String =>table type. Typical types are "TABLE", "VIEW", "SYSTEM TABLE", "GLOBAL TEMPORARY", "LOCAL TEMPORARY", "ALIAS", "SYNONYM".

Returns:
a ResultSet object in which each row has a single String column that is a table type

Throws:
SQLException - if a database access error occurs

109.6.84 getTimeDateFunctions as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a comma-separated list of the time and date functions available with this database.

109.6.85 getTypeInfos as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of all the standard SQL types supported by this database.
Notes: They are ordered by DATA_TYPE and then by how closely the data type maps to the corresponding JDBC SQL type.

Each type description has the following columns:

TYPE_NAME String =>Type name
DATA_TYPE int =>SQL data type from java.sql.Types
PRECISION int =>maximum precision
LITERAL_PREFIX String =>prefix used to quote a literal (may be null)
LITERAL_SUFFIX String =>suffix used to quote a literal (may be null)
CREATE_PARAMS String =>parameters used in creating the type (may be null)
NULLABLE short =>can you use NULL for this type.

typeNoNulls - does not allow NULL values
typeNullable - allows NULL values
typeNullableUnknown - nullability unknown
CASE_SENSITIVE boolean=>is it case sensitive.
SEARCHABLE short =>can you use "WHERE" based on this type:
typePredNone - No support
typePredChar - Only supported with WHERE .. LIKE
typePredBasic - Supported except for WHERE .. LIKE
typeSearchable - Supported for all WHERE ..
UNSIGNED_ATTRIBUTE boolean =>is it unsigned.
FIXED_PREC_SCALE boolean =>can it be a money value.
AUTO_INCREMENT boolean =>can it be used for an auto-increment value.
LOCAL_TYPE_NAME String =>localized version of type name (may be null)
MINIMUM_SCALE short =>minimum scale supported
MAXIMUM_SCALE short =>maximum scale supported
SQL_DATA_TYPE int =>unused
SQL_DATETIME_SUB int =>unused
NUM_PREC_RADIX int =>usually 2 or 10

Returns:
a ResultSet object in which each row is an SQL type description

Throws:
SQLException - if a database access error occurs

This method is named getTypeInfo in Java and getTypeInfos in this plugin because Xojo has a global method and sees a conflict.

109.6.86 getURL as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the URL for this DBMS.
Notes: Returns the URL for this DBMS or "" if it cannot be generated.

109.6.87 getUserName as string

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves the user name as known to this database.

109.6.88 getVersionColumns(catalog as string, schema as string, table as string) as JavaResultSetMBS

MBS Java Plugin, Plugin Version: 9.1, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves a description of a table's columns that are automatically updated when any value in a row is updated. They are unordered.
Notes: Each column description has the following columns:

SCOPE short =>is not used
COLUMN_NAME String =>column name
DATA_TYPE int =>SQL data type from java.sql.Types
TYPE_NAME String =>Data source-dependent type name
COLUMN_SIZE int =>precision
BUFFER_LENGTH int =>length of column value in bytes
DECIMAL_DIGITS short =>scale
PSEUDO_COLUMN short =>whether this is pseudo column like an Oracle ROWID
versionColumnUnknown - may or may not be pseudo column
versionColumnNotPseudo - is NOT a pseudo column
versionColumnPseudo - is a pseudo column
Parameters:
catalog - a catalog name; must match the catalog name as it is stored in the database; "" retrieves those without a catalog; null means that the catalog name should not be used to narrow the search
schema - a schema name; must match the schema name as it is stored in the database; "" retrieves those without a schema; null means that the schema name should not be used to narrow the search
table - a table name; must match the table name as it is stored in the database

Returns:
a ResultSet object in which each row is a column description

109.6.89 importedKeyCascade as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: For the column UPDATE_RULE, indicates that when the primary key is updated, the foreign key (imported key) is changed to agree with it.
Notes: For the column DELETE_RULE, it indicates that when the primary key is deleted, rows that imported that key are deleted.
A possible value for the columns UPDATE_RULE and DELETE_RULE in the ResultSet objects returned by the methods getImportedKeys, getExportedKeys, and getCrossReference.

109.6.90 importedKeyInitiallyDeferred as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates deferrability. See SQL-92 for a definition.
Notes: A possible value for the column DEFERRABILITY in the ResultSet objects returned by the methods getImportedKeys, getExportedKeys, and getCrossReference.

109.6.91 importedKeyInitiallyImmediate as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates deferrability. See SQL-92 for a definition.
Notes: A possible value for the column DEFERRABILITY in the ResultSet objects returned by the methods getImportedKeys, getExportedKeys, and getCrossReference.

109.6.92 importedKeyNoAction as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: For the columns UPDATE_RULE and DELETE_RULE, indicates that if the primary key has been imported, it cannot be updated or deleted.
Notes: A possible value for the columns UPDATE_RULE and DELETE_RULE in the ResultSet objects returned by the methods getImportedKeys, getExportedKeys, and getCrossReference.

109.6.93 importedKeyNotDeferrable as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates deferrability. See SQL-92 for a definition.
Notes: A possible value for the column DEFERRABILITY in the ResultSet objects returned by the methods getImportedKeys, getExportedKeys, and getCrossReference.

109.6.94 importedKeyRestrict as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: For the column UPDATE_RULE, indicates that a primary key may not be updated if it has been imported by another table as a foreign key.
Notes: For the column DELETE_RULE, indicates that a primary key may not be deleted if it has been imported by another table as a foreign key.
A possible value for the columns UPDATE_RULE and DELETE_RULE in the ResultSet objects returned by the methods getImportedKeys, getExportedKeys, and getCrossReference.

109.6.95 importedKeySetDefault as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: For the columns UPDATE_RULE and DELETE_RULE, indicates that if the primary key is updated or deleted, the foreign key (imported key) is set to the default value.
Notes: A possible value for the columns UPDATE_RULE and DELETE_RULE in the ResultSet objects returned by the methods getImportedKeys, getExportedKeys, and getCrossReference.

109.6.96 importedKeySetNull as Integer

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: For the columns UPDATE_RULE and DELETE_RULE, indicates that when the primary key is updated or deleted, the foreign key (imported key) is changed to NULL.
Notes: A possible value for the columns UPDATE_RULE and DELETE_RULE in the ResultSet objects returned by the methods getImportedKeys, getExportedKeys, and getCrossReference.

109.6.97 insertsAreDetected(type as Integer) as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether or not a visible row insert can be detected by calling the method ResultSet.rowInserted.
Notes: Parameters:
type - the ResultSet type; one of ResultSet.TYPE_FORWARD_ONLY, ResultSet.TYPE_SCROLL_INSENSITIVE, or ResultSet.TYPE_SCROLL_SENSITIVE

Returns:
true if changes are detected by the specified result set type; false otherwise

109.6.98 isCatalogAtStart as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether a catalog appears at the start of a fully qualified table name. If not, the catalog appears at the end.

109.6.99 isReadOnly as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether this database is in read-only mode.

109.6.100 locatorsUpdateCopy as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Indicates whether updates made to a LOB are made on a copy or directly to the LOB.
Notes: Returns:
true if updates are made to a copy of the LOB; false if updates are made directly to the LOB

109.6.101 nullPlusNonNullIsNull as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether this database supports concatenations between NULL and non-NULL values being NULL.

109.6.102 nullsAreSortedAtEnd as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether NULL values are sorted at the end regardless of sort order.

109.6.103 nullsAreSortedAtStart as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Retrieves whether NULL values are sorted at the start regardless of sort order.

109.6.104 nullsAreSortedHigh as boolean

MBS Java Plugin, Plugin Version: 8.5, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.
